SECTION L1

Introduction

This Operation and Maintenance (O&M) Manual is Appendix L of the Basis of Design (BOD) Report/Final (100%) Design Submittal. The O&M Manual (or manual) consists of plans for operation and maintenance, sampling and monitoring, and management of contingencies associated with the selected final groundwater remedy at the Pacific Gas and Electric Company (PG&E) Topock Compressor Station (TCS, or the Compressor Station) in San Bernardino County, California. In addition, the O&M Manual also includes a Soil Management Plan and a Health and Safety Plan (HSP) for remedy O&M. (The terms "final groundwater remedy" and "remedy" are interchangeable as used throughout this document; other equivalent terms used herein include "selected groundwater remedy" and "groundwater remedy.")

The California Department of Toxic Substances Control (DTSC) is the state lead agency overseeing corrective actions at the Compressor Station in accordance with the Resource Conservation and Recovery Act (RCRA) Corrective Action. In February 1996, PG&E and DTSC entered into a Corrective Action Consent Agreement (CACA) pursuant to Section 25187 of the California Health and Safety Code (DTSC 1996). The U.S. Department of the Interior (DOI) is the lead federal agency overseeing response actions on or emanating from land under its jurisdiction, custody, or control near the Compressor Station pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). In July 2005, PG&E and the federal agencies (DOI, U.S. Bureau of Land Management (BLM), U.S. Fish and Wildlife Service (USFWS), and U.S. Bureau of Reclamation [BOR]) entered into an Administrative Consent Agreement (DOI 2005). A Remedial Design/Remedial Action Consent Decree (CD) between the United States, on behalf of the DOI, and PG&E (DOI 2013) was approved by the United States District Court for the Central District of California in November 2013. DOI and DTSC executed a Memorandum of Understanding (MOU) concerning the coordination in overseeing the implementation of groundwater response action at TCS on November 22, 2011 (DTSC and DOI 2011). In a coordinated effort, DOI and DTSC selected the final groundwater remedy to address chromium in groundwater at Solid Waste Management Unit (SWMU) 1/ Area of Concern (AOC) 1 and AOC 10.

In conformance with the 1996 CACA (DTSC 1996) and the CD requirements (DOI 2013), this O&M Manual builds on the framework established in the Revised Groundwater Corrective Measures Implementation/Remedial Design (CMI/RD) Work Plan for SWMU 1/ AOC 1 and AOC 10 (CH2M HILL 2011). The Revised CMI/RD Work Plan was approved by the DOI on November 3, 2011 for use in development of the groundwater remedy design documents and associated plans (DOI 2011). The CMI/RD Work Plan and other key project documents may be reviewed on the DTSC's Topock Compressor Station web site: http://www.dtsc-topock.com.

The following subsections describe the remedy and the remedial action objectives (RAOs), summarize the applicable or relevant and appropriate requirements (ARARs) and EIR Mitigation Measures, and describe the content and organization of this O&M Manual.

L1.1 Overview of Groundwater Remedy and Requirements

The final groundwater remedy, its objectives, and its regulatory requirements are described below. The groundwater remedy includes:

- An In-situ Reactive Zone (IRZ) using a line of wells installed along National Trails Highway (NTH) that may be used as both injection and extraction wells to circulate groundwater and distribute an organic carbon source to promote reduction of the hexavalent chromium (Cr[VI]) to trivalent chromium (Cr[III]).
- An Inner Recirculation Loop (IRL) comprised of:
  - River Bank Extraction Wells along the Colorado River to provide hydraulic capture of Cr(VI) groundwater concentrations, clean up the floodplain downgradient of the IRZ, enhance the flow of contaminated groundwater through the NTH IRZ line, and control migration of IRZ-generated by-products.

  - IRL injection wells to re-inject groundwater extracted from the River Bank Extraction Wells (which may be amended with an organic carbon source) and/or inject fresh water in the upgradient portion of the Cr(VI) plume to flush the plume through the NTH IRZ.

- A TCS Recirculation Loop comprised of:
  - East Ravine Extraction Wells in the eastern (downgradient) end of the East Ravine to provide hydraulic capture of contaminated groundwater in bedrock.
  - TCS injection wells located upgradient of the TCS for the re-injection of groundwater extracted from the East Ravine Extraction Wells and Transwestern Bench Extraction Wells, which will be amended with an organic carbon source to promote reduction of the Cr(VI) to Cr(III) and remove elevated Cr(VI) groundwater concentrations from the alluvial aquifer in the vicinity of the TCS.
- Freshwater injection wells to inject freshwater into wells upgradient of the Cr(VI) plume to control and confine the plume migration to the west, to assist with flushing the chromium plume through the NTH IRZ, and to constrain westward spread of carbon-amended water and in-situ byproducts from the Inner Recirculation Loop.
- A monitoring well network that consists of existing site wells and new monitoring wells.
- Institutional controls (ICs) to restrict surface land uses and prevent the use of groundwater.
- Monitored natural attenuation (MNA) as a long-term component to address residual chromium that may remain in recalcitrant portions of the aquifer after enhanced in-situ treatment and optimized system performance.

L1.1.1 Remedial Action Objectives, Completion Criteria/Performance Standards, and Short-Term Goals

The RAOs for the groundwater remedy are to:

1. Prevent ingestion of groundwater as a potable water source having Cr(VI) in excess of the regional background concentration of 32 micrograms per liter (µg/L).
2. Prevent or minimize migration of total chromium (Cr[T]) and Cr(VI) in groundwater to ensure concentrations in surface water do not exceed water quality standards that support the designated beneficial uses of the Colorado River (11 µg/L Cr[VI]).
3. Reduce the mass of Cr(T) and Cr(VI) in groundwater at the site to achieve compliance with ARARs in groundwater. This RAO will be achieved through the cleanup goal of the regional background concentration of 32 µg/L of Cr(VI).
4. Ensure that the geographic location of the target remediation area does not permanently expand following completion of the remedial action.

The completion criteria or performance standards for the groundwater remedy are mainly driven by RAO #3, reducing Cr(VI) concentrations throughout the plume to concentrations of 32 µg/L or less. Attainment of the completion criteria or achievement of performance standards (Cr[VI] concentrations of 32 µg/L or less) is intended to be applied throughout the area of contaminated groundwater. In establishing this criterion, the following are recognized:

- Attaining the cleanup criterion of 32 µg/L Cr(VI) in groundwater may be achieved through active remediation or through MNA after active remediation has been employed and optimized.
- Different areas of the plume may reach the cleanup criterion of 32 µg/L Cr(VI) in groundwater at different times.

Additional discussions about the Corrective Measures/Remedial Action Completion Criteria are included in Section L4.

In addition to the RAOs, short-term goals and criteria are being developed in coordination with DTSC and DOI to facilitate future evaluations of remedy performance including assessments of whether the remedy is Operational and Functional (OF) and Operating Properly and Successfully (OPS).

Pursuant to CERCLA, 40 CFR § 300.435(f)(2), the groundwater remedy becomes OF either one year after construction is complete, or when the groundwater remedy is determined by DOI to be functioning properly and is performing as designed, whichever is earlier. DOI may grant extensions to the one-year period, as appropriate. This period is often referred to as "commissioning" or "shakedown," when the construction contractor(s) make minor adjustments as necessary to ensure the remedy is operating as designed.

Pursuant to Exhibit A to the Settlement Agreement between DTSC and the FMIT (DTSC 2012), the groundwater remedy is considered to be OPS when a) the remedy is operating as designed, b) the information obtained from remedy operation indicates that the remedy is protective of human health and the environment, and c) the remedy is likely to be able to achieve the cleanup levels or performance goals delineated in the DTSC's Statement of Basis (DTSC 2011a) and the DOI's Record of Decision (ROD; DOI 2010) for the groundwater remedy at the PG&E Topock Site. In general, OPS is expected within 1 to 3 years of the beginning of remedy start-up.

L1.1.2 Incorporation of ARARs and EIR Mitigation Measures into Operation and Maintenance

CERCLA remedial actions are required to comply with the substantive requirements of identified ARARs. Therefore, the operation and maintenance as well as sampling and monitoring of the final groundwater remedy incorporates the requirements of ARARs documented in the ROD (DOI 2010). These ARARs include federal, California, and Arizona chemical-specific, location-specific, and action-specific ARARs. The chemical-specific ARARs for the site constituents of concern (COCs) (Cr[VI] and Cr[T]) have already been incorporated into the RAOs, ensuring that compliance with these ARARs (for the site COCs) will be attained when the remedy is complete (defined by attainment of the RAOs). Evaluation of the compliance with chemical specific ARARs for arsenic in the freshwater source is addressed in Table L1.1-3, Summary of Compliance with Identified ARARs (Items 2, 52, 99, and 100).

In conformance with the California Environmental Quality Act (CEQA), DTSC prepared and certified the Final Environmental Impact Report (EIR) (DTSC 2011b), and adopted a Mitigation Monitoring and Reporting Program (MMRP) for the groundwater remedy. The MMRP includes mitigation measures for various resources, including aesthetic, air quality, cultural, biological, geology and soils, hazardous materials, hydrology and water quality, noise, and water supply resources. An addendum to the EIR (2013 Addendum; DTSC 2013) was subsequently issued on August 2, 2013 to evaluate potential alternative freshwater supply locations in order to identify a freshwater supply source of adequate quantity and quality to be used in the Topock groundwater remedy.

Identification and demonstration of how the identified EIR mitigation measures and ARARs have been incorporated into the design and remedy O&M are summarized and discussed in tables presented in Section 6 of the Final BOD Report; copies of these tables are presented as Tables L1.1-1 and L1.1-3, respectively, at the end of this volume (for the reader's convenience).[1] In addition, a summary of compliance with applicable Cultural Impact Mitigation Program (CIMP; PG&E 2015) protocols, Programmatic Agreement (PA; BLM 2010) stipulations, and

[1] The compliance tables in this O&M Manual are copied directly from Section 6 of the Basis of Design Report to which this O&M Manual is an appendix. The table numbers have been changed, but the contents of the tables are unchanged. This includes the reference citations, which correspond to the References List (Section 9) of the BOD Report, not the References List in this O&M Manual. Please refer to Section 9 of the BOD Report to identify the sources cited in these tables in the O&M Manual. References within the tables to Tables 6.1-1, 6.1-2, 6.2-1, 6.2-1A, 6.2-2, and 6.2-3 of the BOD Report correspond to Tables L1.1-1, L1.1-2, L1.1-3, L1.1-3A, L1.1-4, and L1.1-5, respectively, in this document.

Cultural and Historic Properties Management Plan (CHPMP; BLM 2012) provisions[2] are included in Tables L1.1-2, L1.1-4, and L1.1-5, respectively.

L1.2 Organization and Content of O&M Manual

In conformance with the 1996 CACA and the 2013 CD requirements, this O&M Manual is organized into the following sections:

- Section 1 describes the groundwater remedy and the RAOs, summarizes how the plans included herein have complied and will continue to comply with the ARARs and EIR MMRP, and describes the organization and content of this O&M Manual.
- Section 2 describes the levels of authority and responsibility (including organization chart), lines of communication, and the qualifications /training of personnel who will operate and maintain the corrective measure.
- Section 3 describes the framework for the evaluation of analytical data and field measurements, along with the documentation, management, and maintenance of information. Details are presented in Volume 2 of the manual.
- Section 4 discusses the process and criteria for determining when the corrective measure/remedial action may cease. This section also describes the process and criteria for determining when maintenance and monitoring may cease.
- Section 5 provides reference information for the works cited in this report.

This O&M Manual also includes the following five volumes consisting of related project plans:

- **Volume 1 (Operation and Maintenance Plan)** describes the main remedy system and its supporting systems, discusses procedures for O&M including start-up/shutdown and replacement schedule for equipment and system alarms, describes means and methods for well and pipeline maintenance, and describes waste management practices and other site management practices such as road maintenance, stormwater pollution prevention, and hazardous material management. Detailed standard operating procedures (SOPs) for O&M tasks are included in this volume.
- **Volume 2 (Sampling and Monitoring Plan)** presents the goals and data quality objectives for sampling and monitoring of groundwater, surface water, and process water, along with details (i.e., sampling locations, analytes, and sampling frequencies) for various monitoring programs including remedy compliance monitoring, in-situ remediation performance monitoring (including monitoring of the upland injected water quality), monitoring for other constituents of potential concern (COPCs) (selenium, molybdenum, and nitrate), monitoring of freshwater source, process control monitoring for the remedy-produced water management system, and domestic/private well monitoring. This volume also includes sampling methods and procedures as well as data management, documentation, and reporting.
- **Volume 3 (Contingency Plan)** presents contingency planning and procedures to address potential operational problems, equipment failures, failures due to “acts of god,” etc.
- **Volume 4 (Soil Management Plan)** presents sampling protocols and analysis for soil and the plan for managing soils during O&M, consistent with the established displaced material handling protocols. Also presented are a sampling and analysis plan to document baseline soil conditions prior to remedy implementation, and a plan to implement Best Management Practices (BMPs) to prevent or reduce storm water pollution related to soil storage activities during remedy O&M.

[2] Per DOI’s comment #511 DOI-190 on the 60% BOD Report, “It should be noted that additional CHPMP measures may be identified during ongoing consultation meetings with the Tribes, and the CHPMP will be modified accordingly.”

- **Volume 5 (Project Health and Safety Plan)** presents the Project HSP which provides a framework for safe operation and maintenance of the remedy and includes procedures that will apply to PG&E employees who may operate and maintain the remedy. Any contractor who may be involved in the operation and maintenance of the remedy will be required to prepare its own site-specific HSP in conformance with this Project HSP that addresses their specific scope of work. Contractor personnel will be required to sign a form acknowledging that they understand and will fully comply with their own HSP.

SECTION L2

Project Management, Communication Framework, and Workers Training

As required by the 1996 CACA and 2013 CD (DTSC 1996; DOI 2013), this section describes the management approach for this project, including levels of authority and responsibility, lines of communication, and qualifications of key personnel who will operate and maintain the remedy. In addition, this section also describes training for O&M personnel and presents a framework for communication during the O&M phase of the project.

L2.1 Project Management

PG&E is committed to implementing the remedial action in an effective manner that is safe, sustainable, and respectful to the sacredness and sensitivity of the cultural, historical, and biological resources at or near the Topock site, while complying fully with all regulatory mandates. Pursuant to DTSC's direction, PG&E will comply with the California Business and Professions Code during the implementation of the groundwater remedy.

PG&E has chartered an implementation team with the accountability to ensure that the above commitment is fulfilled. Exhibit L2.1-1 presents the overall PG&E Topock Groundwater Remedy Implementation Project Team organization chart. This project organization is intended to be a "living" element throughout the remedy implementation, meaning that it can be updated as new information becomes available as the project proceeds or as site circumstances change.

Exhibit L2.1-2 summarizes the qualifications and project roles of key personnel, as well as their levels of authority and responsibility and lines of communication. At the time of the preparation of this O&M Manual, contractor(s) for the construction and O&M of the groundwater remedy have not been identified.

L2.2 Summary of Communication Procedures and Protocols

This section presents a summary of communication procedures and protocols to be used during the operation and maintenance of the project, and is intended to be used by PG&E to inform, seek inputs, seek approval (from agencies), resolve issues, and/or comply with requirements. This summary is a compilation of the communication procedures and protocols specified in various project directives and agreements (e.g., the CACA, CD, EIR mitigation measures, PA, Programmatic Biological Assessment (PBA), CHPMP, CIMP, HMBP, and Section 1600 Avoidance and Minimization Measures) and relevant state and federal requirements (e.g., those related to reporting of releases of fuels or hazardous materials). This communication framework is intended to be a dynamic "living" element throughout the remedy implementation, meaning that it can be updated as new information becomes available as the project proceeds or as site circumstances change.

In general, project communications occurs in two forms -- routine (regular periodic communication) and non-routine (communication when the project experiences unexpected changes during O&M). Communication could be spoken, written, or both. Examples of routine communication include quarterly Consultative Working Group (CWG) meetings and quarterly progress reports. Examples of non-routine communication include notification of a pipeline leak or unplanned system shutdown. Exhibit L2.2-1 identifies triggering events, party or parties initiating communication, party or parties receiving communication, and general communication protocols and procedures.

EXHIBIT L2.1-2
Key Project Personnel, Qualifications, Levels of Authority and Responsibility, and Lines of Communication
Groundwater Remedy Operation and Maintenance Manual
PG&E Topock Compressor Station, Needles, California

Key Personnel	Project Role, Summary of Qualifications, and Lines of Communication
Andrew Williams	**PG&E Vice President Safety, Health, and Environmental** Mr. Williams is the executive sponsor of the project and represents PG&E at the executive level on the Topock Leadership Partnership (TLP). Mr. Williams has served in this role since 2014.
Kevin Sullivan	**PG&E Director of Chromium Remediation** Mr. Sullivan reports to Mr. Williams; he has the overall responsibility for the project direction and implementation, and represents PG&E at the executive level on the Clearinghouse Task Force (CTF). Mr. Sullivan has served in this role since June 2014.
Jose Moreno-Jimenez	**PG&E Director of Stakeholder Engagement** Mr. Jimenez has the overall responsibility for community relations, outreach programs, and stakeholder engagement. Mr. Jimenez has served in this role since 2015.
Juan Jayo	**Legal** Mr. Jayo has the overall responsibility for the legal aspects of the project and reports to the General Counsel of PG&E. Mr. Jayo has served in this role since 2005.
Yvonne Meeks	**PG&E Project Manager** Ms. Meeks reports to Mr. Sullivan; she is responsible for the technical direction and the day-to-day execution of the project. Ms. Meeks has served in this role since 2004.
Curt Russell	**PG&E Topock Site Operations Manager** Mr. Russell reports to Ms. Meeks; he is responsible for all aspects of Topock site/local operations related to the project. Mr. Russell has served in this role since 2005. For the groundwater remedy implementation, Mr. Russell is also a designated disturbance coordinator for noise/vibration.
Glenn Caruso	**PG&E Project Cultural Resources Expert** Mr. Caruso reports to Ms. Meeks; he is the project liaison for issues related to cultural resources and historic properties. Mr. Caruso has served in this role since 2004.
Virginia Strohl	**PG&E Project Biologist** Ms. Strohl reports to Mr. Russell; she is the project liaison for issues related to biological resources. Ms. Strohl has served in this role since June 2012.
Chris Smith	**PG&E Site Compliance Management** Mr. Smith reports to Mr. Russell; he is responsible for the overall site compliance management activities. Mr. Smith has served in this role since 2005. For the groundwater remedy implementation, Mr. Smith is also a designated disturbance coordinator for noise/ vibration.
Glen Riddle	**Project Engineer** Mr. Riddle reports to Mr. Russell; he is responsible for engineering design activities. Mr. Riddle has served in this role since 2012.
Valisa Nez	**Project Environmental Scientist** Ms. Nez reports to Mr. Caruso; she is the project liaison for issues related to regulatory compliance. Ms. Nez has served in this role since January 2013.
PG&E In-House Quality Assurance Team	**PG&E in-house subject matter experts** report to Ms. Meeks and will perform review/quality assurance of the remedial design documents prepared by the remedial design contractors. The engineering discipline reviewers will include, but not be limited to, structural, geotechnical, electrical, and instrumentation and controls.

EXHIBIT L2.2-1
Communication Framework During Operation and Maintenance
Groundwater Remedy Operation and Maintenance Manual
PG&E Topock Compressor Station, Needles, California

Type	Triggering Event	Required By[1]	Party Initiating Communication	Party Receiving Communication[2]	General Communication Procedures/Protocols
Routine Communication	Notification of planned O&M/field activities (including sampling activities and planned downtime)	Cultural Impact Mitigation Program (CIMP) and EIR MMRP measures CUL-1a-8a, CUL-1a-8j, CUL-1a-8l, CUL-1a-8h EIR MMRP measures NOISE-1b, 2d, and 3b Consent Decree (CD) #24 Corrective Action Consent Agreement (CACA) X(3) Programmatic Agreement (PA) Appendix C Monitoring Protocol Section 1600 Avoidance and Minimization Measure (AMM) #34	PG&E Topock Site Operations Manager or designee	DTSC, DOI, HNWR, Tribes, CDFW, BLM Project stakeholders	Notify agencies and Tribes monthly of scheduled project-related field activities. For Tribal monitoring/observation of ground-disturbing activities, notify Tribes as early as possible, but at least three business days in advance of the initiation of the identified project work, whenever possible per the PA's Monitoring Protocol and not less than one week in advance of the initiation of planned activities (CUL-1a-8l/CIMP § 2.12). When activity is imminent and advance notification was not possible, PG&E will place telephone calls to key Tribal representatives (CUL-1a-8j/CIMP § 2.10). Notify DOI 28 days in advance of sample collection activities, unless shorter notice is agreed to by DOI (CD ¶24). Notify DTSC at least 7 days in advance of sample collection activities (CACA X[3]). In the event short-order sampling/field activity needs occur, PG&E will call DTSC and DOI (prior to proceeding with the activity) and then follow up by email. In the event that email or voice mail is not available to PG&E, a text message will be sent to DTSC and DOI prior to proceeding with the activity and then a follow-up by email. Notify CDFW at least 5 days prior to initiation of construction (project) activities and at least 5 days prior to completion of construction (project) activities (Section 1600 AMM #34). See also CIMP § 2.8.5 for details related to, depend on activities, notifications to nearby vibration-sensitive and noise-sensitive receptors.
	Progress reporting	CACA Attachments 6 and 7 CD ¶32; CD, Appendix C, Section 5	PG&E Project Manager (PM) or designee	DTSC, DOI	Quarterly during O&M; Exhibit L2.2-2 presents a template for the Quarterly O&M Progress Reports.
	EIR mitigation measure compliance reporting	EIR MMRP measures CUL-1a-8a, CUL-1a-2, CUL-1a-3b, CUL-1a-11	PG&E PM or designee	DTSC	Quarterly reports via email during design and construction/start-up, and annually during O&M.
	Tribal outreach activities	2006 Settlement Agreement between PG&E and FMIT (Section VIII[A]); PG&E Memoranda of Agreement with various Tribes EIR mitigation measure CUL-1a-8a	PG&E PM or designee	Tribes, Agencies	Frequent communications with Tribes to address current issues and provide a forecast of upcoming activities (CUL-1a-8a). Additional communications will depend on purpose of the communication and type of info to be exchanged.
Non-Routine Communication *(Remedy O&M)*	**Request for Variance/Notification of Changes**				
	Material deviation[5] from Work Plans, Mitigation Monitoring and Reporting Program (MMRP), action-specific and location-specific ARARs, design documents, etc.	This O&M Manual	PG&E PM, PG&E Topock Site Operations Manager, or designee	DTSC, DOI, Interested Tribes FMIT (for material deviation on FMIT property)	Notify the agencies orally within 3 days of when PG&E first knew of potential material deviations. Submit a variance request form to agencies for approval 5 calendar days before the anticipated work occurs. Agencies will act on the request or notify PG&E that more time is required. Exhibit L2.2-3 presents a template for a Work Variance Request Form. Report the material deviations in quarterly progress reports. Notify FMIT that a Work Variance Request has been submitted to the agencies for a material deviation on FMIT property.
	Discovery of event that occurs or has occurred that causes delay in the performance of any obligation under the CD for which PG&E intends to assert a claim of force majeure	CD ¶61	PG&E PM or designee	DOI	Orally within 3 working days of when PG&E first knew the event might cause a delay and written notification within 7 days thereafter.
	Discovery of changes to the schedule described in the progress reports (i.e., change in schedule described in the quarterly progress reports for the performance of any activity including, but not limited to data collection and implementation of work plans)	CD ¶33 CACA	PG&E PM, PG&E Topock Site Operations Manager, or designee	DOI, DTSC	No later than 7 days prior to the performance of the activities, or as otherwise agreed to by DOI and PG&E.

Type	Triggering Event	Required By[1]	Party Initiating Communication	Party Receiving Communication[2]	General Communication Procedures/Protocols
	Discovery of human-caused disturbance/human remains or burials/previously unidentified potentially significant cultural, historic, or paleontological resources/dead or injured listed species				
	Discovery of human-caused disturbance to remedy facilities	EIR MMRP measure CUL-1a-3b Site Security Plan	PG&E Topock Site Operations Manager, PG&E Remediation Resources Specialist or designee	DTSC, DOI, Landowners involved in the incursion (BLM, USFWS, or FMIT)	Notification protocols per Site Security Plan; summarized in quarterly compliance report. Additional notifications may be required (e.g., spills).
	Discovery of human remains or burials	EIR MMRP measure CUL-4 PA Section IX CHPMP (Section 8.2 and Appendix D, Plan of Action)	PG&E Topock Site Operations Manager, PG&E Cultural Resources Expert, Qualified Cultural Resources Consultant, or designee	PG&E's initial communication is to the San Bernardino County Coroner, and PG&E's and DTSC's project managers. The qualified cultural resources consultant shall coordinate the interaction between Tribes, PG&E, the County, and DTSC to determine proper treatment and disposition of any remains. Human remains found on federal land would require notification of BLM. BLM will then notify the Advisory Council on Historic Preservation, California and Arizona State Historic Preservation Officers, BOR, USFWS, DTSC, relevant County Coroner, and Interested Tribes, The County Coroner will contact the Native American Heritage Commission (NAHC) if it determines the remains are Native American and not related to a crime.	Suspend work in the immediate vicinity of the discovery (not less than 5 meters and not to exceed 50 meters from the discovered remains), and if the discovery is on federal land, notify BLM as soon as possible, but no later than 24 hours of the discovery by telephone, followed by written confirmation within three business days. If the remains are found in California, BLM will notify the County Coroner. If the discovery is on non-federal/non-Tribal lands in Arizona, then BLM in consultation with PG&E will report the discovery to the Arizona State Museum. If the discovery is on non-federal/non-Tribal lands in California, then PG&E will notify the County Coroner. Additional notifications and communications are described in the CHPMP, Appendix D, Plan of Action.
	Discovery of previously unidentified potentially significant cultural, historical, and/or paleontogical resources	PBA #29 EIR MMRP measure CUL-1b/c-4 PA Section IX CHPMP (Section 8.1 and Appendix C Discovery Plan) CIMP (CUL-1a-8b/o)	PG&E Topock Site Operations Manager, PG&E Cultural Resources Expert, Qualified Cultural Resources Consultant, or designee	PG&E's initial communication is to BLM and the Tribes, if the resource is Native American in nature. BLM will then notify DOI, the Advisory Council on Historic Preservation, California and Arizona State Historic Preservation Officers, BOR, USFWS, the Tribes (if not already notified) and DTSC.	Suspend work in the immediate vicinity of the discovery (not less than 5 meters and not to exceed 50 meters from the discovered remains), notify BLM and the Tribes, if the resource is Native American in nature, immediately. Qualified archaeologists will inspect and evaluate any new sites that may be discovered during construction and will notify Tribal Monitors of the discovery. Tribal Monitors will then inspect and evaluate the new site(s) (CIMP, Subsections 2.2 and 2.15, EIR MMRP measures CUL-1a-8b and 8o).
	Locate dead or injured listed species	PBA #28	PG&E Topock Site Operations Manager, PG&E Project Biologist or designee	BLM, USFWS	Notify Agencies within 3 working days of its finding.

Notes:
[1] EIR MMRP = Environmental Impact Report Mitigation Measures Reporting Program (DTSC 2011b), PA = Programmatic Agreement (BLM 2010), CD = Consent Decree (DOI 2013), PBA = Programmatic Biological Assessment (CH2M HILL 2014), CHPMP = Cultural and Historic Properties Management Plan (BLM 2012), CACA = Corrective Action Consent Agreement (DTSC 1996), HMBP = Hazardous Materials Business Plan (see Appendix F of the O&M Plan [Volume 1 of this O&M Manual]), AMM = Avoidance and Minimization Measures, CIMP = Cultural Impact Mitigation Program (PG&E 2015).
[2] Agencies: ADEQ = Arizona Department of Environmental Quality; BLM = U.S. Bureau of Land Management; BOR = U.S. Bureau of Reclamation; CDFW = California Department of Fish and Wildlife; CUPA = California Unified Permitting Agency; DOI = U.S. Department of the Interior; DTSC = California Department of Toxic Substances Control; HNWR = Havasu National Wildlife Refuge; MWD = Metropolitan Water District; NRC = National Response Center; OES = California Governor's Office of Emergency Services; RWQCB = Regional Water Quality Control Board; USFWS = U.S. Fish and Wildlife Service.
[3] Excludes permitted discharge of materials and release of hazardous materials/waste into secondary containment areas that is not released to the environment
[4] Transportation includes loading, offloading, and storage of DOT-regulated vehicle/trailer. Notify the NRC in the event of a transportation incident involving death, hospitalization, damage greater than $50,000, roadway shutdown or public evacuation exceeding 1 hour, fire, breakage or spillage.
[5] This notification excludes changes that are considered process improvements and system optimization which are anticipated over decades-long operation. The need for and the timing/frequency of updating this O&M Manual will be discussed with the agencies as remedy start-up and operation progresses. Operations staff will have the latest SOPs on file at the site.

PG&E Topock Compressor Station Groundwater Remediation Project Quarterly Progress Report for Remedy Operation and Maintenance [Indicate Reporting Period]

Table of Contents

1. Introduction

PG&E is implementing the groundwater remedy to address chromium in groundwater at Solid Waste Management Unit (SWMU) 1/Area of Concern (AOC) 1 and AOC 10 near the Topock Compressor Station, in conformance with the requirements of the Resource Conservation and Recovery Act (RCRA) Corrective Action and the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The groundwater remedy includes:

- Construction of an In-situ Reactive Zone (IRZ) along National Trails Highway (NTH) using a line of wells that may be used as both injection and extraction wells to circulate groundwater and distribute an organic carbon source to promote reduction of the Cr(VI) to Cr(III).
- Flushing accomplished through a combination of fresh water injection and injection of carbon-amended water in wells upgradient of the plume.
- Extraction wells near the Colorado River to provide hydraulic capture of the plume, clean up the floodplain downgradient of the NTH IRZ, and enhance the flow of contaminated groundwater through the IRZ line.
- East Ravine Extraction Wells in the eastern (downgradient) end of the East Ravine to provide hydraulic capture of contaminated groundwater in bedrock; and Transwestern Bench Extraction Wells in the area northeast of the TCS to accelerate capture of Cr(VI) impacted groundwater from the alluvial deposits located downgradient of the TCS.
- Institutional controls to restrict surface land uses and prevent the use of groundwater.
- Monitored natural attenuation (MNA) as a long-term component to address residual Cr(VI) that may remain in recalcitrant portions of the aquifer after enhanced in-situ treatment.

The Remedial Action Objectives (RAOs) for the groundwater remedy are to:

1. Prevent ingestion of groundwater as a potable water source having Cr(VI) in excess of the regional background concentration of 32 micrograms per liter (µg/L).
2. Prevent or minimize migration of total chromium (Cr[T]) and Cr(VI) in groundwater to ensure concentrations in surface water do not exceed water quality standards that support the designated beneficial uses of the Colorado River (11 µg/L Cr[VI]).
3. Reduce the mass of Cr(T) and Cr(VI) in groundwater at the site to achieve compliance with ARARs in groundwater. This RAO will be achieved through the cleanup goal of the regional background concentration of 32 µg/L of Cr(VI).
4. Ensure that the geographic location of the target remediation area does not permanently expand following completion of the remedial action.

The completion criteria or performance standards for the groundwater remedy is mainly driven by RAO #3, reducing Cr(VI) concentrations throughout the plume to concentrations of 32 µg/L or less. Attainment of the completion criteria or achievement of performance standards, Cr(VI) concentrations of 32 µg/L or less, is intended to be applied throughout the area of contaminated groundwater. In establishing this criterion, the following are recognized:

- Attaining the cleanup criteria of 32 µg/L Cr(VI) in groundwater may be through active remediation or through MNA after active remediation has been employed and optimized.
- Different areas of the plume may reach the cleanup criteria of 32 µg/L Cr(VI) in groundwater at different times.

In compliance with the 1996 CACA (Attachment 6, Part B, Section 12 and Attachment 7) and the 2013 RD/RA CD, Appendix C Section 5, this quarterly report describes activities taken to implement the Corrective Measure/Remedial

EXHIBIT L2.2-2
Quarterly Progress Report Template
Groundwater Remedy Operation and Maintenance Manual
PG&E Topock Compressor Station, Needles, California

Action since last, reporting period and activities planned for the next reporting period, presents available results from sampling and testing since last reporting period, summarizes progress towards attaining the RAOs, any issues encountered/deviations from design documents, O&M Manual, and Construction/Remedial Action Work Plan, and any optimizations and enhancements. In addition, this report discusses personnel changes and summarizes activities performed and activities planned in support of the DTSC's Community Outreach Plan, DOI's Community Involvement Plan, and any contacts with local community, representatives of the press, and stakeholders/Tribes.

2. Operations Summary

Describe routine and non-routine system downtime, operational data (listed below) and process monitoring data (listed below) (including percentage of time treatment systems were operational on a monthly basis, quantity of water recovered for treatment/recirculated for in-situ remedy, as well as cumulative total, quantity of ethanol injected, etc.), utilities and consumables used and waste handling/disposal, any issues encountered with system operation, any personnel changes, any system optimizations and maintenance that were performed, and any material deviations from design documents, O&M Manual, and Construction/ Remedial Action Work Plan.

- *In-situ remediation - volume of water recirculated, volume of ethanol (or other carbon substrate) injected, volume of well rehabilitation chemicals used, carbon amendment system monitoring data (as needed)*
- *Freshwater supply – volume of water extracted and injected, percentage of time the extraction pumps were operating on a monthly basis*
- *Remedy-produced water management – volume of water managed through the conditioning process, percentage of time the conditioning system was operational on a monthly basis*

3. Performance Summary

Describe monitoring events and sampling performed during the current reporting period, the sampling results and interpretation of results (including volume of water collected and treated, Cr(VI) mass treated, influent-effluent data, etc., where applicable), an evaluation of the hydraulic control of the plume, an interpretation of progress toward RAOs, and any material deviations from design documents, O&M Manual, and Construction/Remedial Action Work Plan (e.g., gaps or inconsistencies in the site conceptual model)

- *In-situ remediation*
- *Freshwater supply*
- *Remedy-produced water management*
- *Material changes to the model including updates and recalibrations will be noted in the corresponding quarterly report, and presented in detail in the annual report.*

4. Green Remediation Evaluation Matrix (GREM) Summary

Summarize the O&M GREM and any changes since last reporting period.

5. Summary of Activities in Support of the Community Relations Plan and Contacts with the Press, Local Community, and Stakeholders/Tribes

Summarize activities performed in support of DTSC's Community Outreach Plan, DOI's Community Involvement Plan, and contacts with local community, representatives of the press, and stakeholders/Tribes, if any.

6. Recommendations

Provide suggestions for system optimizations or procedural enhancements, as applicable, to improve performance, reduce costs, reduce wastes, etc. Optimizations and/or enhancements could be based on system inefficiencies, technological developments, modified regulations, etc. If applicable, discuss whether or not recommendations from the previous quarter were adopted and if not, why not.

7. Planned Activities for Next Reporting Period

Provide planned activities of the next reporting period (O&M activities, groundwater/surface monitoring events, activities in support of the Community Relations Plan, etc.).

L2.3 Workers Training

PG&E is committed to implementing the remedial action in a manner that is respectful of the sacredness and sensitivity of the resources at and near the project area. To that end, PG&E and its contractors will fully comply with the mitigation measures set forth to minimize impacts to the sensitive resources as well as protocols and/or provisions that are in the Cultural Historic Properties Management Plan (BLM 2012) and in the CIMP. Consistent with its obligations under the Programmatic Agreement's Monitoring Protocol, existing PG&E standard practice, and the EIR MMRP requirements, cultural sensitivity training is required of all staff, workers, and contractors engaged in activities within the Area of Potential Effect (APE) and the EIR Project Area to familiarize them with the sacred nature and cultural significance of the area so that they will perform their jobs in a respectful manner. This training includes discussion of appropriate behavior, activities that are to be avoided and consequences for noncompliance. Consistent with these obligations, PG&E will not tolerate any disrespectful behavior in the field and will remove any staff, workers, or contractors who do not comply with this section. In addition, all workers will be required to comply with the training requirements specified in the overall Project HSP (see Volume 5 of the O&M Manual) and their own site-specific HSP specific to their operations on the project.

Cultural and Historical Resources

Cultural and historical resources sensitivity education has been a central part of the Topock remediation project to date. The existing education on cultural/historical resources sensitivity for Topock occurs via periodic training and project initiation meetings. Sensitivity training classes are conducted at least annually, and are attended by all workers available to participate. Sensitivity training/education is also provided at project initiation meetings, typically held at the site and prior to field work. Site orientation will stress that all site activities will be conducted in a respectful manner. Sensitivity training will be provided by PG&E Site Operations Manager, PG&E Remediation Resources Specialist, and PG&E will invite participation from the Tribes, archaeological monitors, and agency staff, as appropriate.

Several EIR mitigation measures associated with the groundwater remedy (e.g., CUL-1a-13, CUL-1b/c-4, CUL-4) are related to continued training of workers regarding cultural resources, historical resources, and the identification of human remains. In compliance with CUL-1a-13, PG&E has prepared, in coordination with agencies and Tribes, educational materials used in Orientation sessions for the Topock project. In addition, PG&E has prepared a cultural sensitivity education program to educate workers (included as an appendix to the Construction/Remedial Action Work Plan). Implementation of this program is underway.

With regard to CUL-1b/c-4, consistent with CUL-1a-3, PG&E has retained Applied Earthworks, Inc. (AE), a consulting firm with qualified cultural resources consultants, to observe ground-disturbing activities and provide training to workers as required. For implementation of CUL-4, qualified cultural resources consultant(s) and designated Tribal monitor(s) will train construction personnel in the identification of human remains and potential burial goods so they may aid in their identification (see guidance for implementing CUL-4 in an appendix to the Construction/Remedial Action Work Plan).

Biological Resources

As with cultural and historical resources, biological resources sensitivity education has also been a central part of the Topock project. PG&E's education program covering threatened and endangered species and the general project management measures specified under the PBA is provided at project initiation meetings, typically held at the site and prior to field work. The training is provided by the PG&E Topock Site Operations Manager, the PG&E Project Biologist, and supporting contract biologists. New employees will receive the training prior to working onsite.

In accordance with the PBA, a PG&E-designated Field Contact Representative (FCR) will be responsible for overseeing compliance with the mitigation measures. The FCR has the authority to halt activities that pose a danger to listed species and/or are in violation with the mitigation measures. A qualified biologist will conduct a preconstruction survey immediately prior to initiation of ground disturbing activities. Within 60 days of completion of construction activities, the FCR and the qualified biologist will prepare a report for submittal to BLM.

SECTION L3

Data Management, Documentation, and Reporting

This section describes the overall management and documentation of data anticipated to be collected during remedy operation, and the reporting of those data. Also discussed are the record-keeping and maintenance of the data. Details on methodology for data collection and evaluation of remedy performance are discussed in Section 4 of Volume 2 (Sampling and Monitoring Plan).

L3.1 Data Management

Three types of data are expected to be collected during implementation of the remedy: field measurement/ process monitoring data, onsite laboratory data, and offsite laboratory data. The management of each type of data is described below. Exhibit L3.1-1 presents a simplified data management process for the project.

Field Measurement/Process Monitoring Data

Field measurements will be collected from the monitoring and remediation well network, the carbon amendment facilities, the remedy-produced water conditioning plant, and the freshwater pre-injection treatment system. Measurements will be conducted in accordance with the SOPs (as described in Section 7.1 of the Sampling and Monitoring Plan [O&M Manual Volume 2] and included in Appendix A of Volume 2), and are recorded manually in a field logbook, field sampling form, tablet computer, and/or process monitoring checklist, or recorded automatically by stationary or handheld data loggers and transmitted to a database using a telemetry system. Periodic field audits by experienced staff will be conducted to verify that SOPs are being followed. Equipment calibration will follow manufacturers' recommendations to ensure data quality. Manually recorded data will be entered and/or transferred into a database. In addition, process monitoring and control data generated in facilities/plants will be automatically recorded into a data historian that resides in the plant control system. The data will be maintained in a database and reviewed by an experienced field staff member or chemist. Historical trends, water quality data, and well construction details will also be made available to the field crew so that anomalous data (compared to historical values) can be identified in a timely manner and field verified/corrected after consulting with an experienced scientist or chemist, as appropriate.

Onsite Laboratory Data

Certain testing for process control monitoring will be performed at an onsite laboratory in accordance with site-specific SOPs (O&M Manual Volume 2, Appendix A). Onsite lab measurements include Cr(VI), Cr(T), ferrous iron, conductivity, turbidity, pH, nitrate, sulfate, alkalinity, total organic carbon, orthophosphate, manganese, and total dissolved solids (see O&M Manual Volume 2, Section 7.1 for list of measurements and Appendix A for SOPs). Additional measurements could be added in the future.

The onsite lab data will be recorded in a bench log book and entered into a spreadsheet and/or database periodically. Although the onsite data will not be validated using the same procedures as the offsite lab data, they will be reviewed; anomalous results will be identified and reviewed and, if needed, reanalyzed at the direction of the project chemist. After quality control (QC) review, data will be stored in a database for use by the project team. Onsite laboratory samples will periodically be analyzed in conjunction with offsite analysis, and the data will be reviewed/compared for quality and accuracy.

Offsite Laboratory Data

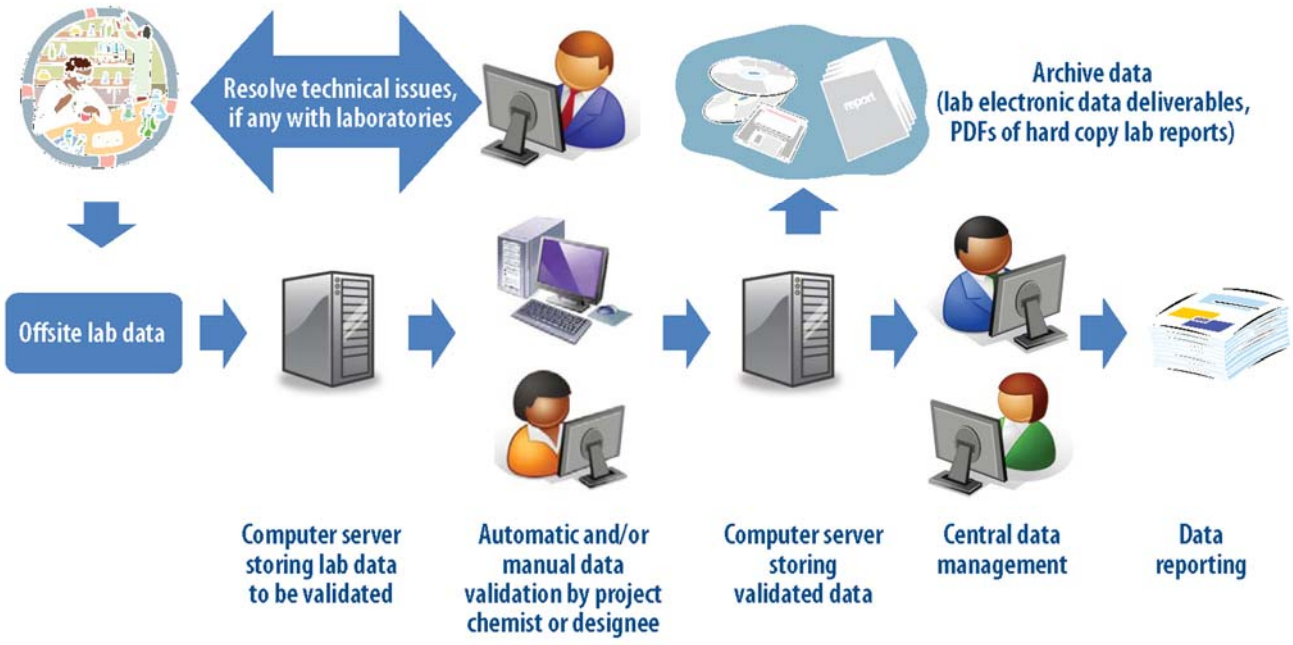
The data flow (electronic and hard copy) from offsite laboratory to the project chemist is tracked to ensure that the data are reviewed and validated in a timely manner. The project chemist will discuss and resolve technical issues, if any, with the laboratory. Electronic data will be entered into a database where they undergo QC checks before being validated. Validated data will be stored in a database for use by project team. The laboratory will maintain electronic and hardcopy records sufficient to re-create each analytical event. In compliance with Section XXV of the CD (DOI 2013), PG&E will maintain offsite laboratory records for 10 years following receipt of certification of completion. At the conclusion of the record retention period, PG&E will notify DOI and DTSC in

writing at least 90 days prior to the destruction of any records and will provide DOI and DTSC with the opportunity to take possession of any records. At a minimum, the laboratory will maintain the following records:

- Raw data, including instrument printouts, bench work sheets, and chromatograms, with compound identification and quantitation reports.
- Laboratory-specific, written SOPs for each analytical method and QA/QC function implemented during the analysis of project samples.

Maintenance Records

It is the responsibility of the plant/system operators to incorporate regular preventative maintenance into the routine work schedule based on guidelines presented in this plan and the maintenance requirements provided in the manufacturer's manual for each piece of equipment in the plant. Computerized maintenance management programs will be implemented at the facility, as appropriate, to keep track of maintenance requirements. In those cases, operators will access the program to determine required maintenance tasks. The maintenance management program will have the capacity to issue work orders for routine maintenance activities. Records documenting completion of preventative maintenance tasks will be kept onsite.



Hardcopy and electronic versions will be archived in project files, on electronic archive tapes, and/or on other electronic storage media for the duration of remedy operation as specified in Section L3.2 (Recordkeeping). All electronic data will be subject to routine back-up until it is archived for long-term retention.

L3.2 Recordkeeping

In compliance with Section XII of the 1996 CACA (DTSC 1996) and Section XXV of the CD (DOI 2013), PG&E will maintain all records for 10 years following receipt of certification of completion. At the conclusion of the record retention period, PG&E will notify DOI and DTSC in writing at least 90 days prior to the destruction of any records and will provide DOI and DTSC with the opportunity to take possession of any records.

L3.3 Reporting

In compliance with Attachment 7 of the 1996 CACA (DTSC 1996) as well as Section X of the 2013 CD and Section 5 of Appendix C of the 2013 CD (DOI 2013), progress reports will be submitted monthly during construction and quarterly after the remedy has been implemented and demonstrated to be operating as intended. Exhibit L2.2-2 in Section L2 presents a quarterly report template that was developed with guidance from the *O&M Report Template for Ground Water Remedies (with Emphasis on Pump and Treat Systems)* (USEPA 2005). A monthly construction report template is included in the Construction/Remedial Action Work Plan (CH2M HILL 2015; see Exhibit 2.2-2 of the Work Plan). It is noted that the agencies may request additional information or reports as the remedy progresses.

PG&E Topock Compressor Station, Needles, California

SECTION L4

Corrective Measures/Remedial Action Completion Criteria

The RAOs are defined in the DTSC Statement of Basis (DTSC 2011a) and DOI ROD (DOI 2010); as noted above in Section 1.1.1 they are:

1. Prevent ingestion of groundwater as a potable water source having Cr(VI) in excess of the regional background concentration of 32 µg/L.
2. Prevent or minimize migration of Cr(T) and Cr(VI) in groundwater to ensure concentrations in surface water do not exceed water quality standards that support the designated beneficial uses of the Colorado River (11 µg/L Cr[VI]).
3. Reduce the mass of Cr(T) and Cr(VI) in groundwater at the site to achieve compliance with ARARs in groundwater. This RAO will be achieved through the cleanup goal of the regional background concentration of 32 µg/L of Cr(VI).
4. Ensure that the geographic location of the target remediation area does not permanently expand following completion of the remedial action.

The completion criteria or performance standards for the groundwater remedy are mainly driven by RAO #3, reducing Cr(VI) concentrations throughout the plume to concentrations of 32 µg/L or less. During the time prior to attaining these concentrations, an institutional control will be established to prohibit development of the groundwater within the plume as a drinking water source, to meet RAO #1. Following attainment of the Cr(VI) concentrations of 32 µg/L or less, the IC can be lifted. Reducing concentrations of Cr(VI) in groundwater to concentrations of 32 µg/L or less will meet RAO #2 by increasing the level of certainty that surface water quality will continue to remain below surface water quality standards in the future. Reducing concentrations of Cr(VI) in groundwater to concentrations of 32 µg/L or less will meet RAO #4 by reducing, and eventually eliminating, the target remediation area.

Attainment of the completion criteria or achievement of performance standards (Cr[VI] concentrations of 32 µg/L or less) is intended to be applied throughout the area of contaminated groundwater. In establishing this criterion, the following are recognized:

- Attaining the cleanup criteria of 32 µg/L Cr(VI) in groundwater may be through active remediation or through MNA after active remediation has been employed and optimized.
- Different areas of the plume may reach the cleanup criteria of 32 µg/L Cr(VI) in groundwater at different times.

MNA is included as a long-term component of the groundwater remedy to address residual chromium that may remain in recalcitrant portions of the aquifer following efforts to enhance and optimize in-situ treatment and flushing systems during the O&M phase. Decisions on specific areas of the plume appropriate for MNA will be made during future evaluations, such as 5-year reviews, based on information about the types and options for active remediation system adjustments, data evaluating the effectiveness of active remediation systems, and location of proposed MNA areas relative to natural reductive zones in the aquifer.

Due to heterogeneity in the aquifer, it is expected that during the decades-long O&M period there will be portions of the site that attain the RAOs at different times. The existing footprint of the plume is expected to change in size and shape, and to diminish. In addition, there may be portions of the site where it could be determined that MNA is appropriate to address residual Cr(VI). During future evaluations, such as 5-year reviews, distinct geographical areas of the site where RAOs have been attained and/or where it has been determined that MNA is appropriate to address residual Cr(VI) could be designated (as appropriate) for Corrective Action/Remedial Action Completion.

For those areas, a Corrective Measure/Remedial Action Completion Report will be prepared. The completion report will demonstrate how the criteria for the completion of the groundwater remedy have been satisfied and outline the criteria for when O&M may cease. A Decommissioning Plan will also be prepared following remedial action completion and/or determination that remedial infrastructure is no longer needed to support the active operation. Post-remediation monitoring and eventual lifting of the IC will be aspects of the Corrective Measure/ Remedial Action completion.

Tables *(on CD-ROM only)*

Please note: These compliance tables, presented on the CD-ROM version of this O&M Manual, are copied directly from Section 6 of the Basis of Design Report to which this O&M Manual is an appendix. The table numbers have been changed, but the contents of the tables are unchanged. This includes the reference citations, which correspond to the References List (Section 9) of the BOD Report, not the References List in this O&M Manual. Please refer to Section 9 of the BOD Report to identify the sources cited in these tables. References within the tables to Tables 6.1-1, 6.1-2, 6.2-1, 6.2-1A, 6.2-2, and 6.2-3 of the BOD Report correspond to Tables L1.1-1, L1.1-2, L1.1-3, L1.1-3A, L1.1-4, and L1.1-5, respectively, in this document.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Aesthetics	**AES-1**	**Impacts on Views from Topock Maze Locus B, a Scenic Vista (Key View 5) - The proposed project shall be designed and implemented to adhere to the design criteria presented below.**						
Aesthetics	AES-1a	a) Existing mature plant specimens shall be protected in place during construction, operation, and decommissioning phases consistent with CUL1a-5. The identification of plant specimens that are determined to be mature and retained shall occur as part of the design phase and mapped/identified by a qualified plant ecologist or biologist and integrated into the final design and project implementation.	Mature Plants Survey Report including map of mature plant species Aesthetics and Visual Resources Protection and Revegetation Plan	Identification and mapping of mature plant species was completed in August 2011. The survey methodology is summarized in a technical memorandum entitled "*Topock Groundwater Remediation Project, Mature Plants Survey Methodology*" (CH2M HILL 2011b) and is included in Appendix A3 of the Basis of Design Report. The mature plant map is under preparation and will be used to guide the remedy design and the planning for construction.	The Mature Plants Survey Report (CH2M HILL 2012b) was completed on January 17, 2012, and is included in Appendix A4 of the 60% BOD Report. The report contains surveys results and associated maps, which have been used to guide the design. An overview of the report and the survey results were discussed with interested Tribes on January 26, 2012. Figure 2.4-8 in the 60% BOD Report document presents the mature plant survey information for Key Views 5 and 11. PG&E biologist Melanie Day and CH2M HILL biologist Marjorie Eisert participated in a field review of planned remedial facilities with the design team on April 23-24, 2012. A field review was also conducted on June 20 by PG&E biologist Virginia Strohl. The purpose of these field reviews along with in office reviews was to ensure the footprints of planned facilities including potential access routes are designed to avoid disturbance of sensitive habitats to the extent feasible.	An addendum to the Mature Plants Survey Report (CH2M HILL 2014j) was completed on May 22, 2014, and is included in Appendix A4 of the 90% BOD Report. The addendum contains surveys results and associated maps for the freshwater well sites (HNWR-1 and Site B) in Arizona as well as potential sites identified for soil storage and/or construction staging west of Moabi Regional Park. Figure 2.4-8 in the 90% BOD Report presents the mature plant survey information for Key Views 5 and 11. The Aesthetics and Visual Resources Protection and Revegetation Plan (CH2M HILL 2014l) is included in an appendix of the Construction/Remedial Action Work Plan. CH2M HILL biologist Steve Long and E2 biologist Russell Huddleston participated in a field review of planned remedial facilities with the design team on April 7-10, 2014. An additional field review of planned remedial facilities was conducted by CH2M HILL biologist Melissa Fowler and E2 biologist Russell Huddleston on August 6-8, 2014. PG&E biologist Virginia Strohl also led the office reviews of planned facilities and footprints. The purpose of the field reviews along with in office reviews was to ensure the footprints of planned facilities including access routes and construction footprints are designed to avoid disturbance of mature plant specimens and sensitive habitats to the extent feasible.		The survey methodology tech memo was completed on October 31, 2011, and provided to Interested Tribes on November 8, 2011. The Mature Plants Survey Report (CH2M HILL 2012e) was completed on January 17, 2012. An addendum to the Mature Plants Survey Report was completed on May 22, 2014. The Aesthetics and Visual Resources Protection and Revegetation Plan was submitted with the Construction/Remedial Action Work Plan (Appendix N) on September 8, 2014 with the 90% design submittal and again on November 18, 2015 with the final design submittal.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Aesthetics	AES-1b	b) Revegetation of disturbed areas within the riparian vegetation along the Colorado River shall occur concurrently with construction operations. Plans and specifications for revegetation shall be developed by a qualified plant ecologist or biologist before any riparian vegetation is disturbed and shall be implemented consistent with CUL-1a-5. The revegetation plan shall include specification of maintenance and monitoring requirements, which shall be implemented for a period of 5 years after project construction or after the vegetation has successfully established, as determined by a qualified plant ecologist or biologist.	Aesthetics and Visual Resources Protection and Revegetation Plan	A revegetation plan for the riparian vegetation along the river will be prepared and submitted with the final design.	A revegetation plan for the riparian vegetation along the river will be prepared and submitted with the final design.	The Aesthetics and Visual Resources Protection and Revegetation Plan is included in Appendix N of the Construction/Remedial Action Work Plan. The plan was prepared by plant ecologist Russell Huddleston of E2 Consulting under the direction of Linda Cyra-Korsgaard, a CH2M HILL landscape architect licensed in California. The plan will be implemented consistent with mitigation measure CUL-1a-5. A technical memorandum titled *Preliminary Assessment of Proposed Mitigation Planting Areas for Final Groundwater Remedy Impacts, Topock Compressor Station, California* (CH2M HILL 2015e) identifies potential revegetation areas where mitigation vegetation could be planted to offset potential impacts to riparian vegetation along the Colorado River that may occur during construction of the remedy. The memo was completed on January 27, 2015 and included in Appendix V of the Supplemental 90% for review and comment.	The *Preliminary Assessment of Proposed Mitigation Planting Areas for Final Groundwater Remedy Impacts, Topock Compressor Station, California* was revised to incorporate review comments, and was submitted with the Construction/Remedial Action Work Plan concurrently with the final design.	The Aesthetics and Visual Resources Protection and Revegetation Plan was submitted with the Construction/Remedial Action Work Plan (Appendix N) on September 8, 2014 with the 90% design submittal and again on November 18, 2015 with the final design submittal. The revised *Preliminary Assessment of Proposed Mitigation Planting Areas for Final Groundwater Remedy Impacts, Topock Compressor Station, California* (CH2M HILL 2015e) was submitted with the Construction/ Remedial Action Work Plan, concurrently with the final design submittal.
Aesthetics	AES-1c	c) Plant material shall be consistent with surrounding native vegetation.	Aesthetics and Visual Resources Protection and Revegetation Plan	This requirement will be incorporated into the revegetation plan, and therefore, will be satisfied by implementation of AES-1b/2c.	This requirement will be incorporated into the revegetation plan, and therefore will be satisfied by implementation of AES-1b/2c.	This requirement was incorporated into the revegetation plan, and therefore satisfied by implementation of AES-1b/2c.	This requirement was incorporated into the revegetation plan, and will be satisfied by implementation of AES-1b/2c.	See AES-1b/2c.
Aesthetics	AES-1d	d) The color of the wells, pipelines, reagent storage tanks, control structures, and utilities shall consist of muted, earth-tone colors that are consistent with the surrounding natural color palette. Matte finishes shall be used to prevent reflectivity along the view corridor. Integral color concrete should be used in place of standard gray concrete.	Design submittals	The requirement of this mitigation measure has been incorporated into the design criteria as presented in Appendix C of this Basis of Design Report for the preliminary design. In addition, the detailed specification for colors will also be included the intermediate (60%) design.	The requirement of this mitigation measure was incorporated into the design criteria as presented in Appendix C of the 60% BOD Report. The detailed specification for colors are included in Appendix E of the 60% BOD Report.	The requirement of this mitigation measure was incorporated into the design criteria as presented in Appendix C of the 90% BOD Report. The detailed specification for colors are included in Appendix E of the 90% BOD Report.	The requirement of this mitigation measure was incorporated into the design criteria as presented in Appendix C (Section C.8) of this Final BOD Report. The detailed specifications for colors are included in Volume 1 Specifications, Painting and Coating, Part 3, Section 3.01.D, in Appendix E of this Final BOD Report.	The Final BOD Report was submitted on November 18, 2015.
Aesthetics	AES-1e	e) The final revegetation plans and specifications shall be reviewed and approved by an architect, landscape architect, or allied design professional licensed in the State of California to ensure that the design objectives and criteria are being met. Planting associated with biological mitigation may contribute to, but may not fully satisfy, visual mitigation.	Aesthetics and Visual Resources Protection and Revegetation Plan	This requirement will be incorporated into the revegetation plan, and therefore, will be satisfied by implementation of AES-1b/2c.	This requirement will be incorporated into the revegetation plan, and therefore will be satisfied by implementation of AES-1b/2c.	This requirement was incorporated into the final revegetation plan, and therefore will be satisfied by implementation of AES-1b/2c.	This requirement was incorporated into the revegetation plan and will be satisfied by implementation of AES-1b/2c.	See AES-1b/2c.

Aesthetics	**AES-2**	**Impacts on Views from Colorado River, a Scenic Resources Corridor (Key View 11) - The proposed project shall be designed and implemented to adhere to the design criteria presented below:**						
Aesthetics	AES-2a	a) A minimum setback requirement of 20 feet from the water (ordinary high water mark or OHWM) shall be enforced, except with regard to any required river intake facilities, to prevent substantial vegetation removal along the river bank.	Design submittals	The OHWM along the bank of the Colorado River, from the mouth of Bat Cave Wash to the BNSF railroad bridge, was mapped in March 2011. The OHWM methodology is summarized in a technical memorandum entitled "*Topock Groundwater Remediation Project, Ordinary High Water Mark Mapping Methodology*" (CH2M HILL 2011d) and is included in Appendix A3 of this Basis of Design Report. A 20-feet setback from the OHWM was used to guide the placement of the River Bank Extraction Wells and associated infrastructure in the floodplain. A map showing the OHWM and the 20-feet setback is included in Figure 2-17 of the 30% BOD Report.	Figure 2.4-6 in the 60% BOD Report illustrates that the locations of the River Bank Extraction Wells and associated piping met the 20-foot setback requirement.	Figure 2.4-6 in the 90% BOD Report illustrates that the locations of the River Bank Extraction Wells and associated access road/piping corridor met the 20-foot setback requirement.	Figure 2.4-6 in this Final BOD Report illustrates that the locations of the River Bank Extraction Wells and associated access road/piping corridor will meet the 20-foot setback requirement.	The mapping methodology technical memorandum and a map with the 20-foot setback from the OHWM were submitted on November 18, 2011, and are included in Appendix A of this report.
Aesthetics	AES-2b	b) Existing mature plant specimens shall be protected in place during construction, operation, and decommissioning phases. The identification of plant specimens that are determined to be mature and retained shall occur as part of the design phase and mapped/identified by a qualified plant ecologist or biologist and integrated into the final design and project implementation consistent with CUL1a-5.	Mature Plants Survey Report including map of mature plant species Aesthetics and Visual Resources Protection and Revegetation Plan	Identification and mapping of mature plant species was completed in August 2011. The survey methodology is summarized in a technical memorandum entitled "*Topock Groundwater Remediation Project, Mature Plants Survey Methodology*" (CH2M HILL 2011b) and is included in Appendix A3 of this Basis of Design Report. The mature plant map is under preparation and will be used to guide the remedy design and the planning for construction.	The Mature Plants Survey Report (CH2M HILL 2012b) was completed on January 17, 2012, and is included in Appendix A4 of the 60% BOD Report. The report contains surveys results and associated maps, which have been used to guide the design. An overview of the report and the survey results were discussed with interested Tribes on January 26, 2012. Figure 2.4-8 in the 60% BOD Report presents the mature plant survey information for Key Views 5 and 11. PG&E biologist Melanie Day and CH2M HILL biologist Marjorie Eisert participated in a field review of planned remedial facilities with the design team on April 23-24, 2012. A field review was also conducted on June 20 by PG&E biologist Virginia Strohl. The purpose of these field reviews along with in office reviews was to ensure the footprints of planned facilities including potential access routes are designed to avoid disturbance of sensitive habitats to the extent feasible.	An addendum to the Mature Plants Survey Report (CH2M HILL 2014j) was completed on May 19, 2014 and is included in Appendix A4 of the 90% BOD Report. The addendum contains surveys results and associated maps for the freshwater well sites (HNWR-1 and Site B) in Arizona as well as potential sites identified for soil storage and/or construction staging west of Moabi Regional Park. Figure 2.4-8 in the 90% BOD Report presents the mature plant survey information for Key Views 5 and 11. The Aesthetics and Visual Resources Protection and Revegetation Plan (CH2M HILL 2014l) is included as an appendix to the Construction/Remedial Action Work Plan (CH2M HILL 2014m). CH2M HILL biologist Steve Long and E2 biologist Russell Huddleston participated in a field review of planned remedial facilities with the design team on April 7-10, 2014. An additional field review of planned remedial facilities was conducted by CH2M HILL biologist Melissa Fowler and E2 biologist Russell Huddleston on August 6-8, 2014. PG&E biologist Virginia Strohl also led the office	On January 30, 2015, PG&E conducted biological surveys to identify plant specimens that are mature and to be retained in the area proposed for remedy use at Moabi Regional Park. On June 24-25, 2015, in conformance with direction from DTSC, PG&E conducted biological surveys to identify plant specimens that are mature and to be retained in an additional 35-acre area considered on the west side of Moabi Regional Park. The survey results were summarized in a technical memorandum titled *Assessment of Biological Resources for a 35-acre Area on the West Side of Moabi Regional Park* (CH2M HILL 2015d), which is included in Appendix A10 of this report. This memorandum provides updates to the January 2015 memorandum as well as information on the natural resources observed within the larger 35-acre area. In addition, a technical memorandum titled *Assessment of Biological Resources for the Proposed Sewer and Firewater Lines for the Construction Headquarters, Final Groundwater Remedy, Topock Compressor Station, California* (CH2M HILL 2015c) was prepared to provide a general	The survey methodology tech memo was completed on October 31, 2011, and provided to Interested Tribes on November 8, 2011. The Mature Plants Survey Report was completed on January 17, 2012. An addendum to the Mature Plants Survey Report was completed on May 22, 2014. The Aesthetics and Visual Resources Protection and Revegetation Plan was submitted with the Construction/Remedial Action Work Plan (Appendix N) on September 8, 2014 with the 90% design submittal and again on November 18, 2015 with the final design submittal. The *Assessment of Biological Resources for the Proposed Soil Management Area* was completed on January 19, 2015, and submitted with the Supplemental 90% on February 5, 2015. The *Assessment of Biological Resources for the Proposed Sewer and Firewater Lines for the Construction Headquarters, Final*

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures

						reviews of planned facilities and footprints. The purpose of the field review along with in-office reviews was to ensure the footprints of planned facilities, including access routes and construction footprints, are designed to avoid disturbance of mature plant specimens and sensitive habitats to the extent feasible. In support of the Supplemental 90% design, PG&E conducted biological surveys (including for mature plants) of the 6.74-acre Construction Headquarters and soil management area at Moabi Regional Park on November 19, 2014 to identify existing mature plant specimens to be protected in place, consistent with mitigation measures AES-2b and CUL-1a-5. The survey results was summarized in a technical memorandum titled *Assessment of Biological Resources for the Proposed Soil Management Areas* (CH2M HILL 2015b), which was submitted in Appendix A10 of the Supplemental 90%.	assessment of biological resources (including mature plants) that could be affected by the proposed sewer and fire water lines that may be installed in the future and are associated with the construction headquarters facilities that would be located to the west of Moabi Regional Park, south of the National Trails Highway. The memo was completed on August 5, 2015 and submitted for review during the 90% RTC process and is included in Appendix A10 of this report.	*Groundwater Remedy, Topock Compressor Station, California* was completed on August 5, 2015 and submitted for review during the 90% RTC process. The *Assessment of Biological Resources for a 35-acre Area on the West Side of Moabi Regional Park: Final Groundwater Remedy, Topock Compressor Station, California* was completed on September 8, 2015. The above documents are also submitted again with the final design on November 18, 2015.
Aesthetics	AES-2c	c) Revegetation of disturbed areas within the riparian vegetation along the Colorado River shall occur concurrently with construction operations. Plans and specifications for revegetation shall be developed by a qualified plant ecologist or biologist before any riparian vegetation is disturbed. The revegetation plan shall include specification of maintenance and monitoring requirements, which shall be implemented for a period of 5 years after project construction or after the vegetation has successfully established, as determined by a qualified plant ecologist or biologist.	Aesthetics and Visual Resources Protection and Revegetation Plan	A revegetation plan for the riparian vegetation along the river will be prepared and submitted with the final design.	A revegetation plan for the riparian vegetation along the river will be prepared and submitted with the final design.	A Habitat Restoration Plan for Riparian Vegetation and Other Sensitive Habitats (CH2M HILL 2014o) is included in an appendix of the Construction/Remedial Action Work Plan (CH2M HILL 2014m). A technical memorandum titled *Preliminary Assessment of Proposed Mitigation Planting Areas for Final Groundwater Remedy Impacts, Topock Compressor Station, California* (CH2M HILL 2015e) identifies potential revegetation areas where mitigation vegetation could be planted to offset potential visual impacts that may occur from potential disturbance of riparian vegetation along the Colorado River during construction of the remedy. The memo was completed on January 27, 2015 and included in Appendix V of the Supplemental 90% for review and comment.	The Preliminary Assessment of Proposed Mitigation Planting Areas for Final Groundwater Remedy Impacts, Topock Compressor Station, California was revised to incorporate review comments.	The Habitat Restoration Plan for Riparian Vegetation and Other Sensitive Habitats was submitted with the Construction/Remedial Action Work Plan on September 8, 2014. Both the revised *Preliminary Assessment of Proposed Mitigation Planting Areas for Final Groundwater Remedy Impacts, Topock Compressor Station* (CH2M HILL 2015e) and the Habitat Restoration Plan were submitted with the Construction/ Remedial Action Work Plan, concurrently with the final design submittal.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Aesthetics	AES-2d	d) Plant material shall be consistent with surrounding native vegetation.	Aesthetics and Visual Resources Protection and Revegetation Plan	This requirement will be incorporated into the revegetation plan, and therefore, will be satisfied by implementation of AES-1b/2c.	This requirement will be incorporated into the revegetation plan, and therefore will be satisfied by implementation of AES-1b/2c.	This requirement was incorporated into the Habitat Restoration Plan for Riparian Vegetation and Other Sensitive Habitats (CH2M HILL 2014o) included as an appendix to the Construction/Remedial Action Work Plan, and therefore was satisfied by implementation of AES-1b/2c.	This requirement was incorporated into the Aesthetics and Visual Resources Protection and Revegetation Plan (CH2M HILL 2014l) drafted to satisfy AES-1/2 and included as Appendix N to the Construction/Remedial Action Work Plan, and which will be followed when AES-1/2 are implemented.	The Aesthetics and Visual Resources Protection and Revegetation Plan was submitted with the Construction/Remedial Action Work Plan (Appendix N) on September 8, 2014 with the 90% design submittal and again on November 18, 2015 with the final design submittal.
Aesthetics	AES-2e	e) The color of the wells, pipelines, and utilities shall consist of muted, earth-tone colors that are consistent with the surrounding natural color palette. Matte finishes shall be used to prevent reflectivity along the view corridor. Integral color concrete should be used in place of standard gray concrete.	Design submittals	The requirement of this mitigation measure has been incorporated into the design criteria as presented in Appendix C of the Basis of Design Report for the preliminary design. In addition, the detailed specification for colors will also be included the intermediate (60%) design.	The requirement of this mitigation measure was incorporated into the design criteria as presented in Appendix C of the BOD Report for the 60% design. The detailed specifications for colors are included in Appendix E of the 60% BOD Report.	The requirement of this mitigation measure was incorporated into the design criteria as presented in Appendix C of the 90% BOD Report. The detailed specifications for colors are included in Appendix E of the 90% BOD Report.	The requirement of this mitigation measure was incorporated into the design criteria as presented in Appendix C (Section C.8) of this Final BOD Report. The detailed specifications for colors are included in Volume 1 Specifications, Painting and Coating, Part 3, Section 3.01.D, in Appendix E of this Final BOD Report.	The Final BOD Report was submitted on November 18, 2015.
Aesthetics	AES-2f	f) The final revegetation plans and specifications shall be reviewed and approved by an architect, landscape architect, or allied design professional licensed in the State of California to ensure that the design objectives and criteria are being met. Planting associated with biological mitigation may contribute to, but may not fully satisfy, visual mitigation.	Aesthetics and Visual Resources Protection and Revegetation Plan	This requirement will be incorporated into the revegetation plan, and therefore will be satisfied by implementation of AES-1b/2c.	This requirement will be incorporated into the revegetation plan, and therefore will be satisfied by implementation of AES-1b/2c.	This requirement was incorporated into the Habitat Restoration Plan for Riparian Vegetation and Other Sensitive Habitats revegetation plan (CH2M HILL 2014o) included as an appendix to the Construction/ Remedial Action Work Plan, and therefore was satisfied by implementation of AES-1b/2c.	The Aesthetics and Visual Resources Protection and Revegetation Plan is included in Appendix N of the Construction/Remedial Action Work Plan. The plan was prepared by plant ecologist Russell Huddleston of E2 Consulting under the direction of Linda Cyra-Korsgaard, a CH2M HILL landscape architect licensed in California.	The Aesthetics and Visual Resources Protection and Revegetation Plan was submitted with the Construction/Remedial Action Work Plan (Appendix N) on September 8, 2014 with the 90% design submittal and again on November 18, 2015 with the final design submittal.
Aesthetics	AES-3	**Impacts on Visual Quality and Character along the Colorado River (Key View 11)** -- Mitigation Measure AES-1 shall be implemented. Implementation of Mitigation Measures AES-1 would reduce the overall change to the visual character of the view corridor along the Colorado River. Although the proposed project would still be visible, incorporating a facilities design that is aesthetically sensitive and preserving the vegetation would blend the proposed project into their visual setting within the floodplain and would reduce the overall contrast of the proposed project.	Design submittals	This requirement is addressed by the actions taken to address AES-1.	This requirement is addressed by the actions taken to address AES-1.	This requirement is addressed by the actions taken to address AES-1.	This requirement is addressed by the actions taken to address AES-1.	See AES-1.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Air Quality	**AIR-1**	**Short-Term Construction-Related Emissions of Criteria Air Pollutants and Precursors - PG&E shall implement the fugitive dust control measures below for any construction and/or demolition activities:**						
Air Quality	AIR-1a	a) Use periodic watering for short-term stabilization of disturbed surface area to minimize visible fugitive dust emissions during dust episodes. Use of a water truck to maintain moist disturbed surfaces and actively spread water during visible dusting episodes shall be considered sufficient;	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This requirement will be incorporated into the forthcoming Corrective Measure Construction/ Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; and Closure Plan for Decommissioning of Remedy Facilities and Restoration	This requirement will be incorporated into the forthcoming Corrective Measure Construction/Remedial Action Work Plan (which will be submitted as part of the 90% design) and the Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration (which will be submitted as part of the Cultural Impact Mitigation Program [CIMP; PG&E 2014] and concurrently with the 90% design). The Closure Plan for Decommissioning of Remedy Facilities and Restoration will be submitted in the future, prior to decommissioning.	This requirement was incorporated into the BMP Plan of the Construction/Remedial Action Work Plan (Section 4) and the Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration (presented as an appendix in the CIMP and the Construction/Remedial Action Work Plan). Both plans were submitted as part of the 90% design documents. The Closure Plan for Decommissioning of Remedy Facilities and Restoration will be submitted in the future, prior to decommissioning.	This requirement was incorporated into the BMP Plan of the Construction/Remedial Action Work Plan (Section 4) and the Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration (presented as an appendix in the CIMP and the Construction/Remedial Action Work Plan). Both plans were submitted as part of the final design documents. The Closure Plan for Decommissioning of Remedy Facilities and Restoration will be submitted in the future, prior to decommissioning.	The Construction/Remedial Action Work Plan was submitted on November 18, 2015. The revised IM-3 Decommissioning Plan was included in the C/RAWP as Appendix F and as part of the CIMP in Appendix H.
Air Quality	AIR-1b	b) Cover loaded haul vehicles while operating on publicly maintained paved surfaces;	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This requirement will be incorporated into the forthcoming Corrective Measure Construction/ Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; and Closure Plan for Decommissioning of Remedy Facilities and Restoration	This requirement will be incorporated into the forthcoming Corrective Measure Construction/Remedial Action Work Plan which will be submitted as part of the 90% design, and the Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration which will be submitted as part of the CIMP and concurrently with the 90% design. The Closure Plan for Decommissioning of Remedy Facilities and Restoration will be submitted in the future, prior to decommissioning.	This requirement was incorporated into the BMP Plan of the Construction/Remedial Action Work Plan (Section 4) and the Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration (presented as an appendix in the CIMP and the Construction/Remedial Action Work Plan). Both plans were submitted as part of the 90% design documents. The Closure Plan for Decommissioning of Remedy Facilities and Restoration will be submitted in the future, prior to decommissioning.	This requirement was incorporated into the BMP Plan of the Construction/Remedial Action Work Plan (Section 4) and the Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration (presented as an appendix in the CIMP and the Construction/Remedial Action Work Plan). Both plans were submitted as part of the final design documents. The Closure Plan for Decommissioning of Remedy Facilities and Restoration will be submitted in the future, prior to decommissioning.	The Construction/Remedial Action Work Plan was submitted on November 18, 2015. The Revised IM-3 Decommissioning Plan was included in the C/RAWP as Appendix F and as part of the CIMP in Appendix H.
Air Quality	AIR-1c	c) Stabilize (using soil binders or establish vegetative cover) graded site surfaces upon completion of grading when subsequent development is delayed or expected to be delayed more than 30 days, except when such delay is caused by precipitation that dampens the disturbed surface sufficiently to eliminate visible fugitive dust emissions;	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This requirement will be incorporated into the forthcoming Corrective Measure Construction/ Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; and Closure Plan for Decommissioning of Remedy Facilities and Restoration	This requirement will be incorporated into the forthcoming Corrective Measure Construction/Remedial Action Work Plan which will be submitted as part of the 90% design, and the Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration which will be submitted as part of the CIMP and concurrently with the 90% design. The Closure Plan for Decommissioning of Remedy Facilities and Restoration will be submitted in the future, prior to decommissioning.	This requirement was incorporated into the BMP Plan of the Construction/Remedial Action Work Plan (Section 4) and the Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration (presented as an appendix in the CIMP and the Construction/Remedial Action Work Plan). Both plans were submitted as part of the 90% design documents. The Closure Plan for Decommissioning of Remedy Facilities and Restoration will be submitted in the future, prior to decommissioning.	This requirement was incorporated into the BMP Plan of the Construction/Remedial Action Work Plan (Section 4) and the Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration (presented as an appendix in the CIMP and the Construction/Remedial Action Work Plan). Both plans were submitted as part of the final design documents. The Closure Plan for Decommissioning of Remedy Facilities and Restoration will be submitted in the future, prior to decommissioning.	The Construction/Remedial Action Work Plan was submitted on November 18, 2015. The revised IM-3 Decommissioning Plan was included in the C/RAWP as Appendix F and as part of the CIMP in Appendix H.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed

Air Quality	AIR-1d	d) Cleanup project-related track out or spills on publicly maintained paved surfaces within twenty-four hours; and	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This requirement will be incorporated into the forthcoming Corrective Measure Construction/ Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; and Closure Plan for Decommissioning of Remedy Facilities and Restoration	This requirement will be incorporated into the forthcoming Corrective Measure Construction/Remedial Action Work Plan which will be submitted as part of the 90% design, and the Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration which will be submitted as part of the CIMP and concurrently with the 90% design. The Closure Plan for Decommissioning of Remedy Facilities and Restoration will be submitted in the future, prior to decommissioning.	This requirement was incorporated into the BMP Plan of the Construction/Remedial Action Work Plan (Section 4) and the Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration (presented as an appendix in the CIMP and the Construction/Remedial Action Work Plan). Both plans were submitted as part of the 90% design documents. The Closure Plan for Decommissioning of Remedy Facilities and Restoration will be submitted in the future, prior to decommissioning.	This requirement was incorporated into the BMP Plan of the Construction/Remedial Action Work Plan (Section 4) and the Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration (presented as an appendix in the CIMP and the Construction/Remedial Action Work Plan). Both plans were submitted as part of the final design documents. The Closure Plan for Decommissioning of Remedy Facilities and Restoration will be submitted in the future, prior to decommissioning.	The Construction/Remedial Action Work Plan was submitted on November 18, 2015. The revised IM-3 Decommissioning Plan was included in the C/RAWP as Appendix F and as part of the CIMP in Appendix H.
Air Quality	AIR-1e	e) Curtail nonessential earth-moving activity under high wind conditions (greater than 25 miles per hour) or develop a plan to control dust during high wind conditions. For purposes of this rule, a reduction in earth-moving activity when visible dusting occurs from moist and dry surfaces due to wind erosion shall be considered sufficient to maintain compliance.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This requirement will be incorporated into the forthcoming Corrective Measure Construction/ Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; and Closure Plan for Decommissioning of Remedy Facilities and Restoration	This requirement will be incorporated into the forthcoming Corrective Measure Construction/Remedial Action Work Plan which will be submitted as part of the 90% design, and the Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration which will be submitted as part of the CIMP and concurrently with the 90% design. The Closure Plan for Decommissioning of Remedy Facilities and Restoration will be submitted in the future, prior to decommissioning.	This requirement was incorporated into the BMP Plan of the Construction/Remedial Action Work Plan (Section 4) and the Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration (presented as an appendix in the CIMP and the Construction/Remedial Action Work Plan). Both plans were submitted as part of the 90% design documents. The Closure Plan for Decommissioning of Remedy Facilities and Restoration will be submitted in the future, prior to decommissioning.	This requirement was incorporated into the BMP Plan of the Construction/Remedial Action Work Plan (Section 4) and the Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration (presented as an appendix in the CIMP and the Construction/Remedial Action Work Plan). Both plans were submitted as part of the final design documents. The Closure Plan for Decommissioning of Remedy Facilities and Restoration will be submitted in the future, prior to decommissioning.	The Construction/Remedial Action Work Plan was submitted on November 18, 2015. The revised IM-3 Decommissioning Plan was included in the C/RAWP as Appendix F and as part of the CIMP in Appendix H.
Biological Resources	BIO-1	**Potential Fill of Wetlands and Other Waters of the United States and Disturbance or Removal of Riparian Habitat** -Areas of sensitive habitat in the project area have been identified during project surveys. These areas include floodplain and riparian areas, wetlands, and waters of the United States. Habitats designated by CDFW as sensitive, including desert washes and desert riparian, are also included. To the extent feasible, elements of the project shall be designed to avoid direct effects on these sensitive areas. During the design process and before ground disturbing activities within such areas (not including East Ravine), a qualified biologist shall coordinate with PG&E to ensure that the footprints of construction zones, drill pads, staging areas, and access routes are designed to avoid disturbance of sensitive habitats to the extent feasible. DTSC shall be responsible for enforcing compliance with design and all preconstruction measures.	Design submittals	During the preparation of the Construction/ Remedial Action Work Plan as part of the design process, a qualified biologist will coordinate to ensure that the footprints of construction zones, drill pads, staging areas, and access routes are designed to avoid disturbance of sensitive habitats (floodplain and riparian areas, wetlands, waters of the US, desert washes, and desert riparian) to the extent feasible. The draft and final work plans are planned for submittal in 2012.	During the preparation of the Construction/Remedial Action Work Plan as part of the design process, a qualified biologist will coordinate to ensure that the footprints of construction zones, drill pads, staging areas, and access routes are designed to avoid disturbance of sensitive habitats (floodplain and riparian areas, wetlands, waters of the US, desert washes, and desert riparian) to the extent feasible. The draft Construction/Remedial Action Work Plan is planned for submittal in late 2013, concurrently with the 90% design.	CH2M HILL biologist Steve Long and E2 biologist Russell Huddleston participated in a field review of planned remedial facilities with the design team on April 7-10, 2014. An additional field review of planned remedial facilities was conducted by CH2M HILL biologist Melissa Fowler and E2 biologist Russell Huddleston on August 6-8, 2014. CH2M HILL biologists Steve Long and Russell Huddleston also conducted field reviews of the planned facilities at Moabi Regional Park on November 19, 2014. PG&E biologist Virginia Strohl also led the office reviews of planned facilities and footprints. The purpose of the field review along with in-office reviews was to ensure the footprints of planned facilities, including access routes and	PG&E biologist Virginia Strohl led the office reviews of planned facilities and footprints in September 2015. The purpose of the review was to ensure that the footprints of planned facilities, including footprints of construction zones, staging areas, and access routes had been designed to avoid direct effects on sensitive habitats to the extent feasible. The Construction/Remedial Action Work Plan was submitted concurrently with the final design documents.	September 22, 2015.

						construction footprints, are designed to avoid disturbance of sensitive habitats to the extent feasible. The Construction/Remedial Action Work Plan was submitted on September 8, 2014 as part of the 90% design document.		
Biological Resources	BIO-1	If during the design process it is shown that complete avoidance of habitats under USACE jurisdiction is not feasible, the Section 404 permitting process shall be completed, or the substantive equivalent per CERCLA Section 121(e)(1). In either event, the acreage of affected jurisdictional habitat shall be replaced and/or rehabilitated to ensure "no-net-loss." Before any ground-disturbing project activities begin in areas that contain potentially jurisdictional wetlands, the wetland delineation findings shall be documented in a detailed report and submitted to USACE for verification as part of the formal Section 404 wetland delineation process and to DTSC. For all jurisdictional areas that cannot be avoided as described above, authorization for fill of wetlands and alteration of waters of the United States shall be secured from USACE through the Section 404 permitting process before project implementation. Habitat restoration, rehabilitation, and/or replacement shall be at a location and by feasible methods agreeable to USACE and consistent with applicable county and agency policies and codes. Minimization and compensation measures adopted through any applicable permitting processes shall be implemented. Alternately, if USACE declines to assert jurisdiction because it determines that CERCLA Section 121(e)(1) applies, the substantive equivalent of the Section 404 permitting process shall be complied with by ensuring that the acreage of jurisdictional wetland affected is be replaced on a "no-net-loss" basis in accordance with the substantive provisions of USACE regulations. Habitat restoration, rehabilitation, and/or replacement shall be at a location and by feasible methods consistent with USACE methods, and consistent with the purpose and intent of applicable county and agency policies and codes. Minimization and compensation measures adopted through any applicable permitting processes shall be implemented. In any event, a report shall be submitted to DTSC to document compliance with these mandates.	Jurisdictional Delineation of Waters and Wetlands Report	During the preliminary (30%) design, it has been determined that complete avoidance of habitats under USACE jurisdiction (e.g., Bat Cave Wash) is not feasible. PG&E will work with the USACE to determine and complete the Section 404 permitting process or the substantive equivalent per CERCLA Section 121(e)(1). It is anticipated that a wetland delineation will be conducted in the Spring of 2012.	Figure 2.4-5 in the 60% BOD Report shows the overlaps between planned remedy infrastructure and the USACE jurisdictional waters/wetlands. As shown in Figure 2.4-5, complete avoidance of washes is not feasible due to the need to install remediation and monitoring wells in washes (e.g., a wash in the Upland, Bat Cave Wash). On February 12, 2013, PG&E consulted with Mr. Gerardo Salas of USACE Los Angeles District in Los Angeles regarding the application of the CERCLA 121(e)(1) permit exemption to the Topock remediation project. PG&E will continue to coordinate with USACE on this matter, including on the substantive requirements of CWA Section 404.	On February 13-17, 2012, a wetland delineation was conducted to determine and map the extent of wetlands and other waters of the U.S. located within the EIR project area. Additional wetland delineation was conducted on July 16-17 and December 12-13, 2012, in study areas identified in the alternative freshwater evaluation. A report titled "*Wetlands and Waters of the United States Final Delineation Report for the Topock Compressor Station Groundwater Remediation Project, San Bernardino County, California*" (CH2M HILL 2014c) was prepared to summarize results of the above delineation efforts and submitted to DTSC and DOI on April 18, 2014. The report is also included in Appendix A3 of the 90% BOD Report. In support of the Supplemental 90% design, PG&E conducted surveys for jurisdictional waters and wetlands in the 6.74-acre Construction Heaquarters and soil management area at Moabi Regional Park on November 19, 2014. The survey results were summarized in a technical memorandum titled *Assessment of Biological Resources for the Proposed Soil Management Areas* (CH2M HILL 2015b), which was submitted with the Supplemental 90%. On July 10, 2013, the USACE confirmed that CERCLA 121(e)(1) permit exemption applies to the Topock remediation project, and therefore, PG&E is not required to comply with the administrative and procedural elements of Section 404 of the Clean Water Act; however, PG&E is obligated to comply with the substantive elements that would	On January 30, 2015, PG&E conducted biological surveys (including habitats under USACE jurisdiction) of the area proposed for remedy use at Moabi Regional Park. On June 24-25, 2015, in conformance with direction from DTSC, PG&E conducted surveys (for jurisdictional waters and wetlands) of an additional 35-acre area on the west side of Moabi Regional Park. The survey results were summarized in a technical memorandum titled *Assessment of Biological Resources for a 35-acre Area on the West Side of Moabi Regional Park* (CH2M HILL 2015d). This memorandum provides updates to the January 2015 memorandum as well as information on the natural resources observed within the larger 35-acre area, and is also included in Appendix A10 of this report. In addition, a technical memorandum titled *Assessment of Biological Resources for the Proposed Sewer and Firewater Lines for the Construction Headquarters, Final Groundwater Remedy, Topock Compressor Station, California* (CH2M HILL 2015c) was prepared to provide a general assessment of biological resources (including jurisdictional waters and wetlands) that could be affected by the proposed sewer and fire water lines that may be installed in the future and are associated with the construction headquarters facilities that would be located to the west of Moabi Regional Park, south of the National Trails Highway. The memo was completed on August 5, 2015 and submitted for review during the 90% RTC process and is included in Appendix A10 of this report.	On July 10, 2013, USACE issued a letter (USACE 2013a) that confirmed that a Section 404 permit is not required for the Topock remediation project because the site is exempted under CERCLA 121(e)(1). Additionally, USACE confirmed that it will not verify a jurisdictional delineation for this action because a permit is not required (G. Salas USACE, email communication to V. Nez PG&E, July 12, 2013). The wetland delineation report (CH2M HILL 2014c) was completed on April 18, 2014. The *Assessment of Biological Resources for the Proposed Soil Management Areas* (CH2M HILL 2015b) was completed on January 19, 2015. The *Assessment of Biological Resources for a 35-acre Area on the West Side of Moabi Regional Park: Final Groundwater Remedy, Topock Compressor Station, California* (CH2M HILL 2015d) was completed on September 8, 2015. The *Assessment of Biological Resources for the Proposed Sewer and Firewater Lines for the Construction Headquarters, Final Groundwater Remedy, Topock Compressor Station, California* was completed on August 5, 2015. The above documents are included in Appendix A of this report. The *Habitat Restoration Plan for Riparian Vegetation and Other Sensitive Habitats* (CH2M HILL 2014o) and the revised *Havasu National Wildlife Refuge Habitat*

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
						normally be required by a permit. The USACE also stated that it therefore will not verify the wetlands and waters delineation. Therefore, PG&E is not seeking verification from the USACE. Rather, PG&E assumes that the jurisdictional waters and wetlands delineated and identified as such in the aforementioned report are all the jurisdictional waters under Section 404 of the CWA. The locations of jurisdictional waters have been incorporated into the design. At the 90%/Supplemental 90% design stage, the final remedy avoids almost all permanent impacts within USACE jurisdictional areas with the following exceptions. There is one planned well, IRL-4, that will occur within a jurisdictional water of the U.S. There is also a freshwater pipeline that will be installed within an existing unpaved access road within the 100-year floodplain of the Colorado River. In addition, piping and conduits will be installed in two locations in Bat Cave Wash – one location in the Upland Area and one location near the TCS. However, complete avoidance of other jurisdictional non-wetland waters is not feasible. It has been determined that in order to meet the goals of protection of human health and the environment, to meet the RAOs for the remedy, to monitor remedy performance, to gather data for demonstration of compliance, as well as in response to resolution of design comments with the Tribes, infrastructure (remediation, monitoring wells, and associated piping/conduits) must be installed in certain washes. There are no practicable alternatives to locating certain infrastructure within waters of the United States. Figure 2.4-5 in the 90% BOD Report shows the unavoidable overlaps between planned remedy infrastructure and the USACE jurisdictional waters. In such cases where complete avoidance is not feasible, certain best management	The locations of USACE jurisdictional habitats were considered during the design. At the final design stage, the final remedy avoids almost all permanent impacts within USACE jurisdictional habitats with the following exceptions (see Figure 2.4-5 of this BOD Report): 1) Inner Recirculation Loop Well IRL-4 will occur within a jurisdictional water of the U.S. 2) Remedy and monitoring wells and associated piping/conduits will be installed in Bat Cave Wash, a jurisdictional water of the U.S. 3) Freshwater supply well HNWR-1A, contingent Site B well, associated equipment, and a portion of the freshwater pipeline will be installed within the 100-year floodplain of the Colorado River. 4) Riverbank Extraction Well RB-5, monitoring well MW-W, a portion of Pipeline C, and a portion of the ring road will be installed within the 100-year floodplain of the Colorado River. There are no practicable alternatives to locating the aforementioned infrastructure within waters of the U.S. In such cases where avoidance is not feasible, BMPs will be implemented to avoid and minimize temporary and permanent impacts for activities occurring within jurisdictional wetlands and non-wetland waters of the U.S. (for brevity, the detailed discussion on BMPs in the previous column is not repeated here). The *Preliminary Assessment of Proposed Mitigation Planting Areas for Final Groundwater Remedy Impacts, Topock Compressor Station, California* was revised to incorporate review comments, and was submitted with the Construction/Remedial Action Work Plan concurrently with the final design.	*Restoration Plan* (CH2M HILL 2015g) were submitted with the Construction/Remedial Action Work Plan on September 8, 2014 (90% design) and submitted again on November 18, 2015 (final design). The revised *Preliminary Assessment of Proposed Mitigation Planting Areas for Final Groundwater Remedy Impacts, Topock Compressor Station, California* was submitted with the Construction/Remedial Action Work Plan on November 18, 2015 (final design).

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
						practices (BMPs) (Exhibit 6.1-1 at the end of this table) will be implemented to avoid and minimize temporary and permanent impacts for activities occurring within jurisdictional wetlands and non-wetland waters of the U.S. Although the USACE did not provide a list of measures that may be taken to reduce impacts to jurisdictional waters and wetlands, the California Department of Fish and Wildlife (CDFW) requires compliance with avoidance and mitigation measures (AMMs) for all work conducted in CDFW jurisdictional washes (the 2013 CDFW AMMs can be downloaded from www.dtsc-topock.com, under Document Library, Other and Environmental Impact Review, Approval Letters and Communications). The geographic extent of CDFW's jurisdiction is broader than the jurisdictional extent of the USACE under CWA 404 and thus, avoidance and mitigation measures applied to CDFW jurisdictional waters would as a geographic consequence also be applied to CWA 404 waters. While Arizona does not have a similar state program, PG&E will also implement the same AMMs in Arizona identified by CDFW for California as well to ensure appropriate protection to CWA 404 jurisdictional areas in the project area, including those in Arizona. In addition to the CDFW AMMs, PG&E has identified additional BMPs for implementation during remedy construction, operation and maintenance, as well as decommissioning. The additional BMPs are described in the *Protocol for Compliance with EIR Mitigation and Monitoring Reporting Program BIO-1 and Applicable or Relevant and Appropriate Requirement (ARAR) #32 at the Topock Compressor Station* (see Exhibit 6.1-1 presented at the end of this table). A Habitat Restoration Plan for Riparian Vegetation and Other		

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
						Sensitive Habitats (CH2M HILL 2014o) was also prepared and included in an appendix of the Construction/Remedial Action Work Plan. A technical memorandum titled the *Preliminary Assessment of Proposed Mitigation Planting Areas for Final Groundwater Remedy Impacts, Topock Compressor Station, California* (CH2M HILL 2015e) was prepared to identify potential riparian revegetation areas where mitigation vegetation could be planted to offset potential plant impacts that may occur during construction of the remedy. The memo was completed on January 27, 2015 and included in Appendix V of the Supplemental 90% for review and comment.		
Biological Resources	BIO-1 (continued)	If during the design process it is shown that complete avoidance of habitats under CDFG jurisdiction (such as changes to the natural flow and/or bed and bank of a waterway) is infeasible, a Section 1602 streambed alteration agreement shall be obtained from CDFG and affected habitats shall be replaced and/or rehabilitated. If complete avoidance of identified riparian habitat is not feasible, the acreage of riparian habitat that would be removed shall be replaced or rehabilitated on a no-net-loss basis in accordance with CDFG regulations and, if applicable, as specified in the streambed alteration agreement, if needed. Habitat restoration, rehabilitation, and/or replacement shall be at a location and by methods agreeable to CDFG and consistent with the purpose and intent of applicable county policies and codes, as well as those policies outlined under the respective federal agency guidance documents. Minimization and compensation measures adopted through the permitting process shall also be implemented. Restoration of any disturbed areas shall include measures to achieve "no-net-loss" of habitat functions and values existing before project implementation. These measures shall be achieved by developing and implementing a habitat restoration plan submitted to CDFG, BLM, and USFWS that is agreeable to these agencies, or, alternately, through the implementation of a habitat restoration plan consistent with the substantive policies of CDFG, BLM, and USFWS. The plan shall include a revegetation seed mix or plantings design, a site grading concept plan, success criteria for	Havasu National Wildlife Refuge Habitat Restoration Plan, Habitat Restoration Plan for Riparian Vegetation and Other Sensitive Habitats	During the preliminary (30%) design, it has been determined that complete avoidance of habitats under CDFG jurisdiction (e.g., Bat Cave Wash) is not feasible. PG&E will work with the CDFG to determine and complete the Section 1600 permitting process or the substantive equivalent per CERCLA Section 121(e)(1).	Figure 2.4-5 in the 60% BOD Report shows the overlaps between remedy infrastructure and the CDFW jurisdictional waters/wetlands. As shown in Figure 2.4-5, complete avoidance of washes is not feasible due to the need to install remediation and monitoring wells, and associated pipes and components in washes (e.g., a wash in the Upland, Bat Cave Wash). The CDFG is now the California Department of Fish and Wildlife, and thus is referred to as CDFW in this report. On December 11, 2012, PG&E consulted with CDFW District Regional Manager and his staff at the Blythe, California office regarding the substantive requirements of the CDFW Section 1602 and the application of the CERCLA 121(e)(1) permit exemption to the Topock remediation project. On February 21, 2013, CDFW staff from the Blythe office conducted a field review of the project. On March 6, 2013, the CDFW issued a letter to PG&E confirming that CERCLA 121(e)(1) applies to response actions conducted onsite at Topock, specifically soil and groundwater investigation activities and remedial actions at the site	During the design, a process similar to the above was also conducted to avoid and minimize impacts to CDFW jurisdictional waters/wetlands. CDFW jurisdictional waters in the project area were delineated and mapped. A technical memorandum titled *Riparian Vegetation and California Department of Fish and Wildlife Jurisdiction for the Topock Compressor Station Groundwater Remediation Project* (CH2M HILL 2014i) was prepared to summarize the delineation results. The memo was submitted to the CDFW on 5/9/14, and to DTSC on 5/21/14, and is also included in Appendix A3 of the 90% BOD Report. In support of the Supplemental 90% design, PG&E conducted surveys for USACE jurisdictional waters and wetlands and habitats under CDFW jurisdiction in the 6.74-acre Construction Headquarters and soil management area at Moabi Regional Park on November 19, 2014. The survey results was summarized in a technical memorandum titled *Assessment of Biological Resources for the Proposed Soil Management Areas* (CH2M HILL 2015b), which was	During the design, a process similar to the above was also conducted to avoid and minimize impacts to CDFW jurisdictional waters/wetlands. 1) The locations of CDFW jurisdictional areas have been incorporated into the design. At the final design stage, the final remedy avoids almost all permanent impacts within CDFW jurisdictional areas with the following exceptions (see Figure 2.4-5A of this BOD Report): Inner Recirculation Loop Well IRL-4 will occur within a jurisdictional water of the State. 2) Remedy and monitoring wells and associated piping/conduits will be installed in Bat Cave Wash, a jurisdictional water of the State. 3) Freshwater supply well HNWR-1A, contingent Site B well, associated equipment, and a portion of the freshwater pipeline will be installed within the 100-year floodplain of the Colorado River. 4) Riverbank Extraction Well RB-5, monitoring well MW-W, a portion of Pipeline C, and a portion of the ring road will be	On March 6, 2013, CDFW issued a letter confirming that CERCLA 121(e)(1) permit exemption applies to response actions conducted onsite as part of the Topock remediation project, and specified the substantive requirements in the form of AMMs that PG&E must comply with for the duration of the project. A technical memorandum summarizing the results of delineating CDFW jurisdictional waters in the project area (CH2M HILL 2014i) was submitted to CDFW on May 9, 2014, and to DTSC on May 21, 2014. The memo is included in Appendix A of this report. The Habitat Restoration Plan for Riparian Vegetation and Other Sensitive Habitats (CH2M HILL 2014o) and the Havasu National Wildlife Refuge Habitat Restoration Plan (CH2M HILL 2015g) were submitted with the Construction/Remedial Action Work Plan on September 8, 2014 (90% design) and November 18, 2015 (final design).

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
		restoration, a monitoring plan for achieving no net loss of habitat values and functions, and an adaptive management plan. Alternately, if CDFG declines to assert jurisdiction because it determines that CERCLA Section 121(e)(1) applies, and during the design process it is shown that complete avoidance of habitats under CDFG jurisdiction (such as changes to the natural flow and/or bed and bank of a waterway) is infeasible, the substantive mandates of a streambed alteration agreement shall be implemented, and affected habitats shall be replaced and/or rehabilitated. If complete avoidance of identified riparian habitat is not feasible, the acreage of riparian habitat that would be removed shall be replaced or rehabilitated on a "no-net-loss" basis in accordance with CDFG regulations and, if applicable. Habitat restoration, rehabilitation, and/or replacement shall be at a location and by methods agreeable to CDFG and consistent with the purpose and intent of applicable county policies and codes, as well as those policies outlined under the respective federal agency guidance documents. Minimization and compensation measures adopted through the permitting process shall also be implemented. Restoration of any disturbed areas shall include measures to achieve "no-net-loss" of habitat functions and values existing before project implementation. These measures shall be achieved by developing and implementing a habitat restoration plan developed consistent with the substantive policies of CDFG, BLM and USFWS. The plan shall include a revegetation seed mix or plantings design, a site grading concept plan, success criteria for restoration, a monitoring plan for achieving no net loss of habitat values and functions, and an adaptive management plan.			(CDFW 2013). As a result, no Lake or Stream Bed Alteration Agreement is required by CDFW. However, PG&E must still comply with substantive elements CDFW would require in such an Agreement for the duration of the project. In this case, the substantive elements are the avoidance and minimization measures (AMMs) attached to the March 6, 2013 letter (this letter can be viewed or downloaded from the DTSC Topock website at www.dtsc-topock.com), and any additional measures PG&E's biologist determines to be necessary.	submitted with the Supplemental 90%. The locations of jurisdictional waters have been incorporated into the design. At the 90% design stage, the final remedy avoids almost all permanent impacts within USACE jurisdictional areas with the following exceptions. There is one planned well, IRL-4, that will occur within a jurisdictional waters of the US. There is also a freshwater pipeline that will be installed within an existing unpaved access road within the 100-year floodplain of the Colorado River. In addition, piping and conduits will be installed in two locations in Bat Cave Wash – one location in the Upland Area and one location near the TCS. However, complete avoidance of other CDFW jurisdictional non-wetland waters is not feasible for the same reasons described above for the USACE jurisdictional non-wetland waters. Figure 2.4-5A in the 90% BOD Report shows the unavoidable overlaps between planned remedy infrastructure and the CDFW jurisdictional waters. A Habitat Restoration Plan for Riparian Vegetation and Other Sensitive Habitats and a Havasu National Wildlife Refuge Habitat Restoration Plan were prepared and included as appendices of the Construction/Remedial Action Work Plan. A technical memorandum titled *Preliminary Assessment of Proposed Mitigation Planting Areas for Final Groundwater Remedy Impacts, Topock Compressor Station, California* (CH2M HILL 2015e) identifies potential revegetation areas where mitigation vegetation could be planted to offset potential plant impacts that may occur during construction of the remedy, The memo was completed on January 27, 2015 and included in Appendix V of the Supplemental 90% for review and comment.	installed within the 100-year floodplain of the Colorado River. There are no practicable alternatives to locating the aforementioned infrastructure within waters of the State. A Habitat Restoration Plan for Riparian Vegetation and Other Sensitive Habitats and a Havasu National Wildlife Refuge Habitat Restoration Plan were prepared and included as appendices of the Construction/Remedial Action Work Plan. The *Preliminary Assessment of Proposed Mitigation Planting Areas for Final Groundwater Remedy Impacts, Topock Compressor Station, California* was revised to incorporate review comments, and was submitted with the Construction/Remedial Action Work Plan concurrently with the final design.	The revised *Preliminary Assessment of Proposed Mitigation Planting Areas for Final Groundwater Remedy Impacts, Topock Compressor Station, California* was submitted with the Construction/Remedial Action Work Plan on November 18, 2015 (final design).

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Biological Resources	BIO-2a	**Disturbance of Special-Status Birds and Loss of Habitat.** To the extent feasible, the project implementation plans shall be designed to minimize removal of habitat for special-status birds. During the design process and before ground disturbing activities (except within the East Ravine as described in the Revised Addendum and unless otherwise required as noted below), a qualified biologist shall coordinate with PG&E to ensure that the footprints of project elements and construction zones, staging areas, and access routes are designed to avoid direct or indirect effects on habitat and nesting habitat for other special-status species, to the extent feasible. DTSC will ensure compliance with all preconstruction and construction phase avoidance measures identified during this process and included in any design plans. Vegetation removal and other activities shall be timed to avoid the nesting season for special-status bird species that may be present. The nesting cycle for most birds in this region spans March 15 through September 30. **Preconstruction Measures**: Preconstruction breeding season surveys shall be conducted during the general nesting period, which encompasses the period from March 15 through September 30, if the final design of the project (including East Ravine investigation Sites I, K and L) could result in disturbance or loss of active nests of special-status bird species. If vegetation removal or other disturbance related to project implementation is required during the nesting season, focused surveys for active nests of special-status birds shall be conducted before such activities begin. A qualified biologist shall conduct preconstruction surveys to identify active nests that could be affected. The appropriate area to be surveyed and the timing of the survey may vary depending on the activity and species that could be affected. For the Yuma clapper rail, the preconstruction surveys shall specifically identify habitat within 300 feet of construction areas, in accordance with substantive policies of USFWS including those set out in USFWS protocols. **Construction Measures**: Before the initiation of project elements that could result in disturbance of active nests or nesting pairs of other special-status birds, a qualified biologist shall be consulted to identify appropriate measures to minimize adverse impacts during the construction phase of the project. If deemed appropriate for the final project design because of the potential for impacts, minimization measures will include focusing construction activities that must be conducted during the nesting season to less- sensitive periods in the nesting cycle, implementing buffers around	Avoidance and Minimization Plan; Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration (part of CIMP); Plan for Decommissioning of Remedy Facilities and Restoration	A qualified biologist will coordinate to ensure that the footprints of project elements and construction zones, staging areas, and access routes are designed to avoid direct or indirect effects on habitat and nesting habitat for other special-status species, to the extent feasible, at the intermediate (60%) stage. An Avoidance and Minimization Plan for special-status birds will be developed in consultation with the USFWS, and is subject to agreement from DTSC.	The Yuma clapper rail/California black rail surveys consist of six focused surveys between March 14 and May 19, 2012. The southwestern willow flycatcher (SWFL) surveys were conducted May 21 through 25 and June 4 through 8; June 18 through 22; and June 26 through 30, 2012. The 2012 SWFL survey report was submitted to BLM and USFWS on January 31, 2013 (CH2M HILL 2013a). The results of the Yuma clapper rail/California black rail survey will be summarized in a forthcoming report. An Avoidance and Minimization Plan for special status birds is under preparation, in consultation with the USFWS.	PG&E submitted the Final Bird Impact Avoidance and Minimization Plan (CH2M HILL 2014d), which addresses minimization and avoidance of disturbance of special-status birds and loss of their habitat in the Topock remediation project area, on April 30, 2014. The plan is also included as an appendix of the Construction/Remedial Action Work Plan. Results of the 2012 Yuma clapper rail/California black rail survey were summarized in a report titled *2012 Focused Survey for the Yuma clapper rail and the California black rail at the PG&E Groundwater Remediation Project Site, Needles, California* (CH2M HILL 2013g). The SWFL surveys were conducted on May 20-23, June 3-6; June 16-19; July 1-3, and July 15-17, 2014. Surveys for the western yellow-billed cuckoo were conducted June 16-17; July 2-3; July 16-17; and August 6-8, 2014.	Additional western yellow-billed cuckoo (WYBC) surveys were conducted on June 23-25, July 7-9, July 20-23 and August 4-6, 2015. On June 24-25, 2015, in conformance with direction from DTSC, PG&E conducted biological surveys (including general surveys for wildlife, including surveys for special status birds and their habitat) of an additional 35-acre area on the west side of Moabi Regional Park. The survey results were summarized in a technical memorandum titled *Assessment of Biological Resources for a 35-acre Area on the West Side of Moabi Regional Park* (CH2M HILL 2015d). This memorandum provides updates to the January 2015 memorandum as well as information on the natural resources observed within the larger 35-acre area, and is also included in Appendix A10 of this report.	The Final Bird Impact Avoidance and Minimization Plan (CH2M HILL 2014d) was submitted on April 30, 2014. The C/RAWP was submitted on November 18, 2015. The Revised IM-3 Decommissioning Plan was included in the C/RAWP as Appendix F and as part of the CIMP in Appendix H. The 2014 Southwestern Willow Flycatcher Presence/Absence Surveys for the PG&E Topock Compressor Station report was submitted on October 29, 2014. The 2014 Western Yellow-Billed Cuckoo Presence/Absence Surveys for the PG&E Topock Compressor Station report was submitted on December 22, 2014.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed

		active nests of special-status birds to the extent practical and feasible to limit visual and noise disturbance, conducting worker awareness training, and conducting biological monitoring (including noise monitoring to determine if construction noise at the edge of suitable nesting habitat is elevated above 60 dBA Leq or ambient levels). An avoidance and minimization plan for special status bird species, as defined in Table 4.3-3 of the EIR and those species protected under the federal Migratory Bird Treaty Act, including the Yuma clapper rail, shall be developed and implemented in consultation with USFWS, and agreed upon by DTSC. Avoidance and impact minimization measures, such as prohibiting construction near or in sensitive bird habitat, limiting construction during breeding seasons, and requiring an on-site biological monitor, shall be included in the design plan and implemented to the extent necessary to avoid significant impacts on sensitive bird species.						

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures

Biological Resources	BIO-2b	**Disturbance of Desert Tortoise and Loss of Habitat.** **Preconstruction Measures:** In areas where impacts to potential desert tortoise habitat are unavoidable, measures outlined in the Programmatic Biological Assessment (PBA) and in the USFWS letter concurring with the PBA, shall be implemented, as described below. To the extent feasible, project construction shall be designed to minimize removal of habitat for the desert tortoise. Before any ground-disturbing project activities begin, and except within the East Ravine for which potential effects to the tortoise have been considered per the PBA), a USFWS-authorized desert tortoise biologist shall identify potential desert tortoise habitat in areas that could be affected by the final project design. Through coordination with the authorized biologist, PG&E shall ensure that the footprints of project elements and construction zones, staging areas, and access routes are designed to avoid direct or indirect effects on potential desert tortoise habitat to the extent feasible. These measures include the presence of a USFWS-authorized desert tortoise biologist onsite or designated agent in accordance with the PBA who will examine work areas and vehicles for the presence of desert tortoises, and who will conduct preconstruction desert tortoise surveys in areas where unavoidable impacts to tortoise habitat would occur. If feasible, the preconstruction desert tortoise surveys would coincide with one of the two peak periods of desert tortoise activity (i.e., if feasible, the surveys should be conducted in either the period from April through May, or from September through October). The preconstruction surveys shall be in full accordance with the substantive requirements of USFWS protocols. **Construction Measures**: Before the initiation of project elements that could result in disturbance of desert tortoises or desert tortoise habitat, a USFWS-authorized desert tortoise biologist shall be consulted to identify appropriate measures to minimize adverse impacts. Minimization measures are likely to include micro-siting structures, pipelines, and access roads in previously disturbed areas or in areas with sparse scrub vegetation, conducting worker awareness	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration (part of CIMP); Plan for Decommissioning of Remedy Facilities and Restoration	PG&E, USFWS, and DOI are coordinating on the PBA for the final groundwater remedy. Goal is to complete the PBA in time for the completion of ESA Section 7 consultation prior to the approval of the Construction/Remedial Action Work Plan. Measures outlined in the forthcoming PBA and associated USFWS determination letter will be implemented before and during construction activities.	On September 25, 2012, the USFWS authorized two biologists, Melanie Day and Gabriel Valdes, to conduct activities described in this mitigation measure, pursuant to the PG&E Topock groundwater remediation project. Specifically, these two authorized biologists may survey, provide work area and vehicles inspection, and direct (pre)construction activities to avoid impacts on desert tortoise or their potential habitat, and to provide worker's awareness training for the groundwater remediation project. Gabriel Valdes identified the potential desert tortoise habitat shown in Figure 2.4-10 in the 60% BOD Report. Through coordination with the biologists (Gabriel Valdes and Melanie Day), the footprints of remediation wells, monitoring wells, piping, electrical transformers, access routes and pathways have been designed to avoid direct and indirect effects on potential desert tortoise habitat. PG&E, USFWS, and DOI continue to coordinate on the PBA for the final groundwater remedy. The goal is to complete the PBA in time for the completion of ESA Section 7 consultation prior to the approval of the Construction/Remedial Action Work Plan. Measures outlined in the forthcoming PBA and associated USFWS determination letter will be implemented before and during construction activities.	On April 1-2 and May 12-13, 2013, USFWS authorized biologist Gabriel Valdes conducted additional protocol surveys for desert tortoise in support of the design including the freshwater supply sites. Gabriel Valdes identified the potential desert tortoise habitat shown in Figure 2.4-10 in the 90% BOD Report. Through coordination with the biologists, the footprints of remediation wells, monitoring wells, piping, electrical transformers, access routes and pathways have been designed to avoid direct and indirect effects on potential desert tortoise habitat. PG&E, USFWS, BLM, and DOI coordinated on the PBA for the final groundwater remedy. This ESA Section 7 consultation was concluded with receipt of USFWS concurrency letter on July 7, 2014 which preceded the approval of the Construction/Remedial Action Work Plan. Measures outlined in the PBA and associated USFWS determination letter will be implemented before and during construction activities.	On January 29, 2015, another USFWS-approved biologist William Lee of Transcon Environmental, Inc. conducted a non-protocol survey for desert tortoise for proposed groundwater remedy activities around the Compressor Station Evaporation Ponds and access roadway. On June 24-25, 2015, in conformance with direction from DTSC, PG&E conducted biological surveys (including non-protocol surveys for desert tortoise) in an additional 35-acre area on the west side of Moabi Regional Park. Survey results were summarized in a technical memorandum titled *Assessment of Biological Resources for a 35-acre Area on the West Side of Moabi Regional Park* (CH2M HILL 2015d), which is included in Appendix A10 of this report.	The federal Endangered Species Act (ESA) Section 7 consultation on the PBA was concluded with receipt of USFWS concurrence letter on July 7, 2014 (USFWS 2014). The C/RAWP was submitted on November 18, 2015. The revised IM-3 Decommissioning Plan was included in the C/RAWP as Appendix F and as part of the CIMP in Appendix H. The *Assessment of Biological Resources for a 35-acre Area on the West Side of Moabi Regional Park: Final Groundwater Remedy, Topock Compressor Station, California* was completed on September 8, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Biological Resources	BIO-2c	**Disturbance of Special-Status Species and Loss of Habitat Caused by Decommissioning.** To avoid impacts on special-status species that may occur within the project area as a result of decommissioning activities, an avoidance and minimization plan shall be developed and implemented through consultation with CDFW, BLM, and USFWS. These measures shall be based on surveys conducted prior to decommissioning, and during the breeding season (as previously defined in this EIR for each species or suite of species). Restoration of any disturbed areas shall include measures to achieve no net loss of habitat functions and values existing before project implementation. These measures shall be achieved by developing and implementing a habitat restoration plan submitted to CDFW, BLM, and USFWS that is agreeable to these agencies. The plan shall include a revegetation seed mix or plantings design, a site grading concept plan, success criteria for restoration, a monitoring plan for achieving no net loss of habitat values and functions, and an adaptive management plan.	Avoidance and Minimization Plan	During planning of the IM-3 Decommissioning and Site Restoration Plan, an Avoidance and Minimization Plan and a Habitat Restoration Plan will be developed and implemented through consultation with CDFW, BLM, and USFWS.	The IM-3 Decommissioning Work Plan will describe the general procedures for restoration of the land and habitats. The Avoidance and Minimization Plan and Habitat Restoration Plan associated with decommissioning activities will be based on surveys conducted prior to decommissioning, and during the breeding season; therefore these Plans will be prepared in the future, prior to decommissioning (note that PG&E will prepare a separate Habitat Restoration Plan in compliance with the Consent Decree; this Plan will be developed in coordination with the USFWS Havasu National Wildlife Refuge (HNWR) Manager and submitted with the Construction/Remedial Action Work Plan).	<u>Avoidance and Minimization Associated with Decommissioning of IM-3 Facilities and Site Restoration:</u> A detailed Avoidance and Minimization Plan to minimize disturbance to special status species and their habitats associated with the decommissioning of IM-3 facilities will be developed based on surveys conducted prior to decommissioning, and during the breeding seasons closest to the start date of decommissioning; therefore, this Plan will be prepared in the future, prior to decommissioning. <u>Avoidance and Minimization Associated with Decommissioning of Remedial Facilities and Site Restoration:</u> In compliance with this mitigation measure, a detailed Avoidance and Minimization Plan to minimize disturbance to special status species and their habitats associated with decommissioning of remedial facilities will be developed based on surveys conducted prior to decommissioning, and during the breeding seasons closest to the start date of decommissioning; therefore, this Plan will be prepared in the future, prior to decommissioning. General procedures and protocols for restoring the environment to its preconstruction conditions upon decommissioning of remedial facilities were developed and are included as part of the CIMP (CUL-1a-8e). Also in compliance with the CD, a separate Habitat Restoration Plan for the Refuge was prepared and included as an appendix of the Construction/Remedial Action Work Plan.	<u>Avoidance and Minimization Associated with Decommissioning of IM-3 Facilities and Site Restoration:</u> A detailed Avoidance and Minimization Plan to minimize disturbance to special status species and their habitats associated with the decommissioning of IM-3 facilities will be developed based on surveys conducted prior to decommissioning, and during the breeding seasons closest to the start date of decommissioning; therefore, this Plan will be prepared in the future, prior to decommissioning, when the data necessary to complete the Plan can be collected. <u>Avoidance and Minimization Associated with Decommissioning of Remedial Facilities and Site Restoration:</u> In compliance with this mitigation measure, a detailed Avoidance and Minimization Plan to minimize disturbance to special status species and their habitats associated with decommissioning of remedial facilities will be developed based on surveys conducted prior to decommissioning, and during the breeding seasons closest to the start date of decommissioning; this Plan will also be prepared in the future, prior to decommissioning, when the data necessary to complete the Plan can be collected. General procedures and protocols for restoring the environment to its preconstruction conditions upon decommissioning of remedial facilities were developed and are included in the Cultural Impact Mitigation Program Section 2.5 (see also CUL-1a-8e), which is included in Appendix H of the Construction/Remedial Action Work Plan. In compliance with the CD, a separate Habitat Restoration Plan for the Refuge was prepared and included in Appendix G of the Construction/ Remedial Action Work Plan.	The CIMP and the Habitat Restoration Plan for the Refuge are included in Appendices H and G of the C/RAWP, respectively. The C/RAWP was submitted concurrently with the final design on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Biological Resources	BIO-3a	**Potential Impacts to Aquatic Habitat Related to Turbidity, Erosion, Sedimentation, and Overall Water Quality during Construction of the Intake Structure.** Hydrology & Water Quality Mitigation Measure HYDRO-1 shall be implemented in order to reduce water quality impacts related to erosion and pollutant runoff through implementation of BMPs. In addition, installing the cofferdam and dewatering a portion of the proposed intake structure site during fish screen construction may result in fish stranding. PG&E and its contractor shall coordinate with a qualified fisheries biologist to develop and implement a fish rescue plan. The fish rescue effort would be implemented during the dewatering of the area behind the cofferdam and would involve capturing those fish and returning them to suitable habitat within the river. The fish rescue plan shall identify and describe the following items: collection permits needed, fish capture zones, staffing, staging areas, fish collection and transport methods, species prioritization, resource agency contacts, fish handling protocols, fish relocation zones, site layout and progression of dewatering and fish rescue, and records and data. To ensure compliance, a fisheries biologist shall be present on-site during initial pumping (dewatering) activities and to oversee the fish rescue operation.		No further action is required. The preliminary (30%) design does not include a river water intake structure.	In response to comments on the 30% design submittals, PG&E prepared a technical memorandum to present additional details on three freshwater sources (groundwater from California, groundwater from Arizona, and Colorado River water). No further action is required. The intermediate (60%) design does not include a river water intake structure.	No further action is required. The pre-final (90%) design does not include a river water intake structure.	No further action is required. A river water intake is no longer considered as a potential source of fresh water for the remedy.	
Biological Resources	BIO-3b	**Potential Loss or Degradation of Aquatic Habitat.** To restore, replace, or rehabilitate habitat impacted by the intake structure, PG&E shall implement the measures described below. Unless as provided below, PG&E shall confer with CDFW regarding potential disturbance to fish habitat and shall obtain a streambed alteration agreement, pursuant to Section 1602 of the California Fish and Game Code, for construction work associated with intake structure construction; PG&E shall also confer with CDFW pursuant to the California Endangered Species Act (CESA) regarding potential impacts related to the loss of habitat or other operational impacts on state-listed fish species, respectively. PG&E shall comply with all requirements of the streambed alteration agreement and any CESA permits to protect fish or fish habitat or to restore, replace, or rehabilitate any important habitat on a "no-net-loss" basis. Alternatively, if CDFW declines to assert jurisdiction because it determines that CERCLA Section 121(e)(1) applies, the project proponent shall consult with CDFW regarding potential disturbance to fish habitat and shall meet the substantive policies of a streambed alteration agreement and of the CESA for construction work associated with intake structure		No further action is required. The preliminary (30%) design does not include a river water intake structure.	In response to comments on the 30% design submittals, PG&E prepared a technical memorandum to present additional details on three freshwater sources (groundwater from California, groundwater from Arizona, and Colorado River water). No further action is required. The intermediate (60%) design does not include a river water intake structure.	No further action is required. The pre-final (90%) design does not include a river water intake structure.	No further action is required. A river water intake is no longer considered as a potential source of fresh water for the remedy.	

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
		construction and operations. PG&E shall comply with all substantive requirements of the streambed alteration agreement and CESA to protect fish and fish habitat or to restore, replace, or rehabilitate any important habitat on a "no-net-loss" basis and to operate the facility in accordance with CESA to ensure no net loss of habitat function.						
Biological Resources	BIO-3b	Additionally, PG&E shall consult with USACE regarding the need to obtain permits under section 404 of the CWA and section 10 of the Rivers and Harbors Act. In conjunction with these permitting activities, the USACE must initiate consultation with USFWS under Section 7 of the federal ESA regarding potential impacts of the proposed project on federally listed fish species due to the loss of habitat on federally listed fish species. PG&E shall implement any additional measures developed through the ESA Section 7 processes, or its equivalent, to ensure "no-net loss" of habitat function. Alternatively, if USACE and/or USFWS decline to assert jurisdiction because it determines that CERCLA Section 121(e)(1) applies, PG&E shall confer with USFWS regarding potential disturbance to federally listed fish species and federally listed fish species habitat and shall meet the substantive mandates under Section 7 of the federal ESA regarding potential impacts to fish or to habitat of federally listed fish species. PG&E shall implement any additional measures developed through that processes, including compliance with the substantive requirements of all of what would be permit conditions if not exempt pursuant to CERCLA, and to ensure "no-net-loss" of habitat function. Because the type and extent of habitat potentially affected is unknown, PG&E shall have an instream habitat typing survey conducted in the area potentially affected by the intake construction. Further, cooperation with USFWS and other fisheries biologists shall determine suitable and acceptable location(s) for the intake structure(s) to avoid the spawning habitat of special-status fish species. PG&E shall avoid habitat modifications, especially to habitat that is preferred by native fishes for spawning or rearing including side channels, cobble or gravel bars, and shallow backwaters. If these habitat types cannot be avoided, any disturbed habitat will be restored or replaced to achieve "no-net-loss" of habitat types and values as described above.	Instream Habitat Typing Survey Report	No further action is required. The preliminary (30%) design does not include a river water intake structure.	In response to comments on the 30% design submittals, PG&E prepared a technical memorandum to present additional details on three freshwater sources (groundwater from California, groundwater from Arizona, and Colorado River water). As part of the preparation of the technical memorandum, an instream habitat survey was conducted on April 4, 2012 to determine the preferred locations for spawning and rearing of the razorback sucker and bonytail chub. Survey results were presented in a technical memorandum entitled *Instream Habitat Typing Survey, Topock Compressor Station, Colorado River* (CH2M HILL 2012a). The report was provided to DTSC on May 25, 2012, and is included in Appendix A6 of this BOD report.	No further action is required. The pre-final (90%) design does not include a river water intake structure.	No further action is required. A river water intake is no longer considered as a potential source of fresh water for the remedy.	The Instream Habitat Typing Survey Technical Memorandum (CH2M HILL 2012a) was completed on May 25, 2012.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Biological Resources	BIO-3c	**Potential Fish Entrainment and Impingement during Operation of the Intake Structure.** Both screened and unscreened diversions can entrain larval life stages of fish. For example, adverse effects to early life stages of fish could occur if diversions coincide with planktonic larval life stages that occur during summer months, a period of high entrainment vulnerability. Prior to operation of the intake structure, PG&E shall consult with USFWS and CDFW to determine the most vulnerable time of the year for entrainment or impingement of razorback sucker and bonytail chub eggs or larvae. PG&E shall install a state-of-the-art positive-barrier fish screen that would minimize fish entrainment and impingement at the intake structure. The fish screen shall be designed in accordance with CDFW and the National Marine Fisheries Service criteria, with specific consideration given to minimizing harm to fish eggs and other early life stages. To ensure that the fish screen operates as intended and reduce the risk of impacts, long-term monitoring of the operations and maintenance of the positive-barrier screen shall be conducted. Monitoring at the onset of diversions through the intake shall include approach velocity measurements immediately after the positive-barrier screen operations begin, with fine-tuning of velocity control baffles or other modifications as necessary, to achieve uniform velocities in conformance with the screen criteria established by regulatory agencies.		No further action is required. The preliminary (30%) design does not include a river water intake structure.	In response to comments on the 30% design submittals, PG&E prepared a technical memorandum to present additional details on three freshwater sources (groundwater from California, groundwater from Arizona, and Colorado River water). No further action is required. The intermediate (60%) design does not include a river water intake structure.	No further action is required. The pre-final (90%) design does not include a river water intake structure.	No further action is required. A river water intake is no longer considered as a potential source of fresh water for the remedy.	

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Cultural Resources	CUL-1a	**During Design, Construction, O&M, and Decommissioning Implement Measures to Avoid, Minimize, or Mitigate Impacts on Cultural Resources.** Establishment of a cultural impact mitigation program and a Corrective Measures Implementation Workplan (CMI Workplan), with specific activities stipulated for each phase of the project, will reduce the potential for impacts on historical resources within the project area, and will help preserve the values of and access to the Topock Cultural Area for local Tribal users. As detailed below, measures will be implemented to avoid known resources, re-use existing disturbed areas to the extent feasible, allow for Tribal input to the final design and maintain access for Tribal users during design, construction, operation, and decommissioning activities, as appropriate. During construction, a Worker Education Program and regular archaeological and Tribal monitoring will be implemented, and measures intended to reduce the potential for incursion by outside parties will be strengthened. This measure does not apply to the activities included as part of the East Ravine Revised Addendum, Groundwater Investigation (dated December 31, 2010).	Corrective Measure Implementation Work Plan (CMI) and Cultural Impact Mitigation Program (CIMP)	The Corrective Measure Implementation Work Plan (CMI Work Plan) was completed in November 2011. Work on the Cultural Impact Mitigation Program (CIMP) commenced in May 2011, the CIMP will be submitted with the final design (due 2012) as directed.	Work on the CIMP commenced in May 2011, and the CIMP will be submitted with the 90% design (due late 2013).	PG&E started work on the CIMP in May 2011, in coordination with Interested Tribes during face- to-face meetings or teleconference calls held once per month. On July 8, 2013, PG&E provided a preliminary draft CIMP (including the IM-3 Decommissioning Plan) to Interested Tribes. Tribes provided comments on the draft CIMP in October 2013. PG&E reviewed and discussed select comments and responses with the Tribes during the March and April 2014 Tribal Monthly Updates (TMUs). At DTSC's and Tribes' request, the CIMP (PG&E 2014) was submitted on May 1, 2014, in advance of the 90% design (see paragraph below for submittal dates related to the IM-3 Decommissioning Plan). PG&E incorporated select Tribes' comments in the May 1, 2014 CIMP, and sent Tribes a letter to explain why certain comments were not incorporated. <u>IM-3 Decommissioning Plan (Appendix B of CIMP)</u> A preliminary draft IM-3 Decommissioning Plan was submitted to the Fort Mojave Indian Tribe (FMIT) in April 2013. The FMIT provided comments on the preliminary draft Plan in June 2013. PG&E updated the draft Plan and submitted it to Interested Tribes as an appendix to the CIMP on July 8, 2013. The FMIT and the Hualapai Tribe provided comments on the updated Plan in October 2013. PG&E sent letters to respond to the Tribes' comments on July 8, 2014 and discussed the responses during the July TMU. PG&E incorporated select Tribes' comments and submitted a revised Plan with the 90% design on September 8, 2014.	Minor editorial updates (e.g., change 90% to final design) were made to the CIMP (PG&E 2015). The updated CIMP was included in Appendix H to the C/RAWP, which is submitted concurrently with the final design.	The Revised Groundwater CMI/RD Work Plan (CH2M HILL 2011a) was completed on November 2, 2011. The Cultural Impact Mitigation Program was included in Appendix H to the C/RAWP, which is submitted concurrently with the final design on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Cultural Resources	CUL-1a-1	During development of the final design and the construction, operation, and decommissioning phases of the project, PG&E shall carry out and require all subcontractors to carry out all investigative, testing, and remediation activities, including all supporting operations and maintenance activities, in ways that avoid, minimize, and mitigate significant adverse effects to historically significant cultural and historic resources, consistent with the CEQA Guidelines, and including the Topock Cultural Area, to the maximum extent feasible as determined by DTSC.	Training material for cultural resources	Implementation of this measure will be carried out in a manner that respects cultural and historic resources, to the maximum extent feasible as determined by DTSC.	PG&E remediation resources specialist Glenn Caruso participated in field reviews of planned remedial facilities with the design team on April 23-24 and June 20, 2012. The purpose of these field reviews along with in-office reviews is to ensure that the footprints of planned facilities are designed in ways that avoid, minimize, and mitigate significant adverse effects to historically significant cultural and historic resources.	PG&E Cultural Resources Expert Glenn Caruso participated in field reviews of planned remedial facilities and construction footprints with the design team on April 7-10, 2014. He also led in-office reviews of locations of planned facilities and construction footprints. The purpose of these field reviews along with in-office reviews is to ensure that the footprints of planned facilities are designed in ways that avoid, minimize, and mitigate significant adverse effects to historically significant cultural and historic resources.	PG&E Cultural Resources Expert Glenn Caruso participated in field review of planned remedial facilities and temporary construction footprints at Moabi Regional Park in late 2014 and early 2015. Glenn Caruso also led in-office review of planned facilities and temporary construction-related footprints in September 2015. The purpose of the field review along with in-office reviews is to ensure that project footprints are designed in ways to avoid and minimize impacts on cultural and historical resources, consistent with the CEQA Guidelines, to the maximum extent feasible.	
Cultural Resources	CUL-1a-2	As part of the CMI Workplan, PG&E shall develop a written access plan to preserve Tribal members' access to, and use of, the project area for religious, spiritual, or other cultural purposes. This plan will allow access to the extent PG&E has the authority to facilitate such access, and be consistent with existing laws, regulations, and agreements governing property within the project area. The access plan may place restrictions on access into certain areas, such as the Compressor Station and the existing evaporation ponds, subject to DTSC review with regard to health and safety concerns and to ensure noninterference with approved remediation activities. This access plan may be developed in coordination with the federal agencies with land management responsibilities in the project area (e.g., BLM and USFWS) in accordance with the related stipulation (General Principle I.C) contained in the Programmatic Agreement (Appendix PA). PG&E shall demonstrate a good faith effort to coordinate with Interested Tribes[1] by including communication logs as part of the CMI Workplan. [1]*"Interested Tribes" means, for purposes of this EIR and the mitigation measures contained herein, the six Tribes that have substantially participated in the various administrative processes surrounding remediation of the site with DTSC, PG&E, and DOI, including throughout development of the final remedy. Interested Tribes include the Chemehuevi Indian Tribe, Cocopah Indian Tribe, Colorado River Indian Tribes, Fort Mojave Indian Tribe, Fort Yuma-Quechan Indian Tribe, and Hualapai Indian Tribe.*	Access Plan; Communication Log with Tribes (part of the EIR mitigation measure compliance reports)	In its June 17, 2011 comment on the Draft CMI Work Plan, DTSC stated that "Although DTSC specified that the site access and security plan are to be developed as part of the CMI Work Plan, DTSC acknowledges that the full scope of the plan cannot be accomplished without completion of the design. Therefore, DTSC agrees that PG&E can provide conceptual ideas within the CMI Work Plan for the development of a detailed plan as part of the final design." At the time of this writing, PG&E has been in contact with the BLM who has responsibility for preparing the Access Plan required by the PA. BLM has indicated that they are planning to complete their Access Plan by Fall 2011. Given the majority of land within the area is federal land, PG&E is waiting for BLM to complete their Access Plan in order to avoid the potential for inconsistencies. PG&E will then prepare an Access Plans for the lands not under federal management, for submittal with the final design (target late 2012).	PG&E has initiated work on an Access Plan for the lands not under federal management, taking into consideration the information in the BLM Access Plan, for submittal with the final design (target 2013). Communication logs with Tribes are submitted to DTSC quarterly as part of the quarterly EIR mitigation measures compliance reports (see Table 6.1-2 in the 60% BOD Report)	On October 21, 2013, PG&E provided the Tribes a draft of the Access Plan for lands not under federal management for review and comment. Tribal comments were received on November 22, 2013. PG&E has updated and discussed the plan at the July 24, 2014 TMU. The Access Plan is included as an appendix of the Construction/ Remedial Action Work Plan. Communication logs with Tribes are submitted to DTSC quarterly as part of the quarterly EIR mitigation measures compliance reports (the last quarterly report was submitted on July 31, 2014; the next quarterly report is due October 31, 2014).	The Access Plan to preserve Tribal members' access to and use of the project area for religious, spiritual, and other cultural purposes is included as an appendix of the Construction/Remedial Action Work Plan, which was submitted concurrently with the final design documents. Communication logs documenting efforts to coordinate with Tribes on the Access Plan have been submitted to DTSC quarterly as part of the quarterly EIR mitigation measures compliance reports.	The Access Plan is included in Appendix P (Cultural Resources Protocols) of the Construction/ Remedial Action Work Plan, which is submitted concurrently with the final design documents on November 18, 2015. Communication logs with Tribes are submitted to DTSC quarterly as part of the quarterly EIR mitigation measures compliance reports.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Cultural Resources	CUL-1a-3	PG&E shall enhance existing measures to prevent and reduce incursions from recreational and/or other outside users from affecting unique archeological and historically significant resources, including resources within the Topock Cultural Area, by:		This mitigation measure will be met through actions taken to comply with CUL-1a-3a through 3d (see below).	This mitigation measure will be met through actions taken to comply with CUL-1a-3a through 3d (see below).	This mitigation measure will be met through actions taken to comply with CUL-1a-3a through 3d (see below).	This mitigation measure will be met through actions taken to comply with CUL-1a-3a through 3d (see below).	See CUL-1a-3a and CUL-1a-3d.
Cultural Resources	CUL-1a-3a	a. Retaining a Qualified Cultural Resource Consultant to implement the Mitigation Monitoring and Reporting Program (MMRP) and conducting yearly inspections (or less frequently upon approval by DTSC) of identified historical resources, including inspections of the Topock Cultural Area, to determine if substantial adverse changes have occurred relative to the condition of the historical resources during the past year or prior to the implementation of the proposed project. PG&E shall offer to retain a Tribal monitor at historic rates of compensation or Tribal representatives designated by the Tribal Council or chairperson, if so requested, to accompany the Qualified Cultural Resources Consultant during the inspections. The Qualified Cultural Resource Consultant shall be a person who is acceptable to DTSC and who is also a qualified archaeologist with a graduate degree in archaeology, anthropology or closely related field, plus at least 3 years of full-time professional experience in general North American archaeological research and fieldwork, with expertise/experience in the Southwest preferred.	Annual cultural resources monitoring report	PG&E has retained qualified cultural resources consultants for implementation of the MMRP, subject to DTSC's approval.	On January 27, 2012, PG&E nominated Applied Earthworks, Inc. (AE) as the qualified cultural resource consultant for the groundwater remedy project and requested DTSC's consideration and approval of AE. On March 2, 2012, DTSC accepted PG&E's nomination and approved AE as the qualified cultural resource consultant for the groundwater remedy project. In 2012, the Annual Cultural Monitoring event was conducted November 5 through 7, 2012.	The 2013 annual report titled "*Topock Compressor Station Groundwater Remediation Project: Condition Assessments at Sixty-Nine Archaeological and Historical Sites"* (AE 2014a) was submitted to DTSC on March 12, 2014. On December 2, 2014, AE as PG&E's Qualified Cultural Resource Consultant conducted archaeological and historical field surveys of the locations considered for project features in Moabi Regional Park. A brief summary of the survey results was included in Appendix A11 of the Supplemental 90%.	The 2014 annual archaeological monitoring of the identified sites within the groundwater remedy project area was conducted December 11-19, 2014. The report was submitted to DTSC on March 2, 2015 (AE 2015). On June 24-26, 2015, PG&E conducted field surveys of the additional locations considered for remedy features in Moabi Regional Park. Survey results were summarized in a technical memorandum submitted on September 2, 2015.	DTSC accepted PG&E's nomination and approved AE as the qualified cultural resource consultant for the groundwater remedy project on March 2, 2012. PG&E has offered to retain Tribal monitors at historical rates of compensation.
Cultural Resources	CUL-1a-3b	b. Developing a site security plan as part of the CMI Workplan. The site security plan shall include, but not be limited to, instructions for PG&E personnel to inspect the project site routinely during construction and report any human-caused disturbance to project facilities and the surrounding environment to DTSC and the appropriate landowner, such as BLM, USFWS, or FMIT, as appropriate, depending on the ownership of the property involved in the incursion. Notification shall be within a specified period, as established in the site security plan for the event, and shall also be summarized as part of the periodic implementation status report, as approved by DTSC for remedy implementation. This measure does not impose any obligation on PG&E to perform law-enforcement duties on federal or private lands, but is intended to provide increased observation of potential intrusions into the project area during construction and operation of the final remedy that may impact significant cultural resources. PG&E staff, or assigned agents, should be instructed to report any outside disturbance to the environment personally observed over the course of the working day. Information shall be reported within a specific	Site security plan	In its June 17, 2011 comment on the Draft CMI Work Plan, DTSC stated that "Although DTSC specified that the site access and security plan are to be developed as part of the CMI Work Plan, DTSC acknowledges that the full scope of the plan cannot be accomplished without completion of the design. Therefore, DTSC agrees that PG&E can provide conceptual ideas within the CMI Work Plan for the development of a detailed plan as part of the final design." PG&E provided concepts of security provisions in the CMI Work Plan (Section 4.2.3). PG&E will prepare a site security plan for submittals as part of the final design (target late 2012).	Work on the site security plan has begun. The site security plan is planned for submittal as part of the 90% design (target late 2013).	A site security plan titled *"Groundwater Remedial Action Site Security Plan"* is included in an appendix of the Construction/ Remedial Action *Work Plan.* Also, PG&E will summarize any reports of human-caused disturbance to project facilities and the surrounding environment in the EIR mitigation monitoring compliance reports to be prepared quarterly during construction and annually during operations.	The Site Security Plan was revised in response to comments and included as Appendix Q of the Construction/ Remedial Action Work Plan. PG&E will summarize any reports of human-caused disturbance to project facilities and the surrounding environment in the EIR mitigation monitoring compliance reports to be prepared quarterly during construction and annually during operations.	A site security plan titled *Revised Groundwater Remedial Action Site Security Plan* is included in Appendix Q of the Construction/ Remedial Action Work Plan, which is submitted concurrently with the final design on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
		period, as established in the site security plan, to DTSC and the appropriate landowners, such as BLM, USFWS, or FMIT, depending on the ownership of the property intruded upon. The site security plan may also include the use of PG&E security cameras at major ingress/egress gates into the project site. Finally, if requested by the FMIT the plan may include the use of private security personnel to patrol the FMIT-owned parcel within the project area to prevent outside incursions.						
Cultural Resources	CUL-1a-3c	c. Coordinating with BLM and San Bernardino County to facilitate an outreach effort to the staff at Moabi Regional Park, requesting that they communicate to visitors the parts of the project area that are off limits to off-road vehicle usage because of health and safety concerns, public lands management plans, or landowner requests. PG&E shall make a good faith effort to involve the surrounding Tribes in this outreach effort, providing Interested Tribes with the opportunity to comment on outreach materials or provide a Tribal cultural resources specialist the opportunity to participate in the outreach activities. As part of this outreach effort, PG&E shall work with Moabi Regional Park and offer to design, develop, and fund the installation of an informational kiosk within Moabi Regional Park that informs visitors of the work being done at the project site. PG&E shall involve the Tribes to the maximum extent feasible, as determined by DTSC, in the design and development of the informational kiosk.	Design submittals	PG&E is currently in the process of implementing this mitigation measure.	PG&E is currently in the process of implementing this mitigation measure and has discussed with Interested Tribes at the monthly meetings on November 22, 2011, December 22, 2011, January 26, 2012, and March 22, 2012. To date, Tribal inputs have been received for this measure. PG&E is coordinating with BLM and San Bernardino County on constructing an information kiosk within Moabi Regional Park and posting signage to communicate restrictions to off-road vehicle usage in part of the project area and inform visitors of the work being done at the site.	PG&E has prepared a protocol for a) outreach to Moabi Regional Park staff regarding communication to visitors about the restrictions for off-road vehicle use, and b) establishing an information kiosk. The protocol was included as an appendix of the Construction/Remedial Action Work Plan.	PG&E has prepared a protocol for outreach to Moabi Regional Park staff regarding communication to visitors about the restrictions for off-road vehicle use, and establishing an information kiosk. The protocol is included in Appendix P of the Construction/Remedial Action Work Plan, which is submitted concurrently with the final design. The protocol includes the requirement that PG&E communicate with the surrounding Tribes on the outreach materials, providing Interested Tribes the opportunity to comment on outreach materials.	A protocol was developed in compliance with this measure, and included in Appendix P of the Construction/Remedial Action Work Plan, which is submitted concurrently with the final design on November 18, 2015.
Cultural Resources	CUL-1a-3d	d. Posting signage to indicate those parts of the project area that are off limits to off-road vehicle usage due to possible health and safety concerns and to reduce potential damage to environmental resources. If agreed to by land owners and/or local, state, or federal management entities within the project area, PG&E shall work with the relevant land owner or land management entity to develop, design, and fund the installation of easily visible and clear signage. This may include coordination with BLM to install signage noting the designation of the area as an Area of Critical Environmental Concern owing to its biological and cultural resources, while ensuring that signs are placed in a way that does not draw unwanted attention to specific resources.	Design submittals	PG&E will seek to work with land owners and land management entities (BLM, the Refuge, USFWS) during the design so that the signage can be established prior to commencing construction activities; implementation of this measure may take longer, however, depending upon requirements of land owners and land management entities.	PG&E will seek to work with land owners and land management entities (BLM, the Refuge, USFWS) during the design so that the signage can be established prior to commencing construction activities; implementation of this measure may take longer, however, depending upon requirements of land owners and land management entities.	PG&E has prepared a protocol to establish signage to indicate areas that are off limits to off-road vehicle usage in coordination with BLM and other relevant landowners. The protocol was included as an appendix of the Construction/ Remedial Action Work Plan.	PG&E has prepared a protocol to establish signage to indicate areas that are off limits to off-road vehicle usage in coordination with BLM and other relevant landowners. The protocol was included in Appendix P of the Construction/Remedial Action Work Plan, which is submitted concurrently with the final design.	A protocol was developed in compliance with this measure, and included in Appendix P of the Construction/Remedial Action Work Plan is submitted concurrently with the final design on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Cultural Resources	CUL-1a-4	PG&E shall work with representative members of the Interested Tribes to convene and retain a multidisciplinary panel of independent scientific and engineering experts as part of a Technical Review Committee (TRC). The TRC shall be made up of not more than five multidisciplinary experts who will be on call to review project-related documents, participate in project-related meetings, and advise interested Tribal members on technical matters relating to the final design and remedy. The TRC shall include only persons with technical expertise, including but not limited to geology, hydrology, water quality, engineering, paleontology, toxicology, chemistry, biology, or botany. Before July 1, 2011, PG&E shall post an open grant or Request for Qualifications (RFQ) and retain members of the TRC at rates comparable to those paid historically to Tribal experts by PG&E for the remediation project. TRC members shall be selected by majority vote of one representative from each participating Interested Tribe. PG&E shall provide Interested Tribes at least 30-days' notice of the meeting to select TRC members and to review TRC candidate qualifications. For the purposes of contracting, the grant may be awarded to one Tribal government to manage or, alternatively, PG&E may reimburse the Tribe or TRC members directly. The entirety of the monies shall be used to fund the scientific and engineering team exclusively, and shall not be used to fund other Tribal government expenses or used to support legal counsel. A stipulation of the open grant shall be that the scientific and engineering team shall provide all deliverables and results to all involved Tribes, despite a possible contract agreement with only one Tribe or with PG&E. Upon conclusion of the construction phase of the project, the necessity and dollar value of the TRC shall be assessed by PG&E and, with the approval of DTSC, shall either be extended, reduced, or terminated under the operations and maintenance phase. An annual activity report shall be sent to DTSC for review and to ensure PG&E is in compliance.	EIR mitigation measures compliance reports (quarterly during design/ construction, annual during operation)	In compliance with this measure, PG&E posted a Request for Qualifications on several job boards, TRC members have been retained, and the TRC has been convened.	In March 2012, PG&E expanded the TRC scope to include review of documents related to the soil investigation at locations outside the Compressor Station. As directed by this measure, an annual activity report was submitted to DTSC on June 29, 2012. In addition, TRC activities are summarized and included in the quarterly EIR mitigation measures compliance reports.	As directed by this measure, the second annual activity report titled *"Annual Report Technical Review Committee Activities, Topock Compressor Station Groundwater Remediation Project, San Bernardino County, California"* (HDR 2013) was submitted on November 26, 2013. In addition, TRC activities are summarized and included in the quarterly EIR mitigation measures compliance reports (the last quarterly report was submitted on July 31, 2014; the next quarterly report is due October 31, 2014).	TRC activities are summarized and included in the quarterly EIR mitigation measures compliance reports. The 2014 annual TRC report was submitted in January 2015 (HDR 2015). PG&E continues to fund TRC members at rates comparable to those historically paid to Tribal experts by PG&E for the remediation project through an open grant. Upon conclusion of the construction phase of the project, the necessity and dollar value of the TRC will be assessed by PG&E and, with the approval of DTSC, shall either be extended, reduced, or terminated during the operations and maintenance phase.	The TRC was convened on July 1, 2011. The first annual activity report was submitted on June 29, 2012. The second annual activity report was submitted on November 26, 2013. The third annual activity report was submitted in January 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Cultural Resources	CUL-1a-5	Should any indigenous plants of traditional cultural significance and listed in Appendix PLA of this FEIR be identified within the project area, PG&E shall avoid, protect, and encourage the natural regeneration of the identified plants when developing the remediation design, final restoration plan, and IM-3 decommission plan. In the event that impacts on the identified plants cannot be avoided and such plants will be displaced, PG&E shall retain a qualified botanist who shall prepare a plant transplantation/monitoring plan which can be included as part of the Cultural Impact Mitigation Program (CIMP) referenced in CUL-1a-8 either by (1) transplanting such indigenous plants to an on-site location, or (2) providing a 2:1 ratio replacement to another location decided upon between PG&E and members of the Interested Tribes. Plans to transplant or replace such plants shall be approved by DTSC. In coordination with the qualified botanist, PG&E shall monitor all replanted and replacement plants for at least 5 years, and shall ensure at least a 75 percent survivorship during that time. This mitigation measure is not meant to replace or subsume any actions required by state or federal entities with regard to the protection of species listed as rare, threatened, or endangered.	Mitigation and monitoring plan for culturally sensitive plants	A floristic survey was completed on November 1 through 8, 2011 to establish a comprehensive inventory of plant species that occur in the EIR project area, identify sensitive plants species and to comply with this mitigation measure, which requires PG&E to avoid, protect, and encourage the regeneration of ethnobotanically significant plants listed in Appendix PLA of the EIR. The survey methodology is summarized in a technical memorandum entitled "*Topock Groundwater Remediation Project, Floristic Survey Methodology*" (CH2M HILL 2011c) and is included in Appendix A3 of this Basis of Design Report. Another round of floristic survey will held in the Spring 2012, however, the exact timing of the survey will be determined by a qualified botanist. A map will be prepared to document the survey results.	A continuation of the Fall 2011 floristic survey was conducted from March 12 to 20, 2012. Additional floristic survey was conducted from March 12 through 14 2013. On March 29, 2013 PG&E submitted two reports related to plant surveys: a) The first report titled "Topock Groundwater Remediation Project Floristic Survey Report" summarizes the floristic survey results from 2011 and 2012; this report is included in Appendix A5 of this BOD report. Results from 2013 are planned to be included in the next design deliverable associated with the freshwater source details. b) The second report titled "Topock Groundwater Remediation Project Ethnobotany Survey Report" summarizes the survey results for ethnobotanically sensitive plants from 2011 and 2012; this report is included in Appendix A7 of this BOD report. Results from 2013 are planned to be included in the next design deliverable associated with the freshwater source details. In addition, PG&E is working with interested Tribes on the plant transplantation/monitoring plan required under this measure, as part of the CIMP.	A Revised Floristic Survey Report (CH2M HILL 2013h) summarizing survey results from 2011 through 2013, including freshwater supply sites, was submitted on December 30, 2013. The report is also included in Appendix A5 of the 90% BOD. A Revised Ethnobotany Survey Report (CH2M HILL 2014e) summarizing survey results from 2011 through 2013 was submitted on January 15, 2014. The report is also included in Appendix A7 of the 90% BOD. The *Supplemental Ethnobotanical Plant Surveys for the Pacific Gas and Electric Company's Topock Compressor Station, San Bernardino, California* report (CH2M HILL 2014f) summarizing the December 2013 Survey results was submitted on February 28, 2014. The supplemental report is also included in Appendix A7 of the 90% BOD. In compliance with this measure, a mitigation and monitoring plan for culturally sensitive plants was prepared and included as Appendix A of the CIMP. In support of the Supplemental 90% design, PG&E conducted biological surveys of the 6.74-acre Construction Headquarters and soil management area at Moabi Regional Park on November 19, 2014 to identify existing mature plant specimens and indigenous plants of traditional cultural significance. The survey results were summarized in a technical memorandum titled *Assessment of Biological Resources for the Proposed Soil Management Areas* (CH2M HILL 2015b); this memorandum provides general information of the flora and fauna observed in the areas added to the original project area, and also supplements information on the biological resources presented in prior project documents related to mature vegetation, ethnobotanical plants, and jurisdictional wetlands and waters. The technical	On January 30, 2015, PG&E conducted biological surveys (including indigenous plants of traditional cultural significance) of the area proposed for remedy use at Moabi Regional Park. On June 24-25, 2015, in conformance with direction from DTSC, PG&E conducted biological surveys (including indigenous plants of traditional cultural significance) of an additional 35-acre area on the west side of Moabi Regional Park. The survey results were summarized in a technical memorandum titled *Assessment of Biological Resources for a 35-acre Area on the West Side of Moabi Regional Park* (CH2M HILL 2015d). This memorandum provides updates to the January 2015 memorandum as well as information on the natural resources observed within the larger 35-acre area, and is also included in Appendix A10 of this report. In addition, a technical memorandum titled *Assessment of Biological Resources for the Proposed Sewer and Firewater Lines for the Construction Headquarters, Final Groundwater Remedy, Topock Compressor Station, California* (CH2M HILL 2015c) was prepared to provide a general assessment of biological and cultural resources (including indigenous plants of traditional cultural significance) that could be affected by the proposed sewer and fire water lines that may be installed in the future and are associated with the construction headquarters facilities that would be located to the west of Moabi Regional Park, south of the National Trails Highway. The memo was completed on August 5, 2015 and submitted for review during the 90% RTC process and is included in Appendix A10 of this report. The Preliminary Assessment of Proposed Mitigation Planting Areas for Final Groundwater Remedy Impacts, Topock Compressor Station, California was revised to incorporate	The survey methodology technical memorandum was completed on October 31, 2011, and provided to Interested Tribes on November 8, 2011. The revised Final Floristic Survey Report was completed on December 30, 2013. The revised Final Ethnobotany Survey Report was completed on January 15, 2014. A supplemental report was completed on February 28, 2014. A mitigation and monitoring plan for culturally sensitive plants was prepared and included as Appendix A of the CIMP. The Assessment of Biological Resources for the Proposed Soil Management Areas was completed on January 19, 2015, and submitted with the Supplemental 90% on February 5, 2015. The *Assessment of Biological Resources for the Proposed Sewer and Firewater Lines for the Construction Headquarters, Final Groundwater Remedy, Topock Compressor Station, California* was completed on August 5, 2015 and submitted for review during the 90% RTC process. The *Assessment of Biological Resources for a 35-acre Area on the West Side of Moabi Regional Park: Final Groundwater Remedy, Topock Compressor Station, California* was completed on September 8, 2015. The revised *Preliminary Assessment of Proposed Mitigation Planting Areas for Final Groundwater Remedy Impacts, Topock Compressor Station, California* (CH2M HILL 2015c) was submitted with the Construction/ Remedial Action Work Plan on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
						memorandum was included in Appendix A10 of the Supplemental 90%. A technical memorandum titled *Preliminary Assessment of Proposed Mitigation Planting Areas for Final Groundwater Remedy Impacts, Topock Compressor Station, California* (CH2M HILL 2015e) identifies potential revegetation areas where mitigation vegetation could be planted to offset potential plant impacts that may occur during construction of the remedy. The memo was completed on January 27, 2015 and included in Appendix V of the Supplemental 90% for review and comment.	review comments, and was submitted with the Construction/Remedial Action Work Plan concurrently with the final design.	
Cultural Resources	CUL-1a-6	All additional phone calls and alarms associated with remediation activities or facilities shall not be routed through PG&E's existing alarm system utilized at the compressor station. The notification system for remediation-related alerts and/or phone calls shall not introduce additional noise to the project area, to the maximum extent feasible, provided there is ongoing compliance with applicable safety regulations or standards of the Federal Energy Regulatory Commission, Occupational Safety and Health Administration, and other agencies. (See Mitigation Measure NOISE-3 for additional mitigation related to the Topock Cultural Area).	Design submittals	The requirement of this mitigation measure has been incorporated into the design criteria as presented in Appendix C of this Basis of Design Report for the preliminary design. In addition, the detailed specification for phone calls and alarms associated with remediation activities will also be included the intermediate (60%) design.	The requirement of this mitigation measure has been incorporated into the design criteria as presented in Appendix C of the BOD Report for the intermediate (60%) design.	The requirement of this mitigation measure has been incorporated into the design criteria as presented in Appendix C of the BOD Report for the pre-final (90%) design.	The requirement of this mitigation measure has been incorporated into the design criteria as presented in Appendix C of this Final BOD Report for the final design.	The requirement of this mitigation measure has been incorporated into the design criteria as presented in Appendix C of the BOD Report for the final design, submitted on November 18, 2015.
Cultural Resources	CUL-1a-7	Nighttime construction-related activities shall be limited to work that cannot be disrupted or suspended until the following day, such as, but not limited to, well drilling and development or decommissioning activities. Lighting considerations, including the potential use of solar power for some lighting, shall be included as part of the remedial design plan to be developed with involvement of Interested Tribes and the U.S. Department of the Interior. To minimize construction and operations-related lighting impacts, the lighting in the remedial design plan shall include, at a minimum: (1) shrouding/shielding for portable lights needed during construction and operational activities; (2) installation of portable lights at the lowest allowable height and in the smallest number feasible to maintain adequate night lighting for safety; (3) shielding and orientation of lights such that off-site visibility of light sources, glare, and light from construction activities is minimized to the extent feasible. No additional permanent poles shall be installed for lighting. This mitigation measure is not	Design submittals	The requirement of this mitigation measure has been incorporated into the design criteria as presented in Appendix C of this Basis of Design Report for the preliminary design (see C.5.2). In addition, the detailed specification for lighting will also be included the intermediate (60%) design.	The requirement of this mitigation measure has been incorporated into the design criteria as presented in Appendix C of the BOD Report for the intermediate (60%) design. PG&E discussed this measure with interested Tribes in the monthly meetings on April 26, 2012, July 27, 2012, October 25, 2012, and November 9, 2012.	The requirement of this mitigation measure has been incorporated into the design criteria as presented in Appendix C of the BOD Report for the pre-final (90%) design.	The requirement of this mitigation measure has been incorporated into the design criteria as presented in Appendix C of this BOD Report for the final design.	The requirements of this mitigation measure were incorporated into the design criteria in Appendix C of the final design, submitted on November 18, 2015. The protocol for implementing CUL-1a-7 was included in Appendix P of the C/RAWP, which was submitted on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
		meant to replace or subsume any actions required by the County or state or federal entities with regard to lighting required for minimum security and safety purposes.						
Cultural Resources	CUL-1a-8	Prior to commencement of construction, PG&E shall submit as part of the final Remedial Design, a CIMP developed in coordination with Interested Tribes for DTSC's review and approval. The CIMP may be developed in coordination with the federal agencies with land management responsibilities in the project area (e.g., BLM and USFWS) in accordance with the Programmatic Agreement (Appendix PA). The CIMP shall include, at a minimum and to DTSC's satisfaction, the following:	CIMP	Work on the CIMP commenced in May 2011. The CIMP will be submitted as part of final design as directed.	Work on the CIMP is ongoing. PG&E has been working collaboratively with interested Tribes on various sub-measures under the CIMP. A draft CIMP will be provided to interested Tribes for review prior to submittal to DTSC for review and approval.	PG&E started work on the CIMP in May 2011, in coordination with Interested Tribes during face- to-face meetings or teleconference calls held once per month. On July 8, 2013, PG&E provided a preliminary draft CIMP (including the IM-3 Decommissioning Plan) to Interested Tribes. Tribes provided comments on the draft CIMP in October 2013. PG&E reviewed and discussed select comments and responses with the Tribes during the March and April 2014 TMUs. At DTSC's and Tribes' request, the CIMP (PG&E 2014) was submitted on May 1, 2014, in advance of the 90% design (see paragraph below for submittal dates related to the IM-3 Decommissioning Plan). PG&E incorporated select Tribes' comments in the May 1, 2014 CIMP, and sent Tribes a letter to explain why certain comments were not incorporated. <u>IM-3 Decommissioning Plan (Appendix B of CIMP)</u> A preliminary draft IM-3 Decommissioning Plan was submitted to the FMIT in April 2013. The FMIT provided comments on the preliminary draft Plan in June 2013. PG&E updated the draft Plan and submitted to Interested Tribes as an appendix to the CIMP on July 8, 2013. The FMIT and the Hualapai Tribe provided comments on the updated Plan in October 2013. PG&E sent letters to respond to the Tribes' comments on July 1 and discussed the responses during the July TMU. PG&E incorporated select Tribes' comments and submitted a revised Plan with the 90% design on September 8, 2014.	Minor editorial updates (e.g., change 90% to final design) were made to the CIMP (PG&E 2015). The updated CIMP was included in Appendix H to the C/RAWP, which is submitted concurrently with the final design.	The Cultural Impact Mitigation Program was included in Appendix H to the C/RAWP, which was submitted concurrently with the final design on November 18, 2015.
Cultural Resources	CUL-1a-8a	a. Protocols for continued communication. Consistent with past practice and the communication processes previously entered into by PG&E with Interested Tribes, the company shall	EIR mitigation measures compliance reports (quarterly during design/	Outreach efforts have been and are ongoing. 		continue to communicate with Interested Tribes during the design, construction, operation, and decommissioning of the project. Prior to implementation of construction, PG&E shall communicate with Interested Tribes that place cultural significance on the Topock Cultural Area. Outreach efforts between the Tribes and PG&E shall be communicated by PG&E to DTSC quarterly during the design and construction phase for review and input, and annually during project operations.	construction, annual during project operation)	specified time period. With the completion of the CMI Work Plan in November 2011, PG&E will start to submit quarterly reports to DTSC, starting with the first report (Q4 2011) in January 2012.	discussed with interested Tribes at the monthly meeting on May 24, 2012 and December 4, 2012. As required by DTSC, a log of communications with interested Tribes has been maintained and included in the quarterly EIR mitigation measure compliance reports since January 2012. The last quarterly report was submitted to DTSC on January 31, 2013. Table 6.1-2 of the 60% BOD Report contains a log of Tribal communications since the start of Q1 2013 through March 19, 2013.	communication were developed and included as part of the CIMP. As required by DTSC, a log of communications with interested Tribes has been maintained and included in the quarterly EIR mitigation measure compliance reports since January 2012. The last quarterly report was submitted on July 31, 2014; the next quarterly report is due October 31, 2014.	developed and included as part of the CIMP. As required by DTSC, a log of communications with interested Tribes has been maintained and included in the quarterly EIR mitigation measure compliance reports since January 2012. The last quarterly report was submitted on October 31, 2015; the next quarterly report is due January 31, 2016.	and included as part of the CIMP, included as Appendix H of the C/RAWP submitted on November 18, 2015. As required by DTSC, a log of communications with interested Tribes has been maintained and included in the quarterly EIR mitigation measure compliance reports since January 2012.
Cultural Resources	CUL-1a-8b	b. Protocols for the appropriate treatment of archaeological materials that may be disturbed or discovered during implementation of the final remedy, including protocols for the repatriation of significant items of cultural patrimony that may be recovered during the project, and protocols for the curation of cultural materials recovered during the project. Treatment of archaeological sites may include data recovery or capping. If data recovery is proposed, a Research Design following California Office of Historic Preservation guidelines or federal guidelines, as applicable, shall be prepared and reviewed and approved by DTSC.	CIMP	The required protocols will be developed and included in the CIMP. The CIMP will be submitted with the final design as directed.	Work on the CIMP is ongoing. The CIMP outline was discussed with interested Tribes on March 23 2012. PG&E has and will continue to discuss with and solicit inputs from interested Tribes on various mitigation measures under the CIMP. This measure was discussed with interested Tribes at the monthly meeting on June 28, 2012 and December 4, 2012. A draft CIMP will be provided to interested Tribes for review prior to submittal to DTSC for review and approval.	Protocols for the appropriate treatment of archaeological materials that may be disturbed or discovered during implementation of the final remedy were developed and included as part of the CIMP.	Protocols for the appropriate treatment of archaeological materials that may be disturbed or discovered during implementation of the final remedy were developed and included as part of the CIMP.	Protocols were included as part of the CIMP and submitted on November 18, 2015.
Cultural Resources	CUL-1a-8c	c. Protocols for the review of cultural resource-related documents throughout the design, construction, and operational phases.	CIMP	Draft protocols for review of cultural resource-related documents were included in the CMI Work Plan (Section 4.8), and will also be included in the CIMP. The CIMP will be submitted with the final design as directed.	Work on the CIMP is ongoing. The CIMP outline was discussed with interested Tribes on March 23 2012. PG&E has and will continue to discuss with and solicit inputs from interested Tribes on various mitigation measures under the CIMP. This measure was discussed with interested Tribes at the monthly meeting on June 28, 2012, August 23, 2012, September 19, 2012, September 27, 2012, and January 15, 2013. A draft CIMP will be provided to interested Tribes for review prior to submittal to DTSC for review and approval.	Protocols for the review of cultural resource-related documents throughout the design, construction, and operational phases were developed and included as part of the CIMP.	Protocols for the review of cultural resource-related documents throughout the design, construction, and operational phases were developed and included as part of the CIMP.	Protocols were included as part of the CIMP and submitted on November 18, 2015.

