ENVIRONMENT**Subject:**

Addendum 3 to the *In-Situ Hexavalent Chromium Reduction Pilot Test Work Plan – Floodplain Reductive Zone Enhancement* for the Pacific Gas and Electric Company Topock Compressor Station

Dear: Mr. Perdue

Consistent with the *In-Situ Hexavalent Chromium Reduction Pilot Test Work Plan – Floodplain Reductive Zone Enhancement* (Work Plan) prepared by MWH in August 2005, the *Final Addendum to the In-Situ Hexavalent Chromium Reduction Pilot Test Work Plan – Floodplain Reductive Zone Enhancement* (Addendum 1) dated December 5, 2005, and *Addendum 2 to the In-Situ Hexavalent Chromium Reduction Pilot Test Work Plan – Floodplain Reductive Zone Enhancement* (Addendum 2) dated April 14, 2006, ARCADIS proposes additional refinements to the floodplain reductive in-situ pilot test (ISPT, Figures 1 and 2). This third addendum (Addendum 3) details proposed modifications to the Work Plan and subsequent addenda. These modifications change the number and timing of injection events authorized under California Regional Water Quality Control Board, Colorado River Basin Region (Water Board) Order No. R7-2006-0008. Thus, these Addendum 3 modifications will need Water Board and Department of Toxic Substance Control (DTSC) approval prior to implementation.

The purpose of the floodplain ISPT is to evaluate the efficacy of using food grade materials to reduce hexavalent chromium in groundwater to form stable, insoluble trivalent chromium. As specified in the Work Plan, the results will be used to assess the feasibility and performance (including delivery capabilities and persistence) of selected food grade organic carbon reductants under actual Site conditions. While the pilot test to date has been successful in reducing hexavalent chromium concentrations in the test area, the results of the proposed work will provide additional information on Site conditions necessary for the development of an enhanced reductive zone along the river floodplain and will assist with the selection of specific methodologies for long-term Site management.

Results to Date

The first, second, third, and fourth injection events were on May 4, September 7, August 11, and November 1, 2006, respectively. Table 1 presents well construction details and Tables 2 and 3 present field and analytical data. The following paragraph describes the ISPT results through November 14, 2006.

The analytical results of post-injection sampling indicate that the injected tracers and total organic carbon (TOC) arrived at the PT-1 and PT-3 monitoring well nests within the first 3 days following the initial injections on May 4 through 6 (Table 2 and 3). Data to date from the second, third, or fourth injections do not indicate any changes in groundwater flow relative to the initial injections. Following the first injection, indications of reducing conditions and hexavalent chromium reduction were noted at wells PTI-1D, PT-1D, PT-2D, and PT-3D (Table 2 and 3). Although hexavalent chromium concentrations at wells PTI-1D and PT-1D increased slightly in months 3 and 5, concentrations decreased following the injection events on August 11, September 7, and November 1, 2006 (Table 2). Hexavalent chromium concentrations at well PTI-1D decreased to less than 10 micrograms per liter on September 28 and October 8, 2006 and have remained low. Hexavalent chromium concentrations also declined at well PT-2D following the injections, however, concentrations have remained above the detection limit. Peak TOC concentrations following injections have declined over time, indicating that the amount of TOC reaching this downgradient location is insufficient to support complete chromium reduction. Additionally, dissolved iron concentrations throughout the deep zone have remained low over the course of the injections, suggesting that the carbon addition thus far has not been adequate to stimulate the iron reducing conditions optimal for sustained chromium reduction.

The data suggest that the additional injections have increased the reduction of hexavalent chromium as the aquifer microbes have been conditioned to the presence of organic carbon. It is likely that the continued injection of organic carbon would continue the reduction of hexavalent chromium, but a more persistent reductive environment that is less dependent on continued injections of low concentrations of organic carbon would be preferable. In an effort to create a more persistent reductive environment, modifications to the injection approach are proposed.