Cultural Resources	CUL-1a-8d	d. Protocols for the review of project design documents before the beginning of construction, including reviews of project design documents throughout the design process (e.g., Preliminary [approximately 30% completed], Intermediate [approximately 60% completed] and Pre-final design).	CIMP	Draft protocols for review of project design documents were included in the CMI Work Plan (Section 4.8), and will also be included in the CIMP. The CIMP will be submitted with the final design as directed.	Work on the CIMP is ongoing. The CIMP outline was discussed with interested Tribes on March 23 2012. PG&E has and will continue to discuss with and solicit inputs from interested Tribes on various mitigation measures under the CIMP. This measure was discussed with interested Tribes at the monthly meetings on February 23, 2012, March 22, 2012, April 26, 2012, May 24, 2012, and January 15, 2013. A draft CIMP will be provided to interested Tribes for review prior to submittal to DTSC for review and approval.	Protocols for the review of project design documents were developed and included as part of the CIMP.	Protocols for the review of project design documents were developed and included as part of the CIMP.	Protocols were included as part of the CIMP and submitted on November 18, 2015.
Cultural Resources	CUL-1a-8e	e. Protocols for the appropriate methods to be used to restore the environment to its preconstruction condition upon decommissioning of individual groundwater remedy facilities.	CIMP	The required protocols will be developed and included in the CIMP. The CIMP will be submitted with the final design as directed.	Work on the CIMP is ongoing. The CIMP outline was discussed with interested Tribes on March 23 2012. PG&E has and will continue to discuss with and solicit inputs from interested Tribes on various mitigation measures under the CIMP. This measure was discussed with Interested Tribes at the monthly meeting on January 15, 2013. A draft CIMP will be provided to interested Tribes for review prior to submittal to DTSC for review and approval.	Protocols for the appropriate methods to be used to restore the environment to its preconstruction condition upon decommissioning of individual groundwater remedy facilities were developed and included as part of the CIMP.	Protocols for the appropriate methods to be used to restore the environment to its preconstruction condition upon decommissioning of individual groundwater remedy facilities were developed and included as part of the CIMP.	Protocols were included as part of the CIMP and submitted on November 18, 2015.
Cultural Resources	CUL-1a-8f	f. A plan for the decommissioning and removal of the IM-3 Facility and proposed restoration of the site (to be an appendix to the CIMP).	Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration	The plan for the decommissioning and removal of the IM-3 Facility and Site Restoration will be included as an appendix to the CIMP. The CIMP will be submitted with the final design as directed.	Work on the CIMP is ongoing. The CIMP outline was discussed with interested Tribes on March 23 2012. PG&E has and will continue to discuss with and solicit inputs from interested Tribes on various mitigation measures under the CIMP. A draft CIMP will be provided to interested Tribes for review prior to submittal to DTSC for review and approval.	The plan for the decommissioning and removal of the IM-3 Facility and site restoration was developed and included in Appendix B of the CIMP and also as an appendix of the Construction/Remedial Action Work Plan.	The plan for the decommissioning and removal of the IM-3 Facility and site restoration was revised to incorporate comments. The revised plan is included in Appendix B of the CIMP and also as an appendix of the Construction/Remedial Action Work Plan.	The revised IM-3 Decommissioning Plan was submitted as Appendix B of the CIMP, and submitted as Appendix F of the C/RAWP on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Cultural Resources	CUL-1a-8g	g. Protocols for the repatriation of clean soil cuttings generated during construction activities and during drilling associated with repair/replacement activities during operations and maintenance phases. The soil cuttings shall be managed in compliance with applicable laws and regulations on site.	CIMP	Discussions regarding repatriation of soils have been and are ongoing since early 2011. The required protocols will be developed and included in the CIMP. The CIMP will be submitted with the final design as directed.	Discussions regarding protocols for the repatriation of soils have been and are ongoing since early 2011. Agencies and Tribal members reviewed and provided inputs on the draft *Management Protocol for Handling and Disposition of Displaced Site Material*, as well as participated in conference calls (January 9, 2012, April 10, 2012, June 15, 2012, and August 2012) to discuss comments. A revised protocol along with responses to comments (RTCs) was sent to Agencies and Tribes for review on August 28, 2012. FMIT sent a comment letter on the revised protocol and RTCs on September 7, 2012. DTSC responded to FMIT on September 18, 2012. Tribes and Agencies met on October 16, 2012 to further discuss RTC process. Subsequent to this meeting, DTSC issued directives for implementation of an updated RTC process. On January 14, 2013, the revised protocol was reissued along with updated RTCs (that reflected the updated RTC process) as part of the Final Soil RCRA Facility Investigation/Remedial Investigation Work Plan (CH2M HILL 2013b). The revised protocol is also included in Appendix B of the Soil Management Plan (Volume 4 of the Draft O&M Manual), and will again be included in the CIMP. A draft CIMP will be provided to interested Tribes for review prior to submittal to DTSC for review and approval.	The revised *Management Protocol for Handling and Disposition of Displaced Site Material* was included in Appendix C of the CIMP, Appendix B of the Soil Management Plan (Volume 4 of the Revised O&M Manual), and also as an appendix of the Construction/Remedial Action Work Plan. Detailed procedures to implement the management protocol are included in the Soil Management Plan.	The revised *Management Protocol for Handling and Disposition of Displaced Site Material* (PG&E 2015b), which is the protocol for the repatriation of clean soils cuttings generated during construction and O&M, was revised in response to 90% comment #803. A draft redline of the protocol was provided for discussion during the 90% RTC process at the July 23, August 19, and August 26, 2015 Technical Working Group (TWG) meetings. The revised protocol is included in Appendix C of the CIMP, Appendix B of the Soil Management Plan (Volume 4 of the Revised O&M Manual), and also as an appendix of the Construction/Remedial Action Work Plan. Detailed procedures to implement the management protocol are included in the Soil Management Plan.	The revised protocol was included as part of the CIMP and submitted on November 18, 2015.

Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Cultural Resources	CUL-1a-8h	h. Protocols for the appropriate methods, consistent with Mitigation Measure NOISE-3, to reduce auditory impacts.	CIMP	The required protocols will be developed and included in the CIMP. The CIMP will be submitted with the final design as directed.	Work on the CIMP is ongoing. The CIMP outline was discussed with interested Tribes on March 23 2012. PG&E has and will continue to discuss with and solicit inputs from interested Tribes on various mitigation measures under the CIMP. A draft CIMP will be provided to interested Tribes for review prior to submittal to DTSC for review and approval. This measure was discussed with interested Tribes at the monthly meeting on February 19, 2013.	Protocols for the appropriate methods, consistent with Mitigation Measure NOISE-3, to reduce auditory impacts, were developed and included as part of the CIMP.	Protocols for the appropriate methods, consistent with Mitigation Measure NOISE-3, to reduce auditory impacts, were developed and included as part of the CIMP. Specifically, the following communication protocols developed as part of the CIMP noise protocol (Section 2.8.4) will be implemented. All project construction activities will be communicated to nearby noise-sensitive receptors and Interested Tribes. Elements of this communication include: • A detailed project schedule is established and published for all stakeholders. • Monthly notification to agencies and Tribes of scheduled field activities. During periods of extensive construction activity, these notifications will be issued more frequently – weekly and/or daily, as appropriate. • After issuing these notifications, notify the nearby noise-sensitive receptors and Tribes of any schedule changes. • Provide an open-communication process for Tribal representatives to seek more information about Project noise-generating activities. PG&E welcomes Tribal input on timing of Project noise-generating activities and on potential noise-reducing methods. Per CUL-1a-8k, if ceremonies are requested by any Tribe during construction, then PG&E will follow the protocol to accommodate such requests, which could include monitoring to ensure that construction noise does not exceed the normally acceptable exterior noise level standard in San Bernardino County for places of worship. • The contact information for the disturbance coordinator will be posted in a conspicuous location near the construction areas. This information will also be mailed to	Protocols were included as part of the CIMP and submitted on November 18, 2015.

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Cultural Resources	CUL-1a-8k	k. Protocols to be followed by project personnel to accommodate, if feasible as determined by DTSC, key Tribal ceremonies that involve the Topock Cultural Area.	CIMP	Project personnel will accommodate, if feasible as determined by DTSC, key Tribal ceremonies that involve the Topock Cultural Area, provided that such Tribal ceremonies may not interfere with the expeditious implementation of the remedy or create health and safety concerns. This protocol will be included in the CIMP. The CIMP will be submitted with the final design as directed.	Work on the CIMP is ongoing. The CIMP outline was discussed with interested Tribes on March 23 2012. PG&E has and will continue to discuss with and solicit inputs from interested Tribes on various mitigation measures under the CIMP. This measure was discussed with interested Tribes at the monthly meeting on May 24, 2012, September 27, 2012, October 10, 2012, November 9, 2012, and February 19, 2013. A draft CIMP will be provided to interested Tribes for review prior to submittal to DTSC for review and approval.	Protocols to be followed by project personnel to accommodate key Tribal ceremonies that involve the Topock Cultural Area were developed and included as part of the CIMP.	Protocols to be followed by project personnel to accommodate key Tribal ceremonies that involve the Topock Cultural Area were developed and included as part of the CIMP.	Protocols were included as part of the CIMP and submitted on November 18, 2015.
Cultural Resources	CUL-1a-8l	l. Provisions affording sufficient Tribal monitors to observe ground-disturbing activities and/or other scientific surveying (e.g., biological surveys) that may occur in preparation for construction activities. Ground-disturbing activities include trenching, excavation, grading, well excavation/drilling, decommissioning of the IM-3 Facility and subsurface pipeline, or other construction-related activities.	CIMP	Tribal monitors will be invited to observe ground-disturbing activities. This provision will be included in the CIMP. The CIMP will be submitted with the final design as directed.	Work on the CIMP is ongoing. The CIMP outline was discussed with interested Tribes on March 23 2012. PG&E has and will continue to discuss with and solicit inputs from interested Tribes on various mitigation measures under the CIMP. This measure was discussed with interested Tribes at the monthly meeting on May 24, 2012, December 18, 2012, and February 19, 2013. A draft CIMP will be provided to interested Tribes for review prior to submittal to DTSC for review and approval.	Protocols for Tribal monitors to observe ground- disturbing activities were developed and included as part of the CIMP.	Protocols for affording sufficient Tribal monitors to observe ground-disturbing activities and/or other scientific surveying done in preparation of construction were developed and included as part of the CIMP.	Protocols were included as part of the CIMP and submitted on November 18, 2015.
Cultural Resources	CUL-1a-8m	m. Provisions of reasonable compensation for Tribal monitors consistent with historical rates.	CIMP	Tribal monitors will receive reasonable compensation consistent with agreed upon historical rates. This provision will be included in the CIMP. The CIMP will be submitted with the final design as directed.	Work on the CIMP is ongoing. The CIMP outline was discussed with interested Tribes on March 23 2012. PG&E has and will continue to discuss with and solicit inputs from interested Tribes on various mitigation measures under the CIMP. This measure was discussed with interested Tribes at the monthly meeting on May 24, 2012, December 18, 2012, and March 19, 2013. A draft CIMP will be provided to interested Tribes for review prior to submittal to DTSC for review and approval.	Provisions required in this mitigation measure were developed and included as part of the CIMP.	Provisions for reasonable compensation for Tribal monitors consistent with historical rates were developed and included as part of the CIMP.	Protocols were included as part of the CIMP and submitted on November 18, 2015.

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Cultural Resources	CUL-1a-8n	n. Locations requiring specific protective devices, such as temporary fencing, flagging, or other type of demarcation during construction.	CIMP	Locations requiring specific protective devices, such as temporary fencing, flagging, or other type of demarcation during construction will be included in the CIMP.	Work on the CIMP is ongoing. The CIMP outline was discussed with interested Tribes on March 23 2012. PG&E has and will continue to discuss with and solicit inputs from interested Tribes on various mitigation measures under the CIMP. This measure was discussed with interested Tribes at the monthly meeting on April 26, 2012, August 23, 2012, September 19, 2012, and March 19, 2013. A draft CIMP will be provided to interested Tribes for review prior to submittal to DTSC for review and approval.	Protocols for protective measures for archaeological/historical sites during construction were developed and included as part of the CIMP.	Protocols for determining the locations requiring specific protective devices for protection of cultural resources during construction and protocols for the protective measures were developed and included as part of the CIMP.	Protocols were included as part of the CIMP and submitted on November 18, 2015.
Cultural Resources	CUL-1a-8o	o. Protocols for the reporting of discoveries of cultural importance consistent with existing statutes and regulations.	CIMP	The required protocols will be developed and included in the CIMP. The CIMP will be submitted with the final design as directed.	Work on the CIMP is ongoing. The CIMP outline was discussed with interested Tribes on March 23 2012. PG&E has and will continue to discuss with and solicit inputs from interested Tribes on various mitigation measures under the CIMP. This measure was discussed with interested Tribes at the monthly meeting on June 28, 2012, September 27, 2012, October 10, 2012, and November 9, 2012. A draft CIMP will be provided to interested Tribes for review prior to submittal to DTSC for review and approval.	Protocols for the reporting of discoveries of cultural importance were developed and included as part of the CIMP.	Protocols for the reporting of discoveries of cultural importance were developed and included as part of the CIMP.	Protocols were included as part of the CIMP and submitted on November 18, 2015.
Cultural Resources	CUL-1a-8p	p. Protocols for the inspection of remediation facilities and/or staging areas throughout the construction phase.	CIMP	The required protocols will be developed and included in the CIMP. The CIMP will be submitted with the final design as directed.	Work on the CIMP is ongoing. The CIMP outline was discussed with interested Tribes on March 23 2012. PG&E has and will continue to discuss with and solicit inputs from interested Tribes on various mitigation measures under the CIMP. This measure was discussed with interested Tribes at the monthly meeting on June 28, 2012 and December 4, 2012. A draft CIMP will be provided to interested Tribes for review prior to submittal to DTSC for review and approval.	Protocols for the inspection of remediation facilities and/or staging areas during construction were developed and included as part of the CIMP.	Protocols for the inspection of remediation facilities and/or staging areas during construction were developed and included as part of the CIMP.	Protocols were included as part of the CIMP and submitted on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Cultural Resources	CUL-1a-9	During selection of the design and specific locations for physical remediation facilities, PG&E shall, in communication with the Interested Tribes (and subject to their review), and to the maximum extent feasible, as determined by DTSC, give: (1) priority to previously disturbed areas for the placement of new physical improvements; and (2) priority to re-use of existing physical improvements, such as but not limited to wells and pipelines, but not including IM-3 facilities. "Disturbed" areas in this context means those areas outside of documented archaeological site boundaries that have experienced ground disturbance in the last 50 years. PG&E shall produce an aerial map of these disturbed areas to guide project design, and PG&E shall make a good faith effort to provide Tribes with an opportunity to review and comment on the information displayed on the map in determining "disturbed" areas.	Aerial map of disturbed areas	As directed, PG&E prepared an aerial map of disturbed areas to guide project design and made a good faith effort to provide Tribes with an opportunity to review and comment. PG&E provided the disturbed areas map to Interested Tribes for review and comment on May 26, 2011. Written comments on the map were received from the FMIT on July 5, 2011 and the Hualapai Tribe on July 1, 2011. PG&E responded to the Hualapai and the FMIT in July 2011 with an invitation to a site walk for discussion of the comments and ground-truth the map. To date, three Tribes have attended site walks/onsite meetings to discuss the map -- the site walk/meeting with the Colorado River Indian Tribes (CRIT) occurred on June 7, 2011, the site walk/meeting with the FMIT occurred on October 4, 2011, and the site walk/meeting with the Hualapai Tribe occurred on October 26, 2011. Additional discussions regarding the aerial map are planned. A current version of the aerial map is included in Appendix A2 of this Basis of Design Report. In compliance with the directive to give priority to re-use of existing physical improvements and to previously disturbed areas for new physical improvements, the preliminary (30%) design proposes the following: • The freshwater supply for the remedy will be the existing HNWR-1 well. If needed, this water supply can be supplemented by the current Compressor Station water supply (by existing Topock-2 and Topock-3 wells in Arizona). • The freshwater supply storage will be the existing water storage tanks at the Compressor Station. • The remedy-produced water treatment plant will be located	The design has been and is carried out in a manner that gives: (1) priority to previously disturbed areas for the placement of new physical improvements; and (2) priority to re-use of existing physical improvements, including but not limited to wells and pipelines, but not including IM-3 facilities. In compliance with the directive to give priority to re-use of existing physical improvements and to previously disturbed areas for new physical improvements, the intermediate (60%) design proposes the following: • All existing monitoring wells have been incorporated into the monitoring well network for the remedy, thereby reducing the need for drilling new monitoring wells. • The freshwater supply for the remedy will be the existing HNWR-1 well. • The freshwater supply storage will be the existing water storage tanks at the Compressor Station. • The remedy-produced water treatment plant and the freshwater pre-injection treatment system will be located entirely within the footprint of Compressor Station. • The central maintenance facility for the remedy will be located entirely on PG&E property, at the Transwestern Bench. By centralizing maintenance functions into one location, this reduces the footprint of remedy structure outside of PG&E property.	The aerial map of disturbed areas was updated to include areas with planned facilities associated with freshwater supply in Arizona, and areas west of Moabi Regional Park associated with soil storage. The updated map is included in Appendix A2 of the 90% BOD Report. In compliance with the directive to give priority to re-use of existing physical improvements and to previously disturbed areas for new physical improvements, the pre-final (90%) design proposes the following: • All existing monitoring wells have been incorporated into the monitoring well network for the remedy, thereby reducing the need for drilling new monitoring wells. • The piping corridor is located almost entirely in existing roadways, right- of- ways and previously disturbed areas. • Most of the existing access roads have been incorporated into the 90% design. • The remedy-produced water conditioning plant and the contingent systems (arsenic treatment and dissolved metals removal) are located entirely within the footprint of the Compressor Station. • The operation building and carbon storage/amendment facilities are located on the existing Transwestern Bench and MW-20 Bench. • All of the proposed soil storage and construction staging areas are located on previously disturbed areas. • The main construction headquarters and staging area is located on previously disturbed areas at Moabi Regional Park.	The aerial map of disturbed areas was updated to include areas with planned facilities associated with freshwater supply in Arizona, and areas west of Moabi Regional Park associated with soil storage. The updated map is included in Appendix A2 of this report. In compliance with the directive to give priority to re-use existing physical improvements and to use previously disturbed areas for new physical improvements to the maximum extent feasible as determined by DTSC, the final design proposes the following: • Incorporating all existing monitoring wells into the monitoring well network for the remedy, thereby reducing the need for drilling new monitoring wells. • Locating the piping corridor almost entirely in existing roadways, right-of-ways and previously disturbed areas. • Incorporating most of the existing access routes into the design. • Locating the remedy-produced water conditioning plant and the contingent systems (arsenic treatment and dissolved metals removal) entirely within the footprint of the Compressor Station. • Locating the operation building on the existing Transwestern Bench. • Locating the consolidated carbon storage/amendment facilities on the MW-20 Bench. • Locating all of the proposed soil processing and construction staging areas on previously disturbed areas. • Locating the main construction headquarters and staging area on previously disturbed areas (at Moabi Regional Park). In compliance with this measure, PG&E communicated with the Interested Tribes regarding designing the remedy in a manner that located infrastructure in previously disturbed	A current version of the aerial map of disturbed areas was submitted on November 18, 2011. An update of the aerial map of disturbed areas is included in Appendix A2 of this Final BOD Report.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
				entirely within the footprint of Compressor Station and much of it will replace existing structures within the maintenance shop area.			areas and reused existing physical improvements, including providing the 30%, 60%, and 90% design documents to the Interested Tribes for their review and comment.	
Cultural Resources	CUL-1a-10	PG&E shall consider the location of Loci A, B, and C of the Topock Maze during the design and approval of the physical facilities necessary for the final remedy and is prohibited from creating any direct physical impact on the Topock Maze, as it is manifested archaeologically. Through the design, PG&E shall prevent all indirect (e.g. noise, aesthetics) impacts on the Topock Maze, to the maximum extent feasible as determined by DTSC.	Design submittals	The design has been and is carried out in a manner that excluded direct impacts on Loci A, B, and C of the Topock Maze. Prevention of indirect impacts to the Maze will be incorporated into the design to the maximum extent feasible as determined by DTSC.	The design has been and is carried out in a manner that avoids any direct impacts on Loci A, B, and C of the Topock Maze. PG&E Remediation Resources Specialist Glenn Caruso participated in field reviews of planned remedial facilities with the design team on April 23-24 and June 20, 2012. The purpose of these field reviews along with in-office reviews is to ensure that the footprints of planned facilities do not create direct physical impact on the Topock Maze, as it is manifested archaeologically. There are no remedy facilities inside the Topock Maze. Prevention of indirect impacts to the Maze will be incorporated into the design to the maximum extent feasible as determined by DTSC.	The design was carried out in a manner that avoids any direct impacts on Loci A, B, and C of the Topock Maze. PG&E Cultural Resources Expert Glenn Caruso participated in field review of planned remedial facilities and temporary construction footprints with the design team on April 7-10, 2014. Glenn Caruso also led in-office reviews of planned facilities and temporary construction-related footprints. The purpose of the field review along with in-office reviews is to ensure that project footprints do not create direct physical impact on the Topock Maze, as it is manifested archaeologically. There are no remedy facilities inside the Topock Maze. Prevention of indirect impacts (e.g., noise, aesthetics) to the Maze has been incorporated into the design as follows: <u>Noise/Vibration</u> a) In compliance with EIR mitigation measure NOISE-1a, there is no proposed remediation or new monitoring wells within 45 feet of vibration-sensitive receptors (i.e., homes/structures) or within 30 feet and 275 feet of vibration-sensitive land uses (i.e., homes) in California and Arizona, respectively. b) During the design, PG&E conducted site visits with Agencies, Tribes, and Stakeholders to view and obtain inputs on locations of planned facilities including new remediation, new monitoring wells, and piping corridors. c) In response to Tribes' comments on the 60% design, PG&E moved all remedy wells and vaults from the west side of NTH to the east side. In addition, PG&E will not use the east side (side that is closer to Maze A) of	The design was carried out in a manner that avoids any direct impacts on the Topock Maze as it is manifested archaeologically. PG&E Cultural Resources Expert Glenn Caruso led in-office reviews of planned facilities and temporary construction-related footprints. The purpose of the reviews is to ensure that project footprints do not create direct physical impact on the Topock Maze as it is manifested archaeologically. There are no remedy facilities inside the Topock Maze as it is manifested archaeologically. Prevention of indirect impacts (e.g., noise, aesthetics) to the Maze has been incorporated into the design to the maximum extent feasible as follows: <u>Noise/Vibration</u> a) During the design, PG&E conducted site visits with Agencies, Tribes, and Stakeholders to view and obtain inputs on locations of planned facilities including new remediation, new monitoring wells, and piping corridors. b) In response to Tribes' comments about noise and vibration impacts on the Maze during the 60% design, PG&E moved all remedy wells and vaults from the west side of NTH to the east side. In addition, PG&E will not use the east side (side that is closer to Maze A) of the TCS evaporation ponds for remedy construction staging. c) As indicated in the 60% RTC #319, the Noise Engineer has reviewed the selection of aboveground transformers and air conditioning units for the enclosures of aboveground communication/control panels for conformance with the project noise design criteria (Appendix C of the Final BOD Report) and found them to be in compliance.	This measure was incorporated in the final design, which was submitted on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed

						the TCS evaporation ponds for remedy construction staging. d) As indicated in the 60% RTC #319, the Noise Engineer has reviewed the selection of aboveground transformers and air conditioning units for the enclosures of aboveground communication/control panels for conformance with the project noise design criteria (Appendix C of the 90% BOD Report). e) Mitigation measure NOISE-2 to reduce auditory impacts related to project-generated construction-related noise has been incorporated into the Construction/Remedial Action Work Plan (Section 4) for implementation during construction. f) PG&E has developed protocols to reduce auditory impacts, consistent with EIR mitigation measure NOISE-3, as part of the CIMP, and has included those protocols in the Construction/Remedial Action Work Plan (Section 4) for implementation. <u>Aesthetics</u> a) During the design, PG&E conducted site visits with Agencies, Tribes, and Stakeholders to view and obtain inputs on locations of planned remedial facilities. b) PG&E implemented additional design protocols to reduce visual intrusions, as outlined in Section 2.9.2 of the CIMP. c) PG&E has and will continue to provide opportunities for Agency, Tribal, and Other Stakeholder input on the visual nature of project design through inclusion of visualizations of select remedy components in design documents (CIMP protocol, see Section 2.9.3). d) PG&E has developed protocols to reduce visual intrusion, consistent with mitigation measures AES-1 and AES-2, as part of the CIMP, and has included these protocols in the Construction/Remedial Action Work Plan (Section 4) for implementation.	d) Mitigation measure NOISE-2 to reduce auditory impacts related to project-generated construction-related noise has been incorporated into the Construction/Remedial Action Work Plan (Section 4) for implementation during construction. e) PG&E has developed protocols to reduce auditory impacts in the Topock Cultural Area, consistent with EIR mitigation measure NOISE-3, as part of the CIMP, and has included those protocols in the Construction/ Remedial Action Work Plan (Section 4) for implementation. <u>Aesthetics</u> a) During the design, PG&E conducted site visits with Agencies, Tribes, and Stakeholders to view and obtain inputs on locations of planned remedial facilities. b) PG&E implemented additional design protocols to reduce visual intrusions, as outlined in Section 2.9.2 of the CIMP. c) PG&E has provided opportunities for Agency, Tribal, and Other Stakeholder input on the visual nature of project design through inclusion of visualizations of select remedy components in design documents (Section 2.9.3 of the CIMP). d) PG&E has developed protocols to reduce visual intrusion, consistent with mitigation measures AES-1 and AES-2, as part of the CIMP (Section 2.9), and has included these protocols in the Construction/Remedial Action Work Plan (Section 4) for implementation. e) In response to Tribes' comments on the 90% design, PG&E changed the design of the Bat Cave Wash crossing in the Uplands to directly bury pipes/ conduits in the wash (instead of in the road), thereby eliminating the concrete box culverts. Concurrently, PG&E changed the design of the Bat Cave Wash crossing near TCS to directly bury pipes/conduits in the wash, thereby eliminated the aerial crossing. The revised design was submitted for review and comment	

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
							during the 90% RTC process and is included in the final design.	
Cultural Resources	CUL-1a-11	PG&E shall provide an open grant for two part-time cultural resource specialist/project manager positions during the design and construction phases of the remediation project. The positions shall be filled by qualified members of an Interested Tribe as nominated by a majority vote of their Tribal Council(s) and appointed by DTSC's project manager if more than two members are nominated. The award of the grants is for continued involvement in review of project documents and participation in project-related meetings, including TRC meetings, at rates of historic compensation. Additionally, in light of FMIT's ownership of land in the project area and historical involvement in the environmental process, additional funding is guaranteed for one full-time FMIT position upon submission of an application by a qualified FMIT member who shall be appointed by the FMIT council, provided such funding is not duplicative of the services and funding provided by PG&E pursuant to the Settlement Agreement between PG&E and the FMIT in Fort Mojave Indian *Tribe v. Dept. of Toxic Substances Control, et al.*, Case No. 05CS00437 for a position with the FMIT's AhaMakav Culture Society. The payment of grant monies shall be timed to the awarded Tribes' fiscal cycles so that the Tribes are not forced to front funds for long periods of time. These positions shall act as cultural resources contacts and project managers for interactions between the Tribes, PG&E, and DTSC to ensure coordination for review and comment of subsequent project and/or environmental documents related to the design and implementation of the groundwater remediation project to avoid, reduce, or otherwise mitigate impacts on historical resources, as defined by CEQA. This funding is separate from provisions for Tribal monitor positions and shall not be used for routine Tribal business or legal counsel. For review and approval, PG&E shall provide DTSC with the names of the selected grant recipients and an annual report that summarizes activities associated with the grant program. Upon the conclusion of the construction phase of the project, the necessity and dollar value of the grant program shall be assessed by PG&E and, with the approval of DTSC, shall either be extended or terminated under the operations and maintenance phase.	Administrative step - no technical document required	A notice of the open grant for funding of two part-time cultural resource specialist/project manager positions was sent to Interested Tribes by a letter dated April 20, 2011. To date, PG&E has not received any responses to the April 20, 2011 letter from Tribes.	As of the submittal of the 60% design, PG&E has funded a second project manager position for the Cocopah Indian Tribe. The first funded position was for the Chemehuevi Indian Tribe.	There was no change since the 60% design.	There was no change since the 90% design.	As of the time of this writing, PG&E has funded a second project manager position for the Cocopah Indian Tribe. The first funded position was for the Chemehuevi Indian Tribe.
Cultural Resources	CUL-1a-12	PG&E shall provide sufficient opportunity, as determined by DTSC, for Interested Tribes to provide a traditional healing/cleansing ceremony (or	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility	PG&E will offer interested Native American Tribes the opportunity to provide a traditional healing/cleansing ceremony (or	PG&E will offer interested Native American Tribes the opportunity to provide a traditional healing/cleansing ceremony (or ceremonies) before and	PG&E will offer interested Native American Tribes the opportunity to provide a traditional healing/ cleansing ceremony (or ceremonies)	PG&E will provide sufficient opportunity for interested Native American Tribes to provide a traditional healing/cleansing	This measure is satisfied by the CIMP, which is Appendix H of the C/RAWP and was submitted on November 18, 2015.

		ceremonies) before and after ground disturbing construction activities occur.	and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	ceremonies) before and after ground disturbing activities occur.	after ground disturbing activities occur.	before and after ground disturbing activities occur.	ceremony (or ceremonies) before and after ground disturbing activities occur by following the protocols in Sections 2.10 and 2.11 of the CIMP.	
Cultural Resources	CUL-1a-13	PG&E shall, in communication with Interested Tribes, develop as part of the CMI Workplan, a worker cultural sensitivity education program. The program shall be implemented before commencement of construction and throughout construction and operations as personnel are added. This program may include information provided directly by Tribal entities either in written form or on video, in a manner consistent with Appendix C in the existing BLM Programmatic Agreement. The worker cultural sensitivity education program shall ensure that every person working on the project as an employee or contractor, before participating in design or outdoor activities at the project site, is informed regarding: the cultural significance of the Topock Cultural Area, appropriate behavior to use within the Topock Cultural Area, activities that are to be avoided in the Topock Cultural Area, and consequences in the event of noncompliance.	Worker Cultural Sensitivity Education Program	As described in the CMI Work Plan (Section 4.2.1), the education on cultural/historical resources sensitivity for Topock currently occurs via periodic training and project initiation meetings. Sensitivity training classes are conducted at least annually, and are attended by all workers available to participate. Sensitivity training/education is also provided at project initiation meetings, typically held at the site prior to field work. The training is provided by the Site Operations Manager, the Project Archaeologist, and Interested Tribal members who attend the meetings. In compliance with this measure, a training/education manual will be prepared using existing and new material, as available.	As described in Section 4.2.1 of the CMI/RD Work Plan (CH2M HILL 2011a), the education on cultural/historical resources sensitivity for Topock currently occurs via periodic training and project initiation meetings. Sensitivity training classes are conducted at least annually, and are attended by all workers available to participate. Sensitivity training/education is also provided at project initiation meetings, typically held at the site prior to field work. The training is provided by the Site Operations Manager, the Project Remediation Resources Specialist, and Interested Tribal members who attend the meetings. In compliance with this measure, PG&E and Tribes are collaborating on a training/education manual to educate workers. This measure was discussed with interested Tribes at the monthly meeting on April 26, 2012, August 23, 2012 and September 19, 2012.	PG&E has prepared, in coordination with agencies and Tribes, educational materials used in Orientation sessions for the Topock project. In addition, PG&E has prepared, in compliance with this measure, a protocol for the development of a cultural sensitivity education program to educate workers (included as an appendix to the Construction/Remedial Action Work Plan). Implementation of this protocol is underway.	PG&E has prepared, in coordination with agencies and Tribes, cultural sensitivity educational materials used in Orientation sessions for the Topock project. In addition, PG&E has prepared a protocol for the development of a cultural sensitivity education program to educate workers (included as an appendix to the Construction/Remedial Action Work Plan). Implementation of this protocol is underway.	The protocol for implementing CUL-1a-13 was included in Appendix P of the C/RAWP, which was submitted on November 18, 2015.

Cultural Resources	CUL-1b and 1c	**During Design, Construction, O&M, and Decommissioning Consider the Location of Historical Resources and Implement Measures to Avoid Resources to the Extent Feasible.** The following actions will reduce the potential for impacts on identified historically significant resources (other than the Topock Cultural Area, which is separately addressed in CUL-1a) within the project area. As detailed below, these actions include consideration of the location of historical resources, preparation of a cultural resources study, and preparation of a treatment plan. Monitoring of ground-disturbing activities during project construction will further protect historically significant resources. Protective actions are also described pertaining to the discovery of any previously unidentified potentially significant cultural resources.	Design submittals	This mitigation measure will be met through actions taken to implement CUL-1b/c-1 through c-4 (see below). In addition, the aerial map of disturbed areas (CUL-1a-9) provides a first cut at protecting and avoiding archaeological and historical sites.	This mitigation measure will be met through actions taken to implement CUL-1b/c-1 through c-4 (see below). In addition, the aerial map of disturbed areas (CUL-1a-9) provides a first cut at protecting and avoiding archaeological and historical sites. PG&E remediation resources specialist Glenn Caruso participated in field reviews of planned remedial facilities with the design team on April 23-24 and June 20, 2012. The purpose of these field reviews along with in office reviews is to ensure that the footprints of planned facilities are designed in ways to avoid, minimize, or mitigate impacts on historical and archaeological resources to the maximum extent feasible.	This mitigation measure will be met through actions taken to implement CUL-1b/c-1 through c-4 (see below). In addition, the aerial map of disturbed areas (CUL-1a-9) provides a first cut at protecting and avoiding archaeological and historical sites. PG&E Cultural Resources Expert Glenn Caruso participated in field review of planned remedial facilities and temporary construction footprints with the design team on April 7-10, 2014. Glenn Caruso also led in-office reviews of planned facilities and temporary construction-related footprints. The purpose of the field review along with in-office reviews is to ensure that project footprints are designed in ways to avoid, minimize, or mitigate impacts on historical and archaeological resources to the maximum extent feasible.	This mitigation measure will be met through actions taken to implement CUL-1b/c-1 through c-4 (see below). In addition, the aerial map of disturbed areas (CUL-1a-9) provides a first cut at protecting and avoiding archaeological and historical sites. PG&E Cultural Resources Expert Glenn Caruso participated in field review of planned remedial facilities and temporary construction footprints at Moabi Regional Park in late 2014 and early 2015. Glenn Caruso also led in-office review of planned facilities and temporary construction-related footprints in September 2015. The purpose of the field review along with in-office reviews is to ensure that project footprints are designed in ways to avoid and minimize impacts on historical and archaeological resources to the maximum extent feasible.	
Cultural Resources	CUL-1b/c-1	PG&E shall consider the locations of the identified historic resources described above (EIR Table 4.4-3) during the design of the physical improvements necessary for the proposed project and avoid, minimize, or mitigate impacts on historical and archaeological resources to the maximum extent feasible, as determined by DTSC. The final design plans for the project will be submitted to DTSC for review and approval.	Design submittals	The design has been and is carried out to avoid impacts to historical and archaeological resources to the maximum extent practicable as determined by DTSC. The final design will be submitted to DTSC as directed.	PG&E remediation resources specialist Glenn Caruso participated in field reviews of planned remedial facilities with the design team on April 23-24 and June 20, 2012. The purpose of these field reviews along with in office reviews is to ensure that the footprints of planned facilities are designed in ways to avoid, minimize, or mitigate impacts on historical and archaeological resources to the maximum extent feasible.	PG&E Cultural Resources Expert Glenn Caruso participated in field review of planned remedial facilities and temporary construction footprints with the design team on April 7-10, 2014. Glenn Caruso also led in-office reviews of planned facilities and temporary construction-related footprints. The purpose of the field review along with in-office reviews is to ensure that project footprints are designed in ways to avoid, minimize, or mitigate impacts on historical and archaeological resources to the maximum extent feasible. As noted above under CUL-1a-3a, on December 2, 2014, AE as PG&E's Qualified Cultural Resource Consultant conducted archaeological and historical field surveys of the locations considered for project features in Moabi Regional Park. A brief summary of the survey results was included in Appendix A11 of the Supplemental 90%.	As noted above under CUL-1a-3a, on June 24-26, 2015, PG&E conducted field surveys of the additional locations considered for remedy features in Moabi Regional Park. Survey results were summarized in a technical memorandum submitted on September 2, 2015. PG&E Cultural Resources Expert Glenn Caruso participated in field review of planned remedial facilities and temporary construction footprints at Moabi Regional Park in late 2014 and early 2015. Glenn Caruso also led in-office review of planned facilities and temporary construction-related footprints in September 2015. The purpose of the field review along with in-office reviews is to ensure that project footprints are designed in ways to avoid and minimize impacts on historical and archaeological resources to the maximum extent feasible.	The final design was submitted on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Cultural Resources	CUL-1b/c-2	During preparation of the final design, and consistent with CUL-1 a-3, PG&E shall retain a Qualified Cultural Resources Consultant to prepare a cultural resources study that assesses the potential for the construction, operations, or decommissioning of specific proposed improvements to result in significant impacts on identified historically significant resources described in Impacts CUL-1b and CUL-1c. This may include a geoarchaeological investigation and/or non-destructive remote-sensing surveys of potentially disturbed areas to determine if a potential exists for buried historical and archaeological resources. "Significant impacts" as used here means the potential for construction to demolish or materially alter in an adverse manner those physical characteristics of a resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the CRHR. The study will be submitted to DTSC for review and evaluation to determine if existing mitigation measures are appropriate.	Cultural resources study/Geoarchaeological investigation report	Consistent with CUL-1a-3, PG&E has retained qualified cultural resources consultants to prepare a cultural resources study. The study will commence at the intermediate (60%) design stage, after the locations of remedial facilities are confirmed.	This measure was discussed with interested Tribes at the monthly meeting on April 26, 2012. Geoarchaeological investigations were conducted on June 5-8, 2012 by Dr. Roland Brady of Brady and Associates Geological Services (BAGS) and Pat Maloney of Applied Earthworks (AE); Pat Maloney is the qualified cultural resources consultant. Participants from Interested Tribes include Wirlene Fischer-Holt (CRIT), Dr. Leo Leonhart (Consultant to the FMIT), and Dr. Margaret Eggers (TRC). A geoarchaeological investigation report is forthcoming.	The geoarchaeological investigation report titled *Geoarchaeological Assessment for the Topock Remediation Project, Mohave County, AZ, and San Bernardino County, CA* was completed and submitted to DTSC on February 28, 2014 (BAGS and AE 2014). The information in this report has been used to inform the design (i.e., via reviews by PG&E Cultural Resources Expert) and incorporated into the Construction/Remedial Action Work Plan as protocols to be followed during construction activities (Section 4).	The *Geoarchaeological Assessment for the Topock Remediation Project, Mohave County, AZ, and San Bernardino County, CA* was revised to incorporate comments from DTSC. The report was submitted on September 15, 2015 (BAGS and AE 2015). The information in the report has been used to inform the design (i.e., via reviews by PG&E Cultural Resources Expert) and incorporated into the Construction/Remedial Action Work Plan as protocols to be followed during construction activities (Section 4).	The revised geoarchaeological investigation report (BAGS and AE 2015) was completed on September 15, 2015, and included in Appendix A12 of the Final BOD and T of the C/RAWP. The C/RAWP was submitted concurrently with the final design on November 18, 2015.
Cultural Resources	CUL-1b/c-3	If the cultural resources study determines that the construction of physical improvements would result in significant impacts on identified historically significant resources described in Impacts CUL-1b and CUL-1c, and avoidance of the resource is not feasible, PG&E shall prepare a treatment plan that identifies measures to reduce these impacts (see above description of the CIMP) for DTSC's review and approval. The treatment plan shall identify which criteria for listing on the CRHR contribute to the affected resource's significance and which aspects of significance would be materially altered by construction, operations, or decommissioning and shall provide for reasonable efforts to be made to permit the resource to be preserved in place or left in an undisturbed state. Methods of accomplishing this may include capping or covering the resource with a layer of soil. To the extent that a resource cannot feasibly be preserved in place or left in an undisturbed state, excavation as mitigation shall be restricted to those parts of the resource that would be damaged or destroyed by the project. Excavation as mitigation shall not be required for a historically significant resource if the treatment plan determines that testing or studies already completed have adequately recovered the scientifically consequential information from and about the resource. The plan shall require communication with all Interested Tribes with regard to their perspectives and wishes for the treatment of the resources.	Cultural resources treatment plan	Implementation of this measure is dependent upon the cultural resources study conducted under CUL-1b/c-2.	This measure was discussed with Interested Tribes at the monthly meeting on October 25, 2012 and November 9, 2012.	A Cultural Resources Treatment Plan will be prepared and submitted to DTSC shortly after submission of the 90% design.	A Cultural and Historical Property Treatment Plan, which includes a requirement to communicate with all Interested Tribes with respect to their perspectives and wishes for the treatment of resources, was prepared and submitted to DTSC on September 12, 2014 (AE 2014b).	A Cultural and Historical Property Treatment Plan was prepared and submitted to DTSC on September 12, 2014 (AE 2014b).

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Cultural Resources	CUL-1b/c-4	Consistent with CUL-1a-3a above, PG&E shall retain a Qualified Cultural Resources Consultant to observe ground-disturbing activities and shall be required to request the participation of Tribal monitors during those activities, including steps necessary during operations and decommissioning activities to ensure that historically significant resources are avoided to the maximum extent feasible, as determined by DTSC, during actual construction (see the description of the CMI Workplan, above). The Qualified Cultural Resources Consultant shall provide training to construction personnel on the locations of identified resources, values associated with the identified resources, responsibility for reporting suspected historic resources, and procedures for suspension of work in the immediate vicinity of the discovery, and shall use exclusionary fencing, flagging, or other appropriate physical barriers to mark the boundaries of identified resources. The Qualified Cultural Resources Consultant shall invite participation from Interested Tribal members to participate in the training. In the event that previously unidentified potentially significant cultural resources are discovered during ground-disturbing activities, the Qualified Cultural Resources Consultant shall have the authority to divert or temporarily halt ground-disturbing activities in the area of discovery to allow evaluation of the potentially significant cultural resources. If such discoveries occur on land managed by a federal agency, Stipulation IX (Discoveries) of the Programmatic Agreement shall apply and are deemed adequate by DTSC. If a discovery occurs on other lands within the project area, the Qualified Cultural Resources Consultant shall contact the PG&E and DTSC project managers at the time of discovery and, in consultation with DTSC and Tribal monitors, shall evaluate the resource before construction activities will be allowed to resume in the affected area. For significant cultural resources, and before construction activities are allowed to resume in the affected area, the resource(s) shall be recovered with coordination of the Tribal monitors and DTSC. Recovery may include a Research Design and/or Data Recovery Program submitted to DTSC for review and approval. The Qualified Cultural Resources Consultant (and Tribal monitors) shall determine the amount of material to be recovered for an adequate sample for analysis or data recovery. Any concerns or recommendations regarding the ground-disturbing activities or the handling of cultural resources shall be directed to the Qualified Cultural Resources Consultant or PG&E's site supervisor.		Consistent with CUL-1a-3, PG&E has retained qualified cultural resources consultants to observe ground-disturbing activities and provide training as required.	Consistent with CUL-1a-3, PG&E has retained AE, a consulting firm with qualified cultural resources consultants, to observe ground-disturbing activities and provide training as required. This measure was discussed with Interested Tribes at the monthly meeting on October 25, 2012 and November 9, 2012.	Consistent with CUL-1a-3, PG&E has retained AE, a consulting firm with qualified cultural resources consultants, to observe ground-disturbing activities and provide training as required.	Consistent with CUL-1a-3, PG&E has retained AE, a consulting firm with qualified cultural resources consultants, to observe ground-disturbing activities and provide training as required. PG&E has included the requirement to request participation of Tribal monitors during those activities in CIMP Section 2.12.	PG&E retained AE, which DTSC determined was a Qualified Cultural Resources Consultant, on March 2, 2012.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Cultural Resources	CUL-2	**During Project Design Consider the Location of Unique Archaeological Resources and Avoid Resources to the Maximum extent Feasible.** Cultural resources that qualify as unique archaeological sites in the project area would probably also meet one or more of the criteria for historical resources and would be subject to Mitigation Measures CUL-1b/c-2 and CUL-1b/c-3. The mitigation measures under this identified impact are the same as listed for Impact CUL-1b and CUL-1c. These mitigation measures would reduce the potential for impacts on unique archaeological resources.	Cultural resources study/ Geoarchaeological investigation report; Cultural resources treatment plan	The requirements of this mitigation measure will be met by implementation of CUL-1b/c-2 and CUL-1b/c-3.	The requirements of this mitigation measure will be met by implementation of CUL-1b/c-2 and CUL-1b/c-3. This measure was discussed with interested Tribes at the monthly meeting on May 24, 2012.	The requirements of this mitigation measure have been met by implementation of CUL-1b/c-2 and CUL-1b/c-3.	The requirements of this mitigation measure have been met by implementation of CUL-1b and CUL-1c.	See CUL-1b and CUL-1c.
Cultural Resources	CUL-3	**Conduct Survey and Construction Monitoring**. A **paleontological investigation**, **including a detailed survey of the project area** by a qualified paleontologist, shall be conducted to refine the potential impacts on unique paleontological resources within the final design area and determine whether preconstruction recovery of sensitive resources and/or construction monitoring would be warranted. If construction monitoring is determined to be warranted, ground-altering activity would be monitored by a qualified paleontologist to assess, document, and recover unique fossils. Monitoring shall include the inspection of exposed surfaces and microscopic examination of matrix in potential fossil bearing formations. In the event microfossils are discovered, the monitor shall collect matrix for processing. In the event paleontological resources are encountered during earthmoving activities, recovered specimens shall be prepared by the paleontologist to a point of identification and permanent preservation. PG&E shall retain a Qualified Paleontologist to observe ground-disturbing activities where determined necessary based on the results of the paleontological investigation and shall be required to request the participation of Tribal monitors during those activities, including steps necessary during operations and decommissioning activities to ensure that historically significant resources are avoided to the maximum extent feasible, as determined by DTSC, during actual construction (see above description of the CMI Workplan). Paleontological resources of scientific value shall be identified and curated into an established, accredited, professional museum repository in the region with permanent retrievable paleontological storage. This measure does not apply to the activities included as part of the East Ravine Revised Addendum, Groundwater Investigation.	Paleontological investigation report	PG&E has retained a paleontologist to conduct the investigation, planning for this investigation is currently underway. A draft report has been prepared and is being reviewed by PG&E.	This measure was discussed with interested Tribes at the monthly meeting on January 26, 2012. A paleontological investigation was conducted on July 25, 2012. The outcome of the survey was provided in a report completed in December 2012; this report is currently being revised to incorporate comments received.	The paleontological investigation results were summarized in a report titled "*Paleontological Resources Management Plan: MMRP CUL-3*" (Parus 2014) and submitted to DTSC on February 28, 2014. The plan is also included in an appendix of the Construction/Remedial Action Work Plan.	The *Paleontological Resources Management Plan: MMRP CUL-3* was revised to incorporate DTSC's comments and submitted on October 9. 2015 and is included in Appendix A9 of this report. The plan is also included in Appendix J of the Construction/Remedial Action Work Plan. As a result of the July 2012 survey, the paleontologist determined that paleontological monitoring would not be required during grading and trenching activities. Even though borings would have a low potential to produce significant fossils, the paleontologist recommended that paleontological resources awareness training be completed by field personnel and that a paleontologist be on call to respond if fossils are encountered during drilling. PG&E has hired Qualified Paleontologists from AE to be on call during construction activities. See CUL-1a-8l for provisions related to Tribal Monitors during ground-disturbing activities.	The revised paleontological investigation report (Parus 2015) was completed on October 9, 2015, and included in Appendices A9 of the Final BOD and J of the C/RAWP, respectively.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Cultural Resources	CUL-4	**With Discovery of Human Remains or Burials Suspend Work, Protect Remains, and Comply with Local, State, and Federal Laws Regarding Discoveries During Ground-Disturbing Activities.** Ground-disturbing activities may disturb as-yet undiscovered human remains or Native American burials and associated grave goods. PG&E shall retain a Qualified Cultural Resource Consultant and request designated Tribal monitor(s) to train construction personnel in the identification of human remains so that they may aid in the identification of such resources (see above description of the CIMP). A Qualified Cultural Resource Consultant and Tribal monitor(s) shall be in place to adequately oversee all ground-disturbing activities. In the event human remains are uncovered over the course of project construction, operation and maintenance, and/or decommissioning activities, the following procedures shall be followed to ensure compliance with all applicable local, state, and federal laws.	Training material for the identification of human remains	PG&E will retain Qualified Cultural Resources Consultants prior to construction to prepare training material for the identification of human remains, provide training and oversee ground-disturbing activities as required. All of the provisions of this measure will remain in effect during construction, and will be implemented as directed in the event any human remains are uncovered during construction.	PG&E has retained AE and prior to construction monitoring AE will prepare training material for the identification of human remains, provide training and oversee ground-disturbing activities as required by this mitigation measure. All of the provisions of this measure will remain in effect during construction, and will be implemented as directed in the event any human remains are uncovered during construction.	PG&E has retained AE as the qualified cultural resource consultant and prior to construction monitoring, AE will prepare training material for the identification of human remains, provide training, and oversee ground-disturbing activities as required by this mitigation measure. All of the provisions of this measure will remain in effect during construction, and will be implemented as directed in the event any human remains are uncovered during construction. Procedures for implementing this measure are included in an appendix of the Construction/Remedial Action Work Plan.	PG&E has retained AE as the qualified cultural resource consultant and prior to construction monitoring, AE will prepare training material for the identification of human remains and provide the training required by this mitigation measure. PG&E also will request designated Tribal monitors to train construction personnel in the identification of human remains. AE and the Tribal monitors shall be in place to oversee ground disturbing activities. These requirements are in Appendix P of the C/RAWP. All of the provisions of this measure will remain in effect during construction, and will be implemented as directed in the event any human remains are uncovered during construction.	Procedures for implementing this measure are included in Appendix P of the Construction/Remedial Action Work Plan, submitted on November 18, 2015.
Cultural Resources	CUL-4f	f) The construction contractor shall immediately suspend work within the vicinity of the discovery and determine if the remains discovered are human or nonhuman. This determination shall be made by the Qualified Cultural Resources Consultant, a qualified archaeologist and/or physical anthropologist with expert skill in the identification of human osteological (bone) remains.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This requirement will be met by actions to be taken under CUL-4.	This requirement will be met by actions to be taken under CUL-4.	This requirement will be met by actions taken under CUL-4.	The training and monitoring required by CUL-4 will ensure that this requirement is met.	This measure was incorporated into the O&M Manual (see Exhibit L2.2-1), the C/RAWP (see Table 2.3-1), and the IM-3 Decommissioning Plan (see Table 6-1). These documents were submitted on November 18, 2015.
Cultural Resources	CUL-4g	g) The Qualified Cultural Resources Consultant (and Tribal monitor), or construction contractor, shall protect discovered human remains and/or burial goods remaining in the ground from additional disturbance.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This requirement will be met by actions to be taken under CUL-4.	This requirement will be met by actions to be taken under CUL-4.	This requirement will be met by actions taken under CUL-4.	This requirement was incorporated into the O&M Manual (see Exhibit L2.2-1), the C/RAWP (see Table 2.3-1), and the IM-3 Decommissioning Plan (see Table 6-1). Further, the training and monitoring required by CUL-4 will ensure that this requirement is met.	This measure was incorporated into the O&M Manual (see Exhibit L2.2-1), the C/RAWP (see Table 2.3-1), and the IM-3 Decommissioning Plan (see Table 6-1). These documents were submitted on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Cultural Resources	CUL-4h	h) The Qualified Cultural Resources Consultant, archaeologist, or construction site supervisor shall contact the San Bernardino County Coroner, and the PG&E and DTSC project managers immediately. In California, all subsequent action shall conform to the protocols established in the Health and Safety Code and regulations. In Arizona, the Qualified Cultural Resources Consultant or PG&E construction site supervisor will follow Arizona laws and the implementing regulations. Human remains found on federal land would require the notification of the BLM Havasu City field office and compliance with applicable federal laws and regulations, including the Native American Graves Protection and Repatriation Act if the remains are determined to be of Native American origin. The Qualified Cultural Resources Consultant shall coordinate the interaction between Interested Tribes, PG&E, the County, and DTSC to determine proper treatment and disposition of any remains.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This requirement will be met by actions to be taken under CUL-4.	This requirement will be met by actions to be taken under CUL-4.	This requirement will be met by actions taken under CUL-4.	These requirements were incorporated into the O&M Manual (see Exhibit L2.2-1), the C/RAWP (see Table 2.3-1), and the IM-3 Decommissioning Plan (see Table 6-1). The training and monitoring required by CUL-4 will ensure that this requirement is met.	This measure was incorporated into the O&M Manual (see Exhibit L2.2-1), the C/RAWP (see Table 2.3-1), and the IM-3 Decommissioning Plan (see Table 6-1). These documents were submitted on November 18, 2015.
Cultural Resources	CUL-4i	i) The San Bernardino County Coroner will determine if the remains are of recent origin and if an investigation of the cause of death is required (California Health and Safety Code Section 7050.5). If the coroner determines that the human remains are not Native American and not evidence of a crime, project personnel shall coordinate with the Qualified Cultural Resources Consultant (s) to develop an appropriate treatment plan. This may include contacting the next of kin to solicit input on subsequent disposition of the remains. If there is no next-of-kin, or recommendations by the next-of-kin are considered unacceptable by the landowner, the landowner will reinter the remains with appropriate dignity in a location outside the project area and where they would be unlikely to be disturbed in the future.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This requirement will be met by actions to be taken under CUL-4.	This requirement will be met by actions to be taken under CUL-4.	This requirement will be met by actions taken under CUL-4.	These requirements were incorporated into the O&M Manual (see Exhibit L2.2-1), the C/RAWP (see Table 2.3-1), and the IM-3 Decommissioning Plan (see Table 6-1). The training and monitoring required by CUL-4 will ensure that this requirement is met.	This measure was incorporated into the O&M Manual (see Exhibit L2.2-1), the C/RAWP (see Table 2.3-1), and the IM-3 Decommissioning Plan (see Table 6-1). These documents were submitted on November 18, 2015.
Cultural Resources	CUL-4j	j) In the event that the San Bernardino County Coroner determines that the human remains are Native American and not evidence of a crime, project personnel shall contact the NAHC so that a most likely descendent (MLD) can be identified as required under California Public Resources Code Section 5097.98.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This requirement will be met by actions to be taken under CUL-4.	This requirement will be met by actions to be taken under CUL-4.	This requirement will be met by actions taken under CUL-4.	This requirement was incorporated into the O&M Manual (see Exhibit L2.2-1), the C/RAWP (see Table 2.3-1), and the IM-3 Decommissioning Plan (see Table 6-1). The training and monitoring required by CUL-4 will ensure that this requirement is met.	This measure was incorporated into the O&M Manual (see Exhibit L2.2-1), the C/RAWP (see Table 2.3-1), and the IM-3 Decommissioning Plan (see Table 6-1). These documents were submitted on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Cultural Resources	CUL-4k	k) The MLD(s) shall inspect the area in which the human remains were found and provide treatment recommendations to the landowner and PG&E site manager in accordance with the provisions of PRC Section 5097.98. The treatment may include reburial, scientific removal of the discovered human remains and relinquishment to the MLD(s), nondestructive analysis of human remains and/or other culturally appropriate treatment. If the MLD(s) so requests, the landowner would reinter the remains with the appropriate dignity in a location outside the area of disturbance in a location unlikely to be disturbed in the future.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This requirement will be met by actions to be taken under CUL-4.	This requirement will be met by actions to be taken under CUL-4.	This requirement will be met by actions taken under CUL-4.	This requirement was incorporated into the O&M Manual (see Exhibit L2.2-1), the C/RAWP (see Table 2.3-1), and the IM-3 Decommissioning Plan (see Table 6-1). The training and monitoring required by CUL-4 will ensure that this requirement is met.	This measure was incorporated into the O&M Manual (see Exhibit L2.2-1), the C/RAWP (see Table 2.3-1), and the IM-3 Decommissioning Plan (see Table 6-1). These documents were submitted on November 18, 2015.
Cultural Resources	CUL-4l	l) To the maximum extent feasible, Mitigation Measure CUL-4 shall be implemented in a manner that is consistent with mitigation required by local, state, and federal requirements.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This requirement will be met by actions to be taken under CUL-4.	This requirement will be met by actions to be taken under CUL-4.	This requirement will be met by actions to be taken under CUL-4.	This requirement was incorporated into the O&M Manual (see Exhibit L2.2-1), the C/RAWP (see Table 2.3-1), and the IM-3 Decommissioning Plan (see Table 6-1). The training and monitoring required by CUL-4 will ensure that this requirement is met.	This measure was incorporated into the O&M Manual (see Exhibit L2.2-1), the C/RAWP (see Table 2.3-1), and the IM-3 Decommissioning Plan (see Table 6-1). These documents were submitted on November 18, 2015.
Geology & Soils	**GEO-1a**	**Construction, Operation and Maintenance, and Decommissioning Impacts Related to Erosion of Soils.**						
Geology & Soils	GEO-1a-a	a) A DTSC-approved grading and erosion control plan, prepared by a California Registered Civil Engineer, shall be completed prior to implementation of any grading in areas of the site where there is a potential for substantial erosion or loss of top soils. The plan shall outline specific procedures for controlling erosion or loss of topsoil during construction, operation and maintenance, and decommissioning.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration; O&M Manual	A grading and erosion control plan will be prepared and included in the Construction/Remedial Action Work Plan for DTSC review and approval.	A grading and erosion control plan will be prepared and included in the Construction/Remedial Action Work Plan, which will be submitted as part of the final design for DTSC review and approval.	Grading plans including erosion control are included in Appendix D of the 90% BOD. Erosion control measures to be implemented during construction are also included in the Construction/Remedial Action Work Plan.	Grading plans including specific erosion control procedures were prepared by a California registered engineer and are included in Appendix D of this Final BOD. In addition to the grading and erosion control plan(s) required by this measure, other measures to control soil erosion are included in: • The Final BOD (Appendix C – Design Criteria). • The C/RAWP (Appendix F – IM-3 Decommissioning Work Plan [Appendix G, Construction BMPs Plan] and Appendix M – BMPs Plan). • Volume 1 of the O&M Manual (Appendix B – SOPs, Appendix D – SWPPP for O&M activities, and Section 7.4 – BMPs for maintenance of roads and access pathways). • Volume 2 of the O&M Manual (Appendix A – SOPs). These are discussed below as well.	The grading and erosion control plan (Appendix D of the BOD) was submitted on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Geology & Soils	GEO-1a-b	b) To ensure soils do not directly or indirectly discharge sediments into surface waters as a result of construction, operation and maintenance, or decommission activities, PG&E shall develop a SWPPP as discussed in mitigation measure HYDRO-1 of the "Hydrology and Water Quality" section of this EIR. The SWPPP shall identify best management practices (BMPs) that would be used to protect stormwater runoff and minimize erosion during construction. PG&E shall prepare plans to control erosion and sediment, prepare preliminary and final grading plans, and shall prepare plans to control urban runoff from the project site during construction, consistent with the substantive requirements of the San Bernardino County Building and Land Use Services Department for erosion control.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	PG&E will prepare a BMP Plan prior to construction activities that will be included in the Construction/Remedial Action Work Plan.	PG&E will prepare a BMP Plan prior to construction activities that will be included in the Construction/Remedial Action Work Plan, to be submitted concurrently with the 90% design.	In compliance with mitigation measure HYDRO-1, a BMPs Plan for construction activities was prepared and is included in Section 4.10 of the Construction/Remedial Action Work Plan, as well as an appendix. In addition, an industrial SWPPP was also prepared in compliance with mitigation measure HYDRO-1 and included in Appendix E of the O&M Plan (Volume 1 of the O&M Manual). The SWPPP includes BMPs related to operation and maintenance activities of the remedy.	In compliance with mitigation measure HYDRO-1, PG&E developed a BMPs Plan to minimize erosion during construction activities (see HYDRO-1). This is included in Section 4.10 of the Construction/Remedial Action Work Plan, as well as Appendix M to the C/RAWP. PG&E will follow the General SWPPP for all construction activities. In addition, PG&E has prepared plans to control erosion and sediment runoff, consistent with the County's erosion control requirements, requiring the use of BMPs during construction, operations, and decommissioning. The BMPs for construction activities are located in Appendix G to the IM-3 Decommissioning Plan and Appendix M of the C/RAWP. The SWPPP (including BMPs) for operation and maintenance activities is included in Appendix E of the O&M Plan (Volume 1 of the O&M Manual). In addition, PG&E has prepared grading plans, which are included in Appendix D of this Final BOD.	Appendix G to the IM-3 Decommissioning Plan and Appendix M of the C/RAWP include BMPs to protect storm water runoff and minimize erosion during decommissioning and construction, respectively. In addition, a SWPPP for O&M activities was prepared and included in Appendix D of the O&M Manual Volume 1. The O&M Manual and the C/RAWP (which includes the IM-3 Decommissioning Plan) were submitted on November 18, 2015.
Geology & Soils	GEO-1a-c	c) During road preparation activities, loose sediment shall be uniformly compacted consistent with the substantive San Bernardino County Building and Land Use Services Department requirements to aid in reducing wind erosion. Ongoing road maintenance including visual inspection to identify areas of erosion and performing localized road repair and regrading, installation and maintenance of erosion control features such as berms, silt fences, or straw wattles, and grading for road smoothness shall be performed as needed to reduce potential for erosion.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This measure will be implemented as directed, to aid in reducing wind erosion.	This measure will be implemented as directed to aid in reducing wind erosion.	This measure will be implemented as directed to aid in reducing wind erosion (see BMPs Plan, in Section 4.10 and an appendix of the Construction/Remedial Action Work Plan). Section 6.4 of the O&M Plan (Volume 1 of the O&M Manual) discusses general guidelines for maintenance of access roads and pathways, from visual assessment, local repairs, soil stabilization, and installation/ maintenance of erosion controls, to grading.	The requirements, consistent with County requirements, to uniformly compact loose sediment and to provide ongoing road maintenance (including visual inspection to identify areas of erosion and performing localized road repair and regrading; installation and maintenance of erosion control features such as berms, silt fences, or straw wattles; and grading for road smoothness) to reduce the potential for erosion during road preparation activities have been included as BMPs in the BMPs Plan (Section 4.10 and Appendix M, Section 1.1.3 of the C/RAWP) and are included in Appendix G to the IM-3 Decommissioning Work Plan. This measure will be implemented as directed to aid in reducing wind erosion (see BMPs Plan, in Section 4.10 and an appendix of the Construction/Remedial Action Work Plan). In addition, Section 7.4 of the O&M Plan (Volume 1 of the O&M Manual)	Appendix G to the IM-3 Decommissioning Work Plan and Appendix M of the C/RAWP include BMPs to protect storm water runoff and minimize erosion during decommissioning and construction, respectively. In addition, Section 7.4 of the O&M Manual Volume 1 contains BMPs for ongoing maintenance of roads and pathways. The O&M Manual and the C/RAWP (which includes the IM-3 Decommissioning Work Plan) were submitted on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
							discusses general guidelines for maintenance of access roads and pathways, from visual assessment, local repairs, soil stabilization, and installation/maintenance of erosion controls, to grading.	
Geology & Soils	GEO-1a-d	d) Regarding the potential for contaminated soils to be eroded and contribute contamination into receiving waters, Mitigation Measures GEO-2 and HAZ-2 shall be implemented. Mitigation Measure GEO-2 provides the provisions for mitigating erosion through BMPs which shall be implemented. Mitigation Measure HAZ-2 provides the provisions for safe work practices and handling of contaminated soils as investigation derived wastes.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This mitigation measure will be met through actions to be taken to implement Mitigation Measures GEO-2 and HAZ-2 to prevent contaminated soils to be eroded and contribute contamination into receiving waters.	This mitigation measure will be met through actions to be taken to implement Mitigation Measures GEO-2 and HAZ-2 to prevent contaminated soils to be eroded and contribute contamination into receiving waters.	This mitigation measure will be met through actions to be taken to implement Mitigation Measures GEO-2 and HAZ-2 to prevent contaminated soils from being eroded and contributing contamination into receiving waters.	This mitigation measure will be met through implementation of mitigation measure HAZ-2 to prevent contaminated soils from being eroded and contributing contamination into receiving waters.	This mitigation measure was incorporated into the Health and Safety Plan for O&M activities (included as Volume 5 of the O&M Manual) and construction activities (included as Appendix D of the C/RAWP). Both the O&M Manual and C/RAWP were submitted on November 18, 2015.
Geology & Soils	**GEO-1b**	**Construction, Operation and Maintenance, and Decommissioning Impacts Related to Differential Compaction of Soils.**						
Geology & Soils	GEO-1b-a	a) BMPs shall be implemented during construction, operation and maintenance, and decommissioning activities to minimize impacts on the affected areas. Such BMPs could include, but would not be limited to, the following: uniform compaction of roadways created for accessing the project area as per San Bernardino County Building and Land Use Services Department requirements, returning areas adversely affected by differential compaction to preexisting conditions when these areas are no longer needed, and continuing maintenance of access roads, wellhead areas, and the treatment plant areas.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This measure will be implemented as directed. The BMPs will be identified in the Corrective Measure Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration (part of CIMP); Closure Plan for Decommissioning of Remedy Facilities and Restoration, as appropriate.	This measure will be implemented as directed. The BMPs will be identified in the Construction/Remedial Action Work Plan and Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration which will be submitted as part of the 90% design, as well as the Closure Plan for Decommissioning of Remedy Facilities and Restoration, which will be submitted prior to decommissioning.	This measure will be implemented as directed (see BMPs Plan Section 4.10 and in an appendix of the Construction/Remedial Action Work Plan; Section C2.2, Earthwork, in Appendix C (Design Criteria) of the 90% BOD; and Section 7.4, Access Road and Pathway Maintenance, of the O&M Plan (O&M Manual Volume 1).	BMPs will be implemented as directed (see BMPs Plan in Section 4.10 and Appendix M of the Construction/ Remedial Action Work Plan; Section C2.2, Earthwork, in Appendix C (Design Criteria) of the Final BOD; and Section 7.4, Access Road and Pathway Maintenance, of the O&M Plan (O&M Manual Volume 1).	The BOD, O&M Manual, and the C/RAWP (which includes the IM-3 Decommissioning Work Plan) were submitted on November 18, 2015.
Geology & Soils	GEO-1b-b	b) Work area footprints shall be minimized to the greatest extent feasible to limit the areas exposed to differential compaction. Where possible, existing unpaved access roads and staging/working areas shall be reused and maintained for different stages of the construction. New graded areas for staging or for access roads shall be compacted to a uniform specification, typically on the order of 90 to 95% compaction and consistent with substantive San Bernardino County Building and Land Use Services Department requirements to reduce differential compaction and subsequent erosion of site soils.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This measure will be implemented as directed, to minimize work area footprints to the greatest extent feasible.	This measure will be implemented as directed, to minimize work area footprints to the greatest extent feasible.	This measure has been and will be continue to be implemented as directed. PG&E will strive to minimize work area footprints to the maximum extent feasible, while maintaining a safe work zone and environment for all staffs, contractors, as well as monitors and observers. As discussed in CUL-1a-9, all of the soil storage and construction staging areas proposed in the 90% design are located on existing and/or previously used staging areas, as well as previously disturbed areas. All trench sections underneath roadways and shoulders are designed to be compacted to 95% and all other areas to at least 90%.	This measure has been and will continue to be implemented as directed. PG&E will strive to minimize work area footprints to the maximum extent feasible, while maintaining a safe work zone and environment for all staffs, contractors, as well as monitors and observers. Where possible, PG&E will reuse and maintain existing access routes and staging areas for different stages of construction. As discussed in CUL-1a-9, all of the soil storage and construction staging areas proposed in the final design are located on existing and/or previously used staging areas, as well as previously disturbed areas. Consistent with this measure and GEO-1a-c, all trench sections underneath roadways and shoulders are designed to be compacted to 95% and all other areas to at least 90%.	The O&M Manual and the C/RAWP (which includes the IM-3 Decommissioning Work Plan) were submitted on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Geology & Soils	GEO-1b-c	c) After the completion of the operation and maintenance phase, the disturbed areas which result in increased potential for compaction shall be returned to their respective preexisting condition by regrading consistent with the preconstruction slopes as documented through surveys that may include topographic surveys or photo surveys. The areas will be returned to the surrounding natural surface topography and compacted consistent with unaltered areas near the access roads or staging areas in question. The habitat restoration plan outlined in mitigation measure BIO-1 shall include restoration of native vegetation or other erosion control measures where revegetation would be infeasible or inadequate, for purposes of soil stabilization and erosion control of the project area.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This measure will be implemented as directed. The Habitat Restoration Plan, developed in compliance with BIO-1, will include the requirements under this measure.	This measure will be implemented as directed. The forthcoming Habitat Restoration Plan, to be developed in compliance with BIO-1, will include the requirements under this measure.	**Resurfacing to Preconstruction Condition** These requirements are included in the restoration guidelines for both the Plan for Decommissioning and Removal of the IM-3 Facility and Site Restoration (see Sections 8.1.2 and 8.1.3 of Appendix B of the CIMP) and measure CUL-1a-8e, Protocols for Restoring the Environment to its Preconstruction Conditions (see Sections 2.5.3 and 2.5.4 of the CIMP). **Habitat Restoration and Revegetation** In compliance with BIO-1, the Havasu National Wildlife Refuge Habitat Restoration Plan and the Habitat Restoration Plan for Riparian Vegetation and Other Sensitive Habitats (both provided as appendices to the Construction/ Remedial Action Work Plan) include measures to address restoration of native vegetation.	**Resurfacing to Preconstruction Condition** The requirement to survey sloped areas that will be disturbed by the remedy and return such areas that have an increased potential for compaction to preexisting conditions is included in the restoration guidelines for both the Plan for Decommissioning and Removal of the IM-3 Facility and Site Restoration (see Sections 8.1.2 and 8.1.3 of Appendix B of the CIMP) and measure CUL-1a-8e, Protocols for Restoring the Environment to its Preconstruction Conditions (see Sections 2.5.3 and 2.5.4 of the CIMP). **Habitat Restoration and Revegetation** In compliance with BIO-1, the Havasu National Wildlife Refuge Habitat Restoration Plan and the Habitat Restoration Plan for Riparian Vegetation and Other Sensitive Habitats (both provided as appendices to the Construction/Remedial Action Work Plan) evaluated restoration of native vegetation for the purpose of control erosion. As stated in Section 3.1 of the HNWR Habitat Restoration Plan and Section 2.1 of the Habitat Restoration Plan for Riparian Vegetation and Other Sensitive Habitats, the use of herbaceous vegetation covers as a soil stabilization technique is not being proposed for this project because this approach was not considered appropriate for this environment.	The C/RAWP (includes the CIMP) was submitted on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Hazardous Materials	**HAZ-1a**	**Spills or Releases of Contaminants during Operation and Maintenance Activities.**						
Hazardous Materials	HAZ-1a-a	a) PG&E shall store, handle, and transport hazardous material in compliance with applicable local, state, and federal laws.	O&M Plan (Volume 1 of the O&M Manual)	This measure will be implemented as directed.	This measure will be implemented as directed. Storage and handling of hazardous materials will be discussed in the Hazardous Materials Business Plan (HMBP), the outline for which is presented in Appendix F of the O&M Plan, with the complete HMBP to be submitted as part of the 90% design.	This measure will be implemented as directed. Storage and handling of hazardous materials are discussed in the HMBP (Appendix F of the O&M Plan).	This measure will be implemented as directed. Storage, transport, and handling of hazardous materials are discussed in the HMBP (Appendix E of the O&M Plan) and will be followed during project implementation.	Volume 1 of the O&M Manual was submitted on November 18, 2015.
Hazardous Materials	HAZ-1a-b	b) All chemical storage and loading areas shall be equipped with proper containment and spill response equipment. BMPs to be implemented may include, but are not limited to, use of secondary containment in mixing and storage areas; availability of spill kits and spill containment booms, and appropriate storage containers for containment of the materials generated during the spill response.	O&M Plan (Volume 1 of the O&M Manual)	This measure will be implemented as directed.	This measure will be implemented as directed. Secondary containment for hazardous materials is described in the design criteria and drawings which are presented in Appendices C and D, respectively, of this BOD Report for the 60% design. Storage and handling of hazardous materials will be discussed in the HMBP, the outline for which is presented in Appendix F of the O&M Plan (Volume 1), with the complete HMBP to be submitted as part of the 90% design.	This measure will be implemented as directed. Secondary containment for hazardous materials is described in the design criteria and drawings which are presented in Appendices C and D, respectively, of the BOD Report for the 90% design. Storage and handling of hazardous materials are discussed in the HMBP (Appendix F of the O&M Plan).	This measure will be implemented as directed. The requirement for all chemical loading and storage areas to be equipped with proper containment and spill response equipment is in the design criteria and drawings which are presented in Appendices C and D, respectively, of this Final BOD Report. Storage and handling of hazardous materials are also discussed in the HMBP (Appendix F of the O&M Plan).	The BOD, including Volume 1 of the O&M Manual, was submitted on November 18, 2015.
Hazardous Materials	HAZ-1a-c	c) A project-specific HMBP, chemical standard operating procedure (SOP) protocols and contingency plans shall be developed to ensure that proper response procedures would be implemented in the event of spills or releases. Specifically, the HMBP and SOPs shall describe the procedures for properly storing and handling fuel on-site, the required equipment and procedures for spill containment, required personal protective equipment, and the measures to be used to reduce the likelihood of releases or spills during fueling or vehicle maintenance activities. BMPs to be implemented may include, but are not limited to, use of secondary containment in mixing and storage areas; availability of spill kits and spill containment booms, and appropriate storage containers for containment of the materials generated during the spill response. The field manager in charge of operations and maintenance activities shall be responsible for ensuring that these procedures are followed at all times.	Project-specific HBMP; O&M Plan (Volume 1 of the O&M Manual)	This measure will be implemented as directed. A project-specific HMBP, chemical standard operating procedure (SOP) protocols and contingency plans will be developed to ensure that proper response procedures would be implemented in the event of spills or releases.	This measure will be implemented as directed. Storage and handling of hazardous materials and spill response procedures will be discussed in the HMBP, the outline for which is presented in Appendix F of the O&M Plan (Volume 1), with the complete HMBP to be submitted as part of the 90% design.	This measure will be implemented as directed. Storage and handling of hazardous materials and spill response procedures will be discussed in the HMBP (Appendix F of O&M Plan).	Storage and handling of hazardous materials and spill response procedures are discussed in the HMBP (Appendix E of O&M Plan). The policy for safe fueling and proper handling of fuel on-site and measures to be used to reduce the likelihood of releases or spills during fueling are discussed in the Fuel SOP (Appendix F of the O&M Plan). The requirement to use appropriate personal protective equipment is contained in several locations in the O&M Manual, including Sections 6 and 7 of Volume 1 as well as Volume 5. The field manager in charge of operations and maintenance activities, or his/her designee, will be responsible for ensuring that safety procedures are followed at all times.	The project-specific HBMP was included as Appendix E in Volume 1 of the O&M Manual which was submitted on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Hazardous Materials	**HAZ-1b**	**Spill or Release of Contaminants during Construction and Decommissioning Activities.**						
Hazardous Materials	HAZ-1b-a	a) Fueling areas and maintenance areas would be supplied with proper secondary containment and spill response equipment.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This measure will be implemented as directed. Fueling areas and maintenance areas will be supplied with proper secondary containment and spill response equipment.	This measure will be implemented as directed. Fueling areas and maintenance areas will be supplied with proper secondary containment and spill response equipment. BMPs/SOPs for fueling during construction will be described in the BMP Plan, which will be submitted at the 90% design stage as part of Corrective Measure Construction/Remedial Action Work Plan and Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration.	This measure will be implemented as directed. Fueling areas and maintenance areas will be supplied with proper secondary containment and spill response equipment. BMPs/SOPs for fueling during construction are described in the BMPs Plan in an appendix of the Construction/ Remedial Action Work Plan. Appendix C of the Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration contains a safe fueling and fuel handling policy for activities during implementation of the Work Plan.	This measure will be implemented as directed. Fueling areas and maintenance areas will be supplied with proper secondary containment and spill response equipment. BMPs/SOPs for fueling during construction are described in the BMPs Plan in an appendix of the Construction/ Remedial Action Work Plan. Appendix C of the Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration contains a safe fueling and fuel handling policy for activities during implementation of the Work Plan.	This mitigation measure is addressed in Section 3 of the Revised IM-3 Decommissioning Plan as well as Section 3.2.3.1 and Appendix M of the C/RAWP. Both documents were submitted on November 18, 2015.
Hazardous Materials	HAZ-1b-b	b) PG&E shall develop fueling SOP protocols and a contingency plan that would be implemented at all fueling areas on-site. The SOPs shall describe the procedures for properly storing and handling fuel on-site, the required equipment and procedures for spill containment, required PPE, and the measures to be used to reduce the likelihood of releases or spills during fueling or vehicle maintenance activities. Potential measures include but are not limited to, fuel storage in bermed areas, performing vehicle maintenance in paved and bermed areas, and availability of spill kits for containment and cleanup of petroleum releases. The field manager in charge of construction and decommissioning activities shall be responsible for ensuring that these procedures are followed at all times.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This measure will be implemented as directed. Fueling SOP protocols and a contingency plan will be developed for implementation at fueling areas on-site during construction.	This measure will be implemented as directed. Fueling areas and maintenance areas will be supplied with proper secondary containment and spill response equipment. BMPs/SOPs for fueling during construction will be described in the BMP Plan, which will be submitted at the 90% design stage as part of Corrective Measure Construction/Remedial Action Work Plan and Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration.	This measure will be implemented as directed. Fueling areas and maintenance areas will be supplied with proper secondary containment and spill response equipment. BMPs/SOPs for fueling during construction are described in the BMPs Plan in an appendix of the Construction/Remedial Action Work Plan. Appendix G (Construction BMPs Plan) of the Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration contains BMPs for storage and handling of hazardous materials.	PG&E has developed fueling SOP protocols that meet the requirements of this measure (Appendix F of Volume 1 of the O&M Manual, Appendix B of the C/RAWP, and Appendix C of the Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration).	This mitigation measure was incorporated into Appendix F of Volume 1 of the O&M Manual, Appendix B of the C/RAWP, and Appendix C of the Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration. These documents were submitted on November 18, 2015.
Hazardous Materials	HAZ-1b-c	c) PG&E shall comply with local, state, and federal regulations related to the bulk storage and management of fuels.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This measure will be implemented as directed, for compliance with local, state, and federal regulations related to the bulk storage and management of fuels.	This measure will be implemented as directed. Fueling areas and maintenance areas will be supplied with proper secondary containment and spill response equipment. BMPs/SOPs for fueling during construction will be described in the BMP Plan, which will be submitted at the 90% design stage as part of Corrective Measure Construction/Remedial Action Work Plan and Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration.	This measure will be implemented as directed. Fueling areas and maintenance areas will be supplied with proper secondary containment and spill response equipment. BMPs/SOPs for fueling during construction are described in the BMPs Plan in Section 4 as well as an appendix of the Construction/ Remedial Action Work Plan. Appendix G (Construction BMPs Plan) of the IM-3 Decommissioning Plan contains BMPs addressing waste and materials storage and handling areas.	This measure will be implemented as directed. PG&E has a bulk storage tank for fuel at the TCS that is included in the TCS HMBP. The TCS HMBP is on file with the local Fire Department.	The TCS HMBP (February 2014) is on file with the local Fire Department.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Hazardous Materials	HAZ-2	**Reasonably Foreseeable Releases of Chemicals from Excavated or Disturbed Soil** -- Before initiating ground-disturbing operations, a health and safety plan shall be developed and implemented by qualified environmental professionals to ensure health and safety precautions are being met. It is not possible to prepare the health and safety plan at this stage of the planning process because final construction plans and other design documents have not been finalized in sufficient detail. However, at a minimum, the health and safety plan shall include procedures to mitigate potential hazards, and such procedures shall include the use of PPE, measures that provide protection from physical hazards, measures that provide protection from chemical hazards that may be present at the site, decontamination procedures, and worker and health and safety monitoring criteria to be implemented during construction. The worker health and safety plan shall include protective measures and PPE that are specific to the conditions of concern and meet the requirements of the U.S. Occupational Safety and Health Administration's (OSHA's) construction safety requirements and Hazardous Waste Operations and Emergency Response Standard (29 CFR 1910.120). In accordance with OSHA requirements, appropriate training and recordkeeping shall also be a part of the health and safety program. The worker health and safety plan shall be certified by a Certified Industrial Hygienist in accordance with OSHA regulations. The worker health and safety plan shall be explained to the construction workers and all workers shall be required to sign the plan, which will be kept on the construction site at all times. Worker safety training shall occur prior to initiation of ground disturbing activities. Training shall include the review of all health and safety measures and procedures. All workers and engineering inspectors at the site shall provide written acknowledgement that the soils management plan (discussed below), worker health and safety plan, and community health and safety plan were reviewed and training was received prior to commencement of construction activities. The following are specific elements and directives that shall be included in the health and safety plan and implemented by PG&E during construction, operation and maintenance, and decommissioning of this project:	Health and Safety Plan	This mitigation measure will be implemented as directed. A health and safety plan will be developed for O&M activities and will be submitted with the O&M Plan. Similarly, a health and safety plan will be developed for construction activities and will be submitted with the Construction/Remedial Action Work Plan. The plans will be implemented by qualified environmental professionals.	This mitigation measure will be implemented as directed. A health and safety plan will be developed for O&M activities and will be submitted at the 90% design stage. Similarly, a health and safety plan will be developed for construction activities and will be submitted with the Construction/Remedial Action Work Plan at the 90% design stage. The plans will be implemented by qualified environmental professionals.	This mitigation measure will be implemented as directed. A health and safety plan for O&M activities was developed and is included in Volume 5 of the O&M Manual. Similarly, a health and safety plan for construction activities was developed and is included in an appendix of the Construction/ Remedial Action Work Plan.	This mitigation measure will be implemented as directed. A health and safety plan and guidelines for O&M activities were developed and are included in Volume 5 of the O&M Manual. The final O&M health and safety plan that meets the requirements of this mitigation measure will be submitted during the start-up phase of the remedy. A health and safety plan for construction activities that meets the requirements of this mitigation measure was developed and is included in Appendix D of the Construction/Remedial Action Work Plan.	The O&M Manual and C/RAWP were submitted on November 18, 2015. The Construction Health and Safety Plan was certified by a Certified Industrial Hygienist in accordance with OSHA regulations on November 8, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Hazardous Materials	HAZ-2a	a. Vehicles traveling on unpaved roadways or surfaces would be directed to avoid traveling in areas where contaminated soils are known to be present; vehicle speeds shall be controlled (e.g., limited to 15 mph or slower) to limit generation of dust; measures, such as wetting of surfaces, will be employed to prevent dust generation by vehicular traffic or other dust-generating work activities.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This measure will be implemented as directed. Vehicle movement will be controlled to avoid traveling in areas where contaminated soils are known to be present, and limit speeds to limit generation of dust.	This measure will be implemented as directed. Vehicle movement will be controlled to avoid traveling in areas where contaminated soils are known to be present, and speeds will be limited to limit generation of dust.	This measure will be implemented as directed. Vehicle movement will be controlled to avoid traveling in areas where contaminated soils are known to be present, and speeds will be limited to limit generation of dust.	This measure will be implemented as directed. Vehicle movement will be controlled to avoid traveling in areas where contaminated soils are known to be present, and speeds will be limited to limit generation of dust.	This mitigation measure was incorporated into the O&M Manual, the C/RAWP, and the IM-3 Decommissioning Plan. These documents were submitted on November 18, 2015.
Hazardous Materials	HAZ-2b	b. Pre-mobilization planning shall occur during which the likelihood of encountering contaminated soils shall be reviewed along with the HMBP, site-specific health and safety plan, and SOPs so that the procedures are followed and the contingencies for handling contaminated soils are in-place prior to implementing the field operations.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This measure will be implemented as directed. Pre-mobilization planning will be used to review the likelihood of encountering contaminated soils, the HMBP, site-specific health and safety plan, and SOPs so that the procedures are followed and the contingencies for handling contaminated soils are in-place.	This measure will be implemented as directed. Pre-mobilization planning will be used to review the likelihood of encountering contaminated soils, the HMBP, site-specific health and safety plan, and SOPs so that the procedures are followed and the contingencies for handling contaminated soils are in-place.	This measure will be implemented as directed, and included in the health and safety plans. Pre-mobilization planning will be used to review the likelihood of encountering contaminated soils, the HMBP, site-specific health and safety plan, and SOPs so that the procedures are followed and the contingencies for handling contaminated soils are in-place.	This measure will be implemented as directed, and has been included in the health and safety plans, which require pre-mobilization planning to review the likelihood of encountering contaminated soils. The HMBP, site-specific health and safety plan, and SOPs will be reviewed at a pre-mobilization meeting so that the procedures are followed and the contingencies for handling contaminated soils are in-place.	This mitigation measure was incorporated into the O&M Manual and the C/RAWP (including the IM-3 Decommissioning Plan). These documents were submitted on November 18, 2015.
Hazardous Materials	HAZ-2c	c. Should evidence of contaminated soil be identified during ground disturbing activities (e.g., noxious odors, discolored soil), work in this area will immediately cease until soil samples can be collected and analyzed for the presence of contaminants by the site supervisor or the site safety officer. Contaminated soil shall be managed and disposed of in accordance with a project-specific health and safety plan and soil management plan. The health and safety plan and soil management plan shall be approved by DTSC before beginning any ground disturbing activities. While the project is exempt from the requirements of the San Bernardino County Division of Environmental Health, the health and safety plan and soil management plan shall be prepared in general accordance with the substantive requirements of this agency.	Health and Safety Plan; Soil Management Plan (Volume 4 of O&M Manual)	This measure will be implemented as directed. A Health and Safety Plan and a Soil Management Plan will be prepared as part of the Construction/Remedial Action Work Plan and submitted to DTSC.	This measure will be implemented as directed. Project-specific Health and Safety Plans for construction and O&M activities will be prepared and submitted to DTSC at the 90% design stage. A Soil Management Plan (SMP) is included in Volume 4 of the O&M Manual, which is Appendix L to the 60% BOD report. The SMP includes procedures and protocols for the management and disposal of potentially contaminated soil displaced during drilling, construction, O&M of the groundwater remedy, and the decommissioning and removal of the IM-3 system.	This mitigation measure will be implemented as directed. A health and safety plan for O&M activities was developed and is included in Volume 5 of the O&M Manual, which is Appendix L to the 90% BOD. Similarly, a health and safety plan for construction activities was developed and is included in an appendix of the Construction/Remedial Action Work Plan. A Soil Management Plan (SMP) is included in Volume 4 of the O&M Manual. The SMP includes procedures and protocols for the management and disposal of displaced soil, including potentially contaminated soil, during drilling, construction, O&M of the groundwater remedy, and the decommissioning and removal of the IM-3 system.	This mitigation measure will be implemented as directed. Section 4.6.2.2 of the C/RAWP requires that if evidence of contaminated soil is identified during ground-disturbing activities, work will be halted until soil samples are analyzed. A Soil Management Plan (SMP) is included in Volume 4 of the O&M Manual. The SMP includes procedures and protocols for the management and disposal of displaced soil, including potentially contaminated soil, during drilling, construction, O&M of the groundwater remedy, and the decommissioning and removal of the IM-3 system.	This mitigation measure was incorporated into the C/RAWP and the O&M Manual. Both the O&M Manual and C/RAWP were submitted on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Hazardous Materials	HAZ-2d	d. In the event that drilling sites must be located within areas of suspected soil contamination, the appropriate PPE shall be worn by all personnel working in these areas and methods specified in the health and safety plan used to control the generation of dust. When working in these areas, personnel shall be required to follow all guidance presented in the site-specific health and safety plan and soil management plan. The site-specific health and safety plan shall include provisions for site control such as, but not limited to, delineation of the exclusion, contaminant reduction and support zones for each work area, decontamination procedures, and procedures for the handling of contaminated soils and other investigation derived wastes. Soil that is excavated shall be loaded directly into containers such as roll-off bins; dust suppression methods shall be used prior to and during loading of soils into the bins. Suspected contaminated soils shall be segregated from suspected uncontaminated soils.	Health and Safety Plan	This measure will be implemented as directed. A Health and Safety Plan will be prepared as part of the Construction/Remedial Action Work Plan and submitted to DTSC.	This measure will be implemented as directed. Project-specific Health and Safety Plans for construction and O&M activities will be prepared and submitted to DTSC at the 90% design stage.	This mitigation measure will be implemented as directed. A health and safety plan for O&M activities was developed and is included in Volume 5 of the O&M Manual. Similarly, a health and safety plan for construction activities was developed and is included in an appendix of the Construction/ Remedial Action Work Plan.	This mitigation measure will be implemented as directed. The requirements of this mitigation measure are included in a health and safety plan for O&M activities (Volume 5 of the O&M Manual) and a health and safety plan for construction activities (Appendix D of the Construction/Remedial Action Work Plan). For example, delineation of the exclusion, contaminant reduction and support zones for each work area, and decontamination, are discussed in Section 6 of the HSP. The management and handling of potentially contaminated soil is included in the Soil Management Plan (Volume 4 of the O&M Manual).	The O&M Manual and the C/RAWP were submitted on November 18, 2015.
Hazardous Materials	HAZ-2e	e. Personnel working at the site shall be trained in Hazardous Waste Operations.	Health and Safety Plan	This measure will be implemented as directed. A Health and Safety Plan will be prepared as part of the Construction/Remedial Action Work Plan, and will include requirement for training of personnel working at the site in Hazardous Waste Operations.	This measure will be implemented as directed. Project-specific Health and Safety Plans for construction and O&M activities will be prepared and submitted to DTSC at the 90% design stage, and will include requirement for training of personnel working at the site in Hazardous Waste Operations.	This mitigation measure will be implemented as directed. A health and safety plan for O&M activities was developed and is included in Volume 5 of the O&M Manual. Similarly, a health and safety plan for construction activities was developed and is included in an appendix of the Construction/ Remedial Action Work Plan.	This mitigation measure will be implemented as directed. The requirement that personnel who will manage hazardous waste or potentially hazardous waste be trained in hazardous waste operations is included in Section 4.1 of the Soil Management Plan (Volume 4 of the O&M Manual), a health and safety plan and guideline for O&M activities (Volume 5 of the O&M Manual), and a health and safety plan for construction activities (Section 5, Appendix D of the C/RAWP).	The O&M Manual and C/RAWP were submitted on November 18, 2015.
Hazardous Materials	HAZ-2f	f. All soil excavated and placed in roll-off bins or trucks for transportation off-site shall be covered with a tarp or rigid closure before transporting, and personnel working in the area shall be positioned upwind of the loading location.	Soil Management Plan (Volume 4 of O&M Manual)	This measure will be implemented as directed. A Soil Management Plan will be prepared as part of the Construction/Remedial Action Work Plan, and will include requirement for soil excavated and placed in roll-off bins or trucks for transportation off-site to be covered with a tarp or rigid closure before transporting.	This measure will be implemented as directed. A Soil Management Plan (SMP) is included in Volume 4 of the O&M Manual, which is Appendix L to the 60% BOD report. The SMP includes requirement for soil excavated and placed in roll-off bins or trucks for transportation off-site to be covered with a tarp or rigid closure before transporting.	This measure will be implemented as directed. An SMP is included in Volume 4 of the O&M Manual, which is Appendix L to the 90% BOD report. The SMP includes requirement for soil excavated and placed in roll-off bins or trucks for transportation off-site to be covered with a tarp or rigid closure before transporting (see Section 4.6 of the SMP).	This measure will be implemented as directed. The requirements of this mitigation measure are included in the Soil Management Plan, which is included in Volume 4 of the O&M Manual, which is Appendix L to this Final BOD report. The Soil Management Plan includes the requirement for soil excavated and placed in roll-off bins or trucks for transportation off-site to be covered with a tarp or rigid closure before transporting (see Section 4.6 of the SMP). In general, personnel working in the area will be positioned upwind of construction activities including bin loading – this safety detail is usually covered under a Job	The Soil Management Plan is included as Volume 4 of the O&M Manual, which was submitted on November 18, 2015. The Construction Health and Safety Plan was included as Appendix D of the C/RAWP which was submitted on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
							Safety Analysis (JSA), which is also known as Activity Hazard Analysis (AHA)) or Job Hazard Analysis (JHA) (see Section 7.2 of the Construction Health and Safety Plan).	
Hydrology and Water Quality	HYDRO-1	**Exceedance of Water Quality Standards.** The project shall implement BMPs to meet the substantive criteria of NPDES General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities Order No. 2009-0009-DWQ, NPDES No. CAS000002 (General Permit) (SWRCB 2009) as well as all other applicable federal, state, and local permit and regulatory requirements, even if a permit is not required pursuant to CERCLA, for purposes of ensuring the protection of receiving water quality. As such, a BMP plan shall be prepared and implemented for the project prior to construction and decommissioning phase activities. Impacts on water quality from pollutants, including soils from erosion, shall be controlled through use of the following types of BMPs, which shall be incorporated into the appropriate project-specific BMP plan. The General Permit requirements include specific BMPs as well as numeric effluent levels (NELs) and numeric action levels (NALs) to achieve the water quality standards (SWRCB 2009:3). Types of BMPs cited in the General Permit (SWRCB 2009:7) include: a) Scheduling of Activities; b) Prohibitions of Practices; c) Maintenance Procedures; d) Other Management Practices to Prevent or Reduce Discharge of Pollutants to Waters of the United States; e) Treatment Requirements; and f) Operating Procedures and Practice to Control Site Runoff, Spillage or Leaks, Sludge or Waste Disposal, or Drainage from Raw Materials Storage. Visual inspections and monitoring and sampling are required under the General Permit to evaluate the effectiveness of the BMPs and to determine whether modifying BMPs or implementing additional BMPs is required. The BMP designations cited below are based on those used by the California Stormwater Quality Association Construction BMP Handbook (California Stormwater Quality Association 2003) and are consistent with the types of BMPs referenced in the General Permit: g) Scheduling (SS-1): Proper scheduling assists in identifying ways to minimize disturbed areas, which allows for a reduction in the active project area requiring protection and also minimizes the length of time disturbed soils are exposed to erosive processes.	BMP Plan	This measure will be implemented as directed. PG&E will prepare a BMP Plan prior to construction activities which will be included in the Construction/Remedial Action Work Plan.	This measure will be implemented as directed. PG&E will prepare a BMP Plan prior to construction activities (at the 90% design stage) which will be included in the Construction/Remedial Action Work Plan. On December 27, 2011, the Superior Court issued a judgment in response to litigation, and the State Water Board will be amending Order 2009-0009-DWQ (as modified by Order No. 2010-00014-DWQ) in accordance with the related peremptory writ of mandate. As a result, the Numeric Effluent Limits (NELs) are no longer in effect. In addition, further amendments to the permit are possible.	This measure will be implemented as directed. A BMP Plan was prepared and included in an appendix of the Construction/Remedial Action Work Plan. On July 17, 2012, the State Water Resources Control Board amended Order 2009-009-DWQ by adopting Order No. 2012-0006-DWQ, NPDES NO. CAS000002. Order 2012-006-DWQ requires effluent monitoring and reporting for pH and turbidity in storm water discharges. The monitoring will be used to evaluate whether numeric action levels (NALs) and numeric effluent limitations (NELs) for Active Treatment Systems included in the Construction General Permit are exceeded. The Permit contains only narrative effluent limitations and does not contain numeric effluent limitations, except for Active Treatment Systems (ATSs).	This measure will be implemented as directed. A BMP Plan was prepared by Gino Nguyen, a Qualified SWPPP Developer, to meet the substantive criteria of the applicable General Permit (including the July 2012 requirements) and all other applicable federal, state, and local permit and regulatory requirements. The BMP Plan is Appendix M to the Construction/Remedial Action Work Plan. Section 2 of the BMP Plan requires visual inspections and monitoring and sampling to evaluate the effectiveness of the BMPs and determine whether modification is required.	This measure is incorporated into the C/RAWP (see Appendix M) and in the IM-3 Decommissioning Work Plan (see Appendix G).These documents were submitted on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
		h) Preservation of Existing Vegetation (SS-2): Preserving existing vegetation to the maximum extent practicable facilitates protection of surfaces from erosion and can also help to control sediments. Sensitive areas should also be clearly identified and protected. i) Hydraulic Mulch (S S-3), Straw Mulch (S S-6), and Wood Mulching (SS-8): Using various mulches is a method for temporarily stabilizing soil and can be used on surfaces with little or no slope. j) Geotextiles, Plastic Covers, and Erosion Control Blankets/Mats (SS-7): These erosion control methods can be used on flat or, usually, sloped surfaces, channels, and stockpiles. k) Stabilized Construction Entrance/Exit (TC-1): A graveled area or pad located at points where vehicles enter and leave a construction site can be built. This BMP provides a buffer area where vehicles can drop their mud and sediment to avoid transporting it onto public roads, to control erosion from surface runoff, and to help control dust. l) Runoff Control Measures (SS-9, SS-10, and SC-10): These include graded surfaces to redirect sheet flow, diversion dikes or berms that force sheet flow around a protected area, and stormwater conveyances (swales, channels, gutters, drains, sewers) that intercept, collect, and redirect runoff. Diversions can be either temporary or permanent. Temporary diversions include excavation of a channel along with placement of the spoil in a dike on the downgradient side of the channel, and placement of gravel in a ridge below an excavated swale. Permanent diversions are used to divide a site into specific drainage areas, should be sized to capture and carry a specific magnitude of storm event, and should be constructed of more permanent materials. A water bar is a specific kind of runoff diversion that is constructed diagonally at intervals across a linear sloping surface such as a road or right-of-way that is subject to erosion. Water bars are meant to interrupt accumulation of erosive volumes of water through their periodic placement down the slope, and divert the resulting segments of flow into adjacent undisturbed areas for dissipation. m) Silt Fence (SC-1): A temporary sediment barrier consisting of fabric is designed to retain sediment from small disturbed areas by reducing the velocity of sheet flows. n) Gravel Bag Berm (SC-6) and Sand/Gravel Bag Barrier (SC-8): A temporary sediment barrier consisting of gravel-filled fabric bags is designed to						

		retain sediment from small disturbed areas by reducing the velocity of sheet flows. o) Desilting Basin (SC-2) and Sediment Trap (SC-3): Constructing temporary detention structures facilitates the removal of sediment from waters. The devices provide time for sediment particles to settle out of the water before runoff is discharged. Secondary concerns include potential pollutants from inappropriate material storage and handling procedures and nonstormwater discharges. These will be addressed through the following types of BMPs, which shall be incorporated into the stormwater BMP plan: p) Material Delivery and Storage (WM-1): Provide covered storage for materials, especially toxic or hazardous materials, to prevent exposure to stormwater. Store and transfer toxic or hazardous materials on impervious surfaces that will provide secondary containment for spills. Park vehicles and equipment used for material delivery and storage, as well as contractor vehicles, in designated areas. q) Spill Prevention and Control (WM-4): Ensure that spills and releases of materials are cleaned up immediately and thoroughly. Ensure that appropriate spill response equipment, preferably spill kits preloaded with absorbents in an overpack drum, is provided at convenient locations throughout the site. Spent absorbent material must be managed and disposed of in accordance with applicable regulations. In particular, absorbents used to clean up spills of hazardous materials or waste must be managed as hazardous waste unless characterized as nonhazardous. r) Solid Waste Management (WM-5): Provide a sufficient number of conveniently located trash and scrap receptacles to promote proper disposal of solid wastes. Ensure that the receptacles are provided with lids or covers to prevent windblown litter. s) Hazardous Waste Management (WM-6): Provide a sufficient number of proper receptacles to promote proper disposal of hazardous wastes. t) Concrete Waste Management (WM-8): Dispose of excess concrete in specific concrete washout facilities. u) Sanitary/Septic Waste Management (WM-9): Locate sanitary and septic waste facilities away from drainage courses and traffic areas. Maintain the facilities regularly. v) Vehicle and Equipment Cleaning (NS-8): Clean vehicles and equipment that regularly enter and leave the construction site. w) Vehicle and Equipment Fueling (NS-9): Fuel vehicles and equipment off- site whenever possible. If off-site fueling is not practical, establish a designated on-site fueling area with proper containment and spill cleanup materials. x) Vehicle and Equipment Maintenance (NS-10): Use off-site maintenance facilities whenever possible.						

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
		Any on-site maintenance areas must be protected from stormwater runoff and on-site flooding.						
Hydrology and Water Quality	HYDRO-1	In addition to BMPs implemented to avoid or reduce impacts from the construction and decommissioning phases, BMPs shall also be implemented to avoid or reduce impacts from the operations and maintenance phases. To address potential violation of water quality standards caused by insufficient treatment, system failure at concentrations in excess of water quality standards, proper design shall include contingency measures such as safeguards to shut down the extraction wells in case of pipeline failure or malfunction. In addition, operation of the proposed project will be governed by and follow an O&M plan. PG&E will comply with all applicable water quality standards, the General Permit, and any SWRCB or RWQCB resolutions identified as ARAR, as well as a corrective action monitoring program. Under the corrective action monitoring program, data will be collected to measure performance of the remedy, compliance with standards, and progress of the remedial action as a part of the project description. In addition, the project will be operated to continually assess performance issues and to modify the type, method, and configuration of the treatment delivery systems to enhance performance of the remedy to attain the cleanup goals and to respond to site conditions and performance issues as described in the project description.	O&M Plan	This measure will be implemented as directed. An O&M Plan will be developed and will include BMPs to avoid or reduce impacts from the operations and maintenance phases, and a monitoring program in compliance with applicable water quality standards, the General Permit, and identified ARARs.	This measure will be implemented as directed. The Contingency Plan (Volume 3) of the O&M Manual, which is included in the 60% design, includes BMPs to avoid or reduce impacts from the operations and maintenance phases. The Sampling and Monitoring Plan (Volume 2) of the O&M Manual includes a monitoring program in compliance with applicable water quality standards, and identified ARARs. The O&M SWPPP (Appendix E of the O&M Plan) will include a storm water monitoring program in compliance with the General Permit. The outline for the O&M SWPPP is included in the Draft O&M Manual at the 60% design stage; the complete SWPPP will be provided at the 90% design stage.	This measure will be implemented as directed. The Contingency Plan (Volume 3) of the O&M Manual, which is included in the 90% design, includes BMPs to avoid or reduce impacts from the operations and maintenance phases. The Sampling and Monitoring Plan (Volume 2) of the O&M Manual includes a monitoring program in compliance with applicable water quality standards, and identified ARARs. The O&M (or industrial) SWPPP (Appendix E of the O&M Plan) includes a storm water monitoring program in compliance with the new Statewide Industrial Storm Water General Permit, which will become effective on July 1, 2015.	This measure will be implemented as directed. The Contingency Plan (Volume 3) of the O&M Manual, which is included in the final design, includes BMPs to avoid or reduce hydrology and water quality impacts from the operations and maintenance phases, including, but not limited to, protocols for shutting down the extraction wells in case of pipeline failure or malfunction. An O&M Manual has been prepared to govern the operation of the remedy. The Sampling and Monitoring Plan (Volume 2) of the O&M Manual includes a monitoring program in compliance with applicable water quality standards, the General Permit, and identified ARARs. The O&M (or industrial) SWPPP (Appendix D of the O&M Plan) includes a storm water monitoring program in compliance with the new Statewide Industrial Storm Water General Permit, which became effective on July 1, 2015.	This measure is incorporated into the Contingency Plan (Volume 3) of the O&M Manual and the Sampling and Monitoring Plan (Volume 2) of the O&M Manual, which was submitted on November 18, 2015.
Hydrology and Water Quality	HYDRO-1	A SWPPP will also be prepared for the proposed project, which will contain BMPs related to industrial activities (industrial SWPPP). The BMPs are designed to reduce pollutants in discharges that may affect receiving water quality during operations and maintenance of the proposed project. As noted above, BMP designations are based on those used by the *California Stormwater Quality Association Construction BMP Handbook* (California Stormwater Quality Association 2003) and those referenced in the General Permit The SWPPP will incorporate BMPs such as the following: y) Good Housekeeping: Maintain facility in a clean manner and train facility personnel to contribute to a safe, clean, and orderly environment by properly disposing of trash in designated containers, storing materials in appropriate locations, and keeping equipment clean and in good working condition. z) Preventative Maintenance: Prevent or minimize release of pollutants. Develop Standard Operating Procedures for operation and maintenance of facility components and train employees to follow the procedures.	Stormwater Pollution Prevention Plan (SWPPP)/ BMP Plan and Monitoring and Reporting	This measure will be implemented as directed. An industrial Storm Water Pollution Prevention Plan (SWPPP) will be developed as part of the O&M Plan and implemented to reduce pollutants in discharges that may affect receiving water quality during operations and maintenance of the remedy	This measure will be implemented as directed. The O&M SWPPP outline is included as Appendix E of the O&M Plan. The complete SWPPP will be submitted at the 90% design stage. The SWPPP will be developed in compliance with the Industrial Storm Water General Permit Order 97-03-DWQ (General Industrial Permit), or the relevant applicable requirements.	This measure will be implemented as directed. The industrial SWPPP was developed and included in Appendix E of the O&M Plan. The O&M (or industrial) SWPPP (Appendix E of the O&M Plan) includes a storm water monitoring program in compliance with the new Statewide Industrial Storm Water General Permit which will become effective on July 1, 2015.	This measure will be implemented as directed. The industrial SWPPP that complies with the requirements of this mitigation measure and the General Permit was developed and included in Appendix D of the O&M Plan. For example, the O&M (or industrial) SWPPP (Appendix D of the O&M Plan) includes a storm water monitoring program in compliance with the new Statewide Industrial Storm Water General Permit which became effective on July 1, 2015.	This measure is incorporated in Appendix D (Storm Water Pollution Prevention Plan for O&M Activities) of the O&M Manual, Volume 1, which was submitted on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
		aa) Non-Stormwater Discharges (SC-10): Ensure that used oil, used antifreeze, and hazardous chemical recycling programs are being implemented. Conduct regular inspections of high priority areas. bb) Spill Prevention, Control, and Cleanup (SC-1 1): Store materials properly to prevent spills from entering the storm drain system or surface waters. Ensure that spill cleanup materials are located on-site and are easily accessible. Clean up leaks and spills immediately using proper absorbent materials. Absorbents used to clean up hazardous materials must be disposed of as hazardous waste. Educate employees about spill prevention and cleanup. cc) Vehicle and Equipment Fueling (SC-20): Maintain clean fuel-dispensing areas using dry cleanup methods, such as sweeping or using rags and absorbents for leaks and spills. Cover the fueling area to prevent contact with stormwater. Train personnel in pollution prevention, focusing on containment of spills and leaks. dd) Outdoor Loading/Unloading (SC-30): Load and unload chemicals during dry weather, if possible, and load and unload in designated areas. Check equipment regularly for leaks. ee) Outdoor Liquid Container Storage (SC-3 1): Cover the storage area with a roof and provide secondary containment. Inspect storage areas regularly for leaks or spills. ff) Outdoor Equipment Operations (SC-32): Perform activities during dry weather, cover the work area with a roof, and use secondary containment. Train employees in proper techniques for spill containment and cleanup. gg) Waste Handling and Disposal (SC-34): Cover storage containers with leak-proof lids, check for leaks weekly, and clean storage areas regularly. Ensure that wastes are disposed of properly. hh) Tank Design System: Ensure that tank systems have sufficient strength to avoid collapse, rupture, or failure and that they are protected against physical damage and excessive stress. Provide adequate secondary containment.						
Hydrology and Water Quality	HYDRO-1	In conformance with the substantive requirements of General Permit (Order No. 2009-0009-DWQ, a monitoring and reporting program will be implemented to assess the effectiveness of BMPs and to modify BMPs and revise the SWPPP, if necessary, to continue to reduce pollutants and impacts on receiving waters. The monitoring program shall include the following minimum elements as per the General Permit: ii) quarterly, nonstormwater visual inspections,	Stormwater Pollution Prevention Plan (SWPPP)/ BMP Plan and Monitoring and Reporting	This measure will be implemented as directed. The SWPPP will include a monitoring and reporting program to assess the effectiveness of BMPs and to modify BMPs and revise the SWPPP, if necessary.	This measure will be implemented as directed. The O&M SWPPP and BMP Plan, which will be submitted at the 90% design stage, will include a monitoring and reporting program to assess the effectiveness of BMPs and to modify BMPs and revise the SWPPP, if necessary. On December 27, 2011, the Superior Court issued a judgment in response	This measure will be implemented as directed. The industrial SWPPP and BMP Plan include a monitoring and reporting program to assess the effectiveness of BMPs and to modify BMPs and revise the SWPPP, if necessary. On July 17, 2012, The State Water Resources Control Board amended Order 2009-009-DWQ by adopting	This measure will be implemented as directed. The industrial SWPPP and BMP Plan include a monitoring and reporting program to assess the effectiveness of BMPs and to modify BMPs and revise the SWPPP, if necessary.	This measure is incorporated in Appendix D (Storm Water Pollution Prevention Plan for O&M Activities) of the O&M manual, Volume 1; Appendix M of the C/RAWP; as well as Appendix G of the IM-3 Decommissioning Plan. These documents were submitted on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
		jj) storm-related visual inspections within 2 business days of a qualifying rain event (producing precipitation of one-half inch or more of discharge), kk) visual inspection after a storm event, ll) monitoring of nonvisual pollutants based on the calculated risk level for the project, with Risk Level 2 and 3 requiring a minimum of three samples per day during qualifying rain events (SWRCB 2009: Tables 5 and 6, 22–27), and mm) monitoring and reporting for linear projects as per Table 2.7-1A of the General Permit Results of this monitoring shall be reported annually to DTSC and to the Storm Water Multi-Application Reporting and Tracking System (SMARTS). The annual report shall include a summary and evaluation of all sampling and analysis results, original laboratory reports, and chain of custody forms; a summary of all corrective actions taken during the compliance year; and identification of any compliance activities or corrective actions that were not implemented. NEL Violation Reports and/or NAL Violation Reports are required for Risk Level 3 and linear underground/overhead project (LUP) Type 3 Discharges. Should the project meet these criteria, the respective reports shall be submitted within 5 days of the end of the storm event, as per General Permit requirements, and provide the required information identified (SWRCB 2009:26–27 and Table 2.7-1A). The implementation of stormwater plans shall include an education component to train workers on water quality concerns and proper BMP implementation, maintenance, and repair, in addition to stormwater management program training on the construction BMP plan and industrial SWPPP.			to litigation, and the State Water Board will be amending Order 2009-0009-DWQ (as modified by Order No. 2010-00014-DWQ) in accordance with the related peremptory writ of mandate. As a result, the Numeric Effluent Limits (NELs) are no longer in effect. In addition, further amendments to the permit are possible.	Order No. 2012-0006-DWQ NPDES NO. CAS000002. Order 2012-006-DWQ requires effluent monitoring and reporting for pH and turbidity in storm water discharges. The monitoring will be used to evaluate whether numeric action levels (NALs) and numeric effluent limitations (NELs) for Active Treatment Systems included in the Construction General Permit are exceeded. The Permit contains only narrative effluent limitations and does not contain numeric effluent limitations, except for Active Treatment Systems (ATSs).		
Hydrology and Water Quality	HYDRO-2	**Exceedance of Water Quality Standards and/or Waste Discharge Requirements** - Implement Mitigation Measure HYDRO-1. Implementation of appropriate BMPs defined in Mitigation Measure HYDRO-1 would minimize impacts on water quality by controlling erosion and siltation. Consequently, any impacts associated with erosion and siltation resulting from alterations of drainage and hydrology and water quality during construction, operation and maintenance, and decommissioning.	Stormwater Pollution Prevention Plan (SWPPP)/ BMP Plan and Monitoring and Reporting	This measure will be met through actions to be taken under HYDRO-1.	This measure will be met through actions to be taken under HYDRO-1.	This measure will be met through actions to be taken under HYDRO-1.	This measure will be met through actions to be taken under HYDRO-1.	See HYDRO-1.
Hydrology and Water Quality	HYDRO-3	**Exceedance of Water Quality Standards and/or Waste Discharge Requirements.** Implement Mitigation Measure HYDRO-1. Mitigation Measure HYDRO- 1 shall be implemented. Implementation of appropriate BMPs defined in Mitigation Measure HYDRO-1 would minimize impacts on water quality by controlling potential pollutants, including sediment, and runoff discharges from the project area. Consequently, any impacts associated with	Stormwater Pollution Prevention Plan (SWPPP)/ BMP Plan and Monitoring and Reporting	This measure will be met through actions to be taken under HYDRO-1.	This measure will be met through actions to be taken under HYDRO-1.	This measure will be met through actions to be taken under HYDRO-1.	This measure will be met through actions to be taken under HYDRO-1.	See HYDRO-1.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
		pollutants resulting from alterations of drainage and water quality during construction, operation and maintenance, and decommissioning.						
Noise	**Noise-1**	**Short-Term Groundborne Noise and Vibration Levels Caused by Construction Activities near Sensitive Receptors.**						
Noise	Noise-1a	a) Construct new wells a minimum of 45 feet from vibration-sensitive receptors. Avoid constructing wells within 30 feet of vibration- sensitive land uses located in California and 275 feet of vibration-sensitive land uses located in Arizona;	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	The EIR defined the Topock Marina Mobile Home Park or single family residences (page 4.9-20) as vibration-sensitive receptors. Since the EIR does not define vibration-sensitive land uses, PG&E assumes that they are residential and mobile home parks. Based on this definition, none of the remediation wells presented in the preliminary (30%) design are located within 45 feet of vibration-sensitive receptors or within 30 feet and 275 feet of vibration-sensitive land uses in California and Arizona, respectively. Locations of new monitoring wells will be presented in the intermediate (60%) design, these wells will be placed to meet the requirements of this mitigation measure.	The EIR defined the Topock Marina Mobile Home Park or single family residences (page 4.9-20) as vibration-sensitive receptors. Based on the EIR discussion, PG&E assumes that vibration-sensitive land uses are residential and mobile home parks. Based on this definition, none of the proposed remediation or new monitoring wells presented in the 60% design is located within 45 feet of vibration-sensitive receptors or within 30 feet and 275 feet of vibration-sensitive land uses in California and Arizona, respectively.	PG&E understands that NOISE-1 analyzes whether construction may result in the exposure of sensitive receptors to groundborne noise and vibration levels that exceed the applicable standards of the San Bernardino County Development Code (83.01.090) and the Mohave County Zoning Ordinance**.** Potential significant impacts the measure is designed to mitigate are “annoyance and/or architectural/structural damage.” For the purpose of NOISE-1, the EIR defined the Topock Marina Mobile Home Park or single family residences (page 4.9-20) as vibration-sensitive receptors. Based on this definition, none of the proposed remediation or new monitoring wells presented in the 90% design is located within 45 feet of vibration-sensitive receptors or within 30 feet and 275 feet of vibration-sensitive land uses in California and Arizona, respectively.	PG&E understands that NOISE-1 analyzes whether construction may result in the exposure of sensitive receptors to groundborne noise and vibration levels that exceed the applicable standards of the San Bernardino County Development Code (83.01.090) and the Mohave County Zoning Ordinance**.** Potential significant impacts the measure is designed to mitigate are “annoyance and/or architectural/structural damage.” For the purpose of NOISE-1, the EIR defined the Topock Marina Mobile Home Park or single family residences (page 4.9-20) as vibration-sensitive receptors. Based on this definition, none of the proposed remediation or new monitoring wells presented in the final design is located within 45 feet of vibration-sensitive receptors or within 30 feet and 275 feet of vibration-sensitive land uses in California and Arizona, respectively.	This measure was incorporated into the final design, submitted on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed

Noise	Noise-1b	b) A disturbance coordinator will be designated by the project applicant, which will post contact information in a conspicuous location near the entrance so that it is clearly visible to nearby receivers most likely to be disturbed. The coordinator will manage complaints resulting from the construction vibration. Reoccurring disturbances will be evaluated by a qualified acoustical consultant retained by the project applicant to ensure compliance with applicable standards. The disturbance coordinator will contact nearby vibration-sensitive receptors, advising them of the construction schedule.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	Noise disturbance coordinators have been designated to manage communication with nearby vibration-sensitive receptors, and noise/vibration issues and complaints.	Noise disturbance coordinators have been designated to manage communication with nearby vibration-sensitive receptors, and noise/vibration issues and complaints.	PG&E disturbance coordinators (Curt Russell and Chris Smith) have been designated to manage both noise and vibration concerns that may arise during construction. The disturbance coordinators will post their contact information in a conspicuous location near the construction trailer entrance so that it is clearly visible to nearby receivers. The disturbance coordinator will send the construction schedule to nearby vibration-sensitive receptors prior to commencement of that construction work. Should a concern about the actual noise generated by remedy construction arise, PG&E disturbance coordinator will thoroughly investigate and resolve the issue appropriately. A qualified acoustical consultant will evaluate all reoccurring disturbances for compliance with applicable standards. All noise complaints and their resolutions will be recorded, tracked, and reported to DTSC in the quarterly compliance reports. The disturbance coordinators will post their contact information in a conspicuous location near the construction trailer entrance so that it is clearly visible to nearby receivers. The disturbance coordinator will send the construction schedule to nearby vibration-sensitive receptors prior to commencement of that construction work. Should a concern about the actual noise generated by remedy construction arise, the PG&E disturbance coordinator(s) will thoroughly investigate and resolve the issue appropriately. A qualified acoustical consultant will evaluate all reoccurring disturbances for compliance with applicable standards. All noise complaints and their resolutions will be recorded, tracked, and reported to DTSC in the quarterly compliance reports.	Disturbance coordinators were designated on November 18, 2011
Noise	**Noise-2**	**Project-Generated Construction-Related Noise Levels.**						
Noise	Noise-2a	a) Construction equipment shall be properly maintained per manufacturer specifications and fitted with the best available noise suppression devices (e.g., mufflers, silencers, wraps). All impact tools shall be shrouded or shielded, and all intake and exhaust ports on power equipment shall be muffled or shielded.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This measure will be implemented as directed. Construction equipment will be maintained and fitted with available noise suppression devices, impact tools will be shrouded or shielded, and all intake and exhaust ports on power equipment will be muffled or shielded.	This measure will be implemented as directed. Construction equipment will be maintained and fitted with available noise suppression devices, impact tools will be shrouded or shielded, and all intake and exhaust ports on power equipment will be muffled or shielded.	This measure will be implemented as directed. Construction equipment will be maintained and fitted with best available noise suppression devices, applicable impact tools will be shrouded or shielded, and all intake and exhaust ports on power equipment will be muffled or shielded.	This measure will be implemented as directed. Construction equipment will be maintained and fitted with best available noise suppression devices, applicable impact tools will be shrouded or shielded, and all intake and exhaust ports on power equipment will be muffled or shielded.	This measure was incorporated into the C/RAWP and the IM-3 Decommissioning Work Plan (Appendix F) which were submitted on November 18, 2015.
Noise	Noise-2b	b) Construction equipment shall not idle for extended periods of time (more than 15 minutes) when not being utilized during construction activities.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This measure will be implemented as directed. Construction equipment will not be left idle for extended periods of time (more than 15 minutes) when not being used.	This measure will be implemented as directed. Construction equipment will not be left idle for extended periods of time (more than 15 minutes) when not being used.	This measure will be implemented as directed. Construction equipment will not be left idle for extended periods of time (more than 15 minutes) when not being used.	This measure will be implemented as directed. The BMP Plan (Section 4.6.3 of the C/RAWP) and Appendix G to the IM-3 Decommissioning Work Plan BMPs (Appendix G to Appendix F of the C/RAWP) require construction equipment to not be left idle for extended periods of time (more than 15 minutes) when not being used.	The C/RAWP and the IM-3 Decommissioning Work Plan (Appendix F) were submitted on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Noise	Noise-2c	c) Construction activities shall include the use of berms, stockpiles, dumpsters, and or bins to shield the nearest noise-sensitive receptor adjacent to construction activities to within acceptable non-transportation noise level standards. When construction activities are conducted within the distances outlined above (i.e., 1,850 feet and 5,830 feet from California receptors and 330 feet and 735 feet from Arizona receptors for daytime and nighttime noise, respectively) relative to noise-sensitive uses in the project area, noise measurements shall be conducted by a qualified acoustical consultant at the nearest noise-sensitive land use relative to the construction activities with a sound level meter that meets the standards of the American National Standards Institute (ANSI Section S14 1979, Type 1 of Type 2) to ensure that construction noise associated with the project component complies with applicable daytime and nighttime noise standards. If noise levels are still determined to exceed noise standards, temporary barriers shall be erected as close to the construction activities as feasible, breaking the line of sight between the source and receptor where noise levels exceed applicable standards. All acoustical barriers shall be constructed with material having a minimum surface weight of 2 pounds per square foot or greater and a demonstrated Sound Transmission Class (STC) rating of 25 or greater as defined by the American Society for Testing and Materials' Test Method E90. Placement, orientation, size, and density of acoustical barriers shall be specified by a qualified acoustical consultant.	Construction/Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	This measure will be implemented as directed. The use of berms, stockpiles, dumpsters, and or bins to shield the nearest noise-sensitive receptor adjacent to construction activities will be implemented. When construction activities are within the distance outline, the additional requirements specified in this measure will be implemented.	This measure will be implemented as directed. PG&E interprets the acceptable non-transportation noise level standards cited in the mitigation measure to be San Bernardino County Development Code 83.01.080; specifically Table 83-2 specifies noise standards for stationary noise sources for residential land use to be 55 A-weighted decibels (dBA) from 7 am-10 pm and 45 dBA from 10 pm-7 am, other Commercial land use to be 60 dBA all day, and Industrial land use to be 70 dBA all day. In addition, Section (g) of the County Code 83.01.080 lists the noise sources that are exempted from the regulations which include a) motor vehicles not under the control of the commercial or industrial use, b) emergency equipment/vehicles/devices, and c) temporary construction, maintenance, repair, or demolition activities between 7 am and 7 pm, except Sundays and Federal holidays. The use of berms, stockpiles, dumpsters, and/or bins to shield the nearest noise-sensitive receptor adjacent to construction activities will be implemented as needed. When construction activities are within the distance outline, the additional requirements specified in this measure will be implemented.	This measure will be implemented as directed. PG&E interprets the acceptable non-transportation noise level standards cited in the mitigation measure to be San Bernardino County Development Code 83.01.080; specifically Table 83-2 specifies noise standards for stationary noise sources for residential land use to be 55 A-weighted decibels (dBA) from 7 am-10 pm and 45 dBA from 10 pm-7 am, other Commercial land use to be 60 dBA all day, and Industrial land use to be 70 dBA all day. In addition, Section (g) of the County Code 83.01.080 lists the noise sources that are exempted from the regulations which include a) motor vehicles not under the control of the commercial or industrial use, b) emergency equipment/vehicles/devices, and c) temporary construction, maintenance, repair, or demolition activities between 7 am and 7 pm, except Sundays and federal holidays. Figures in Section 4 of the Construction/Remedial Action Work Plan identify the noise sensitive receptors and potential construction activities that could trigger noise monitoring in accordance with the EIR mitigation measure Noise-2c. Although night-time construction is not planned, activities that could occur within specified distance from the sensitive receptors are identified on both figures for completeness. Noise monitoring locations will be the boundary of the noise receptors facing the project-related construction activities. The precise monitoring locations will be determined in the field by a qualified acoustical consultant. The use of berms, stockpiles, dumpsters, and/or bins to shield the nearest noise-sensitive receptor adjacent to construction activities will be implemented as needed, and is included in the Construction/Remedial Action Work Plan.	This measure will be implemented as directed. Based on the text in the 2011 EIR, PG&E interprets the acceptable non-transportation noise level standards cited in the mitigation measure to be San Bernardino County Development Code 83.01.080; specifically Table 83-2 specifies noise standards for stationary noise sources for residential land use to be 55 A-weighted decibels (dBA) from 7 am-10 pm and 45 dBA from 10 pm-7 am, other Commercial land use to be 60 dBA all day, and Industrial land use to be 70 dBA all day. In addition, Section (g) of the County Code 83.01.080 lists the noise sources that are exempted from the regulations which include a) motor vehicles not under the control of the commercial or industrial use, b) emergency equipment/vehicles/devices, and c) temporary construction, maintenance, repair, or demolition activities between 7 am and 7 pm, except Sundays and federal holidays. Figures in Section 4 of the Construction/Remedial Action Work Plan identify the noise sensitive receptors and potential construction activities that could trigger noise monitoring in accordance with the EIR mitigation measure Noise-2c. Although night-time construction is not planned, activities that could occur within specified distance from the sensitive receptors are identified on both figures for completeness. Noise monitoring locations will be the boundary of the noise receptors facing the project-related construction activities. The precise monitoring locations will be determined in the field by a qualified acoustical consultant. The use of berms, stockpiles, dumpsters, and/or bins to shield the nearest noise-sensitive receptor adjacent to construction activities will be implemented as needed, and is included in the Construction/Remedial Action Work Plan.	This measure was incorporated into the C/RAWP and the IM-3 Decommissioning Work Plan (Appendix F) which were submitted on November 18, 2015.

Noise	**NOISE-3**	**Land Use Compatibility of Future Project Noise Levels with Places of Worship and the Topock Cultural Area.** Provided that the proposed project would be required to achieve the normally acceptable exterior noise level standard for places of worship, the following mitigation measure shall be incorporated in the project design:		This mitigation measure will be met through actions taken to implement NOISE-3a and 3b (see below).	This mitigation measure will be met through actions taken to implement NOISE-3a and 3b (see below).	The project has been designed to meet the normally acceptable exterior noise-level standard for places of worship during operation. This mitigation measure also will be met through actions taken to implement NOISE-3a and 3b (see below).	The project has been designed to meet the normally acceptable exterior noise-level standard for places of worship during operation. This mitigation measure also will be met through actions taken to implement NOISE-3a and 3b (see below).	
Noise	NOISE-3a	a) Implement all of the mitigation measures outlined for Impact NOISE- 1 and Impact NOISE-2;		This measure will be met through actions to be taken under mitigation measures outlined for Impact NOISE- 1 and Impact NOISE-2.	This measure will be met through actions to be taken under mitigation measures outlined for Impact NOISE-1 and Impact NOISE-2.	This measure will be met through actions to be taken under mitigation measures outlined for Impact NOISE-1 and Impact NOISE-2.	This measure will be met through actions to be taken under mitigation measures outlined for Impact NOISE-1 and Impact NOISE-2.	See NOISE-1 and NOISE-2. A protocol to implement this measure was included in the CIMP (CUL-1a-8h). The CIMP was included as an appendix to the C/RAWP which was submitted on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed
				Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design	
Noise	NOISE-3b	b) Upon completion of detailed project design, the determination of remediation activities and the schedule established to achieve these activities shall be communicated to Native American Tribes. PG&E shall maintain a liaison with requesting Tribes to alert them to project activities that would generate new noise in the Topock Cultural Area on at least an annual basis.		This measure will be implemented as directed. A liaison with requesting Native American Tribes will alert them to project activities that would generate new noise in the Topock Cultural Area on at least an annual basis.	This measure will be implemented as directed. A liaison with requesting Native American Tribes will alert them to project activities that would generate new noise in the Topock Cultural Area on at least an annual basis.	This measure will be implemented as directed. A liaison with requesting Native American Tribes will alert them to project activities that would generate new noise in the Topock Cultural Area on at least an annual basis. In addition, the following communication protocols developed as part of the CIMP noise protocol CUL-1a-8h (Section 2.8.4) will also be implemented: All project construction activities will be communicated to nearby noise-sensitive receptors and Interested Tribes. Elements of this communication include: • A detailed project schedule is established and published for all stakeholders. • Monthly notification to agencies and Tribes of scheduled field activities. During periods of extensive construction activity, these notifications will be issued more frequently – weekly and/or daily, as appropriate. • After issuing these notifications, notify the nearby noise-sensitive receptors and Tribes of any schedule changes. • Provide an open-communication process for Tribal representatives to seek more information about Project noise-generating activities. PG&E welcomes Tribal input on timing of Project noise-generating activities and on potential noise-reducing methods. Per CUL-1a-8k, if ceremonies are requested by any Tribe during construction, then PG&E will follow the protocol to accommodate such requests, which could include monitoring to ensure that construction noise does not exceed the normally acceptable exterior noise level standard in San Bernardino County for places of worship. • The contact information for the disturbance coordinator will be posted in a conspicuous location near the construction areas. This information will also be mailed to	This measure will be implemented as directed. The CIMP contains the requirement to communicate the remediation activities and schedule to the Tribes (see, e.g., CIMP sections 2.1, 2.4, and 2.10) and to maintain a liaison with requesting Native American Tribes to alert those Tribes to project activities that would generate new noise in the Topock Cultural Area on at least an annual basis (CIMP section 2.8.5). Mitigation Measure CUL-1a-8h addresses other measures to minimize impacts to cultural resources from project-related noise. See Mitigation Measure CUL-1a-8h for those measures.	A protocol to implement this measure was included in the CIMP (CUL-1a-8h). The CIMP was included as Appendix H to the C/RAWP which was submitted on November 18, 2015.

TABLE L1.1-1
Summary of Compliance with EIR Mitigation Measures
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Resources	Mitigation Number	Mitigation Measure	Which document(s) will contain or satisfy this measure?[1]	Action (Compliance Status)				Date Completed

						all nearby noise-sensitive receptors and Interested Tribes. In addition to the communication methods described above, PG&E will also consider posting construction schedule information at the information kiosk (CUL-1a-3c). PG&E may also decide to use other communication processes, including a Project website (a Project website could list Project activity schedules and other Project related information) that could be accessed by computer or smartphone and/or other simple push applications that apply to mobile devices.		
Water Supply	WATER-1	**Depletion of Groundwater.** To mitigate potentially significant effects on local groundwater levels associated with the freshwater extraction wells, in the event that freshwater is to be supplied from wells rather than from a surface intake, a hydrologic analysis shall be conducted during the design phase of the project to evaluate the proposed pumping rates for extraction, the potential cone of depression, and the extraction effect on any existing wells in proximity. Proximity shall be defined by the cone of depression boundary of any well to be used in the extraction process. Extraction well location and/or extraction rates shall be adjusted during project design based on this analysis to ensure that extraction does not substantially adversely affect the production rates of existing nearby wells (e.g., adversely affect well production such that existing land uses would not be supported). It shall be demonstrated using computer simulations or other appropriate hydrologic analysis that production rates of existing nearby wells will not be substantially affected before the installation of any new freshwater extraction wells.	Alternative Freshwater Sources Evaluation Technical Memorandum	Work on the required hydrologic analysis has commenced and will be reported in the intermediate (60%) design.	A plan for conducting a long-term constant-rate extraction test at HNWR-1 well is included in the *Revised Implementation Plan for Evaluation of Alternative Freshwater Sources* (CH2M HILL 2013c). Upon receipt of agencies' approval, PG&E will implement the plan. Data collected will be used to evaluate compliance with this measure.	A 72-hour constant-rate extraction test at Havasu National Wildlife Refuge (HNWR)-1 well was conducted in February 11-14, 2014 in accordance with the *Final Implementation Plan for Evaluation of Alternative Freshwater Sources* (CH2M HILL, 2013j). In addition, a 72-hour constant-rate extraction test was conducted at the Site B well from February 7 to 10, 2014. Test results indicated that existing nearby wells will not be substantially affected by pumping at the potential freshwater sites. PG&E presented the information to agencies, Tribes, and stakeholders at the March 19, 2014 TWG meeting, and summarized the results in a technical memorandum (CH2M HILL 2014b) for submittal to DTSC and DOI on April 2, 2014.	A 72-hour constant-rate extraction test at Havasu National Wildlife Refuge (HNWR)-1 well was conducted in February 11-14, 2014 in accordance with the *Final Implementation Plan for Evaluation of Alternative Freshwater Sources* (CH2M HILL, 2013j). In addition, a 72-hour constant-rate extraction test was conducted at the Site B well from February 7 to 10, 2014. Test results indicated that existing nearby wells will not be substantially affected by pumping at the potential freshwater sites. PG&E presented the information to agencies, Tribes, and stakeholders at the March 19, 2014 TWG meeting, and summarized the results in a technical memorandum (CH2M HILL 2014b) for submittal to DTSC and DOI on April 2, 2014.	A 72-hour constant rate extraction test was conducted at potential freshwater supply wells (HNWR-1 and Site B) in February 2014. Test results indicated that existing nearby wells will not be substantially affected by pumping at the potential freshwater sites. Results were summarized in a technical memorandum (CH2M HILL, 2014j) and submitted to DTSC and DOI on April 2, 2014. The memorandum is also included in Appendix N of this report.

Notes:

[1] The intent of this column is to identify what current or future document(s) are intended to satisfy this measure and be transparent on future forthcoming documentation. This column is not intended to document compliance with the mitigation measure.

EXHIBIT L1.1-1

Protocol for Compliance with EIR MMRP Mitigation Measure BIO-1 and ARAR #32 at the Topock Compressor Station

Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Application of Section 404 of the Clean Water Act to the Project

Pacific Gas & Electric Company (PG&E) has prepared this protocol to identify procedures to be taken to ensure compliance with Section 404 of the Clean Water Act (CWA) and for the Topock Remediation Project (the project) located at the Topock Compressor Station in Needles, California. Section 404 of the CWA is an Applicable or Relevant and Appropriate Requirement (ARAR) for the project. Additionally, the Final Environmental Impact Report (EIR) Mitigation and Monitoring Reporting Program (MMRP; California Department of Toxic Substances Control [DTSC] 2011c) mitigation measure BIO-1 contains applicable mitigation requirements related to CWA Section 404.

The text of MMRP BIO-1 (excerpted) and ARAR #32 are as follows:

> **BIO-1:** "If during the design process it is shown that complete avoidance of habitats under U.S. Army Corps of Engineers (USACE) jurisdiction is not feasible, the Section 404 permitting process shall be completed, or the substantive equivalent per CERCLA Section 121(e)(1). In either event, the acreage of affected jurisdictional habitat shall be replaced and/or rehabilitated to ensure 'no-net-loss' Before any ground-disturbing Project activities begin in areas that contain potentially jurisdictional wetlands, the wetland delineation findings shall be documented in a detailed report and submitted to USACE for verification as part of the formal Section 404 wetland delineation process and to DTSC. For all jurisdictional areas that cannot be avoided as described above, authorization for fill of wetlands and alteration of waters of the United States shall be secured from USACE through the Section 404 permitting process before project implementation. Habitat restoration, rehabilitation, and/or replacement shall be at a location and by feasible methods agreeable to USACE and consistent with applicable county and agency policies and codes. Minimization and compensation measures adopted through any applicable permitting processes shall be implemented.
>
> Alternatively, if USACE declines to assert jurisdiction because it determines that CERCLA Section 121(e)(1) applies, the substantive equivalent of the Section 404 permitting process shall be complied with by ensuring that the acreage of jurisdictional wetland affected is replaced on a "no-net-loss" basis in accordance with the substantive provisions of USACE regulations. Habitat restoration, rehabilitation, and/or replacement shall be at a location and by feasible methods consistent with USACE methods, and consistent with the purpose and intent of applicable county and agency policies and codes. Minimization and compensation measures adopted through any applicable permitting processes shall be implemented. In any event, a report shall be submitted to DTSC to document compliance with these mandates."
>
> **ARAR #32**: "This section of the Clean Water Act prohibits certain activities with respect to on-site wetlands and waterways. No discharge of dredged or fill material shall be permitted if there is a practicable alternative to the proposed activity which would have less adverse impact to the aquatic ecosystem." Federal Water Pollution Control Act (Clean Water Act), 33 USC § 1344, 40 CFR 230.10.

Under CWA Section 404, activities that discharge dredged or fill material into waters of the United States typically require a CWA Section 404 permit from the USACE.

PG&E has determined that the Topock Remediation Project would result in a discharge of dredged or fill material into jurisdictional waters and wetlands. However, the project is a CERCLA response action, and therefore the permit exemption at CERCLA Section 121(e)(1) applies to the project's on-site activities.[3] Therefore, PG&E is not required to

[3] *See* 42 U.S.C. 9921(e)(1) ("No Federal, State, or local permit shall be required for the portion of any removal or remedial action conducted entirely on-site where such remedial action is selected and carried out in compliance with this section."); DOI Memorandum, dated November 16, 2007.

comply with the procedural permitting requirements under Section 404. Although no CWA Section 404 permit is required for the Project, PG&E must still comply with the substantive requirements of the CWA Section 404.

PG&E received a letter from the USACE Los Angeles District Regulatory Program, dated July 10, 2013 (USACE 2013a), which stated that no permit is required for the Topock Remediation Project because the project is proceeding pursuant to the U.S. Department of the Interior's (DOI) CERCLA authority. Further, the USACE confirmed that no "substantive requirements or applicable conditions" were provided and the USACE would not verify PG&E's wetland delineation because no permit is required for the CERCLA action (USACE 2013b).

Section 404(b)(1) of the CWA requires that alternatives (or proposed actions) be designed to avoid or minimize adverse impacts to aquatic resources and waters of the United States. Compliance with the 404(b)(1) Guidelines can be achieved generally through the use of appropriate and practicable mitigation measures to minimize or compensate for potential adverse impacts of the discharge on the aquatic ecosystem (40 CFR 230.10(d)). Compensatory mitigation is considered after other appropriate and practicable options have been addressed to avoid and minimize adverse impacts to the aquatic environment. "Practicable" is defined in 40 CFR 230.3(q) to mean "available and capable of being done after taking into consideration cost, existing technology, and logistics in light of overall project purposes."

Further, Section 404(b)(1) requires the least environmentally damaging practicable alternative be selected. During the course of the groundwater remedy design (including the Alternative Freshwater Source Evaluation), efforts were undertaken to avoid and minimize impacts to jurisdictional waters of the United States. However, it has been determined that in order to meet the goals of protection of human health and the environment, to meet the RAOs for the remedy, to monitor remedy performance, to gather data for demonstration of compliance, as well as in response to resolution of design comments with the Tribes, infrastructure (remediation, monitoring wells, and associated piping/conduits) must be installed in certain washes. There are no practicable alternatives to locating certain infrastructure within waters of the United States. For example, monitoring well Q is sited in a wash because it is designed to monitor the effects of injection from well IRL-4, which was placed in a wash as a result of comment resolution at 30% design. Also, to minimize new infrastructure, the remedy design incorporates all existing monitoring wells into the remedy monitoring program. Some of the existing wells are located in Bat Cave Wash and the East Ravine.

1. Avoidance of Adverse Impacts to Wetlands and Non-Wetland Waters of the U.S.

In order to achieve the goal of no-net loss of jurisdictional waters of the U.S., including wetlands, avoidance and minimization measures (AMMs) have been and will continue to be implemented during implementation of the remedy. PG&E prepared a Final Wetlands and Waters of the U.S. Delineation Report (CH2M HILL 2014c), delineating jurisdictional waters of the U.S., that was submitted to DTSC and DOI in April 2014, and has taken the location of jurisdictional waters of the U.S. into consideration in the design of the groundwater remedy in order to avoid impacts to jurisdictional wetlands and waters of the U.S. to the extent practicable.

During the design phase, PG&E's design team consulted the Wetlands and Waters of the U.S. Delineation Report while considering the location of remedy infrastructure. PG&E's design team prioritized avoidance of all wetland and non-wetland waters of the U.S. During the design, PG&E implemented avoidance, to the extent practicable, and impacts to jurisdictional waters would occur only when there is no practicable alternative available.

2. Minimization of Adverse Impacts to Wetlands and Non-Wetland Waters of the U.S.

Consistent with 40 CFR 230.10(d) and Subpart H of Part 40 CFR 230 requirements to minimize the adverse effects of the discharge of dredged or fill material associated with the Topock Remediation Project, PG&E has implemented AMMs during the design phase and will continue to implement best management practices (BMPs) during construction of the remedy in order to minimize adverse impacts to wetlands and non-wetland waters of the U.S.

Minimization measures will be implemented to minimize impacts to wetland and non-wetland waters of the United States within the Project area. All efforts will be taken to avoid jurisdictional resources to the extent practicable. Although the USACE did not provide a list of measures that may be taken to reduce impacts to jurisdictional waters and wetlands, the California Department of Fish and Wildlife (CDFW) requires compliance with AMMs in lieu of a Lake or Streambed Alteration Agreement pursuant to CERCLA Section 121(e) for all work conducted in CDFW jurisdictional washes (CDFW 2013). The geographic extent of CDFW's jurisdiction under California law is broader than the

jurisdictional extent of the USACE under CWA 404 and thus avoidance and mitigation measures applied to CDFW jurisdictional waters would as a geographic consequence also be applied to CWA 404 waters. While Arizona does not have a similar state program, PG&E has implemented and will continue to implement the same AMMs in Arizona identified by CDFW for California to ensure appropriate protection to CWA 404 jurisdictional areas in the project limits, including those in Arizona. Thirty-four AMMs are to be implemented by PG&E for CDFW jurisdictional washes. Actions taken by PG&E, including in the design phase, to avoid and minimize impacts to jurisdictional wetlands and waters will be recorded in a table and maintained by PG&E for the Project.

Remedy Construction, Operation, Maintenance, and Decommissioning BMPs. During construction, operation, maintenance, and decommissioning, certain best management practices would be implemented to avoid and minimize temporary and permanent impacts for activities occurring within jurisdictional wetlands and non-wetland waters of the U.S. These techniques include flagging or fencing around jurisdictional resources, reducing soil erosion/runoff, sediment controls, spill controls, and other BMPs as described in Best Management Practices and Wetlands Avoidance Measures (see Attachment 1 on the following page) and the CDFW AMMs.

3. Compensatory Mitigation

Under the *2008 Compensatory Mitigation for Losses of Aquatic Resources, Final Rule*, compensatory mitigation requires actions that offset the unavoidable adverse impacts to wetlands, streams, and other aquatic resources authorized by Department of the Army permits. Compensatory mitigation is only considered when all appropriate and practicable steps have been taken to avoid and minimize adverse impacts to the aquatic ecosystem. Compensatory mitigation can be implemented by restoration, enhancement, establishment, or preservation. Restoration involves restoring a previously-existing wetland or aquatic site, enhancement involves improving or enhancing the functions of an existing aquatic site, establishment is the creation of a new aquatic site, and preservation involves an existing aquatic site. Compensatory mitigation can be provided by three methods: permittee-responsible compensatory mitigation, mitigation banks, and in-lieu fee mitigation. Further, compensatory mitigation should be commensurate with the amount and type of impact associated with the project.

PG&E will calculate temporary and permanent impacts to jurisdictional waters of the United States resulting from project activities prior to construction and periodically thereafter if additional impacts occur. Temporary impacts to waters of the United States will be restored on site, where possible. Otherwise, impacts will be treated as permanent impacts.

At the Topock Remediation Project, PG&E plans to implement mitigation bank compensatory mitigation for permanent loss of waters of the U.S. at the project site, where reasonably available. Mitigation banks involve off-site compensation under the direction of a third party who ensures that compensation is completed and that no-net loss of wetlands and non-wetland waters is successful. Mitigation bank credits are the preferred option for successfully providing compensatory mitigation under the Final Rule. Restoration is the preferred method of mitigation, and PG&E will attempt to fund a mitigation bank that provides restoration of wetlands at a 1:1 ratio of impact to wetlands, where possible. If a wetland restoration bank is unavailable then an enhancement or preservation bank, or other appropriate option, would be suitable. PG&E will also provide compensatory mitigation for impacts to non-wetland waters of the U.S. at a 1:1 ratio.

ATTACHMENT 1 TO PROTOCOL FOR PG&E COMPLIANCE WITH EIR MMRP MITIGATION MEASURE BIO-1 AND ARAR #32 AT THE TOPOCK COMPRESSOR STATION

Best Management Practices and Wetlands Avoidance Measures

The potential impacts to jurisdictional waters associated with implementation of the Final Groundwater Remedy at the Topock Compressor Station may be permanent or temporary. Permanent impacts are those that are associated with the construction of the new remedy facilities themselves, which will remain in place during the operation phase until decommissioning and removal. These facilities include new wells, pipelines, and ancillary facilities (e.g., drainage features, remote monitoring equipment, and security fencing). Temporary impacts are those that are associated with construction activities that may require removal of vegetation or soil disturbance from construction activities (i.e., access roads) but will not result in permanent modifications to the bed, bank or channel of waterways.

The following wetland avoidance measures and Best Management Practices (BMPs) will be employed for the Topock Final Remedy Project:

1. A delineation of wetlands and waters of the United States has been prepared for the proposed project area, and submitted to DTSC (CH2M HILL 2014c). This delineation has informed the remedial design and was used to avoid or minimize impacts to sensitive resources. In addition to the mapping of federal jurisdictional wetlands and waters of the U.S., there was also a determination of the areas that are jurisdictional by CDFW under Section 1600. The CERCLA Section 121(e) exemption for the Topock Program obviates the need to secure permits from the U.S. Army Corps of Engineers or from CDFW, however, the substantive requirements of applicable state and federal laws are satisfied. A March 6, 2013 letter from CDFW confirming application of the CERCLA Section 121(e) exemption to the Topock Final Remedy Project and stating that PG&E need not obtain a Lake or Streambed Alteration Agreement, was accompanied by a list of Avoidance and Minimization Measures for the Project.

2. When planned work activities occur near or within jurisdictional wetland and waters, a biological monitor will provide a worker environmental awareness training to construction crews. The training will include information on sensitive biological resources that may occur in construction areas and the requirements to protect those resources. The training will also include information about BMPs to avoid potential indirect impacts to water quality at the project location or in downstream areas as described in the CDFW AMMs. PG&E's construction foreman will be responsible for verifying that all construction workers completed the training prior to beginning work at the project site.

3. Where boundaries of jurisdictional wetlands or waters are found in close proximity to planned construction activities, these features will be clearly demarcated in the field using flagging or brightly colored mesh fencing in order to ensure that they are not inadvertently impacted. The demarcation will be conducted under the supervision of a qualified biologist. The biologist will also survey any vegetation areas prior to clearing or cutting to ensure that there are no sensitive biological resources (such as active bird nests) that might be affected. The pre-construction survey will also include photographic documentation of pre-project conditions.

4. Access routes that pass through jurisdictional wetlands and waters, if needed, will be identified in order to minimize the impacts to perennial vegetation (e.g., trees and shrubs). Where impacts cannot be avoided to arrowweed stands within the historical floodplain, the stems of these plants will be cut to approximately 1 to 1 ½ feet above the ground surface. Then plastic sheeting or a tarp will be placed over the cut stems prior to crossing the area with construction vehicles. This approach will favor ready re-growth of the cut plants after the completion of construction activities. Any protected perennial trees or shrubs that are removed as a result of this project will be mitigated as part of the revegetation planning process.

5. Pre-construction surveys for listed species or actively nesting birds will be conducted immediately prior to the start of construction and after demarcation. Should any listed individuals or active nests be identified, the PG&E biologist will contact the United States Fish and Wildlife Service (USFWS) to determine an appropriate response. Only a biologist with an active Section 10(a) permit will be authorized to remove any individuals from the construction areas to a USFWS-approved release location.

6. The boundaries of the construction work zones and staging (supporting) areas including access routes will follow existing routes as much as possible. All construction work zones will be shown on detail site maps and demarcated in the field. No construction activities, vehicular access, equipment storage, stockpiling, or significant human intrusion will be allowed outside of the designated construction work zone and staging areas.

7. Equipment will not be operated in areas of ponded or flowing water, and no wet excavations will be performed during construction. Construction vehicles and equipment will be checked periodically to ensure that they are in proper working condition and that there are no apparent oil or fuel leaks. Onsite refueling or lubrication of vehicles and cleaning of equipment, or other activities that involve the use of fuels, lubricants, or solvents, will occur only in locations that are away from jurisdictional wetlands and waters.

8. Compliance with the above AMMs within jurisdictional waters will be tracked and reported to DTSC in the quarterly EIR mitigation measures compliance reports.

9. At project completion, the designated biological monitor will return to the site to document the post-construction conditions at the site. Information on the pre-and post-construction conditions will be documented in the Remedial Action Construction Completion Report. Post-construction conditions will be documented with photographs.

TABLE L1.1-2
Summary of Compliance with Cultural Impact Mitigation Program (CIMP) Protocols
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Item No.	Reference Location in CIMP Document	Protocols/Relevant Excerpts from Document	Action (Compliance Status)	
			Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
1	Section 2.1	CUL-1a-8a: Protocols for Continuation of Tribal Communications This protocol requires that communication be consistent with past practices and communication processes previously entered into by PG&E with Interested Tribes, and that PG&E would continue to communicate with Interested Tribes during the design, construction, operation, and decommissioning of the project. Prior to implementation of construction. For examples of communication procedures consistent with past practices, see CIMP Section 2.1. Prior to implementation of construction, PG&E shall communicate with Interested Tribes that place cultural significance on the Topock Cultural Area. Outreach efforts between the Tribes and PG&E shall be communicated by PG&E to DTSC quarterly during the design and construction phase for review and input, and annually during project operations.	PG&E has communicated with the Interested Tribes and will continue to communicate with them during all phases of the Project from design and construction through operation and maintenance as well as decommissioning. Tribes were invited to attend monthly meetings to review pieces of the design as they are prepared and to receive updates on the progress of the project. PG&E also held field meetings with Tribes (e.g., meetings to site well locations, etc.) to assist in Tribal understanding of the remedy design. During construction, PG&E will continue to communicate regularly and will also provide updates on field activities so that Tribal monitors may also participate. Outreach efforts are communicated to DTSC on a quarterly basis during design, and will continue to occur quarterly during construction. As required by DTSC, a log of communications with interested Tribes has been maintained and included in the quarterly EIR mitigation measure compliance reports since January 2012.	PG&E has communicated with the Interested Tribes and will continue to communicate with them during all phases of the Project from design and construction through operation and maintenance as well as decommissioning. During construction, PG&E will continue to communicate regularly and will also provide updates on field activities so that Tribal monitors may also participate. Outreach efforts were communicated to DTSC on a quarterly basis during design, and will continue to occur quarterly during construction. As required by DTSC, a log of communications with interested Tribes has been maintained and included in the quarterly EIR mitigation measure compliance reports since January 2012.
2	Section 2.2	CUL-1a-8b: Protocols for Appropriate Treatment of Archaeological Materials These protocols include the following components: • Protocols for the appropriate treatment of archaeological materials that may be disturbed or discovered during implementation of the final remedy – Avoidance is preferred (by PG&E and Tribes) means of treatment in a discovery situation. If PG&E recommends that avoidance is not feasible and the Agencies make a determination that it is not feasible, then the protocols of Discovery Plan of the CHPMP will be followed for appropriate treatment of discoveries. • Protocols for the repatriation of significant items of cultural patrimony that may be recovered during the project • Protocols for the curation of cultural materials recovered during the project. • Treatment of archaeological sites, if data recovery is proposed	During design and construction, if discoveries are made, avoidance is the preferred method of treatment of discoveries. If, however, Agencies make a determination that avoidance is not feasible, PG&E will provide treatment of archaeological materials as outlined in Appendix C (Discovery Plan) of the CHPMP. As described in the protocol, during design and construction, Native American human remains and/or archaeological materials from federal or Tribal land that are funerary objects, or ceremonial objects, or objects of cultural patrimony will be treated as prescribed in the Native American Graves Protection and Repatriation Act (NAGPRA) and its implementing regulations (43 Code of Federal Regulations [CFR] 10), and as discussed in Section 8.2 (Treatment of Any Human Remains, Funerary Objections, Ceremonial Objects and Items of Cultural Patrimony) and Appendix D (Plan of Action) of the CHPMP (BLM 2012). If data recovery is proposed for treatment of an archaeological site, PG&E will follow the steps outlined in Section 2.2.3 of the CIMP.	During design and construction, if discoveries are made, avoidance is the preferred method of treatment of discoveries. If, however, Agencies make a determination that avoidance is not feasible, PG&E will provide treatment of archaeological materials as outlined in Appendix C (Discovery Plan) of the CHPMP. As described in the protocol, during design and construction, Native American human remains and/or archaeological materials from federal or Tribal land that are funerary objects, or ceremonial objects, or objects of cultural patrimony will be treated as prescribed in the Native American Graves Protection and Repatriation Act (NAGPRA) and its implementing regulations (43 Code of Federal Regulations [CFR] 10), and as discussed in Section 8.2 (Treatment of Any Human Remains, Funerary Objections, Ceremonial Objects and Items of Cultural Patrimony) and Appendix D (Plan of Action) of the CHPMP (BLM 2012). If data recovery is proposed for treatment of an archaeological site, PG&E will follow the steps outlined in Section 2.2.3 of the CIMP.
3	Section 2.3	CUL-1a-8c: Protocols for the Review of Cultural Resource-Related Documents These protocols apply to the extent that the BLM has not consulted with Tribes under the consultation process in the Programmatic Agreement and referenced in the CHPMP, and include the following: • Review of cultural resource related documents, including timelines and procedures are specified in detail at Section 2.3.2. • PG&E will afford the Tribes an opportunity to review and comment on Project cultural resource-related documents • Standards as stipulated in the Programmatic Agreement Section XI will be implemented. (Section 2.3.4)	To date, the review of cultural resource related documents has occurred under the procedures identified by the Programmatic Agreement and referenced in the CHPMP. Certain EIR-required cultural resource related documents have also been sent to DTSC for review.	To date, the review of cultural resource related documents has occurred under the procedures identified by the Programmatic Agreement and referenced in the CHPMP. Certain EIR-required cultural resource related documents have also been sent to DTSC for review.
4	Section 2.4	CUL-1a-8d: Protocols for the Review of Project Design Documents These protocols provide for the review of the Topock Compressor Station Groundwater Remediation Project (Project) Design Documents at the Preliminary, Intermediate, and Pre-final phases. In general, at the preliminary phase of each design, PG&E will submit the design document to DTSC/DOI who will then submit to reviewers and invite their initial comments. See CIMP Figure 2-1 for a complete overview of the review process during design.	PG&E has followed the protocols outlined in Figure 2-1 of the CIMP regarding the review of design documents at the 30%, 60%, and 90% design phases.	Pursuant to 90% RTC #7, PG&E understands that there will not be a comment/review process for the final design.

TABLE L1.1-2
Summary of Compliance with Cultural Impact Mitigation Program (CIMP) Protocols
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

			Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
5	Section 2.5	CUL-1a-8e: Protocols for Restoring the Environment to Its Preconstruction Conditions Upon Decommissioning The protocol presents the general approach for restoration of the areas affected by the groundwater remediation facilities. Restoration activities include grading, contouring, and revegetating the site. The restoration approach will be informed by documentation of the pre-construction condition (e.g., ground photographic records, topographic/aerial maps, disturbed area map, archaeological surveys, historical resource surveys, biological surveys). PG&E will seek ways to restore the affected areas to the conditions prior to construction, as closely as possible. Discussions will take place with the Tribes to develop an understanding of the different restoration techniques and expectations for different environments. For additional details, see Sections 2.5.3 (Restoration Guidelines) and 2.5.4 (Habitat Restoration and Revegetation).	A Plan for Decommissioning of Remedy Facilities and Restoration will be completed within 120 days of DOI's certification of completion of the remediation and a determination by DOI that removal of such facilities is protective of human health and the environment. This Restoration Plan will be developed in consultation with the land owners and managers, including FMIT, U.S. Bureau of Reclamation (USBR), and BLM. The BLM will consult with Signatories, Tribes, and Invited Signatories to the PA on the Restoration Plan. PG&E will implement the Plan to restore the site to conditions existing prior to the construction of the groundwater remediation facilities to the maximum extent practicable.	A Plan for Decommissioning of Remedy Facilities and Restoration will be completed within 120 days of DOI's certification of completion of the remediation and a determination by DOI that removal of such facilities is protective of human health and the environment. This Restoration Plan will be developed in consultation with the land owners and managers, including FMIT, U.S. Bureau of Reclamation (USBR), and BLM. The BLM will consult with Signatories, Tribes, and Invited Signatories to the PA on the Restoration Plan. PG&E will implement the Plan to restore the site to conditions existing prior to the construction of the groundwater remediation facilities to the maximum extent practicable.
6	Section 2.6	CUL-1a-8f: IM-3 Decommissioning Plan	The IM-3 Decommissioning, Removal, and Restoration Work Plan is included as Appendix B of the CIMP and also as an appendix of the Construction/Remedial Action Work Plan.	The IM-3 Decommissioning, Removal, and Restoration Work Plan was revised to incorporate comments and is included as Appendix B of the CIMP and also as an appendix of the Construction/Remedial Action Work Plan.
7	Section 2.7	CUL-1a-8g: Protocols for Repatriation of Clean Soils During Construction Specifically, the management protocol for Handling and Disposition of Displaced Site Material requires work plans that involve activities that displace site material (and that are finalized subsequent to the development of the protocol) to include the following information: • The process for soliciting and considering the inputs of Tribe(s) regarding the management of the material that is displaced as a result of the work. • Details on material handling and short-term/long-term storage (including an inventory of materials displaced by the work). • Process for assessing contamination assessment. • Final disposition alternatives for displaced material.	The Soil Management Plan (SMP) (Volume 4 of the O&M Manual) contains procedures and protocols for the management and disposal of displaced soil including potentially contaminated soil, during drilling, construction, operation, and maintenance of the remedy as well as decommissioning of IM-3 facilities. The procedures and protocols included soil and waste characterization, screening and classification of soils, handling and short-term storage of soils, long-term storage of soils, transportation and disposal of hazardous wastes, and record keeping. Additional procedures and protocols for handling, management, and disposal of other waste streams that could be generated from remedy construction and start-up are included in the Waste Management Plan in an appendix of the Construction/ Remedial Action Work Plan.	The Soil Management Plan (SMP) (Volume 4 of the O&M Manual) was revised to incorporate comments. Additional procedures and protocols for handling, management, and disposal of other waste streams that could be generated from remedy construction and start-up are included in the Waste Management Plan in an appendix of the Construction/ Remedial Action Work Plan.
8	Section 2.8	CUL-1a-8h: Noise Protocols <u>Pre-Construction (Section 2.8.3)</u> a) Establish a disturbance coordinator, who will coordinate both noise and vibration concerns that may arise during construction. b) Identify and coordinate activities where Noise-2 requires noise monitoring. Noise-2 states that noise monitoring will be conducted when construction activities are conducted within 1,850 feet and 5,830 feet from California receptors and 330 feet and 735 feet from Arizona receptors for daytime and nighttime noise, respectively. c) If noise monitoring during construction is required, noise monitoring locations will be selected in coordination with the Tribes. The EIR MMRP requires that noise measurements be conducted at the nearest noise-sensitive land use relative to the construction activities. d) Examples of noise barriers that could be used during construction to mitigate noise concerns (e.g., berms, stockpiles, dumpsters, bins, and engineered acoustical barriers), and approaches for implementation, will be included in the Construction/Remedial Action Work Plan for review and comment by Tribes and agencies. In the unlikely event that engineered acoustical barriers are required during construction, they will comply with requirements of the EIR. <u>Construction (Section 2.8.3)</u> e) If noise monitoring finds that the relevant noise thresholds are exceeded, temporary noise barriers will be erected. f) Maintain all construction equipment according to manufacturer guidelines. Equipment will be fitted with the best available noise suppression devices. All impact tools will be shrouded or shielded, and all intake or exhaust ports on power equipment will be muffled or shielded. g) Construction equipment will not be allowed to idle for extended periods of time (more than 15 minutes) when not being used for construction. h) Should a concern about the actual noise generated by remedy construction arise, PG&E disturbance coordinator will thoroughly investigate and resolve the issue appropriately. A qualified acoustical consultant (INCE Board Certified or Professional Engineer in	<u>Pre-Construction</u> a) PG&E disturbance coordinators, Curt Russell and Chris Smith, will coordinate both noise and vibration concerns that may arise during construction. b) Noise monitoring locations will be the boundary of noise receptors as defined by EIR MMRP NOISE-2 facing the project-related construction activities. The precise monitoring locations will be determined in the field by a qualified acoustical consultant in coordination with the Tribes. c) Section 4 of the Construction/Remedial Action Work Plan contains examples of noise barriers that could be used during construction to mitigate noise concerns. Protocols during construction, operation and maintenance, and decommissioning will be adhered to during implementation of each phase. Compliance actions will be documented and reported to DTSC in the quarterly compliance reports. <u>Communication (Section 2.8.4)</u> • A detailed construction schedule is established and included in the Construction/Remedial Action Work Plan for review by agencies, stakeholders, and Tribes.	<u>Pre-Construction</u> a) PG&E disturbance coordinators, Curt Russell and Chris Smith, will coordinate both noise and vibration concerns that may arise during construction. b) Noise monitoring locations will be the boundary of noise receptors as defined by EIR MMRP NOISE-2 facing the project-related construction activities. The precise monitoring locations will be determined in the field by a qualified acoustical consultant in coordination with the Tribes. c) Section 4 of the Construction/Remedial Action Work Plan contains examples of noise barriers that could be used during construction to mitigate noise concerns. Protocols during construction, operation and maintenance, and decommissioning will be adhered to during implementation of each phase. Compliance actions will be documented and reported to DTSC in the quarterly compliance reports. <u>Communication (Section 2.8.4)</u> • A detailed construction schedule is established and included in the Construction/Remedial Action Work Plan for review by agencies, stakeholders, and Tribes.

TABLE L1.1-2
Summary of Compliance with Cultural Impact Mitigation Program (CIMP) Protocols
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Item No.	Reference Location in CIMP Document	Protocols/Relevant Excerpts from Document	Action (Compliance Status)	
			Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
		Acoustics) will evaluate all reoccurring disturbances for compliance with applicable standards. Noise measurements will be in accordance with the Topock Sound Measurement Protocol in the Basis of Design Report and the forthcoming Remedial Action Work Plan. All noise complaints and its resolutions will be recorded, tracked, and reported to DTSC in the quarterly compliance reports. Operation and Maintenance (Section 2.8.3) i) Should a concern about the actual noise generated by remedy operation arise, PG&E disturbance coordinator will thoroughly investigate and resolve the issue appropriately. A qualified acoustical consultant will evaluate all reoccurring disturbances for compliance with applicable standards. Noise measurements will be in accordance with the Topock Project Sound Measurement Protocol. All noise complaints and their resolutions will be recorded, tracked, and reported to DTSC in the quarterly compliance reports. j) If a new well needs to be installed or an existing well has to rebuilt during the operation phase, these activities are considered short-term construction activities and all noise protocols for pre-construction and construction phases will apply. Decommissioning (Section 2.8.3) k) Decommissioning are considered short-term construction activities. All noise protocols for pre-construction and construction phases will also apply to the decommissioning phase. Communication (Section 2.8.4) -All Project construction activities shall be communicated to nearby noise-sensitive receptors and Interested Tribes. Elements of this communication include: • A detailed project schedule is established and published for all stakeholders. • Monthly notification to agencies and Tribes of scheduled field activities. During periods of extensive construction activity, these notifications will be issued more frequently – weekly and/or daily, as appropriate. • After issuing these notifications, notify the nearby noise-sensitive receptors and Tribes of any schedule changes. • Provide an open-communication process for Tribal representatives to seek more information about Project noise-generating activities. PG&E welcomes Tribal input on timing of Project noise-generating activities and on potential noise-reducing methods. • The contact information for the disturbance coordinator will be posted in a conspicuous location near the construction areas. This information will also be mailed to all nearby noise-sensitive receptors and Interested Tribes. In addition to the communication methods described above, PG&E will also consider posting construction schedule information at the information kiosk (CUL-1a-3c). PG&E may also decide to use other communication processes, including a Project website (a Project website could list Project activity schedules and other Project related information) that could be accessed by computer or smartphone and/or other simple push applications that apply to mobile devices.	• Monthly notification to agencies and Tribes of scheduled field activities has been and will continue to be sent by PG&E (Curt Russell or his designee). During periods of extensive construction activity, these notifications will be issued more frequently – weekly and/or daily, as appropriate. This element has been incorporated into the overall communication framework for construction and start-up (see Table 2.3-1 of the Construction/Remedial Action Work Plan). • After issuing these notifications, PG&E will notify the nearby noise-sensitive receptors and Tribes of any schedule changes. Nearby noise-sensitive receptors are residents of the mobile home park at Moabi Regional Park and the Topock Marina, as well as private residents in Topock Marina area. When construction activities occur within 1,850 feet of noise-sensitive receptors to the east, PG&E will post contact information in a conspicuous location near construction areas so that it is clearly visible to nearby sensitive receptors. In addition, mailing of the same information will be sent to those receptors and all Tribes (see Table 2.3-1 of the Construction/Remedial Action Work Plan). • Provide an open-communication process for Tribal representatives to seek more information about Project noise-generating activities. PG&E welcomes Tribal input on timing of Project noise-generating activities and on potential noise-reducing methods. Per CUL-1a-8k, if ceremonies are requested by any Tribe during construction, then PG&E will follow the protocol to accommodate any requests for Tribal ceremonies, which could include monitoring to ensure that construction noise does not exceed the normally acceptable exterior noise level standard in San Bernardino County for places of worship. • The contact information for the Project disturbance coordinators (Curt Russell and Chris Smith) will be posted in a conspicuous location near the construction areas. This information will also be mailed to all nearby noise-sensitive receptors and Interested Tribes. Nearby noise-sensitive receptors include residents at Moabi Regional Park and the Topock Marina area.	• Monthly notification to agencies and Tribes of scheduled field activities has been and will continue to be sent by PG&E (Curt Russell or his designee). During periods of extensive construction activity, these notifications will be issued more frequently – weekly and/or daily, as appropriate. This element has been incorporated into the overall communication framework for construction and start-up (see Table 2.3-1 of the Construction/ Remedial Action Work Plan). • After issuing these notifications, PG&E will notify the nearby noise-sensitive receptors and Tribes of any schedule changes. Nearby noise-sensitive receptors are residents of the mobile home park at Moabi Regional Park and the Topock Marina, as well as private residents in Topock Marina area. When construction activities occur within 1,850 feet of noise-sensitive receptors to the east, PG&E will post contact information in a conspicuous location near construction areas so that it is clearly visible to nearby sensitive receptors. In addition, mailing of the same information will be sent to those receptors and all Tribes (see Table 2.3-1 of the Construction/Remedial Action Work Plan). • Provide an open-communication process for Tribal representatives to seek more information about Project noise-generating activities. PG&E welcomes Tribal input on timing of Project noise-generating activities and on potential noise-reducing methods. Per CUL-1a-8k, if ceremonies are requested by any Tribe during construction, then PG&E will follow the protocol to accommodate any requests for Tribal ceremonies, which could include monitoring to ensure that construction noise does not exceed the normally acceptable exterior noise level standard in San Bernardino County for places of worship. • The contact information for the Project disturbance coordinators (Curt Russell and Chris Smith) will be posted in a conspicuous location near the construction areas. This information will also be mailed to all nearby noise-sensitive receptors and Interested Tribes. Nearby noise-sensitive receptors include residents at Moabi Regional Park and the Topock Marina area.

			Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
9	Section 2.9	CUL-1a-8i: Protocols for the Appropriate Methods, consistent with Mitigation Measures, AES-1 and AES-2, to Reduce Visual Intrusion Additional Design Protocols that PG&E May Employ to Reduce Visual Intrusions (Section 2.9.2) In addition to the specific requirements identified in AES-1 and AES-2, PG&E may employ various feasible design concepts identified by PG&E, Tribes, or other interested parties prior to implementation of a Project activity to reduce visual intrusions of the Project design. Potential design concepts include: • Construction of aboveground facilities within existing facilities, when appropriate. • Building designs that are harmonious with existing buildings and nearby landforms, including low profiles when available. • Flush-mount or below-ground installations whenever feasible. • Construction within existing transportation corridors. • Working only within previously-disturbed sites, whenever possible. • Placing aboveground facilities away from traffic, where feasible (i.e., areas where the introduction of the facilities would not create safety issues or visual impacts), to reduce the need for traffic barricades. • Design the lighting associated with above ground facilities to minimize glare and to focus lighting within a facility (e.g., using shields on lighting to reflect light downward and focused within a facility). Opportunity for Agency, Tribal, and Other Stakeholder Input on the Visual Nature of Project Design (Section 2.9.3) Within the design packages, PG&E will include visualizations of various design features described within the text and drawings in the package. Although the visualizations will not be comprehensive of the entire project, they will include many of the aboveground facilities that may be visible to stakeholders after construction. Potential Temporary Visual Intrusions Identified During Remedy Implementation (Section 2.9.4) During the course of remedy implementation, if agencies, Tribes, or other stakeholders identify temporary visual intrusions that should be addressed by PG&E, they should notify the Project Disturbance Coordinator(s), who will be responsible for resolving the issue or coordinating resolution of the issue with the Tribes, DTSC, other agencies, and/or stakeholders.	See response to EIR mitigation measures AES-1 and AES-2 in Table 6.1-1 for compliance actions. Examples of where the additional protocols were employed during the design to reduce visual intrusions: Building designs that are harmonious with existing buildings and nearby landforms, including low profiles when available. For example, the remedy building inside the compressor station and the TW Bench are designed to be compatible with existing buildings and/or the environment. Flush-mount or below-ground installations whenever feasible. For example, most well head completion is flush-mount and most piping installations are below ground. Construction within existing transportation corridors. For example, the majority of piping corridors are within existing roads. Working only within previously-disturbed sites, whenever possible. For example, all proposed construction staging areas and yard are located in previously-disturbed areas. Design the lighting associated with above ground facilities to minimize glare and to focus lighting within a facility (e.g., using shields on lighting to reflect light downward and focused within a facility). This design concept is followed in all building design for the project. Opportunity for Agency, Tribal, and Other Stakeholder Input on the Visual Nature of Project Design (Section 2.9.3) As was done at the 60% design stage, visualizations of various design components are provided in the 90%/Supplemental 90% BOD Report to facilitate review. In addition, photos of typical construction equipment are provided in the Construction/Remedial Action Work Plan to facilitate review of the document. Potential Temporary Visual Intrusions Identified During Remedy Implementation (Section 2.9.4) During the course of remedy implementation, if agencies, Tribes, or other stakeholders identify temporary visual intrusions that should be addressed by PG&E, they should notify Curt Russell and Chris Smith, the Project Disturbance Coordinator(s), who will be responsible for resolving the issue or coordinating resolution of the issue with the Tribes, DTSC, other agencies, and/or stakeholders.	See response to EIR mitigation measures AES-1 and AES-2 in Table 6.1-1 for compliance actions. In addition to the examples implemented during the 90% stage, PG&E also provided to agencies, Tribes, and stakeholders for review and comment during the 90% RTC process, various figures/maps revised to incorporate comments, and a visualization of the revised design of the Construction Headquarters at its new location at Moabi Regional Park.
10	Section 2.10	CUL-1a-8j: Protocols for Tribal Notification in advance of Project-Related Activities Protocols for Tribal notification in advance of project-related activities that the Interested Tribes may feel have the potential to cause adverse impacts to sensitive cultural resources - PG&E will take care in these advance notifications to identify the field activities that have the potential to be ground disturbing. Examples of field activities which may include potentially ground-disturbing aspects include grading, trenching, boring, drilling, or other excavation for new injection, extraction or monitoring wells. In addition, construction of new pipelines, new treatment facilities, new access roads, new staging areas, other new transportation facilities, or other new Project components may include ground-disturbing aspects. PG&E will use communication methods specified in Section 2.10, and will provide two weeks advance notice of covered activities when possible.	PG&E has provided advance notice of ground-disturbing activities to Tribes during pre-construction phases such as the Freshwater Implementation Plan and Utility Potholing. PG&E also sends monthly emails to Tribes and Agencies that outline the field activities occurring at the Topock Compressor Station for the month. PG&E provides a two week advance notice where possible. PG&E will continue to provide advance notice to Tribes during any other ground-disturbing activities that may occur pre-construction. PG&E will also continue to follow this protocol during construction of the remedy and during operation, maintenance, and decommissioning.	PG&E has and will continue to send monthly emails to Tribes and Agencies that outline the field activities occurring at the Topock Compressor Station for the month. PG&E will provide a two week advance notice where possible. PG&E will continue to provide advance notice to Tribes during any other ground-disturbing activities that may occur prior to the start of remedy construction. PG&E will also continue to follow this protocol during construction of the remedy and during operation, maintenance, and decommissioning.

TABLE L1.1-2
Summary of Compliance with Cultural Impact Mitigation Program (CIMP) Protocols
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Item No.	Reference Location in CIMP Document	Protocols/Relevant Excerpts from Document	Action (Compliance Status)	
			Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
11	Section 2.11	CUL-1a-8k: Protocols to Accommodate Tribal Ceremonies or Activities involving the Topock Cultural Area Protocols to be followed by project personnel to accommodate, if feasible as determined by DTSC, key Tribal ceremonies that involve the Topock Cultural Area. Under the protocol, any Tribe(s) wishing to perform such a ceremony may contact PG&E's Site Manager at the Topock Compressor Station by telephone, email, or in writing to discuss the specific request. PG&E will communicate directly with the requester (by telephone or in person) as soon as the request has been evaluated. PG&E will indicate if all of the requests can be accommodated and, if not, suggest alternatives that PG&E can accommodate. The requestor and PG&E will also discuss the details of other services that PG&E may agree to provide for the benefit of the ceremonial activity, including, power, water, parking, signage, or other support. PG&E will also identify any reasonable and necessary stipulations regarding health and safety, logistical, communication, or site access procedures to be followed in the Topock Compressor Station Groundwater Remediation Project (Project) Area. One stipulation will clearly state that the Topock Compressor Station is excluded, and that access to it cannot be provided.	No requests to conduct Tribal ceremonies have been submitted. If ceremonies are requested during design, construction, operation and maintenance, then PG&E will follow the protocol to accommodate any requests for Tribal ceremonies.	To date, in 2015, PG&E has received one request from Tribes to conduct a Tribal ceremony. This Tribal request was accommodated by PG&E. If ceremonies are requested during construction, operation and maintenance, PG&E will follow the protocol to accommodate any requests for Tribal ceremonies.
12	Section 2.12	CUL-1a-8l: Protocols for Tribal Monitors to Observe Ground Disturbance Activities Provisions affording sufficient Tribal monitors to observe ground disturbing activities and/or other scientific surveying (e.g., biological surveys) that may occur in preparation for construction activities. Ground-disturbing activities include trenching, excavation, grading, well excavation/drilling, decommissioning the IM-3 Facility and subsurface pipeline, or other construction-related activities. Pacific Gas and Electric Company (PG&E) will notify the Interested Tribes (Tribes) as defined by the Environmental Impact Report (EIR) of planned ground-disturbing activities and other scientific surveying that is conducted in anticipation of construction activities. This provides the opportunity for Tribes to send Tribal monitors to the site to observe these activities, if they wish. While on site, Tribal monitors will have the opportunity to discuss their concerns directly with the PG&E project team while the activities are proceeding, as well as reporting their observations and any issues of concern directly to the Tribe(s) that they represent. Sufficient time (a minimum of 1 week notice) will be allowed between the notification and the beginning of the field activity that the Tribe(s) will be able to prepare adequately without undue haste and arrange for one or more monitors.	PG&E has provided notification to Tribes in advance of ground-disturbing activities during the design phase, including during the Alternative Freshwater Evaluation and Utility potholing activities. PG&E will continue to notify Tribes in accordance with the protocol throughout the remainder of the design, construction, operation and maintenance, and decommissioning.	PG&E will continue to notify Tribes in accordance with the protocol throughout remedy implementation including construction, operation and maintenance, and decommissioning.
13	Section 2.13	CUL-1a-8m: Provision of Reasonable Compensation for Tribal Monitors Provisions of reasonable compensation for Tribal monitors consistent with historical rates. PG&E will provide reasonable compensation for Tribal monitors who work on the Project. PG&E will negotiate with Tribes, taking into account the requirements of any pertinent MOUs or other legal agreements, to establish pay rates for monitors consistent with historical rates. The negotiated compensation rates will then be formalized in a separate MOU, or in amendments to an existing MOU, with each Tribe that will be supplying the services of one or more monitors.	PG&E has been operating under MOUs and has provided compensation for Tribal monitors currently and will continue to provide compensation during construction, operation and maintenance, and decommissioning phases.	PG&E has been operating under MOUs and has provided compensation for Tribal monitors currently and will continue to provide compensation during construction, operation and maintenance, and decommissioning phases.
14	Section 2.14	CUL-1a-8n: Protocols for Protective Measures for Archaeological/Historical Sites During Construction Locations requiring specific protective devices, such as temporary fencing, flagging, or other type of demarcation during construction. 2.14.1 Pre-Construction Measures to Identify Sites Requiring Protection. Pre-construction planning efforts will: (1) identify the location and boundaries of any archaeological, historical, and other cultural sites requiring protective measures during construction; and (2) establish zones within which construction may proceed. PG&E and BLM will consult with the Tribes during this process. 2.14.2 Identification of Protective Measures Prior to Construction. Avoidance will be implemented. Avoidance of known cultural sites/sensitive areas may be accomplished by using existing or approved routes of travel, and by carefully avoiding archaeological and historical sites when selecting laydown, access, and temporary work areas appurtenant to construction activities. 2.14.3 Measures to Identify New Sites Requiring Protection during Construction. PG&E's qualified archaeologist would inspect and evaluate any previously unidentified or suspected archaeological or historical resources found during construction, operation, or decommissioning. If resources are discovered, earth-disturbing activities will be temporarily suspended at the location of the find. The find will then be treated by modifying the extent of the construction zone to avoid and protect the resource(s). Thereafter, earth-moving activities may resume within the modified construction zone. Tribal notification will occur under requirements of the CHPMP and PA. 2.14.4 Implementation of Protective Measures. If warranted, protective measures may be employed on or around the archaeological or historical site to protect the resource from disturbance. These measures may include, but are not limited to, protective coverings of soil or riprap, onsite personnel to prevent access to sensitive areas, use of flagging, blaze orange mesh fencing secured to steel posts, bollards, natural barriers of rocks or piled brush, cables suspended between secure posts, and/or signage (e.g., "This Area Closed" or "Exclusion Zone: Keep Out"). Any such measures will be temporary (only as needed during construction), and will, to the extent practicable, not call undue attention to the nature of the resource being protected. Ongoing work within the established construction zone may continue. PG&E, in consultation with DTSC and BLM (if Federal and/or Tribal land is involved) and the Tribes, will determine the appropriate protective measures on a case-by- case basis, and may increase or reduce the size of the Environmentally Sensitive Area (ESA) or Exclusion Zone (EZ) if agreed to by representatives of these parties in the field. The protective measures set forth in this section will be thoroughly covered in the Worker Education Program. 2.14.5 Installation and Inspection of Protective Measures during Construction. PG&E's qualified archaeologists will monitor the installation of all protective measures and their removal after construction. Similarly, Tribal Monitors will be notified and invited to monitor the	PG&E will implement the protocols for protective measures for archaeological/historical sites during the construction of the remedy. As stated in the protocol, avoidance is the preferred protective measure and will be implemented where any identified archaeological, historical, or other cultural sites require protective measures during construction. If protective measures are used, the measures identified in Section 2.14.4 would be implemented. PG&E's archaeologist would monitor the installation and removal of all protective measures, and Tribal monitors would also be invited to monitor installation and removal. After removal, restoration would occur to pre-construction conditions.	PG&E will implement the protocols for protective measures for archaeological/historical sites during the construction of the remedy. As stated in the protocol, avoidance is the preferred protective measure and will be implemented where any identified archaeological, historical, or other cultural sites require protective measures during construction. If protective measures are used, the measures identified in Section 2.14.4 would be implemented. PG&E's archaeologist would monitor the installation and removal of all protective measures, and Tribal monitors would also be invited to monitor installation and removal. After removal, restoration would occur to pre-construction conditions.

TABLE L1.1-2

			Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
		installation of all protective measures and their removal. PG&E construction inspectors will conduct and document systematic inspections of the integrity of protective measures during the entire period of construction activity. 2.14.6 Protection of New Sites Discovered during Construction. PG&E's qualified archaeologist will inspect and evaluate any new sites that may be discovered during construction and will notify Tribal Monitors of the discovery. Tribal Monitors will then inspect and evaluate the new site(s). Every effort will be made to avoid adverse effects on the discovered site(s) to the maximum extent practicable. Details on the initial inspection procedures are provided in Section 2.14.6. 2.14.7 Restoration After Removal of Protective Measures. After removal of protective measures (e.g., fencing, poles), the areas will be restored to pre-construction conditions. For details on documentation of pre-construction condition and post-construction condition, see Section 2.14.7.		
15	Section 2.15	CUL-1a-8o: Protocols for Reporting Discoveries of Cultural Importance Protocols for the reporting of discoveries of cultural importance consistent with existing statutes and regulations. In the event that any previously unidentified or suspected historic or archeological resource, such as human remains and/or associated funerary objects or graves, is discovered during construction, PG&E will immediately notify the DTSC, BLM, and Tribal representatives if the resource is Native American, consistent with the CHPMP and the EIR Chapter 5.1.1. Human remains, items of cultural patrimony, or funerary objects that may be found shall be handled with utmost cultural and religious sensitivity. As specified in Section 2.2.1, avoidance of cultural resources is preferred over excavation, removal, or further disturbance, particularly in discoveries involving human remains, items of cultural patrimony, or funerary objects. Where human remains and funerary objects, ceremonial items, and items of cultural patrimony are discovered, PG&E will implement the reporting protocols provided in Appendix D (Plan of Action [POA]) of the CHPMP and consistent with Mitigation Measure CUL-4 in EIR Chapter 5.1.1. During initial inspection, PG&E's qualified Cultural Resources Consultant (as specified in CUL-1a-3(a)) will document the discovery. Tribal monitors will be invited to assist in the preparation of the documentation and identification of Tribal cultural values. Discoveries identified as having cultural importance will be documented in a culturally sensitive manner acceptable to the Interested Tribe(s). PG&E will consult with the BLM, and BLM will consult with the Tribal representatives if the resource is Native American in nature, to define the nature and extent of any further studies that may be required.	PG&E will follow the protocol for reporting discoveries, in addition to complying with the CHPMP and PA.	PG&E will follow the protocol for reporting discoveries, in addition to complying with the CHPMP and PA.
16	Section 2.16	CUL-1a-8p: Protocols for Inspecting Remediation Facilities and/or Staging Areas During Construction Protocols for the inspection of remediation facilities and/or staging areas throughout the construction phase. The locations of remediation facilities and staging areas will be examined for cultural resources throughout the construction phase. This process will include advance notification of interested parties, including Interested Tribes, implementation of procedures for the review of Project design documents, selecting previously impacted land wherever feasible for re-use as staging areas and/or for the siting of remediation facilities, and avoiding direct physical impacts to the Topock Maze as it is manifested archaeologically. PG&E's qualified archaeologist, in coordination with the Tribes, will perform background research and field verification to identify and evaluate any cultural, historical, or archaeological resources within the location of remediation facilities and/or staging areas. Any resources present will be avoided to the extent feasible during construction and use of staging areas and/or remediation facilities pursuant to CUL-1b/c and CUL-2. Further, construction monitoring and treatment of any unanticipated discoveries will be as specified in CUL-1b/c-4 and CUL- 1a-8o. Accordingly, archaeological and Native American monitors will be invited to observe all earth-disturbing activities at remediation facilities and/or staging areas during construction. These monitors will at all times comply with Project-wide and job site-specific safety requirements.	PG&E has included Tribes in review of project design documents at the 30% and 60% phases, and PG&E has selected previously disturbed land for staging areas and siting of remediation facilities wherever feasible. PG&E's remedial design avoids direct impact to the Topock Maze as it is manifested archaeologically. During construction, PG&E will implement the procedures of the protocol to identify and evaluate any cultural, historical, or archaeological resources within the vicinity of staging areas and remediation facilities. Avoidance will then be implemented for any identified resources, and monitoring and treatment in the case of unanticipated discoveries. PG&E will invite Tribal monitors to observe all earth-disturbing activities.	PG&E has included Tribes in review of project design documents at the 90% phase, and PG&E has selected previously disturbed land for staging areas and siting of remediation facilities wherever feasible. PG&E's remedial design avoids direct impact to the Topock Maze as it is manifested archaeologically by avoiding it. During construction, PG&E will implement the procedures of the protocol to identify and evaluate any cultural, historical, or archaeological resources within the vicinity of staging areas and remediation facilities. Avoidance will then be implemented for any identified resources, and monitoring and treatment in the case of unanticipated discoveries. PG&E will invite Tribal monitors to observe all earth-disturbing activities.

TABLE L1.1-3
Summary of Compliance with Identified ARARs
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Item No.[1]	Category[1]	Citation[1,2]	Determination[1,2]	Description in DOI's ARARs Table[1,2]	Triggering Event	Compliance Responsibility	Which existing/ future document(s) will document continued compliance with this ARAR?[4]	Action (Compliance Status)			
								Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
Chemical-Specific											
1	Federal Chemical-Specific	Federal Safe Drinking Water Act - 42 USC § 300f, et seq.; 40 CFR 141 -- Subpart F– Maximum Contaminant Level Goals (MCLGs)	ARAR Relevant and Appropriate	MCLGs are not federally enforceable drinking water standards, but CERCLA § 121(d) identifies MCLGs as relevant and appropriate requirements.	Remedy Implementation	PG&E	Quarterly progress reports during remedy O&M Other data/reports requested by agencies	Compliance with this requirement will be achieved by reducing the concentration of Cr(T) in the affected aquifer to a concentration below the federal maximum contaminant level goal (MCLG) for Cr(T) of 100 µg/L. There is no federal MCLG for Cr(VI) and the RAO has been established based on the regional background concentration of 32 µg/L Cr(VI) at the conclusion of remedy implementation. Although concentrations of Cr(VI) and in-situ byproducts (e.g., arsenic, manganese) may fluctuate within the treatment area during remedy implementation, institutional controls will prevent use of affected groundwater as a drinking water source until the remedy is complete. Groundwater monitoring will be used to track performance of the remedy and verify that the RAOs have been achieved at the conclusion of remedy implementation and prior to removing the institutional control.	Compliance with this requirement will be achieved by reducing the concentration of Cr(T) in the affected aquifer to a concentration below the federal MCLG for Cr(T) of 100 µg/L. There is no federal MCLG for Cr(VI) and the RAO has been established based on the regional background concentration of 32 µg/L Cr(VI) at the conclusion of remedy implementation. Although concentrations of Cr(VI) and in-situ byproducts (e.g., arsenic, manganese) may fluctuate within the treatment area during remedy implementation, institutional controls will prevent use of affected groundwater as a drinking water source until the remedy is complete. Groundwater monitoring will be used to track performance of the remedy and verify that the RAOs have been achieved at the conclusion of remedy implementation and prior to removing the institutional control.	Compliance with this requirement will be achieved by reducing the concentration of Cr(T) in the affected aquifer to a concentration below the federal MCLG for Cr(T) of 100 µg/L. There is no federal MCLG for Cr(VI) and the RAO has been established based on the regional background concentration of 32 µg/L Cr(VI) at the conclusion of remedy implementation. Although concentrations of Cr(VI) and in-situ byproducts (e.g., arsenic, manganese) may fluctuate within the treatment area during remedy implementation, institutional controls will prevent use of affected groundwater as a drinking water source until the remedy is complete. Groundwater monitoring will be used to track performance of the remedy and verify that the RAOs have been achieved at the conclusion of remedy implementation and prior to removing the institutional control.	Compliance with this requirement will be achieved by reducing the concentration of Cr(T) in the affected aquifer to a concentration below the federal MCLG for Cr(T) of 100 µg/L. There is no federal MCLG for Cr(VI) and the RAO has been established based on the regional background concentration of 32 µg/L Cr(VI) at the conclusion of remedy implementation. Although concentrations of Cr(VI), arsenic from freshwater injection, and in-situ byproducts (e.g., arsenic, manganese) should increase or fluctuate within or immediately adjacent to the plume during remedy implementation, institutional controls will prevent use of affected groundwater as a drinking water source until the remedy is complete. At the completion of the remedy, any elevated concentrations resulting from PG&E's activities should have reverted back to values below MCLGs that are set at levels above zero, MCLs, RAOs, or background concentrations.

52	California Chemical-Specific	California Safe Drinking Water Act - Title 22, CCR, Div 4, Ch 15, §64431, §64444	ARAR Applicable	Maximum Contaminant Levels (MCLs) which shall not be exceeded in the water supplied to the public. California state MCLs for drinking water standards are more stringent than primary federal standards.	Remedy Implementation	PG&E	Quarterly progress reports during remedy O&M Other data/reports requested by agencies	Compliance with this requirement will be achieved by reducing the concentration of Cr(T) in the affected aquifer to a concentration below the state MCL for Cr(T) of 50 µg/L. There is no state MCL for Cr(VI) and the RAO has been established based on the regional background concentration of 32 µg/L at the conclusion of remedy implementation. Although concentrations of Cr(VI) and in-situ byproducts (e.g., arsenic, manganese) may fluctuate during remedy implementation, institutional controls will prevent use of affected groundwater as a drinking water source until the remedy is complete. Groundwater monitoring will be used to track performance of the remedy and verify that the RAOs have been achieved at the conclusion of remedy implementation and prior to removing the institutional control.	Compliance with this requirement will be achieved by reducing the concentration of Cr(T) in the affected aquifer to a concentration below the state MCL for Cr(T) of 50 µg/L. There is no state MCL for Cr(VI) and the RAO has been established based on the regional background concentration of 32 µg/L at the conclusion of remedy implementation. Concentrations of Cr(VI) and in-situ byproducts (e.g., arsenic, manganese) may fluctuate during remedy implementation. In addition, as part of the remedy fresh water from a well in Arizona will be injected west of the plume, within the project's Area of Potential Effects. The naturally occurring arsenic concentration in water from the well exceeds the MCL of 10 µg/L, which is typical of water quality in the vicinity of Topock, Arizona**,** and will be removed to below MCL prior to injection**.** Modeling indicates that arsenic concentrations that may temporarily be elevated by the generation from in-situ remediation are localized, will attenuate under site conditions and will return to pre-remedy baseline levels after the end of active remediation. Institutional controls will prevent use of affected groundwater as a drinking water source until the remedy is complete. Groundwater monitoring will be used to track performance of the remedy and verify that the RAOs have been achieved at the conclusion of remedy implementation and prior to removing the institutional control.	Compliance with this requirement will be achieved by reducing the concentration of Cr(T) in the affected aquifer to a concentration below the state MCL for Cr(T) of 50 µg/L. The state MCL for Cr(VI) is 10 µg/L. The RAO has been established based on the regional background concentration of 32 µg/L at the conclusion of remedy implementation. Concentrations of Cr(VI) and in-situ byproducts (e.g., arsenic, manganese) may fluctuate during remedy implementation. In addition, as part of the remedy fresh water from a well in Arizona will be injected west of the plume, within the project's Area of Potential Effects. The naturally occurring arsenic concentration in water from the well exceeds the MCL of 10 µg/L, which is typical of water quality in the vicinity of Topock, Arizona. Modeling indicates that arsenic concentrations that may temporarily be elevated by the generation from in-situ remediation and freshwater injection are localized, will attenuate under site conditions and will return to pre-remedy baseline levels after the end of active remediation and the cessation of freshwater injection, respectively. Institutional controls will prevent use of affected groundwater as a drinking water source until the remedy is complete. Groundwater monitoring will be used to track performance of the remedy and verify that the RAOs have been achieved at	Compliance with this requirement will be achieved by reducing the concentration of Cr(T) in the affected aquifer to a concentration below the state MCL for Cr(T) of 50 µg/L. The state MCL for Cr(VI) is 10 µg/L, but the RAO has been established based on the Alluvial Aquifer regional background concentration of 32 µg/L at the conclusion of remedy implementation. Concentrations of Cr(VI) and in-situ byproducts (e.g., arsenic, manganese) may fluctuate during remedy implementation. In addition, as part of the remedy fresh water from a well in Arizona will be injected west of the plume, within the project's Area of Potential Effects. The naturally occurring arsenic concentration in water from the well exceeds the MCL of 10 µg/L, which is typical of water quality in the vicinity of Topock, Arizona. Modeling indicates that elevated arsenic concentrations generated from in-situ remediation and freshwater injection are localized, will attenuate under site conditions and will return to pre-remedy baseline levels approximately 10 years after the end of active remediation and the cessation of freshwater injection, respectively. Institutional controls will prevent use of affected groundwater as a drinking water source until the remedy is complete. Groundwater monitoring will be used to track performance of the remedy and verify that the RAOs have been achieved at the conclusion of remedy

										the conclusion of remedy implementation and prior to removing the institutional control.	implementation and prior to removing the institutional control.
53	California Chemical-Specific	Secondary MCLs list for drinking water - Title 22, CCR, Div 4, Ch 15, §64449	ARAR Relevant and Appropriate	State secondary MCLs for drinking water standards are more stringent than federal standards. These secondary MCLs are relevant and appropriate standards, which establish the maximum permissible level of contaminants in sources (or potential sources) of drinking water. These secondary MCLs would be applicable if water at the site was used as drinking water and delivered through a community water supply system.	Remedy Implementation	PG&E	Quarterly progress reports during remedy O&M Other data/reports requested by agencies	There is no secondary MCL for Cr(VI) or Cr(T). Secondary MCLs are community acceptance standards for constituents that may adversely affect the taste, odor or appearance of drinking water. An institutional control will be enforced throughout the chromium plume area during implementation of the remedial action to prohibit use of the groundwater as a drinking water source.	There is no secondary MCL for Cr(VI) or Cr(T). Secondary MCLs are community acceptance standards for constituents that may adversely affect the taste, odor or appearance of drinking water. Concentrations of in-situ by-products (arsenic, manganese [secondary MCL of 50 µg/L]) may fluctuate within the treatment area during remedy implementation. Institutional control will be enforced throughout the chromium plume area during implementation of the remedial action to prohibit use of the groundwater as a drinking water source. Additionally, there are currently no municipal or private wells in the chromium plume area, to PG&E's knowledge.	There is no secondary MCL for Cr(VI) or Cr(T). Secondary MCLs are community acceptance standards for constituents that may adversely affect the taste, odor or appearance of drinking water. Concentrations of in-situ by-products (arsenic, manganese [secondary MCL of 50 µg/L]) may fluctuate within the treatment area during remedy implementation. Action-Specific											
31	Federal Action-Specific	Federal Safe Drinking Water Act - 42 USC §300f, et seq. Part C – Protection of Underground Sources of Drinking Water; 40 CFR 144-148	ARAR Applicable	These Underground Injection Control Regulations assure that any underground injection performed on-site will not endanger drinking water sources. Substantive requirements include, but are not limited to, regulation of well construction and well operation. These requirements will be applicable if underground injection is proposed as a part of a site remedy.	Underground injection activities	PG&E	Filing of inventory of injection wells	Injection wells are classified as Class V injection wells and will be registered with USEPA prior to installation. The injection wells will be monitored to ensure they will not endanger drinking water sources. An institutional control will be enforced throughout the chromium plume area during implementation of the remedial action to prohibit use of the groundwater as a drinking water source. All injection wells will be properly closed upon completion of the remedy.	Injection wells are classified as Class V injection wells and will be registered with USEPA prior to installation. The injection wells will be monitored to ensure they will not endanger drinking water sources. An institutional control will be enforced throughout the chromium plume area during implementation of the remedial action to prohibit use of the groundwater as a drinking water source. All injection wells will be properly closed upon completion of the remedy.	Injection wells are classified as Class V injection wells and will be registered with USEPA prior to installation. An institutional control will be enforced throughout the chromium plume area during implementation of the remedial action to prohibit use of the groundwater as a drinking water source. All injection wells will be properly closed upon completion of the remedy.	Injection wells are classified as Class V injection wells and will be registered with USEPA prior to installation. An institutional control will be enforced throughout the chromium plume area during implementation of the remedial action to prohibit use of the groundwater as a drinking water source. All injection wells will be properly closed upon completion of the remedy.
32	Federal Action-Specific	Federal Water Pollution Control Act (Clean Water Act) - 33 USC § 1344 ; 40 CFR 230.10	ARAR Applicable	This section of the Clean Water Act prohibits certain activities with respect to on-site wetlands and waterways. No discharge of dredged or fill material shall be permitted if there is a practicable alternative to the proposed activity which would have less adverse impact to the aquatic ecosystem.	Activities that occur in the Colorado River or in jurisdictional waters of the United States that result in discharge of dredged or fill material.	PG&E	N/A. No further action required unless post-design approval change triggers.	The preliminary (30%) design includes facilities in the jurisdictional water of the U.S. (see Figure 2-16 of the 30% BOD Report). PG&E will work with the USACE to ensure compliance with the substantive requirements of Section 404 per CERCLA Section 121(e)(1). It is anticipated that a wetland delineation will be conducted in the Spring of 2012.	The intermediate (60%) design includes facilities in the jurisdictional waters of the U.S. (see Figure 2.4-5 in the 60% BOD Report document). PG&E will work with the USACE to ensure compliance with the substantive requirements of Section 404 per CERCLA Section 121(e)(1). A wetlands delineation was completed in March 2012 and is to be revised in April 2013; results will be summarized in a forthcoming report for DTSC review.	A report titled "*Wetlands and Waters of the United States Final Delineation Report for the Topock Compressor Station Groundwater Remediation Project, San Bernardino County, California"* (CH2M HILL 2014c) was prepared to summarize results of efforts to delineate jurisdictional areas in the project area, and was submitted to DTSC and DOI on April 18, 2014. The report is also included in Appendix A3 of the 90% BOD Report. In support of the Supplemental 90% design, PG&E conducted surveys for jurisdictional waters and wetlands in the 6.74-acre and soil management area at Moabi Regional Park on November 19, 2014. The survey results were summarized in a technical memorandum titled *Assessment of Biological Resources for the Proposed Soil Management Areas* (CH2M HILL 2015b), which was submitted with the Supplemental 90%. On July 10, 2013, the USACE confirmed that CERCLA 121(e)(1) permit exemption	On January 30, 2015, PG&E conducted biological surveys (including mature plants and culturally significant plants) of the area proposed for remedy use at Moabi Regional Park. On June 24-25, 2015, in conformance with direction from DTSC, PG&E conducted biological surveys (including mature plants and culturally significant plants) of an additional 35-acre area on the west side of Moabi Regional Park. The survey results were summarized in a technical memorandum titled *Assessment of Biological Resources for a 35-acre Area on the West Side of Moabi Regional Park* (CH2M HILL 2015d). This memorandum provides updates to the January 2015 memorandum as well as information on the natural resources observed within the larger 35-acre area, and is also included in Appendix A10 of this report. In addition, a technical memorandum titled *Assessment of Biological Resources for the Proposed Sewer and Firewater Lines for*

TABLE L1.1-3
Summary of Compliance with Identified ARARs
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Item No.[1]	Category[1]	Citation[1,2]	Determination[1,2]	Description in DOI's ARARs Table[1,2]	Triggering Event	Compliance Responsibility	Which existing/ future document(s) will document continued compliance with this ARAR?[4]	Action (Compliance Status)			
								Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
										applies to the Topock remediation project, and therefore, PG&E is not required to comply with the administrative and procedural elements of Section 404 of the Clean Water Act, however PG&E is obligated to comply with the substantive elements of Section 404 of the Clean Water Act. The locations of jurisdictional wetlands and waters have been incorporated into the design. At the 90%/ Supplemental 90% design stage, the final remedy avoids almost all permanent impacts within USACE jurisdictional areas with the following exceptions. There is one planned well, IRL-4, that will occur within a jurisdictional waters of the US. There is also a freshwater pipeline that will be installed within an existing unpaved access road within the 100-year floodplain of the Colorado River. In addition, piping and conduits will be installed in two locations in Bat Cave Wash – one location in the Upland Area and one location near the TCS. However, complete avoidance of other jurisdictional non-wetland waters is not feasible. It has been determined that in order to meet the goals of protection of human health and the environment, to meet the RAOs for the remedy, to monitor remedy performance, to gather data for demonstration of compliance, as well as in response to resolution of design comments with the Tribes, infrastructure (remediation, monitoring wells, and associated piping/conduits) must be	*the Construction Headquarters, Final Groundwater Remedy, Topock Compressor Station, California* (CH2M HILL 2015c) was prepared to provide a general assessment of biological resources that could be affected by the proposed sewer and fire water lines that may be installed in the future and are associated with the construction headquarters facilities that would be located to the west of Moabi Regional Park, south of the National Trails Highway. The memo was completed on August 5, 2015 and submitted for review during the 90% RTC process and is included in Appendix A10 of this report. The locations of jurisdictional waters have been considered in the design. At the final design stage, the final remedy avoids almost all permanent impacts within USACE jurisdictional areas with the following exceptions: 1) Inner Recirculation Loop well IRL-4 will occur within a jurisdictional water of the U.S. 2) Remedy and monitoring wells and associated piping/conduits will be installed in Bat Cave Wash, a jurisdictional water of the U.S. 3) Freshwater supply well HNWR-1A, contingent Site B well, associated equipment, and a portion of the freshwater pipeline will be installed within the 100-year floodplain of the Colorado River. 4) Riverbank Extraction Well RB-5, monitoring well MW-W, a portion of Pipeline C,

Summary of Compliance with Identified ARARs
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Item No.[1]	Category[1]	Citation[1,2]	Determination[1,2]	Description in DOI's ARARs Table[1,2]	Triggering Event	Compliance Responsibility	Which existing/ future document(s) will document continued compliance with this ARAR?[4]	Action (Compliance Status)			
								Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
										installed in certain washes. There are no practicable alternatives to locating certain infrastructure within waters of the United States. Figure 2.4-5 in the 90% BOD Report shows the unavoidable overlaps between planned remedy infrastructure and the USACE jurisdictional waters. In such cases where complete avoidance is not feasible, certain best management practices (BMPs) will be implemented to avoid and minimize temporary and permanent impacts for activities occurring within jurisdictional wetlands (if any) and non-wetland waters of the U.S. Although the USACE did not provide a list of measures that may be taken to reduce impacts to jurisdictional waters and wetlands, the California Department of Fish and Wildlife (CDFW) requires compliance with avoidance and mitigation measures (AMMs) for all work conducted in CDFW jurisdictional washes. The geographic extent of CDFW's jurisdiction is broader than the jurisdictional extent of the USACE under CWA 404 and thus, avoidance and mitigation measures applied to CDFW jurisdictional waters would as a geographic consequence also be applied to CWA 404 waters. While Arizona does not have a similar state program, PG&E will also implement the same AMMs in Arizona identified by CDFW for California as well to ensure appropriate protection to CWA 404 jurisdictional areas in the project area, including those in Arizona.	and a portion of the ring road will be installed within the 100-year floodplain of the Colorado River. Complete avoidance of jurisdictional areas is not feasible. It has been determined that in order to meet the goals of protection of human health and the environment, to meet the RAOs for the remedy, to monitor remedy performance, to gather data for demonstration of compliance, as well as in response to resolution of design comments with the Tribes, infrastructure (remediation, monitoring wells, and associated piping/conduits) must be installed in certain washes. There are no practicable alternatives to locating certain infrastructure within the waters of the United States. Figure 2.4-5 in this Final BOD Report shows the unavoidable overlaps between planned remedy infrastructure and the USACE jurisdictional waters. In such cases where complete avoidance is not feasible, BMPs will be implemented to avoid and minimize temporary and permanent impacts for activities occurring within jurisdictional wetlands and non-wetland waters of the U.S. (for brevity, the detailed discussion on BMPs in the previous column is not repeated here).

TABLE L1.1-3
Summary of Compliance with Identified ARARs
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Item No.[1]	Category[1]	Citation[1,2]	Determination[1,2]	Description in DOI's ARARs Table[1,2]	Triggering Event	Compliance Responsibility	Which existing/ future document(s) will document continued compliance with this ARAR?[4]	Action (Compliance Status)			
								Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
										In addition to the CDFW AMMs, PG&E has identified additional BMPs for implementation during remedy construction, operation and maintenance, as well as decommissioning. The additional BMPs are described in the *Protocol for Compliance with EIR Mitigation and Monitoring Reporting Program BIO-1 and Applicable or Relevant and Appropriate Requirement (ARAR) #32 at the Topock Compressor Station* (see Exhibit 6.1-1 at the end of Table 6.1-1). A Habitat Restoration Plan for Riparian Vegetation and Other Sensitive Habitats (CH2M HILL 2014o) was also prepared and submitted as an appendix of the Construction/Remedial Action Work Plan.	
33	Federal Action-Specific	Federal Water Pollution Control Act (Clean Water Act) - 33 USC § 1342; 40 CFR 122; 40 CFR 125	ARAR Applicable	These National Pollutant Discharge Elimination System (NPDES) requirements regulate discharges of pollutants from any point source into waters of the United States.	Point source discharges to waters of the US.	PG&E	N/A. No further action required unless post-design approval change triggers.	No further action required. The remedy as presented in the preliminary (30%) design does not result in point source discharges to waters of the United States that will require an NPDES permit.	No further action required. The remedy as presented in the 60% design does not result in point source discharges to waters of the United States that will require an NPDES permit.	No further action required. The remedy as presented in the 90% design does not result in point source discharges to waters of the United States that will require an NPDES permit.	No further action required. The remedy as presented in the final design does not result in point source discharges to waters of the United States that will require an NPDES permit.
34	Federal Action-Specific	Federal Water Pollution Control Act (Clean Water Act) -40 CFR 122.26	ARAR Applicable	These regulations define the necessary requirements with respect to the discharge of storm water under the NPDES program. These regulations will apply if proposed remedial actions result in storm water runoff which comes in contact with any construction activity from the site remediation.	Ground disturbance as a result of construction is > 1 acre	PG&E	SWPPP, BMP Plans and Monitoring & Reporting, Construction/ Remedial Action Work Plan, Plan for Decommissioning and Removal of IM-3 and Site Restoration, Decommissioning Plan for Remedy Facilities and Restoration	PG&E will prepare a BMP Plan prior to construction activities that will be included in the Construction/Remedial Action Work Plan.	PG&E will prepare a BMP Plan to address construction activities which will be included in the Construction/Remedial Action Work Plan and the IM-3 Decommissioning Work Plan that will be submitted as part of the 90% design. In addition, PG&E will prepare an industrial or O&M SWPPP that will include a storm water monitoring program in compliance with the General Permit. The outline for the O&M SWPPP is included in Appendix E of the O&M Plan (Volume 1) at the 60% design stage; the complete industrial SWPPP will be provided at the 90% design stage.	A BMP Plan for construction activities was prepared and is included as an appendix in the Construction/Remedial Action Work Plan and the IM-3 Decommissioning Work Plan. In addition, an industrial SWPPP was also prepared and included in Appendix E of the O&M Plan (Volume 1). The SWPPP includes BMPs for O&M activities and a storm water monitoring program in compliance with the General Permit.	A BMP Plan for construction activities was prepared and is included as an appendix in the Construction/Remedial Action Work Plan and the IM-3 Decommissioning Work Plan. In addition, an industrial SWPPP was also prepared and included in Appendix E of the O&M Plan (Volume 1). The SWPPP includes BMPs for O&M activities and a storm water monitoring program in compliance with the General Permit.

39	Federal Action-Specific	Religious Freedom Restoration Act - 42 USC § 2000bb	ARAR Applicable	Pursuant to this Act, the government shall not substantially burden a person's exercise of religion, unless the application of the burden is in furtherance of a compelling government interest, and it is the least restrictive means of furthering that interest. To constitute a "substantial burden" on the exercise of religion, a government action must (1) force individuals to choose between following the tenets of their religion and receiving a governmental benefit or (2) coerce individuals to act contrary to their religious beliefs by the threat of civil or criminal sanctions. If any remedial action selected imposes a substantial burden on a person's exercise of religion, it must be in furtherance of a compelling government interest and be the least restrictive means of achieving that interest.	Activities with the potential to impose a substantial burden on a person's exercise of religion.	DOI/BLM	Design submittals, Construction/ Remedial Action Work Plan, O&M Plan, Progress Reports, Decommissioning Plan	The remedy, as presented in the preliminary (30%) design does not substantially burden a person's exercise of religion. Additionally, in compliance with the PA, a Tribal Access Plan is being developed for Tribal access to areas within the Topock site for traditional religious, cultural, or spiritual purposes during implementation of the Remedy. BLM is also developing a *Cultural and Historic Properties Management Plan* (CHPMP) to avoid, minimize and mitigate potential affects to historic properties, including the Topock TCP during implementation of the Remedy. BLM distributed a draft CHPMP on November 1, 2011. Comments on the draft CHPMP are due December 5, 2011. The BLM is anticipating that the final CHPMP will be issued by January 20, 2012 The preliminary (30%) design was submitted on November 18, 2011. PG&E will prepare future design submittals, a Construction/Remedial Action Work Plan, a Plan for decommissioning, removal, and restoration of IM-3 facility, and a Decommissioning Plan for Remedy Facilities and Restoration. The other documents will be prepared and submitted.	The remedy, as presented in the intermediate (60%) design, does not substantially burden a person's exercise of religion. Additionally, in compliance with the PA, a Tribal Access Plan (BLM 2011) was completed for Tribal access to lands under federal management within the Topock site for traditional religious, cultural, or spiritual purposes during implementation of the Remedy. PG&E has initiated work on an Access Plan for the lands not under federal management, taking into consideration the information in the BLM Access Plan, for submittal with the final design (target 2013). BLM also developed the CHPMP to avoid, minimize and mitigate potential affects to historic properties, including the Topock TCP, during implementation of the Remedy. BLM issued the final CHPMP on January 20, 2012. The CHPMP can be modified and updated, as needed, to address new information and ongoing activities related to the project. Therefore, subsequently to the issuance of the CHPMP, BLM continues to hold periodic working meetings on the CHPMP. It should be noted that treatment measures are included in the CHPMP and a treatment plan will continue to be developed throughout the design to address mitigation measures. The intermediate (60%) design was submitted on April 5, 2013. PG&E will prepare and submit future design submittals; a Construction/Remedial Action Work Plan; a plan for decommissioning, removal, and restoration of the IM-3 facility; and a Decommissioning Plan for Remedy Facilities and Restoration.	The remedy, as presented in the 90% design, does not substantially burden a person's exercise of religion. Additionally, in compliance with the PA, a Tribal Access Plan (BLM 2011) was completed for Tribal access to lands under federal management within the Topock site for traditional religious, cultural, or spiritual purposes during implementation of the Remedy. On October 21, 2013, PG&E provided the Tribes a draft of the Access Plan for lands not under federal management for review and comment. Tribal comments were received on November 22, 2013. PG&E has updated and discussed the plan at the July 24, 2014 TMU. The Access Plan is included in an appendix of the Construction/Remedial Action Work Plan. BLM also developed the CHPMP to avoid, minimize and mitigate potential affects to historic properties, including the Topock TCP, during implementation of the Remedy. BLM issued the final CHPMP on January 20, 2012. The CHPMP can be modified and updated, as needed, to address new information and ongoing activities related to the project. Therefore, subsequently to the issuance of the CHPMP, BLM continues to hold periodic working meetings on the CHPMP. It should be noted that treatment measures are included in the CHPMP and a treatment plan will be prepared and submitted to	The remedy, as presented in the final design, does not substantially burden a person's exercise of religion. Additionally, in compliance with the PA, a Tribal Access Plan (BLM 2011) was completed for Tribal access to lands under federal management within the Topock site for traditional religious, cultural, or spiritual purposes during implementation of the remedy. PG&E has prepared an Access Plan in coordination with Tribes, for the lands not under federal management, taking into consideration the information in the BLM Access Plan. The Access Plan is included in an appendix of the Construction/Remedial Action Work Plan and was submitted on November 18, 2015. PG&E's Tribal Access Plan preserves Tribal members' access to, and use of, the project area for religious, spiritual, or other cultural purposes, to the extent that PG&E has the authority to facilitate such access, consistent with the requirements of EIR mitigation measure CUL-1a-2. BLM also developed the CHPMP to avoid, minimize and mitigate potential affects to historic properties, including the Topock TCP, during implementation of the Remedy. BLM issued the final CHPMP on January 20, 2012. The CHPMP can be modified and updated, as needed, to address new information and ongoing activities related to the project. Therefore, subsequently to the issuance of the CHPMP, BLM continues

40	Federal Action-Specific	Endangered Species Act of 1973 - 16 USC §§ 1531-1544;50 CFR 402	ARAR Applicable	The ESA makes it unlawful to remove or "take" threatened and endangered plants and animals and protects their habitats by prohibiting certain activities. Examples of such species in or around the Topock site may include, but are not limited to, southwestern willow flycatcher, Mojave Desert tortoise, Yuma clapper rail, Colorado pike minnow, razorback sucker, and bonytail chub. Any remedial action selected for the Topock site will not result in the take of, or adverse impacts to, threatened and endangered species or their habitats, as determined based on consultation with the Fish and Wildlife Service under section 7 of the ESA.	Extension of existing PBA through December 31, 2017 or construction of remedy, whichever is sooner	DOI/USFWS/ PG&E	PBA, Construction/ Remedial Action Work Plan, Plan for decommissioning, removal, and restoration of IM-3 facility, Plan for Decommissioning of Remedy Facilities and Restoration.	PG&E, USFWS, and DOI are coordinating on the Programmatic Biological Assessment (PBA) for the final groundwater remedy. Goal is to complete the PBA in time for the completion of ESA Section 7 consultation prior to the approval of the Construction/Remedial Action Work Plan.	Preparation of the PBA for the final groundwater remedy and coordination with USFWS and DOI are ongoing. Goal is to complete the PBA in time for the completion of ESA Section 7 consultation prior to the approval of the Construction/Remedial Action Work Plan.	The Final Groundwater Remedy PBA was prepared to support informal consultations for actions to be conducted under the remedial action, including activities located on BLM and U.S. Fish and Wildlife Service administered lands. Coordination with USFWS, BLM, and DOI on the PBA had occurred. This ESA Section 7 consultation was concluded with receipt of USFWS concurrency letter on July 7, 2014 which preceded the approval of the Construction/ Remedial Action Work Plan.	The Final Groundwater Remedy PBA was prepared to support informal consultations for actions to be conducted under the remedial action, including activities located on BLM and U.S. Fish and Wildlife Service administered lands. Coordination with USFWS, BLM, and DOI on the PBA occurred. This ESA Section 7 consultation was concluded with receipt of USFWS concurrence letter on July 7, 2014 which preceded the approval of the Construction/ Remedial Action Work Plan.
41	Federal Action-Specific	Migratory Bird Treaty Act - 16 USC 703-712	ARAR Applicable	This Act makes it unlawful to "take, capture, kill," or otherwise impact a migratory bird or any nest or egg of a migratory bird. The Havasu National Wildlife Refuge, which is part of the Topock site, was created as a refuge and breeding ground for migratory birds and other wildlife, therefore, there is potential for contact with migratory birds during proposed remediation activities. Any remedial action selected for the Topock site will be designed and implemented so as to not take, capture, kill, or otherwise impact a migratory bird, nest, or egg.	Remedial action for Topock site	PG&E	Construction/ Remedial Action Work Plan, Plan for decommissioning, removal, and restoration of IM-3 facility, Plan for Decommissioning of Remedy Facilities and Restoration	Avoidance and minimization measures will be included in the Construction/Remedial Action Work Plan to the extent necessary to not take, capture, kill, or otherwise impact a migratory bird, nest, or egg.	Avoidance and minimization measures will be included in the Construction/Remedial Action Work Plan, which will be submitted as part of the 90% design, to the extent necessary to not take, capture, kill, or otherwise impact a migratory bird, nest, or egg. Regarding decommissioning activities, the Avoidance and Minimization Plan and Habitat Restoration Plan will be based on surveys conducted prior to decommissioning, and during the breeding season; therefore these Plans will be prepared in the future, prior to decommissioning. The IM-3 Decommissioning Work Plan will describe the general procedures for restoration of the land and habitats.	PG&E submitted the Final Bird Impact Avoidance and Minimization Plan (CH2M HILL, 2014d) on April 30, 2014. The plan is also included as an appendix of the Construction/Remedial Action Work Plan, and Appendix I of the IM-3 Decommissioning Work Plan. Regarding decommissioning activities, the Avoidance and Minimization Plan will be based on surveys conducted prior to decommissioning, and during the breeding season; therefore this Plan will be prepared in the future, prior to decommissioning.	PG&E submitted the Final Bird Impact Avoidance and Minimization Plan (CH2M HILL 2014d) on April 30, 2014. The plan is also included as an appendix of the Construction/Remedial Action Work Plan, and Appendix I of the IM-3 Decommissioning Work Plan. Regarding decommissioning activities, another Avoidance and Minimization Plan will be based on surveys conducted prior to decommissioning, and during the breeding season; therefore this Plan will be prepared in the future, prior to decommissioning.

Summary of Compliance with Identified ARARs
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Item No.[1]	Category[1]	Citation[1,2]	Determination[1,2]	Description in DOI's ARARs Table[1,2]	Triggering Event	Compliance Responsibility	Which existing/ future document(s) will document continued compliance with this ARAR?[4]	Action (Compliance Status)			
								Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
45	Arizona Action-Specific	Arizona Well Standards - A.A.C. R-12-15-850	ARAR	These requirements on the placement of wells will apply if the selected remedy includes placement of wells in Arizona.	During project design and construction of wells in Arizona	PG&E		The preliminary (30%) design assumes that freshwater supply comes from the existing irrigation well (HNWR-1) on the Refuge in Arizona. If the Refuge irrigation well is not used in the final design, placement of new freshwater supply wells will be needed. In addition, new monitoring wells may also be constructed in Arizona, the locations of the monitoring wells will be presented in the intermediate (60%) design. Wells constructed in Arizona will comply with the Arizona Well Standards	The 60% design assumes that freshwater supply comes from the existing well (HNWR-1) on the Refuge in Arizona, and does not include any new monitoring wells in Arizona. If the Refuge irrigation well is not used in the final design, placement of new freshwater supply wells will be needed. If any new wells are constructed in Arizona they will comply with the Arizona Well Standards.	While the 90% design includes freshwater supply from existing wells in Arizona, these supply wells are part of the alternative freshwater source evaluation (also known as the Fresh Water Implementation Plan [FWIP]). Compliance with ARARs, including the Arizona Well Standards, for the supply wells are included in the FWIP. If additional wells in Arizona are required, they will comply with the Arizona Well Standards.	While the final design includes freshwater supply (planned and contingent) from existing wells in Arizona, two of these supply wells (HNWR-1A and Site B) are part of the alternative freshwater source evaluation (also known as the Fresh Water Implementation Plan [FWIP]). Compliance with ARARs, including the Arizona Well Standards, for these supply wells are included in the FWIP. If additional wells in Arizona are required, they will comply with the Arizona Well Standards.
46	Arizona Action-Specific	Design criteria for treatment units - A.A.C. R18-5-(501-502)	ARAR	These minimum design criteria will apply if the selected remedy includes construction of a groundwater treatment plant.	Construction of treatment plant in Arizona	PG&E	N/A. No further action required unless post-design approval change triggers.	No further action is required. The preliminary (30%) design does not involve the construction of a groundwater treatment plant in Arizona.	No further action is required. The 60% design does not involve the construction of a groundwater treatment plant in Arizona.	No further action is required. The 90% design does not involve the construction of a groundwater treatment plant in Arizona.	No further action is required. The final design does not involve the construction of a groundwater treatment plant in Arizona.
47	Arizona Action-Specific	Requirements for wells, groundwater withdrawal, treatment, and reinjection -A.R.S. §45-454.01	ARAR	This statute exempts new well construction, withdrawal, treatment, and reinjection into a groundwater aquifer as a part of a CERCLA Remedial Action from the requirements of the Arizona Groundwater Code, except that they must comply with the substantive requirements of A.R.S. 45-594, 45-595, 45-596, and 45-600. If groundwater that is withdrawn is not reinjected into the aquifer, the groundwater shall be put to reasonable and beneficial use.	Construction of wells in Arizona	PG&E		This remediation project is a CERCLA remedial action. If a new freshwater supply well or additional monitoring wells in Arizona are required they will be constructed in conformance with State construction standards (A.R.S 45-594) by a State-licensed well driller (A.R.S. 45-595). A notice of intention to drill will be filed (A.R.S. 45-596), and a well driller's report will be filed within 30 days of completion of drilling (A.R.S. 45-600). Most of the groundwater that is withdrawn will be reinjected into the aquifer. Any groundwater that is withdrawn but not reinjected into the aquifer shall be put to reasonable and beneficial use.	This remediation project is a CERCLA remedial action. The 60% design assumes that freshwater supply comes from the existing irrigation well (HNWR-1) on the Refuge in Arizona, and does not include any new monitoring wells in Arizona. If a new freshwater supply well or additional monitoring wells in Arizona are required they will be constructed in conformance with State construction standards (A.R.S. 45-594) by a State-licensed well driller (A.R.S. 45-595). A notice of intention to drill will be filed (A.R.S. 45-596), and a well driller's report will be filed within 30 days of completion of drilling (A.R.S. 45-600). Most of the groundwater that is withdrawn will be reinjected into the aquifer. Any groundwater that is withdrawn but not reinjected into the aquifer shall be put to reasonable and beneficial use.	While the 90% design includes freshwater supply from existing wells in Arizona, these supply wells are part of the alternative freshwater source evaluation (also known as the Fresh Water Implementation Plan [FWIP]). Compliance with ARARs, including the Arizona Well Standards, for the supply wells are included in the FWIP. If a new freshwater supply well or additional monitoring wells in Arizona are required they will be constructed in conformance with State construction standards (A.R.S. 45-594) by a State-licensed well driller (A.R.S. 45-595). A notice of intention to drill will be filed (A.R.S. 45-596), and a well driller's report will be filed within 30 days of completion of drilling (A.R.S. 45-600). Most of the groundwater that is withdrawn will be reinjected	While the final design includes freshwater supply (planned and contingent) from existing wells in Arizona, two of these supply wells (HNWR-1A and Site B) are part of the alternative freshwater source evaluation (also known as the Fresh Water Implementation Plan [FWIP]). Compliance with ARARs for these supply wells are included in the FWIP. Most of the groundwater that is withdrawn will be reinjected into the aquifer. Any groundwater that is withdrawn but not reinjected into the aquifer shall be put to reasonable and beneficial use. If additional wells in Arizona are required, they will be constructed in conformance with state construction standards (A.R.S. 45-594) by a state-licensed well driller (A.R.S. 45-595). A notice of

76	California Action-Specific	Hazardous Waste Control Act (HWCA) - Standards for owners and operators of hazardous waste transfer and TSD facilities Title 22, CCR, Div 4.5, Ch 14, Article 2	ARAR Applicable	Establish requirements for a hazardous waste treatment facility to have a plan for waste analysis, develop a security system, conduct regular inspections, provide training to facility personnel, and use a quality assurance program during construction. The requirements may be applicable if CERCLA response action includes treatment, storage, or disposal as defined under RCRA, or may be relevant and appropriate if the requirements address problems or situations sufficiently similar to the specific circumstances at the site that their usage will be well suited.	Activity associated with construction and operation of a treatment facility or long term (longer than 90 days) storage of hazardous waste. If waste is simply removed, stored in appropriate containers after characterization, and removed off-site within 90 days, PG&E will be required to follow the substantive requirements of PG&E of a generator, including use of manifests, record keep, segregation of incompatibles, etc.	PG&E	O&M Plan, Construction/ Remedial Action Work Plan, Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	In-situ treatment of contaminated groundwater or conditioning of remedy-produced water does not comprise a hazardous waste treatment facility as defined in the hazardous waste regulations. However, a variety of these provisions will be addressed in documents such as the O&M Plan, Soil Management Plan prepared under EIR mitigation measure HAZ-2c, and the Security Plan prepared under EIR mitigation measure CUL-1a-3b. Waste analysis procedures will be addressed in standard operating procedures for the treatment/conditioning process that will be developed.	In-situ treatment of contaminated groundwater or conditioning of remedy-produced water does not comprise a hazardous waste treatment facility as defined in the hazardous waste regulations. However, a variety of these provisions will be addressed in documents such as the O&M Plan, Soil Management Plan prepared under EIR mitigation measure HAZ-2c, and the Security Plan prepared under EIR mitigation measure CUL-1a-3b. Waste management, including waste analysis, is described in Section 6 of the O&M Manual, which is included in this BOD Report for the 60% design as Appendix L. The Soil Management Plan is also included in the O&M Manual (Volume 4).	In-situ treatment of contaminated groundwater or conditioning of remedy-produced water does not comprise a hazardous waste treatment facility as defined in the hazardous waste regulations. However, a variety of these provisions are addressed in documents such as the O&M Plan, the Soil Management Plan prepared under EIR mitigation measure HAZ-2c, the Construction/ Remedial Action Work Plan (including the Construction Quality Assurance Project Plan), and the Security Plan prepared under EIR mitigation measure CUL-1a-3b. Waste management, including waste analysis, is described in: a) Section 6 of the O&M Plan, which is included in the BOD Report for the 90% design as Volume 1 of the O&M Manual (Appendix L), b) The Soil Management Plan, which is included in Volume 4 of the O&M Manual (Appendix L), c) The Waste Management Plan, which is included as an appendix of the Construction/ Remedial Action Work Plan, and d) Section 5 of the IM-3 Decommissioning, Removal, and Restoration Work Plan (appendix to the CIMP and to the Construction/Remedial Action Work Plan).	In-situ treatment of contaminated groundwater or conditioning of remedy-produced water does not comprise a hazardous waste treatment facility as defined in the hazardous waste regulations. However, a variety of these provisions are addressed in documents such as the O&M Plan, the Soil Management Plan prepared under EIR mitigation measure HAZ-2c, the Construction/ Remedial Action Work Plan (including the Construction Quality Assurance Project Plan), and the Security Plan prepared under EIR mitigation measure CUL-1a-3b. Waste management, including waste analysis, is described in: a) Section 6 of the O&M Plan, which is included in the BOD Report for the final design as Volume 1 of the O&M Manual (Appendix L), b) The Soil Management Plan, which is included in Volume 4 of the O&M Manual (Appendix L), c) The Waste Management Plan, which is included as an appendix of the Construction/ Remedial Action Work Plan, and d) Section 5 of the IM-3 Decommissioning, Removal, and Restoration Work Plan (appendix to the CIMP and to the Construction/Remedial Action Work Plan).

Summary of Compliance with Identified ARARs
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Item No.[1]	Category[1]	Citation[1,2]	Determination[1,2]	Description in DOI's ARARs Table[1,2]	Triggering Event	Compliance Responsibility	Which existing/ future document(s) will document continued compliance with this ARAR?[4]	Action (Compliance Status)			
								Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
77	California Action-Specific	Hazardous Waste Control Act (HWCA) - Standards applicable to generators of hazardous waste Title 22, CCR, Div 4.5, Ch 12, Article 2, §66262.20, §66262.22	ARAR Applicable	A generator of hazardous waste who transports or offers hazardous waste for transportation shall prepare a manifest. Substantive requirements will be applicable for any operation where waste is generated. The determination of whether wastes generated during remedial activities are hazardous shall be made when the wastes are generated.	Preparation of offsite shipment of hazardous waste	PG&E	O&M Plan, Construction/ Remedial Action Work Plan, Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	PG&E will prepare an O&M Plan, a Construction/Remedial Action Work Plan, and a Plan for Decommissioning of IM-3 Facility prior to construction activities. These plans will describe waste management procedures. Hazardous waste manifests will be prepared for each off-site shipment of hazardous waste.	Waste management is described in Section 6 of the O&M Plan (Volume 1), which is included in this BOD Report for the 60% design as Appendix L. Waste management will also be described in the Construction/Remedial Action Work Plan and the Plan for Decommissioning of the IM-3 Facility that will be submitted as part of the 90% design. Hazardous waste manifests will be prepared for each off-site shipment of hazardous waste.	Waste management procedures are described in the following documents: 1) O&M Plan (Volume 1 of O&M Manual), Section 6, Waste Management Plan and Recoverable Materials describes procedures for the collection, characterization, storage, transportation, and disposal of waste generated during operation and maintenance of the remedy. 2) Soil Management Plan (Volume 4 of O&M Manual) includes procedures and protocols for the management and disposal of potentially contaminated or contaminated soils displaced during drilling, construction, operation and maintenance of the remedy, and decommissioning and removal of IM-3 facilities. 3) The Waste Management Plan in an appendix of the Construction/Remedial Action Work Plan includes procedures for the management of wastes (other than soil) generated during construction and startup of the remedy. 4) IM-3 Decommissioning, Removal, and Restoration Work Plan, Section 5, Waste Management Plan and Recoverable Materials includes procedures for collection, characterization, storage, transportation, and disposal of wastes (other than soil) generated during the decommissioning and removal of IM-3 facilities. Hazardous waste manifests will be prepared for each off-site shipment of hazardous waste.	Waste management procedures are described in the following documents: 1) O&M Plan (Volume 1 of O&M Manual), Section 6, Waste Management Plan and Recoverable Materials describes procedures for the collection, characterization, storage, transportation, and disposal of waste generated during operation and maintenance of the remedy. 2) Soil Management Plan (Volume 4 of O&M Manual) includes procedures and protocols for the management and disposal of potentially contaminated or contaminated soils displaced during drilling, construction, operation and maintenance of the remedy, and decommissioning and removal of IM-3 facilities. 3) The Waste Management Plan in an appendix of the Construction/Remedial Action Work Plan includes procedures for the management of wastes (other than soil) generated during construction and startup of the remedy. 4) IM-3 Decommissioning, Removal, and Restoration Work Plan, Section 5, Waste Management Plan and Recoverable Materials includes procedures for collection, characterization, storage, transportation, and disposal of wastes (other than soil) generated during the decommissioning and removal of IM-3 facilities. Hazardous waste manifests will be prepared for each off-site shipment of hazardous waste.

79	California Action-Specific	Hazardous Waste Control Act (HWCA) - Standards applicable to generators of hazardous waste Title 22, CCR, Div 4.5, Ch 12, Article 3, §66262.34	ARAR Applicable	Requirements with respect to accumulation of waste on-site.	Accumulation of hazardous waste onsite	PG&E	O&M Plan, Construction/ Remedial Action Work Plan, Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration; Operations documents (e.g., manifests, inspection records)	PG&E will prepare an O&M Plan, a Construction/Remedial Action Work Plan, and a Plan for Decommissioning of IM-3 Facility prior to construction activities. These plans will describe waste management procedures. Hazardous waste generated onsite will meet the accumulation requirements of 22 CCR §66262.34.	Waste management is described in Section 6 of the O&M Plan (Volume 1), which is included in this BOD Report for the 60% design as Appendix L. Waste management will also be described in the Construction/Remedial Action Work Plan and the Plan for Decommissioning of the IM-3 Facility that will be submitted as part of the 90% design. Hazardous waste generated onsite will meet the accumulation requirements of 22 CCR §66262.34.	Waste management procedures (including accumulation requirements) are described in the following documents: 1) O&M Plan (Volume 1 of O&M Manual), Section 6, Waste Management Plan and Recoverable Materials, describes procedures for the collection, characterization, storage, transportation, and disposal of waste generated during operation and maintenance of the remedy. 2) Soil Management Plan (Volume 4 of O&M Manual), includes procedures and protocols for the management and disposal of potentially contaminated or contaminated soils displaced during drilling, construction, operation and maintenance of the remedy, and decommissioning and removal of IM-3 facilities. 3) The Waste Management Plan in an appendix of the Construction/Remedial Action Work Plan includes procedures for the management of wastes (other than soil) generated during construction and startup of the remedy. 4) IM-3 Decommissioning, Removal, and Restoration Work Plan, Section 5, Waste Management Plan and Recoverable Materials includes procedures for collection, characterization, storage, transportation, and disposal of wastes (other than soil) generated during the decommissioning and removal of IM-3 facilities.	Waste management procedures (including accumulation requirements) are described in the following documents: 1) O&M Plan (Volume 1 of O&M Manual), Section 6, Waste Management Plan and Recoverable Materials, describes procedures for the collection, characterization, storage, transportation, and disposal of waste generated during operation and maintenance of the remedy. 2) Soil Management Plan (Volume 4 of O&M Manual), includes procedures and protocols for the management and disposal of potentially contaminated or contaminated soils displaced during drilling, construction, operation and maintenance of the remedy, and decommissioning and removal of IM-3 facilities. 3) The Waste Management Plan in an appendix of the Construction/Remedial Action Work Plan includes procedures for the management of wastes (other than soil) generated during construction and startup of the remedy. 4) IM-3 Decommissioning, Removal, and Restoration Work Plan, Section 5, Waste Management Plan and Recoverable Materials includes procedures for collection, characterization, storage, transportation, and disposal of wastes (other than soil) generated during the decommissioning and removal of IM-3 facilities.

80	California Action-Specific	Hazardous Waste Control Act (HWCA) - Standards applicable to generators of hazardous waste Title 22, CCR, Div 4.5, Ch 12, Article 4, §66262.40, §66262.41	ARAR Applicable	Establishes requirements for record keeping of manifests, test results, waste analyses, and Biennial Reports. Any substantive requirements shall be attained.	Activity generating hazardous waste	PG&E	O&M Plan, Construction/ Remedial Action Work Plan, Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration, Operations documents (e.g., manifests, waste profiling records)	PG&E will prepare an O&M Plan, a Construction/Remedial Action Work Plan, and a Plan for Decommissioning of IM-3 Facility prior to construction activities. These plans will describe waste management procedures. Hazardous waste generated onsite will meet the recordkeeping requirements of 22 CCR §66262.40, §66262.41.	Waste management is described in Section 6 of the O&M Plan (Volume 1), which is included in this BOD Report for the 60% design as Appendix L. Waste management will also be described in the Construction/Remedial Action Work Plan and the Plan for Decommissioning of the IM-3 Facility that will be submitted as part of the 90% design. Hazardous waste generated onsite will meet the recordkeeping requirements of 22 CCR §66262.40, §66262.41.	Waste management procedures (including record keeping requirements) are described in the following documents: 1) O&M Plan (Volume 1 of O&M Manual), Section 6, Waste Management Plan and Recoverable Materials, describes procedures for the collection, characterization, storage, transportation, and disposal of waste generated during operation and maintenance of the remedy. 2) Soil Management Plan (Volume 4 of O&M Manual), includes procedures and protocols for the management and disposal of potentially contaminated or contaminated soils displaced during drilling, construction, operation and maintenance of the remedy, and decommissioning and removal of IM-3 facilities. 3) The Waste Management Plan in an appendix of the Construction/Remedial Action Work Plan includes procedures for the management of wastes (other than soil) generated during construction and startup of the remedy. 4) IM-3 Decommissioning, Removal, and Restoration Work Plan, Section 5, Waste Management Plan and Recoverable Materials includes procedures for collection, characterization, storage, transportation, and disposal of wastes (other than soil) generated during the decommissioning and removal of IM-3 facilities.	Waste management procedures (including record keeping requirements) are described in the following documents: 1) O&M Plan (Volume 1 of O&M Manual), Section 6, Waste Management Plan and Recoverable Materials, describes procedures for the collection, characterization, storage, transportation, and disposal of waste generated during operation and maintenance of the remedy. 2) Soil Management Plan (Volume 4 of O&M Manual), includes procedures and protocols for the management and disposal of potentially contaminated or contaminated soils displaced during drilling, construction, operation and maintenance of the remedy, and decommissioning and removal of IM-3 facilities. 3) The Waste Management Plan in an appendix of the Construction/Remedial Action Work Plan includes procedures for the management of wastes (other than soil) generated during construction and startup of the remedy. 4) IM-3 Decommissioning, Removal, and Restoration Work Plan, Section 5, Waste Management Plan and Recoverable Materials includes procedures for collection, characterization, storage, transportation, and disposal of wastes (other than soil) generated during the decommissioning and removal of IM-3 facilities.

TABLE L1.1-3
Summary of Compliance with Identified ARARs
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Item No.[1]	Category[1]	Citation[1,2]	Determination[1,2]	Description in DOI's ARARs Table[1,2]	Triggering Event	Compliance Responsibility	Which existing/ future document(s) will document continued compliance with this ARAR?[4]	Action (Compliance Status)			
								Preliminary (30%) Design	Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
81	California Action-Specific	Corrective Action - Title 22, CCR, Div 4.5, Ch 14, Article 6, §66264.100 (a) through (d), (f), (g)(1), and (h)	ARAR Relevant and Appropriate	The owner or operator is required to take corrective action under Title 22, CCR, §66264.91 to remediate releases from the regulated unit and to ensure that the regulated unit achieves compliance with the water quality protection standard. Substantive technical requirements are potentially relevant and appropriate for remedial action including groundwater monitoring.	Remedy implementation	PG&E	Not applicable. No further action required unless post-design approval change triggers.	PG&E will prepare an O&M Plan, a Construction/Remedial Action Work Plan, and a Plan for Decommissioning of IME Facility prior to construction activities. These plans will describe spill control and response procedures and will incorporate requirements of mitigation measure HAZ-1a, HAZ-1b, and HYDRO-1 for spill prevention, control, and cleanup during O&M, construction, and decommissioning activities.. In addition the O&M Plan will include a sampling and monitoring plan for groundwater.	The O&M Manual, which is included in this BOD Report for the 60% design as Appendix L, includes a Sampling and Monitoring Plan in Volume 2 to ensure that the regulated unit achieves compliance with the water quality protection standard, and a Contingency Plan in Volume 3 to address circumstances that may adversely affect the operation of the remedy.	The O&M Manual, which is included in the BOD Report for the 90% design as Appendix L, includes a Sampling and Monitoring Plan in Volume 2 to ensure that the regulated unit achieves compliance with the water quality protection standard, and a Contingency Plan in Volume 3 to address circumstances that may adversely affect the operation of the remedy.	DOI has determined that the specific regulations under this ARAR do not currently apply to the RCRA corrective action that is being conducted at the site (see RTC #393). Therefore, no further action is required.
82	California Action-Specific	Corrective Action for Waste Management Units -Title 22, CCR, Div 4.5, Ch 14, Article 6, §66264.101	ARAR Relevant and Appropriate	The owner or operator is required to take corrective action to remediate releases from any solid or hazardous waste management unit at the facility to protect public health and the environment. Substantive technical requirements are potentially relevant and appropriate for remedial action including groundwater monitoring.	Remedy implementation	PG&E	O&M Plan (sampling and monitoring plan, contingency plan), Progress Reports, Construction/ Remedial Action Completion Report	PG&E will prepare O&M Plan and a Construction/Remedial Action Work Plan. These plans will describe spill control and response procedures and will incorporate requirements of mitigation measure HAZ-1a, HAZ-1b, and HYDRO-1 for spill prevention, control, and cleanup during O&M and construction activities. In addition, the O&M Plan will include a sampling and monitoring plan for groundwater.	The O&M Manual, which is included in this BOD Report for the 60% design as Appendix L, includes a Sampling and Monitoring Plan in Volume 2 to ensure that the regulated unit achieves compliance with the water quality protection standard, and a Contingency Plan in Volume 3 to address circumstances that may adversely affect the operation of the remedy.	The O&M Manual, which is included in the BOD Report for the 90% design as Appendix L, includes a Sampling and Monitoring Plan in Volume 2 to ensure that the regulated unit achieves compliance with the water quality protection standard, and a Contingency Plan in Volume 3 to address circumstances that may adversely affect the operation of the remedy.	The O&M Manual, which is included in the Final BOD Report as Appendix L, includes a Sampling and Monitoring Plan in Volume 2 to ensure that the regulated unit achieves compliance with the water quality protection standard, and a Contingency Plan in Volume 3 to address circumstances that may adversely affect the operation of the remedy.
83	California Action-Specific	Closure and post-closure care -Title 22, CCR, Div 4.5, Ch 14, Article 7, §66264.111, §66264.112, §66264.115 through 120	ARAR Applicable	Owners and operators shall close a facility and perform post-closure care when contaminated subsurface soil cannot be practically removed or decontaminated. Contaminated soil, residues, or groundwater from remedial action at a site will achieve clean closure; otherwise, post-closure care requirements will be relevant and appropriate.	Decommissioning	PG&E	Not applicable. No further action required unless post-design approval change triggers.	PG&E will prepare a Decommissioning Plan for Remedy Facility and Site Restoration. Achievement of RAOs will be considered clean closure and that will remove any post-closure care obligations.	PG&E will prepare a Decommissioning Plan for Remedy Facility and Site Restoration that will be submitted prior to decommissioning. Achievement of RAOs will be considered clean closure and that will remove any post-closure care obligations.	The IM-3 Decommissioning, Removal, and Restoration Work Plan was prepared and is included in Appendix B of the CIMP and also as an appendix of the Construction/Remedial Action Work Plan. Achievement of RAOs will be considered clean closure and that will remove any post-closure care obligations. In compliance with the CD (Appendix C Scope of Work, Article 9), PG&E will prepare a site-specific Plan for Decommissioning and Restoration of remedy facilities within 120 days of DOI's certification of remedial action completion and a determination by DOI that removal of such facilities is	DOI has determined that the specific regulations under this ARAR do not currently apply to the RCRA corrective action that is being conducted at the site (see RTC #394). Therefore, no further action is required.

TABLE L1.1-3
Summary of Compliance with Identified ARARs

										protective of human health and the environment.	
84	California Action-Specific	Use and management of containers -Title 22, CCR, Div 4.5, Ch 14, Article 9	ARAR Applicable	Containers used for the transfer or storage of hazardous waste must be in good condition, compatible with the waste, kept closed except to add or remove materials and be inspected weekly. The area used to store the containers must provide adequate secondary containment and be designed with runoff controls. Also, appropriate closure of the containers must take place.	Design and management of hazardous waste containers	PG&E	Design Submittals; O&M Plan; Construction/ Remedial Action Work Plan.	PG&E will prepare an O&M Plan, and a Corrective Measure/Remedial Action Construction Work Plan. These plans will describe waste management procedures. Containers used to transfer, store or treat hazardous waste will comply with requirements in 22 CCR §66262.171-§66262.179.	Waste management is described in Section 6 of the O&M Plan (Volume 1), which is included in this BOD Report for the 60% design as Appendix L. Waste management will also be described in the Construction/Remedial Action Work Plan and the Plan for Decommissioning of the IM-3 Facility that will be submitted as part of the 90% design. Containers used to transfer, store or treat hazardous waste will comply with requirements in 22 CCR §66262.171-§66262.179.	Waste management procedures (including containers requirements) are described in the following documents: 1) O&M Plan (Volume 1 of O&M Manual), Section 6, Waste Management Plan and Recoverable Materials, describes procedures for the collection, characterization, storage, transportation, and disposal of waste generated during operation and maintenance of the remedy. 2) Soil Management Plan (Volume 4 of O&M Manual), includes procedures and protocols for the management and disposal of potentially contaminated or contaminated soils displaced during drilling, construction, operation and maintenance of the remedy, and decommissioning and removal of IM-3 facilities. 3) The Waste Management Plan in an appendix of the Construction/Remedial Action Work Plan includes procedures for the management of wastes (other than soil) generated during construction and startup of the remedy. 4) IM-3 Decommissioning, Removal, and Restoration Work Plan, Section 5, Waste Management Plan and Recoverable Materials includes procedures for collection, characterization, storage, transportation, and disposal of wastes (other than soil) generated during the decommissioning and removal of IM-3 facilities.	Waste management procedures (including containers requirements) are described in the following documents: 1) O&M Plan (Volume 1 of O&M Manual), Section 6, Waste Management Plan and Recoverable Materials, describes procedures for the collection, characterization, storage, transportation, and disposal of waste generated during operation and maintenance of the remedy. 2) Soil Management Plan (Volume 4 of O&M Manual), includes procedures and protocols for the management and disposal of potentially contaminated or contaminated soils displaced during drilling, construction, operation and maintenance of the remedy, and decommissioning and removal of IM-3 facilities. 3) The Waste Management Plan in an appendix of the Construction/Remedial Action Work Plan includes procedures for the management of wastes (other than soil) generated during construction and startup of the remedy. 4) IM-3 Decommissioning, Removal, and Restoration Work Plan, Section 5, Waste Management Plan and Recoverable Materials includes procedures for collection, characterization, storage, transportation, and disposal of wastes (other than soil) generated during the decommissioning and removal of IM-3 facilities.

85	California Action-Specific	Tank systems - Title 22, CCR, Div 4.5, Ch 14, Article 10	ARAR Applicable	The remedial activities may involve storage and/or treatment in tanks. These tanks are required to have secondary containment, be monitored and inspected, be provided with overfill and spill protection controls, and operated with adequate freeboard. Also, appropriate closure must take place.	During project design, operation and maintenance activities where tank systems are used to transfer, store or treat hazardous waste	PG&E	Design Submittals; O&M Plan	PG&E will prepare O&M Plan, and Corrective Measure/Remedial Action Construction Work Plan. Tank systems used to transfer, store or treat hazardous waste will comply with requirements in 22 CCR §66262.192-§66262.195.	At the 60% design stage, there is no transfer, storage and/or treatment of hazardous waste in tank systems.	At the 90% design stage, there are two design elements that could trigger compliance with this ARAR: **Sampling Purge Water Holding Tank in MW-20 Bench Carbon Amendment Building** If the purge water or decon pad water accumulated in this tank exhibits hazardous waste characteristics, the water tank and any ancillary equipment handling hazardous waste will comply with the requirements for hazardous waste tank systems. It will be labeled as a hazardous waste tank, be equipped with secondary containment and overfill prevention controls, daily inspections will be performed and documented, and an engineer's assessment of the tank system's integrity will be performed. **Portable Treatment Unit for Well Rehabilitation at Well Head** Treatment of well rehabilitation water with a pH below 2.0 at the well head may be performed in a portable treatment unit that is subject to the requirements for a fixed treatment unit (FTU) operating under the Conditional Authorization permit tier if it operates entirely onsite, or to the requirements for a transportable treatment unit (TTU) operating under the Permit By Rule permit tier if it operates at multiple sites. If the treatment unit includes tanks that accumulate or treat waste with hazardous characteristics, the tanks and any ancillary equipment that handles hazardous waste will	At the final design stage, there are two design elements that could trigger compliance with this ARAR: **Sampling Purge Water Holding Tank in MW-20 Bench Carbon Amendment Building** If the purge water or decon pad water accumulated in this tank exhibits hazardous waste characteristics, the water tank and any ancillary equipment handling hazardous waste will comply with the requirements for hazardous waste tank systems. It will be labeled as a hazardous waste tank, be equipped with secondary containment and overfill prevention controls, daily inspections will be performed and documented, and an engineer's assessment of the tank system's integrity will be performed. **Portable Treatment Unit for Well Rehabilitation at Well Head** Treatment of well rehabilitation water with a pH below 2.0 at the well head may be performed in a portable treatment unit that is subject to the requirements for a fixed treatment unit (FTU) operating under the Conditional Authorization permit tier if it operates entirely onsite, or to the requirements for a transportable treatment unit (TTU) operating under the Permit By Rule permit tier if it operates at multiple sites. If the treatment unit includes tanks that accumulate or treat waste with hazardous characteristics, the tanks and any ancillary equipment that

86	California Action-Specific	Waste piles - Title 22, CCR, Div 4.5, Ch 14, Article 12	ARAR Applicable	The waste piles should be placed upon a lined foundation or base with a leachate system, protected from precipitation and wind dispersal, designed to prevent run on and run off. Also, closure and post-closure care requirements. Remedial action may involve soil excavation and the compiling of soil in a temporary waste pile. This requirement is applicable if the excavated waste meets RCRA hazardous waste criteria.	Under broad application, a triggering event could be any temporary stockpiling of haz soil	PG&E	Soil Management Plan (Volume 4 of O&M Manual)	PG&E will prepare a Soil Management Plan in conformance with EIR mitigation measures HAZ-2 and HAZ-2f to describe management procedures in the event that evidence of contaminated soil is identified during ground disturbing activities (e.g., noxious odors, discolored soil). It is not anticipated that regulated waste piles will be constructed.	A Soil Management Plan is included in Volume 4 of the O&M Manual as part of the 60% design. In conformance with EIR mitigation measures HAZ-2 and HAZ-2f, the Soil Management Plan describes management procedures in the event that evidence of contaminated soil is identified during ground disturbing activities (e.g., noxious odors, discolored soil). It is not anticipated that long-term storage of soil requiring construction of a waste pile meeting Chapter 14, Article 12 requirements for soil exhibiting RCRA hazardous waste characteristics will occur. If necessary to facilitate characterization or staging for offsite transportation, RCRA and non-RCRA hazardous waste soil will be temporarily accumulated in a staging pile that meets the design standards specified in California Health and Safety Code Section 25123.3 for up to 90 days prior to transportation to a permitted offsite disposal facility.	A Soil Management Plan is included in Volume 4 of the O&M Manual as part of the 90% design. In conformance with EIR mitigation measures HAZ-2 and HAZ-2f, the Soil Management Plan describes management procedures in the event that evidence of contaminated soil is identified during ground disturbing activities (e.g., noxious odors, discolored soil). It is not anticipated that long-term storage of soil requiring construction of a waste pile meeting Chapter 14, Article 12 requirements for soil exhibiting RCRA hazardous waste characteristics will occur. If necessary to facilitate characterization or staging for offsite transportation, RCRA and non-RCRA hazardous waste soil will be temporarily accumulated in a staging pile that meets the design standards specified in California Health and Safety Code Section 25123.3 for up to 90 days prior to transportation to a permitted offsite disposal facility.	A Soil Management Plan is included in Volume 4 of the O&M Manual as part of the final design. In conformance with EIR mitigation measures HAZ-2 and HAZ-2f, the Soil Management Plan describes management procedures in the event that evidence of contaminated soil is identified during ground disturbing activities (e.g., noxious odors, discolored soil). Long-term storage of soil requiring construction of a waste pile meeting Chapter 14, Article 12 requirements for soil exhibiting RCRA hazardous waste characteristics will not occur. If necessary to facilitate characterization or staging for offsite transportation, RCRA and non-RCRA hazardous waste soil will be temporarily accumulated in a staging pile that meets the design standards specified in California Health and Safety Code Section 25123.3 for up to 90 days prior to transportation to a permitted offsite disposal facility.
87	California Action-Specific	Landfills - Title 22, CCR, Div 4.5, Ch 14, Article 14	ARAR Relevant and Appropriate	The requirements for landfills include the design and operation, action	Design, construct, O&M, and closure of landfills	PG&E	N/A. No further action required unless post-design	No further action is required. The preliminary (30%) design does not include construction of a landfill.	No further action is required. The 60% design does not include construction of a landfill.	No further action is required. The 90% design does not	No further action is required. The final design does not

89	California Action-Specific	Land Disposal Restrictions (LDR) for RCRA wastes and non-RCRA wastes -Title 22, CCR, Div 4.5, Ch 18, Articles 1, 3, 4, 10, 11	ARAR Applicable	Movement of hazardous waste to new locations and placed in or on land will trigger LDR. General applicability, dilution prohibited, waste analysis and record keeping, and special rules apply for wastes that exhibit a characteristic waste. Best Demonstrated Available Technology (BDA) standards for each hazardous constituent in each listed waste, if residual is to be disposed. Utilize treatment standards table when necessary. Where applicable, hazardous waste generated from remedial activities must comply with LDR and meet the treatment standards or notify the disposal facility of the treatment standards before disposal at an appropriate offsite disposal facility.	Activity that generates hazardous waste	PG&E	O&M Plan, Construction/ Remedial Action Work Plan; Plan for Decommissioning and Removal of IM-3 Facility and Site Restoration; Plan for Decommissioning of Remedy Facilities and Restoration	PG&E will prepare an O&M Plan, a Construction/Remedial Action Work Plan, and a Plan for Decommissioning of IM-3 Facility prior to construction activities. These plans will describe waste management procedures during construction, operation, and decommissioning. The remedy is not expected to involve onsite placement of hazardous waste that will trigger the LDR requirements. Hazardous waste generated will be characterized to determine if LDR treatment standards are exceeded. A notification will be submitted to the disposal facility indicating whether the waste is restricted from land disposal and whether it exceeds an applicable treatment standard.	Waste management is described in Section 6 of the O&M Plan (Volume 1), which is included in this BOD Report for the 60% design as Appendix L. Waste management will also be described in the Construction/ Remedial Action Work Plan and the Plan for Decommissioning of the IM-3 Facility that will be submitted as part of the 90% design. The remedy is not expected to involve onsite placement of hazardous waste that will trigger the LDR requirements. Hazardous waste generated will be characterized to determine if LDR treatment standards are exceeded. A notification will be submitted to the disposal facility indicating whether the waste is restricted from land disposal and whether it exceeds an applicable treatment standard.	Waste management is described in Section 6 of the O&M Plan (Volume 1), which is included in this BOD Report for the 90% design as Appendix L. Waste management is also be described in the Construction/Remedial Action Work Plan and the Plan for Decommissioning of the IM-3 Facility that was submitted as part of the 90% design. The remedy is not expected to involve onsite placement of hazardous waste that will trigger the LDR requirements. Hazardous waste generated will be characterized to determine if LDR treatment standards are exceeded. A notification will be submitted to the disposal facility indicating whether the waste is restricted from land disposal and whether it exceeds an applicable treatment standard.	Waste management is described in Section 6 of the O&M Plan (Volume 1 of the O&M Manual), which is included in this BOD Report as Appendix L. Waste management is also described in the Construction/Remedial Action Work Plan and the Plan for Decommissioning of the IM-3 Facility that was submitted as part of the final design. The remedy is not expected to involve onsite placement of hazardous waste that will trigger the LDR requirements. Hazardous waste generated will be characterized to determine if LDR treatment standards are exceeded. A notification will be submitted to the disposal facility indicating whether the waste is restricted from land disposal and whether it exceeds an applicable treatment standard.
90	California Action-Specific	Hazardous Waste Control Act (HWCA) - Standards for owners and operators of hazardous waste transfer and TSD facilities, Title 22, CCR, Div 4.5, Ch 14, Articles 3 and 4	ARAR Applicable	Establish requirements for a facility to plan for emergency conditions. In addition, the design and operation of the facility must be done to prevent releases. Other requirements include testing and maintenance of equipment and incorporation of communication and alarm systems and contingency plan. The requirements may be applicable if CERCLA response action includes treatment, storage, or disposal as defined under RCRA, or may be relevant and appropriate if the requirements address problems or situations sufficiently similar to the specific circumstances at the	Design, construction, operation and maintenance of the remedy	PG&E	Design submittals; Project-specific HMBP; O&M Plan; Construction/ Remedial Action Work Plan	PG&E will prepare a Project-specific HMBP; an O&M Plan; and a Construction/Remedial Action Work Plan that will address procedures for emergencies.	The Contingency Plan (Volume 3) of the O&M Manual includes contingency planning for potential failure modes (including large releases), assess and mitigate risks, and prioritize risk management in order to prevent problems before they arise. The O&M Plan (Volume 1) of the O&M Manual covers routine O&M activities which includes testing and maintenance of communication and alarm. Project-specific HMBP and a Construction/Remedial Action Work Plan will address procedures for emergencies. The outline for the HMBP is presented in Appendix F of the O&M Plan, which is included in the 60% design. The complete HMBP and Construction/Remedial Action Work Plan will be included in the 90% design.	The Contingency Plan (Volume 3) of the O&M Manual includes contingency planning for potential failure modes (including large releases), assessing and mitigating risks, and prioritizing risk management in order to prevent problems before they arise. The O&M Plan (Volume 1) of the O&M Manual covers routine O&M activities which includes testing and maintenance of communication and alarm systems. Section 5 of the Construction/Remedial Action Work Plan includes contingency planning for failure modes during construction (including large releases), assess and mitigate risks, and prioritize risk	The Contingency Plan (Volume 3) of the O&M Manual includes contingency planning for potential failure modes (including large releases), assessing and mitigating risks, and prioritizing risk management in order to prevent problems before they arise. 				site that their usage will be well suited.						management in order to prevent problems before they arise. The project-specific HMBP (Appendix F of the O&M Plan) also addresses procedures for emergencies. Communication protocols including contacts and notification in emergency conditions are presented in Exhibit L2.2-1 of the O&M Manual, Table 2.3-1 of the Construction/Remedial Action Work Plan, and the HMBP.	prevent problems before they arise. The project-specific HMBP (Appendix F of the O&M Plan) also addresses procedures for emergencies. Communication protocols including contacts and notification in emergency conditions are presented in Exhibit L2.2-1 of the O&M Manual, Table 2.3-1 of the Construction/Remedial Action Work Plan, and the HMBP.
91	California Action-Specific	Hazardous Waste Control Act (HWCA) - Groundwater monitoring and response, Title 22, CCR, Div 4.5, Ch 14, Article 6, §66264.91 (a) and (c)	ARAR Relevant and Appropriate	Owners or operators of a RCRA surface impoundment, waste pile, land treatment unit, or landfill shall conduct a monitoring and response program for each regulated unit. Substantive technical requirements are potentially relevant and appropriate for remedial action including groundwater monitoring.	Design, construction, operation and maintenance of the remedy	PG&E	No further action required unless post-design approval change triggers.	PG&E will prepare a project-specific HMBP; an O&M Plan (include sampling and monitoring plan); and a Construction/Remedial Action Work Plan. The preliminary (30%) design does not include regulated units.	PG&E will prepare a project-specific HMBP; an O&M Manual (including a sampling and monitoring plan); and a Construction/Remedial Action Work Plan. The O&M Manual, which includes a sampling and monitoring plan for groundwater and surface water, is included as Appendix L in this BOD Report for the 60% design. The outline for the HMBP is presented in Appendix F of the O&M Plan, which is included in the 60% design. The complete HMBP and Construction/Remedial Action Work Plan will be included in the 90% design. Although the 60% design does not include regulated units, these plans present a monitoring and response program that is functionally equivalent and will provide a level of protection to water quality equivalent to the cited requirement.	Although the 90% design does not include regulated units, the following plans present a monitoring and response program that is functionally equivalent and will provide a level of protection to water quality equivalent to the cited requirement: 1) Appendix E of the O&M Plan (Volume 1 of the O&M Manual) includes an industrial SWPPP that involves BMPs designed to reduce pollutants in discharges that may affect receiving water quality during operations and maintenance of the remedy. 2) Volume 2 of the O&M Manual includes a sampling and monitoring plan for groundwater and surface water. 3) The Construction/Remedial Action Work Plan includes a BMP Plan for construction activities that involves visual inspections and monitoring and sampling for purposes of ensuring the protection of receiving water quality. 4) The project-specific HMBP addresses procedures for emergencies.	DOI has determined that the specific regulations under this ARAR do not currently apply to the RCRA corrective action that is being conducted at the site (see RTC #393). Therefore, no further action is required.

92	California Action-Specific	Hazardous Waste Control Act (HWCA) - Monitoring, Title 22, CCR, Div 4.5, Ch 14, Article 6, §66264.97 (b), (c), (d) and (e)(1) through (e)(5)	ARAR Relevant and Appropriate	Requirements for monitoring groundwater, surface water, and vadose zone. Substantive technical requirements are potentially relevant and appropriate for remedial action including groundwater monitoring.	Design, operation and maintenance of the remedy	PG&E	No further action required unless post-design approval change triggers.	PG&E will prepare an O&M Plan and Progress Reports. The O&M Plan will include a sampling and monitoring plan for groundwater and surface water.	The O&M Manual, which includes a sampling and monitoring plan for groundwater and surface water, is included as Appendix L in this BOD Report for the 60% design. PG&E will prepare Progress Reports that presents the results and analysis of monitoring data.	The O&M Manual, which includes a sampling and monitoring plan for groundwater and surface water, is included as Appendix L in the BOD Report for the 90% design. PG&E will prepare quarterly Progress Reports that presents the results and analysis of monitoring data.	DOI has determined that the specific regulations under this ARAR do not currently apply to the RCRA corrective action that is being conducted at the site (see RTC #393). Therefore, no further action is required.
93	California Action-Specific	Hazardous Waste Control Act (HWCA) - Detection Monitoring Title 22, CCR, Div 4.5, Ch 14, Article 6, §66264.98	ARAR Relevant and Appropriate	Requires the owner or operator of a regulated unit to develop a detection monitoring program that will provide reliable indication of a release. Substantive technical requirements are potentially relevant and appropriate for remedial action including groundwater monitoring.	Design, operation and maintenance of the remedy	PG&E	No further action required unless post-design approval change triggers.	PG&E will prepare an O&M Plan and Progress Reports. The O&M Plan will include a sampling and monitoring plan for groundwater and surface water that provides a level of protection equivalent to a detection monitoring program that will provide reliable indication of a release	PG&E will prepare an O&M Manual and Progress Reports. The O&M Manual, which includes a sampling and monitoring plan for groundwater and surface water, is included as Appendix L in this BOD Report for the 60% design. Although the 60% design does not include regulated units, the programs described in these documents provide a level of protection equivalent to a detection monitoring program that will provide reliable indication of a release.	Although the 90% design does not include regulated units, the programs described in the sampling and monitoring plan for groundwater and surface water (Volume 2 of the O&M Manual) and future quarterly progress reports provide a level of protection equivalent to a detection monitoring program that will provide reliable indication of a release.	DOI has determined that the specific regulations under this ARAR do not currently apply to the RCRA corrective action that is being conducted at the site (see RTC #393). Therefore, no further action is required.
94	California Action-Specific	Hazardous Waste Control Act (HWCA) - Evaluation Monitoring, Title 22, CCR, Div 4.5, Ch 14, Article 6, §66264.99	ARAR Relevant and Appropriate	Requires the owner or operator of a regulated unit to develop an evaluation monitoring program that can be used to assess the nature and extent of a release from the unit. Substantive technical requirements are potentially relevant and appropriate for remedial action including groundwater monitoring.	Design, operation and maintenance of the remedy	PG&E	No further action required unless post-design approval change triggers.	PG&E will prepare an O&M Plan and Progress Reports. The O&M Plan will include a sampling and monitoring plan for groundwater and surface water that provides a level of protection equivalent to an evaluation monitoring program, based on site-specific conditions.	PG&E will prepare an O&M Plan and Progress Reports. Reports. The O&M Manual, which includes a sampling and monitoring plan for groundwater and surface water, is included as Appendix L in this BOD Report for the 60% design. Although the 60% design does not include regulated units, the programs described in these documents provide a level of protection equivalent to an evaluation monitoring program, based on site-specific conditions.	Although the 90% design does not include regulated units, the programs described in the sampling and monitoring plan for groundwater and surface water (Volume 2 of the O&M Manual) and future quarterly progress reports provide a level of protection equivalent to an evaluation monitoring program, based on site-specific conditions.	DOI has determined that the specific regulations under this ARAR do not currently apply to the RCRA corrective action that is being conducted at the site (see RTC #393). Therefore, no further action is required.

95	California Action-Specific	Discharges of Waste to Land - Title 23 CCR, Div 3, Ch 15	ARAR Relevant and Appropriate	The regulations in this chapter pertain to water quality aspects of hazardous waste discharge to land, establishing waste and site classifications and waste management requirements for waste treatment, storage, or disposal in landfills, surface impoundments, waste piles, and land treatment facilities. Requirements in this chapter are minimum standards for proper management of each waste category. Pursuant to Section 2511 (Exemptions), because this remediation constitutes actions taken by public agencies to cleanup unauthorized releases of waste, these regulations will only apply if the proposed remedial activities include (1) removal of waste from the immediate place of release, or (2) keeping some contamination in place.	Activities involve (1) removal of waste from the immediate place of release, or (2) keeping some contamination in place.	PG&E	N/A. No further action required unless post-design approval change triggers.	No further action is required. The remedy design does not involve removal of waste from the immediate place of release and is not designed to keep some contamination in place.	No further action is required. The remedy design does not involve removal of waste from the immediate place of release and is not designed to keep some contamination in place.	No further action is required. The remedy design does not involve removal of waste from the immediate place of release and is not designed to keep some contamination in place.	No further action is required. The remedy design does not involve removal of waste from the immediate place of release and is not designed to keep some contamination in place.
96	California Action-Specific	Consolidated Regulations for Storage, Treatment, Processing, or Disposal of Solid Waste - Title 27 CCR, Div 2, Subdivision 1	ARAR Relevant and Appropriate	The regulations in this subdivision (promulgated by the State Water Resources Control Board (SWRCB)) pertain to water quality aspects of discharges of solid waste to land for treatment, storage, or disposal. Pursuant to Section 20090 (Exemptions), because this remediation constitutes actions taken by public agencies to cleanup unauthorized releases of waste, these regulations will only apply if the proposed remedial activities include (1) removal of waste from the immediate place of release, or (2) keeping some contamination in place.	Activities involve (1) removal of waste from the immediate place of release, or (2) keeping some contamination in place.	PG&E	N/A. No further action required unless post-design approval change triggers.	No further action is required. The remedy design does not involve removal of waste from the immediate place of release and is not designed to keep some contamination in place.	No further action is required. The remedy design does not involve removal of waste from the immediate place of release and is not designed to keep some contamination in place.	No further action is required. The remedy design does not involve removal of waste from the immediate place of release and is not designed to keep some contamination in place.	No further action is required. The remedy design does not involve removal of waste from the immediate place of release and is not designed to keep some contamination in place.

97	California Action-Specific	Requirements for land-use covenants - Cal. Code Regs. Title 22, § 67391.1	ARAR Applicable	This regulation requires appropriate restrictions on use of property in the event that a proposed remedial alternative results in hazardous materials remaining at the property at levels which are not suitable for unrestricted use of the land. This is an ARAR with respect to PG&E-owned land at the Topock site.	A decision document finding that hazardous materials, hazardous wastes or constituents, or hazardous substances will remain at the property at levels which are not suitable for unrestricted use of the land.	DTSC	A land use covenant imposing appropriate limitations on land use shall be executed and recorded when hazardous materials, hazardous wastes or constituents, or hazardous substances will remain at the property at levels which are not suitable for unrestricted use of the land. The land use restrictions must be clearly stated in any response action decision document approved by DTSC. The following information must be specified: (1) the limitations or controls that will be incorporated into an appropriate land use covenant and (2) a description of the implementation and enforcement provisions, including but not limited to frequency of inspections and reporting requirements, necessary to ensure the integrity and long-term protectiveness of the land use covenant.	The final groundwater remedy includes restrictions on use of the groundwater for potable use, based on the conclusions of the groundwater risk assessment. The land use covenants (institutional controls) are described in Section 5.0.	The final groundwater remedy includes restrictions on use of the groundwater for potable use. The land use covenants (institutional controls) are described in Section 5.0 of the 60% BOD Report.	The final groundwater remedy includes restrictions on use of the groundwater for potable use. The land use covenants (institutional controls) are described in Section 5.0 of the 90% BOD Report.	The final groundwater remedy includes restrictions on use of the groundwater for potable use. The land use covenants (institutional controls) are described in Section 5.0 of the Final BOD Report.

98	California Action-Specific	California Water Code - Section 1380[c], California Well Standards, Bulletin 74-90 (Supplement to Bulletin 74-81)	ARAR Applicable	These standards for water, cathodic, and monitoring wells will be applicable if the remediation requires use of such wells.	Design, construction, decommission of groundwater wells	PG&E	Design submittals, Construction/ Remedial Action Work Plan, Plan for Decommissioning of IM-3 Facility and Site Restoration, Plan for Decommissioning of Remedy Facilities and Restoration.	PG&E will prepare Design submittals, a Construction/Remedial Action Work Plan, Plan for Decommissioning of IM-3 Facility and Site Restoration, and a Decommissioning Plan for Remedy Facility and Site Restoration. The remedy will include water and monitoring wells, and will adhere to the standards specified in this ARAR. Well construction and decommissioning standards will be described in the Construction /Remedial Action Work Plan.	The remedy includes water and monitoring wells, and will adhere to the standards specified in this ARAR. Note that the general approach for well decommissioning is currently being developed by a subgroup that includes PG&E, DTSC, DOI, and Interested Tribes. Protocols for well decommissioning will be based on this general approach and be presented in Appendix B of the O&M Plan (Volume 1 of the O&M Manual), at the 90% design stage. Well construction and decommissioning standards will also be described the Construction/Remedial Action Work Plan.	The remedy includes water and monitoring wells, and will adhere to the standards specified in this ARAR. An approach for well decommissioning has been developed by a subgroup that includes PG&E, DTSC, DOI, and Interested Tribes. Protocols for well decommissioning developed based on this approach, are presented in the O&M Plan (Volume 1 of the O&M Manual). Well construction and decommissioning procedures are also described in the Construction/Remedial Action Work Plan.	The remedy includes water and monitoring wells, and will adhere to the standards specified in this ARAR. An approach for well decommissioning has been developed by a subgroup that includes PG&E, DTSC, DOI, and Interested Tribes. Protocols for well decommissioning developed based on this approach are presented in the O&M Plan (Volume 1 of the O&M Manual). Well construction and decommissioning procedures are also described in the Construction/Remedial Action Work Plan.
99	California Action-Specific	State Water Resources Control Board Resolution No. 88-63 Adoption of Policy Entitled “Sources of Drinking Water”	ARAR Applicable	With certain exceptions, all surface and ground waters of the State of California are to be considered suitable, or potentially suitable, for municipal or domestic water supply. The Regional Water Quality Control Board and State Water Resources Board have designated the beneficial use of the ground and surface waters in the Topock Site area as “municipal and domestic water supply.” This designation is set forth in the Basin Plan.	Remedy implementation	PG&E	O&M Plan (sampling and monitoring plan, contingency plan), Progress Reports, Corrective Measure/Remedial Action Completion Report	Compliance with this requirement will be achieved by reducing the concentration of Cr(T) in the affected aquifer to a concentration below the federal and state MCLs of 100 µg/L and 50 mg/L respectively which represent the chemical concentrations in drinking water considered safe for human consumption. There are no MCLs or MCLGs for Cr(VI) and the RAO has been established based on the regional background concentration of 32 µg/L Cr(VI) at the conclusion of remedy implementation. The establishment of RAOs (see Section 1.2.1) is based on the conclusions of the groundwater risk assessment which assumed a hypothetical future use of groundwater within the plume as a drinking water supply. The final groundwater remedy includes an institutional control to restrict use of the groundwater for potable use until the remedy is complete. Groundwater monitoring will be used to track performance of the remedy and verify that the RAOs have been achieved at the conclusion	Compliance with this requirement will be achieved by reducing the concentration of Cr(T) in the affected aquifer to a concentration below the federal and state MCLs of 100 µg/L and 50 mg/L respectively, which represent the chemical concentrations in drinking water considered safe for human consumption. There are no MCLs or MCLGs for Cr(VI) and the RAO of 32 µg/L (based on the regional background concentration) has been established at the conclusion of remedy implementation. Concentrations of Cr(VI) and in-situ byproducts (e.g., arsenic, manganese) may fluctuate above baseline levels within the treatment area during remedy implementation. In addition, as part of the remedy fresh water from a well in Arizona will be injected west of the plume, within the project’s Area of Potential Effects. The naturally occurring arsenic concentration in water from the well exceeds the MCL of 10 µg/L, which is typical of water quality in the vicinity of Topock,	Compliance with this requirement will be achieved by reducing the concentration of Cr(T) in the affected aquifer to a concentration below the federal and state MCLs of 100 µg/L and 50 mg/L respectively, which represent the chemical concentrations in drinking water considered safe for human consumption. The state MCL for Cr(VI) is 10 µg/L. The RAO has been established based on the regional background concentration of 32 µg/L at the conclusion of remedy implementation. Concentrations of Cr(VI) and in-situ byproducts (e.g., arsenic, manganese) may fluctuate above baseline levels within the treatment area during remedy implementation. In addition, as part of the remedy fresh water from a well in Arizona will be injected west of the plume, within the project’s Area of Potential Effects. The naturally occurring arsenic	Compliance with this requirement will be achieved by reducing the concentration of Cr(T) in the affected aquifer to a concentration below the federal and state MCLs of 100 µg/L and 50 mg/L respectively, which represent the chemical concentrations in drinking water considered safe for human consumption. The state MCL for Cr(VI) is 10 µg/L but the RAO has been established based on the Alluvial Aquifer regional background concentration of 32 µg/L at the conclusion of remedy implementation. Concentrations of Cr(VI) and in-situ byproducts (e.g., arsenic, manganese) may fluctuate above baseline levels within the treatment area during remedy implementation. In addition, as part of the remedy fresh water from a well in Arizona will be injected west of the plume, within the project’s Area of Potential Effects. The naturally occurring arsenic

13	Federal Location-Specific	Fish and Wildlife Coordination Act - 16 USC §§ 661-667e	ARAR Applicable	This Act requires that any federally-funded or authorized modification of a stream or other water body must provide adequate provisions for conservation, maintenance, and management of wildlife resources and their habitat. Necessary measures should be taken to mitigate, prevent, and compensate for project-related losses of wildlife resources. Any remedial action selected for the Topock site that includes any modification of a water body will be subject to these requirements.	Any modification of a water body	PG&E	N/A. No further action required unless design change triggers; reconfirm in design submittals.	No further action is required. The preliminary (30%) design does not include modification of a water body.	Figure 2.4-5 in the 60% BOD Report document shows the overlaps between remedy infrastructure and the USACE and CDFW jurisdictional waters/wetlands. As shown in Figure 2.4-5, PG&E determined in the 60% Design that complete avoidance of washes is not feasible due to the need to install remediation and monitoring wells and associated pipes and components in washes (e.g., a wash in the Upland, Bat Cave Wash). For activities to be conducted in CDFW jurisdictional washes, PG&E will comply with the avoidance and minimization measures specified in the CDFW letter dated March 6, 2013 (CDFW 2013), and any additional measures PG&E's biologist determines to be necessary. PG&E will work with USACE and USFWS to determine and comply with the substantive requirements, per CERCLA 121(e), of Section 404 and the Fish and Wildlife Coordination Act, respectively.	Figure 2.4-5 in the 90% BOD Report document shows the overlaps between remedy infrastructure and the USACE and CDFW jurisdictional waters/wetlands. As shown in Figure 2.4-5, PG&E determined in the 90% Design that complete avoidance of washes is not feasible due to the need to install remediation and monitoring wells and associated pipes and components in washes (e.g., a wash in the Upland, Bat Cave Wash). For activities to be conducted in CDFW jurisdictional washes, PG&E will comply with the avoidance and minimization measures specified in the CDFW letter dated March 6, 2013 (CDFW 2013), and any additional measures PG&E's biologist determines to be necessary. PG&E will also comply with avoidance, minimization and mitigation measures specified in the Section 404 protocol (see Exhibit 6.1-1 at the end of Table 6.1-1) and the requirements of the Programmatic Biological Assessment. USFWS will be consulted on the 90% BOD Report.	Figure 2.4-5 in this Final BOD Report document shows the overlaps between remedy infrastructure and the USACE and CDFW jurisdictional waters/wetlands. As shown in Figure 2.4-5, PG&E determined in the final design that complete avoidance of washes is not feasible due to the need to install remediation and monitoring wells and associated pipes and components in washes (e.g., a wash in the Upland, Bat Cave Wash). For activities to be conducted in CDFW jurisdictional washes, PG&E will comply with the avoidance and minimization measures specified in the CDFW letter dated March 6, 2013 (CDFW 2013), and any additional measures PG&E's biologist determines to be necessary. PG&E will also comply with avoidance, minimization and mitigation measures specified in the Section 404 protocol (see Exhibit 6.1-1 at the end of Table 6.1-1) and the requirements of the Programmatic Biological Assessment. USFWS was consulted on the 90% BOD Report and during the 90% RTC process.

14	Federal Location-Specific	National Historic Preservation Act - 16 USC § 470, et seq.;36 CFR 800.1, et seq.	ARAR Applicable	This statute and the implementing regulations direct federal agencies to consider the effects of their undertakings on historic properties included in or eligible for inclusion in the National Register of Historic Places and to consult with certain parties before moving forward with the undertaking. The agency must determine, based on consultation, if an undertaking's effects would be adverse and consider feasible and prudent alternatives that could avoid, mitigate, or minimize such adverse effects on a National Register or eligible property. The agency must then specify how adverse effects will be avoided or mitigated or acknowledge that such effects cannot be avoided or mitigated. The Topock site includes historic properties in or eligible for inclusion in the National Register and remedial action selected for the Topock site qualifies as an undertaking pursuant to the NHPA. Measures to avoid or mitigate adverse effects of any selected remedial action that are adopted by the agency through consultation must be implemented by the remedial action to comply with the NHPA.	Remedial action selected for the Topock site qualifies as an undertaking under NHPA	BLM, Advisory Council on Historic Preservation, California and Arizona State Historic Preservation Offices, USFWS and PG&E are parties to the PA	PA, CHPMP, Design Submittals, Construction/Remedial Action Work Plan, Plan for decommissioning, removal, and restoration of IM-3 facility, Plan for Decommissioning of Remedy Facilities and Restoration, Documents related to ongoing consultation, Brochure, Annual Report, Tribal Access Plan	Documents led by BLM include the PA, the CHPMP, the Brochure, the Annual Report, and the Tribal Access Plan. The PA has been completed. The Brochure to notify other state and federal agencies of the Signatories and Invited Signatories with the actions to be taken within the vicinity of the Topock Remediation Project, and the Topock Maze, is completed. The CHPMP, which is a requirement of the PA, is under preparation and the goal is to have a plan in place by January 20, 2012. BLM distributed a draft CHPMP on November 1, 2011. Comments on the draft CHPMP are due December 5, 2011. The Tribal Access Plan is also under preparation and the goal is to complete the Plan by November 26, 2011 (note that the PA-required Tribal Access Plan will be coordinated with the EIR-required Access Plan).Annual reports of cultural resources activities will be prepared and submitted to all Signatories, Tribes, and Invited Signatories as directed in the PA. Documents led by PG&E include design submittals, a Construction/Remedial Action Work Plan, a Plan for decommissioning, removal, and restoration of IM-3 facility, and a Decommissioning Plan for Remedy Facilities and Restoration. The preliminary (30%) design was submitted on November 18, 2011. The other documents will be prepared and submitted.	Documents led by BLM include the PA, the CHPMP, the Brochure, the Annual Report, and the Tribal Access Plan. The PA has been completed. The Brochure to notify other state and federal agencies of the Signatories and Invited Signatories with the actions to be taken within the vicinity of the Topock Remediation Project, and the Topock Maze, is completed. The CHPMP, which is a requirement of the PA, was issued on January 20, 2012. The CHPMP can be modified and updated, as needed, to address new information and ongoing activities related to the project. Therefore, subsequent to the issuance of the CHPMP, BLM continues to hold periodic working meetings on the CHPMP. It should be noted that treatment measures are included in the CHPMP and a treatment plan will continue to be developed throughout the design to address mitigation measures. The Tribal Access Plan for lands under federal management was completed on November 26, 2011 (note that the PA-required Tribal Access Plan will be coordinated with the EIR-required Access Plan). Annual reports of cultural resources activities will be prepared and submitted to all Signatories, Tribes, and Invited Signatories as directed in the PA. BLM published the first Annual Report on November 25, 2011, and the second Annual Report on January 29, 2013. The PA requires that such reports will be prepared and submitted by December 1 each year for the first five years after execution of the PA and every two years thereafter. Documents led by PG&E include design submittals; a Construction/Remedial Action	Documents led by BLM include the PA, the CHPMP, the Brochure, the Annual Report, and the Tribal Access Plan. The PA is completed. The Brochure to notify other state and federal agencies of the Signatories and Invited Signatories with the actions to be taken within the vicinity of the Topock Remediation Project, and the Topock Maze, is also completed. The CHPMP, which is a requirement of the PA, was issued on January 20, 2012. The CHPMP can be modified and updated, as needed, to address new information and ongoing activities related to the project. Therefore, subsequent to the issuance of the CHPMP, BLM continues to hold periodic working meetings on the CHPMP. It should be noted that treatment measures are included in the CHPMP and a treatment plan will be prepared and submitted to DTSC shortly after the submission of the 90% design. The Tribal Access Plan for lands under federal management was completed on November 26, 2011. On October 21, 2013, PG&E provided the Tribes a draft of the Access Plan for lands not under federal management for review and comment. Tribal comments were received on November 22, 2013. PG&E has updated the plan and included the plan in an appendix of the Construction/Remedial Action Work Plan. (Note that the PA-required Tribal Access Plan was coordinated with the EIR-required Access Plan).	Documents led by BLM include the PA, the CHPMP, the Brochure, the Annual Report, and the Tribal Access Plan. The PA is completed. The Brochure to notify other state and federal agencies of the Signatories and Invited Signatories with the actions to be taken within the vicinity of the Topock Remediation Project, and the Topock Maze, is also completed. The CHPMP, which is a requirement of the PA, was issued on January 20, 2012. The CHPMP can be modified and updated, as needed, to address new information and ongoing activities related to the project. Therefore, subsequent to the issuance of the CHPMP, BLM continues to hold periodic working meetings on the CHPMP. It should be noted that treatment measures are included in the CHPMP, and a Cultural and Historic Property Treatment Plan was submitted to DTSC, DOI, and BLM shortly after the 90% design submittal. The Tribal Access Plan for lands under federal management was completed on November 26, 2011. PG&E has prepared an Access Plan in coordination with Tribes for the lands not under federal management, taking into consideration the information in the BLM Access Plan. The Access Plan is included in an appendix of the Construction/Remedial Action Work Plan submitted on November 18, 2015. Annual reports of cultural resources activities will be prepared and submitted to all Signatories, Tribes, and Invited

17	Federal Location-Specific	National Archaeological and Historic Preservation Act – 16 USC § 469, et seq.; 36 CFR 65	ARAR Applicable	This statute requires the evaluation and preservation of historical and archaeological data which might otherwise be irreparably lost or destroyed through any alteration of terrain as a result of federal construction projects or a federally-licensed activity. The Topock site includes historical and archaeological data. Any remedial action selected for the Topock site must include measures for the evaluation and preservation of historical and archaeological data that might be lost or destroyed as a result of the remedial action.	Alteration of terrain that threatens significant scientific, historical or archaeological data.	Federal Agencies, PG&E	PA, CHPMP, Design Submittals, Construction/ Remedial Action Work Plan	Requirements in the PA and the forthcoming CHPMP will be adhered to. Documents led by PG&E include design submittals, a Construction/Remedial Action Work Plan, a Plan for decommissioning, removal, and restoration of IM-3 facility, and a Decommissioning Plan for Remedy Facilities and Restoration. The preliminary (30%) design was submitted on November 18, 2011. The other documents will be prepared and submitted.	Requirements in the PA and the CHPMP will be adhered to. Documents led by PG&E include design submittals; a Construction/Remedial Action Work Plan; a Plan for decommissioning, removal, and restoration of the IM-3 facility; and a Decommissioning Plan for Remedy Facilities and Restoration. The intermediate (60%) design submittal was submitted on April 5, 2013. The other documents will be prepared and submitted.	Requirements in the PA and the CHPMP will be adhered to. These requirements include implementation of mitigation measures identified in the PA and the CHPMP and through ongoing consultation activities with the Tribes that will avoid, mitigate, or otherwise minimize adverse effects from the undertaking. Tables 6.2-2 and 6.2-3 summarize actions by PG&E to implement the applicable provisions under the PA and the CHPMP. Documents led by PG&E include design submittals; a Construction/Remedial Action Work Plan; a Plan for decommissioning, removal, and restoration of the IM-3 facility; and a Decommissioning Plan for Remedy Facilities and Restoration. The 90% design, the Construction/Remedial Action Work Plan, and the IM-3 decommissioning, removal, and restoration work plan were submitted on September 8, 2014. In compliance with the CD (Appendix C Scope of Work, Article 9), PG&E will prepare a Plan for Decommissioning and Restoration of the remedy facilities within 120 days of DOI's certification of remedial action completion and a determination by DOI that removal of such facilities is protective of human health and the environment.	Requirements in the PA and the CHPMP will be adhered to. These requirements include implementation of mitigation measures identified in the PA and the CHPMP and through ongoing consultation activities with the Tribes that will avoid, mitigate, or otherwise minimize adverse effects from the undertaking. Tables 6.2-2 and 6.2-3 summarize actions by PG&E to implement the applicable provisions under the PA and the CHPMP. Additionally, treatment measures are included in a Cultural and Historic Property Treatment Plan that was submitted to DTSC, DOI, and BLM shortly after the 90% design submittal, and will be adhered to. Documents led by PG&E include design submittals; a Construction/Remedial Action Work Plan; a Plan for decommissioning, removal, and restoration of the IM-3 facility; and a Decommissioning Plan for Remedy Facilities and Restoration. The final design, the Construction/Remedial Action Work Plan, and the IM-3 decommissioning, removal, and restoration work plan were submitted on November 18, 2015. In compliance with the CD (Appendix C Scope of Work, Article 9), PG&E will prepare a Plan for Decommissioning and Restoration of the remedy facilities within 120 days of DOI's certification of remedial action completion and a determination by DOI that removal of such facilities is

											protective of human health and the environment.
18	Federal Location-Specific	Archaeological Resources Protection Act - 16 USC § 470aa-ii, et seq.;43 CFR 7.1, et seq.	ARAR Applicable	This statute provides for the protection of archeological resources located on public and Tribal lands. The Act establishes criteria which must be met for the land manager's approval of any excavation or removal of archaeological resources if a proposed activity involves soil disturbances. The Topock site includes archaeological resources on public land. Any remedial action selected for the Topock site must satisfy the criteria applicable to excavation or removal of archaeological resources that might be affected as a result of the remedial action.	Disturbance of archaeological and historical sites	Federal Agencies, PG&E	PA, CHPMP, Design Submittals, Construction/ Remedial Action Work Plan	Requirements in the PA and the forthcoming CHPMP will be adhered to. PG&E will prepare and submit design submittals and the Construction/Remedial Action Work Plan. The preliminary (30%) design was submitted on November 18, 2011.	Requirements in the PA and the CHPMP will be adhered to. PG&E will submit a Construction/ Remedial Action Work Plan as part of the 90% design. The 60% design was submitted on April 5, 2013.	Requirements in the PA and the CHPMP will be adhered to. These requirements include implementation of mitigation measures identified in the PA and the CHPMP and through ongoing consultation activities with the Tribes that will avoid, mitigate, or otherwise minimize adverse effects from the undertaking. Tables 6.2-2 and 6.2-3 summarize actions by PG&E to implement the applicable provisions under the PA and the CHPMP. The 90% design and the Construction/Remedial Action Work Plan were submitted on September 8, 2014.	Requirements in the PA and the CHPMP will be adhered to. These requirements include implementation of mitigation measures identified in the PA and the CHPMP and through ongoing consultation activities with the Tribes that will avoid, mitigate, or otherwise minimize adverse effects from the undertaking. 27	Federal Location-Specific	Resource Conservation and Recovery Act - 42 USC § 6901, et.seq.; 40 CFR 264.18	ARAR Applicable	These regulations promulgated under RCRA establish Seismic and Floodplain considerations which must be followed for treatment, storage, or disposal facilities constructed, operated, or maintained within certain distances of fault lines and floodplains. Portions of the Topock site are located on or near a 100-year floodplain.	Infrastructure in 100-year floodplain/ regulatory floodway	PG&E	Design submittals	The groundwater remedial facilities are not a permitted RCRA treatment, storage or disposal facility. Seismic load design criteria and geotechnical design criteria are described in Appendix C. The 100-year floodplain is defined in the Flood Insurance Rate Map (FIRM), Panel 5705 of 9400 for San Bernardino County, California and Unincorporated Areas, Revised August 28, 2008. The base flood elevation shown on the current FIRM is 464 at River Mile (RM) 234 of the Colorado River. The effective Flood Insurance Study (FIS) for San Bernardino County lists a regulatory base flood elevation of 463.90. This design uses the more conservative elevation of 464 as the base flood elevation. Wells and pipelines are included in the preliminary (30%) design in areas of the Colorado River floodplain necessary for capture and treatment of the chromium plume. The infrastructure in this preliminary (30%) design (wells, pipes) is mostly outside the 100-year floodplain, see Sheet C-2, well FP-EX-5.	The groundwater remedial facilities are not a permitted RCRA treatment, storage or disposal facility. Seismic load design criteria and geotechnical design criteria are described in Appendix C of this BOD Report for the 60% design. The 100-year floodplain is defined in the Flood Insurance Rate Map (FIRM), Panel 5705 of 9400 for San Bernardino County, California and Unincorporated Areas, Revised August 28, 2008, and Panel 5675 of 6700 for Mohave County, Arizona and Unincorporated Areas, Revised November 18, 2009 (Map Number 04015C5675G). The base flood elevation shown on the current FIRM is 464 at River Mile (RM) 234 of the Colorado River. A review of the Mohave County Flood Insurance Study (FIS) shows that this elevation is specific to the California side of the River only, and is different from information found in the newer FIS for Mohave County, AZ. The effective FIS for San Bernardino County lists a regulatory base flood elevation of 463.90 feet. This design uses the more conservative elevation of 464 feet as the base flood elevation for the project on the California side of the Colorado River. The vertical datum for all flood elevations shown on the San Bernardino County FIRM is NAVD88. The effective FIS for Mohave County lists a regulatory base flood elevation of 465.3 feet NAVD. This is used as the base flood elevation for the project on the Arizona side of the Colorado River. The vertical datum for all flood elevations shown on the Mohave County FIRM is NAVD88.	The groundwater remedial facilities are not a permitted RCRA treatment, storage or disposal facility. Seismic load design criteria and geotechnical design criteria are described in Appendix C of this BOD Report for the 90% design. The 100-year floodplain is defined in the Flood Insurance Rate Map (FIRM), Panel 5705 of 9400 for San Bernardino County, California and Unincorporated Areas, Revised August 28, 2008, and Panel 5675 of 6700 for Mohave County, Arizona and Unincorporated Areas, Revised November 18, 2009 (Map Number 04015C5675G). PG&E has worked with the Mohave County Flood Administrator to ensure compliance with the county requirements for construction in the floodplain.
43	Arizona Location-Specific	Archeological Discoveries - A.R.S. § 41-841 through 847	ARAR	This Act prohibits any person from knowingly excavating on Arizona State or State agency owned land which is a historic or prehistoric ruin, burial ground, archaeological or paleontological site. These requirements will apply if the selected remedy involves excavation in Arizona.	Only if remedy in Arizona - Discovery of any archaeological, paleontological or historical site or object (including human remains) that is at least fifty years old	PG&E	PA, CHPMP, Construction/ Remedial Action Work Plan	Requirements from the PA and the forthcoming CHPMP (led by BLM) will be adhered to during implementation of the remedy. PG&E will prepare and submit the Construction/Remedial Action Work Plan.	Requirements from the PA and the CHPMP (led by BLM) will be adhered to during implementation of the remedy. PG&E will prepare and submit the Construction/Remedial Action Work Plan as part of the 90% design.	Requirements in the PA and the CHPMP will be adhered to. These requirements include implementation of mitigation measures identified in the PA and the CHPMP and through ongoing consultation activities with the Tribes that will avoid, mitigate, or otherwise minimize adverse effects from the undertaking. Tables 6.2-2 and 6.2-3 summarize actions by PG&E to implement the applicable provisions under the PA and the CHPMP. The Construction/Remedial Action Work Plan was prepared and submitted concurrently with the 90% design on September 8, 2014.	Requirements in the PA and the CHPMP will be adhered to. These requirements include implementation of mitigation measures identified in the PA and the CHPMP and through ongoing consultation activities with the Tribes that will avoid, mitigate, or otherwise minimize adverse effects from the undertaking. Tables 6.2-2 and 6.2-3 summarize actions by PG&E to implement the applicable provisions under the PA and the CHPMP. Additionally, treatment measures are included in a Cultural and Historic Property Treatment Plan that was submitted to DTSC, BLM, and DOI shortly after the 90% design submittal, and will be adhered to. The Construction/Remedial Action Work Plan was prepared and submitted concurrently with the final design on November 18, 2015.

	90%/Supplemental 90% Design	**Final (100%) Design**
What the proposed actions/facilities are – including specifics (such as how many wells, the spacing of wells, detailed sizes/lengths of facilities, etc.)	The 90% and Supplemental 90% design were submitted to DOI on September 8, 2014 and February 5, 2015, respectively. Section ES. 3 and Table ES-1 (Summary of Engineering Design Parameters and Key features) of the 90% BOD report provide an executive summary and high level description of the remedy features (wells, pipelines, supporting systems and utilities, structures/buildings, access roads, etc.) including references to specific report figures that show the locations of these features. Detailed descriptions of the remedy features are provided throughout the BOD report, specifically: • Section 3.2 describes the in-situ remediation system and its configuration including the IRZ wells, the River Bank Extraction Wells, the Inner Recirculation Loop wells, the TCS Recirculation Loop wells, the Freshwater Injection Wells, and the associated pipeline alignment. • Section 3.3 describes the freshwater source, the contingent arsenic treatment system, and freshwater piping conveyance including storage. • Section 3.4 describes the remedy-produced water management system. • Section 3.5 describes the utilities and other supporting facilities including power supply, SCADA, and structures/buildings to support the remedy. • Section 3.6 describes the monitoring network/wells. • Section 5 describes the ICs which are also required components of the remedy. Additional details were provided for select remedy components in the Supplemental 90% submittal.	The final design was submitted to DOI on November 18, 2015. Section ES. 3 and Table ES-1 (Summary of Engineering Design Parameters and Key Features) of this Final BOD report provide an executive summary and high level description of the remedy features (wells, pipelines, supporting systems and utilities, structures/buildings, access roads, etc.) including references to specific report figures that show the locations of these features. Detailed descriptions of the remedy features are provided throughout the BOD report, specifically: • Section 3.2 describes the in-situ remediation system and its configuration including the IRZ wells, the River Bank Extraction Wells, the Inner Recirculation Loop wells, the TCS Recirculation Loop wells, the Freshwater Injection Wells, and the associated pipeline alignment. • Section 3.3 describes the freshwater source, the contingent arsenic treatment system, and freshwater piping conveyance including storage. • Section 3.4 describes the remedy-produced water management system. • Section 3.5 describes the utilities and other supporting facilities including power supply, SCADA, and structures/buildings to support the remedy. • Section 3.6 describes the monitoring network/wells. • Section 5 describes the ICs which are also required components of the remedy.
Where the use would be conducted – including specific areas of use, habitat types and acres, key wildlife species that occur there, proportion of refuge or habitat type involved, and other areas affected incidental to use – provide in site maps	Section 2.4 (Other Site Conditions Affecting Design) of the 90% BOD report describes the baseline site conditions that affect remedy design. Among the documented conditions related to ecological resources at the site are surface water quality, USACE/CDFW jurisdictional waters and wetlands, vegetation communities, special status plants, and special status wildlife, avian, and aquatic species. Select maps were provided in Section 2.4 that overlays the remedy features on surveyed ecological resources.	Section 2.4 (Other Site Conditions Affecting Design) of this Final BOD report describes the baseline site conditions that affect remedy design. Among the documented conditions related to ecological resources at the site are surface water quality, USACE/CDFW jurisdictional waters and wetlands, vegetation communities, special status plants, and special status wildlife, avian, and aquatic species. Select maps were provided in Section 2.4 that overlay the remedy features on surveyed ecological resources.
When the use would be conducted—including time of day and year; duration of use; and a timeline of implementing, performing/ maintaining, and closing out the actions/facilities	An estimated project schedule is included in Exhibit 7.5-1 in Section 7.5. Exhibit 7.5-1 provides an estimated timeline for implementing the remedial action through remedy start-up and start of full remedy operations (anticipated June 2019). Consistent with the CMS/FS and Agencies Decision Documents (ROD, Statement of Basis), it is anticipated that this remedy could require 30 years of operations on refuge lands. Per the November 20, 2013 State Water Resources Control Board letter, monitoring on refuge land will be required in order to demonstrate that the water quality objective for arsenic in the receiving groundwater is met "within the earlier of (i) 20 years after achieving the remedial action objective for chromium or (ii) 20 years after ceasing injection of the water containing naturally occurring arsenic at concentrations above the water quality objective." After the remedial action is complete, the remedy facilities will be decommissioned.	An estimated project schedule is included in Exhibit 7.5-1 in Section 7.5. Exhibit 7.5-1 provides an estimated timeline for implementing the remedial action through remedy start-up and start of full remedy operations (anticipated June 2019). Consistent with the CMS/FS and Agencies Decision Documents (ROD, Statement of Basis), it is anticipated that this remedy could require 30 years of operations on refuge lands. What would be the anticipated impacts—identifying and describing the impacts; citing available sources of information (plans, environmental assessments, narratives, research, state plans, field experience, consultation with others); distinguishing between long-term and short-term impacts; documenting direct, indirect, and cumulative impacts on refuge resources	Section 2.4 (Other Site Conditions Affecting Design) of the 90% BOD report describes the baseline site conditions that affect remedy design. Among the documented conditions related to ecological resources at the site are surface water and wetlands, vegetation communities, special status plants, and special status wildlife, avian, and aquatic species. PG&E, USFWS, and DOI coordinated on the Programmatic Biological Assessment (PBA) for the final groundwater remedy. The Final Groundwater Remedy PBA (CH2M HILL 2014k) was prepared to support informal consultations for actions to be conducted under the remedial action, including activities located on BLM and U.S. Fish and Wildlife Service administered lands. This ESA Section 7 consultation was concluded with receipt of USFWS's concurrence letter on July 7, 2014 which preceded the approval of the Construction/Remedial Action Work Plan. Measures outlined in the PBA and associated USFWS determination will be implemented before and during construction activities. Biological completion reports will be submitted to USFWS documenting areas of impacts and monitoring of construction activities. Impact analyses for proposed construction and operation activities are described in the Final Groundwater Remedy PBA (CH2M HILL 2014k) for the action area, and also in the Habitat Restoration Plans for the HNWR lands (CH2M HILL 2014n) and for Riparian Vegetation and Other Sensitive Habitats (CH2M HILL 2014o) (these plans are included as appendices to the Construction/Remedial Action Work Plan). Impacts analysis are also described in the EIR Section 4.3.3.3 and include: BIO-1 – Potential Fill of Wetlands and Other Waters of the U.S. or removal of Riparian Habitat; BIO-2 – Direct Disturbance of and Loss of Habitat for Special-Status Birds and Desert Tortoise; and BIO-3 – Fish Mortality, Interference with Spawning Habitat, and Other Adverse Effects. Of these, only BIO-1 and BIO-2 are related to the proposed activities. The certified EIR summarizes results from site-specific surveys that were conducted for Southwestern willow flycatcher, Mojave desert tortoise, Yuma clapper rail, and other avian species which were also identified during these surveys. Implementation of the EIR mitigation measures would reduce all of these impacts to a less-than-significant level. Subsequent studies have been conducted to document the type and extent of jurisdictional wetlands and waters of the U.S. (Wetland Delineation Report, Aug 2013); as well as the type and location of rare and protected plants (Floristic Survey Report, Aug 2013) and culturally significant plants (Ethnobotany Survey Report, Aug 2013). Additional surveys for lycium and arrowweed were conducted in response to comment #311 DOI-140. Potential impacts to sensitive resources during remedy implementation will be documented as required by the EIR. Additionally, applicable cultural resource mitigation measures included in the Programmatic Agreement (PA) (BLM 2010), Cultural and Historic Properties Management Plan (CHPMP), Cultural Impact Mitigation Program (CIMP), and the EIR Section 4.4 are being and will continue to be implemented to avoid, minimize, or mitigate adverse effects to cultural and historic properties on refuge land.	Section 2.4 (Other Site Conditions Affecting Design) of this Final BOD report describes the baseline site conditions that affect remedy design. Among the documented conditions related to ecological resources at the site are surface water and wetlands, vegetation communities, special status plants, and special status wildlife, avian, and aquatic species. PG&E, USFWS, and DOI coordinated on the Programmatic Biological Assessment (PBA) for the final groundwater remedy. The Final Groundwater Remedy PBA (CH2M HILL 2014k) was prepared to support informal consultations for actions to be conducted under the remedial action, including activities located on BLM and U.S. Fish and Wildlife Service administered lands. This ESA Section 7 consultation was concluded with receipt of USFWS's concurrence letter on July 7, 2014 which preceded the approval of the Construction/Remedial Action Work Plan. Measures outlined in the PBA and associated USFWS determination will be implemented before and during construction activities. Biological completion reports will be submitted to USFWS documenting areas of impacts and monitoring of construction activities. Impact analyses for proposed construction and operation activities are described in the Final Groundwater Remedy PBA (CH2M HILL 2014k) for the action area, and also in the Habitat Restoration Plans for the HNWR lands (CH2M HILL 2015g) and for Riparian Vegetation and Other Sensitive Habitats (CH2M HILL 2014o) (these plans are included as appendices to the Construction/Remedial Action Work Plan). Impacts analysis are also described in the EIR Section 4.3.3.3 and include: BIO-1 – Potential Fill of Wetlands and Other Waters of the U.S. or removal of Riparian Habitat; BIO-2 – Direct Disturbance of and Loss of Habitat for Special-Status Birds and Desert Tortoise; and BIO-3 – Fish Mortality, Interference with Spawning Habitat, and Other Adverse Effects. Of these, only BIO-1 and BIO-2 are related to the proposed activities. The certified EIR summarizes results from site-specific surveys that were conducted for southwestern willow flycatcher, Mojave desert tortoise, Yuma clapper rail, and other avian species which were also identified during these surveys. Implementation of the EIR mitigation measures would reduce all of these impacts to a less-than-significant level. Subsequent studies have been conducted to document the type and extent of jurisdictional wetlands and waters of the U.S. (Wetland Delineation Report, Aug 2013); as well as the type and location of rare and protected plants (Floristic Survey Report, Aug 2013) and culturally significant plants (Ethnobotany Survey Report, Aug 2013). Additional surveys for lycium and arrowweed were conducted in response to comment #311 DOI-140. Potential impacts to sensitive resources during remedy implementation will be documented as required by the EIR. Additionally, applicable cultural resource mitigation measures included in the Programmatic Agreement (PA) (BLM 2010), Cultural and Historic Properties Management Plan (CHPMP), Cultural Impact Mitigation Program (CIMP), and the EIR Section 4.4 are being and will continue to be implemented to avoid, minimize, or mitigate adverse effects to cultural and historic properties on refuge land.
What mitigation is planned for loss of functional value of refuge while use is in operation	The Construction/Remedial Action Work Plan includes a Habitat Restoration Plan in compliance with the CD, Appendix C (Scope of Work), Article 3. This plan has been prepared to provide information requested by the HNWR for its Appropriate Use Analysis and Compatibility Determination (AUA/CD) regarding planned mitigation for potential loss of functional value of refuge while use is in operation.	The Construction/Remedial Action Work Plan includes a Habitat Restoration Plan in compliance with the CD, Appendix C (Scope of Work), Article 3. This plan has been prepared to provide information requested by the HNWR for its Appropriate Use Analysis and Compatibility Determination (AUA/CD) regarding planned mitigation for potential loss of functional value of refuge while use is in operation.

Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Items listed in DOI's October 23, 2008 letter *"PG&E Topock Compressor Station Remediation Site – Evaluation of Attainment of Fish and Wildlife Service Location-Specific ARARs for the Proposed Remedial Alternatives"*	**Action (Compliance Status)**	
	90%/Supplemental 90% Design	**Final (100%) Design**
How and when the actions/facilities would be closed out—including restoration plans	In addition to the Habitat Restoration Plan described above, a Plan for Decommissioning of Remedy Facilities and Restoration will include procedures for the removal and decommissioning of the groundwater remedy. The Plan will also incorporate planning/ approaches for post-remedy restoration (including, but not limited to, a series of photo points). This future Plan will be submitted to DOI within 120 days of DOI's certification of completion of the remedial action and a determination by DOI that removal of such facilities is protective of human health and the environment. In addition to the plans mentioned above, three other restoration plans also pertain to HNWR lands including the Habitat Restoration Plan for Riparian Vegetation and Other Sensitive Habitats (CH2M HILL 2014o), the Aesthetics and Visual Resources Protection and Revegetation Plan (CH2M HILL 2014l), and the Mitigation and Monitoring Plan for Culturally Significant Plants (CH2M HILL 2014p).	In addition to the Habitat Restoration Plan described above, a Plan for Decommissioning of Remedy Facilities and Restoration will include procedures for the removal and decommissioning of the groundwater remedy. The Plan will also incorporate planning/approaches for post-remedy restoration (including, but not limited to, a series of photo points). This future Plan will be submitted to DOI within 120 days of DOI's certification of completion of the remedial action and a determination by DOI that removal of such facilities is protective of human health and the environment. In addition to the plans mentioned above, three other restoration plans also pertain to HNWR lands including the Habitat Restoration Plan for Riparian Vegetation and Other Sensitive Habitats (CH2M HILL 2014o), the Aesthetics and Visual Resources Protection and Revegetation Plan (CH2M HILL 2014l), and the Mitigation and Monitoring Plan for Culturally Significant Plants (CH2M HILL 2014p). Further, Section ES.6 of this Final BOD (Executive Summary) describes the decommissioning process envisioned for the proposed remedy even though it is understood that the detailed decommissioning plan will be prepared much later in the remedial process. In compliance with the Agencies' April 4, 2014 directive letter (DTSC and DOI 2014), PG&E has and will continue to reiterate its commitment to remove all underground utilities and infrastructures to the extent practicable at the time of remedy decommissioning. Section ES.6 includes a conceptual list of remedy components that PG&E believes cannot or should not be removed at the end of the remedy (note that this list is based on current information and may be subject to change): • Freshwater pipeline (and casing) under I-40; • Piping/conduits located in (e.g., direct buried or in trenches) or under (e.g., jack and bore) paved, public roadways; and • Subsurface infrastructure that property owner(s) or land manager(s) request not to be removed, and such request is approved by DTSC and DOI. In addition, as directed by DTSC and DOI in the final design directives (DTSC and DOI 2015), PG&E will work with the landowners to incorporate their preference at the time of decommissioning for removal of infrastructures or abandonment in place. It is noted that the Agencies' preference is to remove infrastructure.
What contingency plans will be in place—identifying actions that will be taken should an accident, unintended discharge, etc. occur.	Contingency Plans are described in Volume 3 of the O&M Manual of the 90% BOD report. Additional details on Contingency Plans for the Remedy Construction are included in the Construction/Remedial Action Work Plan.	Contingency Plans are described in Volume 3 of the O&M Manual of this Final BOD report. Additional details on Contingency Plans for the Remedy Construction are included in the Construction/Remedial Action Work Plan.

TABLE L1.1-4
Summary of Compliance with Applicable Programmatic Agreement (PA) Stipulations
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Item No.	Reference Location in PA Document	Relevant Excerpt from Document	Triggering Event	Action (Compliance Status)		
				Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
1	Stipulation I(A)	The Federal Agencies, in consultation with the Tribes, SHPOs, ACHP, PG&E, and other interested parties, agree to select and implement, or cause to be implemented, an alternative or combination of alternatives to remediate the groundwater and soil contamination in a manner that fulfills the requirements of CERCLA and the CERCLA Records of Decision (RODs) and protects the Colorado River, human populations, and the natural environment to the maximum extent practicable.	Implementation of Selected Groundwater Remedy	PG&E is implementing the groundwater remedy selected by DOI and DTSC.	PG&E is implementing the groundwater remedy selected by DOI and DTSC.	PG&E is implementing the groundwater remedy selected by DOI and DTSC.
2	Stipulation I(B)	The Federal Agencies, in consultation with the Tribes, SHPOs, ACHP, PG&E, and other interested parties, agree to Subject to I(A) above, carry out, and require others under their jurisdiction to carry out, all investigative, testing and remediation activities, including all supporting operations and maintenance activities, in ways that avoid, minimize, or mitigate adverse effects to cultural and historic properties within the APE, to the maximum extent practicable.	Implementation of Selected Groundwater Remedy	PG&E remediation resources specialist (Glenn Caruso) participated in field reviews of planned remedial facilities with the design team on April 23-24 and June 20, 2012. The purpose of these field reviews along with the ongoing in office reviews is to ensure that the footprints of planned facilities are designed in ways to avoid, minimize, or mitigate impacts on historical and archaeological resources to the maximum extent feasible.	PG&E Cultural Resources Expert (Glenn Caruso) participated in field reviews of planned remedial facilities with the design team on April 7-10, 2014. The purpose of these field reviews along with the ongoing in office reviews is to ensure that the footprints of planned facilities are designed in ways to avoid, minimize, or mitigate impacts on historical and archaeological resources to the maximum extent feasible.	PG&E Cultural Resources Expert Glenn Caruso participated in field review of planned remedial facilities and temporary construction footprints at Moabi Regional Park in late 2014 and early 2015. Glenn Caruso also led in-office review of planned facilities and temporary construction-related footprints in September 2015. The purpose of the field review along with in-office reviews is to ensure that project footprints are designed in ways to avoid and minimize impacts on historical and archaeological resources to the maximum extent feasible.
3	Stipulation I(C)	The BLM, USFWS, USBR and PG&E shall consult with the Tribes that attach cultural significance to the TCP within the APE to develop a plan to ensure Tribal access to areas within the APE for religious, cultural, or spiritual purposes. Access shall be consistent with applicable laws, regulations and agreements governing property within the APE and may not impede the Topock Remediation Project, may not create health and safety concerns, and shall exclude the Topock Compressor Station and related facilities.	Development of Access Plan (Tribal Access)	The Tribal Access Plan for lands under federal management was completed on November 26, 2011. PG&E has initiated work on an Access Plan for the lands not under federal management, taking into consideration the information in the BLM Access Plan, for submittal with the final design (target 2013).	The Tribal Access Plan for lands under federal management was completed on November 26, 2011. PG&E has prepared an Access Plan in coordination with Tribes, for the lands not under federal management, taking into consideration the information in the BLM Access Plan. The Access Plan is included in an appendix of the Construction/Remedial Action Work Plan and submitted on September 8, 2014.	The Tribal Access Plan for lands under federal management was completed on November 26, 2011. PG&E has prepared an Access Plan in coordination with Tribes, for the lands not under federal management, taking into consideration the information in the BLM Access Plan. The Access Plan is included in an appendix of the Construction/Remedial Action Work Plan and submitted on November 18, 2015.
4	Stipulation I(D)	The Federal Agencies, in consultation with the Tribes, SHPOs, ACHP, PG&E, and other interested parties, agree to ensure that PG&E shall to the extent practicable restore the areas affected by the Topock Remediation Project within the APE, including, but not limited to, the site of the existing treatment plant and related facilities but excluding the Topock Compressor Station and related facilities, to the conditions existing prior to the construction of the PG&E investigation and remediation related appurtenances and facilities.	Planning for Restoration	The plan for the decommissioning and removal of the IM-3 Facility and Site Restoration will be included as an appendix to the CIMP, which will be submitted with the 90% Design.	The plan for the decommissioning and removal of the IM-3 Facility and Site Restoration was prepared and submitted as Appendix B of the CIMP and also as an appendix of the Construction/Remedial Action Work Plan. Section 8 of the Plan includes restoration guidelines (steps to be followed during restoration), elements of the restoration of habitat and revegetation and demobilization, and a draft annotated outline of a future more detailed, site specific IM-3 Restoration Plan. In coordination with the FMIT and other Tribes, PG&E has developed a schedule for developing the more detailed Restoration Plan. PG&E anticipates that some details of the restoration plan, in particular the amount of earthwork and earth movement involved in the restoration, will be deferred to the completion of decommissioning, so that PG&E and the Tribes can evaluate which approach may minimize further disturbance (and may minimize the amount of earth movement) while achieving the required restoration.	The plan for the decommissioning and removal of the IM-3 Facility and Site Restoration was prepared and submitted as Appendix B of the CIMP and also as an appendix of the Construction/Remedial Action Work Plan. Section 8 of the Plan includes restoration guidelines (steps to be followed during restoration), elements of the restoration of habitat and revegetation and demobilization, and a draft annotated outline of a future more detailed, site specific IM-3 Restoration Plan. In coordination with the FMIT and other Tribes, PG&E has developed a schedule for developing the more detailed Restoration Plan. PG&E anticipates that some details of the restoration plan, in particular the amount of earthwork and earth movement involved in the restoration, will be deferred to the completion of decommissioning, so that PG&E and the Tribes can evaluate which approach may minimize further disturbance (and may minimize the amount of earth movement) while achieving the required restoration.

TABLE L1.1-4
Summary of Compliance with Applicable Programmatic Agreement (PA) Stipulations
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Item No.	Reference Location in PA Document	Relevant Excerpt from Document	Triggering Event	Action (Compliance Status)		
				Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
4	Stipulation I(E)	The Federal Agencies, in consultation with the Tribes, SHPOs, ACHP, PG&E, and other interested parties, agree to consult with other Signatories, Tribes and Invited Signatories, following the guidelines in Appendix B of this PA, regarding actions proposed in this Undertaking, including establishment of any rights of way, time critical or emergency actions.	Groundwater Remedy Design and Implementation	BLM has consulted and is continuing to consult with the Tribes regarding the design under the PA's Consultation Protocol.	BLM has consulted and is continuing to consult with the Tribes regarding the design under the PA's Consultation Protocol.	BLM has consulted and is continuing to consult with the Tribes regarding the design under the PA's Consultation Protocol.
5	Stipulation II(B)	At each phase (work plan or design document) of implementation of the Undertaking, an evaluation will occur to determine if the APE should be amended. This evaluation will coincide with the development of the work plan or design document for the specific phase of the Undertaking. Where alternatives under consideration consist of corridors or large land areas, or where access to properties is restricted, the agency official may use a phased process to conduct identification and evaluation efforts (36 CFR §800.4(b)(2)). Prior to implementation of each phase (work plan or design document) of the Undertaking, BLM will determine, in consultation with the AZ SHPO, CA SHPO, Tribes, and PG&E, what, if any, changes are required in the APE. If BLM determines that the APE must be revised, BLM will redefine the APE taking the input from those parties into account. Should such revision to the APE be needed, BLM will amend the CHPMP to include any changes to the APE.	Groundwater Remedy Design and Implementation	BLM has consulted and is continuing to consult with the Tribes regarding the design under the PA's Consultation Protocol, including on the APE.	BLM has consulted and is continuing to consult with the Tribes regarding the design under the PA's Consultation Protocol, including on the APE.	BLM has consulted and is continuing to consult with the Tribes regarding the design under the PA's Consultation Protocol, including on the APE.
6	Stipulation III(B)(1), III(B)(2)(a) - Remediation of GW contamination	Should Alt E be selected, the Federal Agencies will ensure that, consistent with the general principals in Stipulation I, existing monitoring wells and related facilities shall be used to the maximum extent practicable.	Implementation of Selected Groundwater Remedy	In the intermediate (60%) design, all existing monitoring wells have been incorporated into the monitoring well network for the remedy, thereby reducing the need for drilling new monitoring wells.	In the pre-final (90%) design, existing monitoring wells have been incorporated into the monitoring well network for the remedy, thereby reducing the need for drilling new monitoring wells.	In the final design, existing monitoring wells have been incorporated into the monitoring well network for the remedy, thereby reducing the need for drilling new monitoring wells.
7	Stipulation III(B)(2)(b) - Remediation of GW contamination	Should Alt E be selected, the Federal Agencies will ensure that, consistent with the general principals in Stipulation I, the need for and placement of any new facilities or activities will be determined in consultation with the Tribes and the Consulting Parties following the guidelines in Appendix B.	Implementation of Selected Groundwater Remedy	The 60% design presented planned facilities and activities for the implementation of the groundwater remedy. BLM has consulted and is continuing to consult with the Tribes regarding the design under the PA's Consultation Protocol.	The 90% design presents planned facilities and activities for the implementation of the groundwater remedy. The Construction/Remedial Action Work Plan includes procedures and protocols to be implemented and contingencies during remedy construction and start-up. The O&M Manual includes procedures for implementation and contingencies during operation and maintenance of the remedy. BLM has consulted and is continuing to consult with the Tribes regarding the design under the PA's Consultation Protocol, and will consult the Tribes on the Construction/Remedial Action Work Plan and O&M Manual.	The final design presents planned facilities and activities for the implementation of the groundwater remedy. The Construction/ Remedial Action Work Plan includes procedures and protocols to be implemented and contingencies during remedy construction and start-up. The O&M Manual includes procedures for implementation and contingencies during operation and maintenance of the remedy. BLM has consulted and is continuing to consult with the Tribes regarding the design and the Construction/Remedial Action Work Plan as well as the O&M Manual under the PA's Consultation Protocol.

TABLE L1.1-4
Summary of Compliance with Applicable Programmatic Agreement (PA) Stipulations
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Item No.	Reference Location in PA Document	Relevant Excerpt from Document	Triggering Event	Action (Compliance Status)		
				Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
8	Stipulation III(B)(2)(c) - Remediation of GW contamination	Should Alt E be selected, the Federal Agencies will ensure that, consistent with the general principals in Stipulation I, that new facilities or activities be placed in areas already disturbed by previous grading or other mechanized activities to the maximum extent practicable, consistent with protecting human health and the environment and achieving cleanup in a timely manner.	Implementation of Selected Groundwater Remedy	The design has been and is carried out in a manner that gives: (1) priority to previously disturbed areas for the placement of new physical improvements; and (2) priority to re-use of existing physical improvements, such as but not limited to wells and pipelines, but not including IM-3 facilities. A disturbed area map was prepared in compliance with an EIR mitigation measure (CUL-1a-9), to facilitate placement of infrastructure; a current version of the map is included in Appendix A2 of the 60% Basis of Design (BOD) Report. In addition, in compliance with the directive to give priority to re-use of existing physical improvements and to previously disturbed areas for new physical improvements, the intermediate (60%) design proposes the following: • All existing monitoring wells have been incorporated into the monitoring well network for the remedy, thereby reducing the need for drilling new monitoring wells. • The freshwater supply for the remedy will be the existing HNWR-1 well. • The freshwater supply storage will be the existing water storage tanks at the Compressor Station. • The remedy-produced water treatment plant and freshwater pre-injection treatment system will be located entirely within the footprint of Compressor Station. • The central maintenance facility for the remedy will be located entirely on PG&E property, at the Transwestern Bench. By centralizing maintenance functions into one location, this reduces the footprint of remedy structure outside of PG&E property.	The design has been and is carried out in a manner that gives: (1) priority to previously disturbed areas for the placement of new physical improvements; and (2) priority to re-use of existing physical improvements, such as but not limited to wells and pipelines, but not including IM-3 facilities. A disturbed area map was prepared in compliance with an EIR mitigation measure (CUL-1a-9), to facilitate placement of infrastructure; an updated version of the map is included in Appendix A2 of the 90% Basis of Design (BOD) Report. In addition, in compliance with the directive to give priority to re-use of existing physical improvements and to previously disturbed areas for new physical improvements, the pre-final (90%) design proposes the following: • All existing monitoring wells have been incorporated into the monitoring well network for the remedy, thereby reducing the need for drilling new monitoring wells. • The piping corridor is located almost entirely in existing roadways, right of ways and previously disturbed areas. • Most of the existing access roads have been incorporated into the 90% design. • The remedy-produced water conditioning plant and the contingent systems (arsenic treatment and dissolved metals removal) are located entirely within the footprint of the Compressor Station. • The operation building and carbon storage/amendment facilities are located on the existing Transwestern Bench and MW-20 Bench. • All of the proposed soil storage and construction staging areas are located on previously disturbed areas. • The main construction headquarters and staging area is located on previously disturbed areas at Moabi Regional Park.	The design has been and is carried out in a manner that gives: (1) priority to previously disturbed areas for the placement of new physical improvements; and (2) priority to re-use of existing physical improvements, such as but not limited to wells and pipelines, but not including IM-3 facilities (with the exception of certain IM-3 facilities located at the MW-20 bench, which are being reused for the final remedy). A disturbed area map was prepared in compliance with an EIR mitigation measure (CUL-1a-9), to facilitate placement of infrastructure; an updated version of the map is included in Appendix A2 of this Final BOD Report. In addition, in compliance with the directive to give priority to re-use of existing physical improvements and to previously disturbed areas for new physical improvements, the final design proposes the following: • All existing monitoring wells have been incorporated into the monitoring well network for the remedy, thereby reducing the need for drilling new monitoring wells. • The piping corridor is located almost entirely in existing roadways, right of ways and previously disturbed areas. • Most of the existing access roads have been incorporated into the final design. • The remedy-produced water conditioning plant and the contingent systems (arsenic treatment and dissolved metals removal) are located entirely within the footprint of the Compressor Station. • The operation building is located on the existing Transwestern Bench. • The combined carbon storage/amendment facilities are located on the existing MW-20 Bench. • All of the proposed soil processing and construction staging areas are located on previously disturbed areas. • The main construction headquarters and staging area is located on previously disturbed areas at Moabi Regional Park.

TABLE L1.1-4
Summary of Compliance with Applicable Programmatic Agreement (PA) Stipulations

				Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
9	Stipulation III(B)(2)(e) - Remediation of GW contamination	Should Alt E be selected, the Federal Agencies will ensure that, consistent with the general principals in Stipulation I, the performance of all field activities in support of the remedy shall be executed in such a way as to avoid and/or minimize adverse effects to cultural and historic properties to the maximum extent practicable.	Implementation of Field Activities in Support of the Groundwater Remedy	The planning of field activities is executed under the guidance of PG&E's remediation resources specialist (Glenn Caruso). The implementation of field activities is performed in accordance with approved work plans and under the monitoring of Archaeological Monitor(s). Tribal Monitors are invited to observe ground-disturbing field activities.	The planning of field activities is executed under the guidance of PG&E's Cultural Resources Expert (Glenn Caruso). The implementation of field activities is performed in accordance with approved work plans and under the monitoring of Archaeological Monitor(s). Tribal Monitors are invited to observe ground-disturbing field activities.	The planning of field activities is executed under the guidance of PG&E's Cultural Resources Expert (Glenn Caruso). The implementation of field activities is performed in accordance with approved work plans and under the monitoring of Archaeological Monitor(s). Tribal Monitors are invited to observe ground-disturbing field activities.
10	Stipulation III(B)(2)(f) - Remediation of GW contamination	Should Alt E be selected, the Federal Agencies will ensure that, consistent with the general principals in Stipulation I, subject to Stipulation I(A), direct, indirect and cumulative adverse effects shall be considered and mitigated.	Implementation of Selected Groundwater Remedy	Adverse effects are being considered and mitigated through the implementation of the measures included in the PA, the CHPMP and the EIR.	Adverse effects are being considered and mitigated through the implementation of the measures included in the PA, the CHPMP and the EIR.	Adverse effects are being considered and mitigated through the implementation of the measures included in the PA, the CHPMP, the Cultural and Historic Property Treatment Plan and the EIR.
11	Stipulation III(B)(3)(a) - Remediation of GW contamination – Final Design	Consultation between the Signatories, Tribes and Invited Signatories shall be initiated prior to final design and implementation of that alternative.	Design and Implementation of Selected Groundwater Remedy	BLM has consulted and is continuing to consult with the Tribes regarding the design under the PA's Consultation Protocol.	BLM has consulted and is continuing to consult with the Tribes regarding the design under the PA's Consultation Protocol.	BLM has consulted and is continuing to consult with the Tribes regarding the design and implementation under the PA's Consultation Protocol.
12	Stipulation III(B)(3)(b) - Remediation of GW contamination – Final Design	Every effort should be made to avoid and minimize adverse effects in accordance with the general principles set forth in Stipulation I.	Implementation of Selected Groundwater Remedy	PG&E remediation resources specialist (Glenn Caruso) participated in field reviews of planned remedial facilities with the design team on April 23-24 and June 20, 2012. The purpose of these field reviews along with the ongoing in office reviews is to ensure that the footprints of planned facilities are designed in ways to avoid, minimize, or mitigate impacts on historical and archaeological resources to the maximum extent feasible.	PG&E Cultural Resources Expert (Glenn Caruso) participated in field reviews of planned remedial facilities with the design team on April 7-10, 2014. The purpose of these field reviews along with the ongoing in office reviews is to ensure that the footprints of planned facilities are designed in ways to avoid, minimize, or mitigate impacts on historical and archaeological resources to the maximum extent feasible.	PG&E Cultural Resources Expert Glenn Caruso participated in field review of planned remedial facilities and temporary construction footprints at Moabi Regional Park in late 2014 and early 2015. Glenn Caruso also led in-office review of planned facilities and temporary construction-related footprints in September 2015. The purpose of the field review along with in-office reviews is to ensure that project footprints are designed in ways to avoid and minimize impacts on historical and archaeological resources to the maximum extent feasible.
13	Stipulation III(B)(3)(c) - Remediation of GW contamination	Whatever the selected alternative, the Federal Agencies will consult with all Signatories, Tribes, and Invited Signatories during the design, implementation, and monitoring activities to determine how best to restore the areas affected by the Topock Remediation Project. These areas will include, but not be limited to, the site of the existing treatment plant and related facilities but will exclude the Topock Compressor Station and related facilities. The Federal Agencies will ensure that environmental restoration to the conditions existing prior to the construction of the Project, is planned and conducted to the extent practicable.	Implementation of Selected Groundwater Remedy	The plan for the decommissioning and removal of the IM-3 Facility and Site Restoration will be included as an appendix to the CIMP, which will be submitted with the 90% Design. Additionally, a Plan for Decommissioning of Remedy Facilities and Restoration will be submitted in the future, prior to decommissioning, and BLM will consult the Tribes on this Plan.	The plan for the decommissioning and removal of the IM-3 Facility and Site Restoration was prepared and submitted in Appendix B of the CIMP and also as an appendix of the Construction/Remedial Action Work Plan. A site-specific Plan for Decommissioning and Restoration of remedy facilities will be submitted in the future (within 120 days of DOI's certification of remedial action completion and a determination by DOI that removal of such facilities is protective of human health and the environment), prior to decommissioning, and BLM will consult the Tribes on this Plan.	The plan for the decommissioning and removal of the IM-3 Facility and Site Restoration was prepared and submitted in Appendix B of the CIMP and also as an appendix of the Construction/Remedial Action Work Plan. A site-specific Plan for Decommissioning and Restoration of remedy facilities will be submitted in the future (within 120 days of DOI's certification of remedial action completion and a determination by DOI that removal of such facilities is protective of human health and the environment), prior to decommissioning, and BLM will consult the Tribes on this Plan.

TABLE L1.1-4
Summary of Compliance with Applicable Programmatic Agreement (PA) Stipulations
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Item No.	Reference Location in PA Document	Relevant Excerpt from Document	Triggering Event	Action (Compliance Status)		
				Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
14	Stipulation V(A)	All facilities and appurtenances related to the Topock Remediation Project are to be removed as soon as practicable upon attainment of cleanup standards and a determination by DOI that removal of such facilities is protective of human health and the environment. All such removal will be planned in consultation with the Signatories, Tribes, and Invited Signatories, following the guidelines in Appendix B [Consultation Protocol).	Planning for decommissioning	This stipulation will be adhered to in planning for the decommissioning of remedy facilities. Additionally, a Closure Plan for Decommissioning of Remedy Facilities and Restoration will be submitted in the future, prior to decommissioning, and BLM will consult the Tribes on this Plan.	This stipulation will be adhered to in planning for the decommissioning of remedy facilities. A site-specific Plan for Decommissioning and Restoration of remedy facilities will be submitted in the future (within 120 days of DOI's certification of remedial action completion and a determination by DOI that removal of such facilities is protective of human health and the environment), prior to decommissioning, and BLM will consult the Tribes on this Plan.	This stipulation will be adhered to in planning for the decommissioning of remedy facilities. Section ES.6 of this Final BOD (Executive Summary) describes the decommissioning process envisioned for the proposed remedy even though it is understood that the detailed decommissioning plan will be prepared much later in the remedial process. In compliance with the Agencies' April 4, 2014 directive letter (DTSC and DOI 2014), PG&E has and will continue to reiterate its commitment to remove all underground utilities and infrastructures to the extent practicable at the time of remedy decommissioning. Section ES.6 includes a conceptual list of remedy components that PG&E believes cannot or should not be removed at the end of the remedy (note that this list is based on current information and may be subject to change): • Freshwater pipeline (and casing) under I-40; • Piping/conduits located in (e.g., direct buried or in trenches) or under (e.g., jack and bore) paved, public roadways; and • Subsurface infrastructure that property owner(s) or land manager(s) request not to be removed, and such request is approved by DTSC and DOI. Further, in compliance with the Agencies' November 19, 2015 final directives (DTSC and DOI 2015), PG&E will work with the landowners to incorporate their preference at the time of decommissioning for removal of infrastructures or abandonment in place. It is noted that the Agencies' preference is to remove infrastructure. The site-specific Plan for Decommissioning and Restoration of remedy facilities will be submitted in the future (within 120 days of DOI's certification of remedial action completion and a determination by DOI that removal of such facilities is protective of human health and the environment), prior to decommissioning, and BLM will consult the Tribes on this Plan.
15	Stipulation V(B)	The removal of such facilities shall be monitored following the monitoring guidelines in Appendix C.	Planning for decommissioning	This stipulation will be adhered to in planning for the decommissioning of remedy facilities.	This stipulation will be adhered to in planning for the decommissioning of remedy facilities.	This stipulation will be adhered to in planning for the decommissioning of remedy facilities.
16	Stipulation V(C)	The removal of such facilities shall take place along existing graded roads to the maximum extent practicable.	Planning for decommissioning	This stipulation will be adhered to in planning for the decommissioning of remedy facilities.	This stipulation will be adhered to in planning for the decommissioning of remedy facilities.	This stipulation will be adhered to in planning for the decommissioning of remedy facilities.

TABLE L1.1-4

PG&E Topock Compressor Station, Needles, California

Item No.	Reference Location in PA Document	Relevant Excerpt from Document	Triggering Event	Action (Compliance Status)		
				Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
17	Stipulation V(D)	Prior to decommissioning of any remediation facility, the Federal Agencies will consult with all Signatories, Tribes, and Invited Signatories during the development of the closure plan to determine how to best restore the areas affected by the Topock Remediation Project, including but not limited to, the site of the existing treatment plant and related facilities, but excluding the Topock Compressor Station and related facilities, to ensure that environmental restoration of conditions existing prior to the construction of the Project, is achieved to the extent practicable.	Planning for decommissioning	This stipulation will be adhered to in planning for the decommissioning of remedy facilities. The Closure Plan for Decommissioning of Remedy Facilities and Restoration will be submitted in the future, prior to decommissioning, and BLM will consult the Tribes on this Plan.	This stipulation will be adhered to in planning for the decommissioning of remedy facilities. A site-specific Plan for Decommissioning and Restoration of remedy facilities will be submitted in the future (within 120 days of DOI's certification of remedial action completion and a determination by DOI that removal of such facilities is protective of human health and the environment), prior to decommissioning, and BLM will consult the Tribes on this Plan.	This stipulation will be adhered to in planning for the decommissioning of remedy facilities. A site-specific Plan for Decommissioning and Restoration of remedy facilities will be submitted in the future (within 120 days of DOI's certification of remedial action completion and a determination by DOI that removal of such facilities is protective of human health and the environment), prior to decommissioning, and BLM will consult the Tribes on this Plan.
18	Stipulation V(E)	PG&E will draft a plan for decommissioning, removal and restoration of the IM-3 facility prior to implementation of the groundwater remedy, in consultation with all Signatories, Tribes and Invited Signatories.	Groundwater Remedy Design	This stipulation will be adhered to during design. The plan for the decommissioning and removal of the IM-3 Facility and Site Restoration will be included as an appendix to the CIMP, which will be submitted with the 90% Design. The Plan will be drafted in consultation with all Signatories, Tribes and Invited Signatories.	PG&E has developed the plan for the decommissioning and removal of the IM-3 Facility and Site Restoration, in consultation with the Tribes. The Plan was submitted in Appendix B of the CIMP and also as an appendix of the Construction/Remedial Action Work Plan.	PG&E has developed the plan for the decommissioning and removal of the IM-3 Facility and Site Restoration, in consultation with the Tribes. The Plan was submitted in Appendix B of the CIMP and also as an appendix of the Construction/Remedial Action Work Plan.
19	Stipulation IX(A)-(D)	A. If the Undertaking affects a previously unidentified cultural and/or historic resource, including human remains and/or associated funerary objects or graves, or affect such resources in a way not previously anticipated, or have greater adverse effect than previously anticipated, all work in the vicinity of the discovery shall cease. No further action will be taken until the BLM, in consultation with Tribal and Archaeological Monitors and PG&E in the field, has determined the nature of the discovery and delineated an area not to exceed 50 meters from the approximate center point of the discovery (or a smaller or larger areas if warranted by specific circumstances) in which no further work is to take place until treatment of the discovery is resolved. At such point BLM will notify all Signatories, Tribes, and Invited Signatories of the nature and general location of the discovery. The BLM will implement appropriate measures, including stabilization or covering, to protect any discovery (human remains, funerary objects, sacred objects, or objects of cultural patrimony) from further disturbance in accordance with the principles set forth in Stipulation I. Ongoing work not within 50 meters (or a smaller area if determined appropriate by parties in the field) of the discovery may continue. If human remains and/or associated funerary objects compose all or part of the discovery, then BLM shall ensure the stipulations of the POA included in the CHPMP, as described in Stipulation VII (H) hereof, will be completed. Also, if human remains and/or funerary objects are encountered, all activities shall follow the procedures and direction provided in NAGPRA and California Public	Field Implementation of Selected Groundwater Remedy	This stipulation will be adhered to during the field implementation of the Construction/Remedial Action Plan. Tribal monitors will be invited to monitor ground-disturbing field activities. Archaeological monitoring will also be conducted during ground disturbing portions of the project. Applied Earthworks, a professional cultural resources consulting firm, was retained by PG&E with DTSC approval. Applied Earthworks will observe ground-disturbing activities and will have the authority to temporarily divert or halt any activities in the event that previously unidentified potentially significant cultural resources are discovered.	This stipulation will be adhered to during the field implementation of the Construction/Remedial Action Plan and during the operation and maintenance of the remedy. Tribal monitors will be invited to monitor ground-disturbing field activities. Archaeological monitoring will also be conducted during ground disturbing portions of the project. Applied Earthworks, a professional cultural resources consulting firm, was retained by PG&E with DTSC approval. Applied Earthworks will observe ground-disturbing activities and will have the authority to temporarily divert or halt any activities in the event that previously unidentified potentially significant cultural resources are discovered.	This stipulation will be adhered to during the field implementation of the Construction/ Remedial Action Plan and during the operation and maintenance of the remedy. Tribal monitors will be invited to monitor ground-disturbing field activities. Archaeological monitoring will also be conducted during ground disturbing portions of the project. Applied Earthworks, a professional cultural resources consulting firm, was retained by PG&E with DTSC approval. Applied Earthworks will observe ground-disturbing activities and will have the authority to temporarily divert or halt any activities in the event that previously unidentified potentially significant cultural resources are discovered.

TABLE L1.1-4
Summary of Compliance with Applicable Programmatic Agreement (PA) Stipulations
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Item No.	Reference Location in PA Document	Relevant Excerpt from Document	Triggering Event	Action (Compliance Status)		
				Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
		Resources Code sections 5097.98 and 5097.991. For Arizona, such activities shall follow the procedures and direction provided in NAGPRA and applicable state laws, including the Arizona Antiquities Act of 1927 (ARS § 41-841 to 41-846), Burial Protection Law of 1990 (ARS §41-865), and ARS §41-844 of 1990.				
20	Stipulation IX(A)-(D) (continued)	B. If the Tribes, PG&E, and BLM can resolve treatment of the discovery in a manner that does not cause adverse effects to significant cultural and historic properties, BLM shall document the resolution, the activities within the work area may proceed and the AZ SHPO and the CA SHPO shall be notified of the discovery and resolution. The Tribes, PG&E, and BLM will use their best efforts to resolve treatment as quickly as possible. C. If there is failure to resolve treatment of the discovery in consultation with the Tribes and PG&E, BLM shall then consult with the AZ SHPO or the CA SHPO to develop a treatment plan that takes into account the effects of the Undertaking on the discovery. Within fifteen (15) days of notification of discovery, BLM shall provide the consulted SHPO(s), via email, a recommendation for resolving the discovery situation that takes into account the potential effects of the Undertaking on the discovery. D. If the CA SHPO or AZ SHPO (as appropriate, depending on the location of the discovery) does not object to BLM's recommendation(s) within fifteen (15) days, BLM will implement the recommendation(s). If the consulted SHPO objects to the recommendation, BLM will utilize the dispute resolution process in Stipulation XV of this PA to resolve any objection.	Field Implementation of Selected Groundwater Remedy	This stipulation will be adhered to during the field implementation of the selected groundwater remedy.	This stipulation will be adhered to during the field implementation of the selected groundwater remedy.	This stipulation will be adhered to during the field implementation of the selected groundwater remedy.
21	Appendix C Monitoring Protocol	Cultural sensitivity training will be required of all staff, workers and contractors engaged in activities in the Topock Remediation Project APE to familiarize them with the sacred nature of the areas so that they will perform their job in a respectful manner. This training will also be given to new personnel before they are allowed to do fieldwork within the APE. This training will be conducted by PG&E with participation by Tribes and Tribal Monitors, Archaeological Monitors, Federal Agency staff, and PG&E supervising staff, as appropriate. Consistent with PG&E's stated policy, PG&E will not tolerate any disrespectful behavior in the field and will remove any staff, workers or contractors who do not comply with this section.	Implementation of Selected Groundwater Remedy	Site orientation and the training on cultural/historical resources sensitivity will be provided at the project initiation meeting, to be held at the Topock Compressor Station. Site orientation will stress that all site activities will be conducted in a respectful manner. Sensitivity training will be provided by PG&E Site Operations Manager, PG&E Remediation Resources Specialist, and PG&E will invite participation from the Tribes, archaeological monitors, and agency staff, as appropriate. In addition, PG&E and Tribes are collaborating on a similar measure under the CIMP, and to produce a training/education manual to educate workers. This CIMP measure was discussed with interested Tribes at the monthly meeting on April 26, 2012, August 23, 2012 and September 19, 2012.	Site orientation and the training on cultural/ historical resources sensitivity will be provided at the project initiation meeting, to be held at the Topock Compressor Station. Site orientation will stress that all site activities will be conducted in a respectful manner. Sensitivity training will be provided by PG&E's Site Operations Manager, and PG&E Cultural Resources Expert. PG&E will invite participation from the Tribes, archaeological monitors, and agency staff, as appropriate.	Site orientation and the training on cultural/ historical resources sensitivity will be provided at the project initiation meeting, to be held at the Topock Compressor Station. Site orientation will stress that all site activities will be conducted in a respectful manner. Sensitivity training will be provided by PG&E's Site Operations Manager, and PG&E Cultural Resources Expert. PG&E will invite participation from the Tribes, archaeological monitors, and agency staff, as appropriate.

TABLE L1.1-4
Summary of Compliance with Applicable Programmatic Agreement (PA) Stipulations
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Item No.	Reference Location in PA Document	Relevant Excerpt from Document	Triggering Event	Action (Compliance Status)		
				Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
22	Appendix C Monitoring Protocol	Prior to execution of the PA for the Undertaking, PG&E sometimes invited the Tribes to be present on site during construction to monitor and observe non-maintenance grading, trenching, or other excavation for any facilities, new roads, or other project components related to the Undertaking which may have had the potential to adversely impact cultural and historic resources. The Tribal and Archaeological Monitors shall both be invited to monitor such field work.	Implementation of Field Activities	This stipulation will be adhered to during field implementation. Tribal monitors will be invited to monitor ground-disturbing field activities. Archaeological monitoring will also be conducted during ground disturbing portions of the project.	This stipulation will be adhered to during field implementation. Tribal monitors will be invited to monitor ground-disturbing field activities. Archaeological monitoring will also be conducted during ground disturbing portions of the project. In addition, a similar measure under the CIMP (CUL-1a-8l) will also be adhered to during field implementation. The CIMP is included in an appendix of the Construction/Remedial Action Work Plan.	This stipulation will be adhered to during field implementation. Tribal monitors will be invited to monitor ground-disturbing field activities. Archaeological monitoring will also be conducted during ground disturbing portions of the project. In addition, a similar measure under the CIMP (CUL-1a-8l) will also be adhered to during field implementation. The CIMP is included in an appendix of the Construction/Remedial Action Work Plan.
23	Appendix C Monitoring Protocol	This Protocol specifies ways in which the Tribes, BLM, and PG&E may ensure that: 1. Tribes, BLM, and PG&E, each are kept well informed of Undertaking activities and outcomes; 2. Tribal and Archaeological Monitors have the opportunity to alert PG&E's site supervisor (or designee) to potentially sensitive areas or issues that Monitors may be aware of or may become aware of while fieldwork is in progress; 3. PG&E's site supervisor (or designee) notifies BLM of potentially complicated situations. These situations may include discovery of a new cultural or historical resource, damage to a previously recorded cultural or historical resource, or unanticipated effects identified; 4. Tribal concerns regarding work activities are addressed while fieldwork is in progress.	Implementation of Field Activities	This stipulation will be adhered to during field implementation. Tribal monitors will be invited to monitor ground-disturbing field activities. Archaeological monitoring will also be conducted during ground disturbing portions of the project. Applied Earthworks, a professional cultural resources consulting firm, was retained by PG&E with DTSC approval. Applied Earthworks will observe ground-disturbing activities and will have the authority to temporarily divert or halt any activities in the event that previously unidentified potentially significant cultural resources are discovered.	This stipulation will be adhered to during field implementation. Tribal monitors will be invited to monitor ground-disturbing field activities. Archaeological monitoring will also be conducted during ground disturbing portions of the project. Applied Earthworks, a professional cultural resources consulting firm, was retained by PG&E with DTSC approval. Applied Earthworks will observe ground-disturbing activities and will have the authority to temporarily divert or halt any activities in the event that previously unidentified potentially significant cultural resources are discovered. In addition, a similar measure under the CIMP (CUL-1a-8l) will also be adhered to during field implementation. The CIMP is included in an appendix of the Construction/Remedial Action Work Plan.	This stipulation will be adhered to during field implementation. Tribal monitors will be invited to monitor ground-disturbing field activities. Archaeological monitoring will also be conducted during ground disturbing portions of the project. Applied Earthworks, a professional cultural resources consulting firm, was retained by PG&E with DTSC approval. Applied Earthworks will observe ground-disturbing activities and will have the authority to temporarily divert or halt any activities in the event that previously unidentified potentially significant cultural resources are discovered. In addition, a similar measure under the CIMP (CUL-1a-8l) will also be adhered to during field implementation. The CIMP is included in an appendix of the Construction/Remedial Action Work Plan.
24	Appendix C Monitoring Protocol (Work Schedule)	Tribal and Archaeological Monitors will be provided with anticipated schedules for Topock Remediation Project work that requires monitoring as early as possible but at least three (3) business days in advance of the initiation of the identified project work, whenever possible. Recognizing that changes to the work schedule may be inevitable, any change in the work schedule will be provided to the Tribal and Archaeological Monitors as soon as possible after the change becomes part of the work schedule. If there is a question regarding need for a monitor, the questioning party shall consult the BLM Project or Field Manager who will make the final determination of need.	Implementation of Field Activities	This stipulation will be adhered to during field implementation. The PG&E Site Operations Manager or his designee will provide the work schedule and inform the monitors of schedule changes as soon as practicable.	This stipulation will be adhered to during field implementation. The PG&E Site Operations Manager or his designee will provide the work schedule and inform the monitors of schedule changes as soon as practicable. In addition, a similar measure under the CIMP (CUL-1a-8j) will also be adhered to during field implementation. The CIMP is included in an appendix of the Construction/Remedial Action Work Plan.	This stipulation will be adhered to during field implementation. The PG&E Site Operations Manager or his designee will provide the work schedule and inform the monitors of schedule changes as soon as practicable. In addition, a similar measure under the CIMP (CUL-1a-8j) will also be adhered to during field implementation. The CIMP is included in an appendix of the Construction/Remedial Action Work Plan.
25	Appendix C Monitoring Protocol (Discoveries)	If the Undertaking will affect previously unidentified resources, or affect a previously recorded cultural or historical resource in a way not previously anticipated, or have greater or different effects than previously anticipated, all work having potential for adverse affect shall cease within a fifty (50)-meter radius (or a smaller or larger area if determined appropriate by the BLM, the Monitors, and PG&E in the field) of the point of discovery. The Archaeological and Tribal Monitors will work with BLM and PG&E to ensure that the PA requirements of Stipulation VII (CHPMP) and Stipulation IX (Discoveries) are met.	Implementation of Field Activities	This stipulation will be adhered to during field implementation. Tribal monitors will be invited to monitor ground-disturbing field activities. Archaeological monitoring will also be conducted during ground disturbing portions of the project. Applied Earthworks, a professional cultural resources consulting firm, was retained by PG&E with DTSC approval. Applied Earthworks will observe ground-disturbing activities and will have the authority to temporarily divert or halt any activities in the event that previously unidentified	This stipulation will be adhered to during field implementation. Tribal monitors will be invited to monitor ground-disturbing field activities. Archaeological monitoring will also be conducted during ground disturbing portions of the project. Applied Earthworks, a professional cultural resources consulting firm, was retained by PG&E with DTSC approval. Applied Earthworks will observe ground-disturbing activities and will have the authority to temporarily divert or halt any activities in the event that previously unidentified potentially significant cultural resources are discovered.	This stipulation will be adhered to during field implementation. Tribal monitors will be invited to monitor ground-disturbing field activities. Archaeological monitoring will also be conducted during ground disturbing portions of the project. Applied Earthworks, a professional cultural resources consulting firm, was retained by PG&E with DTSC approval. Applied Earthworks will observe ground-disturbing activities and will have the authority to temporarily divert or halt any activities in the event that previously unidentified potentially significant cultural resources are discovered.

TABLE L1.1-4
Summary of Compliance with Applicable Programmatic Agreement (PA) Stipulations
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

				Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
				potentially significant cultural resources are discovered.		
26	Appendix C Monitoring Protocol (Human Remains)	If the Undertaking affects previously unidentified human remains and/or associated funerary objects or graves, or affects such resources in a way not previously anticipated, or has greater adverse effect than previously anticipated, all work in the vicinity of the discovery shall cease. No further action will be taken until the BLM, in consultation with Tribal and Archeological Monitors and PG&E in the field, has determined the nature of the discovery and delineated an area not to exceed 50 meters from the approximate center point of the discovery (or a smaller or larger area if warranted) in which no further work is to take place until treatment of the discovery is resolved.	Implementation of Field Activities	This stipulation will be adhered to during field implementation. Tribal monitors will be invited to monitor ground-disturbing field activities. Archaeological monitoring will also be conducted during ground disturbing portions of the project. Applied Earthworks, a professional cultural resources consulting firm, was retained by PG&E with DTSC approval. Applied Earthworks will observe ground-disturbing activities and will have the authority to temporarily divert or halt any activities in the event that previously unidentified potentially significant cultural resources are discovered.	This stipulation will be adhered to during field implementation. Tribal monitors will be invited to monitor ground-disturbing field activities. Archaeological monitoring will also be conducted during ground disturbing portions of the project. Applied Earthworks, a professional cultural resources consulting firm, was retained by PG&E with DTSC approval. Applied Earthworks will observe ground-disturbing activities and will have the authority to temporarily divert or halt any activities in the event that previously unidentified potentially significant cultural resources are discovered.	This stipulation will be adhered to during field implementation. Tribal monitors will be invited to monitor ground-disturbing field activities. Archaeological monitoring will also be conducted during ground disturbing portions of the project. Applied Earthworks, a professional cultural resources consulting firm, was retained by PG&E with DTSC approval. Applied Earthworks will observe ground-disturbing activities and will have the authority to temporarily divert or halt any activities in the event that previously unidentified potentially significant cultural resources are discovered.
27	Appendix C Monitoring Protocol (Safety)	Tribal and Archeological Monitors will be required to meet with PG&E's site supervisor prior to initiating monitoring activity and will be required to obtain any applicable training required under 29 CFR 1910.120 and 40 CFR 300.150. The PG&E site supervisor will identify the safety and logistical guidelines that are appropriate for the monitoring activity. Tribal and Archaeological Monitors are invited to attend the safety meetings at the start of each workday or new work task. If the Monitors do not attend this meeting, they will be instructed about the safety concerns of the day by a PG&E representative. Tribal and Archaeological Monitors will be expected to wear all personal protective equipment specified by PG&E's site supervisor and required of other similarly situated field workers. Tribal and Archaeological Monitors will be expected to actively participate to enhance the safety of themselves and the other workers onsite by communicating with PG&E's site supervisor if any safety concerns are identified. Due to safety considerations at the Project site, Tribal and Archaeological Monitors will also be prohibited from conducting any monitoring within designated construction exclusion zones, unless otherwise authorized by PG&E. Such zones are to be clearly delineated to the Tribal and Archaeological Monitors by PG&E's site supervisor. In these situations, other efforts to provide alternative methods for accommodating Monitors including, but not limited to, high-powered binoculars, spotting scopes, or other vision enhancement tools or alternative viewing platforms will occur.	Implementation of Field Activities	During the project initiation meeting or at similar venues (as appropriate), the PG&E Site Operations Manager or his designee will identify the safety and logistical guidelines that are appropriate for the monitoring activity. Tribal and Archaeological Monitors will be invited to attend the safety meetings at the start of each work day or new work task. If they do not attend, they will be instructed of the safety concerns of the day by PG&E.	During the project initiation meeting or at similar venues (as appropriate), the PG&E Site Operations Manager or his designee will identify the safety and logistical guidelines that are appropriate for the monitoring activity. Tribal and Archaeological Monitors will be invited to attend the safety meetings at the start of each work day or new work task. If they do not attend, they will be instructed of the safety concerns of the day by PG&E.	During the project initiation meeting or at similar venues (as appropriate), the PG&E Site Operations Manager or his designee will identify the safety and logistical guidelines that are appropriate for the monitoring activity. Tribal and Archaeological Monitors will be invited to attend the safety meetings at the start of each work day or new work task. If they do not attend, they will be instructed of the safety concerns of the day by PG&E.

TABLE L1.1-5
Summary of Compliance with Applicable Cultural and Historic Property Management Plan (CHPMP) Provisions
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Item No.	Reference Location in CHPMP Document	Relevant Excerpt from Document	Action (Compliance Status)		
			Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
1	Section 6.2	Measures and principles to avoid, minimize, or resolve adverse effects include the following: • Existing monitoring wells and related facilities shall be used to the maximum extent practicable. • The need for and placement of any new facilities or activities will be determined in consultation with the Tribes and the Consulting Parties following the Guidelines in Appendix B. • New facilities or activities will be placed in areas already disturbed by previous grading and other mechanized activities to the extent practicable, consistent with human health and the environment and achieving cleanup in a timely manner. • The performance of all field activities in support of the remedy shall be executed in such a way as to avoid and/or minimize adverse effects to cultural and historic properties to the maximum extent practicable. • Subject to Stipulation I(A) above, direct, indirect and cumulative impacts shall be considered and mitigated.	See responses to PA Stipulations I(B), III(B)(1), III(B)(2)(a)-(c), (e) and (f) in Table 6.2-2.	See responses to PA Stipulations I(B), III(B)(1), III(B)(2)(a)-(c), (e) and (f) in Table 6.2-2	See responses to PA Stipulations I(B), III(B)(1), III(B)(2)(a)-(c), (e) and (f) in Table 6.2-2
2	Section 6.2.3	Refers to the requirement in the PA Stipulation V(E) and PG&E's 2006 Settlement Agreement with the Fort Mojave Indian Tribe that a plan will be prepared for the decommissioning, removal and restoration of the IM-3 facility prior to implementation of the groundwater remedy, in consultation with all Signatories, Tribes and Invited Signatories. Additionally, PG&E will remove all other remediation facilities and appurtenances related to the Topock Remediation Project as soon as practicable following the attainment of cleanup standards and a determination by DOI that the removal of these facilities is protective of human health and the environment.	See responses to PA Stipulations V(A)-(E) in Table 6.2-2.	See responses to PA Stipulations V(A)-(E) in Table 6.2-2.	See responses to PA Stipulations V(A)-(E) in Table 6.2-2.
3	Section 6.3	"Environmental Restoration" refers to the restoration obligations in the Programmatic Agreement and the Consent Decree, including that PG&E draft a plan for decommissioning, removal, and restoration of the IM-3 facility and a Remedy Decommissioning Plan that will address post-remedy restoration of the site.	See responses to PA Stipulations I(D), III(B)(3)(c), and V(D)-(E) in Table 6.2-2.	See responses to PA Stipulations I(D), III(B)(3)(c), and V(D)-(E) in Table 6.2-2.	See responses to PA Stipulations I(D), III(B)(3)(c), and V(D)-(E) in Table 6.2-2.
4	Section 6.6.3	"Avoidance Measures/Management Thresholds" provides that: "The primary means for achieving avoidance will be through careful planning and placement of project facilities and installation of temporary barrier fences around significant cultural and historic properties. Metal fence posts and orange mesh all-weather fabric will be used, unless other appropriate materials are identified as preferable, for temporary fencing and will be regularly inspected and maintained. Permanent post-and double cable fencing may be required in high traffic areas. An archaeologist and/or Tribal representative(s) will clearly delineate the sensitive areas to be avoided by construction and supervise fence installation. Project personnel will be notified that fenced locations are to be completely avoided."	See responses EIR MMRP CUL-1a in Table 6.1-1. PG&E remediation resources specialist (Glenn Caruso) participated in field reviews of planned remedial facilities with the design team on April 23-24 and June 20, 2012. The purpose of these field reviews along with in office reviews is to ensure that the footprints of planned facilities are designed, in ways that avoid, minimize, and mitigate significant adverse effects to historically significant cultural and historic resources.	See responses to EIR MMRP CUL-1a in Table 6.1-1. PG&E's steps to prevent and reduce inadvertent damage are outlined in the CIMP Protocol for CUL-1a-8n: Protocols for protective measures for archaeological/historical sites during construction (Section 2.14 of the CIMP). In this protocol, PG&E outlines pre-construction measures to be taken to identify sites requiring protection, pre-construction identification of protective measures, and procedures for installation and removal of the protective measures, and restoration of the area to pre-construction conditions. Further, under the CHPMP requirements at Section 6.6.5 Periodic Site Monitoring, PG&E has proposed a monitoring and condition assessment program in the 2013 monitoring report (AE 2014a) and submitted for DTSC review.	See responses to EIR MMRP CUL-1a in Table 6.1-1. PG&E's steps to prevent and reduce inadvertent damage are outlined in the CIMP Protocol for CUL-1a-8n: Protocols for protective measures for archaeological/historical sites during construction (Section 2.14 of the CIMP). In this protocol, PG&E outlines pre-construction measures to be taken to identify sites requiring protection, pre-construction identification of protective measures, procedures for installation and removal of the protective measures, and restoration of the area to pre-construction conditions. Further, under the CHPMP requirements at Section 6.6.5 Periodic Site Monitoring, PG&E has proposed and initiated a monitoring and condition assessment program in the 2013 monitoring report (AE 2014a) and submitted for DTSC review.

TABLE L1.1-5
Summary of Compliance with Applicable Cultural and Historic Property Management Plan (CHPMP) Provisions

			Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
5	Section 6.6.4	Construction Monitoring Monitoring of all earth-disturbing Project activities will be in accordance with Appendix C of the PA (Tribal and Archaeological Monitoring Protocol). Qualified archaeological and Tribal monitors will be notified in advance and invited to be on site during earth-disturbing construction activities (grading, trenching, boring, drilling, or other excavation) for new injection, extraction or monitoring wells, new pipelines, new treatment facilities, new access roads, new staging areas, other new transportation facilities, or other new Project components. Due to safety considerations at the Project site, Tribal and archaeological monitors will comply with all safety requirements.	See responses to PA Appendix C, Monitoring Protocol in Table 6.2-2. See also EIR MMRP CUL-1a-8(I).	See responses to PA Appendix C, Monitoring Protocol in Table 6.2-2. See also EIR MMRP CUL-1a-8(I).	See responses to PA Appendix C, Monitoring Protocol in Table 6.2-2. See also EIR MMRP CUL-1a-8(I).
6	Section 6.6.5	Periodic Site Monitoring Sound management of the archaeological and historical properties requires that any progressive degradation of sites be identified. Additionally, it is recognized that a mechanism is needed to identify any accidental damage that may occur. To accomplish these goals, PG&E will develop a proposal describing a program of periodic site monitoring and condition assessment. BLM, following consultation with the Tribes and other appropriate parties, will approve any monitoring program before implementation by PG&E. The program will include all historic properties within the APE. Any previously unknown properties that may be encountered during the Project also will be included in the monitoring program unless such properties are evaluated as ineligible. During its initial phase, periodic monitoring and condition assessment will consist of annual field visits to monitor site conditions and disturbances	As part of the 2004 Cultural Resources Management Plan, Applied Earthworks conducted quarterly monitoring the first year and since then (2005 – 2012) annual monitoring and condition assessment.	PG&E has proposed a monitoring and condition assessment program in the 2013 monitoring report (AE 2014a) and submitted for DTSC review.	PG&E has proposed and initiated a monitoring and condition assessment program in the 2013 monitoring report (AE 2014a) and submitted for DTSC review.
7	Section 6.8	"Protocols for Tribal and Archaeological Monitoring" states that monitoring for the Project will be performed in accordance with the PA's Appendix C (Tribal and Archaeological Monitoring Protocol).	See responses to PA Appendix C, Monitoring Protocol in Table 6.2-2. See also EIR MMRP CUL-1a-8(I).	See responses to PA Appendix C, Monitoring Protocol in Table 6.2-2. See also EIR MMRP CUL-1a-8(I).	See responses to PA Appendix C, Monitoring Protocol in Table 6.2-2. See also EIR MMRP CUL-1a-8(I).
8	Section 6.9	If the Undertaking extends beyond the APE, BLM will determine, in consultation with the PA Signatories, Tribes, and Invited Signatories, what (if any) changes are required in the APE. If BLM determines that the APE must be revised, BLM will redefine the APE, taking into account the advice of the other Consulting Parties. Should such revision to the APE be needed, BLM will amend the CHPMP to include any changes to the APE (BLM et al. 2010:8).	See response to PA Stipulation II(B) in Table 6.2-2.	See response to PA Stipulation II(B) in Table 6.2-2.	See response to PA Stipulation II(B) in Table 6.2-2.

TABLE L1.1-5
Summary of Compliance with Applicable Cultural and Historic Property Management Plan (CHPMP) Provisions
Groundwater Remedy Basis of Design Report/Final (100%) Design
PG&E Topock Compressor Station, Needles, California

Item No.	Reference Location in CHPMP Document	Relevant Excerpt from Document	Action (Compliance Status)		
			Intermediate (60%) Design	Pre-Final (90%)/Supplemental 90% Design	Final (100%) Design
9	Section 7.1	1. Physical avoidance of the Topock Maze and associated prehistoric sites. 2. To the maximum extent practicable, PG&E will avoid all archaeological sites within the APE and protect all historic properties regardless of their NRHP status. The primary means for accomplishing avoidance will be through careful planning and placement of proposed access routes and drilling sites and by the installation of barrier fences around significant historic properties. A pre-project archaeological survey field verification will be conducted prior to any ground-disturbing activities. Consistent with other phases of work conducted at the Topock Remediation Project site, agency representatives and other stakeholders (including representatives of Native American Indian Tribes involved with the Project) will be invited to the site for a project initiation meeting to discuss various cultural sensitivities associated with the Project. 3. Ensure that PG&E shall, to the extent practicable, restore the areas affected by the Topock Remediation Project within the APE, including but not limited to the site of the existing treatment plant and related facilities but excluding the Topock Compressor Station and related facilities, to the conditions existing prior to the construction of the PG&E investigation and remediation related appurtenances and facilities per PA Stipulation I.D. 4. Remediation activities that propose the removal or introduction of vegetation on public lands shall be undertaken after coordination with Tribes to assess if culturally significant native plant species are being impacted and if there could be potential visual impacts to the Topock TCP. 5. Existing monitoring wells and related facilities shall be used to the extent practicable per PA Stipulation III.B.2(a). 6. The need for and placement of any new facilities or activities will be determined in consultation with the Tribes and the Consulting Parties following the Guidelines in Appendix B and per PA Stipulation III.B.2(b). 7. New facilities or activities will be placed in areas already disturbed by previous grading and other mechanized activities to the extent practicable, consistent with human health and the environment and achieving cleanup in a timely manner per PA Stipulation III.B.2(c). 8. Clay deposits are an important resource identified by the Hualapai in their creation, and may be important as well to other Tribes. Accordingly, BLM, PG&E, and those Tribes that ascribe importance to clay deposits shall meet to identify the clay deposits that are considered a resource and develop a protocol to be followed if such clay deposits are encountered.	See responses to PA Stipulations I(B), I(D), III(B)(1), III(B)(2)(a)-(c) and (e), III(B)(3)(c), and V(D) in Table 6.2-2. See also EIR MMRPs CUL-1a-8(i), AES-1, and AES-2. Regarding Item 4, PG&E does not plan to remove or introduce vegetation on public lands in connection with the remedy; instead, only some trimming of vegetation may be required which will be focused on non-native species (e.g., tamarisk). The trimming of native species (e.g., palo verde and mesquite) will be avoided or minimized to the extent practicable. Regarding Item 8, BLM met with the Hualapai Tribe and PG&E in late 2012 and discussed the Clay Monitoring Protocol. The Hualapai representative indicated that the Hualapai would make the initial draft of this protocol and then send it out for BLM and PG&E to review.	See responses to PA Stipulations I(B), I(D), III(B)(1), III(B)(2)(a)-(c) and (e), III(B)(3)(c), and V(D) in Table 6.2-2. See also EIR MMRPs CUL-1a-8(i), AES-1, and AES-2. Regarding Item 4, PG&E will introduce only native plants grown from local seed sources. These plants will be of the same species as those removed. At this 90% design stage, removal of tamarisk and arrow weed will occur during pipeline construction on the historical floodplain. The remedy design has avoided native trees in this area where they have been observed; however, it is possible that individual palo verde or mesquite trees could occur within the tamarisk thickets that will be affected. Where possible during construction, native trees will be avoided even if this requires additional impacts (i.e., removal or trimming) on tamarisk and arrow weed. There will be locations where impacts to native trees cannot be avoided and those losses will be mitigated according to the nature of the impact and the approaches in the appropriate restoration plan for the HNWR refuge, riparian areas, mature plants, or culturally-significant plants. Mitigation for impacts could include transplantation of likely candidate (younger) trees or replacement planting in a designated restoration area. The northern aerial bridge crossing of Bat Cave Wash is one location where it is currently known that 3 palo verde trees will require removal in order to install the aerial pipe bridge. Regarding Item 8, BLM met with the Hualapai Tribe and PG&E in late 2012 and discussed the Clay Monitoring Protocol. The Hualapai representative indicated that the Hualapai would make the initial draft of this protocol and then send it out for BLM and PG&E to review.	See responses to PA Stipulations I(B), I(D), III(B)(1), III(B)(2)(a)-(c) and (e), III(B)(3)(c), and V(D) in Table 6.2-2. See also EIR MMRPs CUL-1a-8(i), AES-1, and AES-2. Regarding Item 4, PG&E will introduce only native plants grown from local seed sources. These plants will be of the same species as those removed. At this final design stage, removal of tamarisk and arrow weed will occur during pipeline construction on the historical floodplain. The remedy design has avoided native trees in this area where they have been observed; however, it is possible that individual palo verde or mesquite trees could occur within the tamarisk thickets that will be affected. Where possible during construction, native trees will be avoided even if this requires additional impacts (i.e., removal or trimming) on tamarisk and arrow weed. There will be locations where impacts to native trees cannot be avoided and those losses will be mitigated according to the nature of the impact and the approaches in the appropriate restoration plan for the HNWR refuge, riparian areas, mature plants, or culturally-significant plants. Mitigation for impacts could include transplantation of likely candidate (younger) trees or replacement planting in a designated restoration area. Regarding Item 8, BLM met with the Hualapai Tribe and PG&E in late 2012 and discussed the Clay Monitoring Protocol. The Hualapai representative indicated that the Hualapai would make the initial draft of this protocol and then send it out for BLM and PG&E to review.
10	Section 7.2	Accommodation of Tribal Activities and Ceremonies Involving the Topock Maze/TCP The BLM will continue to work with the Tribes to identify Tribal activities and ceremonies that are associated with the Topock TCP. When such activities and ceremonies are identified, BLM will consult with the Tribes and PG&E to develop treatment measures to accommodate them. Treatment measures may address scheduling of Undertaking work to accommodate ceremonial activities and to mitigate audible and visual impacts.	See response to EIR MMRP CUL-1a-8k in Table 6.1-1.	See response to EIR MMRP CUL-1a-8k in Table 6.1-1.	See response to EIR MMRP CUL-1a-8k in Table 6.1-1.
11	Section 7.3	Treatment of other cultural, historical, and archaeological properties within the APE "The only properties identified within the APE that are not contributing properties to the Topock TCP are the properties from the historic period (i.e., Route 66, the AT&SF Railroad Grade, and National Old Trails Road). None of these properties has been impacted, to date, by this Undertaking. These properties shall be avoided, to the extent practicable, in the implementation of the Undertaking. These properties are periodically monitored for condition assessment to assure that they are being protected."	See responses to PA Stipulations I(B), III(B)(1), III(B)(2)(a)-(c) and (e) in Table 6.2-2.	See responses to PA Stipulations I(B), III(B)(1), III(B)(2)(a)-(c) and (e) in Table 6.2-2.	See responses to PA Stipulations I(B), III(B)(1), III(B)(2)(a)-(c) and (e) in Table 6.2-2.

12	Section 8.1	Discoveries - Steps to be taken if previously unrecorded properties are found	PG&E will follow the procedures specified in Appendix C of the CHPMP (Discovery Plan). See also response to PA Stipulation IX(A)-(D) in Table 6.2-2, and to EIR MMRP CUL-1a-8(b) and -8(o) in Table 6.1-1.	PG&E will follow the procedures specified in Appendix C of the CHPMP (Discovery Plan). See also responses to PA Stipulation IX(A)-(D) in Table 6.2-2, and to EIR MMRP CUL-1a-8(b) and -8(o) in Table 6.1-1.	PG&E will follow the procedures specified in Appendix C of the CHPMP (Discovery Plan). See also responses to PA Stipulation IX(A)-(D) in Table 6.2-2, and to EIR MMRP CUL-1a-8(b) and -8(o) in Table 6.1-1.
13	Section 8.2	Discoveries - Treatment of any human remains, funerary objections, ceremonial objects and items of cultural patrimony	PG&E will follow the procedures specified in Appendix D of the CHPMP (Plan of Action). See also response to PA Stipulation IX(A)-(D) in Table 6.2-2, and to EIR MMRP CUL-1a-8(b) and -8(o) in Table 6.1-1.	PG&E will follow the procedures specified in Appendix D of the CHPMP (Plan of Action). See also responses to PA Stipulation IX(A)-(D) in Table 6.2-2, and to EIR MMRP CUL-1a-8(b) and -8(o) in Table 6.1-1.	PG&E will follow the procedures specified in Appendix D of the CHPMP (Plan of Action). See also responses to PA Stipulation IX(A)-(D) in Table 6.2-2, and to EIR MMRP CUL-1a-8(b) and -8(o) in Table 6.1-1.
14	Section 8.3	Consultation Procedures Related to Unanticipated Discoveries • The BLM will notify all Signatories of the PA, Tribes and Invited Signatories of the nature and general location of any discovery. If the Tribes, PG&E and BLM can resolve treatment of the discovery in a manner that does not cause adverse effects to significant cultural and historic properties, BLM shall document the resolution, the activities within the work area may proceed and the AZ SHPO and the CA SHPO shall be notified of the discovery and resolution. The Tribes, PG&E and BLM will use their best efforts to resolve treatment as quickly as possible. • If there is failure to resolve treatment of the discovery in consultation with the Tribes and PG&E, BLM shall then consult with the AZ SHPO or the CA SHPO to develop a treatment plan that takes into account the effects of the Undertaking on the discovery. Within fifteen (15) days of notification of discovery, BLM shall provide the consulted SHPO(s), via email, a recommendation for resolving the discovery situation that takes into account the potential effects of the Undertaking on the discovery. • If the CA SHPO or AZ SHPO (as appropriate, depending on the location of the discovery) does not object to BLM's recommendation(s) within fifteen (15) days, BLM will implement the recommendation(s). If the consulted SHPO objects to the recommendation, BLM will utilize the dispute resolution process in Stipulation XV of the PA to resolve any objection.	See response to PA Stipulation IX(A)-(D) in Table 6.2-2. See also EIR MMRP CUL-1a-8(b) and -8(o) in Table 6.1-1.	See responses to PA Stipulation IX(A)-(D) in Table 6.2-2 and to EIR MMRP CUL-1a-8(b) and -8(o) in Table 6.1-1.	See responses to PA Stipulation IX(A)-(D) in Table 6.2-2 and to EIR MMRP CUL-1a-8(b) and -8(o) in Table 6.1-1.

SECTION 1

Introduction

This Operation and Maintenance (O&M) Plan presents the strategy and procedures for performing operations and maintenance of the groundwater remedy system to be constructed at the Pacific Gas and Electric Company (PG&E) Topock Compressor Station (TCS). To the extent practicable, operational flexibility has been built into the design of the remedy to allow foreseeable future issues to be addressed by procedural changes rather than equipment design changes. The groundwater remedy will be operated in accordance with this O&M Plan and other volumes of the O&M Manual. Not included in this O&M Plan are the layup procedures for the Interim Measure No. 3 (IM-3) treatment plant, which are presented in the IM-3 Decommissioning Work Plan (Appendix F to the Construction/Remedial Action Work Plan [CH2M HILL 2015]).

Changes will occur during the decades-long operation of the remedy, which may necessitate the update of select portions of this O&M Plan. Material changes to the O&M procedures/Standard Operating Procedures (SOPs) will be reported in the quarterly progress reports. Operations staff will have the latest SOPs on file at the site. For administrative changes to the SOPs, such as changes in point of contact information, a log of changes will be maintained by PG&E. For efficiency, administrative changes will be bundled and/or opportunistically combined with O&M Plan updates to incorporate material changes. Current SOPs and change logs will be made available on a SharePoint site for reference by agencies, stakeholders, and Tribes. The need for and the timing/frequency of updating this O&M Plan will be discussed with the agencies as remedy start-up and operation progresses.

1.1 Report Organization

This O&M Plan is organized into the following sections:

- Section 2.0 describes the key remedy components: in-situ remediation; freshwater supply, conveyance, and storage; remedy-produced water management; power supply and distribution; Remedy Supervisory Control and Data Acquisition (SCADA); and institutional controls (ICs). In addition, improvements at TCS ponds to enhance evaporation and truck loading capability, as well as the long-term remedy support area at Moabi Regional Park, are also described.
- Section 3.0 describes the in-situ remediation systems startup and normal operations, controls, and associated alarms. Also discussed are the detailed SOPs and select equipment O&M Manuals for the in-situ remediation and freshwater supply, conveyance, and storage systems; remedy-produced water management; power supply and distribution; Remedy SCADA systems; ICs; and improvements at TCS ponds. A list of control set points and control approaches and referenced process and instrumentation diagrams (P&IDs) is also presented.
- Section 4.0 describes the procedures and approaches to well maintenance and decommissioning.
- Section 5.0 discusses general guidelines for maintenance of pipelines (plastic and cement mortar lined steel pipe).
- Section 6.0 presents the Waste Management Plan for expected waste streams from remedy O&M activities and lists potential recoverable materials and best practices for recycling and reusing materials. The handling and management of soils are discussed in the Soil Management Plan (Volume 4 of the O&M Manual).
- Section 7.0 discusses other site management practices including the Storm Water Pollution Prevention Plan (SWPPP), Hazardous Materials Business Plans (HMBPs), access roads maintenance, management of vegetation for clearance of telecommunication lines, and maintenance of small solar panels.
- Section 8.0 presents a list of references used in the preparation of this volume.

SECTION 2

System Description

This section describes the main systems and sub-systems of the groundwater remedy. The description includes the purpose, a listing of the components, a description of the process, and anticipated controls. For simplicity, the abbreviation SCADA (supervisory control and data acquisition system) is used to refer collectively to the hardware and software used to control the Remedy systems including: programmable logic controllers (PLCs), communication infrastructure (e.g., cables and equipment, fiber-optic communication, radio transmission, or other wireless communication), and the operator interface terminals (OITs) or human/machine interface (HMI) devices.

For the reader's convenience, the referenced P&IDs and drawings have been included in Appendix A of this volume. All P&IDs can be found in Appendix D, Plans (Engineering Drawings), of the Basis of Design Report/Final (100%) Design Submittal (BOD Report). All pumps and valves will have stainless steel identification tags attached to the device to enable operations personnel to identify equipment and cross-reference information within the O&M Manual and drawings.

2.1 In-Situ Remediation

The in-situ remediation at the Topock site is shown on Figure 2.1-1 (figures are located at the end of each section) and consists of the following components:

- An In-situ Reactive Zone (IRZ) using a line of wells installed along National Trails Highway (NTH) may be used as both injection and extraction wells to circulate groundwater and distribute an organic carbon source to promote reduction of the hexavalent chromium (Cr[VI]) to trivalent chromium (Cr[III]).
- An Inner Recirculation Loop (IRL) consisting of:
  - River Bank Extraction Wells along the Colorado River to provide hydraulic capture of the plume, clean up the floodplain downgradient of the IRZ, enhance the flow of contaminated groundwater through the NTH IRZ line, and control migration of IRZ-generated by-products.
  - IRL Injection Wells to re-inject groundwater extracted from the River Bank Extraction Wells, which may be amended with an organic carbon source, and/or inject fresh water into wells in the upgradient portion of the Cr(VI) plume to flush the plume through the NTH IRZ.
  - Freshwater Injection Wells which inject fresh water obtained outside the treatment area into wells upgradient of the Cr(VI) plume to control and confine the plume migration to the west, assist with flushing the plume through the NTH IRZ (see Section 2.2), and constrain westward spread of carbon-amended water and in-situ byproducts from the Inner Recirculation Loop.
- A TCS Recirculation Loop consisting of:
  - East Ravine Extraction Wells in the eastern (downgradient) end of the East Ravine to provide hydraulic capture of contaminated groundwater in bedrock; and Transwestern (TW) Bench Extraction Wells in the area northeast of the TCS to accelerate capture of Cr(VI) impacted groundwater from the alluvial deposits located downgradient of the TCS.
  - TCS Injection Wells located upgradient of the TCS for the re-injection of groundwater extracted from the East Ravine Extraction Wells and TW Bench Extraction Wells, which will be amended with an organic carbon source to promote reduction of the Cr(VI) to Cr(III) and remove elevated Cr(VI) groundwater concentrations from the alluvial aquifer in the vicinity of the TCS.
- An electrical power, control, and communications system will be used to operate and control the different elements of the in-situ remediation system, and to integrate the in-situ remediation system with other

elements of the groundwater remedy. The electrical power, control, and communications system is discussed in further detail in Sections 2.4 and 2.5.

2.1.1 NTH IRZ

The NTH IRZ will act as a recirculation system in which water extracted via the four NTH IRZ Extraction Wells will be amended with carbon substrate and injected into the NTH IRZ line via the 24 NTH IRZ Injection Wells, resulting in a net flow of 0 gallon per minute (gpm). The NTH IRZ includes the following components:

- Four groundwater extraction wells (i.e., NTH IRZ Extraction Wells) situated at four locations (IRZ-1, IRZ-5, IRZ-9, and IRZ-23) within the NTH IRZ (see Figure 2.1-1).
- Carbon amendment facilities, located at the MW-20 Bench that will be used to amend the extracted groundwater with carbon substrate.
- Up to 24 injection wells (i.e., NTH IRZ Injection Wells) situated at 16 locations (IRZ-11, IRZ-13, IRZ-15, IRZ-16, IRZ-17, IRZ-19, IRZ-20, IRZ-21, IRZ-25, IRZ-27, IRZ-29, IRZ-31, IRZ-33, IRZ-35, IRZ-37, and IRZ-39) within the NTH IRZ (see Figure 2.1-1) that will be used to re-inject carbon-amended water into the aquifer.
- One provisional extraction well (IRZ-40) and up to 30 provisional injection wells situated at 19 locations within the NTH IRZ (see Figure 2.1-1) that may be installed and operated depending on the monitored performance of the NTH IRZ over time. Flexibility will be retained to adjust the locations of provisional wells in the future as the remedial program evolves. Provisional well locations will be discussed with the stakeholders prior to implementation. Criteria for installation and activation of the provisional wells are provided in Section 2.2.1 of the Sampling and Monitoring Plan in Volume 2 of this O&M Manual.
- Below-grade piping for the conveyance of extracted groundwater, carbon-amended water, fresh water, and/or water produced from routine remedy O&M activities (i.e., backwashing).
- A well maintenance system to facilitate routine backwashing of the injection wells and pipeline maintenance (see Section 4 below).
- A clean-in-place (CIP) pipeline maintenance system (see Section 5 below).

2.1.1.1 NTH IRZ Extraction Wells

Each NTH IRZ Extraction Well will have a flow rate ranging from 40 to 160 gpm at approximately 300 feet of water column (ft w.c.) total dynamic head (TDH). The nominal total extraction flow rate for the NTH IRZ Extraction Wells will be 300 gpm, with an anticipated range of 200 to 400 gpm (see Table 2.1-1; tables are located at the end of each section).

The NTH IRZ Extraction Wells will be constructed using up to 12-inch nominal diameter well casing with one or two screened intervals to target specific intervals of the geologic formation. Preliminary screen lengths for each of the NTH IRZ Extraction Wells are summarized in Table 2.1-1. Additional details on well construction are provided in Section 3.2.5.1 of the BOD Report and Drawing M-04-01 in Appendix A.

Electric motor-operated, submersible pumps will be deployed in each extraction well, and the pump intakes will be positioned above the screens to prevent dewatering of the screen and subsequent fouling. Dual screen extraction wells will be constructed with a dedicated pump and riser pipe for each well screen with the intervals separated using a pneumatic packer. The motors will be 460 volts alternating current (VAC), 3-phase, 60 hertz (Hz). The wellhead connection and control/monitoring devices, including flow meters, water level sensors, leak detection sensors, and submersible pump controls, will be contained within a below-grade concrete vault.

NTH IRZ wells configured as extraction wells will be connected to a groundwater conveyance header and will be routed to carbon amendment and well maintenance facilities located at the MW-20 Bench. Conveyance piping from extraction well IRZ-23 to the main groundwater conveyance header will be double-contained and include leak detection instrumentation at low points. Each NTH IRZ Extraction Well screened interval will include a sample port upstream of the point where groundwater from that screened interval exits the vault.

2.1.1.2 NTH IRZ Injection Wells

The nominal total NTH IRZ injection flow rate will be 300 gpm, with an anticipated range of 200 to 400 gpm. The anticipated nominal injection flow rates per well range from 4 to 20 gpm, with a maximum injection flow rate per well of 40 gpm (IRZ-11 and IRZ-13), as summarized in Table 2.1-1.

The NTH IRZ Injection Wells will be constructed using up to 12-inch nominal diameter well casing with one or two screened intervals to target specific intervals of the geologic formation. Preliminary screen lengths for each of the NTH IRZ Injection Wells are summarized in Table 2.1-1. Additional details on well construction are provided in Section 3.2.5.1 of the BOD Report and Drawing M-04-02 in Appendix A.

In-well components will include pneumatic packers, injection drop pipes, spring-loaded check valves, pressure transducers, backflushing pumps, and ancillary piping and fittings. The wellhead connections and additional control and monitoring devices including flow meters, leak detection sensors, and backflush pump controls will be contained within a below-grade concrete vault. Additional injection well vault components will include electrically actuated diaphragm, globe, or other suitable control valves to facilitate the periodic adjustment of injection flow rates, and pressure gauges, sample ports, and/or packer pressure control devices.

Each NTH IRZ Injection Well will be connected to a carbon-amended groundwater conveyance header and a backwash return header.

2.1.1.3 Carbon Amendment System (MW-20 Bench)

Carbon amendment facilities will be located at the MW-20 Bench. The system consists of a tanker truck offload bay; the primary carbon amendment, metering, and control equipment; the primary carbon substrate storage and carbon substrate storage instrumentation; and extraction well header network monitoring equipment. The carbon substrate will be delivered by tanker truck and stored in the carbon tank until it is metered into the extracted groundwater. Concentrated carbon amendment piping will be installed as double-contained with leak detection instrumentation at low points. Each carbon amendment pump (designated as PMP-IRZ00-0640, PMP-IRZ00-0641, and PMP-IRZ00-0642) is capable of delivering up to 230 gallons per hour (gph) of carbon substrate from the tank to the groundwater injection header(s).

Primary Carbon Amendment, Metering, and Control Equipment. The carbon amendment, metering, and control equipment will include valves, flow meters, chemical metering pumps, and ancillary equipment (see Drawing I-06-02 in Appendix A). Groundwater produced by the NTH IRZ Extraction Wells will be conveyed to the MW-20 Bench Carbon Amendment Building, where the amendment equipment will be used to control amendment of the extracted groundwater with carbon substrate. The amended water will then flow through an in-line static mixer before being routed to the carbon-amended groundwater conveyance header. A sample port and pressure gauge located downstream of the static mixer will be used for monitoring purposes. In addition, a sample port will be included upstream of the static mixer for diagnostic purposes.

Primary Carbon Substrate Storage. The primary carbon substrate storage system will include double-walled piping and tank systems, with secondary containment around the nozzles and connections as required by regulation and/or best practices.

The primary carbon substrate storage tank will be a 15,000-gallon, above-grade, horizontal saddle tank that is fully compatible with the contained substrate. The tank will have double-wall construction and an integral interstitial zone to provide secondary containment and appropriate ports for the installation of leak detection monitoring devices. The storage tank will include the following, as shown in Appendix A, Drawing M-06-04 or I-06-02:

- An integral overfill prevention device, attached to the tank fill line, designed to prevent filling of the tank beyond 90 percent of the rated capacity
- A primary pressure/vacuum (P/V) vent sized in accordance with applicable codes and regulations

- Emergency vents to prevent damage from failure of the primary P/V vent
- A vapor recovery system designed to capture any emissions generated during the storage tank filling process

In general, the carbon substrate storage tank piping network will be designed and constructed by the manufacturer to comply with applicable codes and requirements, including San Bernardino Fire Marshall and Mojave Desert Air Quality Management District requirements, which may dictate the specifications for external connections to the tank (e.g., for the tank fill line and vapor recovery line). The option of installing different types of fittings to minimize the potential of connecting to the wrong line will be considered with the manufacturer. The lines connected to the tank will also be identified with labels as appropriate.

Details of electrical classifications (in accordance National Fire Protection Association (NFPA) and California Fire Code electrical hazard classifications) are shown on the engineering drawings (C-06-03) provided in Appendix D of the BOD Report.

Carbon Substrate Storage Instrumentation. Carbon substrate storage instrumentation will include the following:

- Tank interstitial space fluid level sensors
- A primary tank level transmitter—radar, ultrasonic, physical reading, or pressure type—with a manual gauging port for operator verification
- A primary tank high level switch
- A primary tank fluid temperature sensor
- A visible beacon and audible alarm, within the MW-20 Bench only, to notify operators of a high level during tank filling operations
- A pipeline secondary containment leak detection system

Details are shown on Drawing M-06-04 or I-06-02 (see Appendix A).

Tanker Truck Unloading Pad. The tanker truck unloading pad will be constructed as a concrete slab and designed for at least 7,700 gallons (110 percent of the volume of one tanker truck).

Portable Tanks. The NTH IRZ Injection Well design will include manual addition ports to accommodate the potential use of portable tanks (5 to 1,000 gallon capacity) for the direct injection of carbon substrate solution at the wellheads.

2.1.2 Inner Recirculation Loop

The IRL will consist of the following system components:

- Five River Bank Extraction Wells (RB-1 through RB-5) installed along the Colorado River (see Figure 2.1-1).
- Four Inner Recirculation Loop Injection Wells (IRL-1 through IRL-4) installed near the western margin of the groundwater plume north of I-40 (see Figure 2.1-1).
- Up to four provisional River Bank Extraction Wells (RB-6 through RB-9, to be located within the approximate area shown in Figure 2.1-1), and three provisional Inner Recirculation Loop Injection Wells (IRL-5 through IRL-7;[1] see Figure 2.1-1) that may be installed and operated dependent on the monitored performance of the remedy over time. Flexibility will be retained to adjust the locations of provisional wells in the future as the remedial program evolves. Provisional well locations will be discussed with the stakeholders prior to implementation. Criteria for installation and activation of the provisional wells are provided in Section 2.2.2 of the Sampling and Monitoring Plan in Volume 2 of this O&M Manual.

[1] IRL-6 may alternatively be considered as an extraction well with extracted groundwater re-injected into the other IRL injection wells.

- Carbon amendment facilities, located at the MW-20 Bench, used to amend the extracted groundwater with carbon substrate, if needed.
- Above- and below-grade piping for the conveyance of extracted groundwater, carbon-amended water, fresh water, and/or water produced from routine remedy O&M activities.
- A well maintenance system to facilitate routine backwashing of the injection wells (see Section 4 below).

2.1.2.1 River Bank Extraction Wells

Four of the River Bank Extraction Wells (shown on Figure 2.1-1) are planned to be operated initially, although flexibility will be provided to operate any and all River Bank Extraction Wells at any given time. The nominal total extraction flow rate of these wells is 150 gpm, although flexibility will be provided to increase this flow rate to 500 gpm, if needed, or to decrease the extraction flow rate (e.g., during later stages of the remedial operation) based on monitored remedy performance (see Table 2.1-2). The nominal extraction flow rate will range from approximately 25 to 50 gpm per well at approximately 350 ft w.c. TDH, although flexibility will be provided for a maximum per well extraction flow rate of 170 gpm.

The River Bank Extraction Wells are currently anticipated to be constructed with 8-inch nominal diameter well casing, although up to 12-inch nominal diameter well casing may be used. The River Bank Extraction Wells will be constructed with one screened interval to target the deeper portions of the aquifer (see Table 2.1-2), as well as a second shallow screen interval, for potential future use, that will be isolated from the deeper screen interval with a pneumatic packer. Preliminary screen lengths for each of the River Bank Extraction Wells are summarized in Table 2.1-2. Additional details on well construction are provided in Section 3.2.5.1 of the BOD Report and Drawing M-05-01 in Appendix A.

As with the NTH IRZ Extraction Wells, an electric motor-operated, submersible pump will be installed in each River Bank Extraction Well; motors will be 460 VAC, 3-phase, 60 Hz. Other down-hole components will include pump discharge piping, and control and monitoring instrumentation. Each well will be connected to a groundwater conveyance header that will be routed to the carbon amendment facilities located at the MW-20 Bench. The wellhead connection and additional control/monitoring devices will be contained within a below-grade concrete vault similar to those for the NTH IRZ Extraction Wells. Each River Bank Extraction Well will include a sample port upstream of the point where groundwater from that well exits the vault.

2.1.2.2 Inner Recirculation Loop Injection Wells

Water injected via the Inner Recirculation Loop Injection Wells (see Figure 2.1-1) will include: (1) groundwater captured by the River Bank Extraction Wells and amended with carbon, as necessary, using the carbon amendment facilities located at the MW-20 Bench; and (2) fresh water from the freshwater supply system (see Section 2.2). The nominal total IRL injection flow rate will be 450 gpm, including 150 gpm from the River Bank Extraction Wells injected into the deep screens (lower approximately two-thirds of the saturated interval) at IRL-1 and IRL-2 and 300 gpm of fresh water injected at IRL-3 and IRL-4. Flexibility will be provided to inject a maximum total combined flow rate of up to 900 gpm into the Inner Recirculation Loop Injection Wells, which may include either or both of the above mentioned water sources at each well. Note that groundwater captured by the River Bank Extraction Wells will not be injected into the shallow screens (upper approximately one-third of the saturated interval) at IRL-1 and IRL-2, or into IRL-3 or IRL-4, without preapproval from the agencies. The anticipated nominal per well injection flow rates range from 75 to 200 gpm Table 2.1-2.

Water captured by the River Bank Extraction Wells will be amended with carbon substrate if the Cr(VI) concentrations are greater than 32 micrograms per liter (μg/L). The Sampling and Monitoring Plan in Volume 2 of this O&M Manual presents the monitoring plan for collecting and evaluating analytical data to determine whether or not carbon amendment will be required according to this criterion. If carbon amendment is required for the Inner Recirculation Loop Injection Wells, it will be conducted in a similar manner as for the NTH IRZ Injection Wells, following a similar data collection and operational adjustment framework as presented in the operational flowcharts in the Sampling and Monitoring Plan (Volume 2 of this O&M Manual). Similar to the NTH IRZ Injection Wells, the Inner Recirculation Loop Injection Well design will include manual addition ports to accommodate the

potential use of portable tanks (5- to 1,000-gallon capacity) for the direct injection of carbon substrate solution at the wellheads.

Inner Recirculation Loop Injection Wells will be constructed using up to 12-inch nominal diameter well casing. IRL-1 and IRL-2 will be installed as dual-screen wells with the shallow screen (upper one-third of the saturated interval) separated from the deep screen (lower two-thirds of the saturated interval) with a pneumatic packer. IRL-3 and IRL-4 will be installed with both a shallow screen (upper two-thirds of the saturated interval) and deep screen (lower one-third of the saturated interval), and are designed to accommodate a pneumatic packer for potential future isolation of the shallow and deep screened intervals. However, under the final nominal scenario, only fresh water will be injected into IRL-3 and IRL-4, and the shallow and deep screens in these wells will not be isolated. Preliminary screen lengths for each of the Inner Recirculation Loop Injection Wells are summarized in Table 2.1-2. Additional details on well construction are provided in Section 3.2.5.1 of the BOD Report and Drawings M-05-02 and M-05-03 in Appendix A. In-well components and wellhead connections will include valving and instrumentation similar to the NTH IRZ Injection Wells. The Inner Recirculation Loop Injection Wells will be connected to a carbon-amended groundwater conveyance header, a backwash return header, and the freshwater supply pipeline.

Below-grade piping between the IRL-4 valve/meter and well vaults will be installed in double-contained piping with leak detection instrumentation at low points. Due to the steepness of the access road, secondary containment is included between the meter vault and the well vault. A sump pump and concrete containment vault is included near the well vault to capture and recover fluids emanating from a release. This approach also improves safety during O&M. For example, during well maintenance, fluids can be pumped from the well directly into a temporary portable tank located near the meter vault located outside the ravine. This approach eliminates the need to haul a tank into the ravine.

2.1.3 TCS Recirculation Loop

The TCS Recirculation Loop will consist of the following system components:

- Two Transwestern Bench Extraction Wells, TWB-1 and TWB-2, installed northeast of the TCS (see Figure 2.1-1).
- Five East Ravine Extraction Wells, ER-1 through ER-4 and ER-6, installed within bedrock.
- Two provisional Transwestern Bench Extraction Wells, TWB-3 and TWB-4; one provisional East Ravine Extraction Well (ER-5); and up to five additional provisional East Ravine Extraction Wells (ER-7 through ER-11, to be located within the approximate area shown in Figure 2.1-1) that may be installed and operated dependent on the monitored performance of the remedy over time. Flexibility will be retained to adjust the locations of provisional wells in the future as the remedial program evolves. Provisional well locations will be discussed with the stakeholders prior to implementation. Criteria for installation and activation of the provisional wells are provided in Section 2.2.3 of the Sampling and Monitoring Plan in Volume 2 of this O&M Manual.
- Two TCS Injection Wells, TCS-1 and TCS-2, installed upgradient of the TCS.
- Carbon amendment facilities, located at the MW-20 Bench, used to amend the extracted groundwater with carbon substrate.
- Above- and below-grade piping for the conveyance of extracted groundwater, carbon-amended water, and/or water produced from routine remedy O&M activities.
- A well maintenance system to facilitate routine backwashing of the injection wells (see Section 4 below).

2.1.3.1 Transwestern Bench Extraction Wells

The Transwestern Bench Extraction Wells will be operated at any given time for a total extraction flow rate ranging from 2 to 30 gpm, with an anticipated combined nominal rate of approximately 22 gpm (see Table 2.1-3).

The expected nominal extraction flow rates per well will be 13 gpm (TWB-1) and 9 gpm (TWB-2) at approximately 320 ft w.c. TDH, although flexibility will be provided to operate each well at up to 15 gpm.

Transwestern Bench Extraction Wells will be constructed using up to 12-inch nominal diameter well casing with one discrete screened interval. Preliminary screen lengths for each of the TW Bench Extraction Wells are summarized in Table 2.1-3. Additional details on well construction are provided in Section 3.2.5.1 of the BOD Report and Drawing M-03-01 in Appendix A.

Similar to the NTH IRZ Extraction Wells, an electric motor-operated submersible pump will be installed in each TW Bench Extraction Well with the pump discharge piping and associated controls and monitoring instrumentation contained in a below-grade vault. Each well will be connected to a groundwater conveyance header that will be routed to the carbon amendment facilities located at the MW-20 Bench. Each TW Bench Extraction Well will include a sample port upstream of the point where groundwater from that well exits the vault.

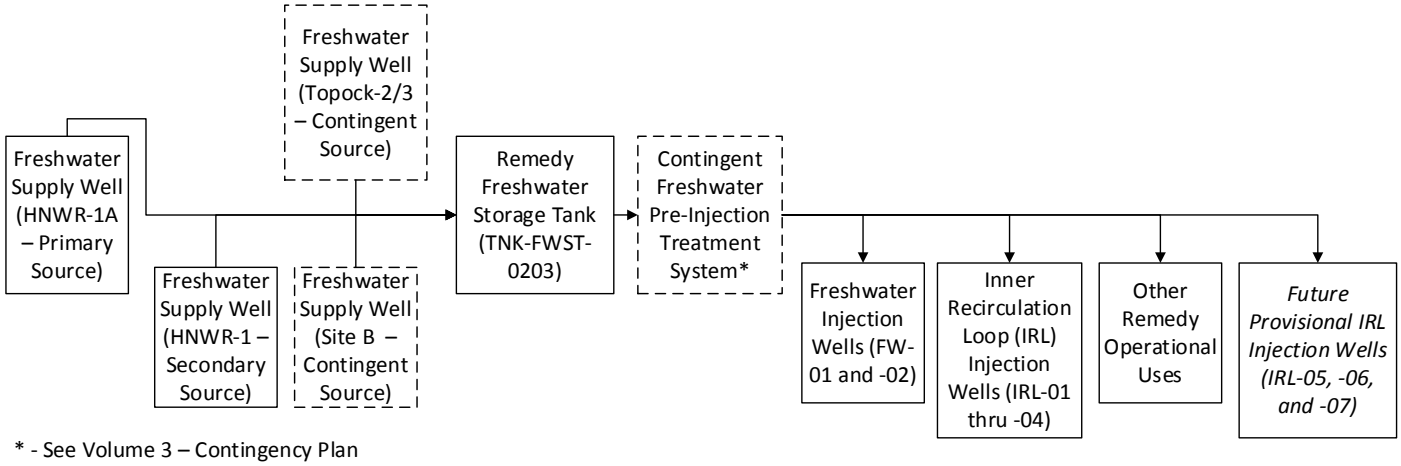
2.1.3.2 East Ravine Extraction Wells

It is anticipated that the five East Ravine Extraction Wells will be operated at any given time for a combined nominal flow rate of 5 gpm (i.e., approximately 0.5 gpm per well for ER-1 to ER-4 and 3 gpm for well ER-6; see Table 2.1-3), although flexibility will be provided to operate up to a maximum total combined flow rate of 9 gpm.

East Ravine Extraction Wells will be constructed using up to 12-inch nominal diameter carrier casing set to the top of competent bedrock. A minimum of 20 feet of carrier casing is required to comply with State well regulations for a sanitary seal. Below the carrier casing depth drilling would proceed to the target depth and the well would consist of an open bedrock borehole (up to 5-inch-diameter) beneath the casing.

Similar to the Transwestern Bench Extraction Wells, an electric motor-operated submersible pump will be installed in each East Ravine Extraction Well with the pump discharge piping and associated controls and monitoring instrumentation contained in a below-grade vault. The vault for extraction well ER-6 will be installed above the base of the wash to prevent the vault from being flooded during rain events. Each well will be connected to a groundwater conveyance header that will be routed to the header of the extraction well network located northeast of the TCS. Each East Ravine Extraction Well will include a sample port upstream of the point where groundwater from that well exits the vault.

2.1.3.3 TCS Injection Wells



The two TCS Injection Wells will each receive approximately 13.5 gpm of carbon-amended groundwater for a combined nominal flow rate of 27 gpm (see Table 2.1-3), although flexibility will be provided to inject a maximum total combined flow rate of up to 75 gpm and up to 40 gpm per well.

TCS Injection Wells will be constructed using up to 12-inch nominal diameter well casing with two discrete screened intervals. Preliminary screen lengths for each of the TCS Injection Wells are summarized in Table 2.1-3. Additional details on well construction are provided in Section 3.2.5.1 of the BOD Report and Drawing M-03-02 in Appendix A.

In-well components and wellhead connections will include valving and instrumentation similar to the NTH IRZ Injection Wells. The TCS Injection Wells will be connected to a carbon-amended groundwater conveyance header and a backwash return header. The carbon-amended groundwater conveyance header will be routed to/from the carbon substrate amendment system located at the MW-20 Bench. Similar to the NTH IRZ Injection Wells, the TCS Injection Well design will also include manual addition ports to accommodate the potential use of portable tanks (5- to 1,000-gallon capacity) for the direct injection of carbon substrate solution at the wellheads.

2.2 Freshwater Supply

The Freshwater Supply System is an important part of the remedy. Fresh water is injected upgradient to push the Cr(VI) plume toward the NTH IRZ to reduce overall cleanup time, and to prevent westward spreading of the plume and in-situ byproducts. In addition, fresh water is also used for miscellaneous operational uses (for example, laboratory use, use at the carbon amendment facility, use at the Remedy-produced Water Conditioning Building, etc.). A new freshwater storage tank (TNK-FWST-0203) will be used to serve the remedy water demand. A schematic of the freshwater supply system is shown in Exhibit 2.2-1.

* - See Volume 3 – Contingency Plan

EXHIBIT 2.2-1
Freshwater Supply System Process Schematic
Groundwater Remedy Operation and Maintenance Manual
Volume 1: Operation and Maintenance Plan
PG&E Topock Compressor Station, Needles, California

2.2.1 Freshwater Supply Wells, Conveyance, and Storage

2.2.1.1 Purpose

In November 2010, the Havasu National Wildlife Refuge (HNWR) installed an irrigation well (HNWR-1) in Arizona to supply water for a re-vegetation project. Two freshwater supply wells, Site B and HNWR-1A, were installed by PG&E in October 2013 and June 2014, respectively. Both of these wells are also located on HNWR lands in Arizona. The HNWR-1A well will serve as the primary freshwater supply well for the groundwater remedy, while the HNWR-1 well will serve as a secondary supply well. The Topock-2/-3 wells (which currently supply water for Compressor Station uses) and the Site B well will serve as contingency freshwater supply sources, if needed. Locations of the primary, secondary, and contingent freshwater supply wells are shown in Figure 2.2-1.

The primary supply well, HNWR-1A, will pump fresh water to the new remedy freshwater storage tank at the TCS (TNK-FWST-0203). Fresh water is currently used for fire protection, cooling tower make up, use in sinks, etc. For the groundwater remedy, fresh water will be used for injection into remediation wells, and for miscellaneous operational uses as described in Section 2.2. Fire protection water for remedy facilities located on the Compressor Station, Transwestern Bench, and MW-20 Bench will be supplied from the existing TCS freshwater storage tanks.

2.2.1.2 Components

The primary freshwater supply well (HNWR-1A) will be equipped with aboveground well head equipment placed on two concrete pads - one for electrical and controls equipment and one for mechanical equipment. A 7-foot-high chain link fence and camera provide security for the aboveground equipment. The wellhead equipment includes:

- Electrical submersible pump
- Power panel and transformer

- Remote terminal unit
- Pressure switch and local indicator
- Pressure indicating transmitter
- Flowmeter and transmitter
- Level transducer and transmitter
- Local Hand-Off-Auto (H-O-A) switch
- Camera to remotely inspect conditions of well and equipment at well site
- Piping, valves, and fittings
- Sand separator and dry well

The HNWR-1A well will supply water via a new 12-inch conveyance pipeline; the material of construction for this new piping will be cement mortar lined steel aboveground and high-density polyethylene (HDPE) below-ground. Other pipeline components include expansion loops, pipe supports, air release valves, and fittings. The new 12-inch-diameter pipeline will follow the county road (underground), cross under the railroad overpass (trenchless technology not required), cross under I-40 (trenchless technology required), and cross the Colorado River to California via the Arched Bridge. From there the pipeline will run along the PG&E Line 300A gas pipeline maintenance road toward the Compressor Station. The pipeline will terminate in connections at the remedy freshwater storage tank (TNK-FWST-0203). The remedy freshwater storage tank will be a 10,000-gallon coated carbon steel tank equipped with piping, valves, fittings, level switches and transmitters, an overflow pipe, and a tank vent. A spare connection will be installed to provide fresh water for other possible future demands. Pipes will originate from this tank to serve Freshwater Injection Well FW-2 and the future provisional well located north of the TCS (i.e., IRL-6).

Midway along the PG&E Line 300A gas pipeline maintenance road, the freshwater pipeline will branch to the north (i.e., Pipeline J) to connect to the piping corridor located near NTH and the Compressor Station access road. This branch will pass by the MW-20 Bench facilities and then cross NTH toward the IM-3 treatment plant. This branch will serve the upland wells (FW-1, IRL-1 through IRL-4, as well as future provisional wells IRL-5 and IRL-7). In the event that pre-treatment of fresh water is required, all fresh water will be piped to the Compressor Station for treatment, and the treated fresh water will be conveyed along PG&E's natural gas pipeline right-of-way prior to joining the freshwater pipeline leading to NTH. The treated freshwater pipe will be installed concurrently with construction of the untreated freshwater pipe (i.e., Pipeline B).

If needed in the future, the existing HNWR-1 well can be tied into the freshwater supply system by extending wellhead piping to a flange located near the HNWR-1A well. The contingency Site B well can also be tied into the freshwater supply system by installing a 12-inch conveyance pipeline along County Road 10, to a flange located near the HNWR-1A well. Both of these wells will need to be outfitted with proper wellhead equipment prior to tie-in.

Existing supply wells Topock-2 and -3 currently supply fresh water to the TCS through an existing 6-inch pipeline that terminates at the existing TCS storage tanks. The final design includes a tie-in to this existing 6-inch freshwater pipeline, upstream of the existing TCS freshwater storage tanks that would allow use of Topock-2/-3 water as a primary contingency freshwater source for remedy operations when the Compressor Station is not receiving water from these wells. The tie-in location and associated piping/valves are located within the Compressor Station footprint.

2.2.1.3 Process Description

The well pump in HNWR-1A lifts groundwater to the surface in a pipe from which it is conveyed to the freshwater supply pipeline. The pump will be activated automatically when water levels are less than a pre-set level in the remedy freshwater storage tank (TNK-FWST-0203).

If needed in the future, a new pump can be installed in the HNWR-1 and Site B wells. The well pumps will be controlled in a similar manner as the HNWR-1A well pump.

2.2.1.4 Control System

The pump motor in the HNWR-1A well will be activated when: a) the water level in the remedy freshwater storage tank (TNK-FWST-0203) drops to below the low-level set point, b) water level in HNWR-1A is greater than the low-level set point, and c) pump discharge pressure is less than the high pressure set point. Initial control set points and approaches are included in Table 3.1-1 at the end of Section 3. These set points will be periodically adjusted based on system operational experience.

If needed in the future, the secondary supply well (HNWR-1) and contingency supply well (Site B) can be tied to the freshwater supply system; the pump motor controls are anticipated to be activated in a similar manner as the HNWR-1A pump motor control.

2.2.2 Conveyance to Injection Wells

2.2.2.1 Purpose

The conveyance piping transports stored fresh water to the Freshwater Injection Wells (see Section 2.2.3) and the Inner Recirculation Loop Injection Wells (see Section 2.1.2).

2.2.2.2 Components

Conveyance piping will be a combination of buried (HDPE) pipe and aboveground pipe (cement mortar lined steel). Pipe sizes will vary, but the trunk lines will be a minimum of 6 inches in diameter. The piping will be equipped with isolation valves (for maintenance and repair purposes) and air release valves (release air to prevent flow restrictions and make pumping efficient).

2.2.2.3 Process Description

Water will flow by gravity from the remedy freshwater storage tank (TNK-FWST-0203) to FW-2, or will be conveyed directly from the supply well (HNWR-1A) to the upland injection wells.

2.2.2.4 Control System

The conveyance piping has no control system components.

2.2.3 Freshwater Injection Wells

2.2.3.1 Purpose

Water supplied to the Freshwater Injection Wells is used to create a hydraulic push on the Cr(VI) plume to move it toward the NTH IRZ more quickly than natural processes would and to prevent westward spreading of the plume and the in-situ byproducts. Preliminary screen lengths for each of the Freshwater Injection Wells are summarized in Table 2.2-1.

2.2.3.2 Components

Each well includes piping, valves, instrumentation, controls, and pre-cast concrete vaults, located at the injection well sites. The wellhead will be located in one vault (“well vault”), and the process valves and flow meters will generally be located in a second vault (“meter vault”). Components include:

- Pre-cast concrete meter vault and separate well vault with spring assist lids
- Flow meters
- Pressure gauge and transmitter
- Air release valve
- Level transducer and transmitter
- Flow control valve (this will be an orifice type with an adjustable sleeve operated hydraulically; the valve will include a hydraulic actuator assembly including pump, fluid reservoir, and controller that is controlled through the Remedy SCADA system)
- Submersible backwash pump – see also Section 2.3.1, Generation – Routine Automatic Backwash

- Local H-O-A switch
- Level switches in the well and meter vaults
- Drop pipe
- Well seal with pre-fabricated holes for drop pipe, sounding tube, chemical injection, camera, and power and signal wires
- Process piping, valves, and fittings
- Local pressure gauges for O&M

2.2.3.3 Process Description

Freshwater Injection Wells FW-1 and FW-2 are designed to receive up to 200 and 100 gpm, respectively, under gravity flow from the remedy freshwater storage tank (TNK-FWST-0203) (see Table 2.2-1). Although FW-1 is capable of receiving fresh water by way of gravity flow from TNK-FWST-0203, FW-1 will receive fresh water directly from the freshwater supply well under normal operating conditions. FW-2 will receive fresh water from the remedy freshwater storage tank. Wells that receive water are in injection mode under remote control. Water level builds up in the casing and then spreads into the aquifer formation under gravity head.

2.2.3.4 Control System

Conditions for normal well operations (auto/remote mode) are as follows:

- Fresh water is in the storage tank (TNK-FWST-0203) above the low-level set point
- Water level in the well is below the high-level and pipeline pressure is less than the high-pressure set point
- Well is not in backwash mode (see Section 2.3.1.3 below)
- Well is not in another maintenance condition.

Control set points and approaches are included in Table 3.1-1 at the end of Section 3. These set points will be periodically adjusted based on system operational experience.

2.3 Remedy-produced Water Management

Remedy wells will require regular maintenance to sustain well efficiency and effective operations over the decades-long lifetime of the remedy. Wastewater generated during well maintenance falls into two categories: 1) routine backwash water and 2) periodic rehabilitation water. Other types of water produced from remedy operation, at smaller volumes, will also need to be managed. They include monitoring well sampling and development purge water, equipment decontamination wastewater, and rainwater that collects in remedy facility secondary containment. Collectively, these categories of wastewater are called remedy-produced water. An estimated 7.6 million gallons of wastewater is generated per annum. A schematic of the remedy-produced water management system is shown in Exhibit 2.3-1.

This section describes the equipment and materials associated with permanent facilities for managing remedy-produced water. The functions are divided into:

- Generation - Automatic Backwash
- Conveyance
- Conditioning
- Disposal/Reuse

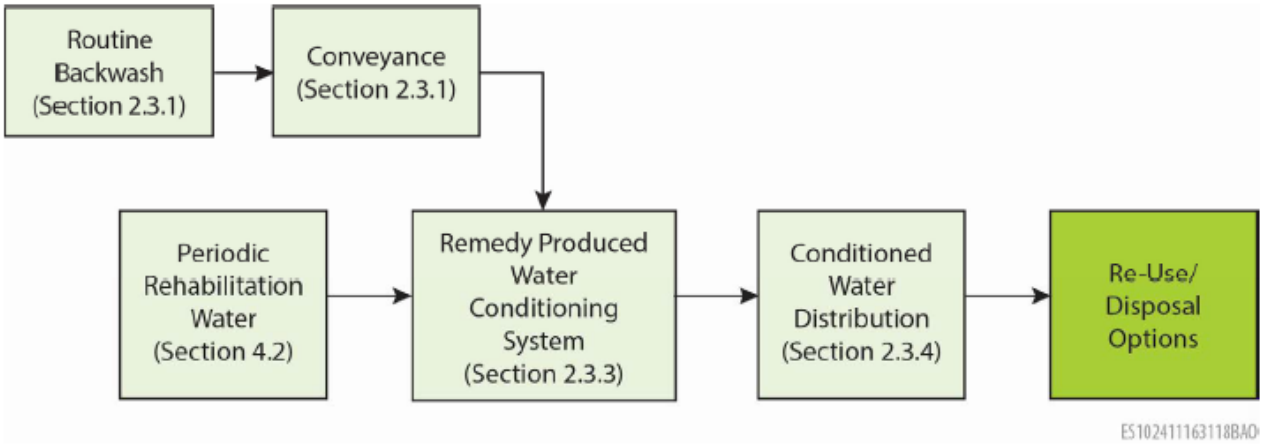


EXHIBIT 2.3-1
Remedy-produced Water Management Process Schematic
Groundwater Remedy Operation and Maintenance Manual
Volume 1: Operation and Maintenance Plan
PG&E Topock Compressor Station, Needles, California

2.3.1 Generation – Routine Automatic Backwash

Over 60 percent of the remedy-produced water is generated through automatic backwashing of injection wells. This section describes the mechanics of the automatic backwash system. Approaches to well performance monitoring and well maintenance are discussed in Section 4, Well Maintenance and Decommissioning, of this O&M Plan. Also discussed in Section 4 is the periodic well rehabilitation process that generates the first flush and second flush rehabilitation water, and the associated mechanics and logistical details for management of that water.

2.3.1.1 Purpose

The purpose of the routine maintenance that automatically generates the produced water is to maintain high well efficiency and prolong well life while minimizing disturbance and footprint associated with well maintenance.

2.3.1.2 Components

See Sections 2.1.1, 2.1.2, 2.1.3, and 2.2.3 for descriptions of components in the NTH IRZ, Inner Recirculation Loop, TCS, and Freshwater Injection Wells, respectively. The automatic backwash function in the remediation wells utilizes backwash pumps installed in the well casings. In the IRL and Freshwater Injection Wells, a two-way valve designed for both injection (recharge) and backwash (extraction) flow modes will be installed. The valve is equipped with a controller and hydraulic cylinder/pump assembly.

2.3.1.3 Process Description

The backwash pumps operate at pre-programmed intervals (initially set to a 10 minutes on/5 minutes off cycle repeated three times to complete a cleaning cycle, which is equivalent to 30 minutes total pumping time every week). The desired backwash flowrate is twice the injection rate; this rate will be adjusted as needed during operation. Produced water flows through the produced water conveyance lines to the Remedy-produced Water Conditioning Plant. Some produced water is also conveyed to the MW-20 Bench backwash frac tank (T-IRZ00-0621) before it is pumped to the Remedy-produced Water Conditioning Plant (see Section 2.3.2 below).

2.3.1.4 Control System

At pre-programmed time intervals in the NTH IRZ Injection Wells, the backwash pumps will be energized, start, and reach the desired backwash rate (initially set at twice the injection rate). Conditions for normal system operations (auto/remote mode) include water level being above the well low-level set point and water level in the backwash frac tank (T-IRZ00-0621) at the MW-20 Bench being lower than the high-level set point. Control set

points and approaches are included in Table 3.1-1. These set points may be adjusted periodically based on system operational experience.

At pre-programmed time intervals the FW-1, FW-2, and Inner Recirculation Loop Injection Wells flow control valves will open to enable the backwash pump to start and reach the desired backwash rate (initially set at twice the injection rate). Conditions for normal system operations (auto/remote mode) include water level above the well low-level set point, and water levels in the remedy-produced water influent tanks (TNK-RTP01-1101 through TNK-RTP01-1104 [see Section 2.3.3.2 below]) lower than the high-level set point. For operational flexibility, the produced water can be pumped to T-IRZ00-0621 at the MW-20 Bench or pumped directly to the influent tanks (TNK-RTP01-1101 through TNK-RTP01-1104). If T-IRZ00-0621 is used to hold the water, the water level must be below the high level set point. An actuated valve, FCV-IRZ00-0628T, enables the flow to bypass T-IRZ00-0621 or go directly to T-IRZ00-0621. Control set points and approaches are included in Table 3.1-1. These set points may be periodically adjusted based on system operational experience.

At pre-programmed time intervals in the TCS Injection Wells, the backwash pumps will be energized, start, and reach the desired backwash rate (initially set at twice the injection rate). Conditions for normal system operations (auto/remote mode) include water level above the well low-level set point and water level in the remedy-produced water influent tanks (TNK-RTP01-1101 though TNK-RTP01-1104 [see Section 2.3.3.2 below]) less than the high-level set point. Control set points and approaches are included in Table 3.1-1. These set points may be periodically adjusted based on system operational experience.

2.3.2 Conveyance of Unconditioned Remedy-produced Water

2.3.2.1 Purpose

Conveyance piping transports unconditioned backwash water from the wellheads to a main or trunk line, the backwash frac tank at the MW-20 Bench, and to the remedy-produced water influent tanks.

2.3.2.2 Components

The conveyance system consists of pipeline, air release valves, pigging stations or cleanouts, and isolation valves. Unconditioned water pipeline ranges from 2 to 6 inches in diameter, and pipe materials are HDPE.

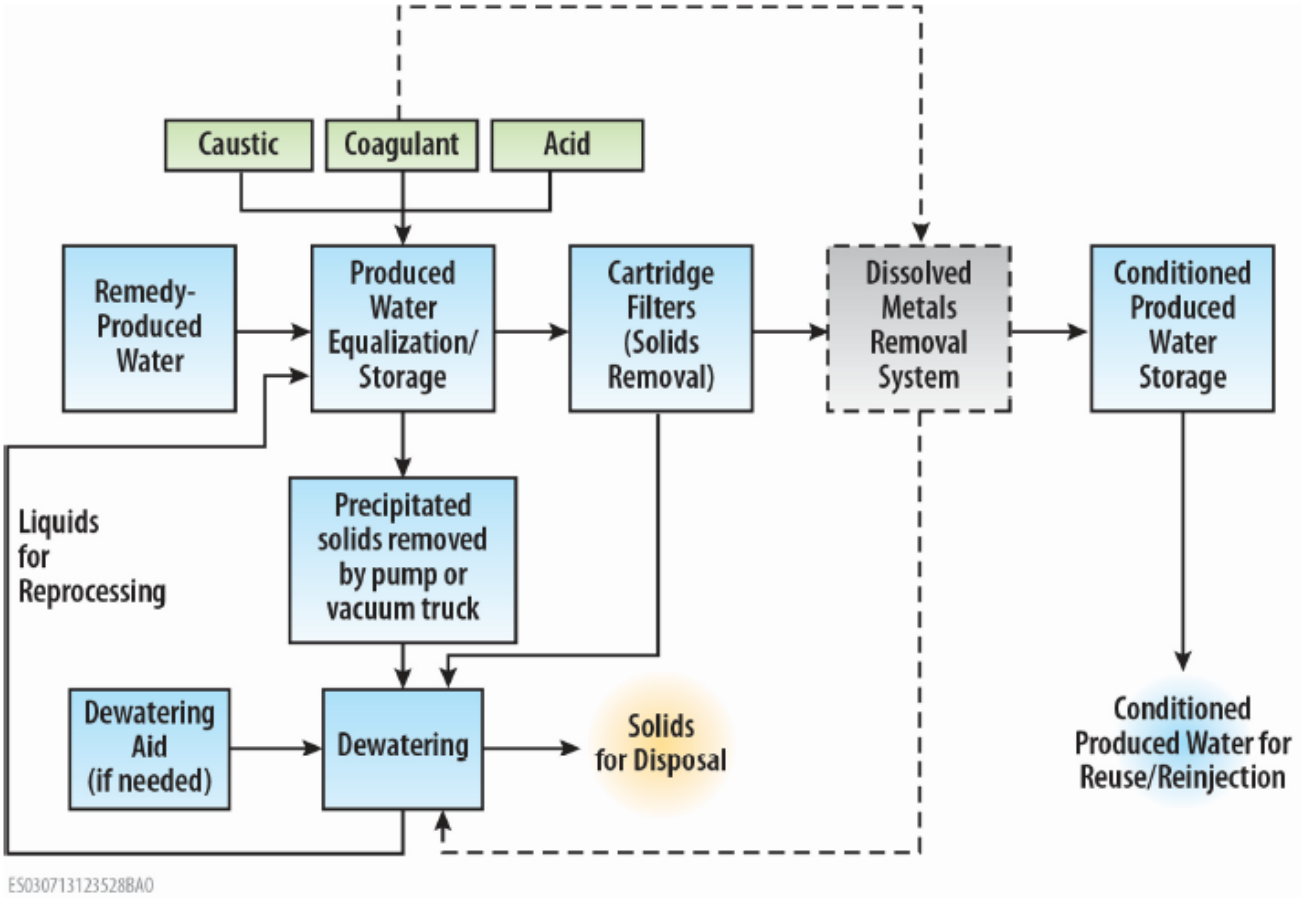
The conveyance piping for unconditioned remedy-produced water is either buried in the soil or installed in pre-cast concrete trenches. Level switches and alarms are provided at low point locations in the concrete trench to detect pipeline leaks.

2.3.2.3 Process Description

Unconditioned remedy-produced water is pumped through the conveyance piping system to the backwash storage tank (T-IRZ00-0621) at the MW-20 Bench, and four influent tanks (TNK-RTP01-1101 to TNK-RTP01-1104) at the Remedy-produced Water Conditioning Plant.

2.3.2.4 Control System

Alarm conditions include the following:



- For pipe segments with below-ground concrete trenches, the conveyance piping is equipped with a leak monitoring system with level switches and alarms installed at low points. For direct buried pipe segments, potential leaks will be monitored by measuring backwash pump discharge pressure and flow rates. In addition, annual pressure testing of these segments will be performed as routine operation. This will apply to over 60 percent of the approximate 15,000 feet of piping sections with remedy-produced water pipes.

Further information on control set points and approaches are included in Table 3.1-1. These set points may be periodically adjusted based on system operational experience.

2.3.3 Conditioning

2.3.3.1 Purpose

The conditioning system is used to treat the remedy-produced water in order to make it suitable for re-use or re-injection onsite. The conditioning system is divided into a Remedy-produced Water A-side (Remedy A-side) and a Freshwater B-side with identical process streams as shown on Exhibit 2.3-2. The A-side is designed to process potentially "dirtier" influent water, and the B-side is designed to process potentially "cleaner" influent water. This design will enable more flexibility in segregating and managing produced water streams.

Note: See O&M Volume 3 (Contingency Plan) for details on the Contingent Dissolved Metals Recovery System (DMRS)

EXHIBIT 2.3-2
Conditioning System Process Schematic
Groundwater Remedy Operation and Maintenance Manual
Volume 1: Operation and Maintenance Plan
PG&E Topock Compressor Station, Needles, California

2.3.3.2 Components

The conditioning system is located at the Compressor Station, with the majority of the equipment housed inside the Remedy-produced Water Conditioning Plant. The storage tanks for unconditioned water (i.e., influent) and conditioned water (i.e., effluent) are also located at the Compressor Station, but are outside of the conditioning plant.

The **Unconditioned Water Storage** system includes the following major components:

- Influent storage tanks
- Influent water tank farm recirculation pumps

- Eight built-in process eductors on the influent storage tanks (2 on each tank) for mixing water in the tanks by recirculation
- Caustic feed tank and pump system
- Acid feed tank and pump system
- Coagulant feed tank and pump system
- Future provisional dewatering aid supply system
- pH/conductivity meters on the recirculation piping of the influent tanks
- Turbidity meters on the recirculation piping of the influent tanks
- Solids pump
- Influent tank farm and chemical storage area sump pumps
- Pneumatic actuated valves for flow diversion on the tanks
- Level elements/transmitters for tanks
- Level switches for sumps
- Process piping, valves, and fittings

The **Conditioning** system includes the following major components:

- Filter feed pumps with variable frequency drives (VFDs)
- Duplex cartridge filters
- Liquid phase separators
- Differential pressure indicators/transmitters for each of the cartridge filters
- One flow meter on the discharge side of the Remedy A-side and Freshwater B-side duplex filters
- Liquid phase separator sump pump
- Pneumatic actuated valves for flow diversion on the filter skids
- Level switch for sump
- Process piping, valves, and fittings
- Air compressor for instrument and utility compressed air

The **Conditioned Water Storage** system includes the following major components:

- Remedy A-side conditioned water tank farm consisting of two frac tanks with secondary containment
- Freshwater B-side conditioned water storage tank
- pH/conductivity meters on the Remedy A-side conditioned water tanks' influent piping
- Turbidity meter on the Remedy A-side conditioned water tanks' influent piping
- Conditioned water tank farm sump pump
- Pneumatic actuated valves for flow diversion on the Remedy A-side conditioned water tanks
- Level elements/transmitters for tanks
- Level switches for conditioned water tank farm sump
- Process piping, valves, and fittings

2.3.3.3 Process Description

The conditioning system is divided into two identical systems:

- The "Remedy A-side" is for "dirtier" water from the IRZ and carbon-amended injection wells (both backwash and second flush rehabilitation water) and first flush rehabilitation water from all sources.
- The "Freshwater B-side" is for "cleaner" water from the injection wells receiving fresh water (both backwash and second flush rehabilitation water).

The Remedy A-side and Freshwater B-side systems will work in the same fashion and will have the capability to operate in batch or continuous modes. The operational mode for each process side may be different; however, in general, the batch mode is better suited for produced water containing more solids. Detailed SOPs for both batch and continuous operating modes are included in Appendix B of this O&M Plan.

Batch Sequence

The general conditioning sequence under batch mode begins once the influent storage tanks (TNK-RTP01-1101 through -1104) are full and is as follows:

1. Add caustic to adjust the pH (as needed)
2. Add coagulant to aid in settling solids (will be used normally for Remedy A-side produced water)
3. Add acid to adjust the pH (as needed)
4. A dewatering aid (future provisional) to assist in the dewatering of the influent tank bottoms prior to pumping to the liquid phase separators
5. Settling and pumping out solids from the tank bottom to liquid phase separators (as needed)
6. Pump the water from the tanks with the filter feed pumps through the filters and to either the Freshwater B-side Conditioned Water Storage Tank (TNK-RTP01-1410) or the Remedy A-side Conditioned Water Tank Farm (TNK-RTP01-1401 and TNK-RTP01-1402)

The influent tanks are equipped with eductors and recirculation pumps to mix the water during the first four steps in the sequence.

Continuous Mode Description

Under continuous mode, the process begins when the influent tanks are full and this initiates the filter feed pumps which convey the water from the influent storage tanks to the cartridge filters and then to either the Freshwater B-side Conditioned Water Storage Tank (TNK-RTP01-1410) or the Remedy A-side Conditioned Water Tank Farm (TNK-RTP01-1401 and TNK-RTP01-1402).

Processing Unconditioned Water

In some instances, first flush rehabilitation water may be directed from the influent tanks to the Compressor Station wastewater tank discharge connection to be discharged to the existing TCS evaporation ponds (see Section 2.7 below). This would apply in cases as determined by PG&E based on such factors as pond capacity and incoming produced water flows. The filter feed pumps will be manually activated to move the water to the Compressor Station wastewater tank discharge connection directly.

2.3.3.4 Control System

Normal operations (auto/remote mode) for the conditioning system include (1) water levels in the influent tanks are above the low-level set point, and (2) water levels in the conditioned water tanks are below the high-level set point. Control set points and approaches are included in Table 3.1-1 at the end of Section 3. These set points may be periodically adjusted based on system operational experience.

2.3.4 Conditioned Water Distribution

2.3.4.1 Purpose

Conditioned remedy-produced water will be distributed for reuse and re-injection onsite. In the event the onsite reuse/reinjection options are not available or the conditioned water fails to meet the effluent design criteria, the water will be disposed of at the TCS evaporation ponds, or trucked off site.

2.3.4.2 Components

The distribution system consists of:

- Pumps, piping, and control valves
- Truck fill station pump at the decontamination pad in TCS
- Conditioned water transfer pumps
- Additional valves and fittings

2.3.4.3 Process Description

The Remedy A-side Conditioned Water Tank Farm supplies conditioned water to the IRZ wells by pumping water across the Compressor Station to the pipelines leading to the MW-20 Bench where the pipe will enter the conditioned water frac tank, T-IRZ00-0620. The IRZ wells will be supplied from the T-IRZ00-0620 tank. As a backup measure, Remedy A-side conditioned water can also be pumped to the TCS evaporation ponds via connection to the Compressor Station wastewater tank discharge.

The Freshwater B-side Conditioned Water Storage Tank (TNK-RTP01-1410) supplies conditioned water to the MW-20 Bench conditioned water frac tank, T-IRZ00-0620, and from there to the NTH IRZ wells, which are the primary destination, by gravity flow. Freshwater B-side conditioned water can also be pumped to the TCS truck fill station under manual mode or, as a future provisional option, sent to the cooling tower makeup line.

2.3.4.4 Control System

Normal operations (auto/remote mode) are when the conditioned water tank levels are above the low-level set point, and the destination has capacity to receive the flow. The T-IRZ00-0620 tank at the MW-20 Bench will receive flow if the water level in the tank is below the high-level set point. The discharge line to the TCS evaporation ponds from the Compressor Station wastewater tank will be available to receive flow from the conditioned water tank farm if the Compressor Station wastewater tank discharge pumps are not operating and the wastewater tank level is below the high-level setpoint. Control set points and approaches are included in Table 3.1-1. These set points may be periodically adjusted based on system operational experience.

2.4 Power Supply and Distribution

At the final design stage, it is estimated that the groundwater remedy could require up to 4.3 million kilowatt-hours of electricity annually (see Appendix A, drawing E-00-33 for energy usage calculations). The primary power supply source for the remedy facilities in California will be power generated by the PG&E Topock Compressor Station. For the freshwater supply well (HNWR-1A) in Arizona, the power supply source will be power provided by Mohave Electric Cooperative. Secondary power supply can be generated from small photovoltaic solar panels at the workshop building and parking shade structure at Moabi Regional Park, and at select remote well locations. In addition, a portable, rental backup generator of similar make and model of the existing generator (Isuzu Model 6WG1X) will be mobilized onsite as needed during project implementation to provide power. The power supply for planned improvements at the TCS evaporation ponds and for the Moabi Regional Park facilities are discussed in Sections 2.7 and 2.8, respectively. An uninterruptible power supply (UPS) is also provided for key equipment such as control systems.

The primary power system will be transmitted along the pipeline corridors to serve remedy facilities located in California (including wells, aboveground buildings, etc.). Power will be supplied from the TCS at 480 VAC and will be stepped up to 12 kVAC with a 1,000 kilovolt-ampere (kVA) transformer. At each load center, a step-down transformer will return the voltage to 480 VAC 3 phase. Six load centers are currently planned with a transformer and distribution equipment at each one. The transformers at the load centers will range in size from 225 kVA to 300 kVA, and will be mounted aboveground on shallow concrete foundations. At each well or other load, a motor control panel will be installed. Voltage will also be transformed to 120 VAC, single-phase for instrumentation, lighting, and auxiliary loads. The medium voltage system will consist of electrical cable installed in conduits that are directly buried or placed in conduit in underground concrete trenches. While the National Electrical Safety Code (NESC) requires burial depths of 30 inches for medium voltage, the final design includes a minimum depth of 36 inches for buried medium voltage power. If required to avoid conflict(s) with other utilities, power conduits may have to go deeper; typical vertical separations from pipes could be 6 to 12 inches. For low voltage (up to 480 volts), the minimum depth is 18 inches for buried power (for details on depths, see engineering drawings in Appendix D to the BOD Report). Lightning protection systems and equipment will be provided for all buildings and major structures. All electrical systems and equipment will be grounded.

2.5 Remedy SCADA

A SCADA system will be installed for controlling and monitoring the remedy. The Remedy SCADA (software, servers, and personal computer operator terminals) will be located inside the Operations Building at the Transwestern Bench. From the OITs (and possibly mobile tablets), it will be possible to initiate operation of all pumps, monitor all system status and alarm data, change control set points, and perform all remote control functions. The main components of the SCADA system include the following:

- OIT or HMI devices that present process data to a human operator, and through which the human operator monitors and controls the process
- A supervisory (computer software) system that gathers (acquires) data on the process and sends commands (control) to the process
- Remote terminal units (RTUs) that are connected to sensors in the process, converting sensor signals to digital data and sending digital data to the supervisory system
- Programmable logic controllers (PLCs) (also called digital controllers) will be used as field devices because they are more economical, versatile, flexible, and configurable than special-purpose RTUs, or can be used in a supervisory control function
- Communication infrastructure connecting the supervisory system to the to the PLCs and then from PLCs to their respective RTUs
- Various process and analytical instrumentation (e.g., flow, pH, and conductivity measurement)

The Remedy SCADA system will communicate with numerous digital controllers organized into six nodes (see below) and PLCs for the freshwater supply well(s) in Arizona. These devices will provide local control of one or more pieces of process equipment or process/ mechanical systems. The data from the digital controllers will be displayed on the OITs/HMIs. The digital controllers will monitor their associated equipment or well status and associated instrumentation, including limit switches, flow rates, pressures, well water levels, etc. The information from wells will be transmitted back to the main control station using wires, fiber-optic communications, radio transmission or other wireless communication methods (e.g., information from freshwater supply well[s] in Arizona; select monitoring wells in the floodplain/along the NTH IRZ, near the TCS, and in the East Ravine as necessary; and the equipment at the TCS ponds will be transmitted via radio to the PG&E Station PLC and from the Station PLC network to the Remedy SCADA). Various other systems including carbon substrate amendment storage and dosing as well as the remedy-produced water conditioning process will be monitored and will have local process control capabilities at the equipment location(s), as well as being remotely controllable from the Operations Building. The Remedy SCADA will communicate to the TCS Facilities via the PG&E Station PLC network (e.g., receive permission to discharge remedy-produced or conditioned water to the TCS evaporation ponds). The control nodes will have a PLC and an OIT for operators to monitor and control system equipment. The 6 nodes are as follows:

- Node 1 – Transwestern Bench facilities, and wells TWB-1, TWB-2, IRZ-38 to IRZ-40, ER-1 to ER-4, and ER-6 (and future provisional TWB-3, TWB-4, ER-5, and ER-7 to ER-11).
- Node 2 – Wells IRZ-29 to IRZ-37, RB-3 through RB-5 (and future provisional RB-6 and RB-7).
- Node 3 – MW-20 Bench Facilities and wells IRZ-16 to IRZ-28.
- Node 4 – Wells IRZ-1 to IRZ-15, RB-1, and RB-2 (and future provisional RB-8 and RB-9).
- Node 5 – Wells IRL-1 to IRL-4, and FW-1 (and future provisional IRL-5 and IRL-7).
- Node 99 – Remedy Produced Water Conditioning Facilities and wells FW-2, TCS-1, and TCS-2 (and future provisional well IRL-6, contingency Freshwater Injection Pre-Treatment System and Dissolved Metals Removal

System), as well as remote site radio for the freshwater PLCs located in Arizona and select remote monitoring wells.

The Remedy will have security equipment such as cameras, intrusion alarms, and card readers at remote facilities. The Remedy SCADA will monitor the security equipment via an interface at the Operations Building. This information will be communicated to PG&E's utility data network to be monitored by PG&E's security center.

2.6 Institutional Controls

ICs are legal and administrative mechanisms adopted to limit or prohibit activities on specified property that could interfere with the integrity of the remedy or compromise the continued protection of human health and the environment. There are two categories of ICs:

- **Category 1 ICs – The objective of these ICs is to prevent the use of groundwater and to protect the hydraulic integrity of the remedy.** This objective will be met by prohibiting the installation of new groundwater wells in specified areas for purposes other than site investigation and remediation activities as directed by the California Department of Toxic Substances Control (DTSC) and the U.S. Department of the Interior (DOI).
- **Category 2 ICs - The objective of these ICs is to protect the integrity of the physical elements of the remedy and to ensure access for construction and O&M.** This objective will be met by restricting future development and surface uses of the land in specified areas that could compromise the integrity of the remedial facilities or otherwise interfere with the construction and operation of the facilities and the ability for PG&E to construct, monitor, operate, and maintain the remedy.

Figure 2.6-1 at the end of this section shows the proposed area for which to apply Category 1 ICs, unless a Category 1 IC is determined to not be necessary by DTSC and DOI, as of the final design stage. As for Category 2 ICs, PG&E is the process of obtaining access agreements and other approvals/ permits/agreements with the appropriate agencies and landowners (see Section 5 of the Final BOD for details). PG&E is working towards obtaining all non-federal access agreements within 30 days of DTSC's approval of the Final Design and C/RAWP and within 90 days of DOI's request for such access agreements, consistent with the timing requirements in the Corrective Action Consent Agreement between PG&E and DTSC (DTSC 1996) and the Consent Decree (CD) between PG&E and the United States, on behalf of DOI (DOI 2013).

2.7 Improvements at TCS Evaporation Ponds

One of the management options identified for remedy-produced water is disposal at the existing TCS evaporation ponds (other options include injection into the IRZ wells, re-use in cooling towers, and off-site disposal). Water accumulated in the ponds will evaporate over time. In the event that the ponds are full (i.e., water level in the ponds reaches the maximum level allowed by the Colorado River Basin Regional Water Quality Control Board [RWQCB]), water can also be trucked off-site via the truck loading station at the ponds. The preferred method of water disposal is evaporation; therefore, a new drip system and agitators will be installed to enhance evaporation at the ponds. An automated system for maximizing pond surface area will be installed.

By design, discharge to the TCS evaporation ponds is and will continue to be fully contained, thereby designed to prevent any leaks. In layers (from top to bottom), each pond has a new 60-mil HDPE top liner; the original 60-mil HDPE primary liner (with repairs); a leachate collection and removal system (LCRS); and a secondary 40-mil HDPE liner underlain by 2 feet of low-permeability clay.

The LCRS functions as an early warning system to prevent leaks by enabling a determination of whether the top liner system has been compromised, prior to a potential release of pond water to the environment. In addition, in the area immediately adjacent to the TCS ponds, lysimeters were installed underneath the clay base, and seven groundwater monitoring wells were installed to detect leaks. The groundwater and vadose zone monitoring systems are sufficient to allow detection of potential releases at the earliest possible time or before discharge reaches groundwater (groundwater is between approximately 160 and 190 feet below the bottoms of the ponds).

2.7.1 Purpose

The existing evaporation ponds are used by the TCS to store and evaporate non-hazardous waste water discharged from the Compressor Station. The groundwater remedy will increase the load on the ponds beyond their current capacity under some circumstances. As such, the evaporation rate must be increased in order to accommodate the addition of remedy-produced water to the ponds.

In addition, the ability to pump pond water to tanker trucks for transport off site will be improved by the installation of secondary containment for water transfer equipment and a truck staging area.

2.7.1.1 Components

The layout of the evaporation enhancement equipment is shown in Exhibit 2.7-1. Remedy-produced water will be discharged to the ponds through the existing conveyance pipeline. Existing ponds number 3 and 4 will be equipped with new drip systems and agitators to increase the evaporation rate. Cameras will be installed to allow for remote monitoring of the pond level and system to ensure proper operation. New valves will be placed on the discharge points to the ponds to remotely control filling. The operation of these new automatic valves will be automatically controlled to maximize pond surface area. The system equipment includes:

- Electrical submersible pumps
- Pontoon platforms
- HDPE pipe
- Electric generator and control panel
- Electrical cabling
- Discharge actuator valves
- Conductivity meter
- Liquid level sensor
- Camera and transmitter
- Local H-O-A switch
- Mechanical agitator/drip line
- Electrical outlets to supply power for temporary pumps as needed for balancing pond levels
- Secondary containment for water transfer equipment and truck staging area

The recirculation and transfer pumps at the TCS evaporation ponds will be powered by a new natural gas-fueled reciprocating internal combustion engine (RICE) electrical power generator housed in a new enclosed utility building located within the TCS evaporation ponds fence line. Auxiliary equipment planned for installation at the TCS evaporation ponds (e.g., lighting, controls, sensors, security cameras, and valve actuators) will be supplied with 24-volt direct current (VDC) power by new thermoelectric generators (TEGs) installed in a secure fenced area adjacent to the new utility building. A transfer switch will provide for the flexibility of supplying power to the auxiliary equipment from the RICE.

Natural gas for the new generators will be piped from PG&E's natural gas Line 300B (Exhibit 2.7-1). A natural gas regulator set and isolation valves will be installed in the same secure fenced area as the TEGs, with flexible connections to both generators. Power will be transmitted via electrical cable installed in underground conduit running from the utility building and TEGs to each load.

2.7.1.2 Process Description

Remedy-produced water will be discharged to the existing evaporation ponds via the existing conveyance pipeline. Each pond will have an electronically controlled actuator valve to control which pond receives water. Pond water will be pumped from a sump in the bottom of the pontoon platform to the upper perimeter of the pond via HDPE pipe, which runs along the north- and east-facing walls of the ponds. Water runs down the pond walls through perforations in the pipe.

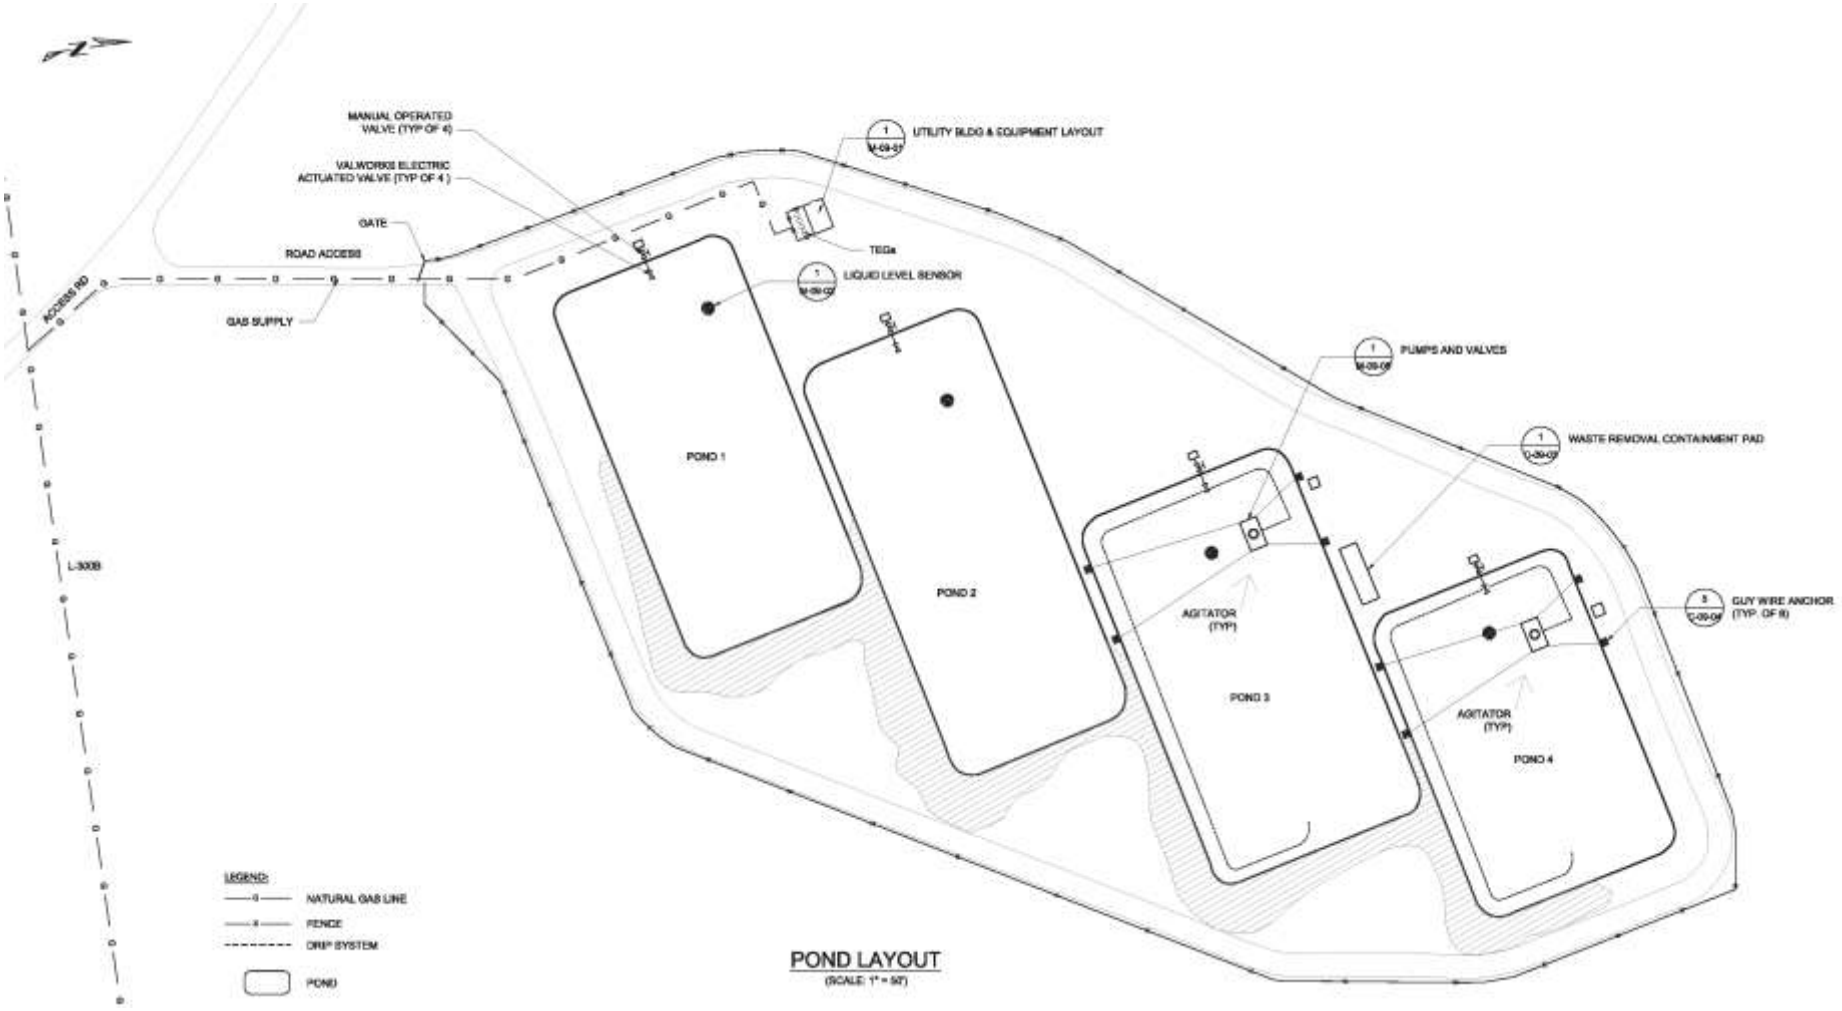


EXHIBIT 2.7-1
Layout of Evaporation Enhancement Equipment at TCS Evaporation Ponds
Groundwater Remedy Operation and Maintenance Manual
Volume 1: Operation and Maintenance Plan
PG&E Topock Compressor Station, Needles, California

2.7.1.3 Control System

The drip system will be activated automatically when pond levels exceed the programmed set points. Levels are monitored by liquid level sensors, and alarms (silent type) are initiated by liquid level detectors at the freeboard markers. The programmed set points will be periodically adjusted based on system operational experience.

2.8 Long-Term Remedy Support Area at Moabi Regional Park

Moabi Regional Park is located approximately 1.5 miles northwest of the TCS site and is accessible via Park Moabi Road and National Trails Highway. A portion of the northwest area of Moabi Regional Park will be used for long-term O&M support functions, including on-site sample processing, and equipment and vehicle storage, decontamination, and maintenance.

Structures in the long-term remedy support area will include: the PG&E office trailer, serving as PG&E's primary office and meeting space for long-term O&M management; the workshop building (including a sample processing area, maintenance bay, and tech shop); a decontamination pad; and a parking shade structure. Utilities will be provided to these structures as follows:

- **Electrical Power** – The primary power supply will be provided by the City of Needles via underground feed from a nearby utility pole to a transformer located on the utility pad in the northeast portion of the yard. Backup power will be provided via an on-site diesel generator (Kohler Power Systems 200REOZJF) with an integral, double-walled fuel tank. The electrical meter, associated switchgear, and distribution panel board will be housed in an equipment rack located on the utility pad. Power will be supplied as 3-phase 208 VAC.

  Photovoltaic solar panels mounted on the parking shade structure and workshop building will also provide power to the long-term remedy support facilities.

- **Potable Water** – The potable water system for the long-term remedy support area will consist of two 5,000-gallon polyethylene tanks connected in series to a skid-mounted booster pump system and pressure (bladder) tank located on the utility pad. Potable water will be trucked to the tanks from an offsite source. Buried HDPE or polyvinyl chloride (PVC) pipe routed from the pressure tank outlet will supply water to the PG&E office trailer, workshop building, decontamination pad hydrants, and other yard hydrants.

- **Sewer and Wastewater** – Sewage generated from the Moabi Regional Park long-term remedy support area will be collected in two 10,000-gallon buried fiberglass-reinforced plastic tanks, connected in parallel, via connections to the PG&E office trailer and workshop building (restrooms and shop sink). The tanks will be emptied and removed sewage hauled off site as needed.

  Wastewater collected from the decontamination pad and sample processing area sinks in the workshop building will be segregated for disposal. This wastewater will be transferred (via underground pipe via gravity flow) to a separate, double-contained 1,000-gallon decontamination water storage tank located below grade near the utility area. Water from the decontamination water storage tank will be trucked to the appropriate location for management as described in Section 3.8.

- **Fire Protection** – As a conservative safety measure, fire sprinklers will be installed in the workshop building. The PG&E office trailer will also be equipped with sprinklers. A booster pump and 15,000-gallon water storage tank located on the utility pad will provide fire suppression water for the sprinkler system. The fire protection system will be designed to provide 1,500 gallons per minute of flow for a duration of 10 minutes.

- **Telecommunications** – Telecommunications services will be available from Frontier Communications and will be brought in with the electrical line (i.e., via underground feed from the nearby utility pole to a telecommunications panel located on the utility pad).

Currently, the potable water, sewer, and fire protection systems are designed as standalone systems. However, PG&E will continue to coordinate with San Bernardino County regarding potential future connection to the Moabi Regional Park water, sewer, and fire water systems.

Notes:

Gray Italics denote future provisional wells.

gpm = gallons per minute

[a] Number of wells, total screen intervals, and screen depth placement at each well location ID are for purposes of the final (100%) design submittal and may be modified during installation. One well location ID may consist of multiple wells or screens, and one well screen interval may include more than one model layer. A maximum of two discrete screen intervals will be included per individual well. Dual screen wells will consist of one well with two discreet screen intervals separated by a packer. Some well location IDs include two dual screen wells which will be installed in separate boreholes.

[b] Wells are constructed with a dedicated pump for each well screen with the intervals separated using a pneumatic packer.

[c] Individual well minimum and maximum flow rates are provided herein. However, the total aggregate extraction/injection flow rates are limited to 200 gpm at minimum flows and 400 gpm at maximum flows.

[d] Extraction well design and operation will target extraction of groundwater from all four model layers without being screened across all layers.

[e] Coordinates listed are North American Datum 1983 State Plane Ground Coordinates, Zone 5 (NAD1983, State Plane, California, V, FIPS, 0405) rounded to the nearest 0.1 foot. Coordinates are for purposes of the final (100%) design submittal and may be modified during installation.

Notes:

Gray Italics denote future provisional wells.

gpm = gallons per minute

[a] Number of wells, total screen intervals, and screen depth placement at each well location ID are for purposes of the final (100%) design submittal and may be modified during installation.

[b] The final nominal scenario assumes IRL-1 and IRL-2 will receive River Bank Extraction Well water (carbon-amended if Cr[VI] concentrations in the River Bank Extraction Wells exceed the clean-up goal); and IRL-3 and IRL-4 will receive fresh water. However, injection wells IRL-1 through IRL-4 (and future provisional wells IRL-5 through IRL-7, if constructed) will be constructed for flexibility to inject either/both fresh water or/and River Bank Extraction Well water during the lifetime of the remedy. IRL-1 and IRL-2 will be installed as dual-screen wells with the shallow screen (upper one-third of the saturated interval) separated from the deep screen (lower two-thirds of the saturated interval) with a pneumatic packer. The final nominal scenario assumes injection of River Bank Extraction Well water into the deep screen only at IRL-1 and IRL-2. IRL-3 and IRL-4 will be installed with both a shallow screen (upper two-thirds of the saturated interval) and deep screen (lower one-third of the saturated interval). IRL-3 and IRL-4 are designed to accommodate a pneumatic packer for potential future isolation of the shallow and deep screened intervals; however, under the final nominal scenario, only fresh water will be injected into IRL-3 and IRL-4 and the shallow and deep screens in these wells will not be isolated.

[c] Individual extraction well minimum and maximum flow rates are provided herein. However, the minimum and maximum aggregate flow rates from the entire extraction well network are estimated to be 0 gpm and 500 gpm, respectively.

[d] Injection flow rate includes 300 gpm of fresh water for the nominal flow, up to 150 gpm of fresh water for the minimum flow, and up to 900 gpm of fresh water for the maximum flow, as needed.

[e] Individual injection well minimum and maximum flow rates are provided herein. However, the minimum and maximum aggregate flow rates for the entire injection well network are estimated to be 150 gpm and 900 gpm, respectively.

[f] Future provisional well IRL-6 or IRL-7 may alternatively be considered as an extraction well with extracted groundwater re-injected into other Inner Recirculation Loop Injection Wells.

[g] River Bank Extraction Wells will be installed with a second shallow screen interval for potential future use which will be isolated from the deeper screen interval with a pneumatic packer.

[h] Coordinates listed are North American Datum 1983 State Plane Ground Coordinates, Zone 5 (NAD1983, State Plane, California, V, FIPS, 0405) rounded to the nearest 0.1 foot. Coordinates are for purposes of the final (100%) design submittal and may be modified during installation.

Notes:
Gray Italics denote future provisional wells.
gpm = gallons per minute
[a] Number of wells, total screen intervals, and screen depth placement at each well location ID are for purposes of the final (100%) design submittal and may be modified during installation. One well location ID may consist of multiple screens, and one well screen interval may include more than one model layer. A maximum of two discrete screen intervals will be included per individual well. Dual screen wells will consist of one well with two discrete screen intervals separated by a packer.

Well Location ID[a]	Final Injection/Extraction Rate per Model Layer (gpm)			Final Well Screen Length (feet)	Model Layer Saturated Thickness (feet)	Final Well Depiction	Final Well Count	Final Future Provisional Well Count	Final Well Coordinates[e]	
	Nominal	Minimum	Maximum						Nominal	Minimum

[b] East Ravine Extraction Wells are not expected to produce significant water, and automated pump cycling will be required.

[c] Individual well minimum and maximum flow rates are provided herein. However, the total aggregate minimum and maximum extraction/injection flow rates are limited to 10 gpm and 75 gpm, respectively.

[d] Extraction well design and operation will target extraction of groundwater from all four model layers without being screened across all layers.

[e] Coordinates listed are North American Datum 1983 State Plane Ground Coordinates, Zone 5 (NAD1983, State Plane, California, V, FIPS, 0405) rounded to the nearest 0.1 foot. Coordinates are for purposes of the final (100%) design submittal and may be modified during installation.

SECTION 3

Operation and Maintenance Procedures

This section describes the operating features of the in-situ remediation systems components, associated start-up and normal operating procedures, and the alarms that are part of the system operation. Lists of pertinent SOPs and equipment O&M manuals are provided below for the in-situ remediation systems (Section 3.1.6), the freshwater supply system (Section 3.2), the remedy-produced water conditioning system (Section 3.3), the power distribution system (Section 3.4), and the Remedy SCADA system (Section 3.5). Detailed SOPs and select equipment manuals are provided in Appendices B and C of this volume, respectively.

For the reader's convenience, select P&IDs have been included in Appendix A of this volume. All P&IDs can be found in Appendix D (Engineering Drawings) of the BOD Report.

Changes will occur during the decades-long operation of the remedy, which may necessitate the update of select portions of this O&M Plan. Material changes to the O&M procedures/SOPs will be reported in the quarterly progress reports. Operations staff will have the latest Standard Operating Procedures (SOPs) on file at the site. For administrative changes to the SOPs, such as changes in point of contact information, a log of changes will be maintained by PG&E. For efficiency, administrative changes will be bundled and/or opportunistically combined with O&M Plan updates to incorporate material changes. Current SOPs and change logs will be made available on a SharePoint site for reference by agencies, stakeholders, and Tribes. The need for and the timing/frequency of updating this O&M Plan will be discussed with the agencies as remedy start-up and operation progresses.

3.1 In-situ Remediation

3.1.1 Groundwater Extraction and Recirculation

3.1.1.1 NTH IRZ Extraction and Recirculation

Groundwater is extracted from the screened area(s) of NTH IRZ Extraction Wells IRZ-1,-5,-9 and -23 (IRZ-40 is designated as a provisional extraction well) using dedicated extraction well pumps. Extracted groundwater is conveyed through an appropriately sized drop pipe inside the well casing to a 2-inch conveyance line inside each well vault. The 2-inch line from each extraction well is tied into a single 6-inch groundwater forcemain, which is routed below-grade to the MW-20 Bench. Each extraction well is equipped with a check valve integral to the pump, and a pressure transducer (see Drawings I-04-01 and I-04-02 in Appendix A). Each well vault includes a globe valve, check valve, level switch, sample port and pressure indicator assembly, and flow meter (Drawings I-04-01 and I-04-02). Water is conveyed to the Carbon Amendment Building on the MW-20 Bench where carbon substrate is injected into the groundwater conveyance lines. From the MW-20 Bench, the groundwater forcemain will extend to the northern and southern ends of the NTH IRZ and will convey the carbon-amended extracted water to the NTH IRZ Injection Wells. At the injection well valve/meter vaults, the groundwater forcemain connects to smaller diameter injection well piping, is metered, throttled with valves, and injected into the aquifer.

Initially, the NTH IRZ Injection and Extraction Wells will be operated to target flow rates as specified in Table 2.1-1. However, actual flow rates may vary in the field. As system operations begin, well capacities and achievable flow rates will be evaluated. Injection and extraction flow rates will be balanced to optimize the rates across the system. Groundwater monitoring data, including water level data and analytical data, will be collected to evaluate the performance of the system and to make further adjustments to the injection and/or extraction flow rates as outlined in the Sampling and Monitoring Plan in Volume 2 of this O&M Manual. In addition, injection and extraction well performance will be evaluated over time to ensure well performance and guide the frequency of backwashing and well rehabilitation procedures, as outlined in Section 4. Additional adjustments to the balance of flow rates throughout the system may be needed as well performance changes over time.

3.1.1.2 Inner Recirculation Loop Extraction and Recirculation

Groundwater is extracted from the screened area of River Bank Extraction Wells RB-1 through RB-5 using a dedicated extraction well pump. Extracted groundwater is conveyed through an appropriately sized drop pipe

inside the well casing to a 2-inch conveyance line inside each well vault. The 2-inch line from each River Bank Extraction Well is tied into a single 6-inch groundwater forcemain, which is routed below-grade to the MW-20 Bench. Each extraction well is equipped with a check valve integral to the pump, and a pressure transducer (see Drawing I-05-01 in Appendix A). Each well vault includes a ball valve, check valve, level switch, sample port and pressure indicator assembly, and flow meter (Drawing I-05-01). Water is conveyed to the Carbon Amendment Building at the MW-20 Bench where carbon substrate is injected into the groundwater conveyance lines, when required. From the MW-20 Bench, the Inner Recirculation Loop forcemain will convey the water extracted by the River Bank Extraction Wells to the Inner Recirculation Loop Injection Wells. At the injection well valve/meter vaults, the Inner Recirculation Loop and/or freshwater forcemains connect to the smaller diameter injection well piping, allowing for either the extracted river bank water (with or without carbon amendment) or fresh water to be injected into the Inner Recirculation Loop Injection Wells. Metering equipment, check valves, and flow control valves in the injection well valve/meter vaults allow for control of each of the potential water sources to be injected. As discussed previously in Section 2.1.2.2, the nominal scenario includes injection of extracted river bank water into the deep screened interval at IRL-1 and IRL-2 (lower two-thirds of the saturated interval) and injection of fresh water into the entire screened interval at IRL-3 and IRL-4. Groundwater captured by the River Bank Extraction Wells will not be injected at IRL-3 or IRL-4 without pre-approval from the agencies. Similar to the NTH IRZ, flow rates will initially be targeted to match the design flow rates specified in Table 2.1-2. Actual flow rates will be adjusted based on achievable flow rates and adjusted as process control data are collected and evaluated according to the plan presented in Volume 2 of this O&M Manual, and as well performance is evaluated according to the plan presented in Section 4 below.