Proposed Modifications

The following modifications are proposed to the floodplain ISPT, as currently detailed in the Work Plan, Addendum 1, and Addendum 2:

- Increase the number of injection events from four to six;
- Increase the amount of injected reductant reagent from 50, 100, 100, and 200 pounds, for the first four injections, to 1,500 pounds per injection for the fifth and sixth injection;
- Increase the total volume of injected reductant solution from 6,000 gallons per injection to 18,000 gallons;
- Modify the groundwater monitoring schedule and list of monitored parameters; and
- Clarify the reporting schedule and the content of the reports.

The proposed changes are discussed in more detail in the following paragraphs.

Number of Injection Events

The Work Plan noted that reduction efficiency can be determined from groundwater chemistry and a comparison between TOC concentrations and tracer concentrations. If the reduction efficiency indicates a high reductant consumption rate by compounds other than hexavalent chromium, additional injections of higher concentrations of lactate would be completed.

Water Board Order No. R7-2006-0008 provides for up to four injection events to be completed over a six-month period. ARCADIS is proposing to increase the number of injection events to six and, in an attempt to increase the persistence of the treatment, to increase both the concentration of lactate in the injectant and the volume of the injection solution used in each of the fifth and sixth injections. The total amounts of injected lactate and diluted solution used for all six injections will not exceed the respective amounts authorized under Order No. R7-2006-0008 to be used in four injections.

ARCADIS completed four injection events during the six month period from May 4, 2006 through November 2, 2006. The first event was completed in all three injection

wells (PTI-1S/M/D); the three subsequent injections were completed in the deep zone only. ARCADIS is now proposing to complete two additional injections of lactate in the deep zone. It is anticipated that these additional injections will result in the further reduction of hexavalent chromium concentrations in the groundwater. In addition, the additional injections are expected to stimulate the reduction of iron and the production of ferrous iron that is necessary to sustain continued hexavalent chromium reduction between organic carbon injections.

The data from these additional injections will support the full scale application of in-situ remediation at the Topock site. A comparison between water chemistry data from the low concentration and higher concentration lactate injections will provide data that can be used to determine the required loading of organic carbon in the upland recirculation test, as well as to calibrate organic carbon loading in a full scale floodplain injection program.

Reducant Reagent

In the original Work Plan, it was proposed to use both emulsified vegetable oil (EVO) and lactate as injected reductants. Addendum 1 modified the Work Plan to use lactate only and increased the proposed volume of lactate to be used to 500 pounds in each of the three injection wells. The proposed total volume of reagent solution (6,000 gallons per injection well) was not modified in Addendum 1.

In a deliberate, measured approach, only 50 pounds of lactate per injection well (a 10-fold reduction in the lactate volume) was used during the first injection event. Data from this initial injection event provided the basis for increasing the lactate volume used during subsequent injections as described in the *Request for Approval of Second and Third Injection Events*, dated July 25, 2006 and the *Request for Approval of a Fourth Injection Event*, dated October 18, 2006. During the second and third injections, 100 pounds of lactate were injected and 200 pounds of lactate were injected during the fourth injection.

ARCADIS proposes to inject 1,500 pounds of lactate (60% solution) during each of two additional injections (events 5 and 6) in the deep zone. It is anticipated that an increase in the volume of injected TOC should create a more persistent reducing zone. ARCADIS has completed half life calculations on the injected TOC and determined that TOC degradation rates are sufficient to degrade the TOC before the injected solution could arrive at the downgradient IM-3 extraction wells (TW-2D and TW-3D). These calculations were derived from the analytical data (Table 3). The

concentrations and types of other constituents in the reductant solution (i.e. yeast extract and tracers) will remain the same as was proposed in the Work Plan, Addendum 1, the *Request for Approval of Second and Third Injection Events*, and the *Request for Approval of a Fourth Injection Event*.

The total amount of lactate injected for all six injections would be 3,450 pounds, which is within the 6,000 pounds authorized under Water Board Order No. R7-2006-0008 for four injections.