3.1.1.3 TCS Recirculation Loop Extraction and Recirculation

Groundwater is extracted from the screened area of Transwestern Bench Extraction Wells TWB-1 and TWB-2 and East Ravine Extraction Wells ER-1 through ER-4 and ER-6 using dedicated extraction well pumps. Extracted groundwater is conveyed through an appropriately sized drop pipe inside the well casing to a 2-inch conveyance line inside each well vault. The 2-inch line from each TCS Recirculation Loop extraction well is tied into a single 3-inch groundwater forcemain, which is routed below-grade to the MW-20 Bench. Each extraction well is equipped with a check valve after the pump and a pressure transducer (see Drawings I-03-01 and I-03-02 in Appendix A). Each well vault includes a globe valve, check valve, level switch, sample port and pressure indicator assembly, and flow meter (Drawings I-03-01 and I-03-02). Water is conveyed to the MW-20 Bench where carbon substrate can be injected into the groundwater conveyance lines.

Groundwater leaving the MW-20 Bench will be routed through a forcemain to the TCS Injection Wells (TCS-01 and -02) located in the TCS area. The TCS Injection Well valve/meter vaults will include metering and throttling equipment consistent with the other injection well valve/meter vaults described above. Similar to the NTH IRZ, flow rates will initially be targeted to match the design flow rates specified in Table 2.1-3. Actual flow rates will be adjusted based on achievable flow rates and adjusted as process control data are collected and evaluated according to the plan presented in Volume 2 of this O&M Manual, and as well performance is evaluated according to the plan presented in Section 4.

3.1.1.4 Recirculation Start-up Procedures

The circulation of groundwater may be interrupted during scheduled maintenance periods due to an alarm designated for system shutdown, or during non-operational periods designed into the remedial strategy. When the recirculation of groundwater is restarted after any of these events, a series of actions will be undertaken. The Remedy SCADA system will be consulted to verify that all critical alarms have been cleared and reset prior to any groundwater extraction pumps and actuated valves opening. Extraction pumps and actuated valves must also be in the ”auto” control mode, allowing for the PLC-contained programming logic to shut down each piece of equipment in the event of another alarm notification. If all conditions have been met, the system will start operation by opening actuated valves controlling flow into the injection wells and energizing the groundwater extraction pumps. Flow rates and pressures will be monitored across the system to verify successful start-up and flow balancing at all operating wells.

3.1.2 Carbon Substrate Storage and Deliveries

The carbon substrate amendment facilities include a Carbon Amendment Building located at the MW-20 Bench. This location has a main tank for carbon substrate storage, carbon substrate pumps, and actuated valves to control the distribution of carbon substrate to the groundwater recirculation system.

At the MW-20 Bench carbon substrate is stored in the Carbon Substrate Tank T-IRZ00-0601 (see Drawing I-06-02 in Appendix A). The carbon substrate is received via tanker truck at the facility, and the Carbon Substrate Tank is filled via a fill port fitted with a lockable valve. Operations personnel will be present during all chemical transfer activities and will verify the liquid level (using LE/LT-IRZ00-0652) in the tank prior to beginning the filling operation. Each Carbon Substrate Tank is equipped with integral secondary containment, including leak detection within the containment (LSH-IRZ00-0651), integral thermal insulation per Steel Tank Institute (STI) Standard F941 for a thermally insulated aboveground storage tank (AST), overfill protection (V-IRZ00-0601C), pressure/vacuum relief valve to prevent pressure/vacuum fluctuations (V-IRZ00-0601D and V-IRZ00-0601E), temperature sensor, flame arrestor, and a liquid level measurement device (LE/LT-IRZ00-0652). A liquid level sensor (LE/LT-IRZ00-0652) monitors the carbon substrate level within Carbon Substrate Tank T-IRZ00-0601 and generates an alarm, as necessary, at the Remedy SCADA system based on the measured level within the tank.

Instrumentation control set points and approaches for carbon substrate storage are summarized in Table 3.1-1. These set points may be adjusted based on system operational experience.

3.1.3 Carbon Substrate Amendment

The amendment sequencing event is automated by the Remedy SCADA system by turning the appropriate H-O-A switches to Auto. The target carbon load will be based on the extracted groundwater flow rate of each individual well and the target in-situ carbon concentration. As detailed in the Sampling and Monitoring Plan in Volume 2 of this O&M Manual, carbon substrate amendment concentrations, frequency, and duration will be adjusted based on analytical groundwater data and injection well performance data. The injected concentration is the main dosing control that will be adjusted to improve distribution. Frequency may also need to be adjusted to maintain injection capacity. The duration of the injection will be adjusted to control the total amount of ethanol being injected. Carbon substrate is pumped from the Carbon Substrate Tank T-IRZ00-0601 to the groundwater extraction header piping within the MW-20 Bench building using Carbon Substrate Pumps PMP-IRZ00-0640, PMP-IRZ00-0641, and PMP-IRZ00-0642 (see Drawing I-06-02 in Appendix A). Carbon substrate is amended into the groundwater recirculation conveyance lines within the MW-20 Bench building. The carbon-amended groundwater is then conveyed to the Inner Recirculation Loop, NTH IRZ, and TCS Injection Wells.

At the MW-20 Bench, a 1.5-inch diameter distribution line runs from the Carbon Substrate Tank (T-IRZ00-0601) to the pump manifold, where the line is split, reduced to 1-inch line, and connected to the suction side of each of the Carbon Substrate Pumps (PMP-IRZ00-0640, PMP-IRZ00-0641, and PMP-IRZ00-0642). The pumps discharge into a common 2-inch line that injects the substrate into one of four forcemains, including the Inner Recirculation Loop, North NTH IRZ, South NTH IRZ, and TCS Injection forcemains (see Drawings I-06-01 and I-06-02 in Appendix A).

The dosing of carbon substrate into the groundwater forcemains can be continuous or intermittent and is controlled by actuated valves (FCV-IRZ00-0615, FCV-IRZ00-0616, FCV-IRZ00-0617, or FCV-IRZ00-0618) operated by a timer. Carbon substrate is dosed into one or multiple forcemains at a time. An individual flow meter FM-IRZ00-0671, FM-IRZ00-0675, FM-IRZ00-0676, and FM-IRZ00-0681, located on the injection line prior to the individual forcemains, measures the total quantity of carbon substrate injected into each forcemain. Similarly, there are flow meters (FM-IRZ00-0672, FM-IRZ00-0673, FM-IRZ00-0674, and FM-IRZ00-0680) on each forcemain prior to the injection of carbon substrate, to measure total flow from the extraction wells. Each extraction well is equipped with a flow meter (FM-*0370A, FM-*0371A, FM-*0470A, FM-*0471A/B, FM-*0570A). Finally, each injection well is equipped with a flow meter (FM-*0372A/B, FM-*0472A, FM-*0473A/B, FM-*0474A/B, FM-*0475A/B, FM-*0571A, FM-*0572C) to measure the totalized flow of groundwater or carbon-amended groundwater into the injection well. The flow meters and totalizers in the injection wells are used to calculate the total quantity of groundwater and carbon-amended groundwater injected into the wells.

Between carbon substrate injection cycles, groundwater is continuously recirculated from the extraction wells to the groundwater recirculation lines within the MW-20 Bench building, and then to the injection wells via the forcemain lines. Check valves (V-*0303F, V-*0304J, V-*0403D, V-*0407H, V-*0407G, V-*0413D, V-*0413G, V-*0418C, V-*0418F) in each injection well prevent groundwater from backing up into the carbon substrate distribution lines. Each individual mechanical component is not shown or numbered on the drawings at each well; rather, a typical arrangement is shown. A well schedule is included as Drawing I-00-03 in Appendix A.

The following provides a brief description of the process control valves that are related to the carbon substrate distribution system. Instrumentation control approaches for the carbon substrate distribution system are also summarized in Table 3.1-1.

MW-20 Bench Valves

1. Manual Valves. The orientation (open or closed) of the following valves should be confirmed prior to operation as specified:
    - V-IRZ00-0603A and V-IRZ00-0603F should be open in line with Pump PMP-IRZ00-0640.
    - V-IRZ00-0603G and V-IRZ00-0603L should be open in line with Pump PMP-IRZ00-0641.
    - V-IRZ00-0603M and V-IRZ00-0603S should be open in line with Pump PMP-IRZ00-0642.
    - V-IRZ00-0603T should be open in manifold line to the injection points.
    - V-IRZ00-0603V, V-IRZ00-0603X, V-IRZ00-0603Z, and V-IRZ00-0604K should be open at the individual injection points.
    - V-IRZ00-0608A, V-IRZ00-0608B, and V-IRZ00-0608D on the River Bank Extraction Well Network Line should be open.
    - V-IRZ00-0609A on the IRZ-23 Extraction Well line should be open.
    - V-IRZ00-0609B on the Northern NTH IRZ Extraction Well Network Line should be open.
    - V-IRZ00-0609L and V-IRZ00-0610L on the TCS Extraction Well Network Line should be open.
    - V-IRZ00-0609C and V-IRZ00-0609H on the North NTH IRZ Injection Header line should be open.
    - V-IRZ00-0609D and V-IRZ00-0609K on the South NTH IRZ Injection Header line should be open.
    - During normal operation V-IRZ00-0604B, V-IRZ00-0604D, V-IRZ00-0604F, V-IRZ00-0604M, V-IRZ00-0610A, V-IRZ00-0610C, V-IRZ00-0610E, V-IRZ00-0610F, and V-IRZ00-0610G are to be closed. These valves are for the Clean-In-Place system or the Well Maintenance Reagent injection procedure.
    - Valve V-IRZ00-0610G should remain closed at all times; this valve is to be used for future operation.
    - In the extraction well vaults, valves V-*301D, V-*302D, V-*0401D, V-*0402D, V-*0402H, and V-*501D should be open.
    - All sample port collection valves should remain closed until sample collection is required.
    - In the injection well vaults, the diaphragm valves (V-*0303B, V-*0304G, V-*0403B, V-*0407B, V-*0407E, V-*0413B, V-*0413E, V-*0418A, and V-*0418D) are to be manually adjusted to approximate the proper flow.
    - V-*0518 should be adjusted to the appropriate pressure regulating set point.
2. Actuated Flow Control Valves. The following valves are considered critical to the distribution of carbon substrate, and therefore proper actuation of these valves should be checked during startup.
    - FV-IRZ00-0611 located downstream of Carbon Substrate Tank T-IRZ00-0601 (carbon substrate forcemain) should be open during an injection sequence.

- FCV-IRZ00-0612 downstream of Carbon Substrate Pump PMP-IRZ00-0640 should be open when Pump PMP-IRZ00-0640 is set to "auto".
- FCV-IRZ00-0613 downstream of Carbon Substrate Pump PMP-IRZ00-0641 should be open when Pump PMP-IRZ00-0641 is set to "auto".
- FCV-IRZ00-0614 downstream of Carbon Substrate Pump PMP-IRZ00-0642 should be open when Pump PMP-IRZ00-0642 is set to "auto".
- FCV-IRZ00-0615 injection point of carbon substrate to Inner Recirculation Loop should be open when the Remedy SCADA is set to "Inject IRL".
- FCV-IRZ00-0616 injection point of carbon substrate to North NTH IRZ should be open when the Remedy SCADA is set to "Inject to North NTH IRZ".
- FCV-IRZ00-0617 injection point of carbon substrate to South NTH IRZ should be open, when the Remedy SCADA is set to "Inject to South NTH IRZ".
- FCV-IRZ00-0618 injection point of carbon substrate to TCS Recirculation Loop should be open, when the Remedy SCADA is set to "Inject to TCS Loop".
- FV-*0307, FV-*0308, FCV-*0404, FCV-*0408, FCV-*0409, FCV-*0414, FV-*0415, FV-*0416, FV-*0417, and *FCV-*0507 located in each injection well vault (in the TCS Recirculation Loop, NTH IRZ, and Inner Recirculation Loop) should be open when the Remedy SCADA is set to "auto".
- FCV-*0509 should be closed when the Remedy SCADA is set to auto.

The need to routinely implement the dosing of specific quantities of carbon substrate to wells on an individual basis is not anticipated. However, if certain injection wells require supplemental substrate injections, provisions have been included for dosing immediately at the well vaults using manual addition ports and portable tanks. An SOP for this operation is included in Appendix B (IRZ-SOP-11).

3.1.3.1 Carbon Amendment Procedure (MW-20 Bench)

Continuous or intermittent injection or dosing of the selected carbon substrate, carbon substrate target total organic carbon (TOC) concentrations, and injection frequency and duration will be adjusted based on groundwater analytical data and injection well performance, as summarized in Section 2.1.1.4 and presented in the Sampling and Monitoring Plan in Volume 2 of this O&M Manual. Anticipated injection rates are included in Tables 2.1-1 and 2.1-2.

Injections can be initiated by logging onto the Panel View (remotely or at the site) and clicking on or pressing the "Start Injection" button. Carbon amendment injections will not run or continue to run under the following system conditions:

1. If PMP-IRZ00-0640, PMP-IRZ00-0641, or PMP-IRZ00-0642; FCV-IRZ00-0611, FCV-IRZ00-0612, FCV-IRZ00-0613, or FCV-IRZ00-0614; and FCV-IRZ00-0615, FCV-IRZ00-0616, FCV-IRZ00-0617, or FCV-IRZ00-0618 are not in "Auto" position.[2]
2. If there is a communication alarm.

The carbon-amended water from the NTH IRZ can be injected into the North NTH IRZ Injection Header Leg or the South NTH IRZ Injection Header Leg, carbon-amended water from the River Bank Extraction Well Header can be injected into the Inner Recirculation Loop Header, and carbon-amended water from the TCS Extraction Well header can be injected into the TCS Injection Header (see Drawing I-06-01 in Appendix A). The determination regarding which header to inject into will be made by the project team based on performance monitoring and sampling results. The injection system can run with any combination of Carbon Amendment Pumps (PMP-IRZ00-

[2] Refer to the P&IDs in Appendix D of the BOD Report for details on the flow valves and controls.

0640, PMP-IRZ00-0641, or PMP-IRZ00-0642). The average anticipated carbon substrate injection flow rate is approximately 30 gph; however, the injection equipment is capable of injecting at up to 150 gph if needed. The Remedy SCADA system will be programmed with an injection program. The injection program can be field-adjusted via Remedy SCADA access to control the injection duration, flow rate, and frequency.

The following provides a brief description of the process control valves that are related to the injection system.

1. Manual Valves. The orientation (open or closed) of the following valves should be confirmed prior to operation as specified:
   - V-IRZ00-0603A, V-IRZ00-0603F, V-IRZ00-0603G, V-IRZ00-0603L, V-IRZ00-0603M, V-IRZ00-0603S, and V-IRZ00-0603T should be in the open position.
   - V-IRZ00-0603V should be in the open position when injecting into the Inner Recirculation Loop Header.
   - V-IRZ00-0603X should be in the open position when injecting into the North NTH IRZ Injection Header.
   - V-IRZ00-0603Z should be in the open position when injecting into the South NTH IRZ Injection Header.
   - V-IRZ00-0604K should be in the open position when injecting into the TCS Injection Header.
2. Actuated Flow Control Valves. The following valves are considered critical to the injection of carbon amendment, and therefore proper actuation of these valves should be checked during startup:
   - FCV-IRZ00-0612 should be in the “Auto” position during all injection activities and should actuate to the open position when PMP-IRZ00-0640 is activated.
   - FCV-IRZ00-0613 should be in the “Auto” position during all injection activities and should actuate to the open position when PMP-IRZ00-0641 is activated.
   - FCV-IRZ00-0614 should be in the “Auto” position during all injection activities and should actuate to the open position when PMP-IRZ00-0642 is activated.
   - FCV-IRZ00-0615 should be in the “Auto” position during all injection activities and should actuate to the open position when injecting into the Inner Recirculation Loop Header.
   - FCV-IRZ00-0616 should be in the “Auto” position during all injection activities and should actuate to the open position when injecting into the North NTH IRZ Injection Header
   - FCV-IRZ00-0617 should be in the “Auto” position during all injection activities and should actuate to the open position when injecting into the South NTH IRZ Injection Header
   - FCV-IRZ00-0618 should be in the “Auto” position during all injection activities and should actuate to the open position when injecting into the TCS Injection Header

3.1.3.2 NTH IRZ Carbon Substrate Amendment

In order to establish the IRZ, carbon-amended groundwater is injected through a drop pipe located in each of the NTH IRZ Injection Wells. A check valve is placed at the bottom of the injection well drop pipe to keep water from flowing back into the distribution lines. Carbon substrate flow rate (and total quantity) and carbon-amended groundwater injection flow rate are measured with magnetic flow meters located at the carbon substrate injection header and in each injection well vault, respectively, and will be controlled by automated flow control valves. The mechanical and process controls for NTH IRZ injection operation are described below. Instrumentation control approaches for the NTH IRZ injection operation are also summarized in Table 3.1-1.

The following provides a brief description of the process control valves that are related to the North NTH IRZ Injection Header Leg (IRZ 1-22) and the South NTH IRZ Injection Header Leg (IRZ 24-40).

1. Manual Valves. The orientation (open or closed) of the following valves should be confirmed prior to operation as specified:
    - V-IRZ00-0609A, V-IRZ00-0609B, V-IRZ00-0609C, V-IRZ00-0609D, V-IRZ00-0609H, and V-IRZ00-0609K should be in the open position.
    - V-IRZ00-0610F should be in the closed position for flow to the North NTH IRZ.
    - V-IRZ00-0610G should be in the closed position for flow to the South NTH IRZ.
    - If directing amendment water to the South NTH IRZ, only, V-IRZ00-0609C should be in the closed position.
    - The sample port valve should be in the closed position.

Three separate injection well location designs exist for the NTH IRZ injection system: a single-screen injection well design, a dual-screen well design, and a dual-screen injection well clusters design. P&IDs for the NTH IRZ Injection Wells are shown on Drawings I-04-03 through I-04-06 in Appendix A. The operator will select the target injection well(s) on the Remedy SCADA and select the appropriate "H-O-A" setting. The "Off" setting will close the actuated flow control valve at the well, the "Auto" setting will actuate the solenoid valve according to the programmed interval, and the "Hand" setting will leave the valve in the open position.

The following provides a brief description of the process control valves in the injection well vaults for the single-screen injection well design.

1. Manual Valves. The orientation (open or closed) of the following valves should be confirmed prior to operation as specified:
    - V-*0403A should be in the open position.
    - The sample port valve should be in the closed position.
    - V-*0403B should be manually adjusted to approximate the proper flow using the injection well flow meter.
2. Actuated Flow Control Valves. The following valve is considered critical to the injection of carbon-amended groundwater, and therefore proper actuation of this valve should be checked during startup:
    - FCV-*0404 should be in the "Auto" position during all injection activities. This valve is a flow control valve; therefore, the valve will actuate to ensure proper flow is achieved at the flow meter (FM-*0472A).

The following provides a brief description of the process control valves in the injection well vaults for the dual-screen injection well design. When a dual-screen injection well is selected for use, the Remedy SCADA will prompt the operator to select the appropriate injection screen(s) for use during the injection sequence. In this case, the operator will have the option of selecting injection screen 1, injection screen 2, or injection screens 1 and 2. The appropriate injection sequence will be selected based on chemistry results. Details on the types of chemical data that will be collected and how these will be used to determine injection operations are presented in Sections 2.2 and 4.2 of the Sampling and Monitoring Plan in Volume 2 of this O&M Manual.

1. Manual Valves. The orientation (open or closed) of the following valves should be confirmed prior to operation as specified:
    - V-*0407A should be in the open position.
    - The sample port valve should be in the closed position.
    - V-*0407B and V-*0407E should be manually adjusted to approximate the proper flow.
2. Actuated Flow Control Valves. The following valves are considered critical to the injection of carbon-amended groundwater, and therefore proper actuation of these valves should be checked during startup:

- FCV-*0408 and FCV-*0409 should be in the "Auto" position during all injection activities. These valves are flow control valves; therefore, the valves will actuate to ensure proper flow is achieved at the flow meter (FM-*0473A and FM-*0473B).

The following provides a brief description of the process control valves in the injection well vaults for the dual-screen injection well cluster design. When a dual-screen injection well cluster is selected for use, the Remedy SCADA will prompt the operator to select the appropriate injection screen(s) for use during the injection sequence. In this case the operator will have the option of selecting injection screen 1, injection screen 2, injection screen 3, injection screen 4, or all injection screens.

1. Manual Valves. The orientation (open or closed) of the following valves should be confirmed prior to operation as specified:
   - V-*0413A should be in the open position.
   - The sample port valves should be in the closed position.
   - Depending on the injection screen, selected valves V-*0413B, V-*0413E, V-*0418A, and V-*0418D should be manually adjusted to approximate the proper flow.
2. Actuated Flow Control Valves. The following valves are considered critical to the injection of carbon-amended groundwater, and therefore proper actuation of these valves should be checked during startup:
   - FCV-*0414, FCV-*0415, FCV-*0416, and FCV-*0417 should be in the "Auto" position during all injection activities. These valves are flow control valves; therefore, the valves will actuate to ensure proper flow is achieved at the flow meter (FM-*0474A, FM-*0474B, FM-*0475A, and FM-*0475B).

3.1.3.3 Inner Recirculation Loop Carbon Substrate Amendment

Groundwater, carbon-amended groundwater, and/or fresh water can be injected through a drop pipe located in each of the Inner Recirculation Loop Injection Wells. The P&ID for the Inner Recirculation Loop Injection Wells is shown on Drawings I-05-02 and I-05-03 in Appendix A. A check valve is placed at the bottom of the injection well drop pipe to keep water from flowing back into the distribution lines. Carbon substrate flow rate (and total quantity), as applicable, and groundwater injection flow rate are measured with magnetic flow meters located at the carbon substrate injection header and in each injection well vault, respectively, and will be controlled by automated flow control valves (see also Table 3.1-1).

The following provides a brief description of the process control valves that are related to the carbon-amended Inner Recirculation Loop Injection Wells.

1. Manual Valves. The orientation (open or closed) of the following valves should be confirmed prior to operation as specified:
   - V-IRZ00-0608A, V-IRZ00-0608B and V-IRZ00-0608D should be in the open position.
   - The sample port valve should be in the closed position.

Groundwater or carbon-amended groundwater associated with the Inner Recirculation Loop system will be injected using the dual-screen injection wells. The operator will select the injection well(s) on the Remedy SCADA and the desired "H-O-A" setting. The "Off" setting will close the automated flow control valve at the well, the "Auto" setting will actuate the flow control valve according to the programmed interval, and the "Hand" setting will leave the flow control valve in the open position.

The following provides a brief description of the process control valves in the injection well vaults.

1. Manual Valves. The orientation (open or closed) of the following valves should be confirmed prior to operation as specified:
   - V-*0502A, V-*0510, and V-*0511 should be in the open position.

- The sample port valve should be in the closed position.
- The pressure regulating valve V-*0518 is to be manually adjusted to approximate the proper operation.

2. Actuated Flow Control Valves. The following valves are considered critical to the injection of groundwater or carbon-amended groundwater, and therefore proper actuation of these valves should be checked during startup:
   - FCV-*0507 will be adjusted via the Remedy SCADA to ensure proper flow is achieved at flow meter FM-*0571A.F.

3.1.3.4 TCS Recirculation Loop Carbon Substrate Amendment

In order to establish an IRZ, carbon-amended groundwater will be injected through a drop pipe located in each of the TCS Injection Wells. The P&ID for the TCS Injection Wells is shown on Drawing I-03-03 in Appendix A. A check valve is placed at the bottom of the injection well drop pipe to keep water from flowing back into the distribution lines. Carbon substrate flow rate (and total quantity) and carbon-amended groundwater injection flow rate are measured with magnetic flow meters located at the carbon substrate injection header and in each injection well vault, respectively, and will be controlled by automated flow control valves. The mechanical and process controls for TCS Recirculation Loop injection operation are described below. Instrumentation control approaches for the TCS Recirculation Loop injection operation are also summarized in Table 3.1-1.

1. Manual Valves. The orientation (open or closed) of the following valves should be confirmed prior to operation as specified:
   - V-IRZ00-0609L and V-IRZ00-0610L should be in the open position.
   - The sample port isolation valve should be in the closed position.

Extracted groundwater from the Transwestern Bench and East Ravine Extraction Well networks are combined at the MW-20 Bench. The blended water can be amended with carbon, supplemented with fresh water or extracted groundwater from the NTH IRZ as necessary, and then conveyed to the TCS Injection Wells. The injection sequence will allow for the flow of groundwater or carbon-amended groundwater into the wells. The TCS Injection Wells are single-screen wells. The operator will select the target injection well(s) on the Remedy SCADA and the appropriate “H-O-A” setting. The “Off” setting will close the solenoid valve at the well, the “Auto” setting will actuate the solenoid valve according to the programmed interval, and the “Hand” setting will leave the valve in the open position.

The following provides a brief description of the process control valves in the injection well vaults.

1. Manual Valves. The orientation (open or closed) of the following valves should be confirmed prior to operation as specified:
   - V-*0303A should be in the open position.
   - The sample port valves should be in the closed position.
   - V-*0303B and V-*0304G should be manually adjusted to approximate the proper flow.
2. Actuated Flow Control Valves. The following valves are considered critical to the injection of groundwater or carbon-amended groundwater, and therefore proper actuation of these valves should be checked during startup:
   - FV-*0307 and FV-*0308 should be in the “Auto” position during all injection activities. These valves are flow control valves; therefore, the valves will actuate to ensure proper flow is achieved at the flow meters (FM-*0372A and FM-*0372B).

3.1.4 Miscellaneous Controls

3.1.4.1 Well Packer

Pneumatic well packers are present in dual-screen injection and extraction wells. The purpose of the well packer is to provide a seal such that fluids will be injected/extracted within a specific interval of the aquifer. The well packers are initially inflated using compressed air to a pressure of at least 60 pounds per square inch (psi). Each well packer is equipped with a pressure indicator (PI-*0362C, PI-*0461F, PI-*0463D, PI-*0464E, PI-*0465E, PI-*0560D, PI-*0563) and a pressure switch (PSL-*0362D, PSL-*0461E, PSL-*0463G, PSL-*0464G, PSL-*0465G, PSL-*0560C, PSL-*0562). If the pressure of a well packer drops below the set point of a minimum of 40 psi (dependent on pressure setpoint), an alarm will be activated within the Remedy SCADA, which will require operator attention. An air line quick disconnect fitting is available within each well vault to allow for the connection of an air compressor to re-inflate the well packer.

3.1.4.2 Additional Process Controls

Several additional process controls will be utilized as part of the groundwater in-situ remediation system operation. Further information on control set points and approaches are included in Table 3.1-1. Set points may be adjusted in the future based on system operational experience. A brief description of process controls is also provided below:

- MW-20 Bench building level switches (LSH-IRZ00-0654 and LSH-IRZ00-0649) will initiate a locking high level alarm that will disable all of the pumps (carbon substrate, well maintenance reagent, and process water) located within the building, all of the extraction well pumps, and all of the backwash pumps. The alarm will also close the actuated valves that control the fresh water, carbon substrate, and well maintenance reagents.
- Carbon substrate tank interstitial space level switch (LSH-IRZ00-0651) will initiate a locking high level alarm. In addition, the carbon substrate delivery piping from the tanker trucks to the Carbon Substrate Tank and from the Carbon Substrate Tank to the building is double-walled. The interstitial spaces in the piping are also equipped with level switches (LSH-IRZ00-0650 and LSH-IRZ00-0653), which will initiate a locking alarm.
- All individual well vaults and well meter vaults for the remediation injection wells are equipped with leak detection level switches (LSH-*0352A, LSH-*0352B, LSH-*0452A, LSH-*0453A, LSH-*0453B, LSH-*0454A, LSH-*0454B, LSH-*0454C, LSH-*0551A, LSH-*0551B, LSH-*0552A, and LSH-*0552B), which will initiate a locking high level alarm that will disable the corresponding groundwater extraction pump/backwash pump and flow control valve (FV-*0307, FV-*0308, FCV-*0404, FCV-*0408, FCV-*0409, FCV-*0414, FCV-*0415, FCV-*0416, FCV-*0417, FCV-*0507, FCV-*0508, and FV-*0513) on each injection well line within the vault.
- The River Bank Extraction Wells and the NTH IRZ Extraction Wells each have a dedicated extraction well vault and, in some cases, a separate well meter vault. Each is equipped with a level switch (LSH-*0450A, LSH-*0451A, LSH-*0451B, and LSH-*0550A,), which will initiate a locking high alarm that will disable the corresponding extraction well pump (PMP-*0440, PMP-*0441, PMP-*0442, PMP-*0540).
- The single-screen Transwestern Bench and East Ravine Extraction Wells each have a single vault (combined extraction well and well meter vault). These vaults are equipped with a single level switch (LSH-*0350A and LSH-*0351A) which will initiate a locking high alarm that will disable the corresponding extraction well pump (PMP-*0340 and PMP-*0341).
- The carbon substrate tank is equipped with a level transmitter (LE/LT-IRZ00-0652). If the liquid level falls below the pre-set low-level setting, a nuisance alarm will be initiated to inform the system operators of the condition. Furthermore, if the liquid level rises above a pre-set high-level setting, a nuisance alarm will be initiated to inform the system operators of the condition.
- The well maintenance reagent day tank (T-IRZ00-0619) is equipped with a level transmitter (LE/LT-IRZ00-0659). If the liquid level falls below the pre-set low-level setting, a nuisance alarm will be initiated to inform the system operators of the condition and the reagent pump (PMP-IRZ00-0643) will be de-energized. Further,

if the liquid level rises above a pre-set high-level setting, a nuisance alarm will be initiated to inform the system operators of the condition and actuated valve FV-IRZ00-0630 will be set to the closed position.

- The pressure transducers (LT-*0360B, LT-*0361B, LT-*0460B, LT-*0461B, LT-*0461C, LT-*0560B) in the extraction wells transmit a 4 to 20 milliamp signal to their respective processors. The operating range for the pressure transducers is 0 to 100 psi gauge (psig). The 4 to 20 milliamp signals provide the processor with a pressure that is converted into a water level reading using a set depth and pressure range. If the water level decreases to a low level alarm set point, the extraction well pump is disabled until the groundwater level recovers to a set restart extraction level set point. These sensors are disabled via the Remedy SCADA.
- Each screened interval of an injection well is equipped with a pressure transducer. The pressure transducers (LT-*0362E, LT-*0362F, LT-*0462E, LT-*0463H, LT-*0463I, LT-*0464H, LT-*0464I, LT-*0465H, LT-*0465I, LT-*0561F, and LT-*0562F) in the injection wells transmit a 4 to 20 milliamp signal to their respective processors. The operating range for the pressure transducers is 0 to 100 psig. The 4 to 20 milliamp signals provide the processor with a pressure that is converted into a water level reading using a set depth and pressure range. The injection well water levels outputted by the processor are used to control the operation of the automated valves at the respective well locations. If the water level reaches a high level alarm set point, the automated valve closes until the injection well water level recovers to a set restart injection water level set point. If the water level in the injection well exceeds the high level alarm set point and triggers the high-high level alarm set point, then the system again attempts to close the automated valve, and an alarm notification is sent out to operator and management staff. High-high water level alarms usually indicate that an automated valve is not working properly.

3.1.5 Regularly Scheduled Equipment O&M

This section presents the routine O&M requirements for the individual equipment components.

3.1.5.1 Carbon Substrate Tank

The routine O&M requirements for the Carbon Substrate Tank (T-IRZ00-0601) are identified as follows:

Operating Requirements

1. Record tank level (LE/LT-IRZ00-0652). This data point is found on the HMI screen in the MW-20 Bench, as well as at the Operations Building.
2. The flow data will be used to calculate the volume of carbon substrate flowing to the injection headers, and all operational data will help to determine maintenance requirements for the tank and associated piping, valves, and flow monitoring equipment.

Maintenance Requirements

1. Visually inspect the tank exterior and associated piping for signs of damage, leaks, or excessive deformation of the tank walls.
2. Inspect filling apparatus and piping for leaks or damage.
3. Check level switch LSH-IRZ00-0651 to see if alarms have been initiated on the HMI data screen in the MW-20 Bench, as well as at the Operations Building.
4. Inspect the carbon substrate vent screen for fouling, and clean the screen or replace as necessary.

These maintenance inspection data will be recorded in the electronic data handheld instrument at the site. Routine maintenance inspections will be conducted on a weekly basis.

3.1.5.2 Carbon Substrate Pumps

The routine O&M requirements for the Carbon Substrate Pumps (PMP-IRZ00-0640, PMP-IRZ00-0641, and PMP-IRZ00-0642) are identified as follows:

Operating Requirements

1. Operate the pumps in accordance with the manufacturer's recommendations identified in the manufacturer-supplied O&M manuals.

Maintenance Requirements

1. Maintain the pumps in accordance with the manufacturer's recommendations identified in the manufacturer-supplied O&M manuals.
2. Visually inspect pumps for damage or leaks.

The routine maintenance inspections will be conducted on a weekly basis.

3.1.5.3 Well Maintenance Reagent Pump

The routine O&M requirements for the Well Maintenance Reagent Pump (PMP-IRZ00-0643) are identified as follows:

Operating Requirements

1. Operate the pump in accordance with the manufacturer's recommendations identified in the manufacturer-supplied O&M manuals.
2. Record flow meter totalizer (FM-IRZ00-0679) reading prior to and after every maintenance event. This data point is found on the HMI screen on the control panel in the MW-20 Bench, as well as at the Operations Building.
3. Record flow settings for every maintenance event. These settings will be set by the operator and can be changed on the HMI screen in the main control room.
4. Record average pump speed for every injection event. These data are found on the HMI screen in the MW-20 Bench, as well as at the Operations Building.
5. Record discharge pressure readings (PIT-IRZ00-0661) during every maintenance event. These data can be found on the pressure indicator transmitter after the pump.

The operation data will be recorded in the electronic data handheld instrument at the site. The flow meter data will be used to calculate the maintenance reagent concentration flowing to the injection wells; all operational data will help to determine maintenance requirements for the pumps and associated piping, valves, and flow meters.

Maintenance Requirements

1. Maintain the pump in accordance with the manufacturer's recommendations identified in the manufacturer-supplied O&M manuals.
2. Visually inspect pump for damage or leaks.

Routine maintenance inspections will be conducted on a weekly basis.

3.1.5.4 Submersible Well Pumps

The routine O&M requirements for the Submersible Well Pumps (PMP-*0340, PMP-*0341, PMP-*0342, PMP-*0343, PMP-*0440, PMP-*0441, PMP-*0442, PMP-*0443, PMP-*0444, PMP-*0445, PMP-*0446, PMP-*0447, PMP-*0448, PMP-*0449, PMP-*0540, PMP-*0541A, PMP-*0542A) are identified as follows:

Operating Requirements

1. Operate the pump in accordance with the manufacturer's recommendations identified in the manufacturer-supplied O&M manuals.
2. Record flow meter totalizer reading (FM-*0370A, FM-*0371A, FM-*0470A, FM-*0471A, FM-*0471B, FM-*0570A).

3. Calculate and record the average flow going into the injection wells.
4. Record the extraction well discharge pressure at the appropriate header (PIT-IRZ00-0662 and PIT-IRZ00-0663).
5. Record the pre-injection water level and post-injection water level for both the extraction and injection well(s).

3.1.6 Standard Operating Procedures and Equipment O&M Manuals

Detailed SOPs are provided in Appendix B. These include the following:

- IRZ-SOP-01: MW-20 Bench system startup
- IRZ-SOP-02: MW-20 Bench system shutdown/emergency shutdown
- IRZ-SOP-03: MW-20 Bench routine operation system inspection
- IRZ-SOP-04: Carbon amendment dosing procedures
- IRZ-SOP-05: MW-20 Bench carbon storage tank delivery/filling
- IRZ-SOP-06: MW-20 Bench sampling purge water transfer
- IRZ-SOP-07: Bench scale testing of clean-in-place reagents
- IRZ-SOP-08: Clean-in-place reagent delivery
- IRZ-SOP-09: Clean-in-place solution mixing and application
- IRZ-SOP-10: Discharge of clean-in-place water to the Remedy-produced Water Conditioning Plant
- IRZ-SOP-11: Use of portable tanks for individual well dosing
- IRZ-SOP-12: Off-site trucking of clean-in-place water from MW-20 Bench
- Remedy-SOP-03: Cleaning and maintenance of instrumentation and control equipment
- Remedy-SOP-04: Maintenance of aboveground pumps
- Remedy-SOP-05: Cleaning and maintenance of valves and flow control equipment
- Remedy-SOP-06: Automatic backwashing
- Remedy-SOP-07: Secondary containment inspection and maintenance at buildings
- PIPE-SOP-01: Conveyance system inspection and maintenance (to be provided at final [100%] design)
- PIPE-SOP-02: Well and meter vault inspection and maintenance

Select equipment manuals are provided in Appendix C. These include the following:

- Extraction and injection well backwash pumps
- Hose pumps

Selection of instrumentation and control equipment as well as valve and flow control devices is ongoing; therefore, their equipment manuals will be provided when available.

3.2 Freshwater Supply, Conveyance, Storage, and Injection

The freshwater supply conveyance and storage system extends from the freshwater supply well HNWR-1A to the remedy freshwater storage tank (TNK-FWST-0203) at the Compressor Station. Fresh water is supplied to the Freshwater Injection Wells (FW-1 and FW-2); Inner Recirculation Loop Injection Wells (IRL-1 through IRL-4); and multiple remedy facilities on the TW Bench and MW-20 Bench, and at the Remedy-produced Water Conditioning Plant inside TCS.

The following SOPs are provided in Appendix B of this O&M Plan:

- FWS-SOP-01: Startup and shutdown of freshwater supply conveyance and storage system
- FWS-SOP-02: Sand separator and drywell operation and maintenance
- FWS-SOP-03: Freshwater supply well site inspection
- PIPE-SOP-01: Conveyance system inspection and maintenance
- PIPE-SOP-02: Well and meter vault inspection and maintenance
- Remedy-SOP-03: Cleaning and maintenance of instrumentation and control equipment
- Remedy-SOP-05: Cleaning and maintenance of valves and flow control equipment

- Well-SOP-02: Cleaning and maintenance of well pumps (also see Section 4 for well maintenance)

The following equipment O&M manuals are provided in Appendix C:

- Freshwater supply and injection well pumps
- Sand separator

Selection of instrumentation and control equipment as well as control systems is ongoing; therefore, their equipment manuals will be provided when available.

3.2.1 Operating Procedures

Operating procedures outlined below include routine checks and normal operations. Instrumentation control set points and approaches are included in Table 3.1-1. These set points may be adjusted periodically based on system operational experience.

3.2.1.1 Routine Checks

Personnel will complete daily review of the operating conditions of process equipment within the freshwater supply, conveyance, and storage system via the Remedy SCADA. This check will be performed daily, during regular business hours, and may include pressure, flow, level, and operating status for rotating equipment. The freshwater supply well site(s) will be monitored remotely using the camera(s) and will be inspected annually or as required due to equipment faults (see SOPs PIPE-SOP-02: Well and meter vault inspection and maintenance and FWS-SOP-03: Freshwater supply well site inspection, in Appendix B). Visual inspections of the remedy freshwater storage tank will be performed weekly. Annual pipeline inspections will be made.

3.2.1.2 Normal Operations

During normal operations, PMP-HNWR1A-0110A in the HNWR-1A well will pump water to the Remedy Freshwater Storage Tank (TNK-FWST-0203) and the injection wells in the uplands (FW-1, and IRL-3 and IRL-4) (see P&IDs I-01-01, I-02-01, I-02-02, and I-05-03 in Appendix A). Fresh water stored in the Remedy Freshwater Storage Tank (TNK-FWST-0203) will flow by gravity to the Freshwater Injection Well FW-02 (P&IDs I-02-01 and I-02-02).

Process Conditions for Freshwater Supply:

- TNK-FWST-0203 level below high-level set point (LSH-FWST-0255)
- PMP-HNWR1A-0110A at freshwater supply well in “Auto” mode

Manual valves need to be in the following positions:

- Manual valves on pipeline leading to TNK-FWST-0203 and the injection wells in the uplands (V-HNWR1A-0110B, V-HNWR1A-0120A, V-HNWR1A-0120C, V-HNWR1A-0171A, and V-HNWR1A-0161A) - Open
- TNK-FWST-0203 inlet valve (V-FWST-0203B) – Open
- TNK-FWST-0203 future connection valve (V-FWST-0203A) – Closed

Process Conditions for Freshwater Injection:

- TNK-FWST-0203 level above the low-level set point (LSL-FWST-0255)
- A given injection well must have water level less than the high-level set point (LT-*0252, LT-*0562F)
- A given injection well vault must have water level lower than the high-level set point (LSH-*0251, LSH-*0552A/B)
- Backwash pump in a given injection well (PMP-*0201, PMP-*0542A) is not in “Run” mode
- Wellhead pressure is below the high-pressure set point in a given injection well (PI/PIT-*0262)
- Freshwater conveyance line pressure is below the high-pressure set point (PI/PIT-*0261)

Manual valves need to be in the following positions:

- TNK-FWST-0203 outlet valve (V-FWST-0203C) – Open
- Manual valves on freshwater conveyance line valves (V-FWST-0203E, V-*0201A, V-*0201G, V-*0270, V-*0532B, V-*0540, V-*0541) – Open
- Manual valve on pipeline leading to the contingent Freshwater Pre-injection Treatment System (FWPTS) (V-FWST-0203D) – Closed
- Manual valves on pressure indicators PIT-*0261 and PIT-*0262 (V-*0261A, V-*0261B, V-*0262A, V-*0262B), and PI-*0562A and PI-*0562D (V-*0562D and V-*0562F) – Open
- Manual valves on air release valve ARV-*0214 (V-*0214A) – Open

Automated valves in "Auto" mode:

- Open position (if the well is in injection mode) – FCV-*0212, FV-*0211, FV-*0513

3.3 Remedy-produced Water Management

The remedy-produced water management system starts at the remedy injection wells, continues through the conveyance system to the produced water conditioning system, and ends at the reuse/re-injection locations.

The following SOPs are provided in Appendix B of this O&M Plan:

- PIPE-SOP-01: Conveyance system inspection and maintenance
- Remedy-SOP-03: Cleaning and maintenance of instrumentation and control equipment
- Remedy-SOP-04: Maintenance of aboveground pumps
- Remedy-SOP-06: Automatic backwashing
- Remedy-SOP-07: Secondary containment inspection and maintenance at buildings
- Remedy-SOP-08: Inspection of frac tanks
- RTP-SOP-01: System "hot" startup and shutdown
- RTP-SOP-02: Batch conditioning process
- RTP-SOP-03: Continuous conditioning process
- RTP-SOP-04: Cartridge filter maintenance
- RTP-SOP-05: Secondary containment operation in the Remedy-produced Water Conditioning Plant
- RTP-SOP-06: Phase separator loading and removal
- RTP-SOP-07: Manual cleaning of frac tanks
- RTP-SOP-08: Off-site trucking of remedy-produced water
- RTP-SOP-09: Inspection of B-Side Conditioned Water Storage Tank
- RTP-SOP-10: Disposal of produced water in evaporation ponds via the TCS Wastewater Tank Discharge Connection
- RTP-SOP-11: Water transfer from conditioned water tank farm to tank at MW-20 Bench

Equipment O&M manuals provided in Appendix C include the following:

- Extraction well, centrifugal, metering, sump, air-operated diaphragm pumps
- Seal water system
- Cartridge filters
- Air compressor
- Flow control valves

Selection of instrumentation and control equipment as well as control systems is ongoing; therefore, their equipment manuals will be provided when available.

3.3.1 Operating Procedures

Operating procedures outlined below include routine checks, Influent Tank Farm fill cycle; Continuous Processing mode; Batch Processing mode; and Conditioned Water Storage Tank or Conditioned Water Storage Tank Farm Empty Cycle. The procedure outlines are for normal operational modes. Instrumentation control set points and approaches are included in Table 3.1-1. These set points may be periodically adjusted based on system operational experience.

3.3.1.1 Routine Checks

Personnel will review the operating conditions of all process equipment within the remedy-produced water conditioning system via the Remedy SCADA. This check will be performed daily during regular business hours, and may include pressure, flow, level, analytical instruments (pH, conductivity, turbidity), and operating status for rotating equipment. Visual inspections of the facilities, including physical conditions of process areas, will be performed during the daily walk-through of the system (see SOP Remedy-SOP-07: Secondary containment inspection and maintenance at buildings and Remedy-SOP-08: Inspection of frac tanks in Appendix B).

3.3.1.2 Influent Tank Farm Fill Cycle

This cycle occurs when backwash water from an injection well is being pumped to the Influent Tanks (TNK-RTP01-1101 through TNK-RTP01-1104). It will be terminated in an individual tank when the high water level is reached at which time the automated valve (FV-RTP01-1117, FV-RTP01-1127, FV-RTP01-1137, and FV-RTP01-1147) will close (see P&IDs I-11-01 through I-11-04 in Appendix A and Remedy-SOP-06: Automatic backwashing in Appendix B).

Process Conditions:

- A given tank must have water level less than the high-level set point (LSH-RTP01-1151, LSH-RTP01-1153, LSH-RTP01-1155, LSH-RTP01-1157).
- Air Compressor (CMP-RTP01-1201), Air Dryer/Filter (DRYER-RTP01-1202), and Receiver (DRM-RTP01-1203) are in Auto Mode (see P&ID I-12-05).

Automated valves in AUTO mode:

- Open position (if the tank is in the fill cycle) – FV-RTP01-1117, FV-RTP01-1127, FV-RTP01-1137, and FV-RTP01-1147.
- Closed position – FV-RTP01-1111, FV-RTP01-1112, FV-RTP01-1121, FV-RTP01-1122, FV-RTP011131, FV-RTP01-1132, FV-RTP01-1141, FV-RTP01-1142.

Manual valves need to be in the following positions:

- Manual valves upstream of automated valves FV-RTP01-1117, FV-RTP01-1127, FV-RTP01-1137, and FV-RTP01-1147 (V-RTP01-1101A, V-RTP01-1102A, V-RTP01-1103A, V-RTP01-1104A) – Open.
- Drain valves on Influent Tanks (V-RTP01-1101M, V-RTP01-1102M, V-RTP01-1103M, V-RTP011104M) – Closed.

3.3.1.3 Continuous Processing

This mode occurs when designated Influent Tanks are full and no pH adjustment is needed or no heavy solids loads are in the Influent Tanks. This mode applies to the A-side and B-side process streams. This mode will terminate when the low water level is reached in the tank, at which time the filter feed pumps in service will be shut down. This mode is also the same as the Empty Tank mode (see P&IDs I-11-01 through I-11-04, I-12-01, I-12-02, I-14-01, and I-14-02 in Appendix A and RTP-SOP-03: Continuous conditioning process in Appendix B).

Process Conditions:

- A given influent tank must have water level greater than the low-level set point (LSL-RTP01-1151, LSL-RTP01-1153, LSL-RTP01-1155, LSL-RTP01-1157).
- Filter Feed Pumps (PMP-RTP01-1210, PMP-RTP01-1220, PMP-RTP01-1230, PMP-RTP01-1240) in “Auto” mode.

The operator will designate the appropriate pair of pumps (A-side or B-side) to be in service.

- For the A-side, the Conditioned Water Storage Tank Farm (TNK-RTP01-1401, TNK-RTP01-1402) water levels are less than the high-level set point (LSH-RTP01-1451, LSH-RTP01-1453).
- For the B-side, the Conditioned Water Storage Tank (TNK-RTP01-1410) water level is less than the high-level set point (LSH-RTP01-1452).
- Air Compressor (CMP-RTP01-1201), Air Dryer/Filter (DRYER-RTP01-1202), and Receiver (DRM-RTP01-1203) are in "Auto" mode (see P&ID I-12-05).

Automated valves in "Auto" mode:

- Closed position (if the influent tank is in the Continuous Processing Mode) – FV-RTP01-1117, FV-RTP01-1127, FV-RTP01-1137, and FV-RTP01-1147 to prevent additional produced water from entering the tanks.
- Open position (if the A-side is in the Continuous Processing Mode) – FV-RTP01-1411, FV-RTP01-1412.

Automated valve positions for the filter feed pumps and flow control valves are a function of in service filter configuration and which process side is operating. Exhibit 3.3-1 lists the valve positions corresponding to the pump and process side in service.

- Manual valves need to be in the following positions: Manual valves upstream of automated valves FV-RTP01-1111, FV-RTP01-1112, FV-RTP01-1121, FV-RTP01-1122, FV-RTP011131, FV-RTP01-1132, FV-RTP01-1141, FV-RTP011142 (V-RTP01-1101G, V-RTP01-1101I, V-RTP01-1102G, V-RTP01-1102I, V-RTP01-1103G, V-RTP01-1103I, V-RTP011104G, V-RTP011104I) – Open.
- For A-side – Manual valves upstream and downstream of filter feed pumps (V-RTP01-1210A, V-RTP01-1210C, V-RTP01-1220A, V-RTP01-1220C) – Open; manual valves upstream of TNK-RTP01-1401 and TNK-RTP01-1402 (V-RTP01-1401A, V-RTP01-1402A) – Open; manual valves for unconditioned water bypass to Cooling Tower Blowdown Line (V-RTP01-1210E, V-RTP01-1220E) – Closed; drain valves for TNK-RTP01-1401 and TNK-RTP01-1402 (V-RTP01-1401C, V-RTP01-1402C) – Closed.

- For B-side – Manual valve upstream of TNK-RTP01-1410 (V-RTP01-1410A) – Open; manual valves upstream and downstream of filter feed pumps (V-RTP01-1230A, V-RTP01-1230C, V-RTP01-1240A, V-RTP011240C) – Open.

3.3.1.4 Batch Processing

This mode occurs when designated Influent Tanks are full and either pH adjustment is needed or heavy solids loads are in the Influent Tanks. This mode is anticipated to apply to only the A-side process, so the B-side process equipment is not included. This mode has up to five elements including pH adjustment, coagulant addition, solids settling, sludge draw-off, and pH adjustment. All the elements except sludge draw-off will last a minimum of 30 minutes to enable complete tank mixing. The tank-emptying mode was described above (under Continuous Processing) (see P&IDs I-11-01 through I-11-04, I-12-01, I-12-03, I-12-04, I-12-05, and I-14-01 in Appendix A and RTP-SOP-02: Batch conditioning process in Appendix B).

Process Conditions:

- A given influent tank must have water level greater than the low-level set point (LSL-RTP011151, LSL-RTP011153, LSL-RTP011155, LSL-RTP01-1157).
- Any chemicals that are required like caustic, acid, or coagulants, must have sufficient chemical in the associated storage tank.
- Influent Tank Recirculation Pumps (PMP-RTP011101, PMP-RTP01-1102, PMP-RTP011103, PMP-RTP01-1104) are in “Auto” mode.
- Solids Pump (PMP-RTP01-1201) is in “Auto” mode.
- Air Compressor (CMP-RTP01-1201), Air Dryer/Filter (DRYER-RTP01-1202), and Receiver (DRM-RTP01-1203) are in “Auto” mode.
- Filter Feed Pumps (PMP-RTP01-1210, PMP-RTP011220) in “Auto” mode.
- The Conditioned Water Storage Tank Farm (TNK-RTP01-1401, TNK-RTP01-1402) water levels are less than the high-level set point (LSH-RTP01-1451, LSH-RTP01-1453).

Automated valves in “Auto” mode:

- Closed position (if the influent tank is in the Batch Processing mode) – FV-RTP01-1117, FV-RTP01-1127, FV-RTP01-1137, and FV-RTP01-1147 to prevent additional produced water from entering the tanks.
- Closed position (prevent discharge from designated Influent Storage Tanks) – FV-RTP01-1111, FV-RTP01-1112, FV-RTP01-1121, FV-RTP01-1122, FV-RTP01-1131, FV-RTP01-1132, FV-RTP01-1141, FV-RTP01-1142.
- Open position (if the tank is in the Batch Processing mode and a chemical is being injected) – FV-RTP01-1113, FV-RTP01-1114, FV- RTP01-1115, FV- RTP01-1123, FV- RTP01-1124, FV- RTP01-1125, FV-RTP01-1133, FV-RTP01-1134, FV-RTP01-1135, FV-RTP01-1143, FV-RTP01-1144, and FV-RTP01-1145.

Automated valve positions for the filter feed pumps and flow control valves are a function of in service filter configuration. Exhibit 3.3-2 lists the valve positions corresponding to the pump and process side in service.

Notes: Where "*" is Location ID RTP01.

Manual valves need to be in the following positions:

- Manual valves upstream and downstream of the Influent Tank Recirculation Pumps (V-RTP011101B, V-RTP01-1101E, V-RTP01-1101F, V-RTP01-1101K, V-RTP01-1102B, V-RTP01-1102E, V-RTP01-1102F, V-RTP01-1102K, V-RTP01-1103B, V-RTP01-1103E, V-RTP01-1103F, V-RTP01-1103K, V-RTP01-1104B, V-RTP01-1104E, V-RTP01-1104F, V-RTP01-1104K – Open.
- Manual valves upstream and downstream of the Caustic Feed, Coagulant Feed, and Acid Feed Pumps (V-RTP01-1212B, V-RTP01-1211A, V-RTP01-1211F, V-RTP01-1220D, V-RTP01-1221A, V-RTP01-1221E, V-RTP01-1230E, V-RTP01-1231A, V-RTP01-1231F) – Open.
- Manual valves upstream and downstream of the Caustic Feed, Coagulant Feed, and Acid Feed Pumps (V-RTP01-1212C, V-RTP01-1212D, V-RTP01-1211D, V-RTP01-1211G, V-RTP01-1220F, V-RTP01-1221D, V-RTP01-1222D, V-RTP01-1230F, V-RTP01-1232A, V-RTP01-1231D, V-RTP01-1231G) – Closed.
- Manual valves upstream and downstream of the automated valves on the Caustic Feed, Coagulant Feed, and Acid Feed lines (V-RTP01-1113A, V-RTP01-1113B, V-RTP01-1114A, V-RTP01-1114B, V-RTP01-1115A, V-RTP01-1115B, V-RTP01-1123A, V-RTP01-1123B, V-RTP01-1124A, V-RTP01-1124B, V-RTP01-1125A, V-RTP01-1125B, V-RTP01-1133A, V-RTP01-1133B, V-RTP01-1134A, V-RTP01-1134B, V-RTP01-1135A, V-RTP01-1135B, V-RTP01-1143A, V-RTP011143B, V-RTP01-1144A, V-RTP01-1144B, V-RTP01-1145A, V-RTP01-1145B) – Open.

3.3.1.5 Empty Cycle in Conditioned Water Storage Tank

This cycle occurs when the Conditioned Water Storage Tank (TNK-RTP01-1410) is full and conditioned water needs to be conveyed to a re-use or re-injection location (see P&IDs I-06-04, I-12-05, and I-14-02 in Appendix A).

Process Conditions:

- Conditioned Water Storage Tank (TNK-RTP01-1410) water level is greater than the low-level set point (LSL-RTP01-1452).
- Conditioned Water Frac Tank (TNK-IRZ00-0620) water level is less than high level (LE/LT-IRZ00-0656).
- Air Compressor (CMP-RTP01-1201), Air Dryer/Filter (DRYER-RTP01-1202), and Receiver (DRM-RTP01-1203) are in "Auto" mode.

Automated valves in "Auto" mode:

- Open position – FV-RTP01-1414 (discharge line to TNK-IRZ00-0620 located at MW-20 Bench).
- Open position – FCV-IRZ00-0628M (valve upstream of TNK-IRZ00-0620 located at MW-20 Bench).

Manual valves need to be in the following positions:

- Manual valve downstream of Conditioned Water Storage Tank (V-RTP01-1410B) – Open.
- Manual valves upstream and downstream of TCS Truck Fill Pump (V-RTP01-1403A, V-RTP01-1403C) – Closed.

3.3.1.6 Empty Cycle in Conditioned Water Storage Tank Farm

This cycle occurs when the A-side Conditioned Water Storage Tanks (TNK-RTP01-1401, TNK-RTP01-1402) are full and conditioned water needs to be conveyed to re-use or re-injection location (see P&IDs I-06-02, I-12-05, and I-14-01 in Appendix A and RTP-SOP-11 in Appendix B).

Process Conditions:

- Conditioned Water Storage Tanks (TNK-RTP01-1401, TNK-RTP01-1402) water level is greater than the low-level set point (LSL-RTP01-1451, LSL-RTP01-1453).
- Conditioned Water Frac Tank (TNK-IRZ00-0620) water level is less than high level (LE/LT-IRZ00-0656).
- Conditioned Water Transfer Pumps (PMP-RTP01-1405/-1406) in "Auto" mode.
- Air Compressor (CMP-RTP01-1201), Air Dryer/Filter (DRYER-RTP01-1202), and Receiver (DRM-RTP01-1203) are in "Auto" mode (see P&ID I-12-05).

Automated valves in AUTO mode:

- Closed position – FV-RTP01-1415 (discharge line to Cooling Tower Blowdown Line).
- Open position – FV-RTP01-1416 (discharge line to TNK-IRZ00-0620 located at MW-20 Bench).
- Open position – FCV-IRZ00-0628M (valve upstream of TNK-IRZ00-0620 located at MW-20 Bench).

Manual valves need to be in the following positions:

- Manual valves upstream and downstream of Conditioned Water Transfer Pumps (V-RTP01-1401B, V-RTP01-1402B, V-RTP01-1405C, V-RTP01-1406B) – Open.

3.4 Power Supply and Distribution

The power supply system for the remedy will enter near the Remedy-produced Water Conditioning Plant and will supply power to a 12 kV medium voltage distribution system with six transformers to step the voltage down to 480 volts.

The SOPs provided in Appendix B include the following:

- PWR-SOP-01: Transformer inspection
- PWR-SOP-02: Solar photovoltaic system maintenance (see also Section 7.6, Maintenance of Small Solar Panels)
- PWR-SOP-03: Communication panel inspection and maintenance
- PWR-SOP-04: Remote well(s) panel inspection and maintenance

Select equipment O&M manuals provided in Appendix C include the following:

- Transformers

Selection of motor control centers is ongoing; therefore, their equipment manuals will be provided when available.

3.5 Remedy SCADA

The Remedy SCADA system is a series of computers networked together to monitor, control, and acquire data from the system instruments. The Remedy SCADA is located at the Operations Building at the Transwestern Bench. Numerous PLCs will be installed at wells and control nodes (co-located with the electrical transformers).

The SOPs provided in Appendix B include the following:

- SCADA-SOP-01: HMI/SCADA application backup and cleaning
- SCADA-SOP-02: SCADA historian backup and cleaning
- PWR-SOP-03: Communication panel inspection and maintenance
- PWR-SOP-04: Remote well(s) panel inspection and maintenance

Selection of Remedy SCADA equipment and networking devices is ongoing; therefore, their equipment manuals will be provided when available.

Note that to maintain compliance with carbon substrate storage and use permits, the Remedy SCADA will record the following information: Start Injection T-IRZ00-0601 Height, End Injection T-IRZ00-0601 Height, and carbon amendment temperature for every injection event. At the end of the 24-hour period, the injection volume and tank volume are automatically calculated. This information is sent to the carbon amendment use page on the Remedy SCADA. The Remedy SCADA system will also provide an HMI screen for selection of injection and backwashing sequences. Current valve indication (open or closed and hand/off/auto), pump indication (hand/off/auto), and various alarm indications are provided via the Remedy SCADA system. All operations and monitoring points can be controlled or viewed from the Remedy SCADA in the Operations Building at the Transwestern Bench or at HMI screens located at the carbon amendment facility at the MW-20 Bench and at the Remedy-produced Water Conditioning Plant, or at remote terminal locations as well as on mobile tablets.

3.6 Institutional Controls

Each IC enacted as part of the groundwater remedy will be operated and maintained in a manner consistent with any specific requirements detailed in the IC, including any periodic review schedule determined to be required and any process to ensure the effectiveness and successful implementation of the ICs.

3.7 Improvements at TCS Evaporation Ponds

Anticipated maintenance activities for the planned improvements at the TCS evaporation ponds are described below.

3.7.1 Electrical Power Generator

The RICE electrical power generator will utilize natural gas fuel to supply three-phase 120/208 VAC electrical power to pumps and three-phase loads at the TCS evaporation ponds. The system consists of a RICE, an alternator, a fuel system, control panel, and power electronics. Key maintenance activities will typically include the following:

- Clean radiator matrix monthly or after 100 hours of operation.
- Check oil levels, drive belt condition, electrical connections, and operation of emergency stop button weekly or after every 50 hours of operation.
- Perform a check of engine fluids, lines, hoses, cooling fan blades, exhaust components, and air intake daily or after every 8 hours of operation.

The TEGs will consist of three Global Thermoelectric model 8550 power sources, and will utilize natural gas fuel to generate 24 VDC power for supply to auxiliary equipment such as lighting, controls, sensors, security cameras, and valve actuators. TEGs are solid state devices that require minimal maintenance; however, a yearly service check is recommended to maintain reliable service. The annual service check will typically include the following activities:

- Perform power check and conduct maintenance as needed.
- Replace fuel filter.
- Drain pressure regulator sediment bowl.
- Check fuel orifice for clogging.
- Clean heat pipe fins, air intake screens, and cabinet interior.

- Check all bolts and fasteners for tightness.
- Restart TEG.

Additional information on maintenance procedures for the TEGs is provided in the Global Thermoelectric Operating Manual included in Appendix C.

3.7.2 Natural Gas Regulators

The natural gas supply fueling the electrical power generator consists of a 600-100 psig primary regulator and a 100-60 psig secondary regulator. Maintenance activities consist of the following:

- Annual check of regulators and monitoring of set points.
- Annual inspection of regulators, monitors, valves, and fittings for leaks and other damage.
- Annual check of differential pressure across filter.
- Annual manual operation of emergency valves.
- Annual exercising of valves to ensure functionality.
- Annual inspection of ¼ inch Welker Sulfur Removal Filter.
- Three year inspection of atmospheric corrosion damage.
- Five year internal inspection of regulator and monitor.

3.7.3 Water Recirculating Pumps

The 3-horsepower, 230V, three-phase vertical centrifugal recirculating pumps located at ponds 3 and 4 recirculate pond water. Maintenance activities consist of the following:

- Monthly visual inspection of hose connections and overall hose condition.
- Monthly visual inspection of power supply cable connections and overall cable condition.
- Monthly visual inspection of pump influent and effluent to ensure there are no obstructions present hindering flow.
- Monthly inspection to determine if pump is making unusual sounds (e.g., unusual vibrations, squealing, etc.).

3.7.3.1 Actuator Valves

Water is transferred to the individual ponds via a 3-inch HDPE header and piping configuration. The operation is controlled by electric actuated butterfly valves located at each individual pond. Visual inspection of power supply cable connections and overall cable condition will be conducted on a monthly basis.

3.7.3.2 Liquid Level Sensors and Control Units

Water levels in each pond are monitored utilizing independent Rosemount Ultrasonic Liquid Level Transmitters and control units. Maintenance activities consist of the following:

- Monthly visual inspection of power supply cable connections and overall cable condition.
- Monthly visual inspection of cover seal and wire glands.
- Monthly visual inspection of transmitter face to ensure cleanliness.

3.7.3.3 Cathodic Protection

To increase the life of the buried steel natural gas supply line, a cathodic protection system will be installed. The system may include an air-cooled rectifier, remote monitoring unit, or deep well sacrificial anode. Maintenance activities consist of the following:

- Bi-monthly inspection of rectifier
- Annual measurement of pipe-to-soil potential

3.8 Long-Term Remedy Support Area at Moabi Regional Park

Remedy systems at the Moabi Regional Park facilities requiring routine or non-routine O&M include the following:

- **Electrical power supply system** – Inspection and preventative maintenance of the generator and solar panels.
- **Potable water supply and distribution system** – Routine (i.e., weekly) water delivery to the potable water tank and inspection/maintenance of the booster pump.
- **Sewer system** – Routine (i.e., monthly) sewage removal and offsite hauling.
- **Decontamination/other wastewater management system** – Decontamination of construction vehicles and equipment, including drill rigs; management of rainwater collected in the secondary containment; inspection/maintenance of the sump pump; and offsite hauling of wastewater from the decontamination water storage tank. Water from this tank will be trucked to the appropriate location (e.g., the Remedy-produced Water Conditioning Plant or off site) for management.

Detailed SOPs are provided in Appendix B for the above-listed O&M activities. These include:

- CHQ-SOP-01: Offsite hauling of wastewater
- CHQ-SOP-02: Truck decontamination
- CHQ-SOP-03: Generator inspection
- CHQ-SOP-04: Potable water delivery
- CHQ-SOP-05: Offsite hauling of sewage

SOPs for maintenance of aboveground pumps—e.g., booster and sump pumps—and solar panels (Remedy-SOP-04 and PWR-SOP-02, respectively) are also available in Appendix B.

In addition, crane inspection, maintenance, operation, and testing will be performed in accordance with California Occupational Safety and Health Administration requirements (California Code of Regulations [CCR] Title 8, Sections 4990-5035).

SECTION 4

Well Maintenance and Decommissioning

The final groundwater remedy is reliant on several dozen wells used for the IRZ, freshwater and carbon-amended injection, and groundwater extraction. For each of these types of wells, especially for the injection and IRZ wells, regular maintenance such as backwashing and rehabilitation is vital to maintain efficient and effective operations during the decades long projected life of the remedy. Well maintenance will also prevent or reduce the need for drilling new replacement wells. Sections 4.1 and 4.2 discuss approaches for assessing well performance and well maintenance; detailed Standard Operating Procedures for conducting the well maintenance activities are presented in Appendix B. These maintenance activities will produce an ongoing water stream that must be managed as part of the remedial action; protocols for management of remedy-produced water are discussed in Section 6 of this O&M Plan.

Also included in this section is information related to well decommissioning (Section 4.3). This section includes the general approach for decommissioning wells related to the final remedy at Topock as well as wells utilized as part of site characterization activities, and will be a guide to determining the appropriate methods for a given well. The general approach for well decommissioning was developed by a subgroup that includes PG&E, DTSC, DOI, and Interested Tribes. Detailed SOPs for conducting well decommissioning are based on this general approach and are presented in Appendix B.

4.1 Well Performance Tracking

Well performance will be monitored to assess the frequency and methods required for well maintenance (Section 4.2). Well performance monitoring consists of establishment of a baseline (baseline assessment) during well installation/development and system startup (commissioning). Once the system is online, well performance will be tracked by comparing the baseline data to long-term performance data. The following subsections describe the data collection planned as part of well performance tracking.

4.1.1 Baseline Assessment

A baseline assessment will be conducted to characterize the initial well performance. Reliable baseline data is a necessity for tracking well performance and understanding performance degradation. Future data will be compared to baseline conditions to diagnose potential well plugging problems and equipment failure, and will guide decisions related to well performance mitigation and well rehabilitation methods. Key elements of the baseline assessment are detailed in the following subsections.

4.1.1.1 Well Capacity

The term *well capacity* is used in this plan to describe the well performance regardless of well type, but refers to the specific capacity of an extraction well or specific injectivity for an injection well. Reliable and frequent measurements of water levels and flow rates are important for evaluating well capacity. Specific capacity and specific injectivity are defined as follows:

Specific Capacity – defined as the rate of discharge or extraction per unit of drawdown in the extraction well, expressed in gallons per minute per foot (gpm/ft):

$$Specific\ Capacity\ \left(\frac{gpm}{ft}\right) = \frac{discharge\ rate\ (gpm)}{pumping\ water\ level\ (ft) - static\ water\ level\ (ft)}$$

Specific Injectivity – defined as the rate of injection per unit of drawup in the injection well, expressed in gallons per minute per foot (gpm/ft):

$$Specific\ Injectivty\ \left(\frac{gpm}{ft}\right) = \frac{injection\ rate\ (gpm)}{injecting\ water\ level\ (ft) - static\ water\ level\ (ft)}$$

The specific capacity or specific injectivity is a direct measure of well performance decline when compared to a baseline reference capacity (that is measured when pumping or injecting at similar rates). During well testing, "static" water level data will be collected from each well and will be used to calculate the specific capacity and specific injectivity once the well is in service. Water level logging (with level probes) in all wells associated with the given test as well as in the Colorado River should begin 1 to 2 weeks prior to startup so that background water level trends can be evaluated. Static water levels should be measured prior to start-up of extraction or injection.

4.1.1.2 Flow Logging and Well Performance Testing

Baseline flow logging and aquifer testing results are required for comparison with future data to understand the specific intervals or depths of well screen where clogging has occurred.

Flow logging can be a useful element of the baseline evaluation, particularly in wells with longer screens. In shorter-screened wells (less than about 75 feet of screen length) there is typically less need to understand the variations in flow along the screen, and therefore flow logging is less useful. Spinner logging, the most common method of flow logging, measures the contribution of groundwater flow into the well from various depth intervals of screen. Measurements of vertical flow velocities are collected under dynamic (pumping/injection) conditions and analyzed to develop a flow profile. Other methods of flow logging that have been conducted as part of the Topock Remediation Project that can be considered for use during well testing, include hydrophysics and dye pulse logging.

Following development, specific capacity and injectivity testing will be conducted at all extraction and injection wells so that baseline specific capacity/injectivity can be evaluated. Typically, the testing will include evaluation of specific capacity/injectivity at flow increments of approximately 50, 100, and 150 percent of the design extraction or injection rate. These tests will typically be conducted over a 2- to 12-hour period depending on the performance of the well and the water level in the pumping well will be monitored using pressure transducers. Field water quality measurements will be monitored on the pump effluent at the surface (e.g., specific conductance, pH, and oxidation-reduction potential) during testing. For injectivity assessment, this testing will involve extracting water from the well, storing the water in portable tanks, then injecting the water back into the well through a filter to remove particulate matter. Injectivity testing may also include the use of fresh water. Chemical additives will not be used during well testing activities, and therefore the water will not be tested prior to re-injection. The injection rate will be increased in three or more steps. This type of step test provides data that can be used to estimate the maximum injection capacity of a well. These same test procedures were used for the Topock IM-3 injection wells. An abbreviated version of baseline specific capacity testing will be conducted at all new monitoring wells. Monitoring wells, which are not designed for target extraction rates, will be pumped at one to three different rates following development such that specific capacity information can be compared to that collected during subsequent monitoring and/or re-development events (see Section 4.2.4). The use of slug testing may also be appropriate to assess changes in well hydraulics over time.

Sand content and turbidity with pumping time will be measured during the aquifer testing to establish a baseline for these parameters using a Rossum Sand Tester and turbidimeter.

Once the system is online and operational, the well capacity baselines will be re-evaluated over a much longer period to confirm that steady state conditions are met and the capacity is not fluctuating. It is expected that this will be done during the first month to few months of the system being commenced.

4.1.1.3 Video Survey

Video surveys can be used for construction acceptance (once the well is installed and developed) and provide a baseline for future well diagnostics. Once development is complete, and all equipment is removed from the well, a baseline video survey will be conducted on all remediation wells to support diagnosis of future well problems. Video survey results provide direct visual evidence of potential problems in the well when a baseline survey is compared to a survey conducted once well degradation has occurred.

The video survey should be conducted using a color camera capable of side-scanning and photographs plus video recording of the survey so that it can be viewed later. As a general guide, the video survey should be conducted after the well has remained idle for at least 24 hours to improve the quality of the video.

4.1.1.4 Water Quality Sampling

Water quality data incorporating physical, field chemistry, laboratory chemistry, and biological analytes provides important information on system status. These data help diagnose well clogging issues in the early stages, providing information critical for designing corrective measures.

Water quality samples collected from the wells will be analyzed for the biological and geochemical analytical parameters, as listed in Exhibit 4.1-1, and field screening parameters, as listed in Exhibit 4.1-2. Results will be used as a reference point during future diagnosis of well performance decline.

The baseline and long-term monitoring plan for the freshwater source is included in Section 5.2 of Volume 2 of the O&M Manual.

4.1.2 Long-Term Performance Tracking

Long-term performance tracking consists of well capacity monitoring, wellhead inspection and testing, and water quality monitoring. Long-term performance tracking will be conducted routinely throughout the life of the remedial action. Performance tracking data will be used to report well performance trends and to identify potential performance declines. Performance tracking frequency requirements are shown in Exhibit 4.1-3. Long-term performance tracking data will be reported in the Well Performance Report, as described in Section 4.2.5.

• Biological Activity Tests		X	X		X
• Sand Content		X[b]	X		X
• Modified Fouling Index (MFI)		X			X

Notes:
[a] The frequency of manual well capacity measurement for wells used for determining hydraulic gradients and/or capture zones is monthly when the Remedy SCADA system is capable of calculating a daily average well capacity based on minute data. If this assumption is not true, the frequency should be increased to weekly as that becomes the only means of performance monitoring. The frequency of manual well capacity measurement for wells not used for measuring gradients and/or capture zones is annually, or as needed, based on performance data.
[b] Extraction wells will be sampled monthly for the first quarter, quarterly for the next three quarters, semiannually between years 1 and 2 of operation, then annually after the second year of operation.

4.1.2.1 Well Capacity Monitoring

The Remedy SCADA system will record water levels and extraction/injection flow rates from data transmitters at the wells (electronic data). With these data, the SCADA system can track well capacity at selected frequencies.

To evaluate the level-indicating transmitter (LIT) accuracy and as a backup in case of level transmitter failure, water levels should be measured manually as part of the performance evaluation and documented for reporting purposes. Manual water level data should be collected from within dedicated sounding tubes/stilling wells, or if a sounding tube/stilling well is unavailable, from within the well casing. If the electronic and manual water level data (and resulting capacity calculations) disagree, then the level probes must be rescaled or evaluated for functionality.

A generalized well performance color code system related to well capacity has been established for use by the technicians in the field, and is summarized in Exhibit 4.1-4.

The demotion/promotion of the performance color code will result in consideration for routine maintenance frequency changes (see Exhibit 4.2-1 in Section 4.2.1, Routine Maintenance). For example, if the capacity of a given well drops below 85 percent, the well will be coded as yellow and potentially undergo more frequent maintenance or rehabilitation until the capacity is improved. Regardless, well rehabilitation should be considered once the well capacity decreases to 75 percent of its baseline value (Driscoll 1986). The expected rehabilitation frequency for the different types of wells is presented in Section 4.2.3.

EXHIBIT 4.1-4
Well Performance Color Code System
Groundwater Remedy Operation and Maintenance Manual
Volume 1: Operation and Maintenance Plan
PG&E Topock Compressor Station, Needles, California

Well Performance Code	Well Performance Color Code Description	Well Performance Percent of Baseline (low range)	Well Performance Percent of Baseline (high range)
Code Green	Good	90	100
Code Yellow	Fair	80	90
Code Red	Poor	<70	80

4.1.2.2 Wellhead Inspection and Field Parameter Testing

Wellhead inspection and field parameter testing is intended to detect and evaluate damage to the above-ground well components, well casing and screen, and the discharge/supply line, and the potential for suspended solids in the freshwater source. Key elements of this inspection and testing that may be used include:

1. **Visual Inspection.** The aboveground discharge/supply pipe(s), valves, gauges, meters, well seals, well pads, vaults, and flanges should be inspected for visible leaks and damage.
2. **Field Parameters: temperature, pH, turbidity, specific conductance (SC), dissolved oxygen (DO), redox potential**. Field parameters should be measured in accordance with the methods listed in Exhibit 4.1-2.
3. **Biological Activity Tests.** Biological Activity Reaction Tests (BARTs) are bacteria testing kits used to measure the population size and activity of specific bacteria groups such as: iron related bacteria (IRB), sulfate reducing bacteria (SRB), slime forming bacteria (SLYM), and others. Fouling deposit samples can also be analyzed by specialty laboratories to quantify the composition of the sample and the type and amount of bacteria. Analyses typically include a microscopic evaluation to determine the amount of non-biological deposits such as iron and manganese oxide, silica, phosphate compounds, and insoluble particulates. Biological analyses include plate counts (colonies per milliliter [mL]), positive/negative tests for iron and manganese oxidizing bacteria and sulfate reducing bacteria, percentage of anaerobic/aerobic growth, adenosine triphosphate (ATP) (cells per mL), and specific bacterial identification.
4. **Sand Content Testing.** Sand testing using a Rossum Sand Content Tester is conducted to evaluate the amount of sand being produced from extraction wells and injection wells during backwashing.
5. **Modified Fouling Index (MFI).** The MFI test is a method of characterizing the plugging potential of suspended solids in the Source. The MFI test measures the combined effect of solids concentration, particle size, particle composition, and develops a clogging index (Hutchinson and Randall 1997) which provides a warning of potential clogging and helps to establish a frequency of rehabilitation or modification of the routine maintenance frequency.

4.1.2.3 Water Quality Monitoring

Water quality monitoring as discussed in this section pertains specifically to the assessment and tracking of well performance. Water quality monitoring for the purposes of plume monitoring or remedy performance is detailed in Volume 2 of this O&M Manual. During the life of the remediation system, water samples will be collected from the extraction and injection wells and the freshwater source. The samples will be analyzed for the biological and geochemical analytical monitoring parameters and field screening parameters listed in Exhibits 4.1-1 and 4.1-2, respectively. Results will be used as needed to evaluate causes of well performance decline and to mitigate or prevent plugging at the wells. Sampling frequency may be adjusted as the results are evaluated.

4.2 Well Maintenance

This section includes the general approach for maintaining the health of all the Topock wells related to the Final Remedy and is a guide to performance monitoring and maintenance frequency. This section describes maintenance activities conducted to ensure that the wells achieve the operational goals. Routine and non-routine activities discussed in this plan focus on individual wells and their elements (screen, casing, gravel pack, and the aquifer formation near the borehole wall, plus down-hole equipment and pumps). Maintenance information for above-grade equipment such as valves, gauges, flanges, meters, vaults, etc., are included in Section 2.

4.2.1 Routine Maintenance

Routine or preventative maintenance is used to mitigate performance losses at extraction and injection wells. Routine maintenance methods are generally conducted without intrusive modifications to the wellhead or well and do not require removing existing equipment from the well for access.

Simple operational procedures are implemented in order to prevent clogging and maintain well capacity over the service life of the well. One non-invasive procedure for extraction wells involves surging and pumping to remove siltation or mineral encrustation, while tightening the filter pack. Backwashing of the injection wells involves a similar non-invasive procedure. Backwashing is conducted by stopping injection and pumping the well for a short period. Backwashing removes the solids which have accumulated in the well screen and gravel pack during injection. Aqua Gard™ is the other non-intrusive method that can be done on both extraction and injection wells.

The initial recommendation for routine maintenance frequency is discussed in Section 4.2.3. However, as maintenance activities are implemented during system operation the frequency may change based on the conclusions of well performance tracking data. Exhibit 4.2-1 presents suggested modifications to routine maintenance frequencies based on the color code assigned to each well though performance tracking.

Operational details associated with routine maintenance for extraction and injection wells are presented in the following subsections, respectively.

		Extraction Wells		Injection Wells		
Well Performance Code	Well Performance Color Code Description	Frequency of Pumping and Surging (months)	Frequency Aqua Gard™ (months)	Frequency of Backwashing (weeks)	Frequency Aqua Gard™ (months)[a]	Performance Criteria for Code Promotion
Code Green	Good	As needed	18	1	12	Not applicable
Code Yellow	Fair	As needed	12	0.75	9	Improves to more than 90% of baseline
Code Red	Poor	As needed	6	0.5	6	Improves to more than 80% of baseline

Notes:
[a] Aqua Gard™ may not be used on IRZ injection wells and if it is, the frequency is to be determined.

4.2.1.1 Extraction Well Routine Maintenance

Extraction well routine preventative maintenance methods include redevelopment by pump and surge methods. Pump and surge methods consist of rapidly cycling the submersible pump on and off (surge) several times (approximately five times) so that water rushes in and out of the well screen causing flow reversals in the gravel pack and formation, followed by pumping. During pump and surge, the pump should be run only long enough to fill the riser pipe. Following pump and surge, the specific capacity should be recorded at the end of each pump cycle. Pump and surge activities should continue until little improvement is measured for the specific capacity

after each cycle. Pump and surge routine maintenance only works on extraction wells where a foot valve or check valve is absent in the pump and column pipe and an air relief valve is installed at the well head prior to any check valves, flow meters or other equipment or valves. Extraction wells that do not have this type of equipment configuration should not be pumped and surged as no flow reversals will occur in the well rendering the work of no use. The pump and surge activity will generally be performed manually, although it may be partially automated using the SCADA. Required equipment may include a tank, trailer, bag filter and hose.

Aqua Gard™ is a more aggressive routine maintenance event that can be conducted at both the extraction and injection wells. The method is completed by injecting cryogenic liquid carbon dioxide (CO_2) into existing well access tubes. During the injection, plugging and fouling deposits are dislodged and detached from the filter pack and formation through rapid gas expansion during the liquid/gas phase change. Once the injection is complete, pumping, surging, and/or backwashing is employed to agitate and remove the material that was loosened during the injection. Some of the necessary equipment needed to conduct Aqua Gard™ may include all or some of the following: a CO_2 injection trailer, CO_2 storage vessel, support truck, pump rig and/or crane (if a pump or pipe needs to be installed/removed), bag filters, and a support truck. This equipment is similar to what was used during the IM-3 injection well Aqua Gard™ work that was completed in spring of 2012. There may be unforeseen or other specialty equipment that is not included in the list above.

Periodic pump and surge and Aqua Gard™ activities may be conducted at each extraction well. The initial frequency of pump and surge activities and Aqua Gard™ are presented in Section 4.2.3, but the frequency may increase if well performance declines between events. Conversely, if well performance trends remain stable, the frequency could decrease.

Application of Code Red classification for six or more consecutive cycles may indicate that the well requires repair or invasive rehabilitation methods. The inability to recover specific capacity through routine maintenance should be considered alongside the performance evaluation data. Once the cause(s) of the performance decline are better understood, a plan should be established to repair or rehabilitate the well. Other existing plans may influence the decision to proceed with repair or rehabilitation.

Extraction wells that are operating under idle mode operation should be periodically exercised by returning the well to extraction mode operation for 24 hours. Routine maintenance events at idle wells may occur at the same frequency as for wells that are active.

4.2.1.2 Injection Well Routine Maintenance

Backwashing is a routine preventative maintenance method used to prevent injection well performance loss. Backwashing consists of turning off injection and pumping the well for a total of 30 minutes. Some wells will require that pumping is paused (stopped) before a total of 30 minutes so that the pumping water level does not reach the well screen depth – this allows the well to recover before being backwashed for the remaining time until a total of 30 minutes of pumping has been accomplished. Backwashing loosens and removes sediment, encrustation, or biofouling that may be present on the well screen or gravel pack. It is anticipated that the backwashing pumping rate will be roughly twice the injection rate. The backwashing will be conducted such that the recovery period is normalized, i.e. the well will restart at a fixed water level recovery percentage (such as 90 percent), so that the recovery can be consistently compared across backwashing events.

As discussed above in the Extraction Well Routine Maintenance section, the Aqua Gard™ application can also be used at the injection wells. The process and steps are similar as discussed above except backwashing will follow injection.

The initial frequency of backwashing and Aqua Gard™ are presented in Section 4.2.3, but the frequency may increase if the well performance declines and may decrease if routine maintenance improves the well performance.

Well repair or rehabilitation may be required for injection wells that operate under a well performance Code Red. The inability to recover specific injectivity through routine maintenance should be considered alongside the performance evaluation data. Once the cause(s) of the performance decline are better understood, a plan should

be established to repair or rehabilitate the well. Other existing plans may influence the decision to proceed with repair or rehabilitation.

Routine maintenance events at idle injection wells may occur at the same frequency as for wells that are active.

4.2.2 Non-Routine Maintenance

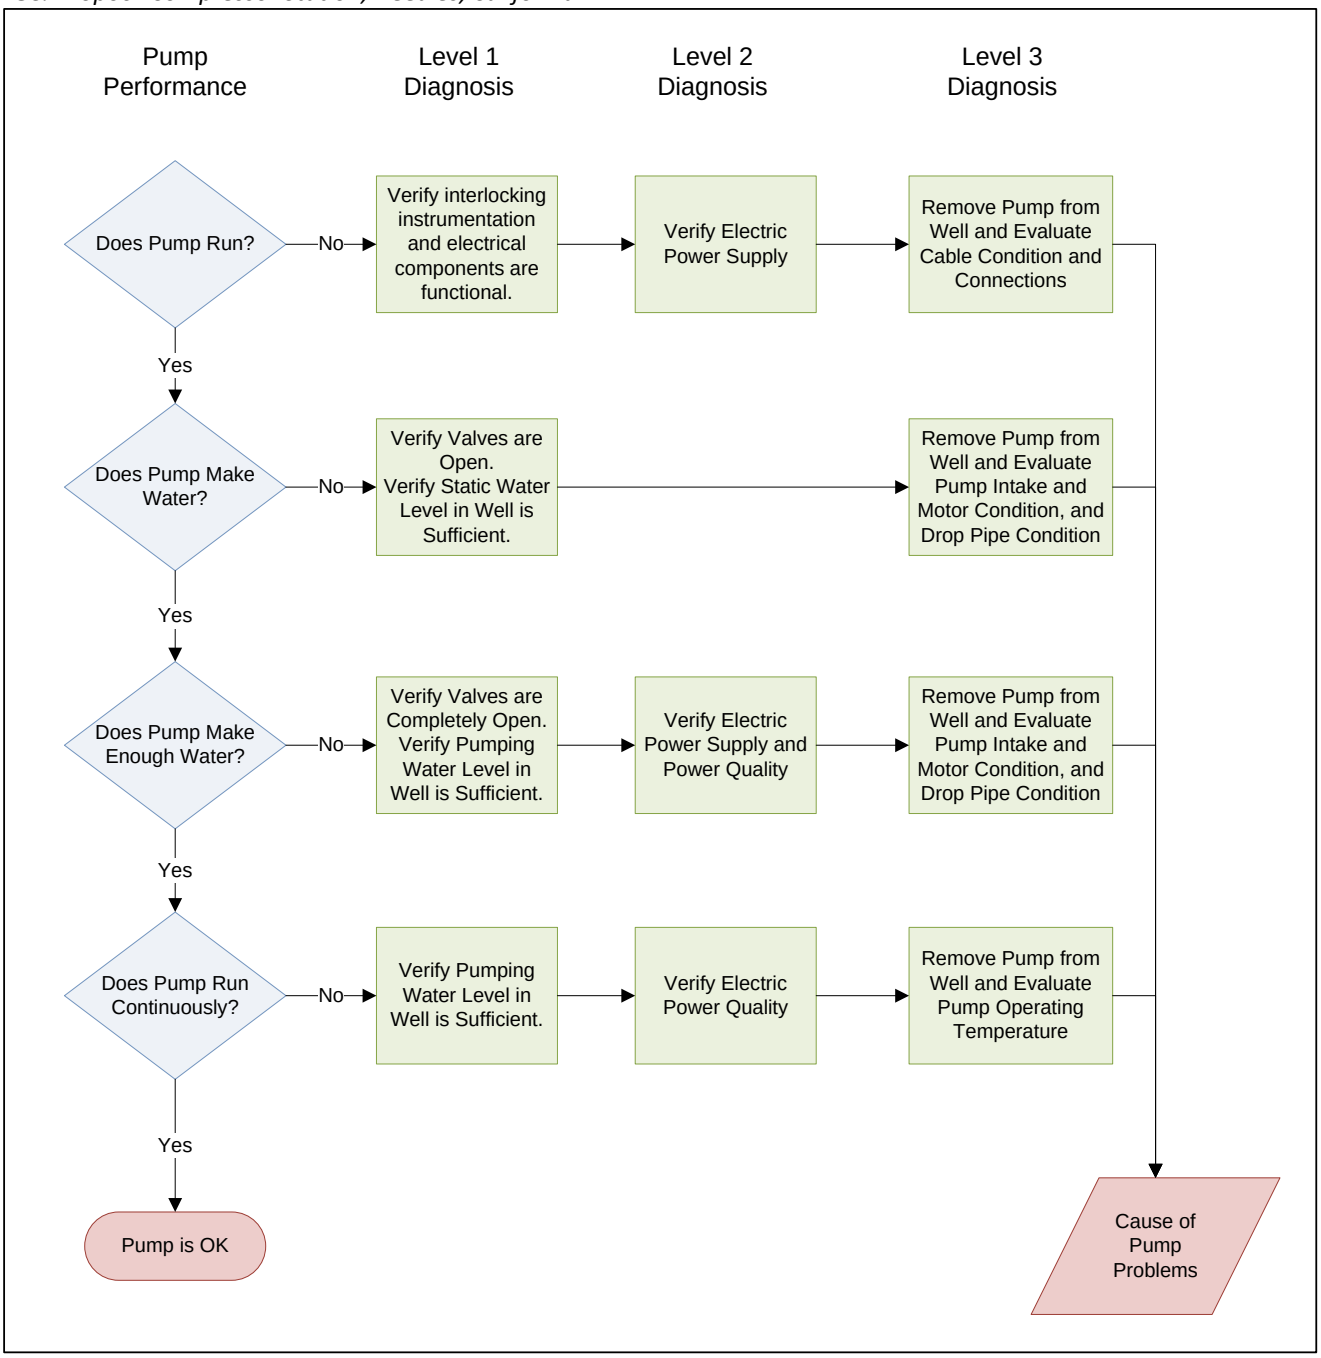
This section describes the non-routine maintenance activities conducted at the extraction and injection wells. Non-routine maintenance methods are intrusive, requiring removal of existing equipment from the well prior to conducting maintenance. Drop-pipe replacement, submersible pump repair/replacement, and well repair and well rehabilitation are the three types of non-routine maintenance included in this plan. Although the causes of performance losses often differ for extraction wells versus injection wells, well rehabilitation techniques may be the same.

4.2.2.1 Drop-Pipe Inspection and Replacement

Over time, the column pipe in extraction wells and drop-pipes in injection wells can corrode, negatively influencing pumping or injection activities. Column/drop-pipe should be thoroughly inspected for corrosion and damage every time equipment is removed from the well. Corroded or damaged pipe and couplings should be replaced if threads, rings, or seals are damaged by corrosion or fluid abrasion/erosion.

Formation silt and sand, filter pack, and other debris will accumulate at the bottom of the well or sump over time. Anytime the drop-pipe is removed from the well, the total depth of the well should be measured and compared against the well completion diagram depth to determine the amount of debris in the well sump. If more than 30 percent of the sump is filled with debris, the sump should be bailed free of debris prior to reinstallation of the drop-pipe or pump equipment.

4.2.2.2 Submersible Pump Repair and Replacement



The majority of down-hole equipment maintenance needs in extraction wells are associated with the submersible pumps. Over time pump components wear out. Based on site experience, submersible pumps have lasted for 5 to 7 years under normal operating conditions. Conditions that can reduce the life of a submersible pump include: wear to the pump from excessive sand related to the well, a well that is not plumb and straight, blocked or plugged pump intake, improper motor cooling, corrosion, extended cavitation, and poor electricity supply. Diagnosis of the cause of pump problems is outlined in Exhibit 4.2-2.

Most problems that center on the pump require that it be removed from the well for troubleshooting purposes. Submersible pumps may provide some advanced warnings, such as decreased production due to impeller wear and electrical changes (amp draw), but may provide no advance warning of problems, other than failure to operate. However, the pump and electrical system should be tested for function prior to removing the pump. If pump issues cannot be resolved, the pump should be removed and the drop-pipe, pump, intake, motor, and cable should be inspected, then the pump should be tested for function to determine if it needs to be repaired or replaced. Spare submersible pumps will be available for replacement while the removed submersible pump is being tested or repaired.

The diagnoses listed in Exhibit 4.2-2 usually point to an obvious remedy, whether the remedy is to reset a circuit breaker, provide electrical power conditioning, rebuild a pump or motor, or replace.

Inadequate cooling of the pump motor may cause premature failure of the pump. Submersible pumps require sufficient water flow around the motor for cooling; this is achieved by placing the pump above the well screen so that groundwater flow is from the bottom of the pump to the intake (the pump motor is located below the intake), and velocities past the motor are greatest. Although most submersible pumps are set adjacent to a blank section of well casing so that flow is from below the pump, other considerations at some wells may require placement of the pump within the well screen. At these locations a cooling shroud may be placed around the pump to direct the flow from below the pump if there is sufficient space between the pump and the well screen to keep flow velocities within the correct range.

4.2.2.3 Well Rehabilitation

If well performance declines, and routine maintenance proves ineffective, then more extensive measures are required. Well rehabilitation is defined as restoring a well to its most efficient condition by various rehabilitation methods (Driscoll 1986). Experience indicates a large range in the rehabilitation frequency: 1 year to greater than 10 years. When well repair, rehabilitation, and reconstruction cannot restore the well performance to acceptable levels, well decommissioning and new well installation is the final and most costly step. Typical industry well rehabilitation costs are 10 to 20 percent of the costs of a new well. Therefore, time and attention paid to ongoing well maintenance and monitoring is a sound investment.

There are numerous causes of well performance loss. Depending on the plugging or clogging mechanism, the recommended rehabilitation method may vary. Well rehabilitation programs must be tailored to the given well conditions and problems. This plan lists rehabilitation methods that focus on a specific problem. It is thus critical to understand the cause of well performance decline in order to develop a successful rehabilitation program.

Typically, rehabilitation consists of seven basic steps:

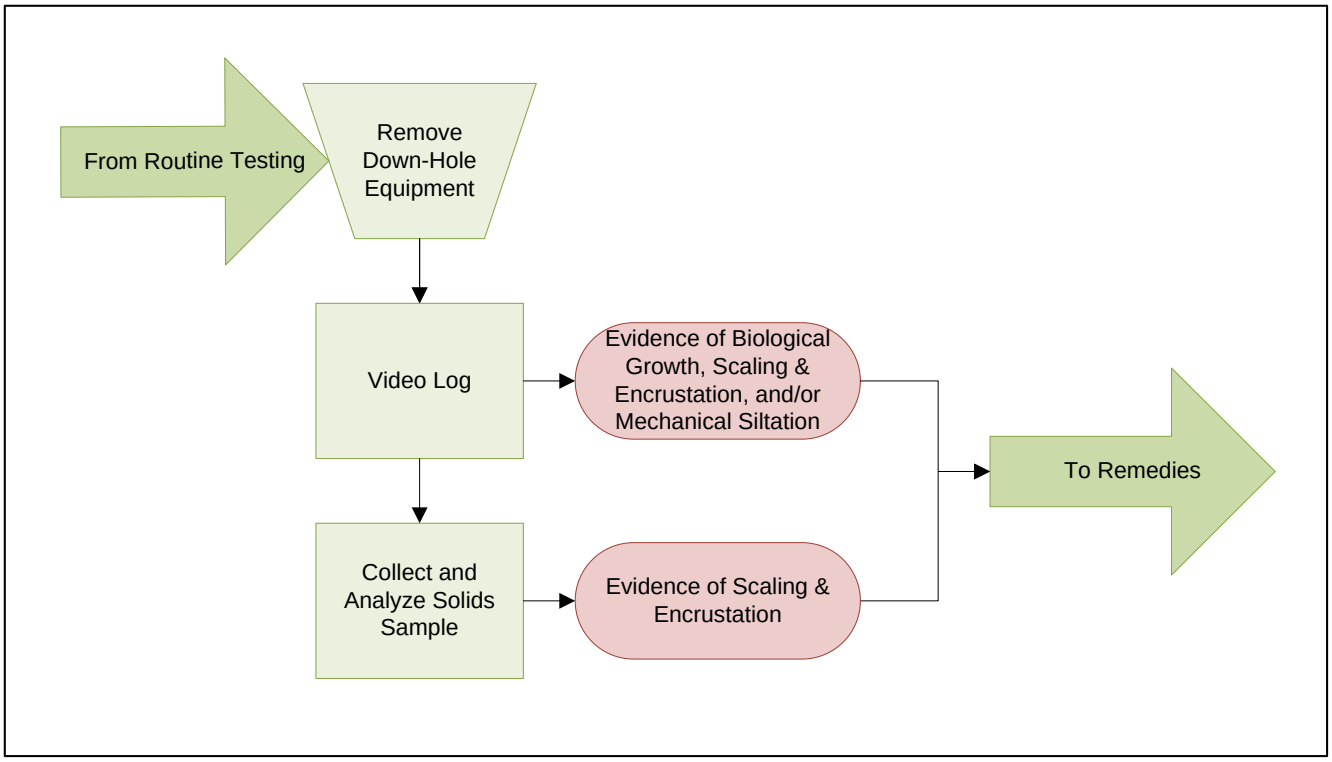
1. Diagnosis of Well Problem
2. Pre-Rehabilitation Testing
3. Conditioning
4. Chemical Application
5. Mechanical Agitation and Removal
6. Post-Rehabilitation Testing
7. Wellhead Reassembly

The focus of well rehabilitation is to effectively remove the material that is plugging the well and restore capacity. The general well rehabilitation steps are outlined in more detail in the following sections; however, specific plans for well rehabilitation activities will be prepared at the time rehabilitation is required, as rehabilitation methods must be custom tailored for each well and rehab method.

Some of the necessary equipment needed to conduct well rehabilitation work may include all or some of the following: a pump rig and/or crane, support or pipe truck, generator(s), air compressor, chemical trailer (mixing tanks and pumps), neutralization trailer (mixing tanks and pumps), support truck, video van, vac or tanker truck, forklift, and 20,000-gallon frac tanks. This equipment is similar to what was used during the IM-3 injection well chemical rehabilitation that was completed in fall of 2010. There may be unforeseen or other specialty equipment that is not included in the list above.

4.2.2.3.1 Diagnosis of Well Problems

Before an effective well rehabilitation program can be developed, the cause of well plugging or performance decline can be useful if it is possible to determine. Performance testing and monitoring is far less expensive and labor intensive than down-hole work, and so those methods will be exhausted to help diagnose well problems before implementing more invasive measures. Only after the diagnostic methods are complete should the following non-routine, invasive down-hole diagnostic methods be employed. The non-routine diagnosis of well problems is illustrated in Exhibit 4.2-3.



1. **Drop-Pipe Sampling**. The wellhead should be disassembled and the down-hole equipment removed in preparation for a down-hole video survey. During removal down-hole equipment should be examined for the presence, or lack of, scale and precipitates. Scale deposits on the down-hole piping provide direct evidence of the clogging material. If scale is present on down-hole piping, characteristics should be noted such as color, texture, odor, thickness, grain size, ability to remove from pipe, and reaction to acid. The scale deposited on the drop-pipe should also be photographed. If possible, a sample should be scraped from the piping and compiled and analyzed for the following:

- Physical characteristics: particle size distribution (electronic or visual counter), specific gravity, color, odor, scaling nature and shape, etc.
- Optical microscopy (visual description, microorganisms, crystalline or amorphous matter)
- X-ray diffraction
- Metal analysis (acid digested) – calcium (Ca), iron (Fe), manganese (Mn), chromium (Cr), aluminum (Al), barium (Ba), strontium (Sr)
- Acid insoluble fraction
- Biological analysis

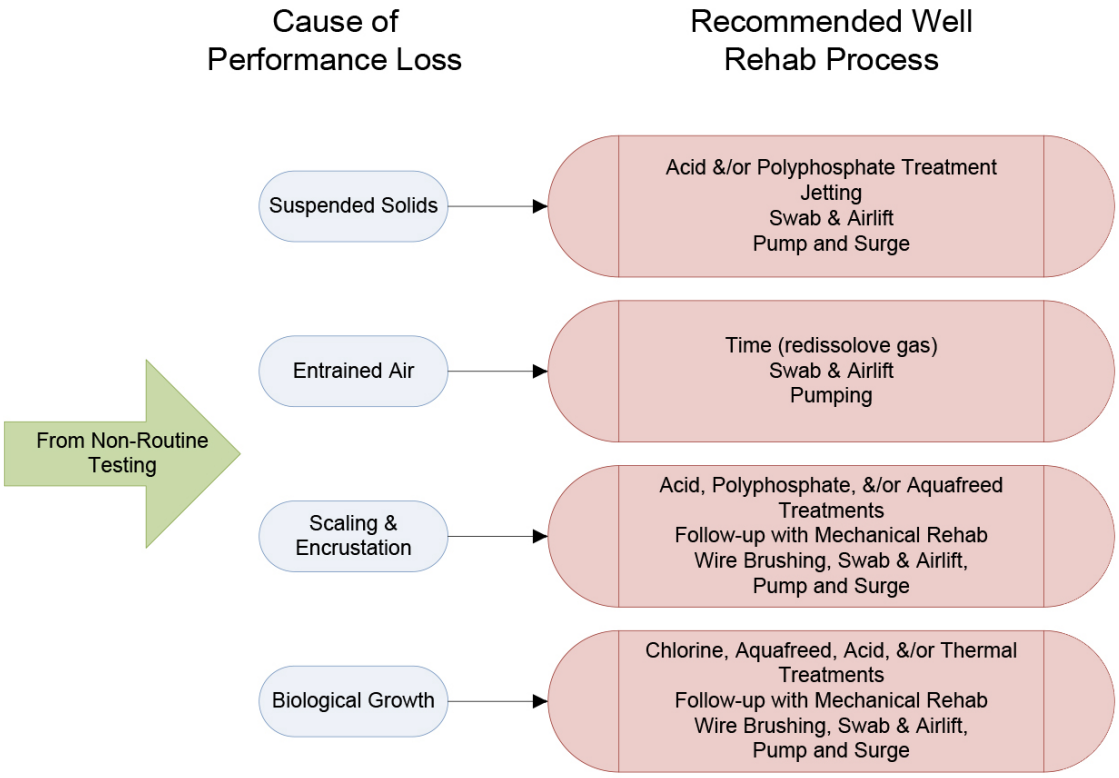
Extra samples should be collected and archived for later analysis. The down-hole piping, pump, and equipment must be cleaned and scale-free prior to reinstallation in well.

If scale is present on the drop pipe but cannot be sampled, a sample of biological scale or encrustation can also be collected from the well casing wall or screen using a scale sampler performed by a well geophysical logging contractor. Samples should be analyzed for the items listed above.

EXHIBIT 4.2-3
Well Problem Diagnosis using Non-Routine Methods
Groundwater Remedy Operation and Maintenance Manual
Volume 1: Operation and Maintenance Plan
PG&E Topock Compressor Station, Needles, California

2. **Video Survey**. The video survey results provide visual evidence of well problems. Specifically, this can include the degree and physical characteristics of encrustation deposited on the well screen; the structural condition of the well casing and screen; the extent of corrosion; the volume of sand and debris in the well sump; biological scaling or activity; and the percentage well screen surface area that is blocked. This type of information should be used to support well problem diagnosis.

   The video survey should be conducted using a color camera capable of side-scanning and photography plus video recording of the survey so that it can be viewed later. The video survey will also be encoded with depth. A video survey will be conducted before and after rehabilitation to evaluate the success of the rehabilitation program.



3. **Flow Logging and Aquifer Testing.** Flow logging is used to measure the contribution of groundwater to the well from various depth intervals of well screen. Baseline flow logging results are required for comparison and to understand the specific intervals or depths of well screen where clogging has occurred. Based on these results, well rehabilitation can focus on discrete clogging intervals.

A step-rate discharge aquifer test should be conducted so that the efficiency of the well can be evaluated. The test should include at least three steps, at recommended flow rates of 50, 100, and 150 percent of the design discharge or injection rate.

Borehole flow logging and aquifer testing will be completed before and after rehabilitation to assess the success of the rehabilitation program.

When the cause of well problems has been evaluated, a plan will be developed to remedy the causes. A summary of recommended actions, based on the cause of performance loss, is included in Exhibit 4.2-4. Details of the remedies are included in the following sections.

PG&E Topock Compressor Station, Needles, California

4.2.2.3.2 Conditioning

The purpose of conditioning is to remove loosened material from the well casing and screen, readying these surfaces for more aggressive rehabilitation measures. Conditioning reduces the consumption of chemicals which helps the chemicals reach a greater radius of influence from the well. The most common way to accomplish this is by wire brushing the well casing and screen followed by bailing the material from the well sump. These and other methods are described below.

Wire Brushing. Removes scale and deposits on the inside of the well screen and casing. The diameter of the wire brush should be greater than the inner diameter of the well casing by roughly ¼ to ½ inch.

Surging. Use of a single swab or dual surge block swab may be used to surge the well prior to chemical application to remove loose deposits and to “prepare” the gravel pack and formation.

Air Impact Gun. Use of down-hole tools that fire compressed gas as the tool is lowered down the well. This method is more effective at removing soft scale deposits such as bacteria or algae than wire charge devices.

Nitrogen is the most common gas utilized for air impact guns. Air impact gun methods are also often used as an agitating mechanism after application of chemicals and additives. Air impact gun methods are known to be currently available through the following licensed dealers:

- Boreblast II™, Registered Dealer: Layne Christensen Company, Fontana, CA
- Hydropuls®, Sole Licensee: Kleinfelder, Redmond, WA
- AirBurst®, Sole Licensee: Frazier Industries, Inc, Muskego, WI

Bailing. Bailing is the last step of conditioning to remove material that was brushed or blasted off the inner well casing and screen. A suction type bailer capable of removing sand and gravel from the well sump should be used. The well sump should be bailed free of sediment and debris before any chemical application is performed.

4.2.2.3.3 Chemical Application

If it has been determined during well diagnosis that a chemical application is required as part of the rehabilitation program, then the next step after conditioning is the application of chemicals. As the conditioning step targets cleaning the inside of the well, the chemical application step is designed to penetrate outside of the well into the filter pack and aquifer and to detach or dissolve the plugging material from those surfaces of the filter pack and aquifer formation. Chemical applications including the selection of chemicals and their concentrations must be tailored for each specific problem or well. However, the basic chemical application steps are as follows:

1. **Volume.** The volume of the chemical to be applied during the chemical application typically involves three times the saturated well casing and borehole volume to ensure sufficient penetration into the filter pack and aquifer formation. The volume of the well casing is determined using the well inside diameter, static depth to water and total depth of well. The volume of the borehole is determined using the borehole diameter, static depth to water, total depth of borehole, and 30 percent gravel pack porosity, minus the well casing volume previously calculated.
2. **Concentration.** The concentration of the chemical will vary for different rehabilitation programs, but needs to be considered prior to chemical application. Manufacturer specifications and expert recommendations are typically used to determine the concentrations applied in specific cases.
3. **Mixing.** Chemicals must be premixed (diluted) at the wellhead prior to injection. Chemicals should never be injected in their concentrated form as the chemistry concentrations will vary greatly inside the well.
4. **Injection.** The best practice for chemical injection into wells with long screens (e.g., screens 50 feet long or longer) is the use of an isolation tool that is typically 15 to 20 feet in length. When an isolation tool is not used, chemicals should be added through a tremie pipe from the well head. Using these methods, a batch of mixed chemical is injected at a specific depth interval. The tool/tremie pipe is lowered (or raised) so that the entire length of the well screen is injected or treated with the chemical. The volume of each batch injected into a specific zone should be calculated by dividing the number of batches by the volume calculated in Step 1 (equal volume per each injection zone).
5. **Agitation.** Once the entire interval of well screen has been treated with chemical, the well should be lightly agitated over the entire depth of the well screen. “Lightly agitated” is considered to be approximately 5 to 10 minutes per each well screen interval. Several agitation methods exist, but swabbing is the best choice for this step. Acceptable tools include a single swab, a dual swab (surge block), or the isolation tool that is used during injection. An isolation tool capable of airlifting (or pumping) while simultaneously swabbing the well screen is valuable as it can be used for chemical injection, chemical agitation, and mechanical agitation.
6. **Contact Time.** After chemical injection and agitation is complete, it is important to allow the chemical to have contact time with the filter pack and formation so that it can detach and dissolve the plugging material. In most cases, the chemical mixing, injection, and agitation steps utilize the majority of the day, thus allowing the chemicals contact time overnight. Typically, approximately 12 to 24 hours is provided for chemical contact time.

7. **Removal.** Mechanical agitation and removal of solids always follows chemical application. Any unexpended chemicals in the wells will be removed during the mechanical rehabilitation processes.

4.2.2.3.4 Selection of Chemicals

The selection of chemicals and their concentrations must be tailored for each specific problem or well (see Well-SOP-07, Well Rehabilitation Bench Testing). Numerous chemicals and additives are available for rehabilitation applications. For example, at a similar groundwater remediation project at the PG&E Hinkley Compressor Station, hydrochloric acid was initially used for IRZ well cleaning and resulted in well screen corrosion. To date a phosphoric acid (NuWell 120) and a biodispersant (NuWell 310) have been used with success on IRZ, clean water injection, and extraction wells. A variety of materials comprise the various well screens at the Hinkley site including low-carbon steel, copper-bearing mild steel, and stainless steel. No corrosion has been detected in Hinkley wells during post-chemical cleaning video logging since the use of hydrochloric acid for well cleaning was discontinued. Similarly, variables specific to the Topock site such as groundwater chemistry, pre-injection amendment chemicals, and well construction materials must be considered when selecting the appropriate chemical(s).

Available chemicals for well rehabilitation are categorized under the following types: Inorganic acids, organic acids, Bases, disinfectants, oxidants, reductants, corrosion inhibitors, surfactants, dispersants, wetting agents, chelating agents, and enhancers. A summary of available chemicals that are anticipated to be most applicable to the Topock site are listed in Exhibit 4.2-5. Other chemicals may be used during well maintenance events but are not listed in Exhibit 4.2-5, including sodium chloride and sodium hydroxide.

Acids are discussed in more detail due to the large selection of chemical products, which are classified as either inorganic or organic acids. Acids commonly used in well cleaning applications include the following:

Inorganic Acids:

- Hydrochloric or muriatic acid (HCl)
- Sulfuric acid (H_2SO_4)
- Sulfamic acid (H_3NSO_4)
- Phosphoric acid (H_3PO_4)

Organic Acids:

- Hydroxyacetic or glycolic acid ($C_2H_4O_3$)
- Citric acid ($C_6H_8O_7$)
- Ascorbic acid ($C_6H_8O_6$)

Inorganic Acids

- **Hydrochloric acid** is an inorganic acid effective at removing hard mineral scale deposited on the filter pack and aquifer formation particles. Hydrochloric acid has the longest history of use as a chemical used for well rehabilitation applications and is very effective for several applications. As it is corrosive, hydrochloric acid must be used with an inhibitor, such as QC-21 or Rodine 103NPF, that minimizes its corrosive effect. Hydrochloric acid is typically available in a liquid form that is 32 percent acid, which should be diluted to 8 to 15 percent for well rehabilitation.

- **Sulfuric acid** is an inorganic acid that is a good alternative for HCl because it is less corrosive, but sulfuric acid is not as strong as HCl.

- **Sulfamic acid** is an inorganic acid effective at dissolving calcium and magnesium carbonate but has little ability to dissolve iron and manganese deposits. Sulfamic acid is often selected over hydrochloric because it is less corrosive. Corrosion inhibitors should still be mixed with the acid solution. Sulfamic acid is typically available in powder or pellet form and should be mixed to 8 to 15 percent for well application. Sulfamic should not be confused with sulfuric acid.

  Phosphoric acid has no particular advantage over other acids in the ability to dissolve iron and manganese compounds except for sulfate salt removal (Smith 2007). Reactions associated with phosphoric acid are slow, so the contact time during rehabilitation will need to be greater than with HCl (12 to 24 hours). Phosphoric acid is less corrosive to metals than hydrochloric acid and provides some passivation of metal surfaces resulting in future corrosion protection. Phosphoric acid is safer to handle since it does not have the

EXHIBIT 4.2-5

Summary of Available Chemicals for Well Rehabilitation Applications

Groundwater Remedy Operation and Maintenance Manual
Volume 1: Operation and Maintenance Plan
PG&E Topock Compressor Station, Needles, California

Chemical or Product	Chemical Formula	Primary, Secondary, Additive?	Chemical Type	Purpose	Notes
Hydrochloric Acid	HCl	Primary	Inorganic Acid	Geochemical scale and inorganic metal oxide scale	Also called muriatic. Highly corrosive - must use inhibitors. Do not mix with chlorine.
Sulfamic Acid	H_3NSO_4			Ca and Mg carbonate	Also an acid enhancer for acetic acid
Sulfuric Acid	H_2SO_4			Geochemical scale or encrustation	Less corrosive than HCl (not typically used)
Phosphoric Acid	H_3PO_4			Metal and mineral hydroxides, sulfate salts	Often used with biological dispersant
Hydroxyacetic Acid	$C_2H_4O_3$	Secondary	Organic Acid	Biofouling and disinfecting	Also called glycolic acid, often mixed with HCl
Acetic Acid	CH_3COOH			Biofouling	Acidizing to pH<2 with sulfamic acid recommended.
Citric Acid	$C_6H_8O_7$			Dissolves iron deposits, disperse biofilms	Useful as chelating agent
Oxalic Acid	$C_2O_4H_2$	Primary or Secondary		Reductant and chelating agent. Effective as primary acidizer in low-Ca water, removes iron	Reductant. Can form insoluble scale if Ca > 125 ppm in water.
Ascorbic Acid	$C_6H_8O_6$			Iron and manganese scale	Reductant
Hydrogen Peroxide	H_2O_2	Secondary	Disinfectant/Oxidant	Biofouling and disinfecting	Often mixed with HCl
Sodium Hypochlorite	NaOCl	Primary		Biofouling and disinfecting, sulfide removal	Used for "shock chlorination". Use of chlorine based products result in the formation of trihalomethanes
Chlorine Dioxide	ClO_2			Biofouling and disinfecting	Common disinfectant in drinking water
Potassium Hydroxide	KOH		Base	Shocking microorganisms that have previously been treated with acids.	Extremely corrosive, do not add to acids
Polyphosphate	NA	Additive	Polymer	Disperses dislodged scale	Use only phosphate free polymers
Aqua Clear™ PFD	NA		Dispersant	Disperses mud, sediment and clay	Phosphate free dispersant
Rodine-103/ Rodine-213	NA		Corrosion inhibitor	Protects against corrosion	Additive needed for some acids
QC-21	NA		Corrosion inhibitor/Surfactant	Biological slime dispersion and disinfectant	Should be mixed with other acids. Mainly for corrosion protection.
CB4	NA		Wetting agent	Helps get chemicals further into formation	Often used in Blended Chemical Heat R
Nitrogen	N	Other	Compressed gas	Dislodges and detaches deposits as compressed gas is fired into well.	Driver of air impact guns
Carbon Dioxide	CO_2	Other	Cryogen (solid, liquid or gas)	Dislodges and detaches deposits during phase change	Cryogenic - freeze thaw.

Note:
NA = Not available

dangerous hydrochloric acid fumes and is much less corrosive to eyes and tissue. Phosphoric acid should be used with a polymeric biodispersant to limit the formation of phosphate and the possible resulting bacterial stimulus. But, phosphoric acids have the potential to provide nutrients for biological regrowth and this should therefore be considered during rehabilitation planning.

Organic Acids

- **Hydroxyacetic acid, or glycolic acid,** works best to disperse biological slime and as a disinfectant. Hydroxyacetic acid is best to use if iron-related bacteria have been identified as a problem, as this acid will directly attack iron bacteria. Hydroxyacetic acid is a weak organic acid, and thus is relatively non-corrosive, but requires much more contact time (typically, 12 to 24 hours) during rehabilitation as its reaction is slow (roughly 0.8 billion times slower than HCl [Mansuy 1999]). Hydroxyacetic acid comes in both powder and liquid form.
- **Citric acid** is an organic acid that is very soluble in HCl and can be used with HCl to improve solubility of phosphates and iron deposits. Solutions of citric acid will support bacterial growth. In general, citric acid is weak and should always be used with a stronger mineral acid.
- **Ascorbic acid** is an organic acid that is effective at dissolving iron and manganese oxides. Dissolution occurs as the chemical acts as a reductant that transforms insoluble metal oxide species into more soluble reduced species (Houben and Treskatis 2007).

Commercially Available Products

Many commercial brand name products for well cleaning and rehabilitation are sold as a mix of the chemicals listed in this plan, such as an acid and a corrosion inhibitor. Some examples of these products include: Aqua-Clear AE (glycolic acid), Aqua-Clear MGA (sulfamic acid/sodium chloride), NuWell® 120 (phosphoric acid), NuWell® 310 (bioacid dispersant), NuWell® 400 (non-Ionic surfactant), Tolcide®(biocides to inhibit microbial growth), BETZMPH500 (citric acid: chelating agents), Rodine 103NPF (corrosion inhibitor), etc. These are just examples of some commercial names and mixtures. As new products are developed and chemical companies emerge, more options will become available, so there may be products not listed in this plan that will be utilized for well maintenance at Topock; however, the product should consist of chemicals listed in this plan.

Many of the above listed commercial mixtures, including Aqua-Clear AE, Aqua-Clear MGA, NuWell® 120, NuWell® 310, NuWell® 400, and BETZMPH500, are certified under the specifications of National Science Foundation/ American National Standards Institute (NSF/ANSI) 60-2005 (Drinking Water Treatment Chemicals –Health Effects). The NSF/ANSI 60-2005 certified compounds listed above are routinely used for rehabilitation of drinking water wells in California under the California Waterworks Standard (California Code of Regulations Title 22, Section 64590: Direct Additives). Additional chemicals that are not listed here, but with similar properties or certifications, may also be used for rehabilitation.

4.2.2.3.5 Mechanical Agitation and Chemical Removal

Mechanical redevelopment is the agitation and removal of dislodged, detached, and dissolved deposits. Effective agitation followed by removal is the most important step for any rehabilitation program. The greater the hydraulic energy induced in the well during agitation, the greater the radius of influence will be, resulting in a more effective rehabilitation.

If during the diagnosis step it is determined that chemical application is not required as part of the rehabilitation program, then the sequence of rehabilitation activities will be conditioning followed by mechanical agitation and removal.

Mechanical agitation involves the concentration of energy on discrete intervals of the well screen so that the energy is transmitted in all directions away from the well and transferred into the filter pack and formation. Groundwater is the vehicle used to transfer energy away from the well during mechanical agitation and to then transport the dislodged/dissolved deposits from the filter pack and formation to the well for removal.

Typically, approximately 2 to 6 days should be spent conducting mechanical agitation and removal activities during rehabilitation, although rehabilitation programs will vary for each well depending on its depth and condition and must be specific to the problems diagnosed and to the well's response during rehabilitation. Mechanical agitation and removal should continue if it is apparent that material is being removed from the well and the capacity is improving enough to justify the cost.

There are several tools and methods used to achieve mechanical agitation. Mechanical agitation and removal techniques can involve swabbing, jetting, surging, and pumping. The best, proven techniques are those where both agitation and removal are achieved simultaneously, thus eliminating one step. If adequate submergence exists, surge block with airlifting is a very effective and efficient method. Regardless of the selected mechanical agitation technique, pumping and surging should always be conducted as the final step during mechanical agitation and removal. Hence, surge block with airlifting (or pumping) followed by pumping and surging is a sensible approach for agitation and removal. Each agitation and removal method is described below.

Swabbing (agitation). Agitation involves aggressively raising and lowering the swab tool in the well screen interval, creating a plunger effect. As the swab is raised and lowered, extreme pressure differences occur above and below the swab. The pressure difference will depend on whether the tool is being raised or lowered. Swabbing is one of the best agitation procedures to detach deposits from the filter pack and formation and move them into the well. Swabbing alone must be followed by a removal or pumping method such as air lifting and bailing.

A swab consists of a rubber disc sandwiched between two metal discs. The swab (or set of cleaning discs) is attached to rigid pipe. Swabbing tools can consist of either a single or double swab.

Air-Lift Pumping (removal). Air-lift pumping utilizes compressed air to lift water from the well. Air lift pumping is essentially the same process described in the injection well routine maintenance section as backwashing. In this method, an eductor pipe (discharge drop-pipe) and an air line are used to perform pumping where the bottom of the eductor pipe is open-ended and installed to a depth where pumping will occur. The airline is often installed inside the eductor pipe some distance above the bottom of the pipe. The larger the eductor pipe and airline diameter, the greater the pumping rate will be during airlifting.

Jetting (agitation and removal). Jetting involves a pipe equipped with nozzles into the well screen and injecting a high velocity horizontal stream of water through the pipe into the screen openings. The high-energy jet of water agitates and rearranges the filter pack, loosening debris. Typically a submersible pump is incorporated into the jetting assembly to extract the injected water and maintain the static water level, however; alternate removal methods (i.e. air lifting, centrifugal pump) are acceptable. The jets are moved vertically along the screened interval and rotated, if needed, to effectively address the entire screen surface area. Typical jetting tools have two to four nozzles; however site conditions and well diameter will ultimately dictate the number of nozzles.

Surge Block with Air-Lift Pumping (agitation and removal). The surge block with air-lift pumping (SBAP) tool is a combination of the dual swab tool (surge block or isolation tool) and airlift pumping (both described in this section). SBAP is very effective as both agitation and removal occur simultaneously. Proper airlift design is outlined in the airlift pumping section and should be followed when conducting SBAP activities.

During SBAP, the length of the zone interval is calculated and divided by the screen length to determine the total number of zone intervals required to treat or agitate:

$$\text{Zone Interval (ft)} = \text{bottom of tool at the downstroke} - \text{top of tool at the upstroke}$$

SBAP activity will be focused at one zone interval at a time starting with the shallowest zone and working downward. Agitation is created by aggressively raising and lowering the tool while simultaneously airlift pumping, followed by airlifting pumping without agitation, typically this can be achieved using a spudder rig, or a rig that is capable of spudder. During SBAP activities, the water color, turbidity, and sediment concentration should be measured and recorded after every agitation/air-lift pump cycle.

Turbid and/or discolored discharge water means that material is being dislodged and removed from the well. Clear discharge water after aggressive agitation indicates that the energy level is too low to dislodge and remove additional material, or it may be that the zone has been cleaned and activities should be focused on the next zone. As a rule of thumb if turbid and/or discolored discharged water is being generated, then progress is being made and should continue until the water becomes clear.

Prior to and during SBAP, the depth of debris in the sump should be evaluated and removed by bailing if needed.

Pumping and Surging (agitation and removal). Pumping and surging activities should be conducted once the other agitation and removal methods described above are completed and the well is relatively clean. Surging causes flow reversals through the filter pack that will agitate, dislodge, and rearrange the formation particles and help break down sediment bridging in the formation. Pumping and surging is effective at removing fine material from the filter pack and formation and is the polishing stage of development or rehabilitation.

A test pump capable of over-pumping the well by 150 to 200 percent of the design rate should be installed in the well next to a blank section of well screen (preferably located in a section of casing where the screen is located above and below the blank casing). The test pump should not have a foot valve so that during pumping and surging, as the pump is cycled on and off, the water rushes in and out of the well screen at high discharge rates.

In surging, the pump is rapidly cycled on and off to produce agitation. The pump should only be run long enough to fill the drop-pipe and it is suggested that a sample port on the temporary wellhead be left open to indicate when water has reached the surface. When the drop-pipe is full, the pump is shut off, permitting the water to fall back into the well and the surrounding annular and aquifer materials. Surging should be repeated 5 to 10 times before pumping. After surging, the pump is run at a constant rate of 150 to 200 percent of the design rate of the well for 5 minutes to remove dislodged material.

The surging and pumping is done several times over the course of one or two days or until the specific capacity stops increasing. It is critical that at the end of each pumping cycle, the pumping rate, drawdown, sand content, and water color be recorded to monitor progress.

Bailing (removal). Removal of material from the bottom of the well by bailing should occur at the end of several rehabilitation steps: conditioning, surge block and airlift pumping, and surging and pumping. Bailing should always be the last step in the rehabilitation program before post-rehabilitation testing begins. A suction type bailer capable of removing sand and gravel from the well sump should be used.

4.2.2.3.6 Post-Rehabilitation Testing

Once pumping and surging activities are complete post-rehabilitation testing should be conducted to evaluate the success of the rehabilitation activities. Flow logging, step-rate discharge aquifer testing, and video surveying are types of tests that are useful for this assessment. Aquifer testing should be conducted at the same discharge rates and duration as the test conducted during the well problem diagnosis step. If a post-rehabilitation video survey is conducted, all equipment should be removed from the well and debris that may have accumulated in the sump should be removed prior to implementation.

Once post-rehabilitation testing is complete, a decision must be made whether the well should be returned to service or if additional efforts should be attempted to further rehabilitate the well. If the rehabilitation efforts are deemed successful, then the wellhead should be reassembled and the well returned to service.

Rarely does the capacity of a well return to its baseline value after rehabilitation efforts, as it is nearly impossible to completely remove the plugging material and fouling mechanism from the filter pack and aquifer formation. Nonetheless, an intuitive definition of a successful well rehabilitation program is one that returns the well capacity to its original value (100 percent). Well rehabilitation expectations must be managed so that realistic and reachable goals are established before rehabilitation efforts begin. As an example, if a well is rehabilitated after losing 25 percent of its original specific capacity and 15 percent is regained after rehabilitation efforts (to achieve 90 percent of the original capacity), then the rehab should be considered effective or successful. Well performance sustainability is another factor that should be evaluated to understand the effectiveness of well

rehabilitation, but this can't be done until the well is returned to service and several months of performance data are available.

Irreversible damage to the filter pack and aquifer formation may occur in wells that have experienced significant loss in well capacity (30 percent or more). While the original capacity may never be restored, experience with multiple wells at other sites suggests that successful rehabilitation can often restore roughly 75 percent of the baseline value. Consequently, it is important that actions be taken to rehabilitate wells during the early stages of plugging and fouling to reduce rehabilitation costs and improve rehabilitation results.

4.2.2.3.7 Wellhead Reassembly

Once it is determined that the well should be returned to operation, the down-hole equipment should be reinstalled in the well and the wellhead reassembled. Before installing equipment in the well, it is important to confirm that the well sump is free of debris. If it is determined that debris exists in the sump, the well should be bailed prior to installing any equipment. Once the down-hole equipment is installed, the wellhead, supply line, and instrumentation should be reassembled. Instrumentation measurements should be confirmed through the collection of manual measurements when possible to confirm functionality. Following complete reassembly, the well should be tested for approximately an hour to verify that it will function properly under normal operating conditions.

4.2.2.3.8 Other Rehabilitation Techniques

In addition to the rehabilitation process and methods discussed above in this section, other techniques may be considered based on a given well problem scenario. Advances in well rehabilitation methods provide additional techniques that that can be added to the well rehabilitation toolbox. All methods described in this section require that conventional well rehabilitation techniques (mechanical agitation and removal) be performed in conjunction with these methods. These methods are briefly described in this section and include the following:

Aqua Freed™. The Aqua Freed™ method is similar to Aqua Gard™, but requires removal of in-well equipment. The method uses cryogenic liquid carbon dioxide that dislodges and detaches filter pack and formation deposits through freeze-thaw, gas expansion, and the formation of carbonic acid during well rehabilitation. Conventional mechanical rehabilitation must be conducted before (conditioning) and after application (agitation and removal). No other chemicals are necessary, but adding a chemical application step is an option.

Wire Charge Devices. Detonation of a charged wire in the well produces mild shockwaves that loosen hardened deposits from the well casing and screen. Wire charge devices are known to be currently available through the following licensed dealers:

- Sonar-Jet™, Registered Dealer: Thompson Drilling, Moses Lake, WA
- Ener-Jet, Sole Licensee: Welenco, Bakersfield, CA

Blended Chemical Heat Treatment (BCHT). The BCHT method utilizes heat augmentation with a chemical mixture that involves three phases of application to shock, disrupt, and disperse (Alford and Cullimore 1998). The shock phase usually involves a water-jet injection of a tailored chemical mixture that is often a mix of acetic or glycolic acid and surfactants. The disruption phase is similar to the shock phase, but instead application is often with an inorganic chemical mixture such as hydrochloric acid and a corrosion inhibitor. During both phases of rehab, the chemical mixture is heated to 100 to 200°F. The first phase is intended to shock the bacteria and biofilms, the second to disrupt the biofilm, and the third to disperse or detach the biofilms from the well surfaces.

A simpler version of this method, which uses strong acidic and caustic chemical mixtures, is referred to as "ultra acid-base (UAB)" (Smith 2007).

Suction Flow Control Device (SFCD). This device is installed in pumping wells as a preventative measure, counteracting uneven groundwater flow from the formation and filter pack into the well (uneven well inflow). In any well, the pump represents the lowest pressure point in the aquifer affected by the well. In most scenarios where the pump is situated in the casing above the screen, almost all flow enters through the top 10 to 15 percent of the screen (Pelzer and Smith 1990). If the pump is situated in the screen, flow through the screen

occurs predominantly near the pump and can result in actual inflow velocities that are higher than the inflow velocities calculated using the Driscoll method. As a result, this can cause filter pack erosion induced in the high-velocity zone during well operation, which leads to sand pumping and increased filter pack plugging (Smith 2007). By using a SFCD device the path of water entering the pump is modified and the tendency of plugging near the pump intake is reduced. Aquastream, Inc. designs and fabricates SFCD systems.

4.2.2.4 Well Casing Repair

Extraction and injection wells may require repairs to maintain their structural integrity as they age. Common problems include holes in the well casing due to construction flaws, material failure, and/or extensive casing corrosion. Holes in well casing lend themselves to localized repairs, whereas the latter is best addressed with a complete re-line. Wells that have a hole in the well casing or screen are susceptible to excessive sand production. A hole or structural flaw is observed by use of a video log survey, which is typically prompted by the sand production. Because well repairs are site- or well-specific, general well repair methods are listed below.

Patching. A patch can be used to block a hole or gap in the well casing or damaged well screen. The need for a patch and the location is evaluated with a video survey. The patch may consist of a thin wall stainless steel tube with a vulcanized-rubber outer cover. The patch is swaged in place using a high-pressure inflatable packer or hydraulic swaging tool. Then the swaging tool is expanded until the thin wall tube yields, permanently swaging the outer rubber cover into a sealing contact with the original surrounding casing. The swaging tool is removed, and the inside well diameter is roughly equal to the original inside well casing diameter.

Relining. Relining methods are used when it is determined that more extensive structural problems exist, versus a localized hole or damage. Relining may consist of a long sequence of collars or sleeves swaged in place, or may entail building a complete new well within the existing well. Several relining methods exist that use inflatable packers and swaging tools to insert gravel pack liners (within well screen) and annular grouting (above well screen). Some features of the old well casing that may hamper the insertion of a liner include rough surfaces, insufficient well straightness or plumbness, and protrusions. Metal compatibly must be considered for metal liners so that corrosion related to dissimilar metals does not occur.

Reconstruction. A complete reconstruction of the well may be needed if damage is too extensive to remedy with patching or relining. Reconstruction will entail the removal of the old well casing and screen to permit the reuse of above-ground system components. During reconstruction the old well materials should be removed, the borehole should be reamed to a diameter sufficient to remove scale buildup in the old annular materials and aquifer materials, and the well should be reconstructed as determined appropriate. Reconstruction is typically only practicable for smaller diameter wells than can be effectively over-drilled.

4.2.2.5 Well Replacement

Wells that cannot be restored to a condition that is satisfactory to fulfill the given well objective using the routine or non-routine maintenance methods defined above may require replacement. Well replacement entails the construction of a new well within a new borehole, and should be considered as the least desirable option to achieve the given objective of a well. The location of replacement wells will be determined based on the evaluation of available remediation system performance data (e.g., current hydraulic gradient and water quality data, as well as model predictions), accessibility, and agency-approved work plans and compliance documents. If it is determined after further evaluation and discussions with agencies that a replacement well is warranted and that the most suitable location to achieve the well objective is within the area of the original well location, well replacement will proceed under the scope of this O&M Plan. The well that is being replaced may require decommissioning as presented in Section 4.3.

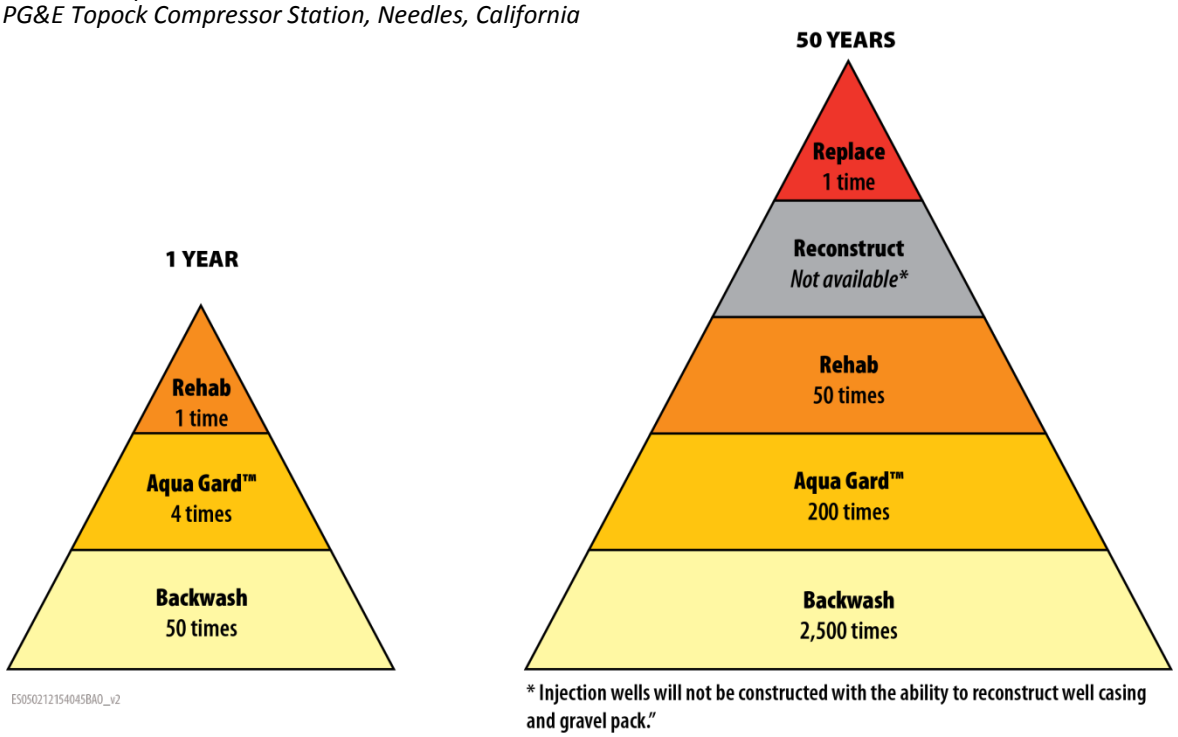
4.2.3 Well Maintenance Frequency

The estimated initial routine and non-routine maintenance frequency for each activity is summarized in Exhibit 4.2-6. The frequency of routine and non-routine maintenance events may vary from well to well, as one well may require more frequent backwashing or rehabilitation compared to another well. Further, routine and

non-routine maintenance frequencies will need to be refined as the system is operated. In general, as well performance declines, the well maintenance activities required to restore well health becomes more aggressive.

EXHIBIT 4.2-6
Estimated Frequency for Maintenance Activities
Groundwater Remedy Operation and Maintenance Manual
Volume 1: Operation and Maintenance Plan
PG&E Topock Compressor Station, Needles, California

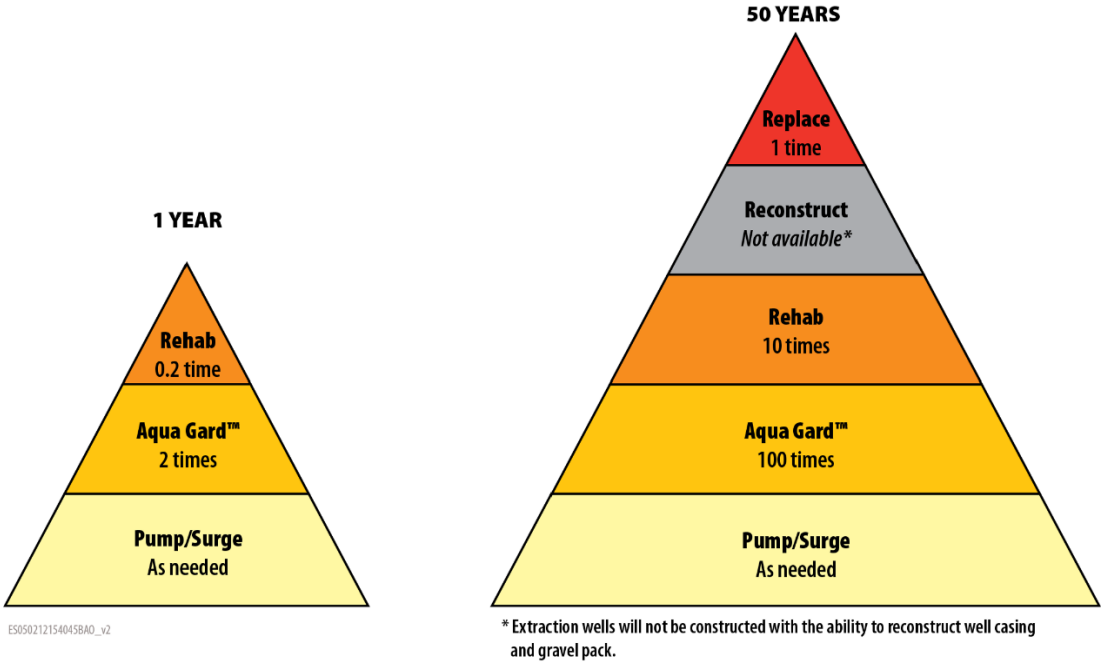
Maintenance Activity	Routine Maintenance	Non-Routine Maintenance	Extraction Wells Frequency [a]	Injection Wells Frequency	IRZ Injection Wells Frequency	Monitoring Wells Frequency [a]
Well Health						
Pump and Surge Event	X		As needed			
Backwash Event	X			3 to 7 days	3 to 7 days	
Aqua Gard™	X		6 months to 1.5 years	3 months to 1 year	TBD	
Well Rehabilitation		X	3 to 5 years	1 year	6 months to 1.5 years [b]	As Needed
Well Reconstruction		X				As Needed
Well Replacement		X	50 years	50 years	50 years	As Needed
Down-Hole Equipment						
Drop-Pipe Inspection and Replacement		X	5 to 7 years	5 to 7 years	5 to 7 years	
Pump Inspection, Repair, and Replacement		X	5 to 7 years	5 to 7 years	5 to 7 years	
Well Repair		X	As Needed	As Needed	As Needed	As Needed



Notes:

[a] Extraction wells are not considered to be good candidates for reconstruction due to their smaller borehole diameter. Monitoring wells are generally not anticipated to need replacement or reconstruction.

[b] The initially planned schedule for site IRZ injection wells is 6 months of operation followed by 18 months of non-operation. IRZ wells will be rehabilitated during the 18-month rest periods, unless backwashing fails to maintain well performance. In those cases, wells may be rehabilitated at a greater frequency during the 6-month operating period. The IRZ injection wells may be backwashed on a less frequent basis while they are not in service (i.e., during the 18-month off cycle).



Based on the estimated maintenance frequency outlined in Exhibit 4.2-6, the estimated number of times a maintenance activity will occur during each year and throughout the duration of the groundwater remediation activities are displayed in Exhibits 4.2-7 (for injection wells) and 4.2-8 (for extraction wells). These exhibits are conceptual and illustrate well maintenance frequency using pyramid diagrams where the activities near the top of the pyramid are more aggressive and occur less often than the activities at the bottom.

Volume 1: Operation and Maintenance Plan
PG&E Topock Compressor Station, Needles, California

Note: Extraction wells are not considered to be good candidates for reconstruction due to their larger borehole diameter.

4.2.4 Monitoring Well Acceptance

Monitoring wells will be inspected during routine sampling or gauging events to confirm that the condition of the well is acceptable for the given data collection objective (using Well-SOP-09 [Appendix B]). If a monitoring well is not sampled or gauged routinely, then the condition of the well will be assessed on an annual frequency, at minimum. Acceptance criteria will include:

- Wellhead Condition – All monitoring wells will be inspected to assess whether well protection features, including the well seal, well vault/protective monument casing, and concrete pad/collar, are in place and functioning as designed.
- Well Casing and Screen Integrity – Wells will be sounded to verify total depth and determine if there are obstructions that could prevent sample collection. Field parameter measurements collected during sampling events (e.g., turbidity and pH) will also be monitored for indications that the well screen or casing might be compromised by collapse or grout intrusion. If there are indications of downhole problems, video surveying may be conducted as a second-level method to evaluate well casing and screen integrity.
- Well Fouling – Measurements of pumping rate and resulting drawdown within the monitoring well during routine purging during sampling events will provide ongoing assessment of well performance. These measurements will be compared against those collected during assessment of baseline well performance measured during well development or initial purging events.

Monitoring well maintenance, including wellhead repair or well screen re-development, will be performed on an as-needed basis as deficiencies are identified. For example, if the well does not yield groundwater samples that meet the sample collection criteria identified in the appropriate SOP (e.g., sustained turbidity above the given criteria), then re-development should be conducted. If well maintenance actions alone do not sufficiently correct a well deficiency, then the need for monitoring well reconstruction or replacement will be assessed with the regulatory agencies prior to implementation. Specific criteria/triggers related to well redevelopment will include:

- Turbidity measurements will be tracked in monitoring wells during routine sampling events. When the final, stabilized turbidity measurement collected during well sampling is consistently measured in the range of approximately 20-30 nephelometric turbidity units (NTU) additional evaluation will be conducted to determine if the well should be re-developed. This evaluation will include review of relevant information including past development records, water quality and hydraulic measurements collected during sampling events, and hydraulic data collected from well testing or longer-term pressure transducer measurement. As re-development events are evaluated and performed the results will be used to determine whether monitoring well re-development should be performed on a more or less frequent basis.
- Measurement (SOP-A11, Total Depth Measurements) of infill (siltation) at a depth that corresponds to the bottom of or within the screened interval will trigger re-development. It should be noted that if the well was constructed with a sump (as opposed to a standard threaded cap at the bottom of the well) re-development may be required to remove thicknesses of sediment that collect below the well screen.
- Specific capacity measurements will be tracked over time and compared against the baseline measurements and from event-to-event. Decrease in the specific capacity of a monitoring well that precludes groundwater sample collection in compliance with SOP-A18 (minimal drawdown method) will be re-developed. For wells that are sampled in accordance with SOP-A1 (well-volume method), re-development will be triggered when the specific capacity drops below 70 percent of the baseline measurement (at the flow rate used for sampling).

4.2.5 Reporting

Reporting requirements associated with the baseline evaluation of a well and performance monitoring data collected during the duration of remedial activities are defined in this section.

Baseline reporting will be completed once all the wells have been drilled, installed, developed, and tested and will be included in the *Corrective Measure/Remedial Action Construction Report*.

The well performance tracking data will be evaluated and reported on a quarterly basis. The frequency of data evaluation and reporting may change as well performance trends evolve during system operation. A suggested Well Performance Report outline, which includes the reporting of maintenance activities, is shown in Exhibit 4.2-9. Not all of the report elements included in the suggested outline may be applicable to each report.

4.3 Well Decommissioning

This section includes the general approach for decommissioning wells related to the Final Remedy at Topock and will be a guide to determining the appropriate methods for a given well. The general approach for well decommissioning was developed by a subgroup that includes PG&E, DTSC, DOI, and Interested Tribes. Detailed work plans for conducting well decommissioning will be based on this general approach. The Standard Operating Procedure for Well and Borehole Decommissioning (Well-SOP-01) is presented in Appendix B of this O&M Plan. As detailed in Well-SOP-01, a comprehensive list of all wells associated with the Topock Project will be maintained on the DTSC website, and the archive will be updated periodically as additional wells and boreholes are installed or decommissioned. The general procedures for decommissioning wells and exploratory boreholes are summarized below and further detailed in Section 2 of the Well-SOP-01. These four elements correspond to subsections 2.1 through 2.4 of the SOP, respectively.

- Evaluation of Well or Borehole – Key borehole information will be assembled and reviewed prior to decommissioning activities. This may include, but is not limited to, well measurements, video survey, geophysical survey, etc.
- Identification of Material and Placement Requirements - Different types of materials are required for different well or borehole decommissioning scenarios depending on the above-ground and subsurface environment. Selection of an appropriate well-specific material(s) will be made and could include a sealing material (such as neat cement, sand-cement slurry, concrete, or bentonite clay), filler material (such as clay, silt, sand, gravel, crushed stone, native soils, or mixtures of these) and/or displaced site material.
- Well or Borehole Decommissioning Scenarios – A suitable approach to well or borehole decommissioning will be selected based on the procedures in Well-SOP-01 and may include decommissioning in place, decommissioning in place with modification, or decommissioning by removing well materials.
- Well Decommissioning Reporting - Following completion of well or borehole decommissioning tasks, field activities and results will be reported to the agencies.

SECTION 5

Pipeline Maintenance and Repair

The groundwater remedy includes approximately 34,000 feet of trench and approximately 110,000 linear feet of pipeline, with over 90 percent being installed below ground either by direct burial, jack and bore, or in pre-cast concrete trenches. Belowground water pipes are made of plastic (HDPE). Aboveground water pipes are made of steel (Schedule 40 steel with AWWA C205 cement mortar lining).

This section discusses the clean-in-place (CIP) system, which is part of the in-situ remediation system (see Section 3.2.4), and presents general guidelines for the proper maintenance and repair of belowground plastic and aboveground steel that may be subject to third party or other unforeseen damage. This section is not intended to replace or supersede pipe manufacturers' instructions concerning the proper and safe delivery, handling, installation, testing, and use of the pipe product. Manufacturers' instructions and their terms for product warranty, and applicable standards set forth by industry and codes/regulations, shall be adhered to. Pipeline maintenance and repair shall be conducted by qualified and trained staff.

Additional pipeline maintenance provisions are described below in Section 5.4. An SOP for pipeline maintenance (PIPE-SOP-01) is provided in Appendix B.

5.1 Clean-In-Place (CIP) System

A CIP system has been included in the design of the NTH IRZ to facilitate maintenance of the groundwater pipelines. It is possible, during operation of the remedy, for biological films and mineral scale depositions to accumulate within the pipelines. The CIP system located at the MW-20 Bench carbon amendment facility allows for short duration addition of maintenance chemicals to remove the collected materials in the pipelines that may impact remedy performance. The CIP system has been designed to allow for connection of the extracted groundwater, backwash, and/or groundwater re-injection forcemains to create a recirculation loop within the pipeline system.

By installing dedicated piping and equipment for the chemical reagent metering process, the hazards to treatment system operators are minimized and controlled to the maximum extent possible. The CIP equipment includes day tanks for batch mixing chemical reagents, receiving tanks for recirculated and spent CIP solutions, dedicated floor space for totes or drums of chemical reagents, pumps and flow meters to control the addition of reagents, and associated alarms and valves to allow for the safe operation of the chemical addition process. Chemical reagents to be used are those categories of chemicals approved for use in drinking water systems. Bench-scale testing may be required before final reagent selection to determine the most effective reagent (see IRZ-SOP-07 in Appendix B).

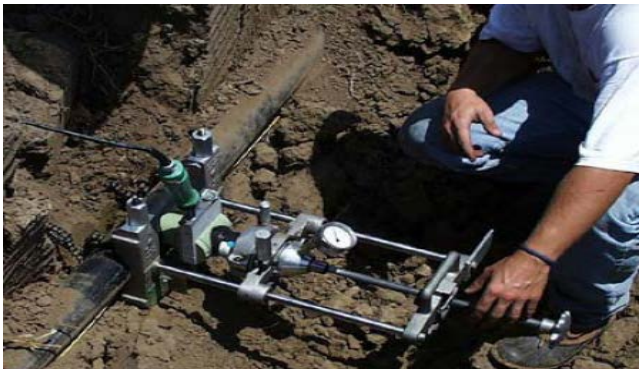
During operation of the CIP loop, all of the groundwater extraction pumps will be de-energized, and the extraction and injection wells will be isolated from the pipelines by way of valves within the well vaults (i.e., the IRZ system will be shut down). Fresh water (or conditioned water) will be used to first flush the pipelines. The CIP solution will then be mixed in the reagent day tanks and pumped through the pipelines and into the receiving tank (in some cases the CIP solution may be mixed directly in the receiving tank). The solution will be re-circulated through the pump and piping system. Criteria for assessing pipeline flushing completion will depend on the nature of any biological films and/or mineral scale that may develop in the pipelines as well as the final reagent solution selection. SOPs for bench-scale testing (IRZ-SOP-07), CIP reagent delivery (IRZ-SOP-08), and CIP solution mixing and application (IRZ-SOP-09) are included in Appendix B of this O&M Plan. Potential chemical reagents for use in the CIP system may include hydrochloric, glycolic (hydroxyacetic), and phosphoric acids, sodium hydroxide, and hydrogen peroxide (see also Exhibit 5.1-1). After the CIP maintenance procedures have been completed, the spent CIP solution will be flushed from the groundwater force mains with fresh water (or conditioned water), and the spent solution will either be transferred from the receiving tank to the Remedy-produced Water Conditioning Plant, to the TCS ponds, or shipped off-site by tanker truck for disposal. The total volume of spent CIP solution is expected to be between 10,000 and 40,000 gallons per event. Operation of the CIP system is anticipated to occur

approximately annually, although it may possibly be as little as once every five years, and will be scheduled during times the IRZ system is offline to the extent possible.

EXHIBIT 5.1-1
Summary of Available Chemicals for Clean-In-Place System
Groundwater Remedy Operation and Maintenance Manual
Volume 1: Operation and Maintenance Plan
PG&E Topock Compressor Station, Needles, California

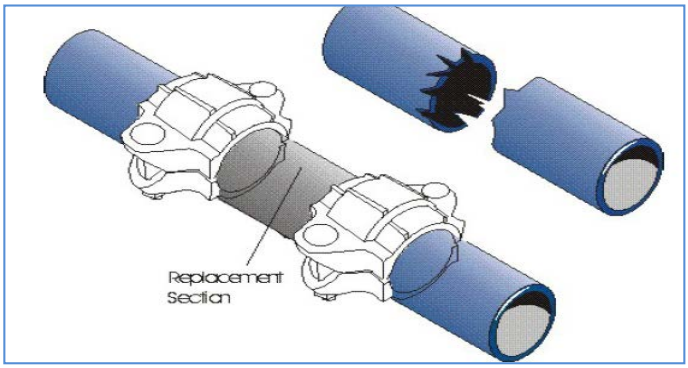
Chemical or Product	Chemical Formula	Primary/ Secondary	Chemical Type	Purpose	Notes
Hydrochloric Acid	HCl	Primary	Inorganic Acid	Geochemical scale and inorganic metal oxide scale	Also called muriatic. Highly corrosive - must use inhibitors. Do not mix with chlorine.
Phosphoric Acid	H_3PO_4			Metal and mineral hydroxides, sulfate salts	Often used with biological dispersant
Glycolic (Hydroxyacetic) Acid	$C_2H_4O_3$	Secondary	Organic Acid	Biofouling and disinfecting	Often mixed with HCl
Hydrogen Peroxide	H_2O_2	Secondary	Disinfectant/Oxidant	Biofouling and disinfecting	Often mixed with HCl
Sodium Hydroxide	NaOH	Primary	Caustic/Base	Biofouling/organic fouling and pH buffer	Corrosive, do not add to acids

5.2 Maintenance and Repair of Plastic Pipe (HDPE)



In general, properly handled and installed heat-fused HDPE pipeline provides a maintenance-free system with leak-free joints at up to 40-foot intervals, except for infrequent unforeseen third party damage. If HDPE pipe is damaged or leaking, repair methods will be required to bring the piping system back into service as soon as practicable. Section(s) of direct burial pipe requiring repairs will need to be exposed by excavation, whereas below-ground pipe sections inside precast concrete trenches can be accessed via maintenance manhole(s) or by removing sections of the precast concrete lids.

For aboveground repairs (or below ground pipe sections that have been exposed for repair), when the pipe can be moved, the damage can be cut out and replacement pipe can be butt fused or electrofused into the system. In the event that the pipe cannot be moved, alternative repair techniques and fittings that do not require longitudinal movement can be used.



For field repairs of small puncture damage, techniques involving saddle fusion, electrofusion patch, mechanical fittings, etc. can be used depending on the location, nature, and extent of the damage. Exhibit 5.2-1 shows example pictures of select repair techniques. An electrofusion patch can be used when the water flow can be stopped and the repair area can be kept dry during the repair process. In some cases where the damage is limited to a single discrete location but has severed the pipe, a small section of the pipe can be cut out to install a mechanical coupling in the damaged area. A certain amount of the piping system will need to be exposed to allow the pipe to be bent for installation of the coupling.

For larger field repairs, techniques involving mechanical fittings, solid sleeves, flange adapter spool, electrofusion spool, etc. can be employed depending on the location, nature, and extent of the damage(s).

Exhibit 5.2-1
Pictures of Select Repair Techniques - Saddle Fusion, Electrofusion Patch, Mechanical Coupling (top to bottom)
Groundwater Remedy Operation and Maintenance Manual
Volume 1: Operation and Maintenance Plan
PG&E Topock Compressor Station, Needles, California

5.3 Maintenance and Repair of Aboveground Pipe (Schedule 40 Steel with Cement Mortar Lining)

Although over 90 percent of the remedy piping system is below ground, there is one aboveground water pipe segment: over 900 feet of 12-inch pipe (Schedule 40 steel with cement mortar lining) conveying fresh water from the water supply well HNWR-1A in Arizona across the Arched Bridge to the California side of the Colorado River.

Overall, cement mortar lined steel pipe conveying treated or conditioned water has proven to have a long and maintenance free service life in the water services industry. Cement mortar lined pipe conveying raw or fresh water will require periodic inspection of the lining to see if the thickness has reduced or if the cement mortar is corroding. Repair of the lining usually requires curing time that could take up to 24 hours. All inspection and repair work will be in accordance with manufacturer's recommendations.

All of the exterior aboveground pipe segments will be painted externally (the paint color will be in compliance with the Environmental Impact Report (EIR; DTSC 2011) mitigation measure AES-1d and AES-2e, i.e., muted, earth-tone colors that are consistent with the surrounding natural color palette; the paint color for the pipe segment on the Arch Bridge will match the color of neighboring pipe). Therefore, they will need to be repainted periodically for upkeep and aesthetic reasons.

5.4 Additional Pipeline Maintenance Provisions

Provisions are included in the design to allow for removal of potential blockages and solids that may settle in the piping network during the decades-long operation of the remedy. These provisions include pipe cleanouts and blowoffs - pipe cleanouts are intended to provide access to the pipe for cleanout of blockages, and pipe blowoffs are typically provided at low points to allow for removal of solids that settle at the bottom of the pipe. In addition, for the freshwater pipeline, a sand separator will be installed at the wellhead to minimize the amount of sand in the water and thereby minimize solids settle-out at the bottom of the downstream conveyance pipe. The addition

of maintenance additives for short durations to remove collected materials in the pipelines, as included in the NTH IRZ using the CIP system (see Section 5.1), may also be necessary for other remedy piping.

Access to remedy piping, such as that provided by the pipeline cleanouts and blowoffs, will allow for pipeline cleaning using the following methods in addition to short-duration chemical addition:

- **Flushing** – Flushing involves controlling water flow direction and velocity in order to re-suspend settled solid deposits and flush them from the pipeline.
- **Pigging** – Pigging involves the use of pressure to propel a pipeline pig device (for HDPE piping typically a cylindrical foam and plastic device) through the pipeline in order to scrape/scrub the pipe surfaces and push loosened materials to a pre-determined recovery point.

Procedures for implementation of the above maintenance methods are detailed in the conveyance system inspection and maintenance SOP (PIPE-SOP-01) provided in Appendix B of this O&M Plan.

Additional preventative maintenance measures may be employed, including pH adjustment to control potential scale formation. pH adjustment involves the continuous dosing of acid (e.g., hydrochloric acid or other acids included in Exhibit 5.1-1) at low concentrations into the conveyed water to depress pH to a level that would suppress the formation of mineral scales, such as calcite. The adjusted pH is expected to remain circumneutral (i.e., pH between 5.5 and 7.4).

Water and sediments generated from pipeline maintenance operations will be containerized (for example, at the frac tanks at the MW-20 Bench) and transported off site, to the TCS evaporation ponds, or to the influent tanks of the Remedy-produced Water Conditioning Plant.

Sands from the sand separator located at the freshwater supply well site will be contained in the purge water. The purge water will be allowed to percolate into the ground via a dry well filled with rock located near the freshwater supply well.

SECTION 6

Waste Management Plan and Recoverable Materials

6.1 Waste Management Plan

This section presents procedures for the proper collection, characterization, storage, transportation, and disposal of waste generated during the operation and maintenance of the groundwater remedy. Wastes generated from O&M activities will be managed onsite in compliance with the EIR mitigation measures adopted in the certified EIR (DTSC 2011) and the applicable or relevant and appropriate requirements (ARARs) established in the Record of Decision (DOI 2010), and will be disposed of offsite in a manner consistent with applicable local, state, and federal laws and regulations.

Disposal facilities that receive Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) waste (wastes that contain CERCLA hazardous substances, pollutants, or contaminants) will be in compliance with the CERCLA Off-Site Rule (42 U.S.C. 9621 (d) (3) and 40 CFR 300.440). In accordance with the requirements of the Remedial Design/Remedial Action Consent Decree (DOI 2013), prior to the first shipment of waste material offsite, and annually thereafter, PG&E will demonstrate to DOI's satisfaction that the U.S. Environmental Protection Agency (USEPA) has determined that the proposed receiving facility is operating in compliance with 42 U.S.C. § 9621(d)(3) and 40 C.F.R. § 300.440. If PG&E knows or has reason to know the facility no longer meets the criteria of 40 C.F.R. § 300.440(b), PG&E will inform DOI, propose an alternate receiving facility prior to any subsequent shipments, and demonstrate to DOI's satisfaction that USEPA has determined that the alternate receiving facility is operating in compliance with 42 U.S.C. § 9621(d)(3) and 40 C.F.R. § 300.440. The waste material will be stored onsite in accordance with this waste management plan until approval is received and the waste material is transported offsite. If the waste management facility is out-of-state, prior to the first shipment of waste material, PG&E will provide written notice for disposal of waste material at the listed facilities to the appropriate State environmental official in each receiving facility's State and the DOI Project Manager.

Characterization and management of displaced soil generated during drilling, construction, and O&M activities are not discussed herein. Management of soil is discussed in the Soil Management Plan (see Volume 4 of this O&M Manual). A subgroup that consists of Agencies, Interested Tribes, and PG&E has worked on the *Draft Management Protocol for Handling and Disposition of Displaced Site Material, Topock Remediation Project, Needles, California.* A copy of the revised management protocol is included as Appendix B in the Soil Management Plan (Volume 4 of this O&M Manual).

Characterization and management of waste generated from construction activities are included in the Construction/Remedial Action Work Plan, which is being submitted concurrently with the final design submittal.

6.1.1 Expected Waste Streams

Expected waste streams from remedy O&M activities and their estimated quantities are described below:

- Remedy-produced water generated from well maintenance activities such as backwashing and rehabilitation, sampling purge water, equipment decontamination, rainfall that collects in secondary containment areas, and wastewater from well drilling/replacement/decommissioning. Some wastewater may be temporarily stored in portable tanks at well heads during the characterization step prior to the final disposal. The current estimated total volume of remedy-produced water is shown in Exhibit 6.1-1.
- The volume of spent solution generated from the CIP system is expected to be roughly 10,000 to 40,000 gallons per maintenance event. The frequency of maintenance is anticipated to be once per year (see Section 5.1).
- Displaced soil from well drilling/replacement/decommissioning and O&M activities. See Volume 4, Soil Management Plan, of this O&M Manual.

- Precipitated solids/sludge and spent filters generated from the Remedy-produced Water Conditioning Process. The amount of precipitated solids and sludge is estimated to be 1.6 tons (dry weight) per year, based on 7.6 million gallons per year of remedy-produced water, using 25 percent caustic to neutralize the first flush of well rehabilitation water. The amount of spent filters is estimated to be 0.45 tons (dry weight) per year.
- Water and sediments from pipeline maintenance (pipe maintenance vaults).
- Used personal protective equipment.
- Empty drums, cans, unused chemicals, paints, used oil, used solvents, etc.
- Universal waste including batteries, electronic devices, lamps, aerosol cans, and mercury-containing equipment.
- Non-Regulated Waste such as but not limited to; paper bags, cardboard boxes, basic household and office debris, etc.
- Recoverable materials (see Section 6.2).
- Sanitary waste (buried septic tanks connected to restrooms/shop sink at the TW Bench and the long-term remedy support area at Moabi Regional Park).

EXHIBIT 6.1-1
Summary of Remedy-produced Water Volume by Source and Type
Groundwater Remedy Operation and Maintenance Manual
Volume 1: Operation and Maintenance Plan
PG&E Topock Compressor Station, Needles, California

Source/Type[c]	Wells [a]	Events/ Year	Annual Volume, MG/year	Comments
Backwash				
Injection Wells	32	30-51 [b]	4.67	Weekly backwashing
Well Rehabilitation				
Injection/IRZ Extraction Wells	36	1	2.42	Annual rehabilitation
Extraction Wells (non-IRZ)/Supply Well	13	0.2	0.14	Rehabilitation every 5 years
Other				
Rainwater	-	-	0.3	
Monitoring well sampling and development purge water and equipment decontamination water	-	-	0.1	
Total			**7.6**	

Notes:
MG = million gallons
[a] The well count is as follows: 32 Injection Wells = 24 NTH IRZ, 4 IRL, 2 TCS, and 2 Freshwater Injection Wells; 36 Injection/IRZ Extraction Wells = 32 Injection Wells plus 4 IRZ extraction wells; 13 Extraction Wells (non-IRZ)/Supply Well = 5 Riverbank Extraction Wells, 5 East Ravine Extraction Wells, 2 TW Bench Extraction Wells, and 1 Freshwater supply well.
[b] IRZ wells will be operated on a 6 month on/18 month off cycle, so backwashes are assumed to be only 30 times per year. See Appendix F of the BOD Report, Remedy-produced Water Management Technical Memorandum, for more detail.
[C] If the contingent FWPTS were to be implemented, backwash water generated from the treatment system is an additional source of remedy-produced water. The majority (approx. 95%) of the backwash water generated will be recycled in the FWPTS leaving only about five percent of the backwash stream needing to be managed (this stream is not expected to have elevated arsenic concentrations). The volume of this backwash stream is anticipated to be minimal.

6.1.2 Waste Characterization

Characterization of displaced soil is discussed in the Soil Management Plan (Volume 4 of the O&M Manual). Waste material with the potential to be hazardous wastes will be characterized per the procedures outlined below. Note that once the characteristics or profile of a waste stream is established, PG&E will continue to use the same waste profile, unless a process change indicates that the waste stream should be re-characterized.

6.1.2.1 Liquid Wastes

Liquids will be classified as hazardous waste if they exhibit a pH of 2.0 or below, or 12.5 or above; dissolved chromium concentration equal to or greater than 5 parts per million (ppm); and/or dissolved arsenic concentration equal to or greater than 5 ppm. Liquids will be evaluated for the presence of metals having hazardous waste toxicity characteristic levels specified in 22 CCR 66261.24 using the following approach:

- Liquid wastes containing less than 0.5 percent filterable solids will be analyzed for total metals and the results compared with the Resource Conservation and Recovery Act (RCRA) toxicity characteristic (TC) limits in 22 CCR 66261.24(a)(1) and the soluble threshold limit concentrations (STLC) in 22 CCR 66261.24(a)(2). If any constituent exceeds the RCRA TC limit the waste will be classified as RCRA hazardous. If no constituents exceed the RCRA TC limit, but one or more constituents exceed the STLC, the waste will be classified as non-RCRA hazardous. If neither limit is exceeded the waste will be classified as non-hazardous.
- Liquid wastes containing 0.5 percent or more filterable solids will be analyzed using the toxicity characteristic leaching procedure (TCLP) and the results compared with the RCRA TC limits. If a TC limit is exceeded the waste will be classified as RCRA hazardous. If no TC limits are exceeded the waste will be analyzed using the California Waste Extraction Test (WET) and the results compared with the STLCs. If one or more STLCs is exceeded the waste will be classified as non-RCRA hazardous. If neither limit is exceeded the waste will be classified as non-hazardous.

6.1.2.2 Solid Wastes

Solid wastes will be analyzed for total metals expressed in milligrams per kilogram (mg/kg) and the results will be evaluated as follows:

1. If the total constituent concentration exceeds the total threshold limit concentration (TTLC) in 22 CCR 66261.24(a)(2), material will be classified as a non-RCRA hazardous waste. Additional evaluation of the STLC, as described in step 3 below, will not be performed.
2. If the total constituent concentration exceeds the numeric value of the RCRA TC level by 20 times or more, the TCLP will be performed. If the constituent concentration in the TCLP leachate exceeds the TC level, the material will be classified as a RCRA hazardous waste. Additional evaluation of the STLC, as described in step 3, will not be performed.
3. If the material has not been classified as hazardous waste in steps 1 or 2, the total constituent concentration will be compared to the STLC. If the total constituent concentration exceeds the numeric value of the STLC by 10 times or more, the WET will be performed. If the constituent concentration in the WET exceeds the STLC, the material will be classified as a non-RCRA hazardous waste.

If the material has not been classified as a hazardous waste in steps 1, 2, or 3, it will be classified as non-hazardous waste.

6.1.2.3 Miscellaneous Wastes

Miscellaneous waste such as trash, paper bags, and cardboard boxes will be disposed of as non-hazardous solid waste, unless affected by potentially contaminated material or water. Potentially contaminated miscellaneous waste will be combined with other hazardous waste. Empty, used 55-gallon drums that formerly contained hazardous materials will be labeled with the word “empty” and the date emptied, and will be returned to the original chemical supplier or turned over to a drum re-conditioner. Drums being reconditioned will be removed from the site within one year.

6.1.3 Management of Waste

This section discusses the management plan for remedy-produced water and onsite management of other waste streams.

6.1.3.1 Management Plan for Remedy-produced Water (include spent solutions from CIP)

Different types of remedy-produced water require different management approaches. Multiple options are maintained to provide operational flexibility and reliability. A major portion of the produced water will be conditioned in the remedy-produced water conditioning system located at the Compressor Station; a description of the system and its operation and maintenance procedures are provided above in Sections 2 and 3, respectively. The conditioning plant is not designed for treatment of RCRA and non-RCRA hazardous waste. Only non-hazardous waste will be sent to the TCS evaporation ponds. Certain waste streams generated by the remedy (e.g., first flush wastewater from well rehabilitation or purge water from certain monitoring wells) may exhibit hazardous levels of dissolved chromium and/or arsenic, and will be appropriately managed and not send to the ponds. PG&E's understanding of the specific nature of the various wastes in addition to quantity will be further refined through operational experience once the remedy is implemented.

Exhibit 6.1-2 describes the management plan in a narrative format, and Figures 6.1-1 and 6.1-2 (located at the end of this section) illustrate the management plan in a graphical format. This plan is intended to be flexible and to evolve with operational experience during the groundwater remedy implementation.

EXHIBIT 6.1-2
Management Plan for Remedy-produced Water
Groundwater Remedy Operation and Maintenance Manual
Volume 1: Operation and Maintenance Plan
PG&E Topock Compressor Station, Needles, California

Source[d]	Volume (MG/year)	Management Plan – Listed in Order of Preference
Backwash of freshwater injection wells/IRL injection wells receiving fresh water	2.32 [b, c]	Process through B-side of Remedy-produced Water Conditioning Plant,[f] then to: 1. IRZ injection wells 2. Compressor station cooling towers
Backwash of IRZ injection wells, TCS injection wells, IRL injection wells receiving water from river bank extraction wells, and IRZ CIP [a]	2.35 [b, c]	Process through A-side of Remedy-produced Water Conditioning Plant, then to IRZ injection wells
Well rehabilitation (all wells) - first flush	0.77 [b, c]	1. TCS ponds[e] 2. Trucked offsite[e] 3. Field neutralization and/or field filtered with a transportable treatment unit, and then convey water to Remedy-produced Water Conditioning Plant (A-side) for processing and re-inject into IRZ injection wells.
Well rehabilitation (all wells) – second flush	1.8 [b, c]	Same as backwash from corresponding well
Other water – cleaner streams	0.3	Relatively clean water, such as rainwater in containment and some decontamination water, will be managed by the same means as the backwash water from freshwater injection wells. Process through B-side of Remedy-produced Water Conditioning Plant, then to: 1. IRZ injection wells 2. Compressor station cooling towers
Other water – some purge and decontamination water	0.1	1. Process through A-side of Remedy-produced Water Conditioning Plant, then to IRZ injection wells 2. TCS ponds 3. Trucked offsite

EXHIBIT 6.1-2
Management Plan for Remedy-produced Water
Groundwater Remedy Operation and Maintenance Manual
Volume 1: Operation and Maintenance Plan
PG&E Topock Compressor Station, Needles, California

Source[d]	Volume (MG/year)	Management Plan – Listed in Order of Preference
Other water – wastewater from construction of wells in the future	Short-term	High-solids water: TCS ponds or truck offsite Low-solids water: Process through A-side of Remedy-produced Water Conditioning Plant, then to IRZ injection wells For construction of the initial wells (prior to having the IRZ wells and the remedy produced water condition plant in place), the management options will also include re-injection into the aquifer near where the well is drilled and processing at the IM3 treatment plant (after characterization).

Notes:
MG = million gallons

[a] Prior to transferring the spent solution from the Clean-in-Place (CIP) System to the remedy-produced water conditioning plant, the solution will be allowed to settle and precipitate solids prior to pumping to the conditioning plant. Spent solutions from CIP System could also be shipped off-site for disposal or to the TCS ponds.

[b] Assumes half of the flow to the IRL injection wells is fresh water with the remainder amended with carbon.

[c] Testing of IRZ well maintenance schemes at Hinkley is complete and the weekly backwashing and annual rehabilitation frequency have been confirmed. Assumed that roughly 30% of rehabilitation water will be high-solids or low-pH "first flush" water. Remainder assumed to be similar in nature to backwash water.

[d] If the contingent FWPTS were to be implemented, backwash water generated from the treatment system is a potential additional source of remedy-produced water. The majority (approx. 95%) of the backwash water generated will be recycled in the FWPTS leaving only about five percent of the backwash stream needing to be managed (this stream is not expected to have elevated arsenic concentrations). The management options for backwash water include reuse in the cooling towers, discharge to the evaporation ponds, and/or truck to off-site permitted disposal facilities.

[e] Note that prior to the disposal at the TCS ponds or trucking offsite, field neutralization and/or field filtered with a transportable treatment unit may occur.

[f] To allow for operational flexibility to segregate/manage various produced water streams and to optimize processes in the future, the conditioning system will be configured with two parallel trains: 1) A-side Remedy and 2) B-side Freshwater. Both trains will be equipped initially with identical processes/units as illustrated in Exhibit 3.4-4.

6.1.3.2 Onsite Management of Other Wastes

Waste materials will be managed onsite in demarcated waste management areas. Waste management areas are identified in Figure 6.1-3. Within the waste management areas, hazardous wastes will be segregated from non-hazardous wastes (note that hazardous waste will primarily be stored at TCS. If needed, PG&E may also store hazardous wastes at the Transwestern Bench).

Additionally, incompatible hazardous wastes (e.g., flammable and corrosives wastes) will be segregated. Wastes of the same matrix, contamination, and source may be aggregated to facilitate accumulation and disposal. Lined roll-off boxes will be used to contain solid wastes. Liquid wastes will be contained in drums, totes, or portable tanks. Cleaning and decontamination wastewater will be contained in portable tanks within secondary containment near the point of origin while the water is characterized for onsite management or offsite disposal. Incidental trash, such as wooden pallets and food and beverage containers, will be contained in dumpsters located in staging areas near temporary facilities. Universal waste will be stored in containers or packages that will remain closed; are structurally sound; are adequate to prevent breakage; are compatible with contents of batteries, lamps, or thermostats; and lack evidence of leakage, spillage, or damage that could cause leakage under reasonably foreseeable conditions. When possible, containerized wastes will be direct-loaded onto a truck and removed from the site from the point of generation (e.g., potentially during rehabilitation event at well site).

Non-RCRA and RCRA hazardous wastes will be removed from the site within 90 days from the date of generation. The date of generation is the day that a waste is first placed in a container or stockpiled. The accumulation start date for containers is documented on the hazardous waste label. A log or other record will be used to document

the accumulation start date for stockpiles and tanks. Labeling of waste containers (tanks) will be in accordance with 22 CCR Division 4.5 Chapter 12 and 49 CFR 172, 173, and 178. Universal waste will be labeled as universal waste plus the type of universal waste (e.g., "Universal Waste – Batteries"); it will be accumulated onsite up to one year, and not more than 5,000 kilograms (kg) will be accumulated at one time. Universal waste will be sent to a permitted recycling facility. Waste accumulation and equipment storage areas will be inspected daily for labeling, malfunctions, deterioration, discharges, and leaks that could result in a release. Any deficiencies observed or noted during inspection will be corrected immediately, and corrective measures will be documented and maintained onsite.

6.1.4 Waste Transportation and Disposal

After the wastes are containerized and labeled, those wastes ready for offsite disposal will be loaded onto trucks for transport to preapproved disposal facilities. A designated transportation and disposal coordinator will be onsite during transportation and disposal activities. This individual will be responsible for coordinating and overseeing these activities.

As truck loading is completed, the containers and trucks will be inspected and brushed as necessary to remove loose materials, if the truck is transporting hazardous waste. Each load on all trucks will be inspected by the driver to ensure that the load is secure. Appropriate documentation to include waste manifests or shipping papers will be completed, checked, and kept onsite. In addition, a truck log with loading and transportation information will be maintained. Transport vehicles will proceed to the designated disposal facilities in accordance with local, state, and federal transportation requirements. Transportation and disposal of wastes generated during construction are addressed in the Construction/ Remedial Action Work Plan.

6.1.5 Disposal Facilities

Wastes designated as RCRA or Non-RCRA hazardous wastes and non-hazardous soil will be transported to and disposed of at an appropriately permitted facility. In accordance with the requirements of the CD (DOI 2013), prior to the first shipment of waste material offsite, and annually thereafter, PG&E will demonstrate to DOI's satisfaction that USEPA has determined that the proposed receiving facility is operating in compliance with 42 U.S.C. § 9621(d)(3) and 40 C.F.R. § 300.440. If PG&E knows or has reason to know the facility no longer meets the criteria of 40 C.F.R. § 300.440(b), PG&E will inform DOI, propose an alternate receiving facility prior to any subsequent shipments, and demonstrate to DOI's satisfaction that USEPA has determined that the alternate receiving facility is operating in compliance with 42 U.S.C. § 9621(d)(3) and 40 C.F.R. § 300.440. The waste material will be stored onsite in accordance with this waste management plan until approval is received and the waste material is transported offsite. If the waste management facility is out-of-state, prior to the first shipment of waste material, PG&E will provide written notice for disposal of waste material at the listed facilities to the appropriate State environmental official in each receiving facility's State and the DOI Project Manager, and will comply with state law with regard to providing any further notifications. Additionally, PG&E will notify the state environmental official referenced above and the DOI Project Manager of any major changes in the shipment plan, such as a decision to ship the waste material to a different out-of-state facility.

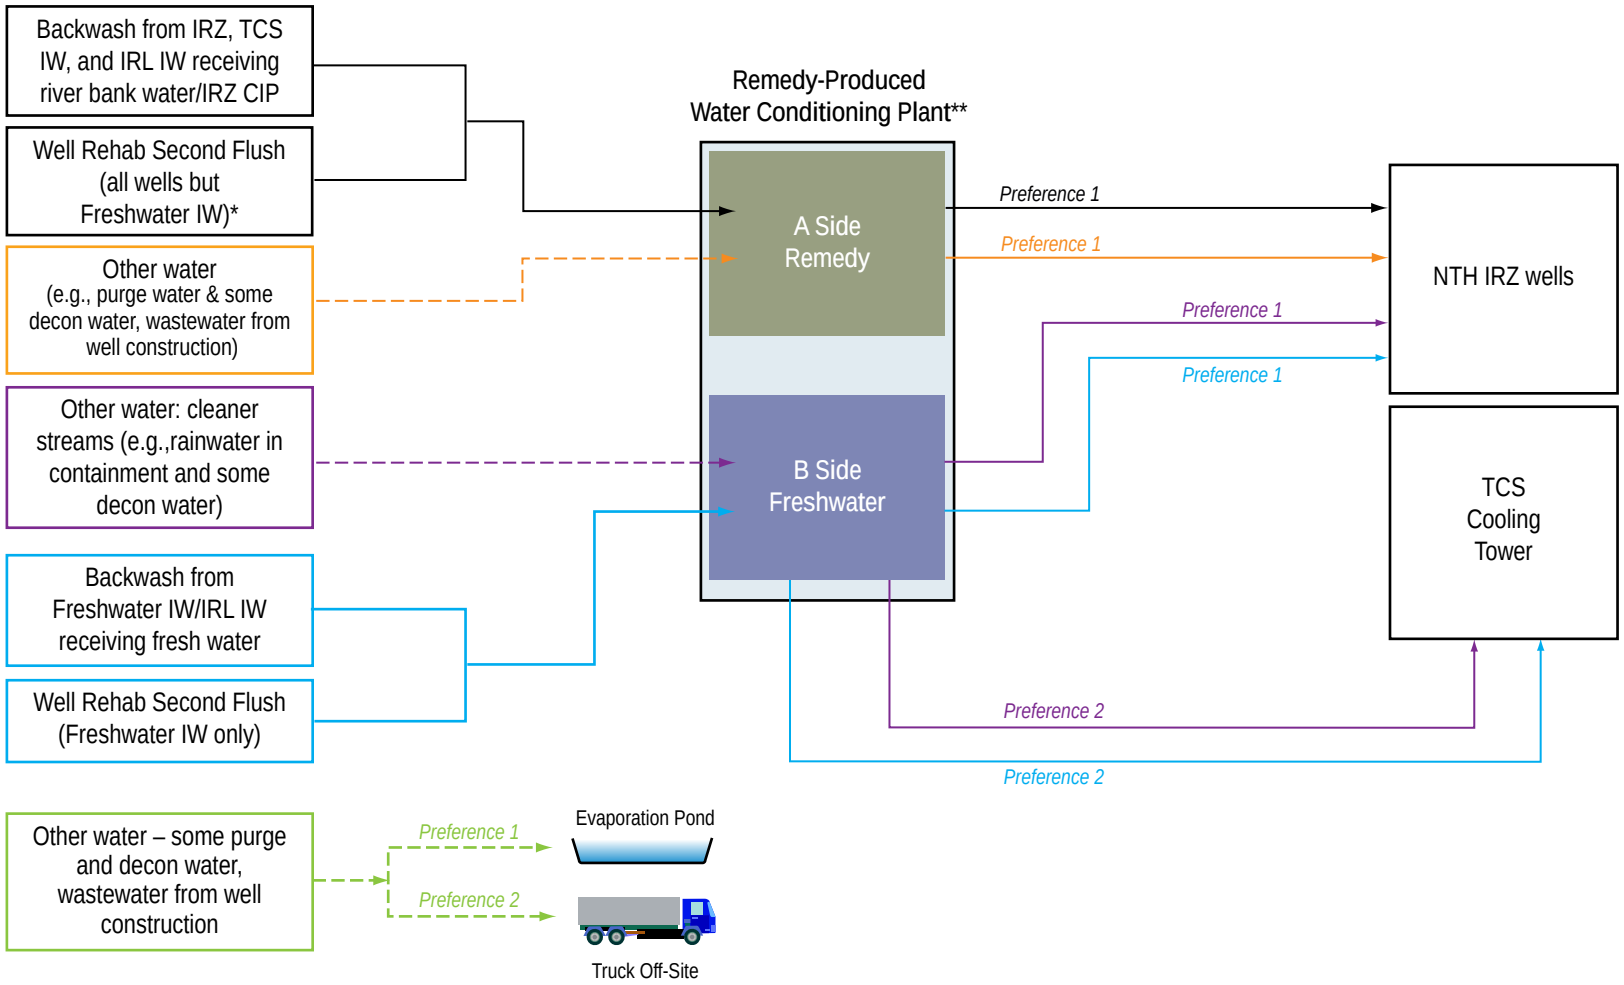
PG&E proposes use of the following potential disposal facilities for the project as well as others, subject to the communication and approval processes under the Consent Decree outlined above:

Chemical Waste Management – Kettleman Hills Facility – Landfill
35251 Old Skyline Road
Kettleman City, CA 93239

US Ecology Inc. - Landfill
Highway 95 (12 miles South of Beatty, NV)
Beatty, NV 89003

Clean Harbors Button Willow – Landfill
2500 West Lokern Road
Button Willow, CA 93206

6.2 Recoverable Materials



Some waste streams generated from various maintenance activities such as piping and/or process equipment removal/replacement, electrical equipment refurbishment, secondary containment structure repair, etc. are potentially recoverable or salvageable for reuse or recycle. Efforts will be made to limit the amount of components and materials leaving the site by recovering non-hazardous equipment and materials. All recoverable materials must be non-hazardous. An evaluation of reuse and recycling options will be conducted to determine the most appropriate and sustainable way to manage non-hazardous recoverable materials.

Exhibit 6.2-1 lists general categories of recoverable materials that could be available and recycle options for these materials.

EXHIBIT 6.2-1
Recoverable Materials
Groundwater Remedy Operation and Maintenance Manual
Volume 1: Operation and Maintenance Plan
PG&E Topock Compressor Station, Needles, California

Recoverable Materials	Recycle Options Typical in the Industry
Useable Equipment	Sell directly or wholesale to third party
Useable Structural Steel & Piping	Sell directly or wholesale to third party
Scrap Steel, Re-bar and Iron	Deliver and sell to scrap processor
Non-Ferrous Metals (copper, aluminum, titanium) and Stainless Steel	Deliver and sell to scrap processor
Plastic	Deliver and sell to a plastic recycler
Concrete – Unprocessed	Deliver to outside crushing plant for processing and sale to third party

Scrap steel and iron could be generated during the maintenance of buildings and removal of equipment, tanks, and piping. Copper could be generated during the removal/replacement of electrical utilities and lighting. Stainless steel could be generated during the removal/replacement of instruments, small diameter piping, fittings, and appurtenances. Plastic could be generated from the removal/replacement of pipes, valves, and appurtenances. Concrete could be generated from the repair of foundation and secondary containment structures, culverts, and precast concrete vaults and trenches. Fiberglass could be generated from the replacement of tanks and pumps.

SECTION 7

Other Site Management Practices

This section of the O&M Plan presents the framework for other site management practices including storm water pollution prevention, hazardous material management, fuel storage and fueling practices, and access road maintenance.

7.1 Storm Water Pollution Prevention

In compliance with the EIR mitigation measures HYDRO-1, HYDRO-2, and HYDRO-3 (DTSC 2011) and Federal Action-Specific ARAR #34 (DOI 2010), a Storm Water Pollution Prevention Plan for O&M activities (O&M SWPPP; see Appendix D of this O&M Plan) has been prepared to comply with the substantive requirements of the 2015 California General Industrial Storm Water Permit (IGP). The Topock project site is under the regional jurisdiction of the RWQCB.

In accordance with the General Permit, stormwater pollution prevention has two major objectives:

- Identifying and evaluating sources of pollutants associated with industrial activities that may affect the quality of storm water discharges and authorized non-storm water discharges from the facility.
- Identifying and implementing site-specific best management practices (BMPs) to reduce or prevent pollutants from being released in storm water discharges and/or authorized non-storm water discharges that may affect receiving water quality.

The O&M SWPPP covers all remedy facilities located outside of the Compressor Station. It identifies BMPs as required by law, and establishes a monitoring and sampling plan (including visual inspections and an annual comprehensive review). The annual comprehensive review is required to evaluate the effectiveness of the BMPs and to determine whether modifying BMPs or implementing additional BMPs is required. Please note that the remedy design has incorporated engineering elements to reduce or prevent pollutants from being released in storm water discharges (e.g., install overhead protection for areas where hazardous materials are stored/handled, collect and route stormwater in secondary containment to either the Remedy-produced Water Condition Plant or the TCS wastewater tank discharge connection to the evaporation ponds).

7.2 Hazardous Material Management

In compliance with the EIR mitigation measure HAZ-1a-c and California Action-Specific ARAR #90, the existing project-specific Hazardous Materials Business Plans (HMBPs) for the Topock Compressor Station and the IM-3 Treatment Plant will be updated to include the hazardous materials used at the new facilities to be constructed for the groundwater remedy, as discussed further below. Each business in San Bernardino County that handles, uses, generates or stores hazardous materials is required to comply with state and federal community right-to-know laws. The primary purpose of these laws is to provide readily available information regarding the location, type, and health risks of hazardous materials to emergency response personnel, authorized government officials, and the public. These requirements are found in California Health & Safety Code Division 20, Chapter 6.95, Sections 25500 – 25520; CCR Title 19, Division 2, Chapter 4, Article 4, Sections 2729 – 2732; Title 40 CFR; and USEPA regulations (Superfund Amendments and Reauthorization Act of 1986 [SARA], Title III).

Hazardous materials used or generated by this project are expected to include the following:

- Groundwater with total chromium or arsenic concentrations of 5 mg/L or more
- Well maintenance and rehabilitation reagents (e.g., hydrochloric acid, sulfamic acid, sulfuric acid, phosphoric acid, hydroxyacetic acid, acetic acid, citric acid, oxalic acid, ascorbic acid, hydrogen peroxide, sodium hypochlorite, sodium hydroxide, chlorine dioxide, potassium hydroxide, polyphosphate, Aqua Clear™ PFD, Rodine-103/Rodine 213, QC-21, CB4, NuWell 120, NuWell 130, nitrogen, and carbon dioxide). These materials

will be brought onsite during the well maintenance/rehabilitation activities, but will not be permanently stored on site

- Remedy-produced water with pH<2 (from well maintenance activities)
- Oil used for pumps and equipment
- Used oil hazardous waste
- Solvents used for pumps and equipment
- Used solvents hazardous waste
- Laboratory reagents and waste
- Compressed gas cylinders
- Universal waste

In addition, chemicals that are anticipated to be used in remedy processes and stored onsite are listed below with locations (the precise locations may change over time and will be reflected in updates to the HMBPs):

- Potential chemicals to be used and stored in the Remedy-produced Water Conditioning Building (located inside the Compressor Station) include the following:
  - Caustic (e.g., sodium hydroxide), to be stored in a 550-gallon tank
  - Acid (e.g., hydrochloric acid), to be stored in a 550-gallon tank
  - A coagulant (e.g., Nalco Ultrion 8187 [aluminum chloride hydroxide]; coagulants were evaluated in jar tests by Nalco Company, Long Beach, California. Several coagulants were screened and coagulant Nalco Ultrion 8187 proved to be the most effective for aiding in settling solids in the Conditioning System (see Appendix G for a summary of the jar test results).
  - A flocculent addition (e.g., Nalco® 7878 Flocculant [anionic type]; flocculents were evaluated in jar tests by Nalco Company, Long Beach, California. Several flocculents were screened and flocculent Nalco 7878 proved to be the most effective to aid in the dewatering of the influent tank bottoms prior to pumping to the liquid phase separators (see Appendix G for a summary of the jar test results). The coagulant was very effective, so the need for this dewatering aid and flocculent type would have to be tested during operations.
  - Laboratory reagents (to be used in a small lab inside the conditioning building) and related waste
  - Compressed gas cylinders
- Potential chemicals to be used and stored in the carbon amendment facilities include:
  - Carbon substrate (95 percent ethanol) - located at the MW-20 Bench (15,000-nominal gallon tank)
  - Acids, caustics, and/or dispersants for use in the Clean-In-Place system at the MW-20 Bench (330-gallon totes or smaller-volume drums). Potential chemical reagents for use in the CIP system may include hydrochloric, glycolic (hydroxyacetic), and phosphoric acids, sodium hydroxide, and hydrogen peroxide
  - Compressed gas cylinders
- Potential hazardous materials/wastes related to the groundwater remedy and stored in the Hazardous Materials Storage Building (located inside the Compressor Station; see Figure 2.1-1) include:
  - Chemicals, hazardous materials, and wastes listed above with the exception of ethanol.
  - Universal waste
  - Compressed gas cylinders

- Potential hazardous materials/wastes to be used in remedy processes and stored at the main construction headquarter and the long-term remedy support area at Moabi Regional Park include:
  - Laboratory reagents (to be used in an onsite laboratory) and related waste
  - Cleaning solutions including solvents used for pumps and equipment
  - Oil used for pumps and equipment
  - Used oil hazardous waste
  - Used solvents hazardous waste
  - Universal waste
  - Compressed gas cylinders

Hazardous materials staged, stored and/or handled at the Remedy-produced Water Conditioning Plant, the Hazardous Materials Storage Building inside the Compressor Station, and the Transwestern Bench will be incorporated into the existing HMBP for the Compressor Station. All hazardous materials stored and handled at remedy facilities located outside of the Compressor Station will be incorporated into the existing HMBP for the IM-3 Treatment Plant. PG&E will submit these HMBPs to San Bernardino County. Both of the current HMBPs are included in Appendix E of this O&M Plan. These HMBPs will be updated for submittal to San Bernardino County when required by HMBP guidance (i.e., after new hazardous materials are on site or qualifying facility modifications require HMBP updates).

7.3 Fuel Storage and Fueling Practices

Types of fuel anticipated to be used onsite include:

- **Diesel Fuel** that meets California low-sulfur standards and regulations. There is a bulk diesel fuel tank in place at the TCS that may be used by PG&E and its contractors conducting remedy activities for re-fueling vehicles and equipment. In addition, re-fueling using diesel from an offsite source is also an option.
- **Gasoline** that meets California's reformulated gasoline (CaRFG) program standards and regulations. There will be no bulk storage of gasoline onsite; however, it is anticipated that pickup truck mounted gasoline storage tanks will be used to transport fuel to the site and re-fuel equipment on site.

Over the decades-long O&M period, it is anticipated that alternative fuels may be considered for onsite use including, but not limited to, bio fuels, ethanol, etc. In addition, bulk fuel storage methods may change to support future remedy needs.

Regardless, the project will comply with local, state, and federal regulations related to the bulk storage and management of fuels. Specifically, the HMBPs (Appendix E) and the fueling SOP (Remedy-SOP-02 in Appendix F) include information regarding consideration for properly storing and handling fuel on-site, equipment and procedures for spill containment, personal protective equipment, and the measures to be used to reduce the likelihood of releases or spills during fueling or vehicle maintenance activities.

7.4 Access Road and Pathway Maintenance

Figures 7.4-1A and 7.4-1B show existing access routes that will continue to be used for remedy activities, existing routes proposed to be used as is for access for remedy activities, and roads to be improved or constructed for the groundwater remedy. Note that public roadways outside of the EIR project area or APE will also be used for the groundwater remedy.

Over time, the access roads and pathways are likely to exhibit deterioration and/or overgrowth, and will require maintenance for safety, and for ensuring access to as well as protection of remedy infrastructure and facilities. Depending on the road or pathway surface and condition, the proper maintenance method(s) will be different. Typically, road maintenance consists of stabilizing disturbed areas, filling/re-grading, and pruning overgrowth. General guidelines for road and pathway maintenance are outlined in this plan.

Once it is determined that a road or pathway must be maintained, an initial assessment including a review of potential causes for deterioration will be completed. Based on the initial assessment, an appropriate method for maintenance will be conducted. Exhibit 7.4-1 presents a general summary of road and pathway maintenance methods.

EXHIBIT 7.4-1
Summary of Roads and Pathways BMPs
Groundwater Remedy Operation and Maintenance Manual
Volume 1: Operation and Maintenance Plan
PG&E Topock Compressor Station, Needles, California

Type of Road or Pathway	Surface	Potential Deterioration Conditions	Solutions	Effective BMPs[1]
Footpath	Loose Dirt	• Shrub overgrowth • Erosion	• Pruning • Soil stabilization	• Pruning of overgrowth using hand or mechanical-powered tools • Stabilize disturbed areas by applying approved soil stabilizing agents[2], erosion control matting, silt fencing, etc.
Access Road	Loose Dirt	• Erosion • Subsidence • Soft spots	• Re-establish road surface • Re-grade road surface • Soil stabilization • Erosion control/ restoration	• Re-establish road surface using manual shovel/ rake or backhoe • Re-grade road surface using grader • Stabilize disturbed areas by applying approved soil stabilizing agents[2], erosion control matting, installing silt fencing, water bars, etc. • Inspect, clean, and maintain ditch/culvert • Reshape ditch, install turnouts/diversion berm if needed, to improve flow capacity
Access Road	Compact Dirt	• Erosion • Subsidence • Soft spots • Pot holes	• Re-establish road surface • Re-grade road surface • Soil stabilization • Erosion control/ restoration	• Re-establish road surface using manual shovel/rake or backhoe • Re-grade road surface using grader • Stabilize disturbed areas by applying approved soil stabilizing agents[2], erosion control matting, installing silt fencing, water bars, etc. • Inspect, clean, and maintain ditch/culvert • Reshape ditch, install turnouts/diversion berm if needed, to improve flow capacity • Repair/rebuild culvert
Access Road	Compact Gravel	• Erosion • Subsidence • Soft spots • Pot holes	• Add minor gravel • Add major gravel • Re-establish road surface • Re-grade road surface • Erosion control/ restoration	• Re-establish road surface using manual shovel/rake or backhoe • Re-grade road surface using grader • Stabilize disturbed areas by applying approved soil stabilizing agents[2], erosion control matting, installing silt fencing, water bars, etc. • Inspect, clean, and maintain ditch/culvert • Reshape ditch, install turnouts/diversion berm if needed, to improve flow capacity • Repair/rebuild culvert
Access Road	Paved asphalt/ concrete	• Cracks • Potholes • Erosion • Subsidence • Pot holes	• Patch • Fill • Re-pave • Erosion control/ restoration	• Repair road to existing grade using asphalt/ concrete paving equipment, backhoe, grader, etc. • Inspect, clean, and maintain ditch/culvert • Reshape ditch, install turnouts/diversion berm if needed, to improve flow capacity • Repair/rebuild culvert

Note:

[1] Source: Massachusetts Unpaved Roads BMP Manual (Berkshire Regional Planning Commission 2001)

[2] List of potential soil stabilizing agents that may be used for the project include SoilTac (approved for use during and after the AOC 4 Time Critical Removal Action [CH2M HILL 2009]), PM10-50 (used at Hinkley Compressor Station), Gorilla-Snot, etc. Future commercially available products with comparable functionality may also be used, as appropriate.

7.5 Vegetation Control for Maintenance of Wireless Infrastructure

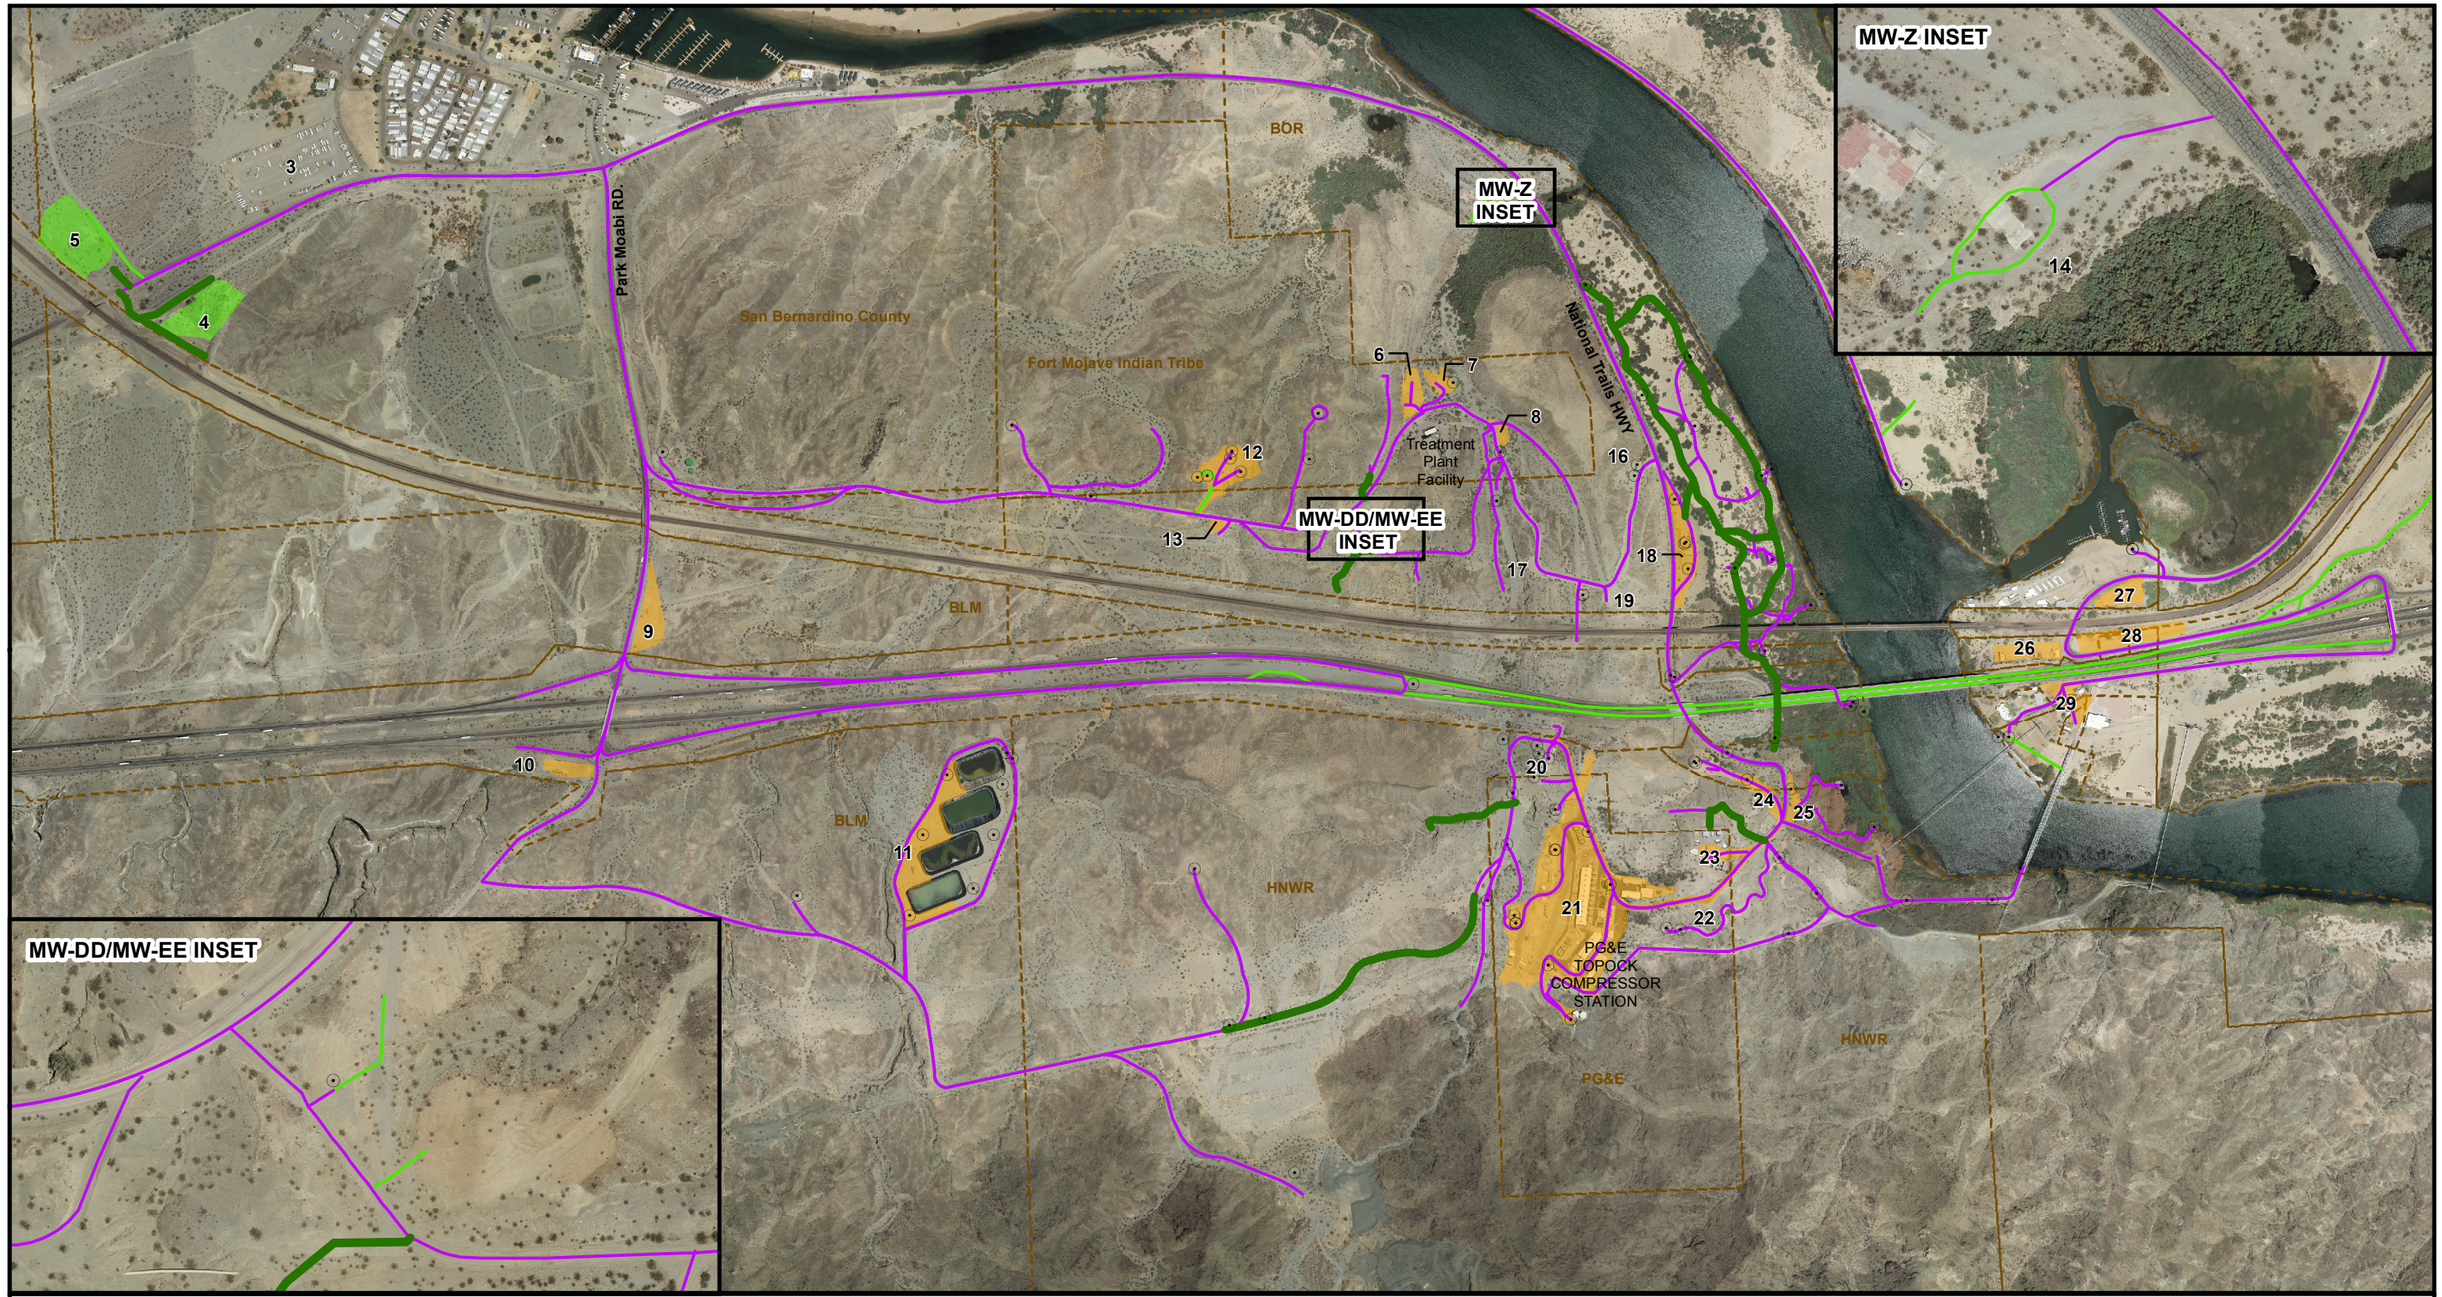
Wireless communication is used in the groundwater remedy, where feasible, to minimize the need for installation of hard wires and conduits. Certain wireless device requires clear line of sight for proper operation. The sites where such devices are located will be inspected on a periodic basis and overgrowth will be pruned or managed (e.g., tie back, bundle, etc.) to maintain clear lines of sight. Care will be taken to ensure that vegetation control measures are consistent with the project mitigation directives such as the protection of mature plants (EIR mitigation measures AES-1a and AES-2b) and the avoidance/protection of ethnobotanical sensitive plants (EIR mitigation measure CUL-1a-5) (DTSC 2011). In addition, vegetation control measures will be consistent with the project's revegetation plans (e.g., the Aesthetics and Visual Resources Revegetation Plan, the Habitat Restoration Plan for Riparian Vegetation and Other Sensitive Habitats, and the HNWR Habitat Restoration Plan) and future restoration plans.

7.6 Maintenance of Small Solar Panels

This section describes general preventive maintenance elements of small stand-alone solar photovoltaic systems including the care of batteries, solar panels, wiring and loads. See also SOP PWR-SOP-02 in Appendix B for additional details.

Battery Maintenance. A battery is a device which is used to store electrical charge. Batteries should be regularly and carefully maintained to extend their useful life. These activities include:

- Visually inspect and clean regularly - check for any electrolyte leak, cracks in the batteries, or corrosion at the terminals or connectors.
- Keep in a high state of charge
- Ensure the proper fluid level is maintained for all non-sealed batteries.



Solar Panel Maintenance. The solar panels are often thought to be maintenance-free. However, occasional maintenance and inspection of the solar panels must be performed to ensure optimal use. This can be done by keeping the surface (glass) area of the panel clean from any excess dirt.

- Remove dust and dirt from the panels. Do not use any abrasives which can damage the panel. Refer to the panel manufacturer for proper cleaning procedures.
- Visually inspect to check for defects such as cracks, chips, de-lamination, discoloration, etc. – note condition of panels including the mounting bolts (e.g., bolt rusting) and check to ensure that the frame and modules are firmly secured. Check junction boxes to ensure that the wires are not chewed by rodents or insects and that no excessive moisture or corrosion is present.

Inverter/Battery Charger and Charge Controller. This component can be maintained by minimizing dust accumulation. Use a dry cloth to wipe away any accumulated dirt/dust. Conduct visual inspection to ensure that all the indicators such as LED lights are working and that the wires leading to and from this device are not loose or damaged. Note that the charge controller should indicate that the system is charging when the sun is up.

Wiring and Connections. Check wiring installations for any cracks, breaks or deterioration in the insulation. Inspect junction boxes to ensure that they have not become a home for rodents and insects and that no excessive moisture is present. Also inspect connections for evidence of corrosion. The following sections of conduit and wiring should be checked for any signs of damage:

- Solar panels to the charge controller
- Charge controller to the battery bank
- Inverter/charger to the battery bank
- Generator to inverter/charger
- Inverter/charger and generator to the AC outlets
- Battery bank to the DC outlets/load
- All ground wires should be checked to ensure they are not damaged.

LEGEND

- Existing Well
- Existing Access Route (will continue to be used for remedial activities)
- Existing Route (proposed to be used as is for access to remedial activities)
- Roads to be Improved or Constructed for Remedy Use
- Proposed Soil Processing (Area #5) and Construction Headquarter (Area #4) for Remediation Project
- Proposed Staging Areas for Remediation Project (see BOD Table 3.5-1 for description of use of staging areas)

Notes:
1. Locations for access routes are approximate.
2. Public roadways outside of the EIR project area and the APE can also be used for remedy implementation.

NOTES:

1. FOR FULL SCADA, INSTRUMENT AND EQUIPMENT TAG NUMBER IDENTIFICATION REPLACE "*" ON THIS DRAWING WITH LOCATION ID RTP01.
2. 'X' IS A PLACEHOLDER TO ALLOW MULTIPLE DEVICES TO REFERENCE THE SAME I/O SYMBOL.

NOTES REFERENCED IN DRAWING:

1. NOZZLES PROVIDED FOR FUTURE RECIRCULATION PUMP AND EDUCTORS, PH, CONDUCTIVITY AND TURBIDITY ANALYZERS AND CHEMICAL FEED TO TANKS.
2. MINIMUM DISTANCE TO BE DETERMINED.
3. BLOWDOWN LINE CONNECTS TO TCS WASTEWATER TANK AND IS PUMPED FROM THERE TO EVAPORATION PONDS.
4. AIR TUBING AND CONTROL WIRES TO SOLENOID PANEL 401, TYPICAL FOR ALL PNEUMATIC VALVES.

Appendix B
Standard Operating Procedures

(Provided on CD-ROM Only)

APPENDIX B

Standard Operating Procedures

This appendix contains the following SOPs for the Final Groundwater Remedy at Topock Compressor Station:

- IRZ-SOP-01: MW-20 Bench System Startup
- IRZ-SOP-02: MW-20 Bench System Shutdown/Emergency Shutdown
- IRZ-SOP-03: MW-20 Bench Routine Operation System Inspection
- IRZ-SOP-04: Carbon Amendment Dosing Procedures
- IRZ-SOP-05: MW-20 Bench Carbon Storage Tank Delivery/Filling
- IRZ-SOP-06: MW-20 Bench Sampling Purge Water Transfer
- IRZ-SOP-07: Bench Scale Testing of Clean-in-Place Reagents
- IRZ-SOP-08: Clean-in-Place Reagent Delivery
- IRZ-SOP-09: Clean-in-Place Solution Mixing and Application
- IRZ-SOP-10: Discharge of Clean-in-Place Water to the Remedy-Produced Water Conditioning Plant
- IRZ-SOP-11: Use of Portable Tanks for Individual Well Dosing
- IRZ-SOP-12: Offsite Trucking of Clean-in-Place Water from MW-20 Bench
- Remedy-SOP-03: Cleaning and Maintenance of Instrumentation and Control Equipment
- Remedy-SOP-04: Maintenance of Aboveground Pumps
- Remedy-SOP-05: Cleaning and Maintenance of Valves and Flow Control Equipment
- Remedy-SOP-06: Automatic Backwashing
- Remedy-SOP-07: Secondary Containment Inspection and Maintenance at Buildings
- Remedy-SOP-08: Inspection of Frac Tanks
- PIPE-SOP-01: Conveyance System Inspection and Maintenance
- PIPE-SOP-02: Well and Meter Vault Inspection and Maintenance
- FWS-SOP-01: Startup and Shutdown of Freshwater Supply Conveyance and Storage System
- FWS-SOP-02: Sand Separator and Drywell Operation and Maintenance
- FWS-SOP-03: Freshwater Supply Well Site Inspection
- Well-SOP-01: Well and Borehole Permanent Decommissioning
- Well-SOP-02: Cleaning and Maintenance of Well Pumps
- Well-SOP-03: Physical/chemical well maintenance
- Well-SOP-04: Well Maintenance Chemical Delivery
- Well-SOP-05: Use of Portable Tanks for Well Maintenance/Rehab
- Well-SOP-06: Packer Inspection and Maintenance/Filling Procedures
- Well-SOP-07: Well Rehab Bench Testing
- Well-SOP-08: Remedy Well Inspection
- Well-SOP-09: Inspection and Repair of Groundwater Monitoring Wells
- RTP-SOP-01: System “Hot” Startup and Shutdown
- RTP-SOP-02: Batch Conditioning Process
- RTP-SOP-03: Continuous Conditioning Process
- RTP-SOP-04: CartridgeFfilter Maintenance
- RTP-SOP-05: Secondary Containment Operation in the Remedy-produced Water Conditioning Plant
- RTP-SOP-06: Phase Separator Loading and Removal
- RTP-SOP-07: Manual Cleaning of Frac Tanks
- RTP-SOP-08: Off-site Trucking of Remedy-produced Water
- RTP-SOP-09: Inspection of B-Side Conditioned Water Storage Tank
- RTP-SOP-10: Disposal of Produced Water in Evaporation Ponds via the TCS Wastewater Tank Discharge Connection
- RTP-SOP-11: Water Transfer from Conditioned Water Tank Farm to Tank at MW-20 Bench

- PWR-SOP-01: Transformer Inspection
- PWR-SOP-02: Solar PhotoVoltaic System Maintenance
- PWR-SOP-03: Communication Panel Inspection and Maintenance
- PWR-SOP-04: Remote Well(s) Panel Inspection and Maintenance
- SCADA-SOP-01: HMI/SCADA Application Backup and Cleaning
- SCADA-SOP-02: SCADA Historian Backup and Cleaning
- CHQ-SOP-01: Offsite Hauling of Wastewater
- CHQ-SOP-02: Truck Decontamination
- CHQ-SOP-03: Generator Inspection
- CHQ-SOP-04: Potable Water Delivery
- CHQ-SOP-05: Offsite Hauling of Sewage

Note: References to “SCADA” in the SOPs refer to the Remedy SCADA. References to the “HMI” in the SOPs refer to Remedy OIT or HMI devices.

Standard Operating Procedure
PG&E Topock IRZ
Operation and Maintenance Plan

Title: MW-20 Bench System Startup
Number: IRZ-SOP-01_Rev1
Creation Date: 9/8/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedures for startup of the National Trails Highway (NTH) In-Situ Reactive Zone (IRZ), Inner Recirculation Loop (IRL), and Topock Compressor Station (TCS) Recirculation Loop extraction and injection well recirculation systems. The NTH IRZ consists of four extraction wells and up to 24 injection wells, while the IRL consists of five River Bank Extraction Wells and four Inner Recirculation Loop Injection Wells. The TCS Recirculation Loop consists of two Transwestern Bench Extraction Wells, five East Ravine Extraction Wells, and two TCS Injection Wells. Below-grade piping networks allow for the conveyance of extracted groundwater, carbon-amended water, and fresh water between extraction wells, the MW-20 Bench, and injection wells. Ethanol dosing facilities are located at the MW-20 Bench with dosing procedures outlined in IRZ-SOP-04.

3 Equipment

- Appropriate PPE
- Health and Safety Plan
- Ethanol spill kit
- Fire extinguisher
- Eyewash supplies and safety shower

4 Procedure

1. Prefield Meeting
    1.1 Confirm with Maintenance Supervisor which injection and extraction wells are desired to operate
2. Pre-startup human machine interface (HMI) checks
    2.1 Check system alarm status on HMI
        2.1.1 Select “ALARMS” tab on HMI
        2.1.2 Verify if any alarm condition exist
            1. Document any alarm conditions in the checklist if they exist
    2.2 Call Maintenance Supervisor or Project Engineer if any alarms are active

2.3 Select the “Injection Well” tab on the HMI to view the NTH IRZ, IRL, and TCS Recirculation Loop injection well valve positions

2.3.1 Place desired wells to operate in “AUTO” position (this will not open the valves at this point)

2.4 Select the “Extraction Well” tab on the HMI to view the extraction well valve positions

2.4.1 Place desired wells to operate in “AUTO” position (this will not activate the pumps)

3. System startup

3.1 Select the “SYSTEM” tab on the HMI screen

3.2 Initiate recirculation by pressing “STARTUP”. Injection wells will open first followed by startup of extraction wells

4. Post-startup HMI checks

4.1 Confirm and record proper operating parameters

4.1.1 MW-20 Bench extraction header pressures. Record pressures on tablet

1. PIT-IRZ00-0662
2. PIT-IRZ00-0663

4.1.2 NTH IRZ

1. Extraction well flow rate (FIT-*0470A, FIT-*0471A, FIT-*0471B). Record flow rates on tablet
2. Extraction well water level (LT-*0460B, LT-*0461B, LT-*0461C). Record water levels on tablet
3. Injection well flow rate (FIT-*0472A, FIT-*0473A, FIT-*0473B, FIT-*0474A, FIT-*0474B, FIT-*0475A, FIT-*0475B). Record flow rates on tablet
4. Injection well water levels (LT-*0462E, LT-*0463H, LT-*0463I, LT-*0464H, LT-*0464I, LT-*0465H, LT-*0465I). Record water levels on tablet

4.1.3 IRL

1. Extraction well flow rate (FIT-*0570A). Record flow rates on tablet
2. Extraction well water level (LT-*0560B). Record water levels on tablet
3. Injection well flow rate (FIT-*0571A). Record flow rates on tablet
4. Injection well water levels (LT-*0561F). Record water levels on tablet

4.1.4 TCS Loop

1. Extraction well flow rate (FIT-*0370A and FIT-*0371A) Record flow rates on tablet
2. Extraction well water level (LT-*0360B and LT-*0361B). Record water levels on tablet
3. Injection well flow rate (FIT-*0372A and FIT-*0372B). Record flow rates on tablet
4. Injection well water levels (LT-*0362E and LT-*0362F) . Record water levels on tablet

4.2 Call Project Engineer if any equipment is operating outside of acceptable range (PLC and tablet will provide warnings if a parameter is out of range)

5. Post-startup manual system checks

5.1 Confirm and record proper operating parameters

5.1.1 MW-20 Bench IRZ injection header pressures. Record pressures on tablet

1. PI-IRZ00-0660A
2. PI-IRZ00-0660B
3. PI-IRZ00-0660C
4. PI-IRZ00-0660D

5.2 Check piping for any leaks within the MW-20 Bench carbon amendment building

Standard Operating Procedure
PG&E Topock IRZ
Operation and Maintenance Plan

Title: MW-20 Bench System Shutdown/Emergency Shutdown
Number: IRZ-SOP-02_Rev1

Creation Date: 9/8/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedures for normal shutdown along with emergency shutdown of the MW-20 Bench System, which includes the National Trails Highwah (NTH) In-Situ Reactive Zone (IRZ), Inner Recirculation Loop (IRL), and Topock Compressor Station (TCS) Recirculation Loop systems. The NTH IRZ consists of four extraction wells and up to 24 injection wells, while the IRL consists of five River Bank Extraction Wells and four Inner Recirculation Loop Injection Wells. The TCS Recirculation Loop consists of two Transwestern Bench Extraction Wells, five East Ravine Extraction Wells, and two TCS Injection Wells. Ethanol dosing facilities are located at the MW-20 Bench. Below-grade piping networks allow for the conveyance of extracted groundwater, carbon-amended water, and fresh water between extraction wells, the MW-20 Bench, and injection wells. The following SOP provides procedures for shutdown of the system along with subsequence checks to verify system parameters are in safe conditions. In the event of an emergency system shutdown it is important to keep human health and safety as the top priority. The system E-Stop should be engaged and then the environment should be deemed safe prior to continuance of procedures. If an unsafe circumstance remains go to a safe location and contact the project engineer.

4 Procedure

Routine Shutdown Procedures

1. Pre-shutdown human machine interface (HMI) checks
    1.1 Check system alarm status on HMI
        1.1.1 Select “ALARMS” tab on HMI
        1.1.2 Verify if any alarm conditions exist

1. Document any alarm conditions in the checklist
2. Troubleshoot any alarms
3. Call Maintenance Supervisor or Project Engineer if alarms cannot be readily addressed

2. System shutdown

2.1 Scroll to the “SYSTEM” tab on the HMI

2.2 Initiate shutdown by pressing “SYSTEM SHUTDOWN”

2.3 Verify that operating equipment on the HMI process flow diagram graphic visually turns from green (operating) to red (inactive)

2.3.1 Red (inactive) equipment to note

1. Pump PMP-IRZ00-0640
2. Pump PMP-IRZ00-0641
3. Pump PMP-IRZ00-0642
4. FV-IRZ00-0611 (located downstream of Tank T-IRZ00-0601) should be closed
5. FCV-IRZ00-0612 (located downstream of Pump PMP-IRZ00-0640) should be closed
6. FCV-IRZ00-0613 (located downstream of Pump PMP-IRZ00-0641) should be closed
7. FCV-IRZ00-0614 (located downstream of Pump PMP-IRZ00-0642) should be closed
8. FCV-IRZ00-0615 (located on ethanol conveyance line upstream of tee with IRL Injection Header) should be closed
9. FCV-IRZ00-0616 (located on ethanol conveyance line upstream of tee with North NTH IRZ Injection Header) should be closed
10. FCV-IRZ00-0617 (located on ethanol conveyance line upstream of tee with South NTH IRZ Injection Header) should be closed
11. FCV-IRZ00-0618 (located on ethanol conveyance line upstream of tee with TCS Injection Header) should be closed
12. FV-*0307, FV-*0308, FCV-*0404, FCV-*0408, FCV-*0409, FCV-*0414, FCV-*0415, FCV-*0416, FCV-*0417, FV-*0507, and FCV-*0510 (located in NTH IRZ, IRL, and TCS injection meter vaults) should be closed
13. FCV-*0509 (located on IRL injection well ASR Pump Package backwash lines) should be closed

3. Post-shutdown human machine interface (HMI) checks

3.1 Check system flow rates

3.1.1 NTH IRZ

1. Extraction well flow rate (FIT-*0470A, FIT-*0471A, FIT-*0471B): 0 gallons per minute (gpm) per well

2. Injection well flow rate (FIT-*0472A, FIT-*0473A, FIT-*0473B, FIT-*0474A, FIT-*0474B, FIT-*0475A, FIT-*0475B): 0 gpm per well

3.1.2 IRL

1. Extraction well flow rate (FIT-*0570A): 0 gpm per well
2. Injection well flow rate (FIT-*0571A): 0 gpm per well

3.1.3 TCS Loop

1. Extraction well flow rate (FIT-*0370A and FIT-*0371A): 0 gpm per well
2. Injection well flow rate (FIT-*0372A and FIT-*0372B): 0 gpm per well

3.1.4 Carbon Amendment Building (* indicates IRZ00)

1. Carbon substrate hose pump PMP-*0640 flow rate (FIT-*0671): 0 gpm
2. Carbon substrate hose pump PMP-*0641 flow rate (FIT-*0675): 0 gpm
3. Carbon substrate hose pump PMP-*0642 flow rate (FIT-*0676 and FIT-*0681): 0 gpm
4. River bank extraction well header flow rate (FIT-*0672): 0 gpm
5. IRZ-23 well and Northern NTH IRZ extraction network header well flow rate (FIT-*0673 and FIT-*0674): 0 gpm
6. TCS extraction well network header flow rate (FIT-*0680): 0 gpm

3.2 Call Maintenance Supervisor or Project Engineer if any detectable flow rate is still observed following shutdown

4. Post-shutdown manual system checks

4.1 Record system pressures – Verify MW-20 Bench System pressures are 0 pounds per square inch (psi). Notify project engineer if system pressures above 5 psi remain in section of the piping

4.1.1 Injection header pressure (* indicates IRZ00)

1. PI-*0660A
2. PI-*0660B
3. PI-*0660C
4. PI-*0660D

4.1.2 Extraction header pressure (* indicates IRZ00)

1. PIT-*0662
2. PIT-*0663

4.2 Check piping for any leaks

Emergency System Shutdown

Note: Human health and safety is the first priority in any emergency situation.

1. System shutdown

1.1 Hit the E-Stop Button

1.1.1 Locations

1. Exterior of the IRZ Carbon Amendment Building
2. On the control panel in the electrical and control room of the IRZ Carbon Amendment Building

1.2 Determine if the emergency condition has been mitigated

1.2.1 If yes proceed to Step 2

1.2.2 If no, locate yourself to a safe area and call the Maintenance Supervisor or Project Engineer

2. System shutdown verification

2.1 Verify that operating equipment on the HMI process flow diagram graphic visually turned from green (operating) to red (inactive)

2.1.1 Pump PMP-IRZ00-0640

2.1.2 Pump PMP-IRZ00-0641

2.1.3 Pump PMP-IRZ00-0642

2.1.4 FV-IRZ00-0611 (located downstream of Tank TNK-IRZ00-0601) should be closed

2.1.5 FCV-IRZ00-0612 (located downstream of Pump PMP-IRZ00-0640) should be closed

2.1.6 FCV-IRZ00-0613 (located downstream of Pump PMP-IRZ00-0641) should be closed

2.1.7 FCV-IRZ00-0614 (located downstream of Pump PMP-IRZ00-0642) should be closed

2.1.8 FCV-IRZ00-0615 (located on ethanol conveyance line upstream of tee with IRL Injection Header) should be closed

2.1.9 FCV-IRZ00-0616 (located on ethanol conveyance line upstream of tee with North NTH IRZ Injection Header) should be closed

2.1.10 FCV-IRZ00-0617 (located on ethanol conveyance line upstream of tee with South NTH IRZ Injection Header Leg IRZ 24-40) should be closed

2.1.11 FCV-IRZ00-0618 (located on ethanol conveyance line upstream of tee with TCS Loop Injection Header) should be closed

2.1.12 FV-*0307, FV-*0308, FCV-*0404, FCV-*0408, FCV-*0409, FCV-*0414, FCV-*0415, FCV-*0416, FCV-*0417, FV-*0507, and FCV-*0510 (located in NTH IRZ, IRL, and TCS injection meter vaults) should be closed

2.1.13 FCV-*0509 (located on IRL injection well ASR Pump Package backwash lines) should be closed

3. Post-shutdown human machine interface (HMI) checks

3.1 System flow rates

3.1.1 NTH IRZ

1. Extraction well flow rate (FIT-*0470A, FIT-*0471A, FIT-*0471B): 0 gpm per well
2. Injection well flow rate (FIT-*0472A, FIT-*0473A, FIT-*0473B, FIT-*0474A, FIT-*0474B, FIT-*0475A, FIT-*0475B): 0 gpm per well

3.1.2 IRL

1. Extraction well flow rate (FIT-*0570A): 0 gpm per well

2. Injection well flow rate (FIT-*0571A): 0 gpm per well

3.1.3 TCS Loop

1. Extraction well flow rate (FIT-*0370A and FIT-*0371A): 0 gpm per well
2. Injection well flow rate (FIT-*0372A and FIT-*0372B): 0 gpm per well

3.1.4 Carbon Amendment Building (* indicates IRZ00)

1. Carbon substrate hose pump PMP-*0640 flow rate (FIT-*0671): 0 gpm
2. Carbon substrate hose pump PMP-*0641 flow rate (FIT-*0675): 0 gpm
3. Carbon substrate hose pump PMP-*0642 flow rate (FIT-*0676 and FIT-*0681): 0 gpm
4. River bank extraction well header flow rate (FIT-*0672): 0 gpm
5. IRZ-23 well and Northern NTH IRZ extraction network header well flow rate (FIT-*0673 and FIT-*0674): 0 gpm
6. TCS extraction well network header flow rate (FIT-*0680): 0 gpm

3.1.5 Call Maintenance Supervisor or Project Engineer if any detectable flow rate is still observed following shutdown

4. Post-shutdown manual system checks

4.1 Record system pressures – Verify MW-20 Bench System pressures are 0 psi. Notify project engineer if system pressures above 5 psi remain in section of the piping

4.1.1 Injection header pressure (* indicates IRZ00)

1. PI-*0660A
2. PI-*0660B
3. PI-*0660C
4. PI-*0660D

4.1.2 Extraction header pressure

1. PIT-*0662
2. PIT-*0663

4.2 Check piping for any leaks

Standard Operating Procedure
PG&E Topock IRZ
Operation and Maintenance Plan

Title: MW-20 Bench Routine Operation System Inspection
Number: IRZ-SOP-03_Rev1

Creation Date: 9/8/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station.

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for routine maintenance inspection of the carbon amendment, well maintenance, and Clean-in-Place (CIP) systems located at the MW-20 Bench. Principal system components include storage tanks, pumps, and piping. Routine system inspections include recording the operating conditions of process equipment, physical inspection of active system components, and physical inspection of the secondary containment areas.

3 Equipment

- Appropriate PPE
- Health and Safety Plan
- Manual level gauge staff
- Electronic data handheld instrument
- Materials for cleaning pressure/vacuum (P/V) vent screens per manufacturer's recommendations
- Possible equipment needed to remove standing water includes but is not limited to:

- Mop
- Shop-vac
- Spill containment
- Extension cord

4 Procedure

1. MW-20 Bench Inspection (* indicates IRZ00)

1.1 Mobilize to MW-20 Bench

1.2 Check that security fence is secure and gates are locked

1.3 Check operating conditions of MW-20 Bench carbon amendment system process equipment on human machine interface (HMI)

1. Record Carbon Substrate Tank T-*0601 level from LT-*0652
2. Record flow meter readings for forcemains prior to carbon substrate injection:
    a. FIT-*0672 for Inner Recirculation Loop (IRL) forcemain
    b. FIT-*0673 for North In Situ Reactive Zone (IRZ) forcemain
    c. FIT-*0674 for South IRZ forcemain
    d. FIT-*0680 for TCS Injection forcemain
3. Record flow meter readings for carbon substrate injection lines:
    a. FIT-*0671 prior to IRL forcemain
    b. FIT-*0675 prior to North IRZ forcemain
    c. FIT-*0676 prior to South IRZ forcemain
    d. FIT-*0681 prior to TCS Injection forcemain
4. Record pressure readings at:
    a. PIT-*0662 for River Bank Extraction Well Network Header
    b. PIT-*0663 for IRZ-23 Extraction Well Header and Northern NTH IRZ Extraction Well Network Header

1.4 Check operating conditions of MW-20 Bench well maintenance reagent delivery system process equipment on HMI

1. Record IRZ Well Maintenance Reagent Day Tank T-*0619 level from LT-*0659
2. Record flow meter reading at FIT-*0679 for well maintenance reagent injection line
3. Record pressure reading at PIT-*0661 for well maintenance reagent injection line

1.5 Check operating conditions of well maintenance/CIP system process equipment on HMI

1. Record tank levels
    a. Record CIP Frac Tank T-*0623 level from LT-*0658

b. Record Backwash Frac Tank level from LT-*0657

c. Record Conditioned Water Frac Tank level from LT-*0656

2. Record flow meter reading

a. FIT-*0680A for CIP system

1.6 Check for leak detection alarms on HMI

1. If an alarm condition is observed:

a. Verify the location of the leak if it is safe and feasible to do so

b. Take measures to address the leak per Remedy-SOP-07

1.7 If carbon amendment system is active:

1. Complete physical inspection of Carbon Substrate Tank T-*0601

a. Visually inspect tank for signs of damage, leaks, or excessive deformation of tank walls

b. Visually inspect associated piping for leaks or damage

c. Visually inspect filling piping and fittings for leaks or damage

2. Check that stairs and platform to access top of tank are in good condition with no signs of wear or damage

3. Inspect P/V vent screens for fouling

a. Access screens from catwalk platform

b. Clean screen(s) in accordance with manufacturer's recommendations if fouling is observed

c. Replace screen(s) in accordance with manufacturer's recommendations if cleaning is ineffective

4. Complete physical inspection of Carbon Substrate Pumps PMP-*0640, PMP-*0641, and PMP-*0642

a. Visually inspect pumps for leaks or damage

b. Check that lubricant sight glasses are at least half full

c. Complete pump maintenance activities, if necessary, in accordance with Remedy-SOP-04

1.8 If well maintenance reagent delivery system is active:

1. Complete physical inspection Well Maintenance Reagent Day Tank T-*0619

a. Visually inspect tank for signs of damage, leaks, or excessive deformation of tank walls

b. Visually inspect associated piping for leaks or damage

c. Visually inspect filling piping and fittings for leaks or damage

2. Complete physical inspection of Well Maintenance Reagent Pump PMP-*0643

a. Visually inspect pump for leaks or damage

b. Check that lubricant sight glass is at least half full

c. Complete pump maintenance activities, if necessary, in accordance with Remedy-SOP-04

1.9 If well maintenance/CIP system is active:

1. Complete physical inspection of well maintenance/CIP system Tanks T-*0620, T-*0621, and T-*0623

    a. Visually inspect tank for signs of damage, leaks, or excessive deformation of tank walls

    b. Visual inspect associated piping for leaks or damage

2. Complete physical inspection of CIP reagent, produced water transfer, and conditioned water injection pumps PMP-*0644, PMP-*0645, and PMP-*0648

    a. Visually inspect pump for leaks or damage

    b. Check that lubricant sight glass is at least half full

    c. Complete pump maintenance activities, if necessary, in accordance with Remedy-SOP-04

1.10 IRZ Carbon Amendment Building piping physical inspection

1. Visually inspect piping for leaks, damage, or signs of wear
2. Pay close attention to valves, joints and connections

1.11 Pressure reading checks

1. Record pressure at pressure gauges:

    a. PI-*0660A located downstream of in-line static mixer M-*0605

    b. PI-*0660B located downstream of in-line static mixer M-*0606

    c. PI-*0660C located downstream of in-line static mixer M-*0607

    d. PI-*0660D located downstream of in-line static mixer M-*0608

    e. PI-*0660F located downstream of CIP Reagent Pump PMP-*0644

    f. PI-*0660G located downstream of Produced Water Transfer Pump PMP-*0645

    g. PI-*0660 located downgradient of Conditioned Water Injection Pump PMP-*0648

1.12 Secondary containment and sump physical inspection

1. Inspect containment pads/concrete for cracks and other signs of wear

    a. Perform inspection in accordance with Remedy-SOP-7

2. Check for standing water
3. If standing water is present:

a. Remove the water using the appropriate equipment (mop, shop-vac, etc.)
b. Attempt to determine the source of the water if it is safe and feasible to do so

4. Dispose of any observed debris in the appropriate receptacle

Standard Operating Procedure
PG&E Topock IRZ
Operation and Maintenance Plan

Title: Carbon Amendment Dosing Procedures

Number: IRZ-SOP-04_Rev1

Creation Date: 9/8/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for automated dosing of ethanol (as the carbon amendment) into the groundwater recirculation conveyance lines using the human machine interface (HMI) on the control panel within the MW-20 Bench carbon amendment buildings. Components of the carbon amendment system located at the MW-20 Bench include the carbon substrate storage tank; carbon amendment, metering, and control equipment (including valves, flow meters, carbon substrate hose pumps, and ancillary equipment); and monitoring equipment for the extraction well header network. Between ethanol injection cycles, groundwater is continuously recirculated from the extraction wells to the groundwater recirculation lines within the MW-20 Bench building, and then to the injection wells via the forcemain lines.

2 Drawing Numbers

- I-06-01: MW-20 Bench Carbon Amendment Building P&ID Sheet 1 of 4
- I-06-02: MW-20 Bench Carbon Amendment Building P&ID Sheet 2 of 4
- I-06-03: MW-20 Bench Carbon Amendment Building P&ID Sheet 3 of 4
- I-06-04: MW-20 Bench Carbon Amendment Building P&ID Sheet 4 of 4

3 Equipment

- Appropriate personal protective equipment (PPE)
- Health and Safety Plan
- Electronic data handheld instrument
- Ethanol spill kit
- 5-gallon bucket with lid or other appropriate receptacle

4 Procedure

1. Dosing Event Specifications Check
   - 1.1 Confirm target ethanol dosing concentration with Maintenance Supervisor
   - 1.2 Confirm dosing duration with Maintenance Supervisor
   - 1.3 Confirm dosing point(s): IRL, North NTH IRZ, South NTH IRZ, and/or TCS Loop
2. Pre-dosing HMI checks
   - 2.1 Check system alarm status on HMI
     1. Scroll to the "ALARMS" tab on HMI
     2. Verify if any alarm condition exist
        a. Document any alarm conditions in the checklist if they exist
        b. Troubleshoot any alarms that are active
   - 2.2 Call the Maintenance Supervisor or Project Engineer or if any alarms cannot be readily addressed
   - 2.3 Check tank level at LT-IRZ00-0652 for Carbon Substrate Tank T-IRZ00-0601
     1. If tank level is at less than 25%, notify Maintenance Supervisor so substrate delivery can be scheduled
3. Initiation of Ethanol Dosing Event at HMI (* indicates IRZ00)
   - 3.1 Select the "CARBON DOSING" tab on the HMI and verify the following equipment is in "AUTO"
     1. Solenoid valve FV-*0611 (downstream of Carbon Substrate Tank T-*0601)
     2. Carbon Substrate Pumps PMP-*0640, PMP-*0641, and PMP-*0642
     3. Motorized valves FCV-*0612, FCV-*0613, and FCV-*0614 (downstream of the carbon substrate pumps)
     4. Motorized valves FCV-*0615, FCV-*0616, FCV-*0617, and FCV-*0618 (to the injection points)
   - 3.2 Verify flow rate from extraction wells (record values in tablet)
     1. Record flow rate at FIT-*0672 if dosing into the IRL
     2. Record flow rate at FIT-*0673 if dosing into the North NTH IRZ
     3. Record flow rate at FIT-*0674 if dosing into the South NTH IRZ
     4. Record flow rate at FIT-*0680 if dosing into the TCS Loop
   - 3.3 Input target dosing concentration into HMI
     1. Select "ETHANOL CONCENTRATION" within the "CARBON DOSING" tab
     2. Use 0-9 digit touch pad to enter target dosing concentration in mg/L
        a. A single carbon dosing concentration will be applied to all recirculation loops

b. Maximum allowable carbon dosing concentration in programming is 4.15 g/L TOC (1% by volume ethanol)

3.4 On the "CARBON DOSING" tab on the HMI select "AUTOMATE DOSING" to activate the process.

3.5 Confirm proper actuation of valves – alarm will trigger and carbon substrate hose pumps will not turn on if valves do not actuate properly

1. Ensure that FV-*0611 is open
2. Ensure that FCV-*0612 is open if PMP-*0640 is active
3. Ensure that FCV-*0613 is open if PMP-*0641 is active
4. Ensure that FCV-*0614 is open if PMP-*0642 is active
5. Ensure that FCV-*0615 is open if dosing into the IRL (FCV-*0616, FCV-*0617, and FCV-*0618 closed)
6. Ensure that FCV-*0616 is open if dosing into the North NTH IRZ (FCV-*0615, FCV-*0617, and FCV-*0618 closed)
7. Ensure that FCV-*0617 is open if dosing into the South NTH IRZ (FCV-*0615, FCV-*0616, and FCV-*0618 closed)
8. Ensure that FCV-*0618 is open if dosing into the TCS Loop (FCV-*0615, FCV-*0616, and FCV-*0617 closed)

3.6 Confirm proper operation of Carbon Substrate Pumps PMP-*0640, PMP-*0641, and PMP-*0642

1. Short time delay programmed between valve activation and pump startup
2. Pump status changes from "Auto, Off" to "Auto, On"
3. Pump speeds to steady after 1-2 minutes of operation

4. Termination of Ethanol Dosing Event (* indicates IRZ00)

4.1 Ethanol dosing event to be manually terminated at HMI

1. On the "CARBON DOSING" tab on the HMI select "STOP DOSING" to stop the process.

4.2 Confirm Carbon Substrate Pumps PMP-*0640, PMP-*0641, and PMP-*0642 turn off

1. Pump status changes from "Auto, On" to "Auto, Off"

4.3 Confirm proper valve actuation

1. Short time delay programmed between pump shut down and valve activation
2. Ensure that FV-*0611 closes
3. Ensure that FCV-*0612, FCV-*0613, and FCV-*0614 (located downstream of carbon substrate hose pumps) close
4. Ensure that FCV-*0615, FCV-*0616, FCV-*0617, and FCV-*0618 (located just upstream of ethanol-water mixing point) close

Standard Operating Procedure
PG&E Topock IRZ
Operation and Maintenance Plan

Title: MW-20 Bench Carbon Storage Tank Delivery/Filling
Number: IRZ-SOP-05_Rev1

Creation Date: 9/8/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for ethanol delivery and filling at IRZ Carbon Substrate Tank T-IRZ00-0601, located adjacent to the MW-20 Bench Carbon Amendment Building. Tank T-IRZ00-0601 is a 15,000-gallon, above-grade, horizontal saddle tank that is fully compatible with ethanol. T-IRZ00-0601 has double-wall construction and an integral interstitial zone to provide secondary containment. T-IRZ00-0601 also includes a primary pressure/vacuum vent, emergency vents to prevent damage from failure of the primary vent, and a vapor recovery system designed to capture any emissions generated during the storage tank filling process.

2 Drawing Numbers

- I-06-01: MW-20 Bench Carbon Amendment Building P&ID Sheet 1 of 4
- I-06-02: MW-20 Bench Carbon Amendment Building P&ID Sheet 2 of 4
- I-06-03: MW-20 Bench Carbon Amendment Building P&ID Sheet 3 of 4
- I-06-04: MW-20 Bench Carbon Amendment Building P&ID Sheet 4 of 4
- M-06-04: MW-20 Bench Carbon Substrate Storage Tank Mechanical Details and Sections

3 Equipment

- Appropriate PPE
- Health and Safety Plan
- Carbon substrate spill kit
- Water hose and fire extinguisher
- Wheel chocks to be placed behind delivery truck tires
- Electrical grounding equipment for truck, tank, and transfer equipment
- Eyewash supplies and safety shower
- Non-sparking tools (as needed)

4 Procedure

1. Safety equipment check
    1.1 Manually test safety shower and eyewash station
        1.1.1 Troubleshoot safety shower and eyewash station if not functioning properly.
        1.1.2 Do not proceed with tank filling unless functioning safety shower and eyewash station are available.
2. Human machine interface (HMI) system status check (* indicates IRZ00)
    2.1 Confirm Tank T-*0601 transducers are active
        2.1.1 Level transducer LT-*0652
        2.1.2 Temperature transducer TT-*0690
    2.2 Confirm that carbon substrate hose pumps PMP-*0640, PMP-*0641, and PMP-*0642 are not active
        2.2.1 Look at HMI to confirm they are all in the “OFF” position
    2.3 Confirm solenoid valve FV-*0611 is closed
    2.4 Verify alarm status of level switches within carbon storage secondary tanks and discharge piping to detect leaks
        2.4.1 LS-*0651 – IRZ Carbon Substrate Tank T-*0601 secondary tank
        2.4.2 LS-*0653 - IRZ Carbon Substrate Tank T-*0601 discharge piping
3. Tank T-IRZ00-0601 leak inspection
    3.1 Walk around entire tank
    3.2 Check for:
        3.2.1 Leaks along equipment surfaces
        3.2.2 Accumulated liquid on the ground
    3.3 Immediately alert project team if a leak is detected
4. Delivery truck staging
    4.1 Instruct truck driver not to exceed 5 miles per hour (mph) while driving onsite
    4.2 Use a spotter during delivery truck approach and parking
    4.3 Park delivery truck in designated parking space next to Tank T-IRZ00-0601
    4.4 Avoid backing transfer truck
    4.5 Place wheel chocks behind truck tires once it is parked
    4.6 Place buckets under hose connections in transfer equipment
5. Tank T-IRZ00-0601 volume check
    5.1 Check Tank T-IRZ00-0601 level on HMI
    5.2 Verify tank level manually with level gauge staff
    5.3 Request delivery volume from truck driver
    5.4 Calculate available space in tank

5.4.1 Verify Tank T-IRZ00-0601 has adequate available space for delivery volume

5.4.2 Float valve will shut off flow to tank at 90% of tank capacity

6. Delivery specification check

6.1 Confirm the appropriate product is being delivered

CAUTION: Open flames around ethanol fumes may cause a fire creating immediate danger to personnel conducting the procedures.

7. Ignition source check

7.1 Confirm truck engine has been turned off

7.2 Confirm no electrical equipment is operational near the transfer connections

7.3 Staff is not smoking (smoking not allowed onsite)

8. Tank T-IRZ00-0601 and equipment inspection

8.1 Inspect concrete pad for signs of settling or wear

8.2 Visually inspect secondary containment tank, pipes, and hoses for signs of leaks and/or wear

8.3 Ensure check valve V-IRZ00-0601B is installed in the appropriate direction

8.4 Ensure ball valve V-IRZ00-0601A is in the open position

8.5 Connect camlock hose to the camlock connections on the truck and T-IRZ00-0601

8.5.1 Visually inspect the hose for signs of wear

8.6 Manually (by hand) check that pipe, hose, and camlock connections are secure

8.6.1 Secure connections if they are loose

8.7 Visually inspect truck transfer hose, valves, and pump

9. Electrical grounding

9.1 Install electrical ground connection cable and clamp to prevent buildup of static charge

9.1.1 To be installed on truck, tank, and transfer equipment

9.1.2 Grounding cables and clamps to be connected to designated grounding electrode

10. Ethanol transfer

10.1 Initially check Tank T-IRZ00-0601 and transfer equipment for signs of leaks

10.1.1 Immediately stop ethanol transfer if a leak is observed

10.2 Monitor transfer pressure at start of transfer and every 2-3 minutes thereafter

10.2.1 Allowable pressure range: 0 – 10 PSI

10.3 Check Tank T-IRZ00-0601 level on the HMI every 2-3 minutes throughout transfer

11. Ethanol transfer completion

11.1 Disconnect delivery truck from Tank T-IRZ00-0601

11.1.1 Confirm the line is not under pressure

11.1.2 Confirm with driver that ethanol has been purged from delivery lines prior to disconnecting transfer equipment

1. Typically performed by pushing air through the lines

11.1.3 Confirm buckets are placed under connections prior to disconnecting transfer equipment

11.1.4 Disconnect hoses

11.1.5 Clean up any minor carbon substrate spills immediately with absorbent pads

11.1.6 Disconnect grounding/bonding cables and clamps

12. Delivery truck departure

12.1 Unchock the tires

12.2 Remind driver to stay under 5 mph

12.3 Have driver pull through to parking lot exit. Spot driver out to the main road

13. System status check (* indicates IRZ00)

13.1 Check system status on HMI

13.1.1 Record new Tank T-*0601 level upon transfer completion from LT-*0652

13.1.2 Record temperature on TT-*0690

13.1.3 Open solenoid valve FV-*0611

13.1.4 Activate carbon substrate hose pumps PMP-*0640, PMP-*0641, and PMP-*0642 on HMI

Standard Operating Procedure
PG&E Topock IRZ
Operation and Maintenance Plan

Title: MW-20 Bench Sampling Purge Water Transfer
Number: IRZ-SOP-06_Rev1

Creation Date: 9/8/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for the transfer of purge water from the sampling truck to the In Situ Reactive Zone (IRZ) well maintenance reagent day tank T-IRZ00-0619, and the subsequent discharge from T-IRZ00-0619 to the National Trails Highway (NTH) Injection Wells. Purge water is periodically generated during normal sampling activities at the site. Tank T-IRZ00-0619 is 1,000 gallons in volume and located at the MW-20 Bench Carbon Amendment Building/IRZ Well Maintenance Room.

2 Drawing Numbers

- I-06-03: MW-20 Bench Carbon Amendment Building P&ID Sheet 3 of 4

3 Equipment

- Appropriate personal protective equipment (PPE)
- Health and Safety Plan
- Chemical spill kit
- 5 gallon buckets
- Cones, delineators, and caution tape to delineate work zone around sampling truck
- Eyewash supplies and safety shower

4 Procedure

1. Mobilization

    1.1 Park sampling truck in the reagent deliver secondary containment pad at the MW-20 Bench Carbon Amendment Building

        1.1.1 Use a spotter to safely maneuver vehicle

1.1.2 Do not exceed 5 miles per hour (mph) while driving onsite

1.1.3 Select a level parking area

1.1.4 Avoid backing sampling truck – select parking spot that will allow driver to pull through to exit

1.1.5 Place wheel chocks behind truck tires once it is parked

2. IRZ well maintenance reagent day tank T-IRZ00-0619 discharge valve check

2.1 Verify the following valves are open (* indicates IRZ00)

2.1.1 V-*0620G

2.1.2 V-*0620H

2.1.3 V-*0620J

2.1.4 V-*0620K

2.1.5 V-*0604B

2.1.6 V-*0604D

2.1.7 V-*0604F

2.1.8 V-*0604M

3. IRZ well maintenance reagent day tank T-IRZ00-0619 automation

3.1 Select the “IRZ DAY TANK” tab on the human machine interface (HMI)

3.1.1 Select “AUTO” for automated valve FCV-*0631

3.1.2 Select “AUTO” for well maintenance reagent hose pump PMP-IRZ00-0643

1. Ensure IRZ well maintenance reagent day tank T-IRZ00-0619 has been pumped to the low set point dictated by LT-IRZ00-0659

3.2 Manually check purge water volume based on gradations on sampling truck tank

4. Connect sampling truck to IRZ well maintenance reagent day tank T-IRZ00-0619 influent conveyance piping

4.1 Place buckets under hose connections in transfer equipment

4.2 Remove dust cap from tank cam-lock connection

4.3 Connect truck transfer hose to cam-lock connection

4.4 Inspect IRZ well maintenance reagent day tank T-IRZ00-0619 and purge water transfer equipment

4.5 Visually inspect secondary pipes, hoses, and fittings for signs of leaks and/or wear

4.6 Manually open valves

4.6.1 V-*0620M

4.6.2 V-*0620N

5. Transfer purge water to IRZ well maintenance reagent day tank T-IRZ00-0619

5.1 Start sampling truck trash pump to begin transfer

5.2 Check IRZ well maintenance reagent day tank T-IRZ00-0619 conveyance lines and transfer equipment for signs of leaks

5.2.1 Immediately stop purge water transfer if a leak is observed

5.3 Verify that PMP-IRZ00-0643 is operational when the high setpoint is reached

5.4 Check Tank T-IRZ00-0619 level (LT-IRZ00-0659) on the HMI every 1-2 minutes throughout transfer

5.5 End transfer once all fluid has been conveyed to IRZ well maintenance reagent day tank T-IRIZ00-0619

5.6 Turn off sample truck trash pump

5.7 Confirm buckets are placed under hose/pipe connections

5.8 Disconnect sampling truck from the dry break quick connect

5.9 Drain excess water into buckets

5.9.1 Clean up any minor purge water spills immediately with absorbent pads in the event of a spill

5.10 Replace dust cap

5.11 Water from the buckets shall be manually poured into T-IRZ00-0619

5.11.1 Avoid splashing

6. IRZ well maintenance reagent day tank T-IRZ00-0619 automation shutdown

6.1 Select the “IRZ DAY TANK” tab on the HMI

6.1.1 Select “OFF” for automated valve FCV-IRZ00-0631

6.1.2 Select “OFF” for well maintenance reagent hose pump PMP-IRZ00-0643

7. IRZ well maintenance reagent day tank T-IRZ00-0619 discharge valve check

7.1 Verify the following valves are closed (* indicates IRZ00)

7.1.1 V-*0604B

7.1.2 V-*0604D

7.1.3 V-*0604F

7.1.4 V-*0604M

8. Demobilization

8.1 Unchock tires

8.2 Use a spotter to safely maneuver vehicle

8.3 Do not exceed 5 mph while driving onsite

Standard Operating Procedure
PG&E Topock IRZ
Operation and Maintenance Plan

Title: Bench Scale Testing of Clean-in-Place Reagents
Number: IRZ-SOP-07_Rev0

Creation Date: 9/8/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for testing clean-in-place (CIP) chemicals to determine the optimal type and strength required for the various types of fouling deposits that may occur in the IRZ system. Procedures apply to both onsite and offsite testing.

2 Drawing Numbers

- None

3 Equipment

- Health and Safety Plan
- Appropriate personal protective equipment (PPE)
- Faceshield
- Chemical resistant gloves
- Chemical spill kit
- Eyewash supplies and safety shower
- Chemically compatible 250 ml beakers and containers
- Thermometer
- Mortar and pestle
- Weighing scale
- Drying oven
- Chemical hood
- Microscope
- Safety shower and eye wash station

4 Procedure

1. Prebench Test Work

   1.1 Order chemicals to be tested

   1.2 Manually test safety shower and eyewash station

   1.3 Obtain fouling deposits to be tested

2. Bench Testing

   Note: Perform all testing under a chemical hood

   2.1 Preparation

      2.1.1 Crush sample with mortar and pestle if hard and crystalline.

      2.1.2 Separate sample into multiple, equal masses reflective of the number of treatments to evaluate.

      2.1.3 Add sample portion to a 250 ml beaker

      2.1.4 Label each beaker according to the treatment method tested

   2.2 Chemical Guidelines

      2.2.1 Acid and caustics should be NSF, food grade, or approved alternates,

      2.2.2 Use concentrations that can be field implemented

      2.2.3 For acids, use standard concentrations first if evaluating multiple concentrations

   Note: that when using two acids, a dispersant is almost always needed for stabilization of reaction

      2.2.4 For blended acids, check compatibility and threshold allowances.

      2.2.5 Enhancers and surfactants: utilize NSF approved products and follow manufacturer's guidelines

      2.2.6 Inhibitors: test with single acids after blending with water, use on NSF approved products

   2.3 Acids Used in the Testing:

      2.3.1 Hydrochloric acid (6% solution of 20° concentrated HCL)

      2.3.2 Hydrochloric acid (8% solution of 20° concentrated HCL)

      2.3.3 Hydrochloric acid (10% solution of 20° concentrated HCL)

      2.3.4 Phosphoric acid (6% solution of 75% PA)

      2.3.5 Phosphoric acid (8% solution of 75% PA)

      2.3.6 Phosphoric acid (10% solution of 75% PA)

      2.3.7 Sulfamic acid (5% solution of 100% blended SA)

      2.3.8 Sulfamic acid (5% solution of 100% blended SA)

      2.3.9 Oxalic acid (6% of 7% solubilized OA)

      2.3.10 Oxalic acid (6% of 7% solubilized OA)

      2.3.11 Hydroxyacetic acid (6% of 70% concentrated HAA)

      2.3.12 Hydroxyacetic acid (6% of 70% concentrated HAA)

2.4 Chemicals Used in the Testing:

2.4.1 Dispersants – test 0.5%, 1.5%, and 3%

2.4.2 Biodispersants – test at 1.5% and 3%

2.4.3 Surfactants – test at 0.1% (note foaming)

2.4.4 Iron chelation – test at 0.001% and increase if Fe content exceeds 1.0 mg/l

2.4.5 Emulsifiers – test at 0.001%, 0.1% (note foaming)

3. Treatment Evaluation:

3.1 Record observation on log sheet noting heat, odor, effervescence, etc.

3.2 Record appearance and effectiveness of dissolution as a percent of the whole

3.3 Evaluate the reaction at 15 minutes, 30 minutes, 1 hour and 4 hours

3.4 Evaluate level of enhancement added at 30 minutes and 1 hour time periods with the addition of mechanical energy

4. Post Evaluation

4.1 Photograph deposits as received, after drying, and a microscopic 20-30x magnification

4.2 Allow the test solutions to remain under the chemical hood and observe the time it takes for dissolution of the sample.

4.3 Record the estimated percentage of dissolution and general observations of residue

4.4 Neutralize all solutions following completion of testing and dispose of properly

Standard Operating Procedure
PG&E Topock IRZ
Operation and Maintenance Plan

Title: Clean-In-Place Reagent Delivery
Number: IRZ-SOP-08_Rev1
Creation Date: 9/8/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for delivery of drums of Clean-In-Place (CIP) system reagent. The CIP system is designed to circulate acid- or caustic-based maintenance solutions within conveyance pipelines of the National Trails Highway (NTH) In Situ Reactive Zone (IRZ), to address biological fouling and/or mineral scaling. The CIP events are anticipated to coincide with NTH IRZ system shutdown periods at a frequency of approximately once per year. CIP reagent is stored in drums or totes until it is added to frac tank T-IRZ00-0623 located at the MW-20 Bench area as described in IRZ-SOP-09.

2 Drawing Numbers

- I-06-04: MW-20 Carbon Amendment Building P&ID Sheet 4 of 4

3 Equipment

- Appropriate personal protective equipment (PPE)
- Health and Safety Plan
- Chemical spill kit
- Cones, delineators, and caution tape to delineate work zone around delivery truck and tank
- Wheel chocks to be placed behind delivery truck tires
- Eyewash supplies and safety shower

4 Procedure

1. Pre-transfer health and safety procedures

    1.1 Manually test the eyewash station and safety shower at the MW-20 Bench Carbon Amendment Building

    1.2 Run water and verify the temperature of the water is cool enough for exposure

2. CIP delivery truck arrival
    2.1 Verify the truck has a lift gate
    2.2 Instruct truck driver not to exceed 5 miles per hour (mph) while driving onsite
    2.3 Use a spotter during delivery truck approach and parking
    2.4 Select a level parking area
    2.5 Avoid backing transfer truck – select parking spot that will allow driver to pull through to exit
    2.6 Place wheel chocks behind truck tires once it is parked
3. Check CIP reagent specifications
    3.1 Confirm the appropriate product is being delivered
    3.2 Sign for the delivery if it is the correct product

CAUTION: Severe burns may occur if PPE is not worn and a spill occurs

4. CIP reagent delivery offloading and staging
    4.1 CIP reagent to be delivered in drums
    4.2 Secure drum to a drum dolly
    4.3 Move drum to the lift gate
    4.4 Instruct the delivery driver to lower the lift gate to the ground
    4.5 Roll the drum over to secondary containment adjacent to Frac Tank T-IRZ00-0623
    4.6 Unstrap the drum from the drum dolly
5. Direct delivery driver offsite
    5.1 Unchock the tires
    5.2 Remind driver to stay under 5 mph
    5.3 Have driver pull through to parking lot exit
    5.4 Spot driver out to main road
6. Procedures for CIP mixing and application provided in IRZ-SOP-09

Standard Operating Procedure
PG&E Topock IRZ
Operations and Maintenance Plan

Title: Clean-in-Place Solution Mixing and Application
Number: IRZ-SOP-09_Rev1

Creation Date: 9/8/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for Clean-In-Place (CIP) solution mixing and application. The CIP system is designed to circulate acid- or caustic-based maintenance solutions within active and spare pipelines of the National Trails Highway (NTH) In Situ Reactive Zone (IRZ), to address biological fouling and/or mineral scaling. The CIP events are scheduled to coincide with the regular NTH IRZ system shutdown periods at a frequency of approximately once per year; however, depending on the level of fouling, CIP events may be completed as infrequently as once every five years. Concentrated CIP reagent is mixed with water in the 20,000-gallon Clean-In-Place Frac Tank T-IRZ00-0623 located at the MW-20 Bench area prior to circulation throughout the conveyance system. Procedures included this SOP involve manual valve verifications along with human machine interface (HMI) to run the automated circulation process. Manual oversight and operations are critical to proper CIP application. System automation will only convey processes after valves and flow processes are properly verified.

3 Equipment

- Appropriate personal protective equipment (PPE)

- Health and Safety Plan
- Chemical spill kit
- Eyewash supplies and safety shower
- IRZ-SOP-02 MW-20 Bench System Shutdown

4 Procedure

1. Prefield verification
   1.1 Obtain solution and pH requirements for CIP event
2. Safety equipment check
   2.1 Manually test safety shower and eyewash station
      2.1.1 Troubleshoot safety shower and eyewash station if not functioning properly.
      2.1.2 Do not proceed with CIP solution mixing and application unless functioning safety shower and eyewash station are available.
3. CIP reagent volume and specification check
   3.1 Confirm necessary CIP reagent volume and target pH
      3.1.1 Mixed reagent volume: 10,000 gallons
      3.1.2 Target pH:
         1. Acidic reagent: 2.5 standard units (SU)
         2. Caustic reagent: 11.5 SU
4. Shutdown MW-20 Bench
   4.1 Follow IRZ-SOP-02 to shut down MW-20 bench carbon amendment if the system is operational
5. Fresh water fill to T-IRZ00-0623
   5.1 Verify open valves: Drawing I-06-03 and I-06-04
      5.1.1 V-IRZ00-0628A, normally closed
   5.2 Verify closed valves: Drawing I-06-03
      5.2.1 V-IRZ00-0625A, normally open
      5.2.2 V-IRZ00-0625E, normally open
   5.3 Select the “CIP APPLICATION” tab on the HMI
      5.3.1 Place “FRESHWATER FILL” into “AUTO”
      5.3.2 Manually observe FCV-IRZ00-0628R open on the HMI
      5.3.3 LT-IRZ00-0658 will conclude the fresh water fill automatically when the tank is half full (approximately 10,000 gallons)
   5.4 Place “FRESHWATER FILL” into “OFF”
   5.5 Close valve V-IRZ00-0628A to assure fresh water is not added during CIP mixing application
6. CIP Valve Arrangements (* indicates IRZ00)

6.1 MW-20 Bench frac tank pad open valves: Drawing I-06-04

6.1.1 V-*0628G, normally closed

6.1.2 V-*0626C, normally closed

6.1.3 V-*0626F, normally closed

6.1.4 V-*0626H, normally closed

6.1.5 V-*0626I, normally closed

6.2 MW-20 Bench frac tank pad closed valves: Drawing I-06-04

6.2.1 V-*0628E, normally closed

6.2.2 V-*0626O, normally closed

6.2.3 V-*0626J, normally closed

6.3 MW-20 Bench Carbon Amendment Building open valves: Drawing I-06-01

6.3.1 V-*0609B, normally open

6.3.2 V-*0609C, normally open

6.3.3 V-*0609D, normally open

6.3.4 V-*0610A, normally closed

6.3.5 V-*0610C, normally closed

6.3.6 V-*0610E, normally closed

6.3.7 V-*0610F, normally closed

6.3.8 V-*0610G, normally closed

6.4 MW-20 Bench Carbon Amendment Building closed valves: Drawing I-06-01

6.4.1 V-*0609A, normally open

6.4.2 V-*0609H, normally open

6.4.3 V-*0609K, normally open

6.4.4 V-*0609P, normally closed

6.4.5 V-*0610H, normally closed

6.5 Clean in place vault open valves

6.5.1 V-*0402J, normally closed: Drawing I-04-02

6.5.2 V-*0424A, normally closed: Drawing I-04-06

6.6 Clean in place vault closed valves

6.6.1 V-*0403I, normally closed: Drawing I-04-03

6.6.2 V-*0412, normally closed: Drawing I-04-04

6.6.3 V-*0424B, normally closed: Drawing I-04-06

7. Begin recirculation of fresh water through conveyance lines

7.1 Select the “CIP APPLICATION” tab on the HMI

7.1.1 Place “CIP APPLICATION” into “AUTO”

7.1.2 Manually observe FCV-IRZ00-0628R open on the HMI

7.1.3 Manually observe FCV-IRZ00-0632 open on the HMI

7.1.4 Manually observe pump PMP-IRZ00-0644 turn on

7.2 With the process running with fresh water walk around the MW-20 Bench and look for signs of leakage

7.2.1 IF the system is running without error proceed to Step 7.3

7.2.2 IF a leak is observed

THEN stop the process on the HMI by placing “CIP APPLICATION” in “OFF”

THEN clean up the spill

8. pH monitoring setup

8.1 Mount pH probe in Tank T-IRZ00-0623

8.1.1 Manually (by hand) confirm that pH probe is secure

9. CIP reagent addition

CAUTION: PPE must be worn at all times when dealing with the CIP reagent

9.1 Remove the bung from the drum of CIP reagent

9.2 Install a drum pump into the drum of CIP reagent

9.3 Connect the drum pump discharge to the quick connect at V-IRZ00-0628E

9.4 Open V-IRZ00-0628E at a 45 degree angle to throttle flow

9.5 Plug in the drum pump and turn it on for 10 seconds

9.6 Verify the tank pH on the pH probe

9.6.1 Repeat Steps 9.5 and 9.6 until the tank reaches the target pH outlined by the maintenance supervisor

9.7 As the CIP reagent buffers through dissipation of scale more reagent will need to be added during the process

9.7.1 Repeat Steps 9.5 and 9.6 intermittently until the tank reaches the target pH outlined by the maintenance supervisor

9.8 Run the process until the pH holds for a duration of 1 hour

9.8.1 Unless the maintenance supervisor approves of an earlier stop time

9.9 Select the “CIP APPLICATION” tab on the HMI

9.9.1 Place “CIP APPLICATION” into “OFF”

9.9.2 Manually observe pump PMP-IRZ00-0644 turn off

9.9.3 Manually observe FCV-IRZ00-0628R close on the HMI

9.9.4 Manually observe FCV-IRZ00-0632 close on the HMI

9.10 Close V-IRZ00-0628E

9.11 Disconnect the drum pump

9.12 Replace bung on drum

10. Discharge CIP remedy water to the Remedy-produced Water Conditioning Plant as outlined in IRZ-SOP-10
11. Rinse out T-IRZ00-0623 with fresh water
    - 11.1 Select the “CIP APPLICATION” tab on the HMI
      - 11.1.1 Place “FRESHWATER FILL” into “AUTO”
      - 11.1.2 Manually observe FCV-IRZ00-0628R open on the HMI
      - 11.1.3 LT-IRZ00-0658 will conclude the fresh water fill automatically when the tank is half full (approximately 10,000 gallons)
    - 11.2 Place “FRESHWATER FILL” into “OFF”
    - 11.3 Close valve V-IRZ00-0628A to assure fresh water is not added during the fresh water flush of the lines
12. Flush the conveyance lines with fresh water
    - 12.1 Select the “CIP APPLICATION” tab on the HMI
      - 12.1.1 Place “CIP APPLICATION” into “AUTO”
      - 12.1.2 Manually observe FCV-IRZ00-0628R open on the HMI
      - 12.1.3 Manually observe FCV-IRZ00-0632 open on the HMI
      - 12.1.4 Manually observe pump PMP-IRZ00-0644 turn on
    - 12.2 Allow the fresh water to circulate for 1 hour
13. Discharge conveyance water to the Remedy-produced Water Conditioning Plant as outlined in IRZ-SOP-10
14. Verify valve positions following conclusion of CIP application (* indicates IRZ00)
    - 14.1 Fresh water valves open: I-06-03 and I-06-04
      - 14.1.1 V-IRZ00-0625A, normally open
      - 14.1.2 V-IRZ00-0625E, normally open
    - 14.2 Fresh water closed valves: Drawing I-06-03
      - 14.2.1 V-IRZ00-0628A, normally closed
    - 14.3 MW-20 Bench frac tank pad closed valves: Drawing I-06-04
      - 14.3.1 V-*0626C, normally closed
      - 14.3.2 V-*0626F, normally closed
      - 14.3.3 V-*0626H, normally closed
      - 14.3.4 V-*0626I, normally closed
    - 14.4 MW-20 Bench frac tank pad closed valves: Drawing I-06-04
      - 14.4.1 V-*0628E, normally closed
      - 14.4.2 V-*0628G, normally closed
      - 14.4.3 V-*0626O, normally closed
      - 14.4.4 V-*0626J, normally closed

14.5 MW-20 Bench Carbon Amendment Building open valves: Drawing I-06-01

14.5.1 V-*0609A, normally open

14.5.2 V-*0609B, normally open

14.5.3 V-*0609C, normally open

14.5.4 V-*0609D, normally open

14.5.5 V-*0609H, normally open

14.5.6 V-*0609K, normally open

14.5.7 V-*0610H, normally closed

14.5.8 V-*0609P, normally closed

14.6 MW-20 Bench Carbon Amendment Building closed valves: Drawing I-06-01

14.6.1 V-*0610A, normally closed

14.6.2 V-*0610C, normally closed

14.6.3 V-*0610E, normally closed

14.6.4 V-*0610F, normally closed

14.6.5 V-*0610G, normally closed

14.7 Clean in place vault open valves

14.7.1 None

14.8 Clean in place vault closed valves

14.8.1 V-*0402J, normally closed: Drawing I-04-02

14.8.2 V-*0424A, normally closed: Drawing I-04-06

14.8.3 V-*0403I, normally closed: Drawing I-04-03

14.8.4 V-*0412, normally closed: Drawing I-04-04

14.8.5 V-*0424B, normally closed: Drawing I-04-06

15. Contact the maintenance supervisor to notify them of completed activities

16. Restart the system as outlined in IRZ-SOP-01

Standard Operating Procedure
PG&E Topock IRZ
Operation and Maintenance Plan

Title: Discharge of Clean-in-Place Water to the Remedy-Produced Water Conditioning Plant

Number: IRZ-SOP-10_Rev1

Creation Date: 9/8/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for the transfer of clean-in-place (CIP) water from MW-20 Bench Frac Tank T-IRZ00-0623 to the Remedy-Produced Water Conditioning Plant. CIP maintenance activities produce water that must be conveyed to the Remedy-Produced Water Conditioning Plant for treatment on an as needed basis. This SOP covers the manual and automated procedures for conveyance of CIP water in tank T-IRZ00-0623 to the Remedy-Produced Water Conditioning Plant. This SOP assumes that all CIP application to the In Situ Reactive Zone (IRZ) conveyance lines outlined in IRZ-SOP-09 has been completed and the CIP water is being stored in frac tank T-IRZ00-0623 awaiting transfer.

2 Drawing Numbers

- I-06-04: MW-20 Bench Carbon Amendment Building P&ID Sheet 4 of 4
- REMEDY-SOP-06

3 Equipment

- Appropriate personal protective equipment (PPE)
- Health and Safety Plan

4 Procedure

1. Pre-startup human machine interface (HMI) checks
    1.1 Check system alarm status on HMI
        1.1.1 Select “ALARMS” tab on HMI
        1.1.2 Verify if any alarm conditions exist associated with the system
            1. Document any alarm conditions in the checklist if they exist

1.2 Attempt to troubleshoot alarms

1.2.1 Call project engineer or maintenance supervisor if alarms cannot be easily addressed

2. Shutdown of automatic backwashing activities

2.1 Select the "AUTOMATIC BACKWASH" tab on the HMI to view the National Trails Highway (NTH) IRZ and Inner Recirculation Loop (IRL) injection well valve positions

2.1.1 To remove ALL wells from automatic operation place extraction pumps in the "OFF" position

2.2 Verify that the Backwash Frac Tank T-IRZ00-0621 is not receiving flow from other processes during the scheduled transfer

3. Valve check

3.1 Select the "CIP TRANSFER" tab on the HMI

3.1.1 Select "CLOSE" for actuated valve FCV-IRZ00-0632

3.2 Manually close valve V-IRZ00-0626B on the backwash transfer line to Backwash Frac Tank T-IRZ00-0621

3.3 Manually open valve V-IRZ00-0626O to transfer pump PMP-IRZ00-0645 to the Remedy-produced Water Conditioning Plant

4. Transfer of CIP water to the Remedy-produced Water Conditioning Plant

4.1 Select the "CIP TRANSFER" tab on the HMI to view the CIP process screen

4.2 Place FCV-IRZ00-0633 into the "OPEN" position

4.3 Place PMP-IRZ00-0645 into "AUTO" to begin the transfer

4.3.1 Transfer will only commence if the water levels in the Remedy-produced Water Conditioning Plant influent tanks (TNK-RTP01-1101, -1102, -1103, -1104) are below the high-level switch (LSH-RTP01-1151, -1153, -1155, -1157) elevations

4.4 Visually inspect the lines for signs of leaks

4.5 Once T-IRZ00-0623 is empty LT-IRZ00-0658 will initiate the programmable logic controller to do the following

4.5.1 FCV-IRZ00-0633 will close

4.5.2 PMP-IRZ00-0645 will automatically shutoff

4.6 Place transfer pump PMP-IRZ00-0645 into "OFF" to make sure it does not turn on again in association with future CIP activities

5. Manual valve check

5.1 Manually close valve V-IRZ00-0626O to the Remedy-produced Water Conditioning Plant

5.2 Manually open valve V-IRZ00-0626B on the backwash transfer line to Backwash Frac Tank T-IRZ00-0621

6. Proceed to REMEDY-SOP-06 for procedures on restarting the automatic backwashing

Standard Operating Procedure
PG&E Topock IRZ
Operation and Maintenance Plan

Title: Use of Portable Tanks for Individual Well Dosing
Number: IRZ-SOP-11_Rev0

Creation Date: 9/8/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for dilute carbon substrate dosing using portable tanks at injection wells at the NTH IRZ, TCS Recirculation Loop, and Inner Recirculation Loop (IRL). This alternative means of reagent delivery allows for added flexibility in long-term system operation. Portable tanks may be used for specific, targeted injections on an as-needed basis, or during times when carbon dosing equipment is undergoing maintenance. Portable tanks may be preferred over pipeline reagent conveyance at locations where the carbon injection volume is low, injections occur with long rest periods, or long pipelines are expected to pose health and safety and/or long-term O&M challenges.

- M-05-06: Inner Recirculation Loop Injection Well Vaults Mechanical Sections

3 Equipment

- Appropriate personal protective equipment (PPE)
- Site-Specific Health & Safety Plan
- Chemical spill kit
- Flexible hose
- Necessary fittings/adapters for connection of portable tank to vault manual addition port
- Cones, delineators, and Caution tape to delineate work zone
- Wheel chocks to be placed behind delivery truck tires
- Eyewash supplies

4 Procedure

1. Injection parameters
    1.1 Obtain target injection parameters from Maintenance Supervisor
        1.1.1 Injection volume
        1.1.2 Injection solution concentration
        1.1.3 Allowable injection pressure
        1.1.4 Expected injection flow rate
    1.2 Confirm that injection concentration is less than 10% by volume if injecting ethanol
        1.2.1 Flash point of 10% by volume ethanol solution is 120 degrees Fahrenheit (°F)
2. Mobilization to tank storage location
    2.1 Do not exceed 5 miles per hour (mph) while driving onsite
    2.2 Select a level parking area
3. Tank loading
    3.1 Load small (up to 500 gallon) by hand using proper lifting techniques (if tank is not already secured to truck)
        3.1.1 Use two staff to lift empty tank
        3.1.2 Use legs instead of back to lift
        3.1.3 Request additional assistance if needed
        3.1.4 Secure tank to truck using appropriate utility straps
4. Pre-transfer health and safety procedures
    4.1 Manually test the eyewash station and safety shower at the MW-20 Bench Carbon Amendment Building

4.2 Run water and verify the temperature of the water is cool enough for exposure

5. Tank filling

5.1 Fill portable tank with water

5.1.1 Mobilize to MW-20 Bench water spigot

1. Do not exceed 5 miles per hour (mph) while driving onsite
2. Select a level parking area

5.1.2 Delineate work area

1. Using cones, delineators, and/or caution tape
2. Place wheel chocks behind truck tires

5.1.3 Connect tank to water spigot

1. Use requisite fittings, adapters, and hoses

5.1.4 Fill tank with target water volume

5.1.5 Close all tank lids/openings

5.2 Fill portable tank with carbon substrate

5.2.1 Mobilize to MW-20 Bench decon pad

1. Carbon substrate used for portable tank injections will be stored in drums/totes at decon pad
2. Do not exceed 5 mph while driving onsite

5.2.2 Delineate work area

1. Using cones, delineators, and/or caution tape
2. Place wheel chocks behind truck tires

5.2.3 Electrical grounding

1. Install electrical ground connection cable and clamp to prevent buildup of static charge
2. To be installed on truck, tank, and transfer equipment
3. Grounding cables and clamps to be connected to designated grounding electrode

5.2.4 Add target carbon substrate volume to portable tank

1. Use 5-gallon buckets
2. Fill 5-gallon buckets by gravity by connecting a hose to the outlet of the drum/tote
3. Do not fill 5-gallon buckets more than 75% full
4. Place lid on bucket
5. Manually transfer carbon substrate to tank slowly to avoid splashing

5.2.5 Close all tank lids/openings

6. Mobilization to injection well vault

6.1 Do not exceed 5 miles per hour (mph) while driving onsite

6.2 Select a level parking area

6.3 Park work truck so that trailer is adjacent to vault

7. Open vault lid

7.1 Remove lid bolts using proper tools

7.2 Use proper lifting techniques

7.2.1 Use two staff to lift vault lids

7.2.2 Use legs instead of back to lift

7.2.3 Ensure vault lid supports are secure after opening

8. Tank connection to injection well

8.1 Electrical grounding

8.1.1 Install electrical ground connection cable and clamp to prevent buildup of static charge

8.1.2 To be installed on truck, tank, and transfer equipment

8.1.3 Grounding cables and clamps to be connected to designated grounding electrode

8.2 Enter injection vault

8.3 Inspect 1-inch diameter injection well manual additional port

8.3.1 Remove cap, if present

8.3.2 Visual check for objects / obstructions

8.3.3 Confirm manual addition port ball valve is closed

8.4 Connect portable tank outlet to manual addition port

8.4.1 Use temporary flexible hosing and requisite adapters/fittings

8.4.2 Connect flow meter in line with temporary conveyance equipment

8.4.3 Lock cam-lock connections at tank outlet and injection well manual additional port

8.4.4 Visually inspect hose for leaks or signs of excessive wear

9. Portable tank injection

9.1 Open ball valve at outlet of portable tank

9.2 Inspect hose for leaks

9.2.1 Stop injection and replace hose if leaking

9.3 Open ball valve at manual addition port

9.4 Start generator

9.4.1 Plug in injection pump

9.5 Start injection pump at low speed

9.6 Check injection pressure using pressure gauge inside vault

9.6.1 Immediately upon starting pump

9.6.2 Any time the pump speed is adjusted

9.6.3 At least once every 15 minutes throughout the injection

9.7 Confirm injection pressure is below maximum allowable pressure

9.7.1 Reduce pump speed if injection pressure

9.8 Check injection flow rate

9.8.1 Flow meter reading

1. Compare flow meter reading to expected flow rate
2. Increase pump speed if flow rate is below expected level and injection pressure is below allowable level

9.8.2 Visually look for fluid flow through flexible hose if flow meter does not detect flow

9.8.3 Troubleshoot setup if it is not obvious that fluid is flowing

1. Check valve configuration
2. Contact project team

10. Injection completion

10.1 Confirm injection has finished

10.1.1 Dilute reagent is no longer flowing through flexible hose

10.1.2 Fluid level is below tank outlet

10.2 Turn off injection pump

10.3 Close portable tank outlet ball valve

10.4 Disconnect hose from portable tank

10.4.1 Allow residual fluid to drain into injection well

10.5 Disconnect hose from manual addition port

10.6 Close manual addition port ball valve

11. Close vault lid

11.1 Use proper lifting techniques

11.1.1 Use two staff to lower vault lids

11.1.2 Use legs instead of back to lift

11.2 Secure bolts

12. Demobilization

12.1 Remove wheel chocks

12.2 Demobilize from injection vault

12.3 Mobilize to MW-20 Bench water spigot

12.3.1 Do not exceed 5 miles per hour (mph) while driving onsite

12.3.2 Select a level parking area

12.4 Delineate work area

12.4.1 Using cones, delineators, and/or caution tape

12.4.2 Place wheel chocks behind truck tires

12.5 Rinse out tank with hose

12.5.1 Drain rinsate into 5 gallon buckets

12.5.2 Drain buckets into MW-20 Bench sump for distribution to injection wells

Standard Operating Procedure
PG&E Topock IRZ
Operation and Maintenance Plan

Title: Offsite Trucking of Clean-in-Place Water from MW-20 Bench

Number: IRZ-SOP-12_Rev1

Creation Date: 9/8/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for transferring clean-in-place (CIP) water from frac tank T-IRZ00-0623 at the MW-20 Bench to the truck fill station for off-site trucking. This procedure is controlled both manually and through automation with the use of the human machine interface (HMI). This SOP assumes that all CIP application to the In Situ Reactive Zone (IRZ) conveyance lines outlined in IRZ-SOP-09 has been completed and the CIP water is currently stored in frac tank T-IRZ00-0623 awaiting transfer.

2 Drawing Numbers

- I-06-04: MW-20 Bench Carbon Amendment Building P&ID Sheet 4 of 4

3 Equipment

- Appropriate personal protective equipment (PPE)
- Health and Safety Plan
- 5-gallon buckets
- Tablet for data recording

4 Procedure

1. Pre-transfer health and safety procedures
   - 1.1 Manually test the eyewash station and safety shower at the MW-20 Bench Carbon Amendment Building
   - 1.2 Run water and verify the temperature of the water is cool enough for exposure
2. Pre-startup human machine interface (HMI) checks
   - 2.1 Check system alarm status on HMI
   - 2.2 Select “ALARMS” tab on HMI

2.3 Verify if any alarm conditions exist associated with the system

1. Document any alarm conditions in the checklist if they exist
2. Attempt to troubleshoot any alarms

2.4 Call project engineer or maintenance supervisor if alarms cannot be readily addressed

3. Loading site preparation

3.1 Inspect concrete pad for signs of settling or wear

3.2 Confirm that load-out hose is properly stored and not in the path of trucks entering the loading area

3.3 Visually inspect load-out hose for signs of wear

3.4 Confirm that necessary hoses and connections are present

4. Truck staging and hook-up

4.1 Instruct truck driver not to exceed 5 miles per hour (mph) while driving onsite

4.2 Confirm that driver and equipment meet job requirements

1. Verify that the driver has completed a pre-trip inspection on the truck and trailer
2. Verify that the driver currently driving the truck is the same driver who performed the pre-trip inspection

NOTE: If any deficiencies are discovered per Step 4.2, contact the Maintenance Supervisor before proceeding.

4.3 Use a spotter to direct truck driver during approach and alignment of truck on containment pad

1. Spotter to use hand signals to stop truck when the front trailer axle is at the north end of the containment pad (opposite of entrance)
2. Ensure that there is enough room in the containment pad behind the trailer to catch any minor spills

4.4 Place wheel chocks behind truck tires once truck is parked

4.5 Place 5-gallon bucket under trailer's inlet connection

4.6 Have driver hook up to the load-out hose

NOTE: Driver is responsible for:

- Attaching the load-out hose to the truck
- Making sure the truck tank is vented
- Determining how many gallons are to be loaded
- Disconnecting the load-out hose
- Operating the load valve (trailer valve) on the truck

Operator is responsible for:

- All valves upstream of the load-out hose

- Operating the transfer pump PMP-IRZ00-0644
- Telling the driver how many gallons have been loaded

4.7 Connect load-out hose to the dry-break coupling on the remedy-produced water line

4.8 Manually check that pipe, hose, and connections are secure

1. Secure any loose connections

4.9 Place 5-gallon buckets under hose connections in transfer equipment

5. Remedy-produced water transfer

5.1 Record the beginning totalizer reading (FIT-IRZ00-0680A) on the shipping documentation and tablet

5.2 Confirm with the driver that the line isolation valves are properly positioned before opening tank valves

5.3 Valve check (* indicates IRZ00)

1. Open manual valves/verify position
    a. V-*0626C
    b. V-*0626F
    c. V-*0626H
    d. V-*0626J
2. Close manual valve/verify position
    a. V-*0626I
    b. V-*0626O

5.4 Have driver check truck valves and vents

5.5 Confirm with driver that truck is ready to receive water

1. Open load supply valve V-IRZ00-0626L

5.6 Select the “CIP TRANSFER” tab on the HMI to view the CIP process screen

5.7 Place FCV-IRZ00-0632 into the “OPEN” position

5.8 Place PMP-IRZ00-0644 into “AUTO” to begin the transfer

5.9 Visually inspect the lines for signs of leaks

5.10 During the pumping operation, the operator must stay in the load control area and the driver must stay by the trailer valve

5.11 Communicate with driver to ensure that truck is not loaded beyond legal limits

5.12 Once T-IRZ00-0623 is empty LT-IRZ00-0658 will initiate the programmable logic controller to do the following

5.13 FCV-IRZ00-0632 will close

5.14 PMP-IRZ00-0644 will automatically shutoff

5.15 Place transfer pump PMP-IRZ00-0644 into “OFF” to make sure it doesn’t turn on again in association with future CIP activities

5.16 Confirm that remedy-produced water line is not under pressure

5.17 Close load supply valve V-IRZ00-0626L

5.18 Have driver close the trailer valve

5.19 Select the “CIP TRANSFER” tab on the HMI to view the CIP process screen

5.20 Place FCV-IRZ00-0632 into the “CLOSE” position

6. Truck disconnection

6.1 Confirm that 5-gallon buckets are under hose connection points

6.2 Have driver open connection to truck (water will be in hose)

6.3 Have driver disconnect load-out hose from trailer valve

6.4 Disconnect load-out hose from the cam-lock coupling on the remedy-produced water line

6.5 Allow load-out hose to drain into 5-gallon buckets

6.6 Remove any adapters used

6.7 Have driver replace trailer valve cap or plug

6.8 Have driver close drip tray valve

6.9 Remove 5-gallon buckets from under connection points

6.10 Empty 5-gallon buckets into containment pad sump

6.11 Store equipment (hose, adapters, buckets) properly

7. Shipping documentation preparation

7.1 Record the ending totalizer reading (FIT-IRZ00-0680A) on the shipping documentation and tablet

7.2 Confirm that appropriate forms are filled out and signed

7.3 Confirm that shipping documentation is complete and signed

7.4 Confirm that shipping documentation number is recorded

7.5 Provide driver with appropriate copies

8. Truck demobilization

8.1 Work with driver to inspect that truck is in safe condition

8.2 Confirm that hose, buckets, and other equipment have been removed from path of truck exiting the loading area

8.3 Unchock tires

8.4 Remind driver to stay under 5 mph while onsite

8.5 Instruct driver to exit the containment pad heading north

8.6 Spot driver out to the main road

9. Post-transfer system checks

    9.1 Select the “CIP TRANSFER” tab on the HMI to view the CIP process screen

        1. Check and record the new tank level on LT-IRZ00-0658 for T-IRZ00-0623 on the tablet
        2. Verify that actuated valve FCV-IRZ00-0632 is in the “CLOSE” position

    9.2 Valve check (* indicates IRZ00)

        1. Close manual valve/verify position
            a. V-*0626J
            b. V-*0626L
            c. V-*0626O

    9.3 Scan/file paperwork/shipping documentation

Standard Operating Procedure
PG&E Topock Groundwater Remedy
Operation and Maintenance Plan

Title: Cleaning and Maintenance of Instrumentation and Control Equipment

Number: Remedy-SOP-03_Rev1

Created Date: 1/6/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS). The objective of this Standard Operating Procedure (SOP) is to describe when preventative maintenance (PM) may be needed for the In-situ Remediation Facility and Remedy-produced Water Conditioning Plant Instrumentation and Control (I&C) instruments (pH analyzer, conductivity analyzer, turbidity analyzer, low and high level switches, level transmitters, pressure switches, pressure gauges and transmitters, flow meters, and temperature sensors). Regular PM schedules are included in the SAP. Cleaning and calibration of I&C equipment should be conducted in accordance with the manufacturers' instruction manuals.

The objective of PM testing is to evaluate effectiveness of some of the key instruments. These can be performed while conducting a visual walk down of the plant. It is best to run these tests first thing in the morning and just before the shift ends.

If unsuitable I&C equipment conditions are observed at any time throughout the procedure, the operator should troubleshoot the piece of equipment with reference the manufacturer's instruction manual. If the conditions cannot be fixed, the operator should contact the Project Manager to determine how to proceed.

3 Equipment

- Appropriate personal protective equipment (PPE)
- I&C Equipment manufacturer's instruction manuals
- Lockout/tagout tags and lockout/tagout manual for I&C equipment
- For (1) pH/temperature probes:
  - Soft bristle toothbrush
  - 2 clean 1000 mL beakers
  - WINK solution
  - Clean towel for wiping metals shaft
  - Clean towel for drying equipment
  - pH buffer solutions (at least 2)
  - Spray bottle with deionized water
  - Handheld laboratory pH/temperature meter
- For (2) conductivity probes:
  - Soft bristle toothbrush
  - 1 clean 1000 mL beaker with DI water
  - 1 empty, clean 1000 mL beaker
  - Clean towel for wiping metals shaft
  - Clean towel for drying equipment
  - Conductivity calibration solutions (at least 2)
  - Spray bottle with deionized water
  - Handheld laboratory conductivity meter
- For (3) turbidity analyzer:
  - Soft bristle toothbrush
  - Clean 1000 mL beaker with DI water

  - Clean towel for wiping metals shaft
  - Clean towel for drying equipment
  - Turbidity calibration solutions (at least 2)
  - Spray bottle with deionized water
  - Handheld turbidity conductivity meter
- For (4) Low/High level probes:
  - Dry, clean towel
- For (6) Level transmitters:
  - If necessary: Dry, clean towel and/or cleaning agent
- For (15) pressure switches:
  - Soft bristle toothbrush
  - Dry, clean towel
  - Cleaning agent
- For (8) pressure transmitters:
  - Soft toothbrush
  - Dry, clean towel
  - Cleaning agent
- For (7) Flow transmitters:
  - Dry, clean towel
  - Cleaning agent
- For (2) Temperature transmitters:
  - Soft toothbrush
  - Dry, clean towel
  - Cleaning agent

4 Approach

The operator needs to be aware of the process parameters, as both pH and temperature may change during processing. Both may appear to drift due to ambient temperature changes.

Once a confidence in instruments is established, and process conditions are stable, calibration frequency can be determined. It is suggested readings be noted twice a shift. The following general guidance is provided, see SAP for actual PM schedule.

1. pH meters may require calibration as often as once a month, but at least once every three months. pH meter readings should be checked daily according to the procedure in Section 5. See SAP for actual PM schedule.
2. Conductivity meters may require calibration as often as once a month, but at least once every three months. Conductivity meter readings should be checked daily according to the procedure in Section 5. See SAP for actual PM schedule.
3. Turbidity meters may require calibration as often as once a month, but at least once every three months. Turbidity meter readings should be checked daily according to the procedure in Section 5. See SAP for actual PM schedule.

4. Low and high level switches in the influent tanks, conditioned water storage tanks, remedy freshwater storage tanks, liquid phase separators, and secondary containment should be checked periodically according to the procedure in Section 5. Low and high level switches may also be pulled and sent to the manufacturer for calibration. See SAP for actual PM schedule.
5. Level transmitters should be checked and calibrated annually, according to the procedure in Section 5. See SAP for actual PM schedule.
6. Pressure switches should be checked periodically according to the procedure in Section 5. See SAP for actual PM schedule.
7. Pressure gauges and transmitters should be checked periodically, according to the procedure in Section 5. Pressure gauges and transmitters should be pulled and sent to the manufacturer for calibration annually. See SAP for actual PM schedule.
8. Flow meters should be checked annually according to the procedure in Section 5. They are calibrated at the factory, and normally only require re-ranging in the field. Flow meters can be cleaned and flow meter seals can be replaced periodically, according to the procedure in Section 5. See SAP for actual PM schedule.
9. Temperature transmitters should be checked periodically according to the procedure in Section 8. See SAP for actual PM schedule.

5 Preventative Maintenance Procedures:

1. To check the accuracy of the pH/Temperature analyzers:
    1.1. Place the pH process output on “hold.”
    1.2. Extract the pH probe from process stream as follows (CAUTION: Probe may forcibly pop out. DO NOT stand in front of the meter):
        1.2.1. Completely loosen the first holding collar.
        1.2.2. Pull back pH probe assembly until the probe tip “clears” the isolation ball valve.
        1.2.3. Close the isolation ball valve.
        1.2.4. Open the lower drain tap then open the upper drain tap. Drain off excess process fluid into a catch basin.
        1.2.5. Completely loosen the second holding collar.
        1.2.6. Remove the pH probe assembly and both holding collars.
    1.3. Place the pH probe into WINK solution in a 1000 mL beaker. Let the pH probe soak.
    1.4. Brush off the sensor using a tooth brush or some other soft brush. Never use abrasive pads on the sensor.
    1.5. Inspect the probe for damage and cleanliness.
    1.6. If necessary, repair and/or further clean the probe in accordance with the manufacturer’s instruction manual.
    1.7. Wipe down the metal shaft with a clean towel so that the shaft is clean. You may use green scratch pad on metal shaft but be sure not to get on the sensor.
    1.8. Rinse the probe with DI water and then dry.
    1.9. If necessary, calibrate the pH meter:

1.9.1. Place the probe in “calibration” mode.

1.9.2. Calibrate the sensor with pH buffer in accordance with the manufacturer’s instruction manual. Use a two-point calibration, at minimum.

1.9.3. Return the pH/temperature meter to measurement mode.

1.10. Collect a sample of process water in the unused 1000 mL beaker. Measure the pH and temperature with the probe and note the readings.

1.11. Use the handheld laboratory pH/temperature meter to collect pH and temperature measurements of the same sample. The laboratory pH/temperature meter is calibrated frequently in accordance with SOP-L09_Rev01.

1.12. If the difference in pH between the process probe and lab instrument is greater than 0.2 pH units:

1.12.1. Inspect both the process probe and the laboratory probe for damages and cleanliness

1.12.2. Place the process probe in “calibration” mode.

1.12.3. Calibrate the process probe in accordance with the manufacturer’s instruction manual, using a two-point calibration, at minimum.

1.12.4. Return the pH/temperature meter to “measurement” mode.

1.12.5. Collect a sample of process water. Measure the pH and temperature with both the process probe and laboratory meter and note the readings.

1.12.6. If the difference in pH between the two probes is still greater than 0.2, troubleshoot the process pH/temperature probe using the manufacturer’s instruction manual.

1.13. After the probe is accurately cleaned and calibrated, rinse the probe with deionized water and replace the process probe.

1.14. Ensure the pH/temperature meter is in “measurement” mode.

1.15. Release the hold on the process probe at the pH transmitter.

2. To check the accuracy of the conductivity analyzers:

2.1. Place the conductivity process output in “hold”.

2.2. Extract the conductivity probe from process stream as follows (CAUTION: Probe may forcibly pop out. DO NOT stand in front of the compression nut.):

2.2.1. Carefully loosen compression nut.

2.2.2. Retract the probe.

2.2.3. Close the isolation valve.

2.2.4. Drain the probe chamber into the bucket.

2.2.5. Slide back the compression not and loosen the retaining nut.

2.2.6. Extract the conductivity probe.

2.3. Place the probe into a 1000 mL beaker filled with DI water.

2.4. Brush off the sensor using a tooth brush or some other soft brush. Never use abrasive pads on the sensor.

2.5. Inspect the probe for damage and cleanliness.

2.6. If necessary, repair and/or further clean the probe in accordance with the manufacturer's instruction manual.

2.7. Wipe down the metal shaft with a clean towel so that the shaft is clean. You may use green scratch pad on metal shaft but be sure not to get on the sensor.

2.8. Rinse the probe with DI water and then dry.

2.9. If necessary, calibrate the conductivity meter:

2.9.1. Place the probe in "calibration" mode.

2.9.2. Calibrate the sensor with conductivity buffer in accordance with the manufacturer's instruction manual. Use a two-point calibration, at minimum.

2.9.3. Return the conductivity meter to measurement mode.

2.10. Measure the conductivity of the probe in the air. The reading in the air should be 0.0.

2.11. Collect a sample of process water in the unused 1000 mL beaker. Measure the pH and temperature with the probe and note the readings.

2.12. Use the handheld laboratory conductivity meter to collect pH and temperature measurements of the same sample. The laboratory conductivity meter is calibrated frequently in accordance with SOP-L04_Rev01.

2.13. If the reading for conductivity in the air is greater than 0.0 and/or the difference in conductivity readings between the process probe and lab instruments is greater than 10%:

2.13.1. Inspect the conductivity probe for damages and cleanliness.

2.13.2. Place the process probe in "calibration" mode.

2.13.3. Calibrate the process probe in accordance with the manufacturer's instruction manual, using a two-point calibration, at minimum.

2.13.4. Return the conductivity meter to "measurement" mode.

2.13.5. Measure the conductivity of the probe in the air.

2.13.6. Collect a sample of process water. Measure the conductivity with both the process probe and laboratory meter and note the readings.

2.13.7. If the reading for conductivity in the air is still greater than 0.0 and/or the difference in conductivity readings between the process probe and lab instruments is greater than 10%, troubleshoot the process conductivity probe using the manufacturer's instruction manual.

2.14. After the probe is accurately cleaned and calibrated, rinse the probe with deionized water and replace the conductivity probe in the process.

2.15. Ensure the conductivity meter is in "measurement" mode.

2.16. Release the hold on the process probe at the conductivity transmitter.

3. To check the accuracy of the turbidity analyzers:

3.1. Place the turbidity process output on "hold."

3.2. Flush and clean the turbidity analyzer in accordance with the manufacturer's instruction manual.

3.3. Inspect the turbidity analyzer for damage and cleanliness.

3.4. Clean the chamber in analyzer in accordance with the manufacturer's instruction manual.

3.5. Place the turbidity analyzer in "calibration" mode.

3.6. Calibrate the turbidity analyzer in accordance with the manufacturer's instruction manual. Use two turbidity standards, at minimum.

3.7. Return the turbidity analyzer to "measurement" mode.

3.8. Measure the turbidity of DI water and confirm that the analyzer reads 0.0 NTU.

3.9. If the reading for turbidity is greater than 0.250 NTU:

3.9.1. Inspect the turbidity analyzer for damages and cleanliness.

3.9.2. Place the process probe in "calibration" mode.

3.9.3. Recalibrate the turbidity analyzer in accordance with the manufacturer's instruction manuals.

3.9.4. Measure the turbidity of DI water and confirm that the analyzer reads 0.0 NTU.

3.9.5. If the reading for turbidity is still greater than 0.250 NTU, troubleshoot the turbidity probe using the manufacturer's instruction manual.

3.10. After the meter is accurately cleaned and calibrated, rinse the chambers with deionized water and replace the turbidity probe in the process.

3.11. Ensure the turbidity meter is in "measurement" mode.

3.12. Release the hold on the process probe at the turbidity transmitter.

4. To inspect the low and/or high level switches in the influent tanks, conditioned water storage tanks, remedy freshwater storage tanks, liquid phase separators, and secondary containment.

4.1. Influent Tanks and Conditioned Water Storage Tanks:

4.1.1. To inspect/maintain the high level switch:

4.1.1.1 Bypass the tank using the HMI in accordance with the respective lock-out/tag-out procedure.

4.1.1.2 Carefully open the lid of the tank. Do not break the plane of the tank with any body part.

4.1.1.3 Visually inspect that there is no breakage, condensation, heavy dust or spider webs on high level switch sensor.

4.1.1.4 If the sensor of the high level switch is tarnished, carefully remove the high level switch from the tank.

4.1.1.5 Wipe down the sensor with a dry, clean towel. If necessary, further clean the level switch in accordance with the manufacturer's instruction manual.

4.1.1.6 Reinstall the high level switch.

4.1.1.7 Remove the lock-out/tag-out on the tank.

4.1.2. To inspect/maintain the low level switch:

4.1.2.1 Inspect the switch after a tank empty cycle and prior to a scheduled tank fill cycle (See Backwashing Schedule)

4.1.2.2 Bypass the tank using the HMI in accordance with the respective lock-out/tag-out procedure.

4.1.2.3 If necessary, open the drain on the bottom of each tank such that the level is lowered below the process tap of the probe.

4.1.2.4 Carefully remove the probe and inspect for a build-up on the probe.

4.1.2.5 Wipe down the sensor with a dry, clean towel. If necessary, further clean the level switch in accordance with the manufacturer's instruction manual.

4.1.2.6 Reinstall the low level switch.

4.1.2.7 Remove the lock-out/tag-out on the tank.

4.2. Conditioned Water Storage Tank (B-Side):

4.2.1. To inspect/maintain the high level switch:

4.2.1.1 Bypass the tank using the HMI in accordance with the respective lock-out/tag-out procedure.

4.2.1.2 Carefully open the lid of the tank. Do not break the plane of the tank with any body part.

4.2.1.3 Visually inspect that there is no breakage, condensation, heavy dust or spider webs on high level switch sensor.

4.2.1.4 If the sensor of the high level switch is tarnished, carefully remove the high level switch from the tank.

4.2.1.5 Wipe down the sensor with a dry, clean towel. If necessary, further clean the level switch in accordance with the manufacturer's instruction manual.

4.2.1.6 Reinstall the high level switch.

4.2.1.7 Remove the lock-out/tag-out on the tank.

4.2.2. To inspect/maintain the low level switch:

4.2.2.1 Inspect the switch after a tank empty cycle and prior to a scheduled tank fill cycle.

4.2.2.2 Bypass the tank using the HMI in accordance with the respective lock-out/tag-out procedure.

4.2.2.3 If necessary, open the drain on the bottom of each tank such that the level is lowered below the process tap of the probe.

4.2.2.4 Carefully remove the probe and inspect for a build-up on the probe.

4.2.2.5 Wipe down the sensor with a dry, clean towel. If necessary, further clean the level switch in accordance with the manufacturer's instruction manual.

4.2.2.6 Reinstall the low level switch.

4.2.2.7 Remove the lock-out/tag-out on the tank.

4.3. Remedy Freshwater Storage Tank:

4.3.1. To inspect/maintain the high level switch:

4.3.1.1 Bypass the tank using the HMI in accordance with the respective lock-out/tag-out procedure.

4.3.1.2 Carefully open the lid of the tank. Do not break the plane of the tank with any body part.

4.3.1.3 Visually inspect that there is no breakage, condensation, heavy dust or spider webs on high level switch sensor.

4.3.1.4 If the sensor of the high level switch is tarnished, carefully remove the high level switch from the tank.

4.3.1.5 Wipe down the sensor with a dry, clean towel. If necessary, further clean the level switch in accordance with the manufacturer's instruction manual.

4.3.1.6 Reinstall the high level switch.

4.3.1.7 Remove the lock-out/tag-out on the tank.

4.3.2. To inspect/maintain the low level switch:

4.3.2.1 Inspect the switch after a tank empty cycle and prior to a scheduled tank fill cycle.

4.3.2.2 Bypass the tank using the HMI in accordance with the respective lock-out/tag-out procedure.

4.3.2.3 If necessary, open the drain on the bottom of each tank such that the level is lowered below the process tap of the probe.

4.3.2.4 Carefully remove the probe and inspect for a build-up on the probe.

4.3.2.5 Wipe down the sensor with a dry, clean towel. If necessary, further clean the level switch in accordance with the manufacturer's instruction manual.

4.3.2.6 Reinstall the low level switch.

4.3.2.7 Remove the lock-out/tag-out on the tank.

4.4. Liquid phase separators (high level switch only):

4.4.1. Bypass the liquid-phase separator using the HMI in accordance with the respective lock-out/tag-out procedure.

4.4.2. Carefully open the lid of the liquid-phase separator. Do not break the plane of the tank with any body part.

4.4.3. Visually inspect that there is no breakage, condensation, heavy dust or spider webs on high level switch sensor.

4.4.4. If the sensor of the high level switch is tarnished, carefully remove the high level switch from the tank.

4.4.5. Wipe down the sensor with a dry, clean towel. If necessary, further clean the level switch in accordance with the manufacturer's instruction manual.

4.4.6. Reinstall the high level switch.

4.4.7. Remove the lock-out/tag-out on the liquid-phase separator.

4.5. Secondary containment (high level switch only):

4.5.1. Visually inspect that there is no breakage, condensation, heavy dust or spider webs on high level switch sensor.

4.5.2. If the sensor of the high level switch is tarnished, carefully remove the high level switch.

4.5.3. Wipe down the sensor with a dry, clean towel. If necessary, further clean the level switch in accordance with the manufacturer's instruction manual.

4.5.4. Reinstall the high level switch.

5. Level Transmitters on the influent tanks, chemical storage tanks and conditioned water storage tanks:

5.1. To inspect/maintain the level transmitters:

5.1.1. Carefully remove the level transmitter from the tank.

5.1.2. Visually inspect the transmitter face for damage and cleanliness.

5.1.3. If necessary, wipe down the transmitter face with a dry, clean towel, and /or further clean the level switch in accordance with the manufacturer's instruction manual.

5.1.4. Reinstall the level transmitter.

5.1.5. Check that the wiring is in good condition.

5.2. To calibrate level transmitters:

5.2.1. Measured distance from the probe head face, less 6", to a target within the range of the transmitter. Accuracy has been shown to be within ¼".

5.2.2. If accuracy is less than ¼", troubleshoot the level transmitter in accordance with the manufacturer's instruction manual.

6. Pressure switches:

6.1. Pre-inspection:

6.1.1. Confirm that the cover is closed.

6.1.2. Visually inspect for:

6.1.2.1 Damage to the housing.

6.1.2.2 Leakage of process media.

6.1.3. If necessary, wipe down the cover and housing with a dry, clean towel.

6.2. Preparatory activities:

6.2.1. Bypass the pressure switch using the HMI and lock-out/tag-out protocol.

6.2.2. Confirm that the line is not under pressure on HMI and visually at system, as applicable.

6.2.3. Drain and evacuate the line.

6.3. Inspection:

6.3.1. Demount the switch using a suitable tool per the manufacturer's instruction manual.

6.3.2. Clean switch using dry, clean towel and cleaning solvent per manufacturer's instruction manual.

6.3.3. Visually inspect for:

6.3.3.1 Corrosion at process connections or diaphragm.

6.3.3.2 Bent, worn, or otherwise damaged components.

6.3.3.3 Damage to wiring.

6.3.4. Perform any other maintenance checks/procedures recommended by the manufacturer.

6.3.5. Reinstall the switch.

6.3.6. Remove the lock-out/tag-out.

6.3.7. Use the HMI to restore flow, as appropriate.

7. Pressure gauges and transmitters:

7.1. Periodically inspect the pressure gauges for:

7.1.1. Erratic or random pointer motion.

7.1.2. Readings that are suspect.

7.1.3. Leakage of gauge fill.

7.1.4. Case damage, dents, and/or cracks.

7.1.5. Any signs of service media leakage through the gauge including its connection.

7.1.6. Discoloration of gauge fill that impedes readability.

8. Flow Transmitters:

8.1. To clean the exterior of the flow meter, wipe it down with a cleaning agent specified by the manufacturer and a dry, clean towel. Do not use high pressure steam.

8.2. To check the accuracy of the flow meter readings, the follow procedures may be followed. Measuring and testing devices offered by the manufacturer may also be used in accordance with the manufacturer's recommendation:

8.2.1. FE/FIT/FM-RTP01-1171: Flow meter can be checked by filling an influent tank (TNK-RTP01-1101, TNK-RTP01-1102, TNK-RTP01-1103, TNK-RTP0-1104), noting starting level and ending level on the HMI for a predetermined time, and converting cubic feet to gallons. The influent tank being tested should not go into the empty cycle during the predetermined time interval.

8.2.2. FE/FIT/FM-RTP01-1271: Flow meter can be checked by filling the conditioned water storage tank (TNK-RTP01-1401, TNK-RTP01-1402), noting starting level and ending level on the HMI for a predetermined time, and converting cubic feet to gallons. Water should not be flowing from conditioned water storage tank being tested during the predetermined time interval.

8.2.3. FE/FIT/FM-RTP01-1273: Flow meter can be checked by filling the conditioned water storage tank (TNK-RTP01-1410), noting starting level and ending level on the HMI for a predetermined time, and converting cubic feet to gallons. Water should not be flowing from TNK-RTP01-1410 during the predetermined time interval.

8.2.4. FE/FIT/FM-1471: Flow meter can be checked using a drawdown method in the A-side conditioned water storage tank (s) (TNK-RTP01-1401, TNK-RTP01-1402, TNK-RTP01-1403, TNK-RTP01-1404), noting starting level and ending level on the HMI for a predetermined time, and converting cubic feet to gallons. Flow should not be entering the conditioned water storage tank being tested during the predetermined time interval.

9. Temperature Transmitters:

9.1. Pre-inspection:

9.1.1. Visually inspect for:

9.1.1.1 Damage to the housing.

9.1.1.2 Leakage of process media.

9.1.2. If necessary, wipe down the cover and housing with a dry, clean towel.

9.2. Preparatory activities:

9.2.1. Bypass the temperature transmitter using the HMI and lock-out/tag-out protocol.

9.2.2. Confirm that the line is not under pressure on HMI and visually at system, as applicable.

9.2.3. Drain and evacuate the line.

9.3. Inspection:

9.3.1. Demount the transmitter using a suitable tool per the manufacturer's instruction manual.

9.3.2. Clean transmitter using dry, clean towel and cleaning solvent per manufacturer's instruction manual.

9.3.3. Visually inspect for:

9.3.3.1 Corrosion at process connections.

9.3.3.2 Bent, worn, or otherwise damaged components.

9.3.3.3 Damage to wiring.

9.3.4. Perform any other maintenance checks/procedures recommended by the manufacturer.

9.3.5. Reinstall the transmitter.

9.3.6. Remove the lock-out/tag-out.

9.3.7. Use the HMI to restore flow, as appropriate.

Standard Operating Procedure
PG&E Topock Groundwater Remedy
Operation and Maintenance Plan

Title: Maintenance of Aboveground Pumps

Number: Remedy-SOP-04_Rev1

Created Date: 4/21/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe preventative maintenance (PM) for aboveground (centrifugal, chemical metering, solids, and sump) pumps. The objective of PM checks and procedures are to maintain functionality and minimize downtime of the aboveground pumps. PM can be performed while conducting a visual walk down of the plant.

CAUTION: Chemical in metering pumps may cause personal harm if procedures are not followed properly.

If unsuitable pump equipment conditions are observed at any time throughout the procedure, the operator should troubleshoot the piece of equipment per the manufacturer's instruction manual. If the conditions cannot be fixed, the operator should contact the Maintenance Supervisor to determine how to proceed.

3 Equipment List

- Appropriate PPE
- Health and Safety Plan
- Manufacturer's operation and maintenance manuals
- Dry towel
- For (1) peristaltic hose pumps:
    - Appropriate cleaning supplies, replacement parts (see manufacturer's instruction manual)
- For (2) centrifugal pumps:

- Appropriate cleaning supplies, lubricants, replacement parts (see manufacturer's instruction manual)

- For (3) chemical metering pumps:
  - Appropriate cleaning supplies, replacement parts, if necessary (see manufacturer's instruction manual)

4 Preventative Maintenance Procedures

Scheduled inspection, cleaning and maintenance of aboveground pumps and related equipment should be conducted in accordance with the manufacturers' instruction manuals. Inspections and maintenance protocols may include, but are not limited to, the following:

1. Peristaltic Hose Pumps

   1.1. Visually inspect that electrical connections are in secure and show no signs of wear.

      a) Note any signs of rust or wear.

   1.2. Check that the pump is securely mounted.

      a) Secure pump if it is loose.

   1.3. Visually inspect the pump for signs of corrosion.

      a) Clean the pump to determine if corrosion is bad enough to require part replacement.

   1.4. Visually inspect the condition of the flexible tubing.

      a) Note any signs of excessive wear.

         1) Replace the tubing if it is damaged.

      b) Visually inspect the connection between the pipe and flexible tubing.

         1) Secure tubing to pipe if it is loose.

         2) Secure the connection if it is loose.

   1.5. Check that there is no extra noise/clicking coming from pump.

      a) Note any noise and troubleshoot per the manufacturer's instructions.

   1.6. Check that the discharge pressure is within the specified parameters in the operations and maintenance (O&M) manual.

   1.7. Wipe off excessive dust from the outside of the pump with a dry towel.

   1.8. Contact the Maintenance Supervisor if there are any notes that indicate further maintenance is required so parts can be procured and work can be scheduled.

2. Centrifugal Pumps

   2.1. Visually inspect that electrical connections are in good condition.

      a) Note any signs of rust or wear.

   2.2. Check that the base plate nuts and bolts are adequately tightened.

      a) Tighten bolts if they are loose.

   2.3. Check that tie down straps are in place and adequately secured.

      a) Secure tie down straps if they are loose.

2.4. Check stuffing box for leakage with packing.

a) Note any leaks and overall condition of packing.

b) Replace packing if needed.

2.5. Check stuffing box for no leakage with mechanical seals.

a) Note any leaks and overall condition of seals.

b) Replace seals if needed.

2.6. Check for excessive noise, vibrations and oil temperatures.

a) Troubleshoot, if necessary, in accordance with the manufacturer's instructions.