Reducant Solution

The Work Plan and Addenda 1 and 2 state that the total volume of solution to be injected into in each injection well during each injection event will be 6,000 gallons. Data collected to date indicate that the radius of influence of a 6,000 gallon injection is approximately 15 feet. In order to increase the radius of influence, ARCADIS proposes to inject 18,000 gallons of solution per each additional injection. The 18,000 gallons of solution is anticipated to have an approximately 25-foot radius of influence. The total volume of injected solution for all six injections injection would be 72,000 gallons, which is the amount authorized under Order No. R7-2006-0008 for four injections.

Groundwater Monitoring Program

Groundwater monitoring will be completed as stated in the *Request for Approval of Second and Third Injection Events* and amended by agreement with the DTSC. ARCADIS proposes that the tracer test parameters (i.e. hexavalent chromium, total organic carbon, and two tracers) will be monitored weekly at the injection well (PTI-1D), three monitoring wells (PT-1D, PT-2D, and PT-3D), and two extraction wells (TW-2D and TW-3D) for one month after each additional injection and bi-monthly for two additional months. This is in accordance with the required monthly sampling under the Board Order No. R7-2006-0008.

Reporting

In accordance with the Work Plan, there will be frequent communication between PG&E, the Water Board, and DTSC. Monthly and quarterly update reports will continue to be prepared and submitted over the duration of the ISPT. A final report will be submitted within approximately three months after the completion of the pilot

study. The pilot study will be determined to be complete three months after TOC concentrations return to approximately baseline conditions.

Upon approval, ARCADIS will begin the fifth injection event at PTI-1D. The tentative proposed schedule for implementation of the fifth injection is January 9, 2006.

If you have any questions regarding the proposed additional injection events, please call Yvonne Meeks of PG&E at (805) 546-5243, or me at (415) 374-2744 ext 20.

Sincerely,

ARCADIS G&M, Inc.

Notes:

Most recent data indicated in **BOLD**

ft bgs	Feet below ground surface
mV	Millivolts
$\mu\text{S}/\text{cm}$	Microsiemens per centimeter
C°	Degrees Celsius
$\mu\text{g}/\text{L}$	Micrograms per liter
ORP	Oxidation Reduction Potential
<	Symbol indicates not detected at or above the estimated reporting limit as noted.
N	Normal
---	Not available/Not analyzed
NA	Not applicable
*	Possible anomaly

Addendum 3 to the In-Situ Hexavalent Chromium Reduction Pilot Test Work Plan – Floodplain Reductive Zone Enhancement

Location Name	Sample Date	Sample Type	Screen Interval (ft bgs)	Hexavalent Chromium (µg/L)	Dissolved Chromium (µg/L)	Iodide (mg/L)	Bromide (mg/L)	Fluorescein (ppb)	Nitrate-N (mg/L)	Nitrite-N (mg/L)	Total Iron (µg/L)	Dissolved Iron (µg/L)	Dissolved Manganese (µg/L)	Sulfate (mg/L)	Total Organic Carbon (mg/L)
---------------	-------------	-------------	--------------------------	----------------------------	---------------------------	---------------	----------------	-------------------	------------------	------------------	-------------------	-----------------------	----------------------------	----------------	-----------------------------

Notes:

Most recent data indicated in **BOLD**

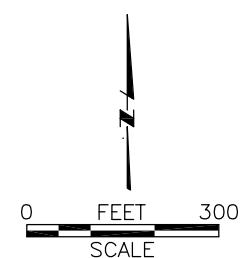

ft bgs	Feet below ground surface
mg/L	Milligrams per liter
µg/L	Micrograms per liter
ppb	Parts per billion
<	Symbol indicates not detected at or above laboratory detection limit as noted
N	Normal
EB	Equipment blank
FB	Field blank
FD	Field duplicate
J	Reported value is estimated
J/HD	Sample analyzed beyond USEPA-recommended holding time. Results may still be used for their intended purpose.
NA	Not applicable
ND	Not detected
Nitrate-N	Nitrate as Nitrogen
	Nitrite as
Nitrite-N	Nitrogen
---	Not analyzed/Not available
USEPA	United States Environmental Protection Agency