2.7. Check that the discharge pressure is within the specified parameters in the O&M manual.

2.8. Check lubrication to the pump, motor, and driver bearing. Lubricate at the frequency recommended by the manufacturer's instructions. Lubricate in accordance with the manufacturer's instructions.

a) Clean the Zerk fittings prior to lubrication.

b) Lubricate the pump per the manufacturer's specification and schedule.

c) Clean the Zerk fittings following lubrication.

2.9. Check that there is no leakage around the cooling system.

a) Note any leaks, and troubleshoot leaks per the manufacturer's instructions.

2.10. Wipe off excessive dust from the outside of the pump with a dry towel.

2.11. Check that the safety guards on the shafts are in place and adequately secured.

a) Tighten safety guards if they are loose.

2.12. Perform any other maintenance checks/procedures as recommended by the manufacturer.

2.13. Contact the Maintenance Supervisor if there are any notes that indicate further maintenance is required so parts can be procured and work can be scheduled.

3. Chemical metering pumps

CAUTION: Chemicals in the metering pumps may cause personal harm if procedures aren't followed properly. Refer to the Health and Safety Plan for proper safety practices and management of hazardous materials while conducting the following procedure.

3.1. Visually inspect that electrical connections are in good condition.

a) Note any signs of rust or wear.

3.2. Check that the pump is securely mounted.

a) Secure pump if it is loose.

3.3. Visually inspect the pump for signs of corrosion.

3.4. Check that the screen and controls are readable.

a) Clean screen if needed.

b) Record settings.

3.5. Check that the tubing connection and coupling nut are secure.

a) Secure tubing connection and coupling nut if needed.

3.6. Check that there are no leaks in the tubing and the tubing ends are not worn.

a) Note any leaks and signs of wear.

b) Shutdown the system if a leak is noted and notify the Maintenance Supervisor.

3.7. Check that the valves on the pump are appropriately positioned and functioning.

a) Adjust valves if needed.

b) Note any valves that are not functioning properly. Troubleshoot valves per manufacturer's instructions.

3.8. Replace the Liquifram (diaphragm) per the method and frequency recommended in manufacturer's instructions.

3.9. Replace the cartridge valves, seal rings/valve balls, and injection check valve spring per the method and frequency recommended in manufacturer's instructions.

3.10. Check that there is no extra noise/clicking coming from pump.

a) Note any extra noise/clicking and troubleshoot per the manufacturer's instructions.

3.11. Check that the discharge pressure is within the specified parameters in the O&M manual.

3.12. Wipe off excessive dust from the outside of the pump with a dry towel.

3.13. Perform any other maintenance checks/procedures recommended by the manufacturer's instructions.

3.14. Contact the Maintenance Supervisor if there are any notes that indicate further maintenance is required so parts can be procured and work can be scheduled.

4. Solids pumps

4.1. Check that the pump is securely mounted.

a) Secure pump if it is loose.

4.2. Check the condition of the solenoid air valve assembly (air valve body, coil and terminal connector). If any part of the solenoid valve assembly (air valve body, coil or terminal connector) is in poor condition, it should be replaced. If air continually blows out the exhaust in very large quantities, the air valve seals may be worn beyond their ability to function and should be replaced.

4.3. Check the ball check valve.

a) Troubleshoot per the method recommended in manufacturer's instruction manual.

4.4. Check to make sure that all suction connections are air tight, and that the clamp bands are properly tightened.

a) Tighten any loose connections.

4.5. Check for excessive moisture in compressed air line.

a) Note any excessive moisture.

4.6. Check for cracks and damage on the body of the pump.

a) Note any cracks and damage

4.7. Check that the discharge pressure is within the specified parameters in the O&M manual.

4.8. Perform any other maintenance checks/procedures recommended by the manufacturer's instructions.

4.9. Contact the Maintenance Supervisor if there are any notes that indicate further maintenance is required so parts can be procured and work can be scheduled.

5. Sump Pumps

5.1. Visually inspect that electrical connections are in good condition.

a) Note any signs of rust or wear.

5.2. Check that the pump is securely mounted.

a) Secure pump if it is loose.

5.3. Check the sump for debris. Clear the debris prior to operating the sump.

5.4. Operate the pump if it isn't already running.

a) If the pump is not running raise the float to operate the pump.

5.5. Check that there is no extra noise/clicking coming from pump.

a) Note any noise and troubleshoot per the manufacturer's instructions.

5.6. Check that the discharge pressure is within the specified parameters in the O&M manual (maintenance to be performed when liquid is present in the sump).

5.7. Verify that the pump turns off when the sump volume has been emptied (maintenance to be performed when liquid is present in the sump).

Standard Operating Procedure
PG&E Topock Groundwater Remedy
Operation and Maintenance Plan

Title: Cleaning and Maintenance of Valves and Flow Control Equipment

Number: Remedy-SOP-05_Rev1

Creation Date: 9/8/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe general procedures for cleaning and corrective maintenance of valves and flow control equipment associated with the groundwater remedy systems. The goals of corrective maintenance are to respond to early signs of potential failure/unsuitable conditions and to restore the equipment to proper functionality while minimizing downtime. Unsuitable conditions are identified during routine system inspections and include, but are not limited to, pressure buildup at valves, locking up of moving/revolving pieces, and evidence of flow downstream of valves when valves are closed.

If the procedures specified herein fail to rectify the unsuitable condition, the operator should contact the Maintenance Supervisor to determine how to proceed.

- Health and Safety Plan
- Manufacturer's instruction manuals
- Lockout/tagout manual and tags
- Container (5-gallon bucket, or similar, with lid)
- Tools – wrench set/pliers, others per manufacturer's instruction manual
- Pipe dope or thread seal tape
- Dry cloth
- Appropriate cleaning supplies per manufacturer's instruction manual
- Appropriate replacement parts per manufacturer's instruction manual
- Spill kit

4 Procedure

Inspection, cleaning, and maintenance of valves and other flow control equipment should be conducted on an as needed basis in response to unsuitable conditions observed during routine system inspections. Corrective maintenance procedures may include, but are not limited to, the following:

1. Preparatory Activities
    - 1.1 Verify location of problematic component on piping and instrumentation diagram (P&ID)
    - 1.2 Use the human machine interface (HMI) to stop the flow to or from the respective extraction well
    - 1.3 Lockout/tagout the junction box to the extraction well
    - 1.4 Lockout/tagout valves to the component/line to isolate from system pressure
    - 1.5 Confirm that line is not under pressure on HMI
    - 1.6 Visually verify pressure at the equipment on the gauges, as applicable

CAUTION: If working with lines containing ethanol, maintenance reagents, or other potentially hazardous substances, don the appropriate PPE and ensure that appropriate safety equipment is in place.

1.7 Drain and evacuate the line into a container

1.8 Dispose of evacuated liquid into sump

1.9 Clean up any spills immediately

2. Inspection

2.1 Remove component using appropriately-sized tool (wrench/pliers)

2.2 Inspect component and immediately adjacent piping for fouling, solids accumulation, or other obstructions

2.3 Disassemble component using appropriate tools per manufacturer's instruction manual, if necessary

2.4 Inspect component parts for signs of corrosion, wear, or other damage

3. Maintenance

3.1 Remove any observed obstructions

3.2 Clean component per manufacturer's instruction manual

3.3 Clean any solids accumulation in the adjacent piping

3.4 Replace component (or component parts) per manufacturer's instruction manual if it is damaged or shows signs of excessive corrosion or wear

3.5 Perform any other maintenance checks/procedures recommended by the manufacturer

3.6 Reassemble component per manufacturer's instruction manual, if necessary

3.7 Replace component in line

1. Clean fittings using dry cloth
2. Use pipe dope and/or thread seal tape as necessary
3. Ensure that connection is tight

4. Testing

4.1 Remove lockout/tagout from the electrical junction box to the downstream pump

4.2 Remove lockout/tagout from upstream valves that were closed for isolation

4.3 Use the HMI to restore flow to or from the component

4.4 Check that there are no leaks at the replaced component

1. If a leak is observed, immediately stop flow to the component using the HMI

4.5 Check that unsuitable condition has been fixed

4.6 If the condition has not been fixed and/or requires further diagnosis, contact the Maintenance Supervisor for directions on how to proceed

Standard Operating Procedure
PG&E Topock Groundwater Remedy
Operation and Maintenance Plan

Title: Automatic Backwashing

Number: Remedy-SOP-06_Rev1

Creation Date: 9/8/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure making changes to routine automatic backwashing of injection well selections. The procedure is automated once extraction pumps are placed in the "AUTO" position on the human machine interface (HMI). The procedures provided describe how to activate and deactivate backwashing pumps within injection wells. Once backwashed water is conveyed to Backwash Frac Tank TNK-IRZ00-0621, it will be pumped to the Remedy Produced Water Conditioning Plant. There are no procedures provided for transfer to the Remedy Produced Water Conditioning Plant given that it is an automated process based on TNK-IRZ00-0621 water levels transmitted by level transmitter LT-IRZ00-0657 that control PMP-IRZ00-0645 Produced Water Transfer Pump.

2 Drawing Numbers

- I-11-01 through I-11-04: P&ID Influent Tank 1 through 4
- I-06-04: IRZ Carbon Amendment Building P&ID Sheet 4 of 4

3 Equipment

- Appropriate PPE
- Health and Safety Plan

4 Procedure

1. Prefield Meeting
    1.1 Confirm with Maintenance Supervisor which injection and extraction wells are desired to operate
2. Pre-startup human machine interface (HMI) checks
    2.1 Check system alarm status on HMI
        2.1.1 Select "ALARMS" tab on HMI

2.1.2 Verify if any alarm conditions associated with the automatic backwashing equipment exist

1. Document any alarm conditions in the checklist if they exist
2. Troubleshoot alarms

2.1.3 Call Project Engineer or Maintenance Supervisor if alarms cannot be readily addressed

2.2 Confirm Remedy Produced Water Conditioning Plant influent tanks have sufficient capacity for additional water

2.2.1 Check influent tank levels

1. Influent tank TNK-RTP01-1101 level indicator transmitter LIT-RTP01-1152
2. Influent tank TNK-RTP01-1102 level indicator transmitter LIT-RTP01-1154
3. Influent tank TNK-RTP01-1103 level indicator transmitter LIT-RTP01-1153
4. Influent tank TNK-RTP01-1104 level indicator transmitter LIT-RTP01-1158

2.2.2 Backwashing cannot commence unless influent tank levels are below high level elevations

1. Influent tank TNK-RTP01-1101 level switch LSH-RTP01-1151
2. Influent tank TNK-RTP01-1102 level switch LSH-RTP01-1153
3. Influent tank TNK-RTP01-1103 level switch LSH-RTP01-1155
4. Influent tank TNK-RTP01-1104 level switch LSH-RTP01-1157

2.3 Select the “AUTOMATIC BACKWASH” tab on the HMI to view the National Trails Highway (NTH) In Situ Reactive Zone (IRZ) and Inner Recirculation Loop (IRL) injection well valve positions

2.3.1 Verify valve FV-IRZ00-0633 is in the “AUTO” position

2.3.2 Verify transfer pump PMP-IRZ00-0645 is in the “AUTO” position

2.3.3 To place the wells into automatic operation place desired extraction pumps to operate in “AUTO” position

2.3.4 To remove a well from automatic operation place desired extraction pumps in the “OFF” position

Standard Operating Procedure
PG&E Topock Groundwater Remedy
Operation and Maintenance Plan

Title: Secondary Containment Inspection and Maintenance at Buildings

Number: Remedy-SOP-07_Rev1

Creation Date: 4/9/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for inspection and maintenance of secondary containment at buildings at the MW-20 Bench and the Remedy-produced Water Conditioning Plant.

2 Drawing Numbers

- IRZ Carbon Amendment Building: I-06-01 through I-06-04
- Remedy-produced Water Conditioning Plant:
  - Secondary Containment for TCS/Remedy-Produced Water: G-10-01
  - Influent Tanks 1 through 4, Instrumentation: I-11-01 through I-11-04
  - Remedy-produced Water Conditioning Systems, Instrumentation: I-12-03 and I-12-04
  - Conditioned Water Storage Tanks and TCS Truck Fill Station, Instrumentation: I-14-01 and I-14-02

3 Equipment/Supplies

- Appropriate personal protective equipment (PPE)
- Health and Safety Plan
- Dry towel and cleaning agents, if necessary
- Possible equipment needed to clean up leaks includes but is not limited to:
  - Shop-vac
  - Spill containment
  - Spare sump pump
  - Extension cord
  - Tools and parts of fittings for repairing pipe
  - Tools and supplies for repairing concrete
  - Vac-truck

4 Procedure

1. Mobilize to the secondary containment area to be inspected. Secondary containment areas include the following:
    - IRZ Carbon Amendment Building:
        - MW-20 Bench Carbon Amendment Building System Containment
        - MW-20 Bench Frac Tank Containment
        - MW-20 Bench Truck Offload Sump
    - Remedy-produced Water Conditioning Plant:
        - Influent Tank Farm
        - First Floor of Remedy-produced Water Conditioning Plant Building
        - Conditioned Water Storage Tank Farm
        - TCS Truck Fill Station Decontamination Pad
2. Visually inspect the secondary containment area:
    - No liquid or solid accumulation
    - No unnecessary objects
    - Clear of large debris and fire hazards
    - No algae/fungi accumulation
    - No signs of cracks, leakage, corrosion
    - Integrity of concrete is adequate
    - Liquids/solids can properly drain to sump from any point
    - Area outside of the containment area is clean and free of liquid and solid accumulation
    - Floor grading integrity is adequate
3. Inspect the sump and piping into the sump:
    - No liquid or solid accumulation that cannot be pumped by sump pump
    - No signs of cracks, leakage, corrosion in sump and piping
    - No signs of distortions, buckling, denting, or bulging in sump and piping
    - Floor grading integrity is adequate
4. Inspect emergency equipment
    - Spill kits are accessible
    - Spill containment booms are accessible
    - Shop-vac is accessible
    - Spare sump pump is accessible
    - Extension cord is accessible
    - Tools and parts of fittings for repairing pipe are accessible

- Tools and supplies for repairing concrete are accessible
- Appropriate storage containers for containment of the materials generated during a spill response are accessible

5. If liquid/solid accumulation is present in the secondary containment, visually inspect the area to determine the source of the liquids/solids.

   5.1. If it is determined that the source of the liquids/solids is from a piece of process equipment, reference the appropriate SOP(s) to, if necessary, shut down the equipment and troubleshoot and/or repair the equipment.

      5.1.1 If further maintenance is necessary, contact the Maintenance Supervisor so parts can be procured and work can be scheduled.

   5.2. If it is suspected that the release is hazardous material (e.g., from visual inspection of area around storage containers, after review of liquid level trends, after review of inventory, etc.), reference the Hazardous Materials Business Plan (HMBP) for further direction on storing and handling hazardous materials, and contact the Maintenance Supervisor.

6. If the liquid/solid accumulation is present in the secondary containment area above the high level set point and the high level alarm and/or the sump pump did not initiate:

   6.1. If the sump pump did not engage automatically, trigger the high level float to attempt to engage the sump pump.

   6.2. If the sump pump is dysfunctional, remove the liquid/solid accumulation using the appropriate equipment (shop-vac, vac truck, spare sump pump, etc.). Refer to the Waste Management Plan (Section 6 of the O&M Plan for proper handling of the liquid/solid accumulation.

7. Troubleshoot/repair the dysfunctional equipment with reference to the appropriate SOP (see SOP Remedy-SOP-03 to troubleshoot the high level switch; see SOP Remedy-SOP-04 to troubleshoot the sump pump).After completion of inspection in one area of secondary containment, move to another area of secondary containment until all areas have been inspected, as necessary.

8. Contact the Maintenance Supervisor if there are any notes that indicate further maintenance is required so parts can be procured and work can be scheduled.

Standard Operating Procedure
PG&E Topock Groundwater Remedy
Operation and Maintenance Plan

Title: Inspection of Frac Tanks

Number: Remedy-SOP-08_Rev1

Revision Date: 5/19/2015

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for inspection and maintenance of frac tanks at the MW-20 Bench (Tanks T-IRZ00-0601, -0619, -0620, -0621, and -0623), the Conditioned Water Storage Tank Farms (Tanks TNK-RTP01-1401 and -1402), and the Influent Tank Farm (Tanks TNK-RTP01-1101 to -1104).

The operator should not break the plane of the tank openings with body parts at any time during this procedure, as it would be considered confined space entry. If confined space entry is necessary for a special procedure, the Health and Safety Plan should be referenced.

2 Drawing Numbers

- MW-20 Bench Carbon Amendment Building: I-06-02 through I-06-04
- Remedy-Produced Water Conditioning Plant Influent Tank Farm: I-11-01 through I-11-04
- Remedy-Produced Water A-Side Conditioned Water Storage Tanks: I-14-01

3 Equipment/Supplies

- Appropriate personal protective equipment (PPE), including fall protection
- Health and Safety Plan
- Lockout/tagout tags and lockout/tagout manual for frac tank maintenance (if tank shutdown is performed)
- Portable/submersible pump or vac truck (if tank draining is performed)

4 Procedure

1. Inspect tanks and associated equipment with reference to the following instructions (Steps 2 through 12). If unsuitable tank conditions are observed at any time throughout the procedure:

    1.1. Reference the Hazardous Materials Business Plan (HMBP) if the tank contains hazardous materials (acid or caustic) to determine how the materials should be handled if the chemicals are discharged from the tank.

1.2. Shut down and/or drain the tank if it is warranted (e.g. the tank is in danger of a blow out or failure). Steps a through f below are procedures to shutdown and drain an individual frac tank (If more than one frac tank is to be shutdown and/or drained at the same time, special procedures are required):

a. Influent Tank Farm (TNK-RTP01-1101 through -1104), Shutdown Frac Tank

i. Lockout/tagout the frac tank by following instructions in the lockout/tagout manual.
ii. Use the HMI to turn OFF the tank's recirculation pump (PMP-RTP01-1101 for Influent Tank 1, PMP-RTP01-1102 for Influent Tank 2, PMP-RTP01-1103 for Influent Tank 3, PMP-RTP01-1104 for Influent Tank 4).
iii. Close the following manual valves upstream, downstream, and on the chemical recirculation line of the frac tank:
    1. Influent Tank 1: V-RTP01-1101A, -1101F, -1101G, -1101I, -1101K
    2. Influent Tank 2: V-RTP01-1102A, -1102F, -1102G, -1102I, -1102K
    3. Influent Tank 3: V-RTP01-1103A, -1103F, -1103G, -1103I, -1103K
    4. Influent Tank 4: V-RP01-1104A, -1104F, -1104G, -1104I, -1104K

b. Influent Tank Farm (TNK-RTP01-1101 through -1104), Drain Frac Tank

i. Use the HMI to verify that there is sufficient volume in the other influent tanks for the discharge from the influent tank being drained.
    - Proceed to next steps only if there is sufficient volume in the other influent tanks.
ii. Inspect the secondary containment per Remedy-SOP-07 (Secondary Containment Inspection and Maintenance at Buildings).
    - Proceed to next steps only if the secondary containment is in acceptable condition.
iii. Plug in the Influent Tank Farm sump pump (PMP-RTP01-1105).
iv. If the frac tank is not already shutdown, shutdown the frac tank by completing all steps listed for shutting down an Influent Tank Farm Frac Tank (see Step a above).
v. Slowly open the manual drain valve on the frac tank (V-RTP01-1101M for Influent Tank 1, V-RTP01-1102M for Influent Tank 2, V-RTP01-1103M for Influent Tank 3, V-RTP01-1104M for Influent Tank 4):
vi. Ensure that the tank discharge properly drains in the secondary containment to the sump pump.
    - If there is any malfunctioning of the secondary containment and/or sump pump, immediately close the manual drain valve that was opened in Step v.
vii. If the frac tank does not drain completely by gravity, pump out the remaining water using a portable pump or vac truck.
    - Drain the discharge into the influent tank farm sump (with the portable pump) OR haul to the influent tanks or liquid phase separator (with the vac truck).
viii. After the frac tank has completely drained, close the manual drain valve that was opened in Step v.
ix. After all discharge has been pumped from the sump, unplug the Influent Tank Farm Sump Pump (PMP-RTP01-1105).
x. If frac tank is to be cleaned after draining, see RTP-SOP-07 (Manual Cleaning of Frac Tanks).

c. Conditioned Water Tank Farm (TNK-RTP01-1401 and -1402), Shutdown Frac Tank

i. Lockout/tagout the frac tank by following instructions in the lockout/tagout manual.
ii. Close the manual valves upstream/downstream of the frac tank:
    1. Conditioned Water Storage Tank 1: V-RTP01-1401A, -1401B
    2. Conditioned Water Storage Tank 2: V-RTP01-1402A, -1402B

d. Conditioned Water Tank Farm (TNK-RTP01-1401 and -1402), Drain Frac Tank

i. Use the HMI to verify that there is sufficient volume in the other influent tanks for the discharge from the influent tank being drained.
ii. Proceed to next steps only if there is sufficient volume in the other influent tanks.
iii. Inspect the secondary containment per Remedy-SOP-07 (Secondary Containment Inspection and Maintenance at Buildings).
iv. Proceed to next steps only if the secondary containment is in acceptable condition. Plug in the Conditioned Water Tank Farm sump pump (PMP-RTP01-1407).
v. If the frac tank is not already shutdown, shutdown the frac tank by completing all steps listed for shutting down the Conditioned Water Tank Farm Frac Tanks (see Step c above).
vi. Slowly open the manual drain valve on the frac tank (V-RTP01-1401C for Conditioned Water Storage Tank 1, V-RTP01-1402C for Conditioned Water Storage Tank 2):
vii. Ensure that the tank drainage properly drains in the secondary containment to the sump pump.
    - If there is any malfunctioning of the secondary containment and/or sump pump, immediately close the manual drain valve that was opened in Step v.
ii. If the frac tank does not drain completely by gravity, pump out the remaining water using a portable pump or vac truck.
    - Drain the discharge into the conditioned water tank farm sump (with the portable pump) OR haul to the influent tanks or liquid phase separator (with the vac truck).
viii. After the frac tank has completely drained, close the manual drain valve that was opened in Step v.
ix. After all discharge has been pumped from the sump, unplug the Conditioned Water Tank Farm sump pump (PMP-RTP01-1407).
x. If frac tank is to be cleaned after draining, see RTP-SOP-07 (Manual Cleaning of Frac Tanks).

e. MW-20 Bench (T-IRZ00-0620, T-IRZ00-0621, T-IRZ00-0623), Shutdown Frac Tank

i. Lockout/tagout the frac tank by following instructions in the lockout/tagout manual.
ii. Close the manual valves upstream of the frac tank as applicable:
    - Backwash Frac Tank (T-IRZ00-0621): V-IRZ00-0628C, -0628I, -0628K, -0628S
    - Clean-in-Place Frac Tank (T-IRZ00-0623): V-IRZ00-0628A, -0628E, -0628G

f. MW-20 Bench (T-IRZ00-0621, T-IRZ00-0623), Drain Frac Tank

i. Use the HMI to verify that there is sufficient volume in the Remedy-produced Water Conditioning Plant Influent Tank Farm (TNK-RTP01-1101 through -1104) for the discharge from the frac tank being drained.
ii. Proceed to next steps only if there is sufficient volume in the Influent Tank Farm.
iii. Close/open valves on discharge line to direct flow to Remedy-produced Water Conditioning Plant.
    - V-IRZ00-0626B (open, manual), V-IRZ00-0626D (open, manual), V-IRZ00-0627D (open, manual), V-IRZ00-0627E (open, manual)
    - Backwash Frac Tank (T-IRZ00-0621): V-IRZ00-0626O (closed, manual)
    - Clean-in-Place Frac Tank (T-IRZ00-0623): V-IRZ00-0626O (open, manual), V-IRZ00-0626F (closed, manual), V-IRZ00-0626B (closed, manual), FCV-IRZ00-0632 (closed, via HMI)
iv. Follow Step 4 of IRZ-SOP-13 to transfer water to the Remedy-produced Water Conditioning Plant.

v. Close the manual valves downstream of the frac tank:
   - Backwash Frac Tank (T-IRZ00-0621): V-IRZ00-0626B
   - Clean-in-Place Frac Tank (T-IRZ00-0623): V-IRZ00-0626C

vi. If the frac tank is not sufficiently drained, pump out the excess water using a vac truck or submersible pump placed in frac tank.

vii. If frac tank is to be cleaned after draining, see RTP-SOP-07 (Manual Cleaning of Frac Tanks).

g. MW-20 Bench (T-IRZ00-0620), Drain Conditioned Water Frac Tank

i. Use the HMI to verify that the National Trails Highway (NTH) In-Situ Reactive Zone (IRZ) injection well system is active.

ii. Proceed to next steps only if NTH IRZ injection wells are able to receive water.

iii. Open manual valves on discharge line to direct flow to the NTH IRZ: V-IRZ00-0626A, V-IRZ00-0627B, V-IRZ00-0627H, V-IRZ00-0610H

iv. Place FCV-IRZ00-0628S into the "OPEN" position via the HMI

v. Place PMP-IRZ00-0648 (Conditioned Water Injection Pump) into "AUTO"

vi. Visually inspect the lines for signs of leaks

vii. Once T-IRZ00-0620 is empty, LT-IRZ00-0656 will initiate the programmable logic controller to do the following:
   - FCV-IRZ00-0628S will close
   - PMP-IRZ00-0648 will automatically shut off

viii. Use HMI to place PMP-IRZ00-0648 into "OFF"

ix. Close manual valve V-IRZ00-0626A downstream of the frac tank

x. If the frac tank is not sufficiently drained, pump out the excess water using a vac truck or submersible pump placed in frac tank.

xi. If frac tank is to be cleaned after draining, see RTP-SOP-07 (Manual Cleaning of Frac Tanks).

1.3. Attempt to fix the tank conditions with reference to the manufacturer's instructions, if feasible.

1.4. If the tank conditions cannot be fixed, the operator should contact the Maintenance Supervisor so parts can be procured and work can be scheduled.

2. Inspect the outside of the process tank (including tank walls, anchors, supports, stairs and platforms) for the following:

   - No signs of distortion, buckling, denting, or bulging on tank
   - No signs of cracks, leakage, or corrosion on tank
   - No severe corrosion or damage on staircase

3. Inspect the nozzles, piping and actuated and manual valves for the following:

   - No signs of leakage or damage along piping
   - No evidence of vibration along piping
   - Piping is adequately supported
   - No signs of leakage or damage at valves
   - Nozzles are adequately sealed and there are no signs of leakage or damage
   - Flanged connection bolts are tight and fully engaged with no sign of wear or corrosion

4. Carefully climb the staircase to the top of the tank to inspect the lid of the tank. If fall protection is required pursuant to California Code of Regulations (CCR) Title 8, the operator should review the requirements in the Health and Safety Plan.

5. Fall protection must also be used when inspecting the lid of the tanks. Set up and connect to fall protection and ascend onto the roof of the tank.

6. Do not break the plane of the tank lid with body parts at any time during this procedure, as it would be considered confined space entry. If confined space entry is necessary for a special procedure, the Health and Safety Plan should be referenced
7. Inspect the roof for the following:
    - No signs of distortion, buckling, denting, or bulging on roof
    - No signs of cracks, leakage, or corrosion on roof
8. Descend from the roof of the tank
9. When it is safe to do so, disconnect from fall protection.
10. Carefully descend the staircase.
11. If applicable, move to next tank for inspection and repeat Steps 1 through 10.
12. Contact the Maintenance Supervisor if there are any notes that indicate further maintenance is required so parts can be procured and work can be scheduled.

Standard Operating Procedure
PG&E Topock Conveyance Systems
Operation and Maintenance Plan

Title: Conveyance System Inspection and Maintenance
Number: PIPE-SOP-01_Rev1

Creation Date: 2/2/2015

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe general procedures for inspection and maintenance of the groundwater conveyance systems. Maintenance methods may include pigging, flushing, and/or chemical application.

- Blowoff Details: C-07-08
- P&ID Influent Tank 1: I-11-01
- P&ID Conditioned Water Storage Tank Farm A Side: I-14-01

3 Equipment

- Appropriate personal protective equipment (PPE)
- Health and Safety Plan
- Lockout/tagout manual and tags
- Keys or other tools for opening vault(s)
- Vehicle for mobilization, if necessary
- Possible equipment needed for maintenance includes but is not limited to:
    - Tools and parts for connection assembly
    - Water truck
    - Soft swab pigs and medium density pigs appropriate for pipe size
    - Flowmeter
    - Pressure gauge
    - Transport polyethylene tank with valve on outlet (capacity to be determined based on pipeline size and anticipated liquid volume)
    - Chemical transfer hose
    - Water hose
    - 5-gallon buckets with lids and spouts
    - Trailer to haul tank
    - 55-gallon drums
    - Portable secondary containment
    - Chemical spill kit including vinyl sheeting
    - Eyewash supplies and safety shower
    - Trash pump
    - Additional pump (as needed to provide motive force for pigging, flushing, chemical application)
    - Generator
    - Hose with camlock connections

4 Procedure

1. Preparatory Activities

    1.1 Verify the segment of pipe to be cleaned on the piping and instrumentation diagram (P&ID)

    1.2 Develop pipe segment-specific clearance checklist

    1.3 Take pipe segment out of service per approved clearance checklist

        1. Lockout/tagout the pipe segment following applicable sections of the lockout/tagout manual, as necessary
        2. Confirm that checklist is complete

    1.4 Fill temporary transport tank with freshwater, if required for maintenance event

        1. Hook up hose between freshwater supply source and transport tank
        2. Manually check that hose and connections are secure
            a. Secure any loose connections
            b. Connect safety whip checks
        3. Begin discharge to transport tank
            a. Monitor water level
            b. Stop discharge once tank is nearly full
            c. Close supply source valve
        4. Disconnect hose
            a. Drain hose
            b. Store hose properly

2. Mobilize to the work area

    2.1 Select a level parking area

    2.2 Establish work zone with cones

    2.3 Set up plastic sheeting around work area and under equipment

    2.4 Stage trucks and equipment to minimize slip, trip, fall hazards and allow access in and out of the work zone

3. Inspection

    3.1 Inspect the condition of the access hatch, if applicable

    CAUTION: The vault may contain biological hazards (e.g., rodents, snakes, scorpions). Use appropriate PPE and visually inspect vault to verify there are no biological hazards prior to proceeding with scope of work

    3.2 Carefully open the access hatch to the vault, if applicable

        1. Use proper lifting techniques
            a. Use two people to lower vault lids if needed
            b. Use legs instead of back to lift

    3.3 Visually check the vault, if applicable, for biological hazards

1. Contact maintenance supervisor if biological hazards are encountered
2. Await further instruction from maintenance supervisor

3.4 Visually inspect that the mechanical process piping is in good condition

1. If any items are noted as non-functioning inform the Maintenance Supervisor

4. Maintenance – Pigging

4.1 Delineate the pigging path by determining the pig launch and retrieval points (identified on P&IDs)

4.2 Valve off all intersecting pathways to prevent the pig from detouring to an incorrect location

1. Validate the valve off procedure by confirming that the flows at the launching point and retrieval point are equal

4.3 Confirm available flow and pressure is adequate to propel pigs

1. Connect additional temporary pump as necessary
2. Connect additional temporary tank as necessary

4.4 Attach the pig launcher to the wye fitting where pig will be launched from using camlock fittings

1. Launching pipe connection will include a flowmeter and pressure gauge for measuring flow and pressure

4.5 Connect hose from motive fluid/freshwater source to the pig launcher

CAUTION: Motive fluid line is under pressure. Do not open valve at this point

1. Connect hose to camlock connection of the launcher
2. Connect hose to the motive fluid line camlock connection
3. Connect safety whip line

4.6 Pig Receiver (Discharge)

1. Stage receiving tank(s) near the location where the pig receiver will be connected
2. Attach the pig receiver to the wye camlock fitting where the pig will be received
3. Connect the discharge hose of the pig receiver to receiving tank
4. Connect safety whip line

4.7 Double check connections are secure at both ends

4.8 Operation

1. First, run a soft swab pig equal to the size of the pipe
2. Slowly open valve on motive fluid line to start pig launcher
3. Monitor flow and pressure to correspond to the pipe size
4. Close valve on motive fluid line when pig reaches receiving tank
    a. The operator at the discharge side will notify the operator at the influent side if the receiving tank is within 25 percent (%) of being full
5. Second, run a soft swab pig one or two sizes larger than the pipe size. Run this pig size once or twice until dislodged sediment diminishes

6. Repeat Steps 3.8.b. through 3.8.d.
7. Finally, run a medium density poly pig one or two sizes larger than the pipe size. Run this pig size until dislodged sediment completely diminishes
8. Repeat Steps 3.8.b. through 3.8.d.
9. Containerize and properly dispose of effluent

5. Maintenance – flushing

5.1 Delineate the flushing path by determining the feed and retrieval points (identified on P&IDs)

5.2 Valve off all intersecting pathways to prevent from detouring to an incorrect location

1. Validate the valve off procedure by confirming that the flows at the feed point and retrieval point are equal

5.3 Confirm available flow and pressure is adequate for flushing

1. Connect additional temporary pump as necessary
2. Connect additional temporary tank as necessary

5.4 Connect hose from flushing fluid/freshwater source to the feed point

CAUTION: Flushing fluid line is under pressure. Do not open valve at this point

1. Connect hose to camlock connection
2. Connect hose to the conveyance line being cleared
3. Connect safety whip line

5.5 Receiving tank staging

1. Stage receiving tank(s) near the retrieval point
2. Connect the discharge hose to the retrieval point and the receiving tank
3. Connect safety whip line

5.6 Double check connections are secure at both ends

5.7 Operation

1. Slowly open valve on flushing fluid line to start flushing
2. Monitor flow and pressure
3. The operator at the discharge side will notify the operator at the influent side if the receiving tank is within 25% of being full
4. Close valve when flushing is complete

6. Maintenance – chemical application (no recirculation)

6.1 Pre-field verification

1. Obtain solution and, if applicable, pH requirements for event

6.2 Valve off all intersecting pathways to prevent chemical solution from detouring to an incorrect location (identified on P&IDs)

6.3 Chemical application

1. Verify that solution tank(s) has appropriate secondary containment

2. Stage secondary containment vinyl sheeting prior to setting up tank connections
3. Stage solution tank(s) near application point
4. Connect hose to solution tank(s) and solution pump
5. Connect hose to solution pump and application point
6. Connect safety whip check

6.4 Receiving tank staging

1. Stage secondary containment vinyl sheeting prior to tank setup
2. Stage receiving tank(s) near the retrieval point
3. Connect the discharge hose to the retrieval point and the receiving tank
4. Connect safety whip check

6.5 Double check connections are secure at both ends

6.6 Application

1. Slowly open valve(s) on solution line
2. Slowly turn on pump
3. Monitor flow and pressure
4. Turn off solution pump after required solution has been added

6.7 Post chemical application flushing

1. Connect hose from flushing fluid/freshwater source to the application point

CAUTION: Flushing fluid line is under pressure. Do not open valve at this point

   a. Connect hose to camlock connection
   b. Connect hose to the conveyance line being cleared
   c. Connect safety whip check

2. Double check connections are secure at both ends
3. Confirm that safety whip checks are installed on both ends
4. Slowly open valve on flushing fluid line to start flushing
5. Monitor flow and pressure
6. The operator at the discharge side will notify the operator at the influent side if the receiving tank is within 25% of being full
7. Close valve when flushing is complete

7. Maintenance – chemical application (recirculation)

7.1 Pre-field verification

1. Obtain solution and, if applicable, pH requirements for event

7.2 Connect hosing and adjust valving to connect pipelines for recirculation

7.3 Valve off all intersecting pathways to prevent chemical solution from detouring to an incorrect location (identified on P&IDs)

7.4 Chemical application

1. Verify that solution tank(s) has appropriate secondary containment
2. Stage secondary containment vinyl sheeting prior to setting up tank connections
3. Stage solution tank(s) near application point
4. Connect hose to solution tank(s) and solution pump
5. Connect hose to solution pump and application point
6. Connect the discharge hose to the retrieval point and the solution tank
7. Connect safety whip checks

7.5 Receiving tank staging

1. Stage secondary containment vinyl sheeting prior to tank setup
2. Stage receiving tank(s) near the retrieval point
3. Connect the discharge hose to the retrieval point and the receiving tank
4. Connect safety whip check

7.6 Double check connections are secure at both ends

7.7 Application

1. Slowly open valve(s) on solution line
2. Slowly turn on pump
3. Monitor flow and pressure
4. Monitor applicable parameters of the solution
    a. Add additional chemical if pH buffers out of desired parameters, as applicable
5. Turn off solution pump after specified recirculation time

7.8 Post chemical application flushing

1. Connect hose from flushing fluid/freshwater source to the application point

CAUTION: Flushing fluid line is under pressure. Do not open valve at this point

    a. Connect hose to camlock connection
    b. Connect hose to the conveyance line being cleared
    c. Connect safety whip check

2. Double check connections are secure at both ends
3. Confirm that safety whip checks are installed on both ends
4. Slowly open valve on flushing fluid line to start flushing
5. Monitor flow and pressure
6. The operator at the discharge side will notify the operator at the influent side if the receiving tank is within 25% of being full
7. Close valve when flushing is complete

8. Site clean up
    - 8.1 Return pipe segment to service
        1. Remove lockout/tagout as applicable
    - 8.2 Close the vault, if applicable
        1. Use proper lifting techniques
            a. Use two people to lower vault lids if needed
            b. Use legs instead of back to lift
        2. Secure bolts
    - 8.3 Properly dispose of sheeting used for staging of mechanical equipment in accordance with applicable site waste management practices
    - 8.4 Pick up cones
    - 8.5 Drive to MW-20 Bench or Remedy Produced Water Influent Tank Farm to transfer wastewater
9. Discharge to tank at MW-20 Bench or Remedy Produced Water Influent Tank Farm
    - 9.1 Verify that receiving tank (Backwash Frac Tank T-IRZ00-0621 at MW-20 Bench or Influent Tank TNK-RTP01-1101 at Remedy Produced Water Influent Tank Farm) is not receiving flow from other processes during the scheduled transfer
    - 9.2 Verify that receiving tank has adequate space for discharge volume
    - 9.3 Connect discharge tank trash pump using hose and camlock connections
    - 9.4 Connect trash pump to receiving tank using hose and camlock connections
    - 9.5 Place 5 gallon buckets under hose connections
    - 9.6 Start trash pump to begin transfer
    - 9.7 Discharge until tank is empty
    - 9.8 Stop trash pump
    - 9.9 Disconnect hoses draining water into the 5 gallon buckets
    - 9.10 Dump the collected water into the MW-20 Bench or Remedy Produced Water Influent Tank Farm sump
    - 9.11 Store equipment, tanks, and hose
    - 9.12 Notify maintenance supervisor activities are complete

Standard Operating Procedure
PG&E Topock Conveyance Systems
Operation and Maintenance Plan

Title: Well and Meter Vault Inspection and Maintenance
Number: PIPE-SOP-02_Rev1

Creation Date: 4/9/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for inspection and maintenance of well secondary containment vaults.

The well and meter vaults are below-ground concrete vaults. The floor of the vaults have a concrete bottom where liquids drain to a sump on one edge of the vault. The top of each vault is covered with an access hatch. Each vault contains a high level switch. Some vaults include sump pumps. Some vaults include electrical outlets.

2 Drawing Numbers

- Inner Recirculation Loop Injection Well IRL-4 Site Plan: E-05-04
- P&ID Fresh Water Injection Well: I-02-02
- Well Vault Plans and Sections: S-02-01 through S-05-08
- Freshwater Injection Well and Meter Vault Plans and Sections: M-02-01
- TCS Loop Well Vault Mechanical Details and Sections: M-03-03 through M-03-05
- IRZ Extraction Well Vault Mechanical Details and Sections: M-04-03 and M-04-04
- IRZ Single Screen Injection Well Vault Mechanical Details and Sections: M-04-05
- IRZ Dual Screen Injection Well Vault Mechanical Details and Sections: M-04-06 and M-04-07
- IRZ Dual Screen Cluster Injection Well Vault Mechanical Details and Sections: M-04-08 and M-04-09
- Inner Recirculation Loop Extraction Well Vault Mechanical Details and Sections: M-05-04
- Inner Recirculation Loop Injection Well Vault Mechanical Details and Sections: M-05-05 through M-05-08

3 Equipment

- Appropriate personal protective equipment (PPE)
- Health and Safety Plan
- Manufacturer’s operation and maintenance manuals

- Lockout/tagout manual and tags
- Keys for opening vault(s)
- Vehicle for mobilization, if necessary
- Dry towel and cleaning agents, if necessary
- Appropriate sump pump lubricants and replacement parts, if necessary (see manufacturer's instruction manual)
- Possible equipment needed to clean up leaks includes but is not limited to:
  - Shop-vac
  - Spill containment
  - Spare sump pump
  - Portable generator
  - Extension cord
  - Tools and parts of fittings for repairing pipeline
  - Tools and supplies for repairing concrete
  - Vac-truck

4 Procedure

1. General Items

   1.1 Mobilize to vault to be inspected.

   1.2 Inspect the condition of the access hatch.

CAUTION: The vault may contain biological hazards (e.g., rodents, snakes, scorpions). Use appropriate PPE and visually inspect vault to verify there are no biological hazards prior to proceeding with scope of work.

   1.3 Carefully open the access hatch to the vault.

   1.4 Visually check the vault for biological hazards.

   1.5 Visually inspect the mechanical process piping is in good condition.

      a. If any items are noted as non-functioning (e.g., signs of deterioration or damage, evidence of leakage) inform the Maintenance Supervisor.

   1.6 Check the electrical and instrumentation and controls

      a. Visually inspect that these are in good working condition.

      b. Conduct testing in accordance with the manufacturer's manual as appropriate.

         If any items are noted as non-functioning inform the Maintenance Supervisor.

   1.7 Inspect the vault for damage (cracks) or signs of wear on the concrete.

2. Water Accumulation

   2.1 Check the low point in the vault for visible signs of liquid/solid accumulation.

      a. If the liquid/solid accumulation is above the high level set point and the high level alarm and/or the sump pump did not initiate, the equipment will need to be troubleshooted (see Step 3 to troubleshoot the sump pump; see Remedy-SOP-03 to troubleshoot the high level switch).

   2.2 If there are visible signs of liquid/solid accumulation in the low point of the vault:

a. Trigger the high level float to engage the sump pump.

b. If the vault doesn't have an operating sump pump remove the accumulation using the appropriate equipment (shop-vac, vac truck, spare sump pump, etc.)

c. Determine if the water was from rain water from recent storms or a leak in process piping. Visually inspect the piping for staining, moisture, or other signs of leaks/damage, paying close attention to valves, joints, and connections.

2.3 If the source of the vault water accumulation is determined:

a. Rain water: Troubleshooting is not necessary. Proceed to Step 2.4.

b. Process Piping: Use the human machine interface (HMI) to stop the flow to or from the corresponding wells, if necessary.

c. Lockout/ tagout the well/pipeline, if necessary. Reference the lock/tagout manual for guidance.

d. Drain and evacuate the conveyance lines.

i. Disassemble the process piping

ii. Drain excess water into buckets

e. Fix the leak with reference to the relevant manufacturer's operation and maintenance manual, if it is safe and feasible to do so. If the conditions cannot be fixed or conditions would require excessive repair methods, contact the Maintenance Supervisor to determine how to proceed.

f. Hydrostatically test the line to verify the leak has been fixed.

i. Reassemble the process piping to connect to the in-well pump

ii. Activate the in-well pump to pressurize the line.

iii. Examine the line for leakage.

g. If the leak persists, repeat Steps 2.3c through f.

h. If the leak is successfully fixed, remove the lockout/ tagout from the well/pipeline, if applicable.

i. Use the HMI to restore flow to or from the corresponding injection wells, if necessary.

j. Inspect the adjacent upstream and downstream conveyance system to see if there is liquid/solid accumulation from the condition that was addressed, and use appropriate equipment to clean up the accumulation if it is present.

2.4 If the source of the leak is not determined, contact the Maintenance Supervisor to determine how to proceed.

3. Sump Pump

3.1 Inspect the sump pump in the vault (if applicable) for the following:

a. If the sump pump did not initiate when it should have (see Step 2.1), troubleshoot the sump pump with reference the manufacturer's instruction manual.

b. Visually inspect that electrical connections are in good condition.

i. Check that connections are secure. Check for signs of rust or wear.

c. Check that the mounting unit bolts are adequately tightened.

d. Operate the pump if it is not already running.

e. Check for excessive noise, vibrations and oil temperatures while the sump pump is running. Troubleshoot per the manufacturer's instruction manual if necessary.

f. Check that the discharge pressure meets specification criteria.

g. Check that the inlet is not plugged.

h. Perform any other maintenance checks/procedures recommended by the manufacturer.

4. Wrap up

4.1 Wipe down any dirty equipment with a dry towel.

4.2 After inspection and maintenance of the secondary containment well vault is complete, carefully close and lock the access hatch.

4.3 Contact the Maintenance Supervisor if there are any notes that indicate further maintenance is required so parts can be procured and work can be scheduled.

Standard Operating Procedure
PG&E Topock Freshwater Supply Conveyance and Storage Operation and Maintenance Plan

Title: Startup and Shutdown of Freshwater Supply Conveyance and Storage System

Number: FWS-SOP-01_Rev1

Created Date: 6/25/14

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E PN: Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedures for (a.) starting up and (b.) shutting down the freshwater supply conveyance and storage system. The procedures should only be used to perform (a.) a "hot" startup after a short term shutdown, (b.) a short term system shutdown, or (c.) system shutdown for major maintenance or repair at the well. This procedure applies to the primary freshwater supply well, HNWR-1A. The HNWR-1 well will serve as a secondary supply well and the Site B well will serve as a contingency supply well, if needed.

2 Equipment List

- Health and Safety Plan
- Appropriate personal protective equipment (PPE)

3 Drawing Numbers

- Freshwater Supply Well (HNWR-1A), Instrumentation: I-01-01
- Freshwater Tank, Instrumentation: I-02-01

4 Preconditions

Operators should have system training and operating experience before attempting a system startup or shutdown.

For (a.) system startup, power has been restored (if startup is occurring after a power outage).

For (b.) system shutdown, a power outage has occurred or system needs a manual shutdown for reasons related to the downstream users of freshwater.

For (c.) system shutdown, major maintenance or repair at the well is to be performed.

5 Procedure

a. Startup Procedure

   1. If system power outage has occurred, power first needs to be restored.
   2. Using the HMI, Switch HNWR-1A well pump PMP-HNWR1A-0110A to AUTO.

b. Short-term Shutdown Procedure

   1. Use the HMI to switch HNWR-1A well pump PMP-HNWR1A-0110A to OFF.

c. Shutdown Procedure for Major Maintenance or Repair

   1. Use the HMI to switch HNWR-1A well pump PMP-HNWR1A-0110A to OFF.
   2. Go to the Pump Control Panel on the Control Panel Equipment Pad at HNWR-1A.
   3. Turn switches for the “Main Disconnect” and “Pump Disconnect” to OFF.
   4. Lockout/ Tagout the pump (see SOP-HSE-310 Lockout/Tagout, Enterprise Standard Operating Procedure).
   5. To startup the pump after the completion of major maintenance or repair:
      a. Remove lock and tag from the pump per SOP-HSE-310.
      b. Verify manual valves V-HNWR1A-0110B, -0171A, -0161A, and -0120A, and -0120C are open.
      c. At the Pump Control Panel on the Control Panel Equipment Pad at HNWR-1A, turn switches for the “Main Disconnect” and “Pump Disconnect” to ON.
      d. Use the HMI to switch HNWR-1A well pump PMP-HNWR1A-0110A to AUTO.

Standard Operating Procedure
PG&E Topock Freshwater Supply Conveyance and Storage Operation and Maintenance Plan

Title: Sand Separator and Drywell Operation and Maintenance

Number: FWS-SOP-02_Rev1

Created Date: 6/26/14

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for operation and maintenance of the sand separator and drywell at the primary freshwater supply well, HNWR-1A. The procedure can also be applied to the sand separator and drywell at the Site B freshwater well, which will serve as a contingency supply well if needed.

Visual inspections (part b.) of the sand separator, flow valve, and drywell pit are to be conducted during inspections of HNWR-1A. Internal inspections of the sand separator (part c.) are to be conducted at the frequency recommended by the manufacturer or as needed.

2 Drawing Numbers

- Freshwater Supply Wells, Instrumentation: I-01-01

3 Equipment/Supplies

- Health and Safety Plan
- Appropriate personal protective equipment (PPE)
- Manufacturer's instruction manual for sand separator (STR-HNWR1A-0110)
- Manufacturer's instruction manual for automated motorized flow valve (FV-HNWR1A-0110)
- FWS-SOP-01: Startup and Shutdown of Freshwater Supply Conveyance and Storage System
- Appropriate hand tools
- Appropriate cleaning supplies (for part c.)

4 Preconditions

- For (a.) Automatic purging and (b.) Visual inspection of sand separator (STR-HNWR1A-0110), flow valve (FV-HNWR1A-0110), and drywell pit:
  - PMP-HNWR1A-0110A is ON
  - Water level in HNWR-1A (or Site B) is above the low-level set point (LT-HNWR1A-0151)

5 Procedure

a. Automatic purging

1. The SCADA will control the motorized purge valve FV-HNWR1A-0110. Automatic purging will begin once the Preconditions are met.
2. The motorized purge valve FV- HNWR1A-0110 will purge sand from the sand separator (STR-HNWR1A-0110) at the duration and time interval set by the operator.
    i. FV- HNWR1A-0110 will initially purge sand from the STR- HNWR1A-0110 for 12 seconds, every 15 minutes.
3. Adjust the FV- HNWR1A-0110 purge duration and time interval as necessary, based on the observations of sand in the purge stream during periodic inspections of HNWR-1A (part b.).

b. Visual inspection of sand separator (STR- HNWR1A-0110), flow valve (FV- HNWR1A-0110), and drywell pit:

1. Inspection should be conducted when the Preconditions are met (i.e., the sand separator [STR-HNWR1A-0110] and motorized purge valve [FV- HNWR1A-0110] are operating).
2. Visually inspect the exterior of the sand separator (STR- HNWR1A-0110) for leaks, cracks, and damage.
    - If damage is observed and maintenance is required, reference the manufacturer's instruction manual for instructions on how to perform maintenance.
    - If damage is observed and maintenance that requires isolating the STR-HNWR1A-0110 from the flow stream is required, reference FWS-SOP-01: Startup and Shutdown of Freshwater Supply Conveyance and Storage System (part c.) for instructions on how to shut down PMP-HNWR1A-0110A for maintenance.
3. Visually inspect the motorized purge valve (FV-HNWR1A-0110) for leaks, cracks and damage.
    - If damage is observed and maintenance is required, reference the manufacturer's instruction manual for instructions on how to perform maintenance.
    - If damage is observed and maintenance that requires isolating the FV-HNWR1A-0110 is required:
        i. Turn FV-HNWR1A-0110 OFF.
        ii. Close manual valve V-HNWR1A-0110E.
        iii. Conduct maintenance per the manufacturer's instruction manual.
        iv. When maintenance is complete and FV-HNWR1A-0110 is intact, open FV- HNWR1A-0110 and purge sand from STR-HNWR1A-0110 until discharge water no longer looks sandy (i.e., sand has been completely purged from STR- HNWR1A-0110 and the entire purge line). Inspect the discharge water by lifting the lid of the drywell and visually inspecting the discharge from the purge line.
        v. Put FV-HNWR1A-0110 in AUTO mode.
4. Verify that FV-HNWR1A-0110 purges for the set duration and time interval.
5. When FV-HNWR1A-0110 is purging sand, lift the lid of the drywell and visually inspect the purge stream from the motorized purge valve to the drywell.
6. Verify that by the end of the purge duration, discharge water no longer looks sandy (i.e., sand has been completely purged from the sand separator and the entire purge line).

- If discharge water is still sandy at the end of the purge interval, extend the purge interval. Use the manufacturer's instruction manual for further guidance on selecting an optimal purge interval.

7. Open the top cover of the drywell pit.
8. Visually inspect the inside of the drywell pit to confirm that purged stream is appropriately draining into the drywell, and purged sand is not accumulating at the drywell inlet and discharge pipes.
    - If purged sand is not appropriately draining in the drywell pit and/or accumulating at the top surface of the drywell pit, contact the Maintenance Supervisor to schedule non-routine drywell maintenance (such as cleaning and replacement of geotextile fabric and/or crushed rock).
9. Close and secure the top cover of the drywell pit.

c. Internal inspection of sand separator (STR-HNWR1A-0110):

1. Open the motorized purge valve (FV-HNWR1A-0110) and purge sand from the sand separator (STR-HNWR1A-0110) until discharge water no longer looks sandy (i.e., sand has been completely purged from STR-HNWR1A-0110 and the entire purge line). Inspect the discharge water by lifting the lid of the drywell and visually inspecting the discharge from the purge line.
2. Reference FWS-SOP-01: Startup and Shutdown of Freshwater Supply Conveyance and Storage System (part c.) for instructions on how to shut down PMP-HNWR1A-0110A for maintenance.
3. Close the upstream isolation valve V-HNWR1A-0110B (HNWR-1A).
4. Close the downstream isolation valve V-HNWR1A-0171A.
5. Reference the sand separator manufacturer's instruction manual for procedures to:
    i. Drain STR-HNWR1A-0110 using the inspection/drain plug.
    ii. Inspect the inside slot area of STR-HNWR1A-0110 for sand build-up.
    iii. Clean the inside of STR-HNWR1A-0110, if necessary.
6. After inspection and maintenance of STR-HNWR1A-0110 is complete and STR-HNWR1A-0110 is intact, confirm that FV-HNWR1A-0110 is in AUTO.
7. Open the downstream isolation valve V-HNWR1A-0171A.
8. Open the upstream isolation valve V-HNWR1A-0110B (HNWR-1A).
9. Reference FWS-SOP-01: Startup and Shutdown of Freshwater Supply Conveyance and Storage System (part a.) for instructions on how to start-up PMP-HNWR1A-0110A.

Standard Operating Procedure
PG&E Topock Freshwater Supply Conveyance and Storage Operation and Maintenance Plan

Title: Freshwater Supply Well Site Inspection
Number: FWS-SOP-03_Rev1
Creation Date: 8/9/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for inspection of the HNWR-1A freshwater supply well site. HNWR-1A is the primary freshwater supply well for the groundwater remedy. This procedure can also be applied to inspection of the secondary supply well HNWR-1 or contingency supply Site B well.

2 Drawing Numbers

- Freshwater Supply Wells, Instrumentation: I-01-01

3 Equipment

- Appropriate personal protective equipment (PPE)
- Health and Safety Plan
- FWS-SOP-01, Startup and Shutdown of Freshwater Supply Conveyance and Storage System
- FWS-SOP-02, Sand Separator and Drywell Operation and Maintenance
- Remedy-SOP-03, Cleaning and Maintenance of Instrumentation and Control Equipment
- Manufacturer's instruction manual for the following equipment:
  - Discharge pressure indicator (PIT-HNWR1A-0161A)
  - Discharge flow meter (FM-HNWR1A-0171)
  - Refuge flow meter (FM-HNWR1A-0172)
  - Ball valves (various tag numbers, see drawing I-01-01)
  - Swing check valves (V-HNWR1A-0110A)
  - Air/vacuum release valve (AVRV-HNWR1A-0111)
- Vehicle for mobilization
- Possible equipment needed to clean well site includes but is not limited to:
  - Broom

- Dustpan
- Dry towel
- Extension cord
- Tools for repairing pipeline
- Spare fittings and valves

4 Procedure

1. Mobilization and Site Inspection

   1.1 Mobilize to well site with equipment and supplies.

   1.2 Visually inspect the site for biological hazards such as rodents, snakes, and scorpions.

   - If biological hazards are encountered, consult the Health and Safety Plan.

   1.3 Make sure yard light(s) work.

   1.4 Inspect the fence and gate for damage.

   1.5 Inspect security camera for damage and good operation.

   1.6 Inspect for and note any erosion damage to yard.

2. Well and Equipment Inspection

   CAUTION: Well casing, piping, and equipment may be hot from sun exposure.

   2.1 Visually inspect the mechanical process piping and fittings within the limits of the well site for leaks and damage.

   2.2 Visually inspect the freshwater supply well head for leaks and damage.

   2.3 Inspect paint in piping, valves and electrical boxes.

   2.4 Visually inspect that the following instrumentation and control (I&C) equipment is in good working condition and check all indicator lights:

   - PIT-HNWR1A-0161B, Discharge pressure indicator
   - FM-HNWR1A-0171, Discharge flow meter
   - FM-HNWR1A-0172, Discharge flow meter

   2.5 Visually inspect air/vacuum release valve AVRV-HNWR1A-0111 is in good working condition.

   2.6 Conduct inspection of Sand Separator (STR-HNWR1A-0110) system with reference to the following steps of FWS-SOP-02, Sand Separator and Drywell Operation and Maintenance:

   2.5.1. Part b., Visual inspection of sand separator (STR-HNWR1A-0110), flow valve (FV-HNWR1A-0110), and drywell pit, Steps 1 through 9

   2.5.2 Part c., Internal inspection of sand separator (STR-HNWR1A-0110), Steps 1 through 8 (do not conduct Step 9 [start-up of freshwater well pump PMP-HNWR1A-0110A] because freshwater well pump should remain off for Step 2.6 below)

   2.7 Inspect that the following manual valves are in good working condition by visually inspecting AND exercising (opening and closing) the valves:

   - V-HNWR1A-0172A
   - V-HNWR1A-0110B
   - V-HNWR1A-0171A
   - V-HNWR1A-0161A

- V-HNWR1A-0161C
- SP-HNWR1A-0161B

2.8 If unsuitable conditions were observed for any equipment in Steps 2.1 through 2.6 that require attention prior to restarting the well pump:

- Reference the equipment manufacturer's instruction manual(s) and Remedy-SOP-03, Cleaning and Maintenance of Instrumentation and Control Equipment (for I&C equipment only), for instructions on how to perform maintenance on equipment.
- If the equipment cannot be adequately repaired, inform the Maintenance Supervisor to procure parts and schedule additional maintenance.

2.9 Verify that valves are in appropriate position (open or closed) for routine system operation. Appropriate valve positions are in Volume 1 of the Operation and Maintenance Manual.

2.10 If the freshwater well and equipment is in appropriate condition to return to service, reference FWS-SOP-01: Startup and Shutdown of Freshwater Supply Conveyance and Storage System (part a.) for instructions on how to start-up PMP-HNWR1A-0110A.

2.11 Confirm that the following I&C equipment is functioning properly and check all indicator lights:

- PIT-HNWR1A-0161, Discharge pressure indicator
- FM-HNWR1A-0171, Discharge flow meter
- FM-HNWR1A-0172, Discharge flow meter

3. Wrap up

3.1 Wipe down any dirty equipment with a dry towel and tidy up the site with the broom and dust pan as needed.

3.2 Contact the Maintenance Supervisor if there are any items that require further attention.

Well-SOP-01 Rev. 0

Standard Operating Procedure for Well and Borehole Permanent Decommissioning

PREPARED FOR:	Topock Groundwater Remediation Project
COPY TO:	Project File
PREPARED BY:	Pacific Gas & Electric Company
DATE:	August 27, 2014

This document defines the standard operating procedures (SOP) for decommissioning groundwater wells and boreholes associated with the Pacific Gas and Electric Company (PG&E) Topock Remediation Project, Needles, California (Site). This document was developed, in part, as a direct result of Tribal concerns that included dialog regarding future decommissioning activities at the site between PG&E, agencies, and Native American Indian Tribes (Tribes). PG&E acknowledges that the Topock Remediation Project is an area that is culturally important to the Tribes and that the activities, materials, and procedures used in this process are of specific interest. Tribes have raised concerns with drilling intrusions, well and borehole decommissioning, emplacement of foreign materials into the earth, and retention of soils displaced as a result of drilling. Based on Tribal input, the potential for use of displaced site material in the decommissioning process, which may require a variance with the applicable permitting agency, is included in this document (Section 2.2.3).

An initial draft of this SOP was submitted for review and comment by the agencies and Tribes. The comments received, PG&E responses to these comments, as well as the conclusions of discussion during a June 6, 2014 conference call regarding the PG&E responses to comments are documented in Attachment A.

This SOP will be used as a reference to guide the development of future work plans required for agency, Tribal, and stakeholder review prior to conducting all well and borehole decommissioning tasks associated with the groundwater remedy. For the purpose of this SOP, an exploratory borehole (borehole) is defined as a drilled borehole in which no casings have been installed, regardless of whether or not the borehole was drilled to the water table. However, California boreholes drilled to the water table must be decommissioned per water well standards. The technical procedures included in this SOP are based on applicable regulatory and project-specific guidance information; however, specific work plans for well decommissioning tasks are necessary to evaluate task-specific details and ensure overall compliance. The structure of the SOP has been developed to provide adequate flexibility such that it can be applied to different well types and sizes in a variety of environmental settings. Specifically, this SOP provides a summary of the following key criteria that must be considered when developing a scope of work to decommission a well or exploratory borehole:

- Regulatory information and project-specific resources
- General technical specifications and procedures used for well or borehole decommissioning
- Evaluation of the well or borehole decommissioning scenarios

1.0 Summary of Guidance Information

Multiple sources of guidance information must be considered prior to conducting well or borehole decommissioning activities. Groundwater wells at the Site are located in the states of California and Arizona. Both states regulate the minimum specifications and procedures for the decommissioning of groundwater monitoring and supply wells to protect the quality of groundwater. Further, project-specific documents provide additional guidance related to sensitive cultural and biological resources. A summary of key regulatory information (project-specific applicable or relevant and appropriate [ARAR] numbers are provided) and project-specific resource documents associated with conducting groundwater well or borehole decommissioning activities is provided in the following subsections.

1.1 Regulatory Information – California (ARAR #98)

Statewide minimum standards for decommissioning a groundwater well in the State of California were established by the California Department of Water Resources (DWR) in the California Well Standards. The California Well Standards were originally established in Bulletin 74 (February 1968), later re-written as Bulletin 74-81 (December 1981), and later supplemented by Bulletin 74-90 (June 1991). The DWR states that the California Well Standards may not be sufficient for local conditions and local permitting agencies may need to adopt more stringent standards to ensure groundwater quality protection. However, The County of San Bernardino is the local permitting agency for Site wells located in California and have adopted the DWR standards.

The California Well Standards identify well destruction (or decommissioning for this SOP) requirements for both water supply wells (Part III of Bulletin 74-81), and monitoring wells and exploratory boreholes[1] (Part III of Bulletin 74-90). Although San Bernardino County does not require permits for the decommissioning of boreholes that do not reach the water table, DTSC has stated that they may request that some exploratory boreholes that do not reach the water table be decommissioned as wells under certain circumstances. For example, a borehole that terminates within 10 to 20 feet the water table and is located in an area where the potential for infiltration (e.g., wash channels) or future spills (e.g., an area of active industrial operations) is greater. The general requirements for both well types are similar; however, special considerations for monitoring wells and exploratory boreholes address the potential for these well types to be in areas of known or potential pollution or contamination.

1.2 Regulatory Information – Arizona (ARARs #48 and #49)

Development of rules for adopting standards for the construction and abandonment (or decommissioning for this SOP) of a groundwater well in the State of Arizona are required under Arizona Revised Statute 45-594(A). In response to the statute, the Arizona Department of Water Resources (ADWR), adopted the Well Abandonment Rule. The Well Abandonment Rule as Arizona Administrative Code (A.A.C) R12-15-816 was originally established on March 5, 1984. An amendment to the rule was effected on June 18, 1990. The Well Abandonment Rule requires that the abandonment (decommissioning) of a well be accomplished through filling or sealing the well so as to prevent the well from allowing the vertical movement of water. The rule contained general guidance for the decommissioning process, but lacked specific information regarding applicable aquifer conditions, and for the depths, types of materials and methods for the well decommissioning. ADWR provided additional written guidance for well abandonment to comply with A.A.C. R12-15-816(G) in the Well Abandonment Handbook on October 3, 2008.

The Well Abandonment Handbook (WAH) provides a standard well decommissioning method to be used for the post-installation of any well or borehole, regardless of the aquifer or vadose zone conditions applicable to the well (Section IV A). In addition, the WAH details five alternative abandonment methods. The five alternatives are for specific vadose zone and aquifer conditions which may include contamination, single or multiple aquifers, or dry wells (Section IV B). For example, Alternative 4, which applies to wells that only penetrate a single aquifer without vertical flow components and no water quality contamination issues, might be applicable to wells in the Topock area that are 8-inches or greater in diameter. A variance option to Alternative 4 permits the use of clean fine sand to fill the well being decommissioned.

Legal authorization from the ADWR is required to decommission most types of wells in the State of Arizona. ADWR requires a statewide decommissioning form to be filed and reviewed prior to decommissioning. The notice of intention to abandon a well (NOIA) can be obtained from the ADWR Groundwater Management Support Section in Phoenix or other local offices. In addition, all forms are available online at http://www.azwater.gov/azdwr/WaterManagement/NOI/documents/PermitsFormsApplicationsNOI.htm. The permit must be signed and filed by the well owner. The information on the NOIA must include a well construction diagram with proposed decommissioning specifications; casing type, description of the proposed method of decommissioning (over-drilling, jacking, perforation, etc.); a description of the method of emplacing sealing or fill materials; and the specific type and estimated amount of grout material to be used (water-cement ratio, water-

[1] San Bernardino County does not require permits for the installation or decommissioning of boreholes that do not reach the water table.

bentonite ratio and/or other materials or additives used). ADWR performs a completeness and substantive review of the NOIA to determine whether the proposed abandonment methods and materials meet the requirements of the ADWR abandonment rule in R12-15-816(G). If an alternative method of decommissioning is proposed in lieu of the standard method, further substantive review is performed by ADWR to verify that the proposed methods apply, and whether appropriate fill materials were chosen. A proposal to use an alternative decommissioning method requires an application to ADWR for a variance from the well decommissioning rule (a deviation from the standard decommissioning method). Following ADWR confirmation that the proposed well decommissioning methods and materials meet the requirements of the rule, a well decommissioning authorization card is mailed to the designated well drilling contractor and well decommissioning operations may begin.

1.3 Project-specific Resources

In addition to regulatory guidance, project specific requirements or information must be considered prior to initiating well decommissioning activities. The following is a list of documents that may be applicable:

- **Topock Well Inventory Data Package** – Inventory of wells related to the Topock Remediation Project for reference when developing specific plans for well decommissioning. This data package includes a technical memorandum, well location map, and a searchable spreadsheet of well details. As requested by DTSC, the well inventory spreadsheet (electronic file) and available well logs associated with the Topock Project will be archived on the DTSC website. This archive will be updated periodically as additional wells and boreholes are installed.
- **Environmental Impact Report (EIR) Mitigation Measures Reporting Program (MMRP)** – This document details specific compliance criteria that must be considered before, during, and after implementation of well decommissioning activities.
- **Management Protocol for Handling and Disposition of Displaced Site Material** – This document identifies the general approach and management protocols required for the handling and disposition of soil and/or rock that is displaced as a result of activities associated with the Pacific Gas and Electric Company (PG&E) Topock Remediation Project. The use of displaced site material for use in the well decommissioning process is discussed in Section 2.2.3.
- **Special Handling for Clay Material Encountered During Drilling** – As requested by the Hualapai Department of Cultural Resources, special handling procedures for drill cuttings generated from clay beds will be used in the field (this does not include clay-containing sediment mixtures, only clay beds). If clay bed(s) are encountered during drilling, then the cutting from those interval(s) will be set aside on 100% cotton muslin (dye free) for future disposition, following discussions with the Tribes. PG&E will notify the agencies and Tribes in the event clay material is encountered and separated for storage.
- **Previous Well Decommissioning Work Plans** –
  - Well PGE-6 Revised Decommissioning Work Plan (November 10, 2006).
  - Final Revised Implementation Plan for Repair of Monitoring Wells MW-38S and MW-38D and Old Well/Pipe Reconnaissance (February 11, 2011).
- **Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) Permit Exemption –** Per the November 16, 2007 Memorandum from the United States Department of the Interior, remedial actions including well decommissioning are exempt from the federal, state, and local permitting process. Since the issuance of this memorandum, the applicability of this exemption has been confirmed with the County of San Bernardino, California in February 2008 and January 2011. However, the County of San Bernardino will need to be consulted in the event a variance to the California Well Standards is required. The applicability of this exemption has not been confirmed with the State of Arizona. Regardless of the permit exemption, all work plans for decommissioning activities will be reviewed and approved by the appropriate state and federal agencies prior to implementation.

1.4 General Technical Resources

In addition to regulatory guidance and project specific information various technical resources should be considered during the development of a work plan for well or borehole decommissioning. The following is a list of documents that may be useful:

- Monitoring Well Design and Construction for Hydrogeologic Characterization. Guidance Manual for Ground Water Investigations. July 1995. State of California, Environmental Protection Agency.
- ASTM Standard D5299-99 (2005), "Standard Guidance for Decommissioning of Groundwater Wells, Vadose Zone Monitoring Devices, Boreholes, and Other Devices for Environmental Activities", ASTM International, West Conshohocken, PA, 2005, www.astm.org.
- ASTM Standard C150/C150M-12, "Standard Specification for Portland Cement", ASTM International, West Conshohocken, PA, 2012, www.astm.org.
- ASTM Standard D4380-84 (2006), "Standard Test Method for Density of Bentonitic Slurries", ASTM International, West Conshohocken, PA, 2012, www.astm.org.

2.0 General Technical Specifications and Procedures for Decommissioning Wells and Exploratory Boreholes

Monitoring wells or exploratory boreholes that are no longer useful must be properly decommissioned to ensure the quality of groundwater is protected and eliminate a possible physical hazard to humans and animals. Notification or permitting requirements should be evaluated prior to the initiation of well decommissioning activities in the field. Involved oversight agencies will be notified in advance of any decommissioning activities to ensure concurrence with decommissioning of a particular well(s). The general process for decommissioning a well at the Topock site is presented on Figure 1, Well Decommissioning Decision Protocol. The information provided in this section is intended to be applicable for wells or boreholes located in either California or Arizona; however, it is assumed that the details included in the specific work plan(s) will be designed in compliance with the appropriate state regulations, and reviewed by the appropriate permitting agency. In addition, depending on the condition of the aquifer and well(s) subject to decommissioning, potentially applicable variance options that include the minimization of the placement of sealing material should be evaluated with the lead agencies during well decommission work plan development (e.g., Arizona Alternative 4 – variance option). A discussion of the primary steps identified in this protocol, including the potential materials and methods required for each, is presented in the following subsections.

2.1 Evaluation of Well or Borehole

Key well or borehole information should be assembled and reviewed prior to initiating decommissioning activities to determine lithologic and well construction details, the current condition of the well or borehole, soil and water quality information, applicable regulatory criteria, and identification of the procedures and materials that should be used. The majority of this information will be available through review of drilling and well installation information, the Topock Well Inventory, groundwater sample collection logs, or other related documents. The Topock Well Inventory can be found online at: http://dtsc-topock.com/sites/default/files/Topock-Well-Inventory_Tech-Memo.pdf. However, it is possible that additional survey of the given well or borehole will be required to obtain all key information. The following is a list of survey techniques that may be utilized to evaluate the condition of well or borehole (list is not intended to be all-inclusive):

- Well measurement – Evaluation of the depth to the bottom of, or the depth to water within, a well or borehole. This is typically accomplished using a graduated measuring tape with a water sensor or blunt weight at the end.
- Video survey – An in-well video camera can be used to evaluate the condition of the well casing and screen, and identify obstructions. In-well cameras are typically calibrated for depth and orientation (i.e. north, south, east and west), and deployed on a cable using a winch.

- Geophysical survey – Depending on the well casing type, depth to water, potential presence of metallic centralizers or other well construction components, and other variables, select geophysical survey tools may be useful. Similar to an in-well camera, in-well geophysical tools are deployed on a cable using a winch. While not a complete list, examples of geophysical tools that may be useful include:
  - Acoustic (Cement Bond Log) – Used to determine the quality of cement bonding in cased or sealed wells.
  - Gamma – Used to determine intervals of bentonite seals and gravel pack.
  - Caliper – Used to verify diameter of the well or borehole, which is used to calculate borehole and well casing volumes, and identifies obstructions or areas of borehole washout or constriction.
  - Casing Inspection Thickness Measurement (CITM) – An in well survey that uses electromagnetic waves to measure well casing wall thickness in carbon based steels. Survey can be used to understand or measure the integrity of the well casing.

2.2 Identification of Materials and Placement Requirements

Different types of materials are required for different well or borehole decommissioning scenarios depending on above-ground, and subsurface environment. Sealing materials are required when the potential for flow of water through the material must be kept to an absolute minimum such that the volume of water and possible pollutants and contaminants passing through them will be of minimal consequence (no material is completely impervious). Filler material is permitted for use under some circumstances when the flow of water through the material is not of critical concern. Potential materials suitable for use during well and borehole decommissioning at the Topock site and associated placement requirements are listed in the following subsections.

2.2.1 Sealing Material

Conventional sealing activities are performed with the objective of completely filling the borehole or well casing, voids in the formation in the vicinity of the borehole, and if not over-drilled, the gravel pack and annular spaces. Sealing materials are required for use when decommissioning wells and boreholes regardless of whether they are located in an area of known or potential pollution or contamination. In uncontaminated areas where the well is wholly situated in unconsolidated material in an unconfined groundwater zone, the sealing material is focused in the upper 20 feet of the well or borehole to prevent the infiltration of potential surface contamination. In areas of known or potential soil or groundwater contamination, sealing material is required throughout the entirety of the well or borehole. The following is a list of sealing materials that may be used at the Topock site:

- Neat cement – Compose entirely of Type II/V Portland cement grout with up to 6% bentonite powder.
- Sand-cement grout – Composed of Portland cement with no more than two parts sand to one part cement by weight of sand.
- Concrete – Composed of Portland cement and aggregated mixed at a ratio of at least 564 lbs. of cement per cubic yard of aggregate. Aggregate used must be smaller than 1/5 of the radial thickness of the annular seal and is typically reserved for large volume/diameter borehole or well decommissioning.
- Bentonite clay – Composed of commercially prepared, powdered, granulated, pelletized, or chipped/crushed sodium montmorillonite clay with the largest dimension of pellet or chip being less than 1/5 the radial thickness of the annular seal. Bentonite cannot be used as a sealing material opposite zones of fractured rock, unless otherwise approved by lead agencies. As bentonite seals may have a tendency to dry, shrink and crack in arid and semi-arid areas where subsurface moisture levels can be low, they are not recommended for sealing the vadose zone at the Topock site. In addition, bentonite is not recommended for application in high TDS environments (e.g., >5,000 parts per million) due to the adverse effects on its ability to properly swell and seal in these conditions.

According to Arizona and California Well Standards, drilling mud or cuttings are not acceptable sealing materials.

Water used for the preparation of sealing materials should be potable, compatible with the type of sealing material used and free of contaminants and suspended matter. All manufacturers' specifications for mixture

volumes and curing times must be strictly followed (typically, ASTM C150, Standard Specification for Portland cement). Further, the use of any additives must comply with the requirements of ASTM C494 (Standard Specification for Chemical Admixtures for Concrete).

Sealing material must be placed into a well or borehole at the required interval(s) in one continuous decommissioning operation, which may include multiple lifts of sealant, using methods that prevent the free-fall, dilution, and/or separation of aggregates from the cementing materials. Typically, fluid sealing material is placed using a tremie pipe with positive displacement pumping (pumped under pressure), beginning at the bottom of the sealed interval with the end of the tremie pipe submerged two feet or more below the surface of the grout during placement. When using a tremie pipe, if sealing material is placed throughout the well or borehole, static water is either displaced out of the top by the injected column of sealing material, or into the formation (applicable SOPs for waste management/spill containment will followed). Alternatively, fluid sealing material may need to be pumped into the well under pressure, using the well casing as the conduit. In this case the static water and the sealing material are forced into the voids of the well/borehole and formation. When fluid sealing material is placed under pressure, the pressure must be maintained long enough for the sealing material to cure, as applicable. Dry sealing material, such as bentonite chips or pellets, are typically placed by using a tremie pipe or the well casing as a conduit. Dry sealing materials require water for hydration and proper sealing. Regardless of sealing material type or placement method, verification shall be made that the volume of the material placed in the well or borehole is at least equal to the calculated volume of void space to be sealed.

2.2.2 Filler Material

Filler materials are permitted for use in select portions of the decommissioned well or borehole when located in uncontaminated areas. Suitable filler materials include clay, silt, sand, gravel, crushed stone, native soils, mixtures of the aforementioned types, as well as sealing materials defined above. However, materials containing organic matter are not acceptable.

Filler material must be placed into the well or borehole from the bottom up, such that bridging does not occur and the entire void space is filled. To assure that bridging has not occurred during placement, verification shall be made that the volume of the material placed in the well or borehole (with appropriate porosity assumptions) is at least equal to the calculated volume of void space to be filled (i.e., empty hole).

2.2.3 Displaced Site Material

As discussed in Section 1.3 (Management Protocol for Handling and Disposition of Displaced Site Material), soil and rock that are displaced as a result of the Topock Remediation Project may be retained on site for future use. One of the potential reuses for this material identified in the management protocol is replacement into borings. If the material was generated as drill cuttings, then lead agencies must agree that the material can be used as a component of either sealing or filler material for the purpose of well or borehole decommissioning (a variance may be required).

The requirements for placement of displaced site material, should it be deemed appropriate for use based on physical and chemical composition, are the same as that for filler material. Additional processing of the displaced material may be required to ensure that grain size requirements are met, that the material is free of organic matter, and that the material can be practicably placed into the well or borehole (i.e., prevent bridging). This processing may require the use of heavy equipment for grading or crushing the material so that it is suitable for use in the decommissioning process. An appropriate onsite location would need to be identified if such processing were required.

2.3 Well or Borehole Decommissioning Scenarios

Following evaluation of the well or borehole and in coordination with lead agencies, it must be determined if the well can be decommissioned in place (with or without modification) or if the well materials must be removed. The following subsections define the decommissioning scenarios that may apply pending completion of the well evaluation and coordination with lead agencies, responsible agencies (San Bernardino County or Arizona

Department of Water Resources), affected land owner, Tribes, and other stakeholders. Artesian groundwater conditions have not been observed at the Topock site, and therefore, are not considered in this SOP.

All wells associated with the Topock Remediation Project are considered to be in non-urban areas. When developing work plans that include well or borehole decommissioning, lead and responsible agencies (San Bernardino County) in California will be consulted to confirm this assumption. For the purpose of this SOP, well or borehole decommissioning scenarios are presented for two types of well site environments. These environments, Type 1 and Type 2, are defined as:

- Type 1 Well Environment – A well classified as Type 1 is located outside the area of known or potential soil or groundwater contamination (e.g., as determined by the soil and/or groundwater quality data available for the location or the likelihood of a future release in the area) and is not located in an area that is subject to increased surface water infiltration relative to nearby upland areas (e.g., channel of Bat Cave Wash).
- Type 2 Well Environment – A well classified as Type 2 is located in an area of known or potential soil or groundwater contamination (e.g., as determined by the soil and/or groundwater quality data available for the location or the likelihood of a future release in the area) and/or in an area that is subject to increased surface water infiltration relative to nearby upland areas (e.g., channel of Bat Cave Wash). Any wells located on the Topock Compressor Station, within wash channels, within areas of concern (AOCs), or within/adjacent to roads are in a Type 2 environment.

Three approaches to well and borehole decommissioning, including one approach that would require the approval of a variance to the California Well Standards, were presented by DTSC as draft concepts for discussion during the January 19, 2012 TWG Meeting. This information is provided as Attachment B to this SOP for consideration when developing future work plans that involve borehole or well decommissioning. The overriding consideration for the variance scenario presented in Attachment B was that the decommissioning method would provide seals that had a net permeability equal to or less than the naturally occurring geologic materials encountered along the borehole.

2.3.1 Exploratory Borehole

Typically, exploratory boreholes at the Topock site are installed as part of a data collection effort (i.e., lithologic, soil or groundwater sample collection) and are immediately decommissioned once the data collection objectives for that borehole have been achieved. Therefore, the borehole is typically decommissioned while the drilling tools or casing is still in place, prior to demobilization from that borehole. The following general procedure should be followed for decommissioning an exploratory borehole:

1. Evaluate the borehole for obstructions immediately prior to conducting decommissioning activities. If an obstruction is encountered that will prevent successful sealing of the borehole, attempts must be made to remove it prior to placement of the sealing material.
2. Place sealing material from total depth to ground surface. Typically, sealing material will be placed using a tremie pipe with positive displacement pumping. Industry practice is to place sealing material from total depth to the ground surface. However, if the boring is not within an area of known or potential pollution or contamination as determined by the soil and/or groundwater quality data available for the borehole, evaluate using displaced site material, or filler material if displaced site material is not available or appropriate, in lieu of sealing material in the upper 5 to 10 feet of the borehole. The use of displaced site material or filler material may require a permit variance if the borehole reached the water table.
3. Verify that the resulting condition of the borehole opening at the surface does not present a physical hazard to humans or animals. If voids are present fill voids created with displaced site material, or filler material if displaced site material is not available or appropriate.

2.3.2 Decommissioning a Well in Place

Wells determined to have been constructed in conformance with applicable standards without indication of compromise since the time of installation may be decommissioned in place. This decommissioning option should be utilized whenever acceptable to the regulatory agencies as it represents the field procedures that are least intrusive and create the least amount of disturbance. Further, this decommissioning method is appropriate if the well is in good repair but cannot be removed (e.g., wells constructed with large diameter steel casing), or if removal would negatively influence sealing of the well (e.g., a collapse during removal). In this case the monitoring well casing and any other significant voids (i.e., pore spaces in the gravel pack), at a minimum, should be completely filled with sealing material. The following general procedure should be followed for decommissioning a well in place:

1. Conduct evaluation of the well as detailed in Section 2.1 and verify with lead agencies, responsible agencies (San Bernardino County or Arizona Department of Water Resources), affected land owner, Tribes, and other stakeholders that the well should be decommissioned in place, and whether it is in a location considered to be Type 2.
2. Evaluate well for obstructions immediately prior to conducting decommissioning activities. If an obstruction is encountered that will prevent successful sealing of the well, attempts must be made to remove it prior to placement of the sealing and/or filler material.
3. Place sealing material. Typically, if fluid sealing material is used, this will be conducted using a tremie pipe with positive displacement pumping.
    a. Type 1 Well – Evaluate using filler material in lieu of sealing material in portions of the well casing. Place sealing material from total depth to near ground surface.
    b. Type 2 Well – Place sealing material from total depth to within 5 feet of the ground surface (bgs).
4. Decommission well head.
    a. Type 1 Well – Remove all well head protection and excavate around the well casing to a depth of approximately 1 to 5 feet bgs, or as practicable. Remove all well materials to a depth of approximately 1 to 5 feet bgs, or as practicable, cap casing with sealing material such that it extends beyond the diameter of the borehole and will drain fluids away from the borehole. Backfill the void created with displaced site material, or filler material if displaced site material is not available or appropriate.
    b. Type 2 Well – Remove all well head protection and excavate around the well casing to a depth of 5 feet bgs. Remove all well materials to a depth of 5 feet bgs, cap casing with sealing material such that it extends beyond the diameter of the borehole and will drain fluids away from the borehole. Backfill the void created with displaced site material, or filler material if displaced site material is not available or appropriate.

Note that the Type 1 and Type 2 well scenarios are subtly different. While the Type 2 scenario requires the removal of all well materials to a depth of 5 feet bgs (per CA well standards), Type 1 wells do not require the removal of any well materials. The removal of well materials to a depth of approximately 1 to 5 feet bgs, or as practicable, is not required by CA well standards, but included per stakeholder comments.

2.3.3 Decommissioning a Well in Place with Modification

It may be determined that a well should be decommissioned in place, but requires modification prior to sealing. This method may be appropriate in the event well materials or an obstruction cannot be removed, clogged screen cannot be removed, or if removal would negatively influence sealing of the well. In this scenario it may be required to remove a portion of the well casing, perforate sections of the well screen or casing, or conduct other well modifications to facilitate proper sealing. The following general procedure should be followed for decommissioning a well in place when a modification is required:

1. Conduct evaluation of the well as detailed in Section 2.1 and verify with lead agencies, responsible agencies (San Bernardino County or Arizona Department of Water Resources), affected land owner, Tribes, and other stakeholders that the well should be decommissioned in place, what modification work is required, and whether it is considered to be Type 2.
2. Implement required well modification.
3. Place sealing material. The condition that warrants well modification must be evaluated to determine the method use to place the sealing material. For example, if casing perforations above the water table are required, sealing under pressure may be appropriate.
    a. Type 1 Well – Evaluate using filler material in lieu of sealing material in portions of the borehole. Place sealing material from total depth to near ground surface, or in the event casing is removed, the new top of casing depth. If a portion of the casing is removed, sealing or filler material requirements for the interval above the top of casing must be determined through discussion with lead agencies, responsible agencies (San Bernardino County or Arizona Department of Water Resources), affected land owner, Tribes, and other stakeholders.
    b. Type 2 Well – Place sealing material from total depth to within 5 feet of the ground surface (bgs). If a portion of the casing is removed, sealing or filler material requirements for the interval above the top of casing must be determined through discussion with lead agencies, responsible agencies (San Bernardino County or Arizona Department of Water Resources), affected land owner, Tribes, and other stakeholders.
5. Decommission well head.
    a. Type 1 Well –Remove all well head protection and excavate around the well casing to a depth of approximately 1 to 5 bgs, or as practicable. Removal all well materials to a depth of approximately 1 to 5 feet bgs, or as practicable, cap casing with sealing material such that it extends beyond the diameter of the borehole and will drain fluids away from the borehole. Backfill the void created with displaced site material, or filler material if displaced site material is not available or appropriate.
    b. Type 2 Well – Remove all well head protection and excavate around the well casing to a depth of 5 bgs. Removal all well materials to a depth of 5 feet bgs, cap casing with sealing material such that it extends beyond the diameter of the borehole and will drain fluids away from the borehole. Backfill the void created with displaced site material, or filler material if displaced site material is not available or appropriate.

2.3.4 Decommissioning a Well by Removing Well Materials

In some cases a well may be decommissioned by complete removal of the well materials. This method may be appropriate in the event a well was not constructed in accordance with applicable standards and the deficiencies may prevent the proper sealing of the well, even with modification. Further, when removal is practicable, lead agencies, responsible agencies (San Bernardino County or Arizona Department of Water Resources), affected land owner, or other stakeholders may determine this method preferable to others. Removal is typically conducted by over-drilling the existing well materials with larger diameter drilling tools. Typically, this method is only applied to wells constructed with polyvinyl chloride (PVC) casing or limited lengths of smaller diameter steel casing. Other methods of casing removal (e.g., hydraulic casing jacks) may be useful to remove limited lengths of larger diameter steel casing. The following general procedure should be followed for decommissioning a well by removing the well materials:

1. Conduct evaluation of the well as detailed in Section 2.1 and verify with lead agencies, responsible agencies (San Bernardino County or Arizona Department of Water Resources), affected land owner, Tribes, and other stakeholders that the well should be decommissioned by removal.
2. Remove well materials. Typically, this is conducted by over-drilling or in some cases by combination of the use of hydraulic casing jacks combined with over-drilling.

3. Evaluate borehole for obstructions immediately prior to conducting decommissioning activities. If an obstruction is encountered that will prevent successful sealing of the borehole, it must be removed prior to placement of the sealing material.
4. Place sealing/filler material from total depth to ground surface. Typically, this will be conducted using a tremie pipe with positive displacement pumping. Industry practice is to place sealing material from total depth to the ground surface. However, if the boring is not within an area of known or potential pollution or contamination, evaluate using filler material in lieu of sealing material in portions of the borehole.
5. Decommission remaining elements of the well head protection and fill voids created with displaced site material, or filler material if displaced site material is not available or appropriate.

Other methods may be employed for removal of the well, particularly for steel well materials and steel conductor casings used to seal off upper lithologic zones. Specifically, the well string (or conductor casing) may be pulled by jacking with external equipment, or with the drill rig. Once the well string is removed from the borehole, the remaining materials in the original borehole should be over-drilled to remove them from the formation.

2.4 Well Decommissioning Reporting

Following completion of well decommissioning tasks, reporting of field activities must be completed in compliance with the lead agencies requirements. In addition, project-specific reporting must be completed (as required) and the Topock Well Inventory must be updated to reflect the results of decommissioning activities. The timeline for reporting requirements will be specified in the project-specific work plan. The Well Decommissioning Report will be submitted to lead agencies no later than 90 days after completion of well decommissioning activities and will include, at a minimum:

- A summary of the approval process completed prior to well decommissioning, including reference to submitted work plans, subsequent communication and modifications (as applicable) and documentation of approval to proceed;
- Discussion regarding application of the Well Decommissioning Decision Protocol;
- Details of the work performed, including explanation of the applicable well decommissioning scenario and materials utilized;
- Documentation of compliance with applicable permitting requirements, and;
- Signature and seal of an appropriately licensed professional geologist or engineer.

Well Decommission Decision Protocol
Standard Operating Procedure for
Well and Borehole Decommissioning
PG&E Topock Compressor Station
Needles, California

Attachment A
Responses to Comments on Draft *Standard Operating Procedure for Well and Borehole Decommissioning*

Responses to Comments on *Standard Operating Procedure for Well and Borehole Decommissioning*, Pacific Gas and Electric Company, Topock Compressor Station, Needles, California

Absolute Comment No.	Comment Source/Number	Section	Reference Text	Comment	Response	Summary of June 6, 2014 RTC Discussion
1	Arizona Department of Water Resources (ADWR) February 28, 2013 Letter ADWR-1			The text in the Standard Operation Procedure (SOP), section 1.2 states that all required forms can be obtained from the Phoenix ADWR offices. All forms are available online at: http://www.azwater.gov/iazdwr/WaterManagement/NOI/documents/PermitsFormsApplicationsNOI.htm	The text in **bold** will be added to the following statement. The notice of intention to abandon a well (NOIA) can be obtained from the ADWR Groundwater Management Support Section in Phoenix or other local offices. **In addition, all forms are available online at:** http://www.azwater.gov/iazdwr/WaterManagement/NOI/documents/PermitsFormsApplicationsNOI.htm	No additional comments.
2	ADWR-2			The SOP document describes requirements for abandoning (decommissioning) wells in Arizona and California and technical specifications and procedures for abandoning wells at the Topock Compressor Station remediation site. The proposed methods are thorough, protective of the aquifer, and consistent with minimum well construction and abandonment requirements in Arizona Administrative Code (A.A.C.) R12-15-816 and substantive policy described in the ADWR "Well Abandonment Handbook" (2008).	PG&E appreciates the review and input from ADEQ and ADWR on this SOP.	No additional comments.
3	ADWR-3			The proposed methods suggested for abandoning exploratory boreholes in Arizona utilizing "granulated material" are satisfactory. The methods are consistent with the variance option of Alternative 4 in the "Well Abandonment Handbook". Notices of Intent to Abandon a Well must be accompanied with a written request for a variance from the provisions of the minimum well construction and abandonment standards and in accordance with A.A.C. R12-15-820.	This comment is specific to the *Revised Implementation Plan for Evaluation of Alternative Freshwater Sources in the Topock Remediation Project Area, Pacific Gas and Electric Company, Topock Compressor Station, Needles, California* (January 28, 2013). However, as noted by the Fort Mojave Indian Tribe in comment FMIT-6, this represents an example of successful application of a variance to the standard well decommissioning procedure in Arizona. This variance was approved by ADWR based on project-specific information about the condition of the aquifer and planned boreholes (not a well in this example). PG&E anticipates similar discourse with the regulatory agencies based on future project-specific information in the development of future well decommissioning work plans.	No additional comments.
4	Department of Toxics Substances Control (DTSC) Document edits in redline strikeout DTSC-1	2nd paragraph	However, California boreholes drilled to the water table must be decommissioned per water well standards.	[DTSC Comment CG1]: Revise text. Clarify that an exploratory borehole drilled to the water table in California must comply with well decommissioning standards. Underlined text indicates new text inserted into document.	The text in **bold** will be added to the following statement. For the purpose of this SOP, an exploratory borehole (borehole) is defined as a drilled borehole in which no casings have been installed, regardless of whether or not the borehole was drilled to the water table. **However, California boreholes drilled to the water table must be decommissioned per water well standards.**	No additional comments.
5	DTSC-2	1.1	[1.] San Bernardino County does not require permits for the installation or decommissioning of boreholes that do not reach the water table.	[DTSC Comment CG2]: Please note that DTSC may request that some exploratory boreholes that do not reach the water table be decommissioned as wells under certain circumstances (e.g., deep boreholes that almost reach the water table). Please incorporate this concept into the SOP.	The text in **bold** will be added to the following statement. The California Well Standards identify well destruction (or decommissioning for this SOP) requirements for both water supply wells (Part III of Bulletin 74-81), and monitoring wells and exploratory boreholes[1]. **Although San Bernardino County does not require permits for the decommissioning of boreholes that do not reach the water table, DTSC has stated that they may request that some exploratory boreholes that do not reach the water table be decommissioned as wells under certain circumstances. For example, a borehole that terminates within 10 to 20 feet the water table and is located in an area where the potential for infiltration (e.g., wash channels) or future spills (e.g., an area of active industrial operations) is greater.**	No additional comments.

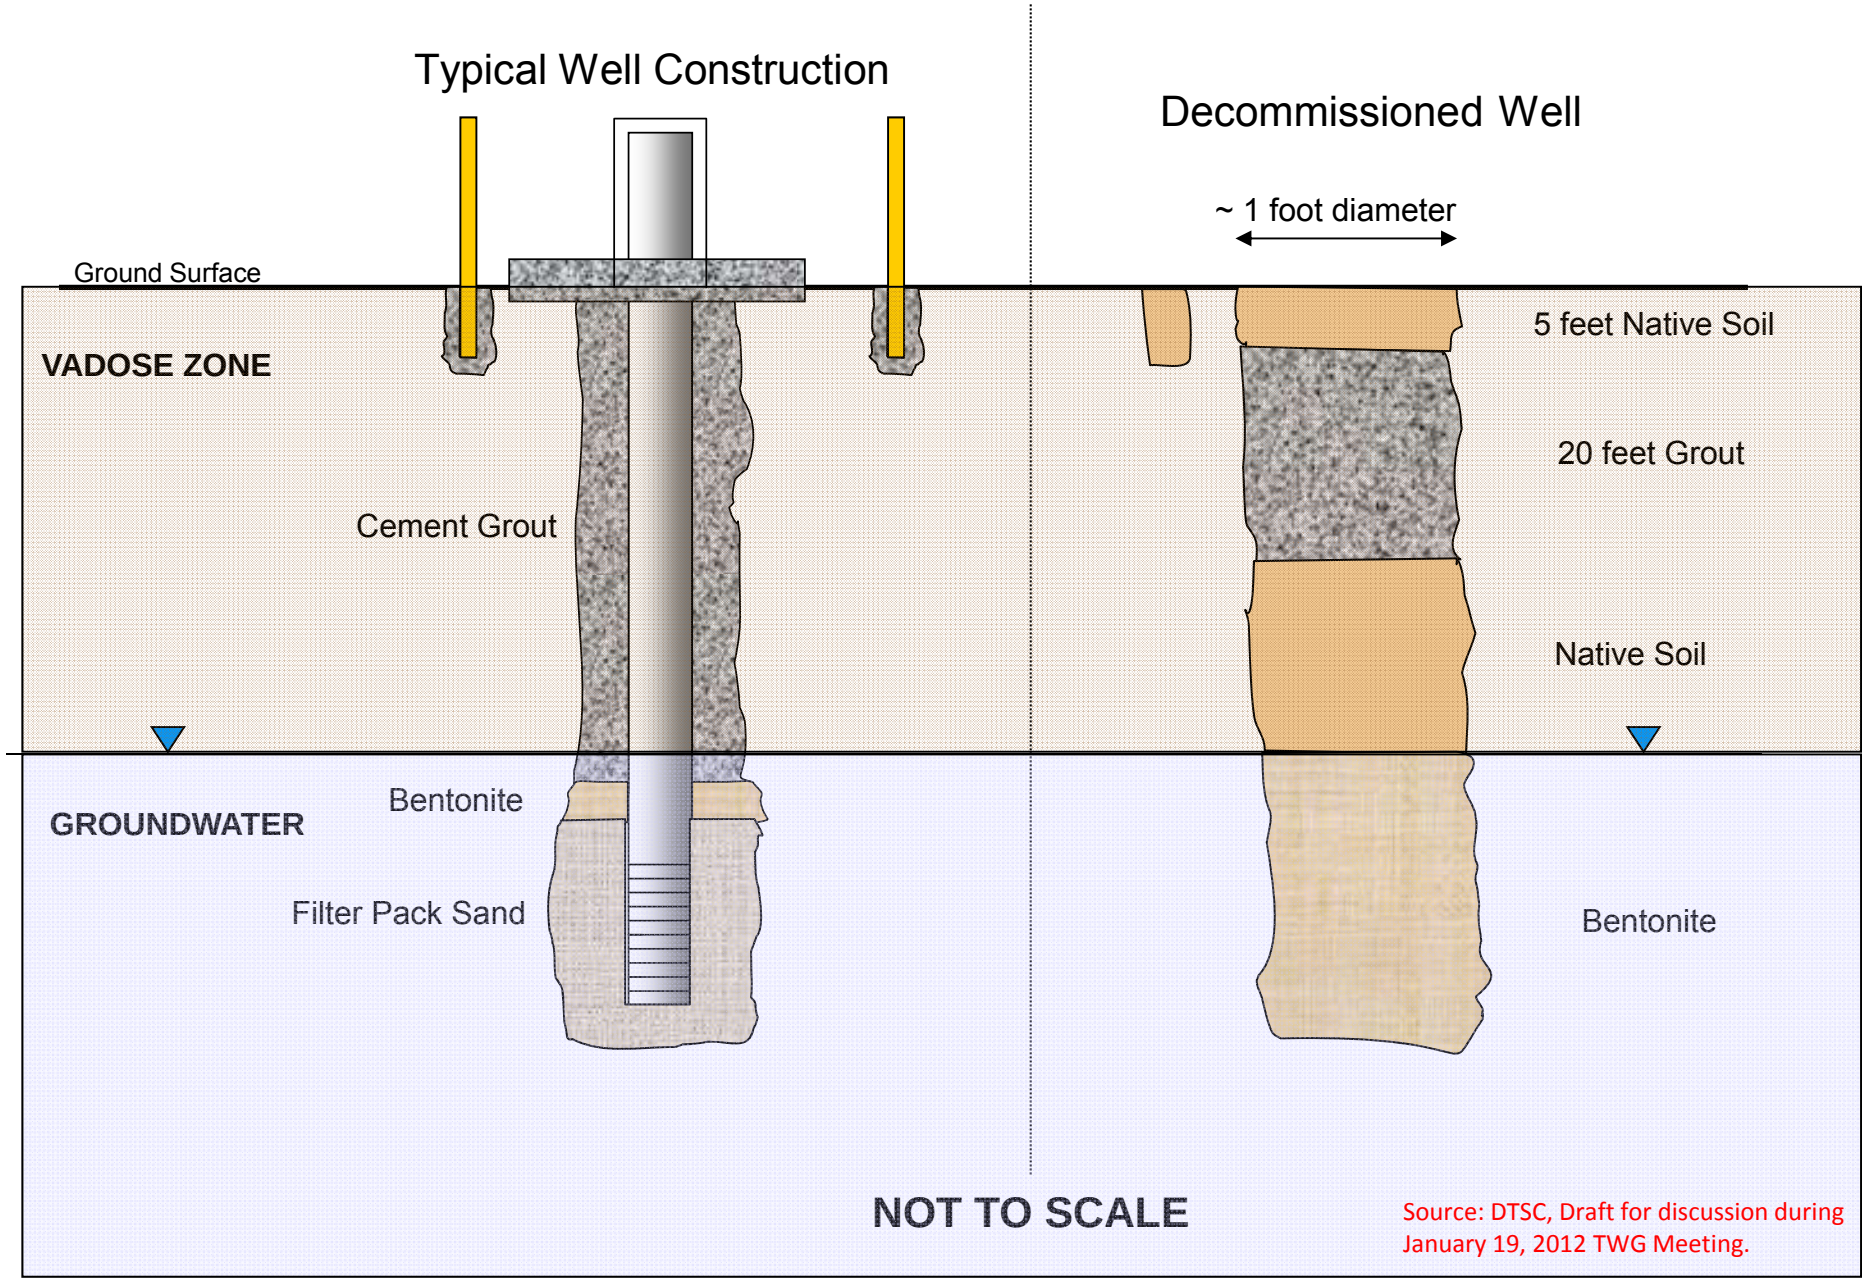
Absolute Comment No.	Comment Source/Number	Section	Reference Text	Comment	Response	Summary of June 6, 2014 RTC Discussion
6	DTSC-3	1.3	However, the County of San Bernardino will need to be consulted in the event a variance to the California Well Standards is required.	[DTSC Comment CG3]: As the SOP is now sufficiently developed, it is important to have San Bernardino review the next version and provide input as they are a key decision maker regarding well decommissioning.	After PG&E response to comments from ADWR, DTSC, Fort Mojave Indian Tribe and the Hualapai Dept of Cultural Resources included in this table have been addressed and discussed by the Well Decommissioning Subgroup, a draft of this SOP will be submitted to the County San Bernardino for their review and input.	No additional comments.
7	DTSC-4	2.0	Involved oversight agencies will be notified in advance of any decommissioning activities to ensure concurrence with decommissioning of a particular well(s).	Underlined text indicates new text inserted into document.	The proposed text has been added to the document.	No additional comments.
8	DTSC-5	2.1	drilling and well installation information	[DTSC Comment YA4]: A repository of drilling logs and installation notes should be put into a central archive for access by involved stakeholders.	Drilling logs and installation notes, where available, have been included in various documents submitted to the agencies following field work. As specific well decommissioning work plans are developed, this information will be included in those plans. **Further, as requested by DTSC, the well inventory spreadsheet (electronic file) and available well logs associated with the Topock Project will be archived on the DTSC website. This archive will be updated periodically as additional wells and boreholes are installed.** The text above in **bold** will be added to Section 1.3, first bullet (Topock Well Inventory Data Package).	No additional comments.
9	DTSC-6	2.1	Topock Well Inventory	[DTSC Comment CG5]; Include the current Topock Well Inventory as an electronic attachment to this SOP.	The text in **bold** will be added to the following statement. The majority of this information will be available through review of drilling and well installation information, the Topock Well Inventory, groundwater sample collection logs, or other related documents**. An electronic copy of the Topock Well Inventory has been included in this SOP under Attachment A.**	No additional comments.
10	DTSC-7	2.1	Geophysical survey – Depending on the well casing type, depth to water, presence or absence of centralizers, and other variables, select geophysical survey tools may be useful.	Underlined text indicates new text inserted into document.	The modified text in **bold** will be added to the statement. Geophysical survey – Depending on the well casing type, depth to water, **potential presence of metallic centralizers or other well construction components**, and other variables, select geophysical survey tools may be useful.	No additional comments.
11	DTSC-8	2.2.1	Bentonite cannot be used as a sealing material opposite zones of fractured rock, unless otherwise approved by lead agencies (DTSC/DOI).	Underlined text indicates new text inserted into document. Deleted text includes "the permitting" agency. Subsequent comment from DTSC regarding when bentonite is appropriate as a sealing material…	The proposed edit has been incorporated into the document. In addition, based on subsequent discussion with DTSC, the following text in **bold** has been added to Section 2.2.1, fourth bullet (bentonite clay): **In addition, bentonite is not recommended for application in high TDS environments (e.g., >5,000 parts per million) due to the adverse effects on its ability to properly swell and seal in these conditions.**	No additional comments.
12	DTSC-9	2.2.3	If the material was generated as drill cuttings, then lead agencies must agree that the material can be used as a component of either sealing or filler material for the purpose of well or borehole decommissioning (a variance may be required).	[DTSC Comment CG6]: Change text as a permit exemption may be used and since DOI and DTSC will, at a minimum, be approving agencies. Underlined text indicates new text inserted into document. Deleted text includes "the permitting" agency.	The proposed edit has been incorporated into the document.	No additional comments.

Absolute Comment No.	Comment Source/Number	Section	Reference Text	Comment	Response	Summary of June 6, 2014 RTC Discussion
13	DTSC-10	2.3	Following evaluation of the well or borehole and in coordination with the lead agencies, it must be determined if the well can be decommissioned in place (with or without modification) or if the well materials must be removed.	Underlined text indicates new text inserted into document. Deleted text includes "the permitting" agency.	The proposed edit has been incorporated into the document.	No additional comments.
14	DTSC-11	2.3	The following subsections define the decommissioning scenarios that may apply pending completion of the well evaluation and coordination with lead agencies, responsible agencies **(San Bernardino County or Arizona Department of Water Resources)**, affected land owner, **Tribes,** and other stakeholders.	Underlined text indicates new text inserted into document. Deleted text includes "the permitting" agency.	The proposed edit has been incorporated into the document.	Tech in **bold and underlined** in the "Reference Text" column has been added globally as requested during the call.
15	DTSC-12	2.3.2	1. Conduct evaluation of the well as detailed in Section 2.1 and verify with lead agencies, responsible agencies, affected land owner, and other stakeholders that the well should be decommissioned in place.	[DTSC Comment CG7]: The urban versus non-urban terms created concern to some tribes and distracted from the technical issues at hand. It is recommended that explicit reference to the term be minimized (see highlights in text and Figure 1). Perhaps just referencing the standards will suffice. Underlined text indicates new text inserted into document. Deleted text includes "the permitting" agency.	The proposed edit has been incorporated into the document. See response to comment DTSC-16 regarding the urban and non-urban topic. Reference June 6, 2014 RTC Discussion and what changes result (e.g. Type 1 and Type 2).	As a result of the June 6, 2014 RTC Discussion the terms "urban" and "non-urban" have been removed from the SOP. These terms have been replaced throughout with "Type 1" and "Type 2". A definition for these terms has been added to the beginning of Section 2.3. In addition, Figure 1 has been revised to include the new terminology.
16	DTSC-13	2.3.2	a. Non-urban Area – Place sealing material from total depth to near ground surface.	Yellow highlight added.	See response to comment DTSC-16.	See summary for comment DTSC-12.
17	DTSC-14	2.3.2	b. Urban Area – Place sealing material from total depth to within 5 feet of the ground surface (bgs).	Yellow highlight added.	See response to comment DTSC-16.	See summary for comment DTSC-12.
18	DTSC-15	2.3.2	c. For urban or non-urban area wells located outside an area of known or potential pollution or contamination as determined by the soil and/or groundwater quality data available for the location, evaluate using filler material in lieu of sealing material in portions of the well casing.	[DTSC Comment CG8]: Made edit assuming that well is left in place and could only fill well casing with filler or sealing material. Yellow highlight added. Underlined text indicates new text inserted into document. Deleted text includes "borehole".	The proposed edits have been incorporated into the document. See response to comment DTSC-16 regarding highlighted text.	See summary for comment DTSC-12.

Absolute Comment No.	Comment Source/Number	Section	Reference Text	Comment	Response	Summary of June 6, 2014 RTC Discussion
19	DTSC-16	2.3.2	a. Non-urban Area – Remove all well head protection and excavate around the well casing to a depth of approximately 5 feet bgs, or as practicable. Remove all well materials to a depth of approximately 5 feet bgs, or as practicable, cap casing with sealing material such that it extends beyond the diameter of the borehole and will drain fluids away from the borehole. Backfill the void created with displaced site material, or filler material if displaced site material is not available or appropriate. b. Urban Area – Remove all well head protection and excavate around the well casing to a depth of 5 <u>feet</u> bgs. <u>Remove</u> all well materials to a depth of 5 feet bgs, cap casing with sealing material <u>such that it extends beyond the diameter of the borehole and will drain fluids away from the borehole</u>. Backfill the void created with displaced site material, or filler material if displaced site material is not available or appropriate.	[DTSC Comment YA9]: Urban and non-urban decommissioning scenarios appear to be the same. If that the case, let's not differentiate between the two. Yellow highlight added. Underlined text indicates new text inserted into document.	The proposed edits have been incorporated into the document. The following text in **bold** has been added at the end of Section 2.3.2 to address the comment regarding the urban and non-urban topic: **Note that the urban and non-urban scenarios are only subtly different. While the urban scenario requires the removal of all well materials to a depth of 5 feet bgs (per CA well standards), non-urban areas do not require the removal of any well materials. The removal of well materials to a depth of approximately 5 feet bgs, or as practicable, is not required by CA well standards, but included per stakeholder comments.** To further clarify this difference in the text, bullet 4a (decommission well head, non-urban area) has been revised to indicate a range of 1 to 5 feet bgs. The same revision has been made to Section 2.3.3, bullet 4a, and Figure 1.	See summary for comment DTSC-12.
20	DTSC-17	2.3.3	1. Conduct evaluation of the well as detailed in Section 2.1 and verify with <u>lead agencies</u>, <u>responsible agencies</u>, affected land owner, and other stakeholders that the well should be decommissioned in place, what modification work is required, and whether it is in a location considered to be urban.	Underlined text indicates new text inserted into document. Deleted text includes "the permitting".	The proposed edit has been incorporated into the document.	See summary for comment DTSC-11.
21	DTSC-18	2.3.3	a. Non-urban Area – Place sealing material from total depth to near ground surface, or in the event casing is removed, the new top of casing depth. If a portion of the casing is removed, sealing or filler material requirements for the interval above the top of casing must be determined through discussion with <u>lead agencies, responsible agencies</u>, affected land owner, and other stakeholders.	Yellow highlight added. Underlined text indicates new text inserted into document. Deleted text includes "the permitting".	The proposed edit has been incorporated into the document. See response to comment DTSC-16 regarding highlighted text.	See summary for comment DTSC-12.
22	DTSC-19	2.3.3	b. Urban Area – Place sealing material from total depth to within 5 feet of the ground surface (bgs). If a portion of the casing is removed, sealing or filler material requirements for the interval above the top of casing must be determined through discussion with <u>lead agencies, responsible agencies</u>, affected land owner, and other stakeholders.	Yellow highlight added. Underlined text indicates new text inserted into document. Deleted text includes "the permitting".	The proposed edit has been incorporated into the document. See response to comment DTSC-16 regarding highlighted text.	See summary for comment DTSC-12.

Absolute Comment No.	Comment Source/Number	Section	Reference Text	Comment	Response	Summary of June 6, 2014 RTC Discussion
23	DTSC-20	2.3.3	c. For urban or non-urban area wells located outside an area of known or potential pollution or contamination, evaluate using filler material in lieu of sealing material in portions of the borehole.	Yellow highlight added.	See response to comment DTSC-16.	See summary for comment DTSC-12.
24	DTSC-21	2.3.3	a. Non-urban Area –Remove all well head protection and excavate around the well casing to a depth of approximately 5 bgs, or as practicable. Remove all well materials to a depth of approximately 5 feet bgs, or as practicable, cap casing with sealing material such that it extends beyond the diameter of the borehole and will drain fluids away from the borehole. Backfill the void created with displaced site material, or filler material if displaced site material is not available or appropriate. b. Urban Area – Remove all well head protection and excavate around the well casing to a depth of 5 bgs. Removal all well materials to a depth of 5 feet bgs, cap casing with sealing material such that it extends beyond the diameter of the borehole and will drain fluids away from the borehole. Backfill the void created with displaced site material, or filler material if displaced site material is not available or appropriate.	[DTSC Comment CG10]: See Comment YA9 above. Urban and non-urban decommissioning scenarios appear to be the same. If that the case, let's not differentiate between the two. Yellow highlight added.	See response to comment DTSC-16.	See summary for comment DTSC-12.
25	DTSC-22	2.3.4	Further, when removal is practicable, lead agencies, responsible agencies, affected land owner, or other stakeholders may determine this method preferable to others. Removal is typically conducted by over-drilling the existing well materials with larger diameter drilling tools.	Underlined text indicates new text inserted into document. Deleted text includes "the permitting".	The proposed edit has been incorporated into the document.	See summary for comment DTSC-11.
26	DTSC-23	2.3.4	1. Conduct evaluation of the well as detailed in Section 2.1 and verify with lead agencies, responsible agencies, affected land owner, and other stakeholders that the well should be decommissioned by removal.	Underlined text indicates new text inserted into document. Deleted text includes "the permitting".	The proposed edit has been incorporated into the document.	See summary for comment DTSC-11.
27	DTSC-24	2.4	Following completion of well decommissioning tasks, reporting of field activities must be completed in compliance with the lead agencies requirements.	Underlined text indicates new text inserted into document.	The proposed edit has been incorporated into the document.	No additional comments.
28	DTSC-25	2.4	The Well Decommissioning Report will be submitted to lead agencies no later than 90 days after completion of well decommissioning activities.	Underlined text indicates new text inserted into document.	The proposed text and text deletions have been incorporated into the document.	No additional comments.
29	DTSC-26	Figure 1	Between steps 3 and 4	Insert step: "Obtain approval to proceed from lead agencies"	The proposed revision to Figure 1 has been incorporated.	

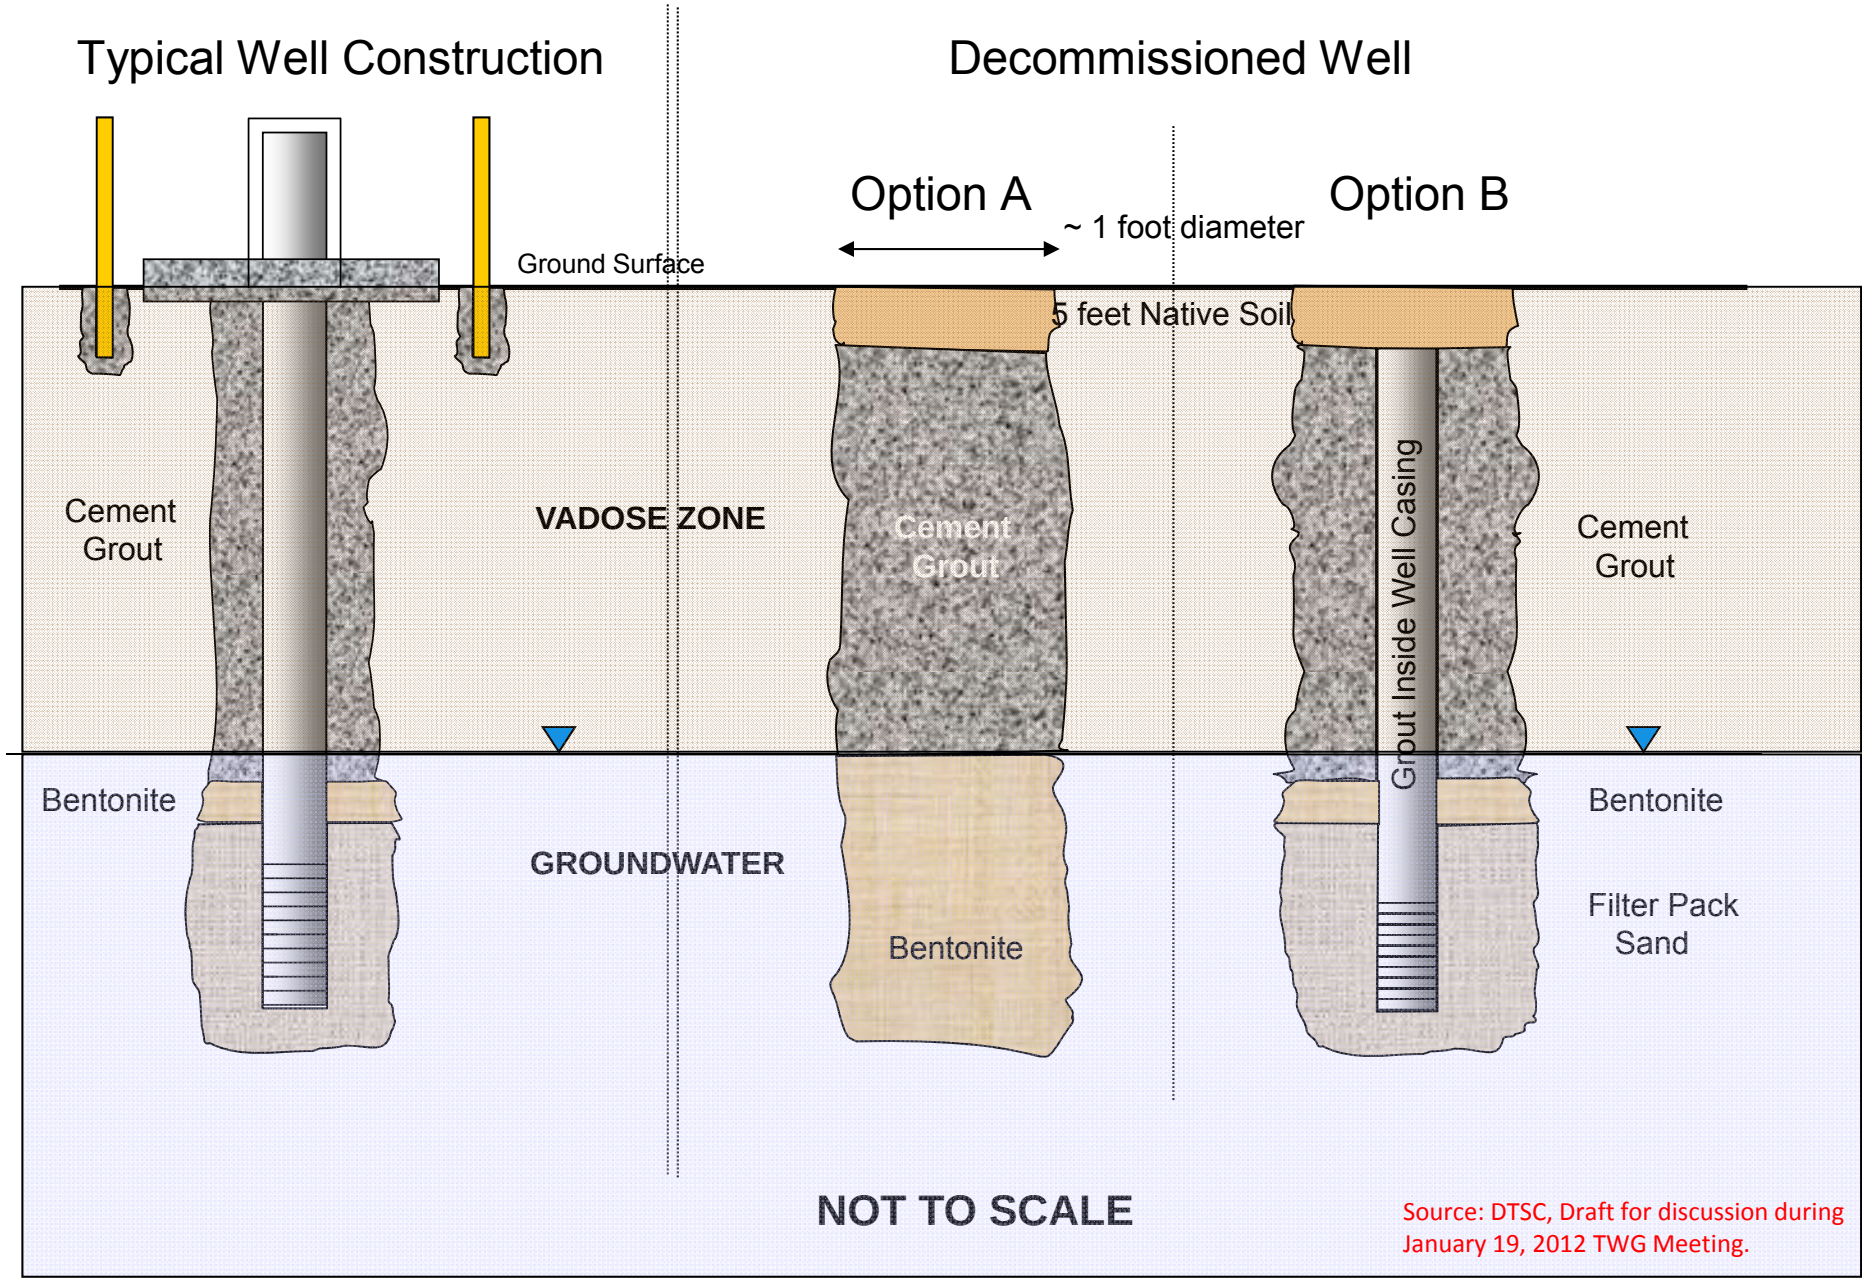
Absolute Comment No.	Comment Source/Number	Section	Reference Text	Comment	Response	Summary of June 6, 2014 RTC Discussion
30	DTSC-27	Figure 1	After step 13	Insert step: "Document all activities in a Well Decommissioning Report to be submitted no later than 90 days after the decommissioning event.	The proposed revision to Figure 1 has been incorporated.	
31	DTSC-28	Figure 1	Step 12	Delete "e.g., urban area vs. non-urban area" within the brackets.	The proposed revision to Figure 1 has been incorporated.	
32	Hargis + Associates, Inc. Fort Mojave Indian Tribe (FMIT) April 19, 2013 Letter FMIT-1	General	No specific text.	The Tribe has asked for and supported this effort to proceduralize the decommissioning of the physical intrusions into the landscape created by the drilling of wells and boreholes. Nevertheless, the alternatives available for the decommissioning procedure remain hurtful as they represent a permanent disfiguration of the hallowed landscape across which the project will be constructed. Basically, once a well/borehole is in place, the options for decommissioning involve either the emplacement of foreign, unnatural materials in place of the materials emplaced for during well construction/operation, or attempting to destroy the original downhole materials. In the process of well destruction, however, an even greater disturbance results. Neither option is attractive to the Tribe. Avoiding further disturbances by not constructing additional wells/boreholes of course is the Tribe's preference, particularly recognizing that the cumulative number of anticipated intrusions will perhaps be 350 or more before the project is over. Nevertheless, considering the reality that more disturbances will be created as a result of the remedy, the Tribe emphasizes that flexibility must be maintained. The decision as to how to proceed with decommissioning will necessarily be case-specific and requires advance discussions and consultations with the Tribes.	Comment noted. PG&E has drafted this SOP in coordination with the agencies and Tribes to meet regulatory requirements and minimize both disturbance and the placement of foreign materials. PG&E anticipates further discussions with and input from the Tribes on future work plans, as well as consultation with Tribes in accordance with the consultation protocol detailed in the Programmatic Agreement.	
33	FMIT-2	Preface	"This document was developed as a direct result of Tribal concerns …	The preface claims that "This document was developed as a direct result of Tribal concerns …" While this is in part true, it should be acknowledged that it would have been necessary to develop and SOP for this purpose for overall project purposes anyway. The Tribal request is consistent with the ARARs identified for this action.	Comment noted. The second sentence of the first paragraph has been edited to read as follows (new text in **bold**): This document was developed**, in part,** as a direct result of Tribal concerns that included dialog regarding future decommissioning activities at the site between PG&E, agencies, and Native American Indian Tribes (Tribes).	No additional comments.
34	FMIT-3	Preface	"… use of displaced site material in the decommissioning process …"	The preface also asserts that the "… use of displaced site material in the decommissioning process …" is based on Tribal input. This again is not a possibility related to Tribal input or preference. Provisions for backfilling certain boreholes with drill cuttings is an option that is commonly exercised, such as for exploratory borings. Nevertheless, the Tribe generally regards the earth materials removed from their natural place as a disturbance and potentially a desecration of the land. This section should probably also reference the preparation of an SOP for the handling and disposition of soils displaced as a result of project activities.	While permits are not required for the decommissioning of exploratory boreholes that do not reach the water table, based on the regulations~~, it is not best industry practice to backfill boreholes with drill cuttings~~. The SOP for the handling of disposition of soils displaced as a result of project activities (Management Protocol for Handling and Disposition of Displaced Site Material) is referenced in Section 1.3. A reference to the use of displaced site material (Section 2.2.3) is already included in the first paragraph of the document.	The response has been revised per the discussion. Changes shown in ~~strikeout~~.
35	FMIT-4	Preface	"exploratory borehole."	The preface offers a definition of an "exploratory borehole." Considering that the shelf life of this document is anticipated to be in excess of three decades, there should be a definition section for this term as well as others used throughout the text, such as "decommissioning," "displaced site material," "sealing material," "filler material," "monitor well," "production or extraction well," "injection well," etc. It is understood that some of these terms do not presently appear in the text, but it is necessary to establish the types of wells/boreholes to which this SOP applies. Perhaps a section further explaining the applicability and scope of this SOP is needed.	The first sentence of the second paragraph of the SOP has been revised as follows (new text in **bold**): This SOP will be used as a reference to guide the development of future work plans required for agency, Tribal, and stakeholder review prior to conducting **all** well and borehole decommissioning tasks **associated with the groundwater remedy**. Based on the revised text definition of well types would only add complexity to the SOP. The definition of "sealing material", "filler material", and "displaced site material" is provided in detail in Sections 2.2.1, 2.2.2, and 2.2.3, respectively.	No additional comments.



Absolute Comment No.	Comment Source/Number	Section	Reference Text	Comment	Response	Summary of June 6, 2014 RTC Discussion
36	FMIT-5	Section 1.0		Both California and Arizona regulatory requirements are outlined in Section 1.0, however, the respective subsections fail to mention provisions for variances within the regulations and guidance documents cited. Additionally, are there any conflicts between the rules promulgated by the two states?	Section 1.2 (Regulatory Information – Arizona [ARARs #48 and #49]) states: *If an alternative method of decommissioning is proposed in lieu of the standard method, further substantive review is performed by ADWR to verify that the proposed methods apply, and whether appropriate fill materials were chosen. A proposal to use an alternative decommissioning method requires an application to ADWR for a variance from the well decommissioning rule (a deviation from the standard decommissioning method).* The technical specifications and procedures for decommissioning well and exploratory boreholes presented in Section 2 of the SOP were developed to be in compliance with both California and Arizona regulations.	No additional comments.
37	FMIT-6	Section 1.3		Section 1.3 discusses CERCLA exemptions for permitting proposed well abandonment. It refers to various discussions with San Bernardino County authorities in this regard and further indicates that, to date, no discussions have been scheduled. It is strongly recommended that PG&E initiate the further discussions with the respective regulatory authorities in both California and Arizona. In fact, it may be advisable to familiarize the regulatory personnel with the context of this particular procedure. The Tribe notes that a preliminary exchange has been made with the Arizona Department of Water Resources (ADWR) through the Arizona Department of Environmental Quality (ADEQ) in regard to the decommissioning of borings proposed in support of exploration for a freshwater source in Arizona. The February 28, 2013, letter from ADWR addresses a proposed variance for this purpose. This seems to indicate ADWR's willingness to work with PG&E in regard to such requests. Accordingly, further liaison with these agencies may be helpful in future situations. If the Tribe can do anything to facilitate such discussions in the interest of its preferences, it stands ready to support such an effort.	PG&E appreciates the Tribe's willingness to assist with discussions with state permitting agencies related to well decommissioning variance options. PG&E anticipates holding these discussions with the agencies when future work plans that involves well decommissioning are being developed so that specific aquifer and well conditions can be contemplated in the context of potential variance options. Further, given that the groundwater remediation project is estimated to last for tens of years, the evaluation of variance options at the time each well decommissioning plan is developed will allow for potential changes in well decommissioning regulations to also be considered.	No additional comments.

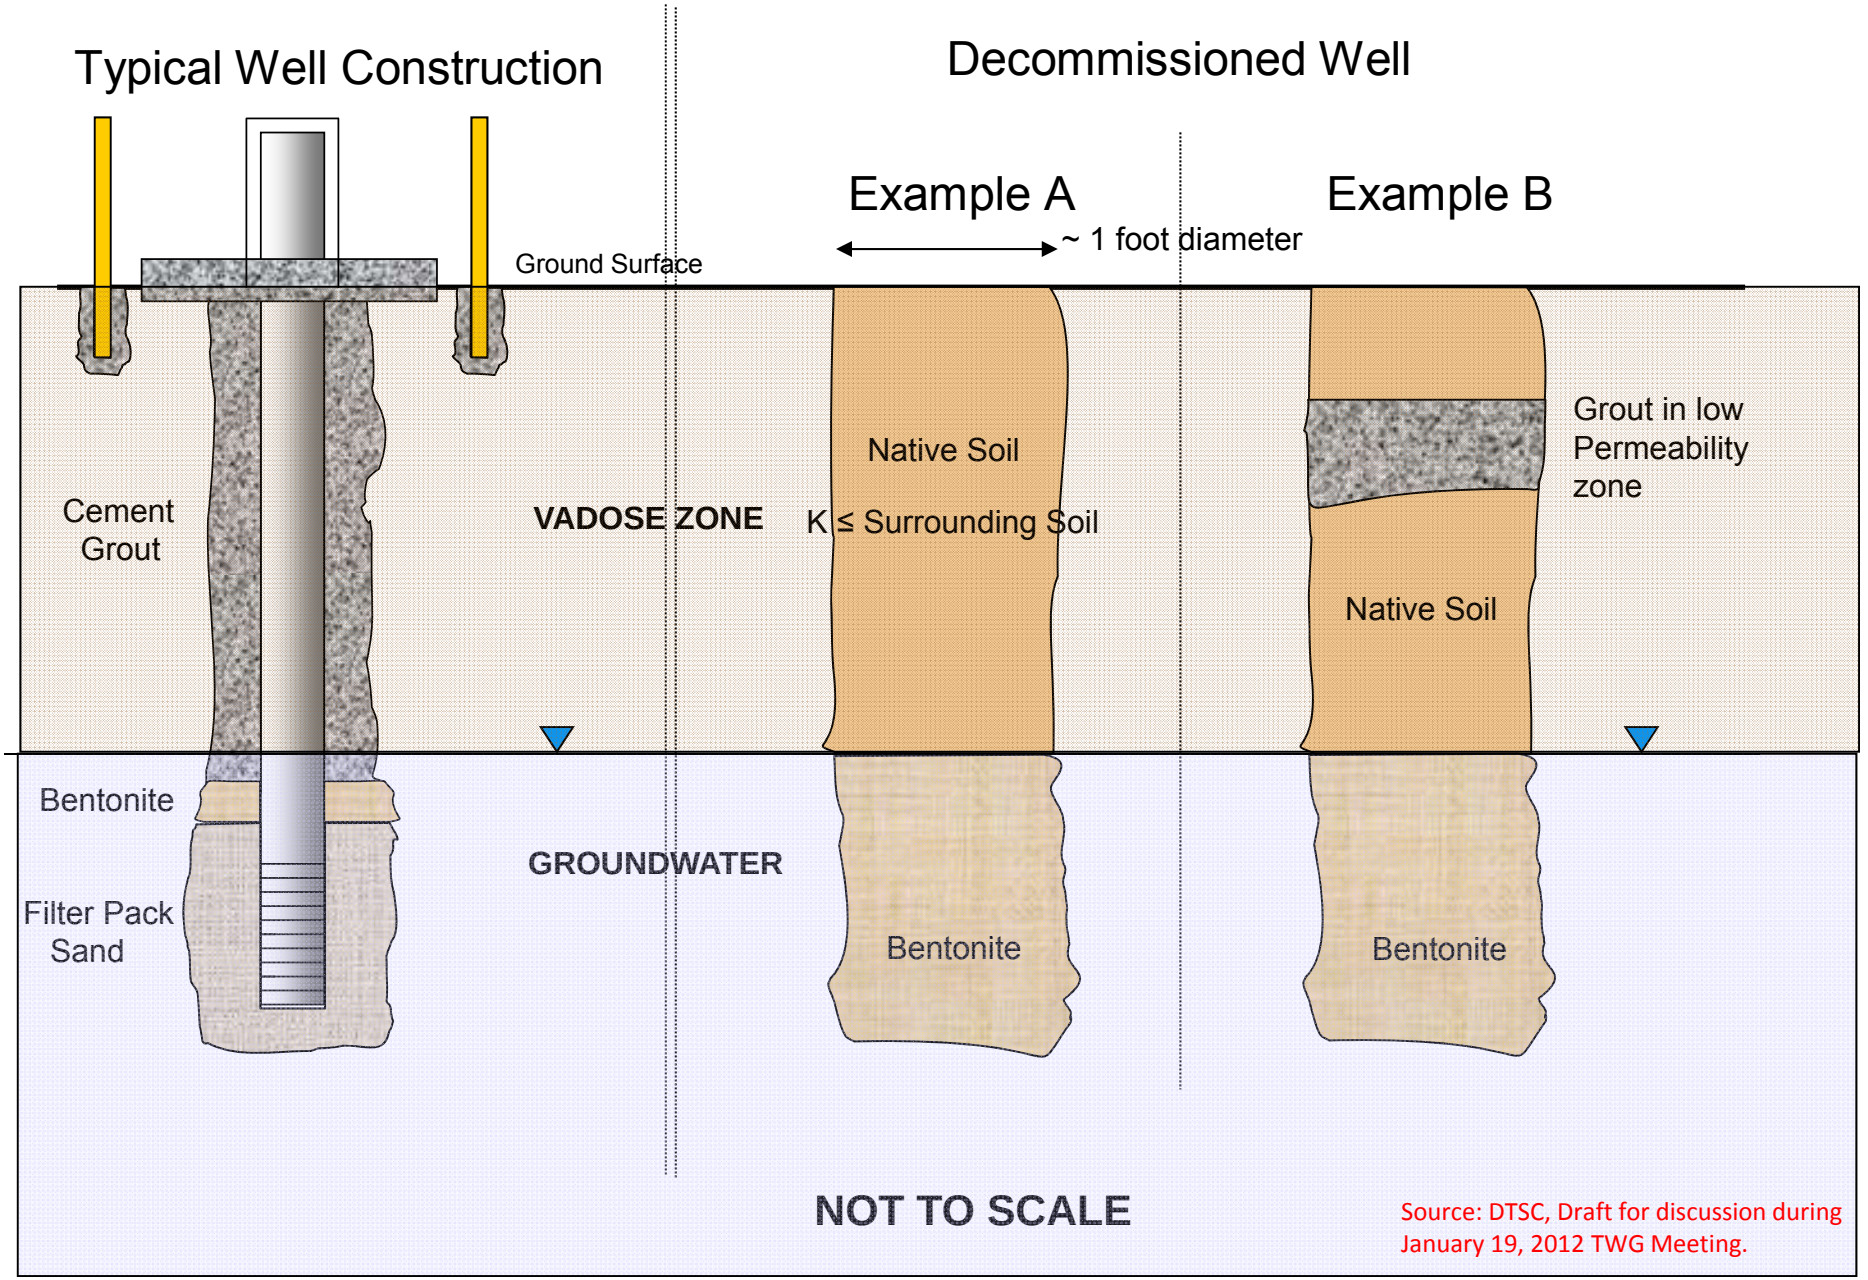
Absolute Comment No.	Comment Source/Number	Section	Reference Text	Comment	Response	Summary of June 6, 2014 RTC Discussion
38	FMIT-7	Section 2.0		Section 2.0 discusses general procedures for decommissioning. Considering the subsections that follow, it appears that PG&E is targeting a specific recommendation for the well/borehole decommissioning procedure under consideration. As discussed earlier, the Tribe requires discussion and consultation on a case-by-case basis because of the variation in construction characteristics, location, and other factors that enter into the decision. Accordingly, at the outset of such discussions, the Tribe would need information in regard to the alternative procedures available for each case. This information would facilitate the Tribes' decisions on the long-term fate of the intrusions.	As stated at the beginning Section 2.0, *The information provided in this section is intended to be applicable for wells or boreholes located in either California or Arizona; however, it is assumed that the details included in the specific work plan(s) will be designed in compliance with the appropriate state regulations, and reviewed by the appropriate permitting agency.* To more clearly acknowledge that potential for well decommissioning procedures that would require a variance to the applicable state regulations, the following statement in **bold** has been added to the document after the text referenced above: **In addition, depending on the condition of the aquifer and well(s) subject to decommissioning, potentially applicable variance options that include the minimization of the placement of sealing material should be evaluated with the lead agencies during well decommission work plan development (e.g., Arizona Alternative 4 – variance option).** In addition, the following text has been added to the end of the second paragraph in Section 1.2 (new text in **bold**): *The Well Abandonment Handbook (WAH) provides a standard well decommissioning method to be used for the post-installation of any well or borehole, regardless of the aquifer or vadose zone conditions applicable to the well (Section IV A). In addition, the WAH details five alternative abandonment methods. The five alternatives are for specific vadose zone and aquifer conditions which may include contamination, single or multiple aquifers, or dry wells (Section IV B).* ***For example, Alternative 4, which applies to wells that only penetrate a single aquifer without vertical flow components and no water quality contamination issues, might be applicable to wells in the Topock area that are 8-inches or greater in diameter. A variance option to Alternative 4 permits the use of clean fine sand to fill the well being decommissioned.*** Further, the text included in box number 13 on the decision flow chart presented in Figure 1 has been revised as follows (including text strikeout per comment DTSC-28 and with new text in **bold**): Place sealing/filler material within the borehole or well casing in accordance with regulatory and project-specific guidance**, and any permitting agency-approved variance conditions**.	During the June 6, 2014 subgroup discussion, the Tribes requested that additional information on potential variance conditions that had been previously developed by DTSC be added to this SOP. Please advise if the three schematics included in new Attachment A to this SOP are appropriate and meet the intent of this comment. Thank you.
39	FMIT-8	Section 2.2		The subsections under Section 2.2 do not appear to recognize provisions for variances as discussed earlier. Indeed such scenarios need to be developed and discussions held with the respective regulatory authorities as to the acceptability, need and justifications, and technical rationale for such requests. To this point, the subcommittee has spent time on alternative conceptual designs. This SOP does not include or acknowledge this work.	The subsections under Section 2.2 simply present the different types of materials that can be used for various well or borehole decommissioning scenarios, and not is not intended to evaluate or disqualify variance well decommissioning options. See the response to FMIT-7, which adds text to more clearly acknowledge the potential for variance options.	During the June 6, 2014 subgroup discussion, the Tribes requested that additional information on potential variance conditions that had been previously developed by DTSC be added to this SOP. Please advise if the three schematics included in new Attachment A to this SOP are appropriate and meet the intent of this comment. Thank you.

Absolute Comment No.	Comment Source/Number	Section	Reference Text	Comment	Response	Summary of June 6, 2014 RTC Discussion
40	FMIT-9	Section 2.3		Section 2.3 develops different scenarios. However, these scenarios only relate to standard situations and again do not consider the possibilities of variances. The situations in which variances are appropriate and applicable for consideration need to be developed in this procedure, otherwise those following the procedure will simply adhere strictly to the content. Additionally, this section appears to only consider the California rules, which distinguish between "urban" and "non-urban" areas. This, for example, is not a relevant consideration for the Site and is not referenced in the Arizona guidelines. The design for well decommissioning should not have to be a choice between these two options.	The evaluation of scenarios in Section 2.3 were developed in consideration of both California and Arizona regulations. The distinction between urban and non-urban is subtle and has been clarified as detailed in the response to comment DTSC-16. Both California and Arizona regulations detail specific procedures depending on aquifer and well conditions. California regulations do not reference any variance conditions, while the Arizona regulations reference alternatives to the recommended standard decommissioning procedure and some variance options associated with those alternatives. Variance conditions or potential scenarios that may or may not be approved by regulatory agencies should not be included in an SOP. Also, see comment FMIT-7.	During the June 6, 2014 subgroup discussion, the Tribes requested that additional information on potential variance conditions that had been previously developed by DTSC be added to this SOP. Please advise if the three schematics included in new Attachment A to this SOP are appropriate and meet the intent of this comment. Thank you.
41	FMIT-10	Section 2.4		Section 2.4 discusses "Well Decommissioning Reporting," and specifies that the information be reported in the Topock Well Inventory. Is this information also reported in the Well Registry for the respective states?	Yes, well decommissioning reports are filed with ADWR and California DWR in accordance with the respective well standards for each state. As noted in the first sentence of Section 2.4 (including edit made in accordance with comment DTSC-24): Following completion of well decommissioning tasks, reporting of field activities must be completed in compliance with the lead agencies requirements.	No additional comments.
42	FMIT-11	Figure 1		Figure 1 needs to be changed to reflect the above comments.	See response to comment FMIT-7.	No additional comments.
43	Hualapai Department of Cultural Resources (HDCR) April 24, 2013 Letter HDCR-1			On behalf of the Hualapai Tribe, we feel that is very important to have minimal disturbance in an area that has been under constant environmental change due to the operations of the Topock Compressor Station. As wells and well materials are intrusive, we feel that it is best that all well casings be left in-situ when and if wells are to be decommissioned. This will be the least intrusive and create the least amount of disturbance.	PG&E agrees that the decommissioning procedure which involves the least amount of disturbance that is acceptable to the regulatory agencies should be implemented. The following text in **bold** has been added to Section 2.3.2 (Decommissioning a Well in Place): **This decommissioning option should be utilized whenever acceptable to the regulatory agencies as it represents the field procedures that are least intrusive and create the least amount of disturbance.**	No additional comments.
44	HDCR-2			In the process of decommissioning, Hualapai prefer that natural materials from the immediate vicinity be placed inside the well-casings, and that wells be capped with the least amount of invasive materials, i.e. concrete, steel bolts, etc. As wells come under the decommissioning process, Hualapai would like to be informed about each well that is going to be subject to decommissioning.	See response to comment FMIT-1 regarding consultation with the Tribes on future work plans, and FMIT-7 regarding clarifying information that is being added to the document to acknowledge the potential for variance conditions.	No additional comments.



Attachment B
Draft DTSC Concepts for Well and Borehole Decommissioning

Category 1: Contaminant Free – No Variance



Source: DTSC, Draft for discussion during January 19, 2012 TWG Meeting.

Category 2: Contaminanted Area – No Variance

Standard Operating Procedure
PG&E Topock Wells
Operation and Maintenance Plan

Title: Cleaning and Maintenance of Well Pumps

Number: Well-SOP-02_Rev0

Creation Date: 9/8/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for the cleaning and maintenance of downhole submersible pumps that may be fouled with sediment, mineral scale, biological deposits or a combination of all three. This SOP assumes that the fouled pumps have been removed from the wells.

- I-04-02: IRZ Dual Screen Extraction Wells P&ID
- I-04-03: IRZ Single Screen Injection Wells P&ID
- I-04-04: IRZ Dual Screen Injection Wells P&ID
- I-04-05: IRZ Dual Screen Cluster Injection Wells P&ID Sheet 1 of 2
- I-04-06: IRZ Dual Screen Cluster Injection Wells P&ID Sheet 2 of 2
- I-05-01: Inner Recirculation Loop Extraction Wells P&ID
- I-05-02: Inner Recirculation Loop Injection Wells Type 1 P&ID
- I-05-03: Inner Recirculation Loop Injection Wells Type 2 P&ID

3 Equipment

- Health and Safety Plan
- Appropriate PPE
- Faceshield
- Chemical resistant gloves
- Chemical spill kit
- Eyewash supplies and safety shower
- Traffic cones
- Service tools
- Hose and water supply
- Horse trough
- 480 volt Power supply
- Multimeter
- Test piping with flow meter, valve and pressure gauge

4 Procedure

1. Work prior to cleaning and maintenance of pumps
    1.1 Order required service kit from manufacturer
    1.2 Obtain relevant service Instructions from the manufacturer
    1.3 Obtain eyewash kit bottles to have at well location
    1.4 Using appropriate PPE, cut the power to the designated pump at the motor control center
        1.4.1 Verify power is terminated on the downstream legs using a multimeter
        1.4.2 Perform lockout/tagout at the motor control panel on the deenergized well breaker
2. Pump removal
    2.1 Establish work zone with cones
    2.2 Stage trucks and equipment to minimize slip, trip, fall hazards and allow access in and out of the work zone
    2.3 Open the vault
        2.3.1 Use proper lifting techniques
            1. Use two staff to lift vault lids
            2. Use legs instead of back to lift
            3. Ensure vault lid supports are secure after opening
        2.3.2 Inspect vault for dangerous insects and animals
    2.4 Electrical lockout/tag out at the junction box

2.4.1 Open the junction box in the vault

2.4.2 Verify the power is terminated to the junction box using a multimeter

2.4.3 If the voltage is 0 volts, disconnect the motor wiring from the terminal block

2.5 Mechanical connections

2.5.1 Use pipe wrenches to loosen union fittings, couplings, and elbows to the riser pipe

2.6 Pump removal

2.6.1 Allow subcontracted driller to work with equipment to remove the riser pipe and spool the electrical cable

2.6.2 Monitor team for safe working conditions

1. Use stop work authority if needed to correct procedures

3. Cleaning and maintenance of Pumps

3.1 Record serial number, model number and well ID

3.2 Rinse off pump end, motor and power cable in containment area

3.3 Inspect equipment for damage or wear

3.4 Disconnect motor from the pump

3.4.1 Remove cable guard

3.4.2 Unbolt pump end from motor using appropriately sized open end wrench

3.5 Disassemble pump following the Service Instructions

3.6 Inspect impellers for wear and type of fouling deposits

3.7 Soak impellers in appropriate chemical to dissolve fouling deposits

3.8 Check bearings and replace if damaged

3.9 Replace valve seats if rubber is hard or pressed together so that the valve cup touches the metal

3.10 Replace neck ring if the rubber is hard or worn

3.11 Rinse off impellers and clean

3.12 Order or procure any damaged parts

3.13 Reassemble pump end following the Service Instructions

3.14 Reinstall motor and cable guard

4. Install new/shelf pump

4.1 Allow subcontracted driller to work with equipment to remove the riser pipe and spool the electrical cable

4.1.1 Monitor team for safe working conditions

4.1.2 Use stop work authority if needed to correct procedures

4.2 Mechanical connections

4.2.1 Use pipe wrenches to connect/tighten union fittings, couplings, and elbows to the riser pipe

4.3 Open the junction box in the vault

4.3.1 Verify the power is terminated to the junction box using a multimeter

4.3.2 If the voltage is 0 volts, connect the motor wiring to the terminal block

4.3.3 Remove electrical lockout/tag out at the junction box

4.4 Close the vault

4.4.1 Use proper lifting/decline techniques

4.4.2 Use caution with pinch point on fingers

4.4.3 Secure bolts

5. Site clean up

5.1 Properly dispose of sheeting used for staging of mechanical equipment in 55 gallon drums

5.2 Pick up cones

5.3 Place removed pump into truck and mobilize to the decon pad at the Transwestern Bench

5.4 Use a spotter to move truck to roadway

5.4.1 Do not drive more than 5 miles per hour while at the Transwestern Bench

6. Test pump at Transwestern Bench

6.1 Install test piping with flowmeter, throttling valve and pressure gauge

6.2 Place pump and piping in horse trough

6.3 Fill horse trough

6.4 Connect pump electrical wires to generator provided by subcontractor

6.5 Run pump and verify operation

7. Store pump

7.1 Attach tag with well ID, pump and motor model and serial numbers

7.2 Properly store pump

Standard Operating Procedure
PG&E Topock Wells
Operation and Maintenance Plan

Title: Physical/chemical well maintenance

Number: Well-SOP-03_Rev1

Creation Date: 9/8/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure physical and chemical cleaning of wells.

- I-02-01: Fresh Water Tanks P&ID
- I-02-02: Fresh Water Injection Well P&ID
- I-03-01: TCS Loop East Ravine Extraction Wells P&ID
- I-03-02: TCS Loop Transwestern Bench Extraction Wells P&ID
- I-03-03: TCS Loop Injection Wells P&ID
- I-04-01: IRZ Single Screen Extraction Wells P&ID
- I-04-02: IRZ Dual Screen Extraction Wells P&ID
- I-04-03: IRZ Single Screen Injection Wells P&ID
- I-04-04: IRZ Dual Screen Injection Wells P&ID
- I-04-05: IRZ Dual Screen Cluster Injection Wells P&ID Sheet 1 of 2
- I-04-06: IRZ Dual Screen Cluster Injection Wells P&ID Sheet 2 of 2
- I-05-01: Inner Recirculation Loop Extraction Wells P&ID
- I-05-02: Inner Recirculation Loop Injection Wells Type 1 P&ID
- I-05-03: Inner Recirculation Loop Injection Wells Type 2 P&ID

3 Equipment

- Health and Safety Plan

- Appropriate PPE
- Faceshield
- Leather gloves
- Nitrile gloves
- Elbow lengthed acid resistant gloves
- Splash apron
- Respirator with organic particulate filter
- 100 gallon transport polyethylene tank with valve on outlet
- Chemical transfer hose
- 5 gallon buckets with lids and spouts
- Trailer to haul tank
- 55-gallon drums
- Portable secondary containment
- Pump rig
- Chemical spill kit
- Eyewash supplies and safety shower
- Hose and water supply

4 Procedure

1. Work prior to mobilization to the well
    - 1.1 Determine amounts of chemical required based on saturated well volume prior to mobilization
    - 1.2 Verify that required chemicals are onsite
    - 1.3 Ensure that field team has copies of well log/construction diagram and downhole equipment list/drawings
    - 1.4 Ensure that well cleaning contractor knows the inner diameter size of the well so that proper tooling will be available
    - 1.5 Obtain eyewash kit bottles to have at well location
    - 1.6 Using appropriate PPE, cut the power to the designated pump at the motor control center
        - 1.6.1 Verify power is terminated on the downstream legs using a multimeter
        - 1.6.2 Perform lockout/tagout at the motor control panel on the deenergized well breaker
2. Mobilization to the work area
    - 2.1 Establish work zone with cones
    - 2.2 Stage trucks and equipment to minimize slip, trip, fall hazards and allow access in and out of the work zone
    - 2.3 Set up plastic sheeting around well head/vault and under equipment

2.4 Review well cleaning and confinded space (if applicable) JSAs with field team

2.5 Open the vault

2.5.1 Use proper lifting techniques

1. Use two staff to lift vault lids
2. Use legs instead of back to lift
3. Ensure vault lid supports are secure after opening

2.5.2 Inspect for biological hazards

2.6 Electrical lockout/tag out at the junction box

2.6.1 Opent the junction box in the vault

2.6.2 Verify the power is terminated to the junction box using a multimeter

2.6.3 If the voltage is 0 volts, disconnect the motor wiring from the terminal block

2.7 Mechanical connections

2.7.1 Use pipe wrenches to losen union fittings, coupings, and elbows to the riser pipe

3. Pump removal

3.1 Allow subcontracted driller to work with equipment to remove the riser pipe and spool the electrical cable

3.2 Monitor team for safe working conditions

3.2.1 Use stop work authority if needed to correct procedures

3.3 Measure and record:

3.3.1 Pipe lengths

3.3.2 Transducer depths

3.3.3 Pump and model and serial numbers

3.3.4 Motor model and serial numbers

3.4 Inspect all downhole equipment for damage, corrosion or wear

3.5 Inspect and test check valves

4. Well maintenance – Day 1

4.1 Put on additional PPE called out in equipment section

4.2 Transfer chemicals to 5-gallon buckets with lids for transfer to work site

4.3 Measure total depth and depth to water

4.4 Brush the well using a stiff, tight fitting brush (can be a tool with both a brush and double surge block)

4.5 Remove any dislodged solids from the well and transfer to 55-gallon drums

4.6 Measure the total depth of the well and depth to water

4.7 Fill the 100 gallon transport tank with 50 gallons of water

4.8 Position the tank/trailer next to the well head

4.9 Place the portable secondary containment under the trailer at the tank outlet.

4.10 Don PPE including respirator, face shield, splash apron and acid resistant elbow length gloves

NOTE: Never add water to acid, due to the potential to cause the acid to splash.

4.11 Transfer pre-measured chemicals in partially filled 5-gallon buckets to water in the 100 gallon transport tank.

4.12 Triple rinse empty containers and add wash water to well chemical solution.

4.13 Label the polyethylene tank as “Corrosive Material, pH < 2”.

4.14 Connect a hose from the polyethylene tank to the well casing

4.14.1 Hose must be compatible with phosphoric acid

4.14.2 Tank should be fitted with an isolation valve to control flow

4.14.3 Use a piece of transporter hose long enough to prevent solution from coming out of the well during transfer.

4.15 Gravity feed the well chemical solution into the injection well casing.

4.15.1 Add all the well chemical solution mixed for the well into the well.

NOTE: Never stand over the well, use a mirror to look down the well.

4.16 At a safe distance from the well, watch for bubbling and foaming while adding the solution.

4.16.1 If foaming is noted:

1. Stop adding the well chemical solution
2. Allow the foaming to subside, then slowly add additional solution.

4.17 Brush the well twice to mix the injected solution

4.17.1 Use a brush fitted with a stainless steel cable

4.17.2 Inspect cables prior to and after lowering brush.

4.18 Check well solution pH

4.18.1 Check pH after injecting and mixing the solution in the well

4.18.2 Use a disposable bailer, pH meter, and pH paper.

4.18.3 Add sufficient well chemical solution to keep the pH of the solution in the well below 2 SU.

4.18.4 If pH rises above 2 SU:

1. Mix additional well chemical solution
2. Add enough solution to drop the pH to below 2 SU
3. Measure the pH at the top, middle and bottom of the water column to ensure even mixing.

4.19 Following well chemical solution injection:

4.19.1 Convey a small quantity of water (2 to 3 gallons) through the hose and into the well

1. Washes out any phosphoric acid solution still present

4.19.2 Carefully remove injection hose to avoid any spilling

4.20 Allow the well to sit overnight

5. Well maintenance – Day 2

5.1 Remobilize to well next day

5.2 Don PPE as specified in JLA

5.3 Check well solution pH

5.3.1 Use a disposable bailer, pH meter, and pH paper.

5.3.2 If pH is above 2 SU:

1. Mix additional well chemical solution
2. Add enough solution to drop the pH to below 2 SU
3. Measure the pH at the top, middle and bottom of the water column to ensure even mixing.

5.4 If the pH <2 let the solution stay in the well until the following day.

6. Well maintenance – Day 3/4

6.1 After 48-72 hours from the initial acid addition, remobilize to well

6.2 Don PPE as specified in JLA

6.3 Check well solution pH

6.3.1 Use a disposable bailer, pH meter, and pH paper

6.3.2 If the pH is greater than 2 SU

1. Go to Step 6.4

6.3.3 If pH is less than 2 SU

1. Wait another day
2. Allow the pH to rise to greater than 2 SU
3. Go to Step 6.4

NOTE: Be aware that the solution is corrosive. Don appropriate PPE

6.4 When the pH is above 2, pump or bail the water out of the well into a polyethylene tank.

6.5 Waste handling/labeling

6.5.1 Label tank with “non-hazardous” waste label

6.5.2 Fill out all required information on the label.

6.6 Test the pH of the water in the tank to ensure that it is greater than 2 SU

6.7 Periodically check the pH of water in the well

6.7.1 When the pH is approximately 5 to 6 SU, brush the well for 20 to 30 minutes.

6.8 Measure the total depth to determine if sediment has entered the well.

6.9 Solids removal from well

6.9.1 Use a bailer to remove the precipitates and solids at the bottom of the well

6.9.2 Place solids into the same 55-gallon drum that was used during the initial mechanical rehab for off-site disposal.

6.10 Pump approximately 10 well volumes of water or until a turbidity of less than or equal to 100 NTU is achieved.

6.11 Reinstall injection equipment

6.12 Evaluate injection capability of the well during normal injection operation

6.13 Discuss potential video survey of well with project team

7. Reinstall pump

7.1 Allow subcontracted driller to work with equipment to remove the riser pipe and spool the electrical cable

7.1.1 Monitor team for safe working conditions

7.1.2 Use stop work authority if needed to correct procedures

7.2 Mechanical connections

7.2.1 Use pipe wrenches to connect/tighten union fittings, coupings, and elbows to the riser pipe

7.3 Wiring connection

7.3.1 Open the junction box in the vault

7.3.2 Verify the power is terminated to the junction box using a multimeter

1. Confirm voltage reads 0 volts

7.3.3 Connect the motor wiring to the terminal block

7.3.4 Remove electrical lockout/tag out at the junction box

7.4 Close the vault

7.4.1 Use proper lifting/decline techniques

7.4.2 Use caution with pinch point on fingers

7.4.3 Secure bolts

8. Site clean up

8.1 Properly dispose of sheeting used for staging of mechanical equipment in 55 gallon drums

8.2 Pick up cones

9. Disposal

9.1 Transfer drums with solids/water to sampling truck storage tank

9.2 Transfer purge water to MW-20 Bench frac tank T-IRZ00-0623

Standard Operating Procedure
PG&E Topock Wells
Operation and Maintenance Plan

Title: Well Maintenance Chemical Delivery

Number: Well-SOP-04_Rev1

Creation Date: 9/8/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for the delivery of well chemicals to the site. Well chemicals will be used to rehabilitate wells and downhole equipment.

2 Drawing Numbers

- I-06-04: IRZ Carbon Amendment Building P&ID Sheet 4 of 4

3 Equipment

- Health and Safety Plan
- Appropriate PPE
- Chemical spill kit
- Cones, delineators, and Caution tape to delineate work zone around delivery truck and tank
- Wheel chocks to be placed behind delivery truck tires
- Safety shower and eye wash station

4 Procedure

1. Safety shower
    1.1 Manually test safety shower and eyewash station
2. Chemical delivery truck staging
    2.1 Verify that truck has a lift gate
    2.2 Instruct truck driver not to exceed 5 miles per hour (mph) while driving onsite
    2.3 Use a spotter during delivery truck approach and parking
    2.4 Park delivery truck in designated parking space next to Tank T-IRZ00-0623
    2.5 Avoid backing transfer truck

2.6 Place wheel chocks behind truck tires once it is parked

2.7 Place buckets under hose connections in transfer equipment

3. Check chemical specifications

3.1 Confirm the appropriate product is being delivered

3.2 Sign for the delivery if it is the correct product

CAUTION: Severe burns may occur if PPE is not worn and a spill occurs

4. Chemical delivery offloading and staging

4.1 Chemicals may be delivered in drums, totes, or smaller containers

4.2 Secure drum to a drum dolly or to pallet jack

4.3 Move containers to the lift gate

4.4 Instruct the delivery driver to lower the lift gate to the ground

4.5 Roll the containers over to secondary containment adjacent to Frac Tank T-IRZ00-0623.

4.6 Unstrap the drum from the drum dolly

5. Direct delivery driver offsite

5.1 Unchock the tires

5.2 Remind driver to stay under 5 mph

5.3 Have driver pull through to parking lot exit

5.4 Spot driver out to main road

Standard Operating Procedure
PG&E Topock Wells
Operation and Maintenance Plan

Title: Use of Portable Tanks for Well Maintenance/Rehab

Number: Well-SOP-05_Rev0

Creation Date: 9/8/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for using portable tanks during well rehabilitation and maintenance tasks.

2 Drawing Numbers

- None

3 Equipment

- Health and Safety Plan
- Appropriate PPE
- Chemical spill kit
- Cones, delineators, and Caution tape to delineate work zone around truck/trailer
- Wheel chocks to be placed behind truck/trailer tires
- Safety shower and eye wash station

4 Procedure

1. Tank selection
    - 1.1 Determine purpose of tank and expected contents
    - 1.2 Select adequate size that allows for freeboard
    - 1.3 Select tank material that is compatible with tank contents
    - 1.4 Determine required penetrations in tank and associated appurtenances
    - 1.5 Verify that tank is designed to be tied down in trucks or on trailers
    - 1.6 Compile manufacturer's information and specifications

1.7 Determine required labeling for the tank

2. Tank installation
   - 2.1 Determine which vehicle (truck, trailer, etc.) will transport tank
   - 2.2 Verify that vehicle has adequate hold down locations to secure tank
   - 2.3 Install tank onto vehicle using adequate lifting assistance
   - 2.4 Secure tank to the vehicle following manufacturer's recommendations
3. Tank use
   - 3.1 Inspect tank and straps prior to each use
   - 3.2 Place wheel chocks behind truck/trailer tires once it is parked
   - 3.3 Verify that tank is empty and cleaned out prior to use
   - 3.4 Verify that labels are in good condition
   - 3.5 Verify that lid in secured prior to moving the vehicle
   - 3.6 Empty tank contents during assigned task
4. After use
   - 4.1 Rinse out tank at the decon pad at the Transwestern Bench
   - 4.2 Inspect tank and straps
   - 4.3 Verify that labels are in good condition
   - 4.4 Verify that lid in secured prior to moving the vehicle
   - 4.5 Unload tank using adequate lifting assistance
   - 4.6 Place tank at its designated storage location and place cones around tank

Standard Operating Procedure
PG&E Topock Wells
Operation and Maintenance Plan

Title: Packer Inspection and Maintenance/Filling Procedures

Number: Well-SOP-06_Rev0

Creation Date: 9/8/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for the inspection, maintenance and filling of well pneumatic packers. Packers are present in dual-screen injection and extraction wells to provide a seal such that fluids will be injected/extracted only within a specific aquifer depth interval. Periodic packer inspection is required to confirm that packers are inflated to an appropriate pressure, and to fill packers with additional air, if needed.

A ¼" hose will be routed from the top of the packer to the surface to allow for filling the packer and measuring the packer pressure. The ¼" hose will be connected to a fill assembly, mounted on the well vault wall that is comprised of a valve, pressure indicator, pressure switch, and quick connect air fitting. If the pressure of a well packer drops below the set-point of 40 pounds per square inch (psi), an alarm will be activated within the PLC, which will require operator attention. An air line quick connect fitting is available within each well vault to allow for connection of an air compressor to re-inflate the well packer.

3 Equipment

- Health and Safety Plan
- Appropriate PPE
- Leather work gloves
- Air compressor
- Cones, delineators, and Caution tape to delineate work zone around truck/trailer
- Wheel chocks to be placed behind truck/trailer tires

4 Procedure

1. Packer inspection prior to installation
    - 1.1 Verify that packer size matches the size for a particular well.
    - 1.2 Verify that the packer has the correct number and size off penetrations. Note that all packers will have a ¼" NPT port for the air fill line and a ¾" NPT port for a pressure relief valve.
    - 1.3 Inspect the outside of the packer for any damage or wear
    - 1.4 Inspect the threads on all the penetrations.
    - 1.5 Verify that pass through piping is clear of any obstructions
2. Work area setup
    - 2.1 Establish work zone with cones
    - 2.2 Stage truck and equipment to minimize slip, trip, fall hazards and allow access in and out of the work zone
3. Opening vault lid
    - 3.1 Remove lid bolts using proper tools
    - 3.2 Use proper lifting techniques
        - 3.2.1 Use two staff to lift vault lids
        - 3.2.2 Use legs instead of back to lift
        - 3.2.3 Ensure vault lid supports are secure after opening
    - 3.3 Inspect for biological hazards
4. Checking packer pressure
    - 4.1 Pressure indicators present in each vault
        - 4.1.1 PI-*0362C – TCS Loop Dual-Screen Injection Wells
        - 4.1.2 PI-*0461F – NTH IRZ Dual-Screen Extraction Wells
        - 4.1.3 PI-*0463D – South NTH IRZ Dual-Screen Injection Wells

4.1.4 PI-*0464E – North NTH IRZ Dual-Screen Cluster Injection Wells

4.1.5 PI-*0465E – North NTH IRZ Dual-Screen Cluster Injection Wells

4.1.6 PI-*0560D – River Bank Dual Screen Extraction Wells

4.1.7 PI-*0563 – Inner Recirculation Loop Type 1 Injection Wells

4.2 Supervisory Control and Data Acquisition (SCADA) system alarm will activate if well packer pressure drops below 40 pounds per square inch (psi)

5. Inflate packer if pressure is below 50 psi
   5.1 Attach air compressor to quick connect fitting
   5.2 Open ball valve on quick connect fitting
   5.3 Turn on air compressor
      5.3.1 Observe packer pressure continuously during filling
6. Terminate packer filling
   6.1 Turn off air compressor when a pressure of 60 psi is read on the packer pressure indicator
   6.2 Close ball valve on quick connect fitting
   6.3 Check packer pressure again
      6.3.1 Fill packer again if pressure dropped during disconnect
   6.4 Record final packer pressure
   6.5 Replace filling line inside vault
7. Close vault lid
   7.1 Use proper lifting/decline techniques
   7.2 Use caution with pinch point on fingers
   7.3 Secure bolts
8. Packer inspection during well pull events
   8.1 Inspect the outside of the packer for any damage or wear
   8.2 Inspect the threads on all the penetrations
   8.3 Inspect all piping for corrosion
   8.4 Verify that pass through piping is clear of any obstructions
   8.5 Inspect the fill hose for discoloration, cracks, kinks, trapped moisture, and other signs of deterioration or wear
      8.5.1 Replace fill hose if significant deterioration or wear is observed

Standard Operating Procedure
PG&E Topock Wells
Operation and Maintenance Plan

Title: Well Rehab Bench Testing

Number: Well-SOP-07_Rev0

Creation Date: 9/8/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for testing well chemicals to determine the optimal type and strength required for the various types of fouling deposits that may occur in the site wells. Procedures apply to both onsite and offsite testing.

2 Drawing Numbers

- None

3 Equipment

- Health and Safety Plan
- Appropriate PPE
- Faceshield
- Chemical resistant gloves
- Chemical spill kit
- Eyewash supplies and safety shower
- Chemical 250 ml beakers and containers
- Thermometer
- Mortar and pedestal
- Weighing scale
- Drying oven
- Chemical hood
- Microscope
- Safety shower and eye wash station

4 Procedure

1. Prebench test work

   1.1 Order chemicals to be tested

   1.2 Manually test safety shower and eyewash station

   1.3 Obtain fouling deposits to be tested

2. Bench testing

   Note: Perform all testing under a chemical hood

   2.1 Preparation

      2.1.1 Crush sample with mortar and pedestal if hard and crystalline.

      2.1.2 Separate sample into multiple, equal masses reflective of the number of treatments to evaluate.

      2.1.3 Add sample portion to a 250 milliliter (mL) beaker

      2.1.4 Label each beaker according to the treatment method tested

   2.2 Chemical guidelines

      2.2.1 Acid and caustics should be NSF, food grade, or approved alternates

      2.2.2 Use concentrations that can be field implemented

      2.2.3 For acids, use standard concentrations first if evaluating multiple concentrations

         Note: that when using two acids, a dispersant is almost always needed for stabilization of reaction

      2.2.4 For blended acids, check compatibility and threshold allowances.

      2.2.5 Enhancers and surfactants: utilize NSF-approved products and follow manufacturer's guidelines

      2.2.6 Inhibitors: test with single acids after blending with water, use on NSF approved products

   2.3 Acids used in the testing:

      2.3.1 Hydrochloric acid (6% solution of 20° concentrated hydrochloric acid)

      2.3.2 Hydrochloric acid (8% solution of 20° concentrated hydrochloric acid)

      2.3.3 Hydrochloric acid (10% solution of 20° concentrated hydrochloric acid)

      2.3.4 Phosphoric acid (6% solution of 75% phosphoric acid)

      2.3.5 Phosphoric acid (8% solution of 75% phosphoric acid)

      2.3.6 Phosphoric acid (10% solution of 75% phosphoric acid)

      2.3.7 Sulfamic acid (5% solution of 100% blended sulfamic acid)

      2.3.8 Sulfamic acid (5% solution of 100% blended sulfamic acid)

      2.3.9 Oxalic acid (6% of 7% solubilized oxalic acid)

      2.3.10 Oxalic acid (6% of 7% solubilized oxalic acid)

      2.3.11 Hydroxyacetic acid (6% of 70% concentrated hydroxyacetic acid)

2.3.12 Hydroxyacetic acid (6% of 70% concentrated hydroxyacetic acid)

2.4 Chemicals used in the testing:

2.4.1 Dispersants – test 0.5%, 1.5%, and 3%

2.4.2 Biodispersants – test at 1.5% and 3%

2.4.3 Surfactants – test at 0.1% (note foaming)

2.4.4 Iron chelation – test at 0.001% and increase if iron content exceeds 1.0 milligrams per liter (mg/L)

2.4.5 Emulsifiers – test at 0.001%, 0.1% (note foaming)

3. Treatment evaluation:

3.1 Record observation on log sheet noting heat, odor, effervescence, etc.

3.2 Record appearance and effectiveness of dissolution as a percent of the whole

3.3 Evaluate the reaction at 15 minutes, 30 minutes, 1 hour and 4 hours

3.4 Evaluate level of enhancement added at 30 minutes and 1 hour time periods with the addition of mechanical energy

4. Post evaluation

4.1 Photograph deposits as received, after drying, and a microscopic at 20-30x magnification

4.2 Allow the test solutions to remain under the chemical hood and observe the time it takes for dissolution of the sample.

4.2.1 Record the estimated percentage of dissolution and general observations of residue

4.3 Neutralize all solutions following completion of testing and dispose of properly

- I-05-02: Inner Recirculation Loop Injection Wells Type 1 P&ID
- I-05-03: Inner Recirculation Loop Injection Wells Type 2 P&ID

3 Equipment

- Health and Safety Plan
- Appropriate PPE
- Chemical resistant gloves
- Leather work gloves
- Chemical spill kit
- Eyewash supplies and safety shower
- Handheld tablet
- Depth to water meter
- Cones, delineators, and Caution tape to delineate work zone around truck
- Wheel chocks to be placed behind truck tires

4 Procedure

Weekly/Biweekly

1. Mobilizing to injection/extraction well vault

    1.1 Do not exceed 5 miles per hour (mph) while driving onsite

1.2 Select a level parking area adjacent to vault

1.3 Park work truck adjacent to vault

2. Opening vault lid

2.1 Remove lid bolts using proper tools

2.2 Use proper lifting techniques

2.2.1 Use two staff to lift vault lids

2.2.2 Use legs instead of back to lift

2.2.3 Ensure vault lid supports are secure after opening

2.3 Inspect for biological hazards

3. Review information on expected and historical readings for the well
4. Review the checklist on the field form or handheld tablet and enter basic information, including:

4.1 Date/time

4.2 Technician(s)

4.3 Location

Note: Access into the vault should not be necessary for routine remedy well inspections

5. Check and record packer pressure, if applicable, following Well-SOP-07
6. Check and record the overall condition of vault, pipe supports, steps and lid
7. Check for and record leaks on any of the piping
8. Look for and record any standing water
9. Check and record if the well is active by noting pressure and flow on the indicators
10. Check and record any flow rate on the flow transmitter
11. Check and record any totalizer value
12. Check and record the well pressure readings. Tablet will list acceptable operational parameters
13. If applicable, sound the well measuring both the total depth and the depth to water with a depth to water meter
14. Verify that all valve and device tags are present and legible
15. Close vault lid

15.1 Use proper lifting/decline techniques

15.2 Use caution with pinch point on fingers

15.3 Secure bolts

Quarterly

16. Exercise all valves
17. Test sump alarm
18. Test level transducer alarms

18.1 Low level: raise the transducer by raising the cable until the alarm triggers

18.2 High alarm: lower excess cable in the well to lower the transducer level until a high level condition arises

19. Test pressure transmitter

19.1 High pressure: close downstream valve slowly to raise wellhead pressure past the alarm setpoint to trigger the alarm

20. Record alarm testing findings in the log

Standard Operating Procedure
PG&E Topock Groundwater Monitoring Well Maintenance Operation and Maintenance Plan

Title: Inspection and Repair of Groundwater Monitoring Wells

Number: Well-SOP-09_Rev02

Revised Date: 5/24/14

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

This standard operating procedure (SOP) addresses the procedures and equipment to be used for inspecting and completing repairs to groundwater monitoring wells. Inspection of the monitoring wells will be completed during each regularly scheduled sampling event but not less than quarterly. This SOP will replace Section 4.10 of the *Topock Program Sampling, Analysis, and Field Procedures Manual* (2005).

2 Required Documents

- Applicable project work plan or monitoring plan, including avoidance and minimization measures, as applicable
- Topock Program Health and Safety Plan (HSP)
- Well Operation and Maintenance (O&M) Manual
- Applicable current SOPs, which may include the following:
  - SOP-A9, *Calibration of Field Instruments*
  - SOP-A10, *Decontamination of Water Sampling Equipment*
  - SOP-A11, *Total Depth Measurements*
  - SOP-A13, *Spill Prevention, Containment, and Control Measures for Monitoring Well Sampling*
  - SOP-C1, *Solinst Pressure Transducers*
- Current site access map
- Blank Well Inspection Log (see attachment), maps, and a field notebook. For annual total depth survey, add well construction details (total depth, screen interval, sump depth if present).
- Maintenance records/documentation

3 Equipment/Supplies List

Depending on the type(s) of maintenance tasks being performed, some or all of the following may be required:

- Appropriate Personal Protective Equipment (PPE).

- 200-foot (ft.) (or longer, up to 400 ft. as needed based on well construction details) water level indicator (WLI).
- Well keys and gate keys as necessary.
- Utility vehicles (UTVs) as necessary.
- Paint marker, black “Sharpie” marker, and ballpoint pen.
- Durable aluminum or similar well tags with "zip tie" or similar fasteners.
- Hand tools as required, which may include drill and bits for drilling through steel well casing lid.
- Length of steel chain (for repairing broken well lid hinge) and 5/16-inch (in.) carriage bolts. The chain material should be about ¼ inch diameter and the links must be large enough to pass the 5/16-inch carriage bolt.
- Clean sand or pea gravel.
- Spare locks, water-tight well plugs and PVC well caps.
- Peristaltic pump and tubing, with 12V power source.
- Spill containment equipment.
- Portable waste water tank.
- Spare vault gaskets.
- Wire and plastic cleaning brush.
- 5 gallon bucket with lid.
- Deionized (DI) water supply.
- Alconox solution.
- Separate spray bottles for Alconox solution and DI water.
- Rags/paper towels.
- Environmentally compliant bolt thread lubricant.
- Mirror/flashlight.
- Tile sponge.
- Wet-Dry vacuum.
- Drop cloth.
- Corrosion-inhibiting primer or paint of site-approved color, and paintbrush.
- Concrete mix and tools (corrosive-resistant concrete may be required if the location is in saline soils).
- Bentonite or cement grout.
- Sonotube concrete collar form (for wells in or near active washes).
- Material for constructing concrete forms for standard well pads (2” x 8” wooden planks and nails).
- Camera.

4 Preparation & Setup

- Review event-specific field instructions and HSP.
- Ensure that the WLI has been decontaminated (check for label/tag) or decontaminate as needed with DI water, Alconox solution, etc. following SOP-A10, *Decontamination of Water Sampling Equipment.*
- Initiate field logbook for field activity.
- Inspect all equipment and calibrate WLIs if multiple meters are being used according to SOP-A9, *Calibration of Field Instruments*.
- If a transducer is present in the well and it is necessary to remove the transducer to allow well access, first note the exact position of the transducer (documenting it with a photograph if needed) and refer to SOP-C1, *Solinst Pressure Transducers,* before proceeding.

5 Procedure for Well Inspection

- Upon arrival at the monitoring well, confirm the well ID on both the interior and exterior of the well.
- Photograph the outside of the well to depict the state of the traffic poles (if applicable), concrete pad, and steel casing or well vault.
- Photograph the inside of the steel well casing or well vault to document the presence or absence of well caps, fill sand, water in the annulus, etc.
- Complete the Well Inspection Log provided as an attachment to this SOP noting any anomalies or abnormalities.
- Complete any needed repairs that can be performed at the time of the inspection.
  - Document repairs in the Well Inspection Log and photograph the well again after any repairs are completed.
  - Report any repairs that remain to be completed to the on-site field coordinator and note on the Well Inspection Log.
- Total depth of each well should be measured annually (typically during the second quarter) following SOP-A11, *Total Depth Measurements*.
  - If more than 10 percent of the screened interval is blocked by sediment, attempt redevelopment of the well (see Well O&M Manual)
  - If there is a change in the performance of a well relative to historical purge data, contact the field coordinator to begin evaluating the reason for the change and identifying appropriate actions in response to the change.
- Lock out/tag out wells in disrepair that should not be sampled until repaired (e.g., developed).
- Following inspection of all wells, prepare a repair checklist to track the status of any needed well repairs.

6 Procedures for Well Repair

Replacing Well Identification Markings

- Upon arrival at the monitoring well, confirm the well ID on both the interior and exterior of the well.
- Clean surface to be marked with a brush or wet cloth.

- Mark the surface with the well name(s) using a permanent paint pen in a clear and legible fashion. Paint markers are used to label metal or concrete surfaces and are the most durable write-on marking tool for exterior use. Sharpie markers are used to label PVC surfaces inside the protective casing.
- Check aluminum tags which show well ID for legibility and clean or replace as needed.
- If the well does not have an aluminum tag as a backup identification to other markings, install a tag. Indent the tag with the well ID by writing on it with a ballpoint pen and then attach it inside the protective cover, secured around the PVC well casing with a "zip-tie" wiring tie or similar means.

Removing Water from Well Annulus (Flush Mounts)

Following are procedures for removing water/liquid that has collected within a flush mount well. The intent is to avoid water/liquid flowing into the well once the cap is removed.

Method 1 – Peristaltic Pump

- Place spill containment according to SOP-A13, *Spill Prevention, Containment, and Control Measures for Monitoring Well Sampling*.
- Place peristaltic pump on the containment such that water can be removed from the annulus and pumped into the portable waste water tank.
- Insert one end of the peristaltic pump tubing into the water in the annulus and secure the other end of the tubing in the portable waste water tank.
- Pump the water out of the annulus without removing any sand or soil.
- After removing water, clean annulus with rag or paper towel if possible.

Method 2 – Wet/Dry Vacuum

- Place spill containment according to SOP-A13, *Spill Prevention, Containment, and Control Measures for Monitoring Well Sampling.*
- Place wet-dry vacuum and generator on spill containment.
- Remove water from the annulus with the vacuum without removing any sand or soil.
- Dump removed water into a waste water tank for disposal.
- After removing water, clean annulus with a rag or paper town if possible.

Method 3 – Absorbent Sponge

- Place spill containment according to SOP-A13, *Spill Prevention, Containment, and Control Measures for Monitoring Well Sampling.*
- Place a 5 gallon bucket and lid on the spill containment.
- Use an absorbent sponge to soak up water in the annulus. Wring sponge out into the bucket and repeat as necessary.
- Dump removed water into a waste water tank for disposal.

Repairing a Broken Hinge on Steel Well Casings

- Drill a 3/8-in. hole in the top of the well casing lid.
- Thread a piece of chain through the hinge loop on the side of the well casing.
- Fasten the chain to the well casing lid by inserting a 5/16-in. carriage bolt through both ends of the chain and through the hole drilled in the top of the well casing lid.

- Secure the carriage bolt on the inside of the well casing lid with a washer and lock nut, or a nut and lock washer, as shown in the photos below.

Installing or Supplementing Sand/Pea Gravel in Well Annulus

- Place spill containment according to SOP-A13, *Spill Prevention, Containment, and Control Measures for Monitoring Well Sampling.*
- If not already installed, place a water-tight expansion well plug in the casing to seal off the well, or place a slip cap over the PVC casing.
- Pour clean sand or pea gravel into the annulus until the top of the material is within approximately one foot of the top of the PVC well casing.

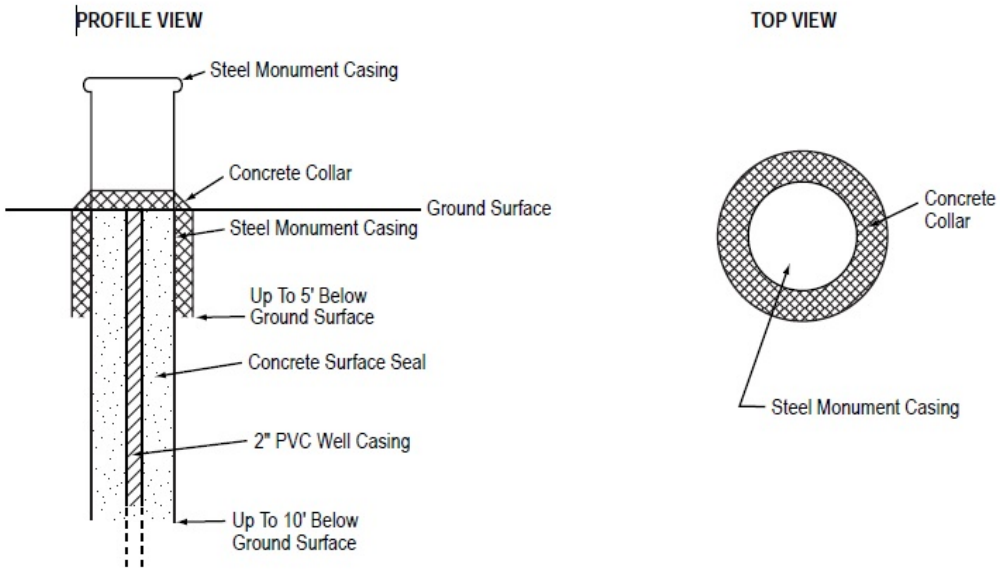
Removing Rust Scale from the Interior of a Steel Conductor Casing

- Place spill containment according to SOP-A13, *Spill Prevention, Containment, and Control Measures for Monitoring Well Sampling.*
- If not already installed, place a water-tight expansion well plug in the PVC casing to seal off the well. Remove any transducers and transducer caps as necessary.
- Remove loose rust scale to a depth of at least 0.5 to 1 foot below the top of the well casing manually or with a wet-dry vacuum.
- Remove additional rust on the interior of the casing with a wire brush or other abrasive or scraping tool such as putty knife, cold chisel or slotted screwdriver.
- Place drop cloth or similar cover(s) to intercept paint drips inside the annulus and use drop cloth or spill containment on the surface pad.
- Paint the interior of the casing with primer (use site-approved color) to reduce future rust erosion.
- Wait for paint to develop tack (begin drying), then remove drop cloths and replace well plug, cap, and transducer.

Repairing Concrete Well Pad

- The following procedure is for wells located on upland areas, or floodplain areas located along and east of National Trails Highway. Wells located within washes may require an alternative, deeper-set concrete pad. Before working in a wash, check with the field coordinator and PG&E field inspector to determine whether specific agency notifications or approvals are required before beginning the work. Wells near active portions of wash channels may use a modified well pad design installed as a Sonotube-formed concrete collar that extends deeper than those used for upland and floodplain wells and is more resistant to damage during flood events. For further details see the procedure below in the “Replacing Concrete Pad with Concrete Collar Reinforcement for Wells in Washes” section.

- Perform necessary site clearance activities (US Alert and coordination with PG&E TCS are minimum actions).
- Remove and properly dispose of the damaged concrete well pad and level the exposed ground at least 4 in. below the surrounding ground surface.
- Construct a concrete form extending at least 2 ft. in diameter from the edge of the exterior steel casing and at least 4 in. thick.
- Mix concrete according to manufacturer's instructions. Utilize corrosive resistant concrete (e.g. type V) if the location is in saline soils (such as locations close to current or former areas of salt cedar vegetation).
- Pour concrete mixture into the previously constructed form, smooth the top of the concrete to create a surface that slopes away from the well casing, and allow the pad to cure for at least 24 hours before disturbing the well or removing forms.



Replacing Steel Protective Casing

- Perform necessary site clearance activities (US Alert and coordination with PG&E TCS are minimum actions).
- Assess annular space: is it feasible to remove the existing protective casing without damage to the inner PVC well casing? If not then evaluate other measures such as installation of an outer sleeve as the replacement steel protective casing, anchored by a new well pad as described above.
- Remove any existing concrete pad surrounding the conductor casing.
- Excavate to the bottom of the conductor casing. If casing is set deeper than 4 ft. below ground surface (bgs), cut off the conductor casing at the 4 ft. level.
- Remove steel conductor casing.
- Inspect the annular seal around the PVC well casing. If damaged, replace or amend with bentonite or cement grout.
- Replace steel protective casing. Use a level to check that the new casing is plumb. Position the new protective casing so that the PVC well casing(s) are centered, then cement the new protective casing into place to the ground surface.
- Construct a concrete form extending at least 2 ft. in diameter from the edge of the steel casing and at least 4 in. thick.
- Mix concrete according to manufacturer's instructions. Utilize corrosive resistant concrete if the location is in saline soils.
- Pour concrete mixture into the previously constructed form, smooth the top of the concrete to create a surface that slopes away from the well casing and cure for at least 24 hours before disturbing the well or removing forms.
- Fill the annulus with filter pack sand or pea gravel to within one foot of the top of the PVC well casing, as described above.

Replacing Concrete Pad with Concrete Collar Reinforcement for Wells in Washes

- Perform necessary site clearance activities (US Alert and coordination with PG&E TCS are minimum actions).
- Remove any existing concrete pad surrounding the conductor casing.

- Excavate to the bottom of the conductor casing, or at least 4 ft. bgs.
- Inspect the annular seal around the PVC well casing. If damaged, replace or amend with bentonite or cement grout.
- Place a piece of Sonotube concrete form over the steel conductor casing. Sonotube should be a minimum of 6 in. larger in diameter than the conductor casing. Sonotube should extend above ground surface a minimum of 4 in.
- Mix concrete according to manufacturer's instructions. Utilize corrosive resistant concrete if necessary.
- Pour concrete mixture into the Sonotube form, smooth the top of the concrete to create a surface that slopes away from the well casing, and cure for at least 24 hours before disturbing the well or removing the form.
- Backfill around the newly placed concrete collar with previously excavated material.
- See diagram below taken from the *Final Revised Implementation Plan for Repair of Monitoring Wells MW-38S and MW-38D and Old Well/Pipe Reconnaissance (2011)*.

Note: *Not to scale*

7 Well Inspection, Maintenance, and Repair Reporting And Documentation Requirements

- Inspection findings and repair actions will be included in the groundwater monitoring reports. This will include when the repair action was completed, or is planned to be completed, and next steps as appropriate. Photographs will be included if appropriate.
- At a minimum, the completed well inspection log will be included with quarterly groundwater monitoring reports to document inspection results and maintenance performed for the reporting period.

- Report the inspection results to the field coordinator and project manager. The project manager will notify California Environmental Protection Agency, Department of Toxic Substances Control (DTSC) of wells found to be damaged or destroyed to an extent prohibiting routine groundwater sampling prior to beginning the next sampling event. The project manager will also inform DTSC of progress of redevelopment or repair (typically via e-mail and in regular monitoring compliance reports).

Standard Operating Procedure
PG&E Topock Remedy-produced Water Conditioning Plant Operation and Maintenance Plan

Title: System "Hot" Startup and Shutdown

Number: RTP-SOP-01_Rev1

Created Date: 12/19/13

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS). The Remedy-produced Water Conditioning Plant (RTP) will treat the water produced by the groundwater remedy prior to re-use or re-injection onsite.

The objective of this Standard Operating Procedure (SOP) is to describe the procedures for (a.) starting up the RTP after a short-term shutdown and (b.) shutting down the RTP for a short term.

2 Drawing Numbers

- Influent Tanks 1 through 4, Instrumentation: I-11-01 through I-11-04
- Filter Systems A and B Side, Instrumentation: I-12-01 and I-12-02
- Remedy-produced Water Conditioning Systems, Instrumentation: I-12-03 and I-12-04
- Air Compressor and Seal Water System, Instrumentation: I-12-05
- Conditioned Water Storage Tanks, Instrumentation: I-14-01 and I-14-02

3 Equipment List

- Health and Safety Plan

4 Preconditions

a. System startup:

- Operators should have system training and operating experience before attempting a system startup.
- Power has been restored (if startup is occurring after a power outage).
- All master control center (MCC) breakers are energized except the "Spare Starter" and "Spare Breaker."

b. System shutdown:

- Operators should have system training and operating experience before attempting a system shutdown.
- The daily scheduled backwash and treatment processes are complete, or it is otherwise necessary to manually shutdown the RTP.

5 Procedure

a. System startup:

1. Go to HMI in the Office/Sample Room on the second floor of the Plant.
2. Ensure that the HVAC unit is ON.
3. Confirm the air compressor and air dryer/filter DRYER-RTP01-1202 are ON.
4. Confirm that seal water package system is ON.
5. Switch Influent Tank 1 recirculation pump PMP-RTP01-1101 to AUTO.
6. Switch Influent Tank 2 recirculation pump PMP-RTP01-1102 to AUTO.
7. Switch Influent Tank 3 recirculation pump PMP-RTP01-1103 to AUTO.
8. Switch Influent Tank 4 recirculation pump PMP-RTP01-1104 to AUTO.
9. Switch A Side filter feed pumps PMP-RTP01-1210 and -1220 to AUTO.
10. Switch B Side filter feed pumps PMP-RTP01-1230 and -1240 to AUTO.
11. Enable chemicals feed pumps:
    - Caustic feed pumps, PMP-RTP01-1211 and -1212
    - Coagulant feed pumps, PMP-RTP01-1221 and -1222
    - Acid feed pumps PMP-RTP01-1231 and -1232
12. Switch conditioned water transfer pumps PMP-RTP01-1405 and PMP-RTP01-1406 to AUTO.
13. Switch truck fill pump PMP-RTP01-1403 to AUTO

b. System shutdown:

1. Go to HMI in the Office/Sample Room on the second floor of the Plant.
2. Switch Influent Tank 1 recirculation pump PMP-RTP01-1101 to OFF.
3. Switch Influent Tank 2 recirculation pump PMP-RTP01-1102 to OFF.
4. Switch Influent Tank 3 recirculation pump PMP-RTP01-1103 to OFF.
5. Switch Influent Tank 4 recirculation pump PMP-RTP01-1104 to OFF.
6. Switch A Side filter feed pumps PMP-RTP01-1210 and -1220 to OFF.
7. Switch B Side filter feed pumps PMP-RTP01-1230 and -1240 to OFF.
14. Disable chemicals feed pumps:
    - Caustic feed pumps, PMP-RTP01-1211 and -1212
    - Coagulant feed pumps, PMP-RTP01-1221 and -1222
    - Acid feed pumps PMP-RTP01-1231 and -1232
8. Switch conditioned water transfer pumps PMP-RTP01-1405 and -1406 to OFF.
9. Switch truck fill pump PMP-RTP01-1403 to OFF.

Standard Operating Procedure
PG&E Topock Remedy-produced Water Conditioning Plant Operation and Maintenance Plan

Title: Batch Conditioning Process

Number: RTP-SOP-02_Rev1

Created Date: 11/25/13

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS). The Remedy-produced Water Conditioning Plant (RTP) will treat the water produced by the groundwater remedy prior to re-use or re-injection onsite.

The objective of this Standard Operating Procedure (SOP) is to describe the procedure of the RTP in "batch conditioning" mode. This mode applies only to the Remedy-produced Water A Side of the RTP.

This automated procedure is largely controlled through the SCADA/HMI.

2 Drawing Numbers

- Influent Tanks 1 through 4, Instrumentation: I-11-01 through I-11-04
- Filter System A Side, Instrumentation: I-12-01
- Remedy-produced Water Conditioning Systems, Instrumentation: I-12-03 and I-12-04
- Liquid Phase Separators, Instrumentation: I-12-05
- Conditioned Water Storage Tank Farm A Side, Instrumentation: I-14-01

3 Equipment List

- Appropriate PPE
- Health and Safety Plan

4 Preconditions

Designated influent tank(s) (TNK-RTP01-1101; TNK-RTP01-1102; TNK-RTP01-1103; TNK-RTP01-1104) water level is full or backwash pumps have completed their designated cycles.

5 Procedure

1. The SCADA will control the tanks and equipment configuration per the backwashing schedule. The procedure begins once the Preconditions are met.

2. pH Adjustment with caustic (if needed): Caustic feed pump (PMP-RTP01-1211; PMP-RTP01-1212) will draw from TNK-RTP01-1212 to add caustic. Recirculation pump (PMP-RTP01-1101; PMP-RTP01-1102; PMP-RTP01-1103; PMP-RTP01-1104) will mix water in influent tank for 30 minutes.
3. Coagulant addition (if needed): Coagulant feed pump (PMP-RTP01-1221; PMP-RTP01-1222) will draw from TNK-RTP01-1220 to add coagulant. Recirculation pump will mix water in influent tank (PMP-RTP01-1101; PMP-RTP01-1102; PMP-RTP01-1103; PMP-RTP01-1104) for 30 minutes.
4. pH Adjustment with acid (if needed): Acid feed pump (PMP-RTP01-1231; PMP-RTP01-1232) will draw from TNK-RTP01-1230 to add acid. Recirculation pump (PMP-RTP01-1101; PMP-RTP01-1102; PMP-RTP01-1103; PMP-RTP01-1104) will mix water in influent tank for 30 minutes.
5. Solids settling time (90 minutes). Recirculation pump (PMP-RTP01-1101; PMP-RTP01-1102; PMP-RTP01-1103; PMP-RTP01-1104) will be off.
6. Sludge draw (15 minutes) with PMP-RTP01-1201 drawing from designated tank(s).
7. The filter feed pumps (PMP-RTP01-1210, PMP-RTP01-1220) will move the water to the Conditioned Water Tank Farm (TNK-RTP01-1401; TNK-RTP01-1402) (Remedy A-side).

Standard Operating Procedure
PG&E Topock Remedy-produced Water Conditioning Plant Operation and Maintenance Plan

Title: Continuous Conditioning Process

Number: RTP-SOP-03_Rev1

Created Date: 11/25/13

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS). The Remedy-produced Water Conditioning Plant (RTP) will treat the water produced by the groundwater remedy prior to re-use or re-injection onsite.

The objective of this Standard Operating Procedure (SOP) is to describe the procedure of the Remedy-produced Water Conditioning system in "continuous conditioning" mode. This mode can be applied to both the Remedy-produced Water A-side and Freshwater B-side of the RTP.

This automated procedure is largely controlled through the SCADA/HMI.

2 Drawing Numbers

- Influent Tanks 1 through 4, Instrumentation: I-11-01 through I-11-04
- Filter Systems A and B Side, Instrumentation: I-12-01 and I-12-02
- Conditioned Water Storage Tank Farm A Side, Instrumentation: I-14-01
- Conditioned Water B Side, Instrumentation: I-14-02

3 Equipment List

- Appropriate PPE
- Health and Safety Plan

4 Preconditions

Designated influent tank(s) (TNK-RTP01-1101; TNK-RTP01-1102; TNK-RTP01-1103; TNK-RTP01-1104) water level is full or backwash pumps (see Backwashing Schedule) have completed their designated cycles; designated solids settling time (up to 2 hours) is complete.

5 Procedure

1. The SCADA will control the tanks and equipment configuration per the backwashing schedule. The procedure begins once the Preconditions are met.

2. The filter feed pumps (PMP-RTP01-1210, -1220, -1230, -1240) will move the water to either
   a. The Conditioned Water Tank Farm (TNK-RTP01-1401 and TNK-RTP01-1402) Remedy A Side

      or

   b. The Conditioned Water Storage Tank (TNK-RTP01-1410) Freshwater B Side

Standard Operating Procedure
PG&E Topock Remedy-produced Water Conditioning Plant Operation and Maintenance Plan

Title: Cartridge Filter Maintenance

Number: RTP-SOP-04_Rev1

Created Date: 12/21/13

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS). The Remedy-produced Water Conditioning Plant (RTP) will treat the water produced by the groundwater remedy prior to re-use or re-injection onsite.

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for maintenance of cartridge filters in the filter housings on the Remedy-produced Water A Side and Freshwater B Side of the RTP. Maintenance activities include either (a.) cleaning and reinstalling cartridge filters or (b.) removing and replacing cartridge filters.

The cartridge filter manufacturer's installation and operation manual should also be referenced while performing cartridge filter maintenance.

2 Drawing Numbers

- Filter Systems A and B Side, Instrumentation: I-12-01 and I-12-02
- Liquid Phase Separator, Instrumentation: I-12-05

3 Equipment List

- Appropriate personal protective equipment (PPE)
- Health and Safety Plan
- Filter manufacturer's instruction manual
- Lockout/tagout tags and lockout/tagout manual for cartridge filter maintenance
- See Step 1 in the Procedure section below for determining the appropriate maintenance option. The necessary equipment includes:
    a. Clean and Reinstall: One 5-gallon bucket, a pressure nozzle, and a standard hose connected to a water source.
    b. Remove and Replace: One 5-gallon bucket for the spent cartridge filter, one 5-gallon bucket for the replacement cartridge filter, and the appropriate replacement cartridge filter for the filter model. Table 1 shows the micron rating for each filter type. See filter manufacturer's instruction manual for appropriate cartridge product code and cartridge dimensions.

TABLE 1
Micron Ratings For Filter Cartridges

	Filter Tag Number	Filter Type	Nominal Micron
A Side	FIL-RTP01-1211/-1221	Coarse	20
	FIL-RTP01-1212/-1222	Fine	5
B Side	FIL-RTP01-1231/-1241	Coarse	20
	FIL-RTP01-1232/-1242	Fine	5

4 Preconditions

- Human-machine interface (HMI) has prompted the operator to perform cartridge filter maintenance on a designated cartridge filter.
- The cartridge filter designated for maintenance is in standby mode.

5 Procedure

1. Determine the appropriate filter maintenance activity by checking the difference between the last operational pressure differential and start-up pressure differential in field logs. Below are the recommended actions. Operators should also verify and confirm that there are no conflicts with the actions specified in the manufacturer's manual; should a conflict arise, the operators should contact the Project Manager to resolve conflicts prior to maintenance activities.
   a. If the difference in pressure differential is between 12 and 30 pounds per square inch (psi), it is recommended that the filter be cleaned and reinstalled (choose option a. *Clean and Reinstall* in Equipment List and Step 8).
   b. If the difference in pressure differential is greater than 30 psi, it is recommended that the filter be removed and replaced (choose option b. *Remove and Replace* in Equipment List and Step 8).
2. Ensure that the actuated and manual valves between the two filter streams are closed:
   - Ensure that V-RTP01-1211 (A Side) or V-RTP01-1231 (B Side) is closed
3. Isolate the cartridge filter receiving maintenance from the piping system by closing the manual valves upstream and downstream of the filter (Table 2). Lockout/tagout the filter (see lockout/tagout manual for filter cartridges).

TABLE 2
Equipment Configuration for Isolating Filters from System (* indicates RTP01)

	Filter Out of Service	Pump Off	Closed Upstream Actuated Valve	Closed Upstream Manual Valve(s)	Closed Downstream Manual Valve(s)
A Side	FIL-*1211	PMP-*1210	--	V-*1210C, FV-*1211A	FV-*1211C, FV-*1212A
	FIL-*1212	PMP-*1210	--	FV-*1212A	FV-*1212C
	FIL-*1221	PMP-*1220	--	V-*1220C, FV-*1221A	FV-*1221C, FV-*1222A
	FIL-*1222	PMP-*1220	--	FV-*1222A	FV-*1222C

TABLE 2
Equipment Configuration for Isolating Filters from System (* indicates RTP01)

	Filter Out of Service	Pump Off	Closed Upstream Actuated Valve	Closed Upstream Manual Valve(s)	Closed Downstream Manual Valve(s)
B Side	FIL-*1231	PMP-*1230	--	V-*1230C, FV-*1231A	FV-*1231C, FV-*1232A
	FIL-*1232	PMP-*1230	--	FV-*1232A	FV-*1232C
	FIL-*1241	PMP-*1240	--	V-*1240C, FV-*1241A	FV-*1241C, FV-*1242A
	FIL-*1242	PMP-*1240	--	FV-*1242A	FV-*1242C

4. Isolate the cartridge filter receiving maintenance from its differential pressure indicator/transmitter (PDIT) by closing the manual valves upstream and downstream of its PDIT (Table 3).

TABLE 3
Manual Valves to be Closed for Isolation of Filter from DPIT (* indicates RTP01)

	Filter in Isolation	Filter DPIT	Closed Upstream DPIT Valve	Closed Downstream DPIT valve
A Side	FIL-*1211	PDIT-*1261	V-*1261C	V-*1261D
	FIL-*1212	PDIT-*1262	V-*1262C	V-*1262D
	FIL-*1221	PDIT-*1263	V-*1263A	V-*1263B
	FIL-*1222	PDIT-*1264	V-*1264A	V-*1264B
B Side	FIL-*1231	PDIT-*1265	V-*1265A	V-*1265B
	FIL-*1232	PDIT-*1266	V-*1266A	V-*1266B
	FIL-*1241	PDIT-*1267	V-*1267A	V-*1267B
	FIL-*1242	PDIT-*1269	V-*1269A	V-*1269B

5. Open the manual drain valve on the filter housing (FV-RTP01-1213, -1214, -1223, -1224, -1233, -1234, -1243, or -1244) and allow the filter housing to drain completely. The drainage should flow to the trench drains on the floor. Leave the manual drain valve open throughout the maintenance procedure.
6. Remove all wing nuts and the lid from the filter housing. The wing nuts should be removable by hand, but use hand tools if necessary.
7. Hold the cross-bar in the retainer nut and pull upward to remove the existing filter cartridge and top plate from the filter housing.
8. Based on the filter maintenance option selected in Step 1, acquire the appropriate materials (see "Equipment List" section above) and handle the cartridge filter(s) as follows:
    a. Clean and Reinstall:
        i. Inspect the existing cartridge for defects. If there are significant defects (such as pits, holes, rounds of o-rings), consider disposing of the filter and switching to the b. *Remove and Replace* option. If the filter does not have significant wear and tear, place the filter cartridge in 5-gallon bucket and carry it to the hose connected to the water source and pressure nozzle.

ii. Remove the filter from bucket and lay on the ground in an area where the excess cleaning water can drain to a trench drain on the floor.

iii. Direct spray at an angle to remove particulates. Proceed until as much particulate matter is removed as reasonably possible. Cleaning water should flow to the trench drains on the floor.

iv. If there is a need to remove oils, organic matter, algae and/or mineral deposits, see manufacturer's installation and operation manual for further instruction.

v. Rinse out 5-gallon bucket, place the clean cartridge filter inside, and carry back to filter housing.

b. Remove and Replace:

i. Place the spent filter cartridge in 5-gallon bucket.

ii. Inspect the new replacement filter cartridge for defects. Acquire a different replacement filter if substantial defects exist.

iii. (This step can alternatively be performed after Step 11) Dispose of used cartridge filter by carrying the cartridge filter in its 5-gallon bucket into the liquid-phase separator room and placing the cartridge filter into the primary liquid-phase separator (LPS-RTP01-1211 or -1212). See *RTP-SOP-06: Phase Separator Loading and Removal* for further instruction.

9. Take the cleaned or new replacement cartridge filter and place the top plate of the filter housing on top of the cartridge with clip upwards. Turn the retainer nut securely for proper seal.
10. Replace the rim gasket and lid.
11. Replace wing-nuts systematically, rotating around filter. "Finger tight" is normally sufficient.
12. Close the manual drain valve on the filter housing.
13. Reopen the manual valves that were closed in Step 3 (Table 2) and Step 4 (Table 3) to reconnect the cartridge filter to the piping system and its PDIT. Remove lockout/tagout on filter.

Standard Operating Procedure
PG&E Topock Remedy-produced Water Conditioning Plant Operations and Maintenance Plan

Title: Secondary Containment Operation in the Remedy-produced Water Conditioning Plant

Number: RTP-SOP-05_Rev1

Created Date: 5/13/14

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS). The Remedy-produced Water Conditioning Plant (RTP) will treat the water produced by the groundwater remedy prior to re-use or re-injection onsite.

The objective of this Standard Operating Procedure (SOP) is to describe the procedures for (a.) manual and (b.) automated operation of secondary containment within the RTP and associated areas. In the event of a spill, refer to the spill response procedures included in the HMBPs.

Secondary containment systems include containment trenches, sumps, sump pumps, and sump level switches with alarms to alert the operators in the event of a spill or leak. Secondary containment systems are provided for the following five areas:

1. Influent Tank Farm
2. RTP - Chemical Storage Area
3. Conditioned Water Storage Tank Farm
4. TCS Truck Fill Decontamination Pad
5. RTP - Liquid Phase Separators Area

Manual vs. automated secondary containment operation is as follows:

a. The operation of pumping down secondary containment for all of the areas above except for the RTP Liquid Phase Separators Area is performed manually. A high-level alarm should sound which would alert the operator to inspect the water level and initiate pumping of water from the secondary containment. Sump pumps have a normal pumping destination (see Table 1 below), but designated pumps can be manually activated to pump to the evaporation ponds or grit tank. Pumping to the evaporation ponds and grit tank requires coordination with TCS Operations. Water is transferred to the evaporation ponds via a connection to the TCS wastewater tank discharge line that is routed directly to the evaporation ponds.

b. The operation of the RTP Liquid Phase Separators Area secondary containment is automated. The sump pump automatically transfers drained liquids from the secondary containment to the Influent Tank Farm.

TABLE 1
Sump Pump Locations, Tag Numbers, P&ID Numbers, and Normal Pumping Destinations

Location	Sump Pump Tag Number	High-Level Alarm Tag Number	Process and Instrumentation Diagram (P&ID) Number	Normal Pumping Destinations
a. Manual Operation				
1. Influent Tank Farm	PMP-RTP01-1105	LSH-RTP01-1159	I-11-01, I-11-02, I-11-03, I-11-04	Influent Tanks
2. RTP - Chemical Storage Area	PMP-RTP01-1207	LSH-RTP01-1255	I-12-03, I-12-04	Influent Tank Farm Sump
3. Conditioned Water Storage Tank Farm	PMP-RTP01-1407	LSH-RTP01-1459	I-14-01	Influent Tank Farm Sump
4. TCS Truck Fill Station Decontamination Pad	PMP-RTP01-1408	LSH-RTP01-1455	I-14-02	Influent Tank Farm Sump
b. Automatic Operation				
5. RTP - Liquid Phase Separator Area	PMP-RTP01-1208	LSH-RTP01-1253	I-12-05	Influent Tank Farm Sump

2 Drawing Numbers

- Secondary Containment for TCS/Remedy-produced Water: G-10-01
- Influent Tanks 1 through 4, Instrumentation: I-11-01 through I-11-04
- Remedy-produced Water Conditioning Systems, Instrumentation: I-12-03 and I-12-04
- Conditioned Water Storage Tanks and TCS Truck Fill Station, Instrumentation: I-14-01 and I-14-02

3 Equipment List

a. Manual operation of secondary containment areas requires appropriate personal protective equipment (PPE). May also require handheld pH and conductivity meters.

b. Operation of secondary containment for the RTP Liquid Phase Separator Area is fully automated and therefore does not require equipment under normal operating conditions.

4 Preconditions

a. Manual operation of secondary containment areas:

- The high-level alarm in the sump pump area has been triggered (LSH-RTP01-1159, LSH-RTP01-1459, LSH-RTP01-1255, LSH-RTP01-1455).
- The manual valves are configured to pump liquids/solids from the designated sump pump to its normal pumping destination (Table 1).
- **If** PG&E has instructed for liquids to be pumped to the evaporation ponds, **the operator must notify and coordinate with TCS Operations before water is transferred.** The operator must confirm the allowable flow rate and allowable volume of liquid that may be transferred to the evaporation ponds. In addition, the discharge of water to the ponds is not allowed to occur while TCS Operations is discharging to the ponds.

b. Automated operation of the Liquid Phase Separator Area secondary containment:

- Manual valve V-RTP01-1208B is open.
- Sump pump PMP-RTP01-1208 is plugged in.

5 Procedure

a. Manual operation of secondary containment areas:

1. Influent Tank Farm (PMP-RTP01-1105)

1.1 Liquids/solids from Influent Tank Farm automatically drain to the containment trench and sump.

1.2 Sump pumps PMP-RTP01-1407, PMP-RTP01-1408, and PMP-RTP01-1207 move liquids/solids to Influent Tank Farm containment sump as needed, via manual operation as described in Steps 2, 3 and 4.

1.3 When the high-level alarm sounds for the Influent Tank Farm sump pump PMP-RTP01-1105, mobilize to the sump. Inspect the level of liquid/solids in the sump to confirm that the liquid high-level threshold has been exceeded.

1.3.1 If the liquid high-level threshold has not been exceeded, clean and troubleshoot the high-level switch using the manufacturer's instruction manual.

1.4 Confirm, based on the direction of PG&E, whether the Influent Tank Farm sump pump PMP-RTP01-1105 will pump liquids/solids to the influent tanks or to the TCS wastewater tank discharge connection.

1.5 If liquids/solids are to be pumped to the influent tanks:

1.5.1 Use the human-machine interface (HMI) to determine whether the influent tanks have the capacity for the volume of liquids/solids to be pumped from the sump. If the influent tanks do not have enough capacity, stop and contact the Maintenance Supervisor to determine how to proceed.

1.5.2 Verify that manual valve V-RTP01-1105A is open and manual valve V-RTP01-1105C is closed.

1.5.3 Plug in PMP-RTP01-1105 at the outlet.

1.5.4 After pumping of liquids/solids from sump is complete or needs to be terminated, unplug the sump pump.

1.6 If liquids/solids are to be pumped to the TCS wastewater tank discharge connection:

1.6.1 Notify and coordinate with TCS Operations before water is transferred. Confirm the allowable flow rate and allowable volume of liquid that may be transferred to the evaporation ponds.

1.6.2 Open manual valve V-RTP01-1105C and then close manual valve V-RTP01-1105A.

1.6.3 Plug in PMP-RTP01-1105 at the outlet. Keep track of the volume of liquids/solids transferred to the TCS evaporation ponds using the flow meter FM-RTP01-1181.

1.6.4 When the maximum allowable volume has been reached **or** if all liquids/solids in the sump have been pumped before the maximum allowable volume has been reached, unplug the sump pump.

1.6.5 Open manual valve V-RTP01-1105A and then close manual valve V-RTP01-1105C.

1.6.6 If liquids/solids remain in the sump (i.e., the evaporation ponds did not have capacity for all of the volume of liquids/solids or there was instruction to stop pumping before

all liquids/solids were removed), pump the remaining liquids/solids to the influent tanks by following Steps a.1.5.1 through a.1.5.4.

2. Remedy-produced Water Conditioning Plant- Chemical Storage Area (PMP-RTP01-1207)

   2.1 Liquids/solids from the Chemical Storage Area automatically drain to the containment trench and sump.

   2.2 Proceed with caution and use appropriate PPE when working in the Conditioning Systems Area secondary containment. The caustic (TNK-RTP01-1212) and acid (TNK-RTP01-1230) tanks contain hazardous chemicals, and the coagulant (TNK-RTP01-1220) tank contains concentrated chemicals that could be dangerous if consumed.

   2.3 When the high-level alarm sounds for the Chemical Storage Area sump pump PMP-RTP01-1207, mobilize to the sump. Inspect the level of liquid/solids in the sump to confirm that the liquid high-level threshold has been exceeded.

      2.3.1 If the liquid high-level threshold has not been exceeded, clean and troubleshoot the high-level switch using the manufacturer's instruction manual.

   2.4 Visually inspect whether the accumulation in secondary containment is a spill from one of the chemical storage tanks (TNK-RTP01-1212, -1220, or -1230). If the accumulation appears to be from a chemical storage tank, check the pH and conductivity of the accumulation using handheld meters. If the pH is less than or equal to 2 or greater than or equal to 12.5, it is considered a corrosive hazardous waste, and will need to be containerized or neutralized before proceeding.

      2.4.1 Inspect the Influent Tank Farm sump to determine whether it has capacity for the liquids/solids to be pumped from the Chemical Storage Area. If the Influent Tank Farm sump does not have enough capacity, do not proceed and contact the Maintenance Supervisor for direction.

      2.4.2 Verify that manual valve is open and manual valve V-RTP01-1207A is closed.

      2.4.3 Plug in PMP-RTP01-1207 at the outlet.

      2.4.4 After pumping of liquids/solids from sump is complete or needs to be terminated, unplug the sump pump.

      2.4.5 Slowly transfer liquids/solids from the Influent Tank Farm sump to the influent tanks or TCS evaporation ponds as instructed in Steps a.1.4 through a.1.5/a.1.6. Alternatively, if the release is a large quantity (determined by the Maintenance Supervisor), recover the material and store in drums. If the release is a small quantity, use absorbent material to soak up the release.

3. Conditioned Water Storage Tank Farm (PMP-RTP01-1407)

   3.1 Liquids/solids from the Conditioned Water Storage Tank Farm automatically drain to the containment trench and sump.

   3.2 When the high-level alarm sounds for the Conditioned Water Storage Tank Farm sump pump PMP-RTP01-1407, mobilize to the sump. Inspect the level of liquid/solids in the sump to confirm that the liquid high-level threshold has been exceeded.

      3.2.1 If the liquid high-level threshold has not been exceeded, clean and troubleshoot the high-level switch using the manufacturer's instruction manual.

3.3 Confirm, based on the direction of PG&E, whether the Conditioned Water Storage Tank Farm sump pump PMP-RTP01-1407 will pump liquids/solids to the Influent Tank Farm or to the TCS evaporation ponds.

3.4 If liquids/solids are to be pumped to the Influent Tank Farm:

3.4.1 Inspect the Influent Tank Farm sump to determine whether it has capacity for the liquids/solids to be pumped from the Conditioned Water Storage Tank Farm. If the Influent Tank Farm does not have enough capacity, do not proceed and contact the Maintenance Supervisor for direction.

3.4.2 Verify that manual valve V-RTP01-1407B is open and manual valve V-RTP01-1407D is closed.

3.4.3 Plug in PMP-RTP01-1407 at the outlet.

3.4.4 After pumping of liquids/solids from sump is complete or needs to be terminated, unplug the sump pump.

3.4.5 Transfer liquids/solids from the Influent Tank Farm sump to the influent tanks or TCS evaporation ponds as instructed in Steps a.1.4 through a.1.5/a.1.6.

3.5 If liquids/solids are to be pumped to the TCS evaporation ponds:

3.5.1 Notify and coordinate with TCS Operations before water is transferred. Confirm the allowable flow rate and allowable volume of liquid that may be transferred to the evaporation ponds.

3.5.2 Open manual valve V-RTP01-1407D and then close manual valve V-RTP01-1407B.

3.5.3 Plug in PMP-RTP01-1407 at the outlet. Keep track of the volume of liquids/solids transferred to the TCS evaporation ponds using the flow meter FM-RTP01-1472.

3.5.4 When the maximum allowable volume has been reached **or** if all liquids/solids in the sump have been pumped before the maximum allowable volume has been reached, unplug the sump pump.

3.5.5 Open manual valve V-RTP01-1407B and then close manual valve V-RTP01-1407D.

3.5.6 If liquids/solids remain in the sump (i.e., the evaporation ponds did not have capacity for all of the volume of liquids/solids or there was instruction to stop pumping before all liquids/solids were removed), pump the remaining liquids/solids to the Influent Tank Farm as instructed in Steps a.3.4.1 through a.3.4.5.

4. TCS Truck Fill Decontamination Pad (PMP-RTP01-1408)

4.1 Liquids/solids from truck decontamination pad automatically drain to the containment trench and sump.

4.2 When the high-level alarm sounds for the TCS Truck Fill Decontamination Pad sump pump PMP-RTP01-1408, mobilize to the sump. Inspect the level of liquid/solids in the sump to confirm that the liquid high-level threshold has been exceeded.

4.2.1 If the liquid high-level threshold has not been exceeded, clean and troubleshoot the high-level switch using the manufacturer's instruction manual.

4.3 Confirm, based on the direction of PG&E, whether sump pump PMP-RTP01-1408 will pump liquids/solids to the Influent Tank Farm or to the grit tank.

4.4 If liquids/solids are to be pumped to the Influent Tank Farm:

4.4.1 Inspect the Influent Tank Farm sump to determine whether it has capacity for the liquids/solids to be pumped from the truck decontamination pad. If the Influent Tank Farm does not have enough capacity, do not proceed and contact the Maintenance Supervisor for direction.

4.4.2 Verify that manual valve V-RTP01-1411A is open and manual valve V-RTP01-1411B is closed.

4.4.3 Plug in PMP-RTP01-1408 at the outlet.

4.4.4 After pumping of liquids/solids from sump is complete or needs to be terminated, unplug the sump pump.

4.4.5 Transfer liquids/solids from the Influent Tank Farm sump to the influent tanks or TCS evaporation ponds as instructed in Steps a.1.4 through a.1.5/a.1.6.

4.5 If liquids/solids are to be pumped to the grit tank:

4.5.1 Notify and coordinate with TCS Operations before water is transferred. Confirm the allowable flow rate and allowable volume of liquid that may be transferred to the grit tank.

4.5.2 Open manual valve V-RTP01-1411B and then close manual valve V-RTP01-1411A.

4.5.3 Plug in PMP-RTP01-1408 at the outlet. Keep track of the volume of liquids/solids transferred to the grit tank using the flow meter FE/FIT-RTP01-1474.

4.5.4 When the maximum allowable volume has been reached **or** if all liquids/solids in the sump have been pumped before the maximum allowable volume has been reached, unplug the sump pump.

4.5.5 Open manual valve V-RTP01-1411A and then close manual valve V-RTP01-1411B.

4.5.6 If liquids/solids remain in the sump (i.e., the grit tank did not have capacity for all of the volume of liquids/solids or there was instruction to stop pumping before all liquids/solids were removed), pump the remaining liquids/solids to the Influent Tank Farm as instructed in Steps a.4.4.1 through a.4.4.5.

b. Automated operation of the liquid phase separator secondary containment area (PMP-RTP01-1208):

1. Liquids/solids from the liquid phase separators automatically drain to containment trench and sump.
2. Sump pump PMP-RTP01-1208 automatically moves liquids/solids from the sump to the Influent Tank Farm containment trench/sump.

Standard Operating Procedure
PG&E Topock Remedy-produced Water Conditioning Plant Operation and Maintenance Plan

Title: Phase Separator Loading and Removal

Number: RTP-SOP-06_Rev1

Created Date: 12/19/13

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS). The Remedy-produced Water Conditioning Plant (RTP) will treat the water produced by the groundwater remedy prior to re-use or re-injection onsite. Solids filtered in the conditioning process will be transferred to the liquid phase separators with a solids pump. Liquid from the phase separators will be recycled using a sump pump to the influent tank farm.

The objective of this Standard Operating Procedure (SOP) is to describe the procedures for (a.) loading spent filter cartridges and solid wastes from sampling to the liquid phase separators for dewatering, (b.) removing liquid phase separators from the system, and (c.) loading liquid phase separators to the system.

2 Drawing Numbers

- First Floor Plan: M-12-01
- Liquid Phase Separators, Instrumentation: I-12-05

3 Equipment List

- Appropriate PPE
- Health and Safety Plan
- Ladder
- Tool for opening/closing the liquid phase separators from the ground level
- (a.) Loading spent filter cartridges and other solid wastes to liquid phase separator also requires a 5-gallon bucket containing the object(s) to be loaded

4 Preconditions

a. Loading spent filter cartridges and other solid wastes to liquid phase separator:
    - The primary phase separator in use (LPS-RTP01-1211, LPS-RTP01-1212) is below high-level set point (LSH-RTP01-1251, LSH-RTP01-1252).

- The plant is not operating in batch processing mode while the phase separator is intended to be loaded. If plant is operating in batch processing mode, wait until the system has completed pumping sludge to the phase separator in the batch conditioning cycle.

b. Removing liquid phase separator from process system:

- The human-machine interface (HMI) has indicated that one of the liquid phase separators (LPS-RTP01-1211, -1212) has reached its high-level set point (LSH-RTP01-1251, -1252).

c. Loading liquid phase separator to process system:

- New liquid phase separator has been transported to its designated location.

5 Procedure

a. Loading spent filter cartridges and other solid wastes to liquid phase separator:

1. Mobilize to the liquid phase separator with the spent cartridge filter and/or other solid wastes to be loaded in a 5-gallon bucket.
2. Make sure there is a non-hazardous waste label showing accumulation “start” date on front end of liquid phase separator. If no label is present, apply a non-hazardous waste label and fill in the accumulation “start” date.
3. Open the lid of the liquid phase separator from the ground level using the designated tool.
4. Check that the ladder adjacent to the liquid phase separator is secure. Pick up bucket containing filter or solid waste and carefully ascend the ladder to reach the top of the phase separator. Maintain proper balance on the ladder.
5. Carefully pour contents of bucket through the opening.
6. Maintain balance on the ladder while descending.
7. Close the lid of the liquid phase separator from the ground level using the designated tool.

b. Removing liquid phase separator from process system:

1. Mobilize to the liquid phase separator to be removed from the system.
2. Make sure there is a non-hazardous waste label showing accumulation “start” date on front end of liquid phase separator; fill in the accumulation “end” date on the non-hazardous waste label.
3. Inspect the exterior of the liquid phase separator to ensure that there are no leaks or other potential hazards.
4. Locate the manual valve located upstream of the liquid phase separator (V-RTP01-1211H, -1212J), which is physically found above the liquid phase separator on the line coming from the solids pump (PMP-RTP01-1201).
5. If necessary, move the ladder located adjacent the liquid phase separator directly beneath the upstream valve. Ensure the ladder is secure. Carefully ascend the ladder.
6. Close the manual upstream valve.
7. Carefully descend the ladder.
8. Open the lid of the liquid phase separator from the ground level using the designated tool.
9. Move the ladder near the high-level switch indicator (LSH-RTP01-1251, -1252). Carefully ascend the ladder.
10. Dismount the high-level switch indicator.

11. Carefully descend the ladder. Store the high-level switch indicator in a safe and dry place until the new liquid phase separator is loaded to the system.
12. Close the lid of the liquid phase separator from the ground level using the designated tool.
13. Locate the hose by which liquid drains from the separator to the floor.
    i. Inspect the length of the hose to ensure there are no kinks or obstructions to flow throughout.
    ii. Check the outlet of the hose and verify that no liquid is draining from hose.
    iii. If there is flow and/or other evidence that dewatering is still occurring in the separator, wait until dewatering is complete before proceeding to the next step.
14. Go to the connection between the outlet of the separator and the hose. Close the manual valve (V-RTP01-1211I, -1212K) between the separator and the cam lock fitting.
15. Carefully disconnect the hose from the outlet of the separator via the cam lock fitting.
16. Cover the outlet with the cam lock plug that is attached to the outlet of the liquid phase separator. Ensure the cam lock plug is secure.
17. Ensure that all liquid drains out of the disconnected hose. Then connect the two ends of those hose together using the fittings and tidily stack the hose near the liquid phase separator.
18. Inspect and clear the area surrounding the liquid phase separator so it is easily and safely accessible by the vehicle that will remove the liquid phase separator.

c. Loading liquid phase separator to process system:
    1. Obtain the hose to be attached to the outlet of the liquid phase separator. Inspect the hose and verify it is in appropriate condition.
    2. Remove the cam lock plug that is attached to the outlet of the liquid phase separator, if applicable. Hang or place the plug nearby.
    3. Carefully attach the hose to the cam lock fitting on the outlet of the separator. Ensure the connection is secure.
    4. Ensure the hose drains within the secondary containment and there are no kinks or obstruction of flow along the length of the hose.
    5. Go to the connection between the outlet of the separator and the hose. Open the manual valve (V-RTP01-1211I, -1212K) between the separator and the cam lock fitting.
    6. Locate the manual valve located upstream of the liquid phase separator (V-RTP01-1211H,), which is physically found above the liquid phase separator on the line coming from the solids pump (PMP-RTP01-1201) and ensure that it is closed.
    7. Acquire the high-level switch indicator (LSH-RTP01-1251, -1252).
    8. Open the lid of the liquid phase separator from the ground level using the designated tool.
    9. Move the ladder located adjacent to the liquid phase separator to the intended location of the high-level switch indicator. Ensure the ladder is secure. Carefully ascend the ladder. Mount the level switch indicator. Carefully descend the ladder.
    10. Close the lid of the liquid phase separator from the ground level.
    11. *If the new liquid phase separator is to be the <u>primary</u> liquid phase separator:* Move the ladder directly beneath the manual upstream valve, if necessary. Ensure the ladder is secure. Carefully ascend the ladder. Open the manual upstream valve. Apply a non-hazardous waste label and fill in the accumulation “start” date. Carefully descend the ladder.

Standard Operating Procedure
PG&E Topock Remedy-produced Water Conditioning Plant Operation and Maintenance Plan

Title: Manual Cleaning of Frac Tanks

Number: RTP-SOP-07_Rev1

Created Date: 6/6/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS). The Remedy-produced Water Conditioning Plant (RTP) will treat the water produced by the groundwater remedy prior to re-use or re-injection onsite.

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for manual cleaning of the frac tanks (influent tanks and conditioned water storage tanks) at the RTP, using a pressure washer. The primary method for removing cleaning water and potential dislodged solids from the tanks is to pump water and solids from the tanks using a portable pump that discharges to the liquid phase separators (if cleaning influent tanks) or a potable tank trailer (if cleaning conditioned water storage tanks). The secondary method for removing cleaning water and solids from the tanks is using a vac truck that will dispose of the water and solids at a predetermined discharge location (e.g., the liquid phase separators, the evaporation ponds, an offsite facility, etc.).

NOTE: The operator should not break the plane of the tank openings with body parts at any time during this procedure, as it would be considered confined space entry. If confined space entry is necessary for a special procedure, the Health and Safety Plan should be referenced.

2 Drawing Numbers

- Remedy-produced Water Conditioning Plant Influent Tank Farm: I-11-01 through I-11-04
- Liquid Phase Seperator and Air Compressor: I-12-05
- Remedy-produced Water A-Side Conditioned Water Storage Tanks: I-14-01

3 Equipment/Supplies

- Appropriate personal protective equipment (PPE), including fall protection
- Health and Safety Plan
- Water supply tank
- Pressure washer and manufacturer’s operation manual
- Hand tools may be necessary

- For cleaning influent tanks (TNK-RTP01-1101, -1102, -1103, -1104): portable pump (a. primary method) OR vac truck (b. secondary method)
- For cleaning conditioned water storage tanks (TNK-RTP01-1401, -1402): portable pump, portable tank trailer (a. primary method) OR vac truck (b. secondary method)

4 Preconditions

- The influent tank(s) and/or conditioned water storage tank(s) designated for cleaning are empty.
- The influent tank(s) and/or conditioned water storage tank(s) designated for cleaning are not scheduled to be in operation while cleaning is to be performed.

5 Procedure

a. Cleaning using a portable pump (primary method)

1. Mobilize to the frac tank(s) to be cleaned in either the Influent Tank Farm or Conditioned Water Storage Tank Farm.
2. Plug in the Influent Tank Farm Sump Pump (PMP-RTP01-1105) or Conditioned Water Tank Farm Sump Pump (PMP-RTP01-1407). As necessary, open the sump pump valves (V-RTP01-1105A and -1105C, or V-RTP01-1407B and -1407D).
3. Set up and connect the pressure washer and water supply tank according to the procedures in the pressure washer manufacturer's operation manual.
4. Connect the outlet hose on the portable pump to either the liquid-phase separator temporary pump connection in the Influent Tank Farm area, if cleaning the influent tanks, OR the portable tank trailer inlet, if cleaning the conditioned water storage tanks.
5. IF cleaning the influent tanks, open the valve on the liquid-phase separator temporary pump connection.
6. Connect the portable pump inlet hose to the drain valve on the outside of the tank to be cleaned (V-RTP01-1101M, -1102M, -1103M, -1104M, -1401C, or -1402C).
7. Remove all wing nuts from the access manway on the side of the tank. The wing nuts should be removable by hand, but use hand tools if necessary.
8. Open the side access manway.
9. Do not break the plane of the tank wall with body parts at any time during this procedure, as it would be considered confined space entry. If confined space entry is necessary for a special procedure, the Health and Safety Plan should be referenced.
10. Use the pressure washer wand to spray the inside walls and floor of the frac tank from the access manway opening, removing solids that are caked onto the inside walls.
11. Close the side access manway.
12. Replace wing-nuts on the side access manway.
13. Carefully climb to the top of the staircase on the side of the tank with the pressure washer wand and fall protection gear.
14. NOTE: Fall protection must be used while on the lid of the tank. Set up and connect to fall protection.
15. Carefully ascend onto the roof of the tank with the pressure washer wand.

16. Remove all wing nuts from the access manway. The wing nuts should be removable by hand, but use hand tools if necessary.
17. Open the access manway.
18. Do not break the plane of the tank lid with body parts at any time during this procedure, as it would be considered confined space entry. If confined space entry is necessary for a special procedure, the Health and Safety Plan should be referenced.
19. Use the pressure washer wand to spray the inside walls and floor of the frac tank from the access manway opening, removing solids that are caked onto the inside walls.
20. Close the access manway.
21. Replace wing-nuts on the access manway.
22. Use the pressure washer to spray down the exterior roof of the frac tank, removing solids that are caked onto the roof. Avoid walking on wet areas, and use caution if walking on wet areas is necessary.
23. After cleaning the roof of the tank, carefully climb down to the top of the side staircase, disconnect fall protection, and descend the staircase.
24. IF cleaning one of the influent tanks:
    i. Turn on the solids pump (PMP-RTP01-1201) to remove the sludge from inside of the tank.
    ii. Allow the solids pump to run until it is no longer able to remove sludge.
    iii. If sludge remains inside the tank, proceed to Step a.25.
    iv. If the solids pump removed all sludge from the inside of the tank, skip Steps a.25-a.27 and proceed to Step a.28.
25. Open the drain valve on the outside of the tank to be cleaned (V-RTP01-1101M, -1102M, -1103M, -1104M, -1401C, or -1402C).
26. Turn on the portable pump and allow the remaining cleaning water and potential dislodged solids to be pumped from the inside of the tank to the liquid-phase separator OR portable tank trailer.
27. Turn off the portable pump.
28. Close the drain valve on the outside of the tank (V-RTP01-1101M, -1102M, -1103M, -1104M, -1401C, or -1402C).
29. Disconnect the portable pump from the drain valve.
30. If another tank in the Influent or Conditioned Water Storage Tank Farm needs to be cleaned, repeat Steps a.6 through a.29 for that tank. Repeat until the interior cleaning of all of the necessary frac tank(s) in the Influent Tank Farm or Conditioned Water Storage Tank Farm is complete.
31. IF cleaning the influent tanks, close the valve on the liquid-phase separator pump connection.
32. Disconnect the outlet hose on the portable pump from either the liquid-phase separator temporary pump connection in the Influent Tank Farm area, if cleaning the influent tanks, OR the portable tank trailer inlet if cleaning the conditioned water storage tanks.
33. Use the pressure washer to spray down the exterior side walls of the frac tank(s), removing solids that are caked onto the sides. Avoid walking on wet areas, and use caution if walking on wet areas is necessary.
34. Ensure that cleaning water drains to the sump and is pumped by the designated sump pump.
35. Unplug the sump pump.

b. Cleaning using a vac truck (secondary method)

1. Mobilize to the frac tank(s) to be cleaned in either the Influent Tank Farm or Conditioned Water Storage Tank Farm.
2. Plug in the Influent Tank Farm Sump Pump (PMP-RTP01-1105) or Conditioned Water Tank Farm Sump Pump (PMP-RTP01-1407).
3. Set up and connect the pressure washer and water supply tank according to the procedures in the pressure washer manufacturer's operation manual.
4. Connect the vac truck vacuum hose to the drain valve on the outside of the tank to be cleaned (V-RTP01-1101M, -1102M, -1103M, -1104M, -1401C, or -1402C).
5. Remove all wing nuts from the access manway on the side of the tank. The wing nuts should be removable by hand, but use hand tools if necessary.
6. Open the side access manway.
7. Do not break the plane of the tank wall with body parts at any time during this procedure, as it would be considered confined space entry. If confined space entry is necessary for a special procedure, the Health and Safety Plan should be referenced.
8. Use the pressure washer wand to spray the inside walls and floor of the frac tank from the access manway opening, removing solids that are caked onto the inside walls.
9. Close the side access manway.
10. Replace wing-nuts on the side access manway.
11. Carefully climb to the top of the staircase on the side of the tank with the pressure washer wand and fall protection gear.
12. NOTE: Fall protection must be used while on the lid of the tank. Set up and connect to fall protection.
13. Carefully ascend onto the roof of the tank with the pressure washer wand.
14. Remove all wing nuts from the access manway. The wing nuts should be removable by hand, but use hand tools if necessary.
15. Open the access manway.
16. Do not break the plane of the tank lid with body parts at any time during this procedure, as it would be considered confined space entry. If confined space entry is necessary for a special procedure, the Health and Safety Plan should be referenced.
17. Use the pressure washer wand to spray the inside walls and floor of the frac tank from the access manway opening, removing solids that are caked onto the inside walls.
18. Close the access manway.
19. Replace wing-nuts on the access manway.
20. Use the pressure washer to spray down the exterior roof of the frac tank, removing solids that are caked onto the roof. Avoid walking on wet areas, and use caution if walking on wet areas is necessary.
21. After cleaning the roof of the tank, carefully climb down to the top of the side staircase, disconnect fall protection, and descend the staircase.

22. Open the drain valve on the outside of the tank (V-RTP01-1101M, -1102M, -1103M, -1104M, -1401C, or -1402C).
23. Turn on the vac truck vacuum and allow the vac truck to remove all water and potential dislodged solids from the inside of tank.
24. Turn off the vac truck vacuum.
25. Close the drain valve on the outside of the tank (V-RTP01-1101M, -1102M, -1103M, -1104M, -1401C, or -1402C).
26. Disconnect the vac truck vacuum hose from the drain valve.
27. If another tank in the Influent or Conditioned Water Storage Tank Farm needs to be cleaned, repeat Steps b.4 through b.26 for that tank. Repeat until the interior cleaning of all of the necessary frac tank(s) in the Influent Tank Farm or Conditioned Water Storage Tank Farm is complete.
28. Use the pressure washer to spray down the exterior side walls of the frac tank(s), removing solids that are caked onto the sides. Avoid walking on wet areas, and use caution if walking on wet areas is necessary.
29. Ensure that cleaning water drains to the sump and is pumped by the designated sump pump.
30. Unplug the sump pump.

Standard Operating Procedure
PG&E Topock Remedy-Produced Water Conditioning Plant Operation and Maintenance Plan

Title: Off-site Trucking of Remedy-produced Water

Number: RTP-SOP-08_Rev1

Created Date: 2/13/14

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS). The Remedy-produced Water Conditioning Plant (RTP) will treat the water produced by the groundwater remedy prior to re-use or re-injection onsite.

The objective of this Standard Operating Procedure (SOP) is to describe the procedures for transferring conditioned water to the TCS truck fill station for off-site trucking

This procedure is controlled both manually and through the SCADA/HMI.

If question/concerns arise throughout the procedure, contact the Maintenance Supervisor to determine how to proceed.

2 Drawing Numbers

- Conditioned Water B-Side, Instrumentation: I-14-02

3 Equipment List

- Appropriate personal protective equipment (PPE)
- Health and Safety Plan
- OSHA suggested spotting signals for vehicles (attached)
- Safety cones
- 5-gallon bucket

4 Preconditions

- B-Side conditioned water storage tank (TNK-RTP01-1410) water level is above the low-level set point (LSL-RTP01-1452).

5 Procedure

1. Be aware that you are working around large equipment with limited visibility. You must make sure that the driver sees you and knows what you intend to do. DO NOT put yourself in a position where you can get crushed or pinched.

2. Prepare loading site:
    a. Adjust containment pad so that when trailer tandems are at the front lip of the pad the loading hose will lie within the rear area of the containment pad.
    b. Confirm that all the adapters are present and that the loading hose is properly stored and not in the path of the trucks as they enter the loading area.
    c. Confirm that the safety cones are in place at the north end of the containment pad (where the truck will be entering) and that you have a 5-gallon bucket to place under the trailer's drip tray valves.
3. Stage truck on the containment pad:
    a. When the driver arrives to the entrance of the loading area, the operator will discuss with the driver the preferred orientation of the truck on the loading pad: The truck will be stopped when the front trailer axle is at the south end of the containment pad (opposite of the entrance). This assures enough room in the containment pad behind the trailer to catch any minor spills. This also provides enough room for the hose to be in the containment pad in case it is dropped during connecting or disconnecting to the trailer. The operator will also discuss with the river that they will direct the driver onto the containment pad using hand signals. The operator will verify that the OSHA suggested spotting signals for vehicles (attached to this SOP) are okay to use, and add/modify hand signals as needed.
    b. As the truck moves to the loading area, the operator directs the truck driver for the placement of the truck on the containment pad using the agreed upon hand signals.
    c. Check that the driver has a valid license and appropriate credentials.
    d. Check that the driver has completed a pre-trip inspection on the truck and trailer.
    e. Check that the driver currently driving the truck is the same driver who performed the pre-trip inspection.

        Note: If there are any discrepancies in Steps 3.b, 3.c and 3.d please contact the Project Manger before proceeding.

    f. Allow the driver to hook up to the load-out hose.

        Note: The driver is responsible for:

        i. Attaching the load-out hose to the truck.
        ii. Making sure the truck tank is vented.
        iii. Determining how many gallons are to be loaded.
        iv. Disconnecting the load-out hose.
        v. Operating the load valve on the truck.

        The operator is responsible for:

        i. All valves upstream of the load-out hose.
        ii. Operating the load-out pump.
        iii. Telling the driver how many gallons have been loaded.
4. Select tank and activate pump:
    a. Confirm using the HMI that the conditioned storage water tank (TNK-RTP01-1410) is in appropriate condition to discharge.
    b. Write the beginning totalizer reading on the shipping documentation.

c. Confirm with the driver that the line isolation valves are properly positioned before opening tank valves.

d. Open the manual valve upstream of the TCS Truck Fill Pump (V-RTP01-1403A).

e. Open the manual valve downstream of the TCS Truck Fill Pump (V-RTP01-1403C).

f. Double check truck valves and vents and confirm with the driver that the truck is ready to receive water before opening the load-out supply hose valve (remember that water may gravity-flow out of the hose even if the pump is off).

g. Open the load-out supply hose valve.

h. Turn on the truck fill/transfer pump PMP-RTP01-1403 by turning the hand switch HS-RTP01-1403 to ON.

i. The truck fill/transfer pump will draw from the conditioned water storage tank (TNK-RTP01-1410).

j. During the pumping operation the operator must stay in the load control area and the driver must stay by the trailer valve.

k. There are numerous ways the drivers use to load their trucks to the legal limits. This means that the operator and the driver need to work together to assure that the truck goes out properly loaded.

l. When the truck is loaded, first turn off the transfer pump PMP-RTP01-1403 by turning the hand switch HS-RTP01-1403 to OFF. Then close the load supply valve.

m. The driver will close the trailer valve.

5. Disconnect the hose from trailer valve:

   a. Confirm that the 5-gallon bucket is under drip tray valve and drip tray valve is open.

   b. The operator will disconnect the load-out hose.

   c. Hang the hose on the storage hook, remove any adapters used and replace trailer valve cap or plug.

   d. Close drip tray valve and remove 5-gallon bucket from under drip tray.

6. Fill out shipping documentation and record the load:

   a. Write the ending totalizer reading on the shipping documentation.

   b. Confirm that you and the driver have filled out and signed the manifest and that the manifest has been properly filled in and the manifest number recorded.

   c. Confirm that you and the driver have signed the shipping documentation and give the driver their copies.

7. Shutdown after loading is completed:

   a. Verify with the driver that the truck is in a safe condition and that it is not overly full.

   b. Instruct the driver to exit the decontamination pad in the eastbound direction. Assist the truck driver with exiting the decontamination pad.

   c. Adjust placement of containment pad in the loading area if it has slipped during the loading operation.

   d. Empty the 5-gallon buckets into the decontamination pad secondary containment trench.

   e. Take all paperwork to office and file in the appropriate place.

Standard Operating Procedure
PG&E Topock Remedy-produced Water Conditioning Plant Operation and Maintenance Plan

Title: Inspection of B-Side Conditioned Water Storage Tank

Number: RTP-SOP-09_Rev1

Revision Date: 5/19/2015

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for inspection of the Freshwater B-Side Conditioned Water Storage Tank.

The operator should not break the plane of the tank openings with body parts at any time during this procedure, as it would be considered confined space entry. If confined space entry is necessary for a special procedure, the Health and Safety Plan should be referenced.

2 Drawing Numbers

- Freshwater B-Side Conditioned Water Storage Tank (TNK-RTP01-1410): I-14-02
- Conditioned Water Storage Tank Mechanical Plans and Details: S-14-01 through S-14-05

3 Equipment/Supplies

- Appropriate personal protective equipment (PPE), including fall protection
- Health and Safety Plan
- Lockout/tagout tags and lockout/tagout manual for B-Side Conditioned Water Storage Tank maintenance (if tank shutdown is performed)
- Portable pump and water hauling truck OR vac truck (if tank draining is conducted)

4 Procedure

1. Inspect tank and associated equipment with reference to the following instructions (Steps 2 through 11). If unsuitable tank conditions are observed at any time throughout the procedure:

   1.1. Shut down and/or drain the tank if it is warranted (e.g. the tank is in danger of a blow out or failure).

      1.1.1. Shutdown Tank

         i. Lockout/tagout the tank by following instructions in the lockout/tagout manual for B-Side Conditioned Water Storage Tank maintenance.
         ii. Use the HMI to turn OFF the B-Side Filter Feed Pumps (PMP-RTP01-1230 and -1240).

iii. Close the manual valve upstream (V-RTP01-1410A) and downstream (V-RTP01-1410B) of the Conditioned Water Storage Tank.

1.1.2. Drain Tank

i. Use the HMI to verify that there is sufficient volume in the influent tanks for the discharge from the B-Side Conditioned Water Storage Tank.
   a. Proceed to next steps only if there is sufficient volume in the influent tanks.
ii. If the tank is not already shutdown, shutdown the tank by completing all steps listed for shutting down the tank (see Step a. above).
iii. Slowly open the manual drain valve on the tank (V-RTP01-1410G).
iv. Ensure that the tank discharge properly drains into the influent tanks.
   a. If there is any malfunctioning of the tank discharge draining to the influent tanks, immediately close the manual drain valve that was opened in step iii.
v. If the tank does not drain completely by gravity, pump out the remaining water using a portable pump and water hauling truck OR vac truck.
   a. Close V-RTP01-1410G.
   b. Connect the portable pump or vac truck to the connection downstream of V-RTP01-1403D.
   c. If using a portable pump, ensure the water flows to the water hauling truck.
   d. Initiate pumping using the portable pump or vac truck.
   e. After TNK-RTP01-1410 is completely drained, terminate pumping from the portable pump or vac truck.
   f. Close V-RTP01-1403D.
   g. Disconnect the portable pump or vac truck.
   h. The discharge in the water hauling truck or vac truck may be drained in the influent tanks or liquid phase separator.
vi. After the tank has completely drained, verify V-RTP01-1410G is closed.

1.2. Attempt to fix the tank conditions, if feasible.

1.3. If the tank conditions cannot be fixed, the operator should contact the Maintenance Supervisor so parts can be procured and work can be scheduled.

2. Inspect the outside of the tank (including tank walls, anchors, supports, stairs and platforms) for the following:

- No signs of distortion, buckling, denting, or bulging on tank
- No signs of cracks, leakage, or corrosion on tank
- No severe corrosion or damage on staircase
- Grating at flush cleanout catch basin is intact
- Flush cleanout catch basin is free of standing water

3. Inspect the nozzles, piping and actuated and manual valves for the following:

- No signs of leakage or damage along piping
- No evidence of vibration along piping
- Piping is adequately supported
- No signs of leakage or damage at valves
- Nozzles are adequately sealed and there are no signs of leakage or damage
- Flanged connection bolts are tight and fully engaged with no sign of wear or corrosion
- Bird screen on overflow line is intact

4. Carefully climb the staircase to the top of the tank to inspect the lid of the tank.

5. Fall protection must also be used when inspecting the lid of the tanks. Set up and connect to fall protection and ascend onto the roof of the tank.
6. Do not break the plane of the tank lid with body parts at any time during this procedure, as it would be considered confined space entry. If confined space entry is necessary for a special procedure, the Health and Safety Plan should be referenced
7. Inspect the roof for the following:
    - No signs of distortion, buckling, denting, or bulging on roof
    - No signs of cracks, leakage, or corrosion on roof
8. Descend from the roof of the tank
9. When it is safe to do so, disconnect from fall protection.
10. Carefully descend the staircase.
11. Contact the Maintenance Supervisor if there are any notes that indicate further maintenance is required so parts can be procured and work can be scheduled.

Standard Operating Procedure
PG&E Topock Remedy-produced Water Conditioning Plant Operation and Maintenance Plan

Title: Disposal of Produced Water in Evaporation Ponds via the TCS Wastewater Tank Discharge Connection

Number: RTP-SOP-10_Rev1

Created Date: 2/24/14

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS). The Remedy-produced Water Conditioning Plant (RTP) will treat the water produced by the groundwater remedy prior to re-use or re-injection onsite.

The objective of this Standard Operating Procedure (SOP) is to describe the procedures for transferring water from the following locations to the evaporation ponds:

a. Unconditioned water from the Remedy A-Side
b. Conditioned water from the Remedy A-Side
c. Liquids/solids from Influent Tank Farm secondary containment
d. Liquids/solids from A-Side Conditioned Water Storage Tank Farm secondary containment

This procedure will require coordination with TCS Operations. Permission to transfer a specific quantity of water must be approved by TCS and steps must be taken to assure that only the specific quantity of water is transferred.

Water is transferred to the evaporation ponds via a connection to the TCS wastewater tank discharge. This procedure is controlled manually and through the SCADA/HMI.

2 Drawing Numbers

- Influent Tanks 1 through 4, Instrumentation: I-11-01 through I-11-04
- Filter System A-Side, Instrumentation: I-12-01
- Conditioned Water Storage Tanks, Instrumentation: I-14-01 and I-14-02

3 Equipment List

- Appropriate personal protective equipment (PPE)
- May also require handheld pH and conductivity meters

4 Preconditions

a. Unconditioned water from the Remedy A-side:

- PG&E has instructed for unconditioned water to be sent from the Remedy A-side to the evaporation ponds via the TCS wastewater tank discharge connection.
- Designated influent tank(s) (TNK-RTP01-1101, -1102, -1103, -1104) water level is full and/or backwash pumps have completed their designated cycles.

b. Conditioned water from the Remedy A-side Conditioned Water Tank Farm:

- PG&E has instructed for water to be sent from the Remedy A-side conditioned water storage tanks (TNK-RTP01-1401 and -1402) to evaporation ponds via the TCS wastewater tank discharge connection.
- Designated Remedy A-side conditioned water storage tank(s) water level(s) are above the low-level set point (LSL-RTP01-1451 and -1453).

c. Liquids/solids from Influent Tank Farm secondary containment:

- PG&E has instructed for water to be sent from the Influent Tank Farm secondary containment to evaporation ponds via the TCS wastewater tank discharge connection.
- There are liquids/solids in the Influent Tank Farm sump.
- The manual valves are configured to pump liquids/solids to the influent tanks.

d. Liquids/solids from A-side Conditioned Water Storage Tank Farm secondary containment:

- PG&E has instructed for water to be sent from Conditioned Water Storage Tank Farm A-side secondary containment to evaporation ponds via the TCS wastewater tank discharge connection.
- There are liquids/solids in the Conditioned Water Storage Tank Farm sump.
- The manual valves are configured to pump liquids/solids to the Influent Tank Farm sump.

5 Procedure

a. Transferring unconditioned water from the Remedy A-side to evaporation ponds via the TCS wastewater tank discharge connection:

1. Notify and coordinate with TCS Operations before water is transferred. Confirm the allowable flow rate and allowable volume of liquid that may be transferred to the TCS evaporation ponds.
2. Use the HMI to turn off the primary filter feed pump on the filter system A-side (PMP-RTP01-1210 or PMP-RTP01-1220).
3. Close the valves upstream of the primary coarse cartridge filter (FV-RTP01-1211A or -1221A).
4. Open the normally closed (NC) manual valve downstream of the primary filter feed pump that routes liquids/solids to the TCS waste water tank (V-RTP01-1210E or -1220E).
5. Use the HMI to program the primary filter feed pump (PMP-RTP01-1210 or -1220) to transfer only the volume of water determined in Step 1 to the TCS evaporation ponds.
6. Use the HMI to turn on the primary filter feed pump (PMP-RTP01-1210 or -1220). Use the speed command to adjust the flow rate to the allowable flow rate determined in Step a.1.
7. The filter feed pump will move water to the TCS evaporation ponds when the second Precondition is met.

8. The filter feed pump will turn off when the volume of water to be transferred that was programmed in Step a.6 is reached.
9. Close the NC manual valve downstream of the primary filter feed pump that routes liquids/solids to the TCS evaporation ponds (V-RTP01-1210E or -1220E).
10. Open the valves upstream of the primary coarse cartridge filter (FV-RTP01-1211A or -1221A).
11. Use the speed command on the HMI to adjust the flow rate of the primary filter feed pump back to its initial flow rate (prior to Step a.4).
12. Use the HMI to return the primary filter feed pump on the filter system A-side (PMP-RTP01-1210 or -1220) to the regular operations mode, unless otherwise instructed.

b. Transferring conditioned water from the Remedy A-side Conditioned Water Tank Farm to evaporation ponds via the TCS wastewater tank discharge connection:

1. Notify and coordinate with TCS Operations before water is transferred. Confirm the allowable flow rate and allowable volume of liquid that may be transferred to the TCS evaporation ponds.
2. Use the HMI to turn off the conditioned water transfer pump (PMP-RTP01-1405 or -1406).
3. Use the HMI to close FV-RTP01-1416.
4. Use the HMI to open FV-RTP01-1415, which allows water to be transferred to the TCS wastewater tank discharge connection.
5. Use the HMI to program the conditioned water transfer pump (PMP-RTP01-1405 or PMP-RTP01-1406) to transfer only the volume of water determined in Step b.1 to the TCS evaporation ponds.
6. The conditioned water transfer pump (PMP-RTP01-1405 or -1406) will move water to the TCS evaporation ponds when the Preconditions are met. The volume of water transferred can be monitored using the flow meter FM-RTP01-1471.
7. The conditioned water transfer pump will turn off when the volume of water to be transferred that was programmed in Step b.5 is reached.
8. Use the HMI to close FV-RTP01-1415.
9. Use the HMI to open FV-RTP01-1416 so that water will be transferred to the T-IRZ00-0620 conditioned water frac tank, unless otherwise instructed.
10. Use the HMI to return the conditioned water transfer pumps on the filter system A-side (PMP-RTP01-1405 or -1406) to the regular operations schedule, unless otherwise instructed.

c. Transferring liquids/solids from the Influent Tank Farm secondary containment to evaporation ponds via the TCS wastewater tank discharge connection:

1. Notify and coordinate with TCS Operations before water is transferred. Confirm the allowable flow rate and allowable volume of liquid that may be transferred to the TCS evaporation ponds.
2. Open manual valve V-RTP01-1105C and then close manual valve V-RTP01-1105A.
3. Plug in sump pump PMP-RTP01-1105. Keep track of the volume of liquids/solids transferred to the TCS evaporation ponds using the flow meter FM-RTP01-1171.
4. When the maximum allowable volume determined in Step c.1 has been reached **or** all liquids/solids in the sump have been pumped before the maximum allowable volume has been reached, unplug the sump pump.
5. Open manual valve V-RTP01-1105A and then close manual valve V-RTP01-1105C.

d. Transferring conditioned water from the Conditioned Water Storage Tank Farm A-side secondary containment to evaporation ponds via the TCS wastewater tank discharge connection:

1. Notify and coordinate with TCS Operations before water is transferred. Confirm the allowable flow rate and allowable volume of liquid that may be transferred to the TCS evaporation ponds.
2. Open manual valve V-RTP01-1407D and then close manual valve V-RTP01-1407B.
3. Plug in PMP-RTP01-1407 at the outlet. Keep track of the volume of liquids/solids transferred to the TCS evaporation ponds using the flow meter FM-RTP01-1472.
4. When the maximum allowable volume determined in Step e.1 has been reached **or** all liquids/solids in the sump have been pumped before the maximum allowable volume has been reached, unplug the sump pump.
5. Open manual valve V-RTP01-1407B and then close manual valve V-RTP01-1407D.

Standard Operating Procedure
PG&E Topock Remedy-produced Water Conditioning Plant Operation and Maintenance Plan

Title: Water Transfer from Conditioned Water Tank Farm to Tank at MW-20 Bench

Number: RTP-SOP-11_Rev1

Created Date: 11/25/13

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS). The Remedy-produced Water Conditioning Plant (RTP) will treat the water produced by the groundwater remedy prior to re-use or re-injection onsite.

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for transferring water to the conditioned water frac tank T-IRZ00-0620, located at the MW-20 Bench, from the (a.) Remedy A-side conditioned water tank farm and (b.) Freshwater B-side conditioned water storage tank.

This automated procedure is largely controlled through the SCADA/HMI.

2 Drawing Numbers

- IRZ Carbon Amendment Building (conditioned water frac tank, T-IRZ00-0620), Instrumentation: I-06-04
- Conditioned Water Storage Tank Farm A-side, Instrumentation: I-14-01
- Conditioned Water B-side, Instrumentation: I-14-02

3 Equipment List

- Not applicable

4 Preconditions

a. For transferring water from Remedy A-side conditioned water tank farm to the conditioned water frac tank, T-IRZ00-0620:
    - Conditioned water frac tank, T-IRZ00-0620, located at the MW-20 Bench water level is below the high-level set point (LE/LT-IRZ00-0656)
    - Designated Remedy A-side conditioned water storage tank(s) (TNK-RTP01-1401, -1402) water level(s) above the low-level set point (LSL-RTP01-1451, -1453)

b. For transferring water from the Freshwater B-side conditioned water storage tank to the conditioned water frac tank, T-IRZ00-0620:
    - Conditioned water frac tank, T-IRZ00-0620, located at the MW-20 Bench water level is below the high-level set point (LE/LT-IRZ00-0656)

- Freshwater B-side conditioned water storage tank (TNK-RTP01-1410) water level is above the low-level set point (LSL-RTP01-1452)

5 Procedure

a. Transfer water from Remedy A-side conditioned water tank farm to the conditioned water frac tank, T-IRZ00-0620:

   1. The SCADA will control the tanks and equipment configuration per the backwashing schedule. The procedure begins once the Preconditions are met.
   2. The conditioned water transfer pump (PMP-RTP01-1405, -1406) will move the water through actuated valve FV-RTP01-1416 and across the Topock Compressor Station to the pipelines leading to the conditioned water frac tank at the MW-20 Bench (T-IRZ00-0620).

b. Transfer water from B-side conditioned water storage tank to the conditioned water frac tank, T-IRZ00-0620:

   1. The SCADA will control the tanks and equipment configuration per the backwashing schedule. The procedure begins once the Preconditions are met.
   2. Water will flow through motorized valve FV-RTP01-1414 to the conditioned water frac tank at the MW-20 Bench (T-IRZ00-0620).

Standard Operating Procedure
PG&E Topock Power Supply, Distribution and Communication Operation and Maintenance Plan

Title: Transformer Inspection

Number: PWR-SOP-01_Rev0

Creation Date: 6/6/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedures for inspection of three-phase pad-mounted compartmental type distribution transformers and transformer pads. Transformer inspection should be conducted on an annual or more frequent interval.

CAUTION: Do NOT open the cabinet of the transformer. The transformer contains hazardous voltage. Topock personnel are typically not trained to perform interior transformer maintenance. If interior transformer inspection or maintenance is necessary, the Maintenance Supervisor should arrange for an electrician to conduct the maintenance.

If unsuitable conditions are encountered that cannot be fixed using this procedure, the operator should take photographs to document the unsuitable conditions and contact the Maintenance Supervisor to determine how to proceed.

2 Equipment and Supplies List

- Health and Safety Plan
- Appropriate personal protective equipment (PPE)
- Manufacturer's installation and operation manual
- Vehicle
- Camera (to document any unsuitable conditions that are observed)
- Broom
- Shop-vac
- Can of touch-up paint and paintbrush
- Dry, clean towel
- Spray bottle filled with water

3 Procedures

1. Inspect the concrete pad of the transformer for the following:
    a. No liquid accumulation on or surrounding the concrete pad.
        i. If liquid accumulation is present, inspect the liquid accumulation to see if it has a sheen and/or petroleum odor.
        ii. If the liquid accumulation has no sheen and/or petroleum odor, remove using a shop-vac.
        iii. If the liquid accumulation has a sheen and/or petroleum odor, verify that the transformer oil is a non-hazardous waste by referring to its SDS (in the Health and Safety Plan)
            1. If the leaked transformer oil is a non-hazardous waste, remove using a shop-vac.
            2. If the leaked transformer oil is a hazardous waste, remove using absorbent.
    b. No excessive soil or dust on the concrete pad.
        i. If excessive soil or dust is present, sweep off of the concrete pad using a broom.
    c. No signs of concrete corrosion.
    d. No signs of concrete breakage or cracks.
    e. No signs of foundation settlement.
2. Inspect all exposed surfaces of the transformer exterior cabinet for the following:

    CAUTION: If severe damage on the exterior of the transformer is present, do NOT attempt to fix the transformer. Contact the Maintenance Supervisor so an appropriately trained electrical technician can perform maintenance activities.

    WARNING: The transformer cabinet may be very hot from sitting in the sun. Appropriate PPE such as leather gloves should be worn when touching the transformer exterior cabinet.

    a. Cabinet handle is locked and intact.
    b. Specification plate is present and legible on the transformer.
    c. The surface of the transformer cabinet (at a shaded portion, if possible) is not excessively hot to the touch.
    d. All bolts and hinges are intact.
    e. No evidence of tampering.
    f. No evidence of battered metal or gouges.
    g. No dents or deformities.
    h. No noticeable vibration originating from the transformer.
    i. No unusual sound originating from the transformer.
    j. No graffiti.
        i. If graffiti is present, paint over the graffiti using the touch-up paint and paintbrush.
    k. No weathered or scratched paint.
        i. If paint is weathered or scratched, paint over weathered or scratched section using the touch-up paint and paintbrush.
    l. No excessive soil or dust on the top/sides of the transformer.

   i. If excessive soil or dust on the top/sides of the transformer is present, wipe down using the dry, clean towel. Use spray bottle with water to clean if necessary.

m. No pooled water on the roof of the transformer.

   i. If pooled water is present on the roof of the transformer, remove using the shop-vac.

3. If any issues were observed in Steps 1 or 2 that were not able to be resolved on the spot such that further maintenance work is needed, take photographs to document the unsuitable conditions and contact the Maintenance Supervisor so any needed parts can be procured and work can be scheduled.

Standard Operating Procedure
PG&E Topock Power Supply, Distribution and Communication
Operation and Maintenance Plan

Title: Solar Photovoltaic System Maintenance

Number: PWR-SOP-02_Rev0

Creation Date: 6/3/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedures for operating and maintaining the solar photovoltaic (PV) systems. The solar PV systems are a source of secondary power supply and are located at select remote well locations, and possibly at the Operations Building at the Transwestern Bench and the Remedy-produced Water Conditioning Building inside TCS.

These operation and maintenance (O&M) procedures are to be performed at the following frequencies, or as recommended by the manufacturer:

Maintenance Task	Weekly	Monthly	Every 3 Months
a. Battery visual inspection	X		
b. Battery cleaning		X	
c. Battery voltage check		X	
d. Solar panel cleaning			X
e. Solar panel visual inspection			X
f. Inverter/battery charger and charge controller inspection	X		
g. Wiring and connections inspection	X		

The manufacturer's installation and operation manual should be referenced while performing O&M procedures. The procedures in this SOP are for sealed gel or Absorbent Glass Mat (AGM) batteries.

If unsuitable conditions of the solar PV systems are observed at any time throughout the procedure, the operator should attempt to fix them, if feasible. If the conditions cannot be fixed, the operator should take photographs to document the unsuitable conditions and contact the Maintenance Supervisor after performing the inspection to determine how to proceed.

2 Equipment and Supplies List

- Health and Safety Plan
- Appropriate personal protective equipment (PPE)
- Manufacturer's installation and operation manual
- Vehicle
- Camera (to document any unsuitable conditions that are observed)
- Spare battery to replace damaged or malfunctioning battery if needed
- For (b.) Battery cleaning:
  - Dry cloth
  - Damp cloth
  - Spray bottle filled with deionized (DI) water
  - Spray bottle filled with DI water mixed with baking soda
  - Metal brush (Do not use metal files)
  - Petroleum jelly or grease, if necessary (to prevent battery corrosion)
- For (c.) Battery voltage check:
  - Volt meter
- For (d.) Solar panel cleaning:
  - Spray bottle filled with DI water
  - Non-abrasive sponge
  - Dry cloth
- For (g.) Wiring and connection inspection:
  - Non-abrasive dry cloth
  - Spare fuses
  - Spare circuit breakers
  - Spare connector screws

3 Procedures

a. Battery inspection:

CAUTION: Electrical hazard present when handling the batteries. Perform the following steps with care.

i. Visually inspect the batteries for the following conditions:

1. Batteries are charging.
   - If batteries are not charging, troubleshoot with reference to the procedures below for (c.) Battery voltage check, (f.) Inverter/battery charger and charge controller inspection, and (g.) Wiring and connections inspection.
2. Batteries are dry.
   - If batteries are wet, carefully wipe down the outside of the battery with a dry towel.
3. Batteries are free of cracks.
   - If a battery is cracked: Use CAUTION while inspecting and handling the battery. Reference the manufacturer's installation and operation manual and follow the steps to remove the battery from the solar PV system and replace it with the spare battery. Dispose of the cracked battery in accordance with the Hazardous Materials Business Plan.

4. Batteries are free of corrosion (typically white coating) at the terminals or connectors.
    - If corrosion is observed, refer to (b.) Battery cleaning step vii below.

b. Battery cleaning:

CAUTION: Electrical hazard is present when handling the battery. Perform the following steps with care.

i. Switch off/disconnect all loads (devices powered by the battery system).

ii. Turn off or disconnect the solar charge.

iii. Turn off the circuit breaker to and from the battery bank.

iv. Ensure that the caps on the batteries are sealed tight to keep any dirt from entering the battery.

v. Wipe the top and outside of the battery with a damp cloth.

vi. If corrosion is present at the terminals:

1. Apply water and baking soda solution to the affected area and wipe with a damp cloth.
2. Stubborn areas should be scrubbed with a metal brush (NOT metal file).
3. After cleaning, rinse the terminals with water.
4. Apply petroleum jelly or grease to the connected terminal to prevent future corrosion.

vii. Use a dry cloth to dry any wetted areas on the battery to ensure that it is safe to connect to loads and solar charge.

viii. CAREFULLY reconnect the loads to the system.

ix. Verify that positive and negative battery terminals are wired properly (see manufacturer's instruction manual).

x. Turn on or reconnect the solar charge.

xi. Turn on the circuit breaker to and from the battery bank.

xii. Check that the battery is properly connected and functioning.

xiii. Move to the next cell, if applicable, and repeat the procedure.

c. Battery voltage check:

i. CAUTION: Electrical hazard is present when working with battery volt meter. Perform the following steps with care.

ii. Connect the volt meter's positive lead to the battery's positive terminal and the negative lead to the negative terminal of the battery.

iii. If the battery voltage is not between 11 and 13 volts, the battery will need to be replaced. Reference the manufacturer's installation and operation manual and follow the steps to remove the battery from the solar PV system and replace it with the spare battery. Dispose of the cracked battery in accordance with the Hazardous Materials Business Plan.

d. Solar panel cleaning:

i. To remove a layer of dust and dirt from the modules, simply wash the panel with DI water.

ii. If the module has a thicker layer of dirt/grime/bird droppings etc. that is harder to remove, wash with cold water and rub the panel surface with a non-abrasive sponge.

iii. Do not use a metal brush or detergents to clean solar panel surface.

e. Solar panel visual inspection:

i. It is optimal to perform visual inspections of the solar panels after they have been cleaned.

ii. Visually inspect that the panel is standing upright (not fallen over) and the surface is generally facing south.

iii. Visually inspect the glass surface of the panel for the following:

1. Glass surface is clean.
    - If surface of glass is dirty, clean with reference to the procedure above for (d.) Solar panel cleaning.
2. Glass surface is intact (parts have not been lost/stolen).
3. Glass surface is free of cracks and chips.
4. Glass surface is free of de-lamination.
5. Glass surface is free of fogged glazing.
6. Glass surface is free of water leaks.
7. Glass surface is free of discoloration.

iv. Visually inspect the array mounting frame for the following:

1. Frame bolts are free of rust.
2. Frame bolts are free of damage.
3. Array mounting frame and glass solar panels are firmly secured.

v. Visually inspect that the wires in the junction boxes for the following:

1. Wires are not chewed by rodents or insects.
2. No excessive moisture is present.

vi. If unsuitable conditions exist that cannot be immediately resolved, contact the Maintenance Supervisor to procure replacement equipment and schedule the replacement work.

f. Inverter/battery charger and charge controller inspection:

CAUTION: Electrical hazard is present when working with inverter/battery charger and charge controller. Perform the following steps with care.

i. Use a dry cloth to wipe away any accumulated dirt/dust.

ii. Visually inspect the inverter/battery charger and charge controller for the following:

iii. All the indicators such as LED lights are working.

iv. Wires leading to and from this device are not loose.

v. Check that the charge controller indicates that the system is charging when the sun is up.

g. Wiring and connections inspection:

CAUTION: Electrical hazard is present when working with wiring and connections. Perform the following steps with care.

i. The following sections of conduit and wiring and their connections should be inspected for any signs of damage:

- Solar panels to the charge controller
- Charge controller to the battery bank
- Inverter/charger to the battery bank
- Inverter/charger to the loads (devices powered by the system)
- Battery bank to the loads

ii. Use a dry cloth to wipe away any accumulated dirt/dust on wiring and connections.

iii. Inspect wiring installations for any cracks, breaks or deterioration in the insulation/conduits.

iv. Inspect panel boxes for the following:

    1. Rodents/insects and/or their nests.
    2. No excessive moisture is present.

v. Inspect connections for any corrosion and/or burning.

vi. Check that switches do not spark when turned on or off.

vii. If unsuitable conditions exist that cannot be immediately resolved, contact the Maintenance Supervisor to procure replacement equipment and schedule the replacement work.

Standard Operating Procedure
PG&E Topock Power Supply, Distribution and Communication Operation and Maintenance Plan

Title: Communication Panel Inspection and Maintenance

Number: PWR-SOP-03_Rev0

Creation Date: 7/10/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedures for inspecting and maintaining the communication panels. The communication panels are located at select node locations, and at the TCS. Each communications panel is a connection and redistribution point for network equipment including process logic controllers (PLCs), human-machine interfaces (HMIs), remote input/output (I/O) panels, and personal computers.

All procedures are to be performed by appropriately trained electrical technicians. Only arc-flash qualified technicians are authorized to open electrical enclosures and perform work within them.

The manufacturer's installation and operation manual should be referenced while performing O&M procedures.

If unsuitable conditions of the communication panels are observed at any time throughout the procedure, the operator should attempt to fix them, if feasible. If the conditions cannot be fixed, the operator should contact the Maintenance Supervisor after performing the inspection to determine how to proceed.

2 Drawing Numbers

- Not applicable

3 Equipment and Supplies List

- Health and Safety Plan
- Appropriate personal protective equipment (PPE), including appropriately caloric-rated Nomex clothing, gloves, and face protection
- Communication Panel manufacturer's installation and operation manual
- Vehicle for mobilization to site
- For (b.) UPS power check and (c.) Power supply voltage check:
  - Multimeter
  - Multimeter manufacturer's instruction manual

  - Replacement batteries (for UPS power check)
  - UPS manufacturer's instruction manual

- For (d.) Ethernet switch wiring and connections inspection:
  - Replacement Ethernet cable
- For (e.) Wiring and connection inspection:
  - Screwdrivers and wire cutter
- For (f.) Panel cleaning and (i.) ventilation/cooling inspection:
  - Dry cloth
  - Hand vacuum
  - Alcohol-based cleaning product (for panel cleaning)
- For (h.) Radio inspection:
  - Radio manufacturer's instruction manual
  - Power over Ethernet (POE) unit manufacturer's instruction manual
- For (i.) Ventilation/cooling inspection:
  - Replacement ventilation filters

4 Procedures

a. Panel visual inspection:

CAUTION: Electrical hazard is present when working inside the communication panel. Perform the following steps with care.

i. Inspect the wire connections for the following conditions:
   - Loose wires.
   - Burnt wires.
   - Flashing red lights or no power lights on.

ii. Inspect for broken or damaged equipment.

iii. Inspect alignment of panel and door.

iv. Inspect panel anchorage.

v. Inspect ground connection.

vi. Inspect all painted surfaces for corrosion, chips or gouges, and heat damage.

vii. Inspect all labels to make sure they are intact.

viii. Inspect all duct seals.

ix. Inspect caulking around base of panel.

x. Inspect concrete equipment pad for damage and standing water.

b. UPS power check:

CAUTION: Electrical hazard is present when working on the UPS. Perform the following steps with care.

i. Reference the UPS manufacturer's instruction manual for direction on how to check relay and see if relay is energized.

   1. If energized then UPS is supplying power.

ii. Unplug UPS from power outlet.

1. Confirm relay is de-energized.

iii. Reference the UPS manufacturer's instruction manual and multimeter manufacturer's instruction manual for direction on how to check the voltage of the UPS battery using the multimeter.

1. If the voltage of a battery is not between the target range specified by the manufacturer, it must be replaced. Reference the manufacturer's installation and operation manual and follow the steps to remove the battery from the UPS system and replace it with a replacement battery. Dispose of the defective or dead battery in accordance with the Hazardous Materials Business Plan.

iv. Plug UPS back into its power outlet.

v. Reference the UPS manufacturer's instruction manual for instruction on how to perform a load test on the UPS and see if the UPS can still handle the load requirements of the communications panel.

c. Power supply voltage check:

CAUTION: Electrical hazard is present when working with the power supply. Perform the following steps with care.

CAUTION: Working in AC voltage setting can be dangerous, and using a multi-meter in the AC voltage setting is not recommended.

i. Check power supply voltage. Use multi-meter and make sure voltage is within ±1 volt of 24 volts DC.

1. Plug the multimeter black probe into the "COM" port.
2. Plug the multimeter red probe into the "mAVΩ" port.
3. Set the multimeter to "200V" in the DC (direct current) range.
4. Connect the multimeter to the power supply as specified in the power supply manufacturer's instruction manual.
5. Check to see if the voltage is within 23 to 25 volts.
6. If voltage is not within 23 to 25 volts, troubleshoot the power supply as instructed in the manufacturer's instruction manual.
7. If further maintenance or replacement is required, contact the Maintenance Supervisor.

d. Ethernet switch wiring and connections inspection:

i. Inspect the Ethernet switch unit for power.

ii. Inspect the Ethernet cables for damage.

iii. Check that all cables are plugged in securely.

iv. Reconnect or replace cables as needed.

e. Wiring and connections inspection:

CAUTION: Electrical hazard is present when working with wiring and connections. Perform the following steps with care.

i. Use a dry cloth to wipe away any accumulated dirt/dust on wiring and connections.

ii. Inspect wiring installations for any cracks, breaks or deterioration in the insulation/conduits.

iii. Inspect panel boxes for the following:
- Rodents/insects and/or their nests.
- No excessive moisture is present.

iv. Inspect connections for any corrosion and/or burning.

v. Check that switches do not spark when turned on or off.

vi. If unsuitable conditions exist that cannot be immediately resolved, contact the Maintenance Supervisor to procure replacement equipment and schedule the replacement work.

f. Panel cleaning:

CAUTION: Electrical hazard is present when working inside the communication panel. Perform the following steps with care.

i. Remove insects or rodents and their nests.

ii. Vacuum out all debris, dirt, and/or sand.

iii. Use cloth with alcohol-based cleaning product to wipe down panel.

g. Fiber inspection:

i. Confirm that all fiber cables are plugged in correctly.

ii. Confirm that spare fiber sockets have a dust cap installed.

h. Radio inspection:

CAUTION: Electrical hazard is present when working with wiring and connections. Perform the following steps with care.

i. Inspect the radio for the following conditions:

1. Ethernet cable is connected.

a. If Ethernet cable is not connected, plug in the Ethernet cable and reference the procedures above for (c.) Ethernet switch wiring and connections inspection.

2. Radio and antenna are free of cracks or chips.

a. If a radio or antenna are cracked:

i. Check to see if radio is still in working order with reference to the radio manufacturer's instruction manual.

ii. If the radio is not in working order, contact the Maintenance Supervisor to replace the antenna or replace the radio with one that is programmed specifically for that well site.

3. Powered inspection:

a. Check that the POE unit LED indicator lights to confirm the POE unit is functioning.

i. If not functioning, inspect cables.

ii. If cables are in good condition, troubleshoot the POE with reference to the manufacturer's instruction manual. If further maintenance is required, contact the Maintenance Supervisor.

b. Check the back of the radio and antenna to make sure power light indicator is lit.

i. If not powered, inspect cables. Reconnect or replace with new cable as needed.

i. Ventilation/cooling inspection:

CAUTION: Electrical hazard is present when working with wiring and connections. Perform the following steps with care.

i. Visually inspect ventilation/cooling for the following conditions:

1. Ventilation is powered.
2. Ventilation filter is intact.

CAUTION: Make sure to power down ventilation before cleaning.

a. Use vacuum and dry cloth to clean as needed.

i. Clean or replace filter(s) as needed.

b. Power ventilation back up.

Standard Operating Procedure
PG&E Topock Power Supply, Distribution and Communication Operation and Maintenance Plan

Title: Remote Well(s) Panel Inspection and Maintenance

Number: PWR-SOP-04_Rev0

Creation Date: 7/22/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedures for inspecting and maintaining the remote well panels. The remote well panels are located at select well locations. Each remote well panel is a distribution point for data collected by analytical equipment for display and recording purposes via the Supervisory Control and Data Acquisition (SCADA) system. The procedures include maintenance of the Solar Photovoltaic (PV) System which is a source of secondary power supply located at select remote well locations.

All procedures are to be performed by appropriately trained electrical technicians. Only arc-flash qualified technicians are authorized to open electrical enclosures and perform work within them.

The manufacturer's installation and operation manual should be referenced while performing O&M procedures.

If unsuitable conditions of the remote wells are observed at any time throughout the procedure, the technician should attempt to fix them, if feasible. If the conditions cannot be fixed, the technician should contact the Maintenance Supervisor after performing the inspection to determine how to proceed.

2 Drawing Numbers

- Not applicable

3 Equipment and Supplies List

- Health and Safety Plan
- Appropriate personal protective equipment (PPE), including appropriately caloric-rated Nomex clothing, gloves, and face protection
- Vehicle for mobilization to the site
- Battery manufacturer's installation and operation manual
- Power supply manufacturer's instruction manual

- Multimeter
- For (c.) Ethernet switch wiring and connections inspection:
  - Replacement Ethernet cable
- For (d.) Wiring and connection inspection:
  - Brush
  - Screwdrivers and wire cutter
- For (e.) Panel cleaning and (g.) Ventilation/cooling inspection:
  - Dry cloth
  - Hand vacuum
  - Alcohol-based cleaning product (for panel cleaning)
- For (f.) Radio inspection:
  - Radio manufacturer's instruction manual
  - Power over Ethernet (POE) unit manufacturer's instruction manual
- For (g.) Ventilation/cooling inspection:
  - Replacement ventilation filter
- For (h.) Battery inspection and (j.) Battery voltage check:
  - Replacement batteries
  - Dry towel (for battery inspection)
- For (i.) Battery cleaning:
  - Dry cloth
  - Damp cloth
  - Spray bottle filled with deionized (DI) water
  - Spray bottle filled with DI water mixed with baking soda
  - Metal brush (do not use metal files)
  - Petroleum jelly or grease, if necessary (to prevent battery corrosion)
- For (k.) Solar panel cleaning:
  - Spray bottle filled with DI water
  - Non-abrasive dry cloth

4 Procedures

a. Panel visual inspection:

CAUTION: Electrical hazard is present when working inside the communication panel. Perform the following steps with care.

i. Inspect the wire connections for the following conditions:
   - Loose wires.
   - Burnt wires.
   - Flashing red lights or no power lights on.

ii. Inspect for broken or damaged equipment.

iii. Inspect alignment of panel and door.

iv. Inspect panel anchorage.

v. Inspect ground connection.

vi. Inspect all painted surfaces for corrosion, chips or gouges, and heat damage.

vii. Inspect all labels to make sure they are intact.

viii. Inspect all duct seals.

ix. Inspect caulking around base of panel.

x. Inspect concrete equipment pad for damage and standing water.

b. Power supply voltage check:

CAUTION: Electrical hazard is present when working with the power supply. Perform the following steps with care.

CAUTION: Working in AC voltage setting can be dangerous, and using a multi-meter in the AC voltage setting is not recommended.

i. Check power supply voltage. Use multi-meter and make sure voltage is within ±1 volt of 24 volts DC.

1. Plug the multimeter black probe into the “COM” port.
2. Plug the multimeter red probe into the “mAVΩ” port.
3. Set the multimeter to “200V” in the DC (direct current) range.
4. Connect the multimeter to the power supply as specified in the power supply manufacturer’s instruction manual.
5. Check to see if the voltage is within 23 to 25 volts.
6. If voltage is not within 23 to 25 volts, troubleshoot the power supply as instructed in the manufacturer’s instruction manual.
7. If further maintenance or replacement is required, contact the Maintenance Supervisor.

c. Ethernet switch wiring and connections inspection:

i. Inspect the Ethernet switch unit for power.

ii. Inspect the Ethernet cables for damage.

iii. Check that all cables are plugged in securely.

iv. Reconnect or replace cables as needed.

d. Wiring and connections inspection:

CAUTION: Electrical hazard is present when working with wiring and connections. Perform the following steps with care.

i. Use a brush to wipe away any accumulated dirt/dust on wiring and connections.

ii. Inspect wiring installations for any cracks, breaks or deterioration in the insulation/conduits.

iii. Inspect panel boxes for the following:
- Rodents/insects and/or their nests.
- No excessive moisture is present.

iv. Inspect connections for any corrosion and/or burning.

v. Check that switches do not spark when turned on or off.

vi. If unsuitable conditions exist that cannot be immediately resolved, contact the Maintenance Supervisor to procure replacement equipment and schedule the replacement work.

e. Panel cleaning:

CAUTION: Electrical hazard is present when working inside the communication panel. Perform the following steps with care.

i. Remove insects or rodents and their nests.

ii. Vacuum out all debris, dirt, and/or sand.

iii. Use cloth with alcohol-based cleaning product to wipe down panel.

f. Radio inspection:

CAUTION: Electrical hazard is present when working with wiring and connections. Perform the following steps with care.

i. Inspect the radio for the following conditions:

1. Ethernet cable is connected.

a. If Ethernet cable is not connected, plug in the Ethernet cable and reference the procedures above for (c.) Ethernet switch wiring and connections inspection.

2. Radio and antenna are free of cracks or chips.

a. If a radio or antenna are cracked:

i. Check to see if radio is still in working order with reference to the radio manufacturer's instruction manual.

ii. If the radio is not in working order, contact the Maintenance Supervisor to replace the antenna or replace the radio with one that is programmed specifically for that well site.

3. Powered inspection:

a. Check that the POE unit is powered up.

i. If not powered, inspect cables.

ii. If cables are in good condition, troubleshoot the POE with reference to the manufacturer's instruction manual. If further maintenance is required, contact the Maintenance Supervisor.

b. Check the back of the radio and antenna to make sure power light indicator is lit.

i. If not powered, inspect cables. Reconnect or replace with new cable as needed.

g. Ventilation/cooling inspection:

CAUTION: Electrical hazard is present when working with wiring and connections. Perform the following steps with care.

i. Visually inspect ventilation/cooling for the following conditions:

1. Ventilation is powered.

2. Ventilation filter is intact.

CAUTION: Make sure to power down ventilation before cleaning.

a. Use vacuum and dry cloth to clean as needed.

i. Clean or replace filter(s) as needed.

b. Power ventilation back up.

h. Battery inspection:

CAUTION: Electrical hazard present when handling the batteries. Perform the following steps with care.

i. Inspect the batteries for the following conditions:

1. Batteries are charging.

a. If batteries are not charging, troubleshoot with reference to the procedures below for (j.) Battery voltage check, (m.) Inverter/battery charger and charge controller inspection, and (n.) PV System wiring and connections inspection.

2. Batteries are dry.

a. If batteries are wet, carefully wipe down the outside of the battery with a dry towel.

3. Batteries are free of cracks.

a. If a battery is cracked: Use CAUTION while inspecting and handling the battery. Reference the manufacturer's installation and operation manual and follow the steps to remove the battery from the solar PV system and replace it with the spare battery. Dispose of the cracked battery in accordance with the Hazardous Materials Business Plan.

4. Batteries are free of corrosion (typically white coating) at the terminals or connectors.

a. If corrosion is observed, refer to (i.) Battery cleaning Step vi below.

i. Battery cleaning:

CAUTION: Electrical hazard is present when handling the batteries. Perform the following steps with care.

i. Switch off/disconnect all loads (devices powered by the battery system).

ii. Turn off or disconnect the solar charge.

iii. Turn off the circuit breaker to and from the battery bank.

iv. Ensure that the caps on the batteries are sealed tight to keep any dirt from entering the battery.

v. Wipe the top and outside of the battery with a damp cloth.

vi. If corrosion is present at the terminals:

1. Apply water and baking soda solution to the affected area and wipe with a damp cloth.
2. Stubborn areas should be scrubbed with a metal brush (NOT metal file).
3. After cleaning, rinse the terminals with water.
4. Apply petroleum jelly or grease to the connected terminal to prevent future corrosion.

vii. Use a dry cloth to dry any wetted areas on the battery to ensure that it is safe to connect to loads and solar charge.

viii. CAREFULLY reconnect the loads to the system.

ix. Verify that positive and negative battery terminals are wired properly (see manufacturer's instruction manual).

x. Turn on or reconnect the solar charge.

xi. Turn on the circuit breaker to and from the battery bank.

xii. Check that the battery is properly connected and functioning.

xiii. Move to the next cell, if applicable, and repeat the procedure.

j. Battery voltage check:

CAUTION: Electrical hazard is present when working with batteries and multimeter. Perform the following steps with care.

i. Connect the multimeter's positive lead to the battery's positive terminal and the negative lead to the negative battery terminal.

ii. If the battery voltage is not between 11 and 13 volts, the battery must be replaced. Reference the manufacturer's installation and operation manual and follow the steps to remove the battery from the solar PV system and replace it with the spare battery. Dispose of the cracked battery in accordance with the Hazardous Materials Business Plan.

k. Solar panel cleaning:

i. Clean solar panels using distilled water (or de-ionized water) and a dry cloth.

ii. Do not use a metal brush or detergents to clean solar panel surface.

l. Solar panel visual inspection:

i. It is optimal to perform visual inspections of the solar panels after they have been cleaned.

ii. Inspect that the panel is standing upright (not fallen over) and the surface is generally facing south.

iii. Inspect the glass surface of the panel for the following:

1. Glass surface is clean.
    a. If surface of glass is dirty, clean with reference to the procedure above for (k.) Solar panel cleaning.
2. Glass surface is intact (parts have not been lost/stolen).
3. Glass surface is free of cracks and chips.
4. Glass surface is free of de-lamination.
5. Glass surface is free of fogged glazing.
6. Glass surface is free of water leaks.
7. Glass surface is free of discoloration.

iv. Inspect the array mounting frame for the following:

1. Frame bolts are free of rust.
2. Frame bolts are free of damage.
3. Array mounting frame and glass solar panels are firmly secured.

v. Inspect that the wires in the junction boxes for the following:

1. Wires are not chewed by rodents or insects.
2. No excessive moisture is present.

vi. If unsuitable conditions exist that cannot be immediately resolved, contact the Maintenance Supervisor to procure replacement equipment and/or schedule the replacement work.

m. Inverter/battery charger and charge controller inspection:

CAUTION: Electrical hazard is present when working with inverter/battery charger and charge controller. Perform the following steps with care.

i. Use a dry cloth to wipe away any accumulated dirt/dust.

ii. Inspect the inverter/battery charger and charge controller for the following:

1. All the indicators such as LED lights are working.
2. Wires leading to and from this device are not loose.
3. Check that the charge controller indicates that the system is charging when the sun is up.

Standard Operating Procedure
PG&E Topock SCADA
Operation and Maintenance Plan

Title: HMI/SCADA Application Backup and Cleaning

Number: SCADA-SOP-01_Rev1

Creation Date: 7/18/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedures for backup and restoration of an installed and fully functional Proficy iFIX human/machine interface (HMI)/supervisory control and data acquisition (SCADA) program. A Proficy iFIX HMI/SCADA system is an open architecture, highly scalable HMI system ranging from simple data entry and validation to total supervisory monitoring and controlling of all plant process data. It provides real time visual information management.

All procedures are to be performed by appropriately trained information technology (IT) technicians. Only qualified technicians are authorized to open electrical enclosures and perform work within them.

The manufacturer's iFIX manuals should be referenced while performing these procedures. The procedures are for iFIX HMI/SCADA software version 5.1 or above.

If unsuitable conditions of the data file transfers are observed at any time throughout the procedure, the operator should attempt to back up and/or restore the files, if feasible. If the data file transfer(s) cannot be fixed, the operator should document the error code, filename, directory, etc. and contact the Maintenance Supervisor to determine how to proceed.

2 Drawing Numbers

- Not applicable

3 Equipment and Supplies List

- Health and Safety Plan
- Manufacturer's iFIX manuals
- For (1.) Manually Back Up iFIX HMI/SCADA Files:
  - Blank CD-ROM or DVD media diskette(s) or portable USB hard disk drive or portable USB flash drive that has sufficient available storage space to perform backup
- For (4.) SCADA/HMI Computer Internal Cleaning:

- Slightly damp lint-free cloth wipe
- Household detergent, if necessary
- Hand vacuum
- LCD screen cleaning cloth and formula

4 Procedures

1. Manually Back Up iFIX HMI/SCADA Files:

1.1. Verify the iFIX HMI/SCADA system computer is “On” and the HMI/SCADA application is running, as follows:

1.1.1. To verify that the iFIX HMI/SCADA system computer is “On,” confirm that the LED light on the front panel of the computer is illuminated blue.

NOTE: If the computer is “Off,” the LED light will not be illuminated.

1.1.2. To verify that the HMI/SCADA application is running:

1. Verify the “iFIX Workspace” icon is on the Windows taskbar.
2. Click the iFIX Workspace icon.
3. Confirm that the HMI/SCADA application appears.

1.2. Export a report of the security configuration:

NOTE: Passwords are not exported with the security configuration report; you must re-enter the passwords manually. This policy is for security purposes.

1.2.1. Open iFIX System Configuration Utility (SCU) application:

1. Click the Windows Start button
2. Click on “All Programs”
3. Click on “Proficy HMI SCADA – iFIX”
4. Click on the “System Configuration” application

- The SCU application will open

1.2.2. On the “Configure” menu, click “Security”.

- The Security Configuration dialog box appears

NOTE: If “Security” is grayed out and cannot be clicked, the system is not set up for security; in this case skip Step 1.2 (Export a report of the security configuration) and proceed to Step 1.3 (Copying iFIX HMI/SCADA files).

1.2.3. On the “File” menu, click “Export”

- The “Select” dialog box appears

1.2.4. Browse to the folder “C:\Program Files\Proficy\Proficy iFIX\LOCAL”

1.2.5. Save the exported file as “Security.RPT” by selecting the “Save” button

1.3. Copying iFIX HMI/SCADA files:

1.3.1. Insert the backup media CD-ROM, DVD, USB HDD, or USB Flash Drive.

1.3.2. Open Windows Explorer:

1. Click the Windows Start button
2. Click “All Programs”
3. Click “Accessories”

4. Click on the “Windows Explorer” application
    - The Windows Explorer application appears.

1.3.3. Verify media storage device has sufficient available storage space to perform backup.

1.3.4. Create a folder named for today’s date (e.g., “2014-07-15”) onto the backup media.

1.3.5. Create new subfolders within the date folder with the following titles:

- HTR
- HTRDATA
- LOCAL
- PIC
- PDB
- RCC
- RCM

1.3.6. Navigate to the SCADA systems “HTR” folder. The default location is “C:\Program Files\Proficy\Proficy iFIX\HTR”; however, your system could be different.

1.3.7. Select and copy all of the .CSV, .CFG and .DAT files.

1.3.8. Paste these files onto the backup media in the HTR folder you created in Steps 1.3.4-1.3.5.

1.3.9. Navigate to the SCADA systems “HTRDATA” folder. The default location is “C:\Program Files\Proficy\Proficy iFIX\HTRDATA”; however, your system could be different.

1.3.10. Select and copy all of the .H04, .H08 and/or .H24 files.

1.3.11. Paste these files onto the backup media in the HTRDATA folder you created in Steps 1.3.4-1.3.5.

1.3.12. Navigate to the SCADA systems “LOCAL” folder. The default location is “C:\Program Files\Proficy\Proficy iFIX\LOCAL”; however, your system could be different.

1.3.13. Select and copy the Security.RPT file, if it exists.

- If the Security.RPT file does not exist because it was determined in Step 1.2 that the system is not set up for security, skip to Step 1.3.15.

1.3.14. Paste this file onto the backup media in the LOCAL folder you created in Steps 1.3.4-1.3.5.

1.3.15. Navigate to the SCADA systems “PIC” folder. The default location is “C:\Program Files\Proficy\Proficy iFIX\PIC”; however, your system could be different.

1.3.16. Select and copy all of the .GRF, .TGD and User.FXG files.

1.3.17. Paste these files onto the backup media in the PIC folder you created in Steps 1.3.4-1.3.5.

1.3.18. Export the existing iFIX process database:

1. Click the iFIX Workspace icon.
2. Confirm that the HMI/SCADA application appears.
3. Press CTRL + W to enter the iFIX Workspace.
4. Verify the “System Tree” is shown on the left by clicking the “Workspace” pulldown menu. If a check mark is shown to the left of “System Tree” the System Tree will be shown. If not, click the “System Tree”. Note: Clicking System Tree menu option turns the tree on or off.

5. In the iFIX Workspace, navigate to the top of the System Tree and find the folder “Database”.
6. Expand the Database folder by double-clicking onto the folder or by clicking the “+” next to the folder.
7. Double-click on "Database Manager". The “Proficy iFIX Database Manager” appears.
8. When the Database Manager opens, it will ask you what node you wish to view.
9. Select “Open Local Node” and click OK.
10. Once the database is loaded in the Database Manager, click the “Export” icon at the top of the screen. The “Save As” dialog window appears.
11. Use the default name and path (“C:\Program Files\Proficy\Proficy iFIX\PDB”) for the export file or provide a new file name and path for the export Process Database file.
12. Go to the “Save As Type” field and select the CSV Files (*.CSV) format.

    Note: All file formats allow any ASCII editor to open/modify this file.
13. Click the “Save” button.
14. Close the Proficy iFIX Database Manager by clicking the “X” at the top right-hand corner of the application.
15. From the iFIX Workspace press CTRL + W to “Switch to Run” mode.

1.3.19. Export/Save the Input/Output (I/O) driver configuration file(s):

1. Open the iFIX SCU application as described in Step 1.2.1.
2. Click the pulldown menu “Configure”.
3. Click “SCADA”, the SCADA Configuration dialog box appears.
4. In the Configured I/O Drivers area, select the I/O driver you would like to export/save. Note: Perform this procedure on all I/O drivers installed on the system.
5. Click the “Configure” button. The driver configuration application appears.
6. Click the pulldown menu “File”.
7. Click “Save As…” to open the dialog box.
8. Navigate to the SCADA systems “PDB” folder (C:\Program Files\Proficy\Proficy iFIX\PDB) and click “Save”.
9. Close the driver configuration application by clicking the “X” at the top right-hand corner of the application.
10. Click “Cancel” on the SCADA Configuration dialog box.
11. Click the pulldown menu “File” and click “Exit” to close the SCU application.

1.3.20. Navigate to the SCADA systems “PDB” folder. The default location is “C:\Program Files\Proficy\Proficy iFIX\PDB”; however, your system could be different.

1.3.21. Select and copy all of the .CSV, .AAD, .PDB, .EVS, .ABR, and .MB1 files.

1.3.22. Paste these files onto the backup media in the PDB folder you created in Steps 1.3.4-1.3.5.

1.3.23. Navigate to the SCADA systems “RCC” folder. The default location is “C:\Program Files\Proficy\Proficy iFIX\RCC”; however, your system could be different.

1.3.24. Select and copy all files within the folder.

1.3.25. Paste these files onto the backup media in the RCC folder you created in Steps 1.3.4-1.3.5.

1.3.26. Navigate to the SCADA systems "RCM" folder. The default location is "C:\Program Files\Proficy\Proficy iFIX\RCM"; however, your system could be different.

1.3.27. Select and copy all files within the folder.

1.3.28. Paste these files onto the backup media in the RCM folder you created in Steps 1.3.4-1.3.5).

2. Backup of iFIX HMI/SCADA Files Using the "iFIX Backup and Restore" Application:

NOTE: A Full Backup includes all of your iFIX files. The default location is "C:\Program Files\Proficy\Proficy iFIX\...":

- ALM path (*.*)
- APP path (*.*)
- HTR path (*.*)
- HTRDATA path (*.*)
- LOCAL path (*.*)
- PDB path (*.*)
- PIC path (*.*)
- RCC path (*.*)
- RCM path (*.*)

2.1. To back up and restore driver configuration files, the driver must be installed and properly configured in the SCU's SCADA Configuration dialog box. Open the SCU application as described in Step 1.2.1.

2.2. Click the pulldown menu "SCADA".

2.3. In the Configured I/O Drivers area, verify a driver is installed.

- If a driver is not installed, contact your System Administrator and/or SCADA Developer. However, you may proceed with the Backup and Restore wizard.

2.4. Be aware that configuration files for 7.x series drivers saved outside of the iFIX database directory will not be backed up with the Backup and Restore Wizard. If you installed iFIX to the default location, the path to the iFIX database directory is: C:\Program Files\Proficy\Proficy iFIX\PDB. (Follow Step 1.3.19 [Export/Save the I/O Driver Configuration file(s)] to properly save the driver configuration files to the correct directory.)

2.5. Access the Backup and Restore wizard:

1. Click the Windows Start button
2. Click All Programs
3. Click Proficy HMI SCADA – iFIX
4. Click Tools
5. Click Backup and Restore Wizard

NOTE: You can also access the application by locating and running the BackupRestore.exe file in the Proficy iFIX folder, which is the folder where you installed iFIX.

2.6. In the Backup and Restore Wizard main screen, select the Full Backup option.

2.7. Click the Backup button.

2.8. Enter a backup file path and filename into the field or browse to select one. This file path should be pointed to the backup media.

NOTE: By default, the wizard will select the path C:\Program Files\Proficy\Proficy iFIX\ProjectBackup\ nodename.FBK.

2.9. Click the Finish button to begin archiving all of your files onto the backup media.

3. SCADA/HMI Computer Hard Disk Drive Space Check:

3.1. Select the Windows Start button and Click “Computer”.

- The Windows Explorer application appears.

3.2. Click on Computer in the left Explorer window pane.

- A list of the Hard Disk Drives appears in the right window pane.

3.3. Verify and note the total disk space available on all drives.

4. SCADA/HMI Computer Internal Cleaning:

4.1. Close all running applications.

4.2. Shut the computer off by selecting the Windows Start button and Shutdown.

4.3. Disconnect the power cable from the back of the computer.

CAUTION: When cleaning the back of the computer, make sure not to disconnect any cables, connectors, or plugs that are connected besides the power plug/cable.

4.4. Using a slightly damp lint-free cloth wipe, clean the metal/plastic case that houses the PC components.

- For stubborn stains, add a little household detergent to the cloth. Do not use a solvent cleaner on plastics.

4.5. Verify all vents and air holes are free of hair and/or lint by rubbing the cloth over the holes and vents. Vacuum around each of the hole, vents, and crevices of the computer.

4.6. Remove the computer case door to access the internal computer components.

4.7. Use a hand vacuum to remove all lint, dust, hair, and etc. from inside the computer case.

CAUTION: Spraying compressed air into a fan or cleaning a fan with a vacuum may cause damage.

4.8. Install the computer case door.

4.9. Use a vacuum and/or damp lint-free cloth to remove lint, dust, hair, dirt, etc. from the keyboard.

4.10. Clean the LCD monitor screen with an LCD cleaning cloth. If a dry cloth does not completely clean the screen, apply LCD cleaning formula and wipe the screen gently.

4.11. Plug in the power cable.

4.12. Turn on the computer by pressing the “On” button.

Standard Operating Procedure
PG&E Topock SCADA
Operation and Maintenance Plan

Title: SCADA Historian Backup and Cleaning

Number: SCADA-SOP-02_Rev0

Creation Date: 7/18/2014

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedures for backup of the Proficy Historian. Proficy Historian is a plant-wide data historian that collects, archives, and distributes large volumes of real-time information quickly and easily.

All procedures are to be performed by appropriately trained information technology (IT) technicians. Only qualified technicians are authorized to open electrical enclosures and perform work within them.

The manufacturer's Proficy Historian manuals should be referenced while performing these procedures. The procedures in this SOP are for Proficy Historian software version 5.0 or above.

If unsuitable conditions of the data file transfers are observed at any time throughout the procedure, the operator should attempt to back up and/or restore them, if feasible. If the data file transfer(s) cannot be fixed, the operator should document the error code, filename, directory, etc. and contact the Maintenance Supervisor to determine how to proceed.

2 Drawing Numbers

- Not applicable

3 Equipment and Supplies List

- Health and Safety Plan
- Manufacturer's Proficy Historian manuals
- Blank CD-ROM or DVD media diskette(s) or portable USB hard disk drive or portable USB flash drive that has sufficient available storage space to perform backup
- Lint-free cloth wipe

- LCD cleaning cloth and formula
- Water
- Rubbing alcohol
- Hand vacuum

4 Procedures

1. Proficy Historian Manual File Backup:

   1.1. Verify the Proficy Historian system computer is “On” and the Proficy Historian application is running, as follows:

      1.1.1. To verify that the Proficy Historian system computer is “On,” confirm that the LED light on the front panel of the computer is illuminated blue.

      NOTE: If the computer is “Off,” the LED light will not be illuminated.

      1.1.2. To verify that the Proficy Historian application is running:

         a. Verify the “Proficy Historian” icon is on the Windows taskbar.
         b. Click the Proficy Historian icon.
         c. Confirm that the Proficy Historian application appears.

   1.2. Copying Proficy Historian files:

      1.2.1. Insert the backup media CD-ROM, DVD, USB HDD, or USB Flash Drive.

      1.2.2. Create a folder of today’s date (e.g., “ 2014-07-15”) onto the backup media.

      1.2.3. Create a new subfolder within the date folder called “HISTORIAN ARCHIVE.”

      1.2.4. Open Windows Explorer application:

         1. Click the Windows Start button
         2. Click “All Programs”
         3. Click “Accessories”
         4. Click on the “Windows Explorer” application

            - The Windows Explorer application appears.

      1.2.5. Navigate to the Historian ”Archives” folder. The default location is “C:\Program Files\GEFanuc\Proficy Historian\Archives”; however, your system could be different.

      1.2.6. Select and copy all of the files.

      1.2.7. Paste these files onto the backup media in the HISTORIAN ARCHIVE folder you created earlier (see Step 1.2.3 above).

2. Historian Server Computer Hard Disk Drive Space Check:

   2.1. Select the Windows Start button and Click “Computer.” The Windows Explorer application appears.

   2.2. Click on Computer in the left window pane. A list of the Hard Disk Drives appears in the right window pane.

   2.3. Verify and note the total disk space available on all drives.

3. Historian Server Computer Internal Cleaning:

   3.1. Close all running applications.

3.2. Shut the computer off by selecting the Windows Start button and Shutdown.

3.3. Disconnect the power cable from the back of the computer.

CAUTION: When cleaning the back of the computer, make sure not to disconnect any cables, connectors, or plugs that are connected besides the power plug/cable.

3.4. Using a slightly damp lint-free cloth wipe, clean the metal/plastic case that houses the PC components.

- For stubborn stains, add a little household detergent to the cloth. Do not use a solvent cleaner on plastics.

3.5. Verify all vents and air holes are free of hair and/or lint by rubbing the cloth over the holes and vents. Vacuum around each of the hole, vents, and crevices of the computer.

3.6. Remove the computer case door to access the internal computer components.

3.7. Use a hand vacuum to remove all lint, dust, hair, and etc. from inside the computer case.

CAUTION: Spraying compressed air into a fan or cleaning a fan with a vacuum may cause damage.

3.8. Install the computer case door.

3.9. Use a vacuum and/or damp lint-free cloth to remove lint, dust, hair, dirt, etc. from the keyboard.

3.10. Clean the LCD monitor screen with an LCD cleaning cloth. If a dry cloth does not completely clean the screen, apply LCD cleaning formula and wipe the screen gently.

3.11. Plug in the power cable.

3.12. Turn on the computer by pressing the “On” button.

Standard Operating Procedure
PG&E Topock Moabi Regional Park CHQ
Operation and Maintenance Plan

Title: Offsite Hauling of Wastewater
Number: CHQ-SOP-01_Rev0
Creation Date: 2/2/2015

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure to transfer accumulated non-hazardous wastewater from the 1,000 gallon remedy-produced water tank at the Construction Headquarters (CHQ) yard at Moabi Regional Park to a subcontracted tanker truck.

2 Drawing Numbers

- C-15-01: Construction Headquarters Yard Plan
- C-15-06: Civil Details

3 Equipment

- Appropriate PPE
- Health and Safety Plan
- 5-gallon buckets
- Spill kit
- Water hose
- Wheel chocks to be placed behind tanker truck tires

4 Procedure

1. Loading site preparation
    - 1.1 Inspect subcontractor parking area for signs of settling or wear
    - 1.2 Confirm that load-out hose is properly stored and not in the path of trucks entering the loading area
    - 1.3 Visually inspect load-out hose for signs of wear
    - 1.4 Confirm that necessary hoses and connections are present

2. Truck staging and hook-up

2.1 Instruct truck driver not to exceed 5 miles per hour (mph) while driving inside the CHQ yard

2.2 Confirm that driver and equipment meet job requirements

1. Verify that the driver has completed a pre-trip inspection on the truck and trailer
2. Verify that the driver currently driving the truck is the same driver who performed the pre-trip inspection

NOTE: If any deficiencies are discovered per Step 2.2, contact the Maintenance Supervisor before proceeding.

2.3 Use a spotter to direct truck driver during approach and alignment of truck near utility pad

1. Spotter to use hand signals to stop truck when the front of the trailer is in position
2. Ensure that there is enough room between the truck and fence for access

2.4 Place wheel chocks behind truck tires once truck is parked

2.5 Place 5-gallon bucket under trailer's inlet connection

2.6 Have driver hook up to the load-out hose

NOTE: Driver is responsible for:

- Attaching the load-out hose to the truck
- Making sure the truck tank is vented
- Determining how many gallons are to be loaded
- Disconnecting the load-out hose
- Operating the load valve (trailer valve) on the truck

Operator is responsible for:

- All valves upstream of the load-out hose
- Telling the driver how many gallons have been loaded
- Turning the remedy-produced water tank transfer pump on and off

2.7 Connect load-out hose to the dry-break coupling on the remedy-produced water tank

2.8 Manually check that pipe, hose, and connections are secure

1. Secure any loose connections

2.9 Place 5-gallon buckets under hose connections in transfer equipment

2.10 Have driver check truck valves and vents

2.11 Confirm with driver that truck is ready to receive water

2.12 Operator will turn on the remedy-produced water tank transfer pump

1. Turn the hand-off-auto switch on the pump panel to "AUTO"
2. Operator to visually inspect for leaks
3. Operator to monitor the level in the tank

4. Operator to instruct the driver when the tank is empty
5. Operator to place the hand-off-auto switch into the “OFF” mode to stop pump

2.13 Have driver close the trailer valve

3. Truck disconnection
   - 3.1 Confirm that 5-gallon buckets are under hose connection points
   - 3.2 Have driver open connection to truck (water will be in hose)
   - 3.3 Have driver disconnect load-out hose from trailer valve
   - 3.4 Disconnect load-out hose from the cam-lock coupling
   - 3.5 Allow load-out hose to drain into 5-gallon buckets
   - 3.6 Remove any adapters used
   - 3.7 Have driver replace trailer valve cap or plug
   - 3.8 Have driver close drip tray valve
   - 3.9 Remove 5-gallon buckets from under connection points
   - 3.10 Empty 5-gallon buckets into containment pad sump
   - 3.11 Store equipment (hose, adapters, buckets) properly
4. Shipping documentation preparation (for offsite disposal as applicable)
   - 4.1 Confirm that appropriate forms are filled out and signed
   - 4.2 Confirm that shipping documentation is complete and signed
   - 4.3 Confirm that shipping documentation number is recorded
   - 4.4 Provide driver with appropriate copies
5. Truck demobilization
   - 5.1 Work with driver to inspect that truck is in safe condition
   - 5.2 Confirm that hose, buckets, and other equipment have been removed from path of truck exiting the loading area
   - 5.3 Unchock tires
   - 5.4 Remind driver to stay under 5 mph while inside the CHQ yard
   - 5.5 Instruct driver to exit the utility pad area
   - 5.6 Spot driver out to the main road
6. Post-transfer system checks
   - 6.1 Scan/file paperwork/shipping documentation (as applicable)

Standard Operating Procedure
PG&E Topock Moabi Regional Park CHQ
Operation and Maintenance Plan

Title: Truck Decontamination
Number: CHQ-SOP-02_Rev0
Creation Date: 2/2/2015

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for decontamination of construction- or operation and maintenance-related trucks at the decontamination pad located in the Construction Headquarters (CHQ) yard at Moabi Regional Park. Water transfer from the decontamination pad sump to a 1,000 gallon remedy-produced water tank is automated.

2 Drawing Numbers

- C-15-01: Construction Headquarters Yard Plan
- C-15-03: Construction Headquarters Piping Plan
- S-15-20: CHQ Decontamination Pad Plans and Details

3 Equipment

- Appropriate PPE
- Health and Safety Plan
- Spill kit
- Water hose
- Wheel chocks to be placed behind truck tires

4 Procedure

1. Decontamination pad preparation
    - 1.1 Inspect pad for signs of settling or wear
    - 1.2 Confirm that necessary hoses are present
2. Truck staging and hook-up

2.1 Instruct truck driver not to exceed 5 miles per hour (mph) while driving inside the CHQ yard

2.2 Confirm that driver and equipment meet job requirements

1. Verify that the driver has completed a pre-trip inspection on the truck and trailer
2. Verify that the driver currently driving the truck is the same driver who performed the pre-trip inspection

NOTE: If any deficiencies are discovered per Step 2.2, contact the Maintenance Supervisor before proceeding.

2.3 Use a spotter to direct truck driver during approach and alignment of truck in the middle of the decontamination pad

1. Spotter to use hand signals to stop truck when the front of the trailer is in position

3. Decontamination

3.1 Verify tank level within 1,000 gallon buried remedy-produced water tank prior to decon to confirm there is available space for decon water

3.2 Verify the sump water level is drained (sump pump automatically runs)

3.3 Use potable water from 5,000 gallon potable water tanks in the utility area to decontaminate truck

1. Connect hose to the yard hydrant fed from the potable water tanks
2. Spray exterior of truck to remove dust and debris
3. Spray under carriage of vehicle
4. Spray wheelwells and behind tires

3.4 Wait for water to cease dripping from truck

1. Verify tires are dry and will not track out of the decontamination area

3.5 **IF** the sump level rises to the high level setpoint for the pump **THEN** verify the pump is operational and discharging to the 1,000 gallon buried remedy-produced water tank

4. Truck demobilization

4.1 Work with driver to inspect that truck is in safe condition

4.2 Confirm that hose, buckets, and other equipment have been removed from exit path of truck from loading area

4.3 Unchock tires

4.4 Remind driver to stay under 5 mph while inside the CHQ yard

4.5 Instruct driver to exit the decontamination pad heading north

4.6 Spot driver during exit to the main road

Standard Operating Procedure
PG&E Topock Moabi Regional Park CHQ
Operation and Maintenance Plan

Title: Generator Inspection
Number: CHQ-SOP-03_Rev0
Creation Date: 2/2/2015

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for inspecting the backup generator located at the Construction Headquarters (CHQ) yard at Moabi Regional Park. Inspections will be conducted on a weekly basis. Personnel conducting inspections and maintenance must be qualified persons in regards to NFPA 70E for arc flash. Additional information can be found in the health and safety plan.

2 Drawing Numbers

- C-15-01: Construction Headquarters Yard Plan
- C-15-06: Civil Details

3 Equipment

- Appropriate PPE
- Health and Safety Plan
- Spill kit
- 5-gallon buckets
- 55-gallon drum

4 Procedure

1. Mobilize to utility pad enclosure
    - 1.1 Have spill kit in the event of a noted spill
    - 1.2 Open fence to utility pad area
2. Visually inspect generator
    - 2.1 Walk around entire unit
    - 2.2 Check for:
        1. Leaks along equipment surfaces
        2. Accumulated liquid on the ground

3. Signs of vandalism

CAUTION: Prior to accessing the generator interior qualified personnel shall put on arc flash PPE

4. Open panels or access doors

2.3 Check fuel tank

1. Verify fuel gauge level
    a. Schedule refueling through maintenance supervisor if level is below ½ tank
2. Collect a fuel sample and analyze for water and bacterial growth annually if fuel stored for longer than 1 year
3. Inspect fuel tank secondary containment
    a. Check for accumulated liquid
    b. Drain any accumulated liquid into 5-gallon bucket
        (1) Dispose of any collected water (no oil contamination) in the decontamination pad sump
        (2) Collect any oil-contaminated water in appropriately-labeled 55-gallon drum
    c. Clear secondary containment of any debris

2.4 Check battery

1. Verify distilled water level in battery cells, if applicable
2. Inspect battery terminals for evidence of corrosion or tightness

2.5 **IF** a leak is detected **THEN**:

1. Immediately alert maintenance supervisor of leak
2. Apply spill kit to spill area
3. Await further instruction from maintenance supervisor

3. Start generator manually

3.1 **IF** generator fails to start **THEN**:

1. Immediately alert maintenance supervisor
2. Await further instruction from maintenance supervisor

4. Complete load testing per manufacturer's recommendations
5. Complete housekeeping tasks

5.1 Clear any debris from utility pad area

5.2 Check condition of traffic bollards around tank

1. Photograph safety bollards that appear to have been hit or damaged
2. Alert maintenance supervisor of damaged bollards

6. Demobilize from utility pad area

6.1 Report findings to maintenance supervisor

Standard Operating Procedure
PG&E Topock Moabi Regional Park CHQ
Operation and Maintenance Plan

Title: Potable Water Delivery
Number: CHQ-SOP-04_Rev0
Creation Date: 2/2/2015

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for a subcontracted delivery truck to enter the Construction Headquarters (CHQ) yard at Moabi Regional Park and discharge potable water from the truck to the potable water tank.

2 Drawing Numbers

- C-15-01: Construction Headquarters Yard Plan
- C-15-06: Civil Details

3 Equipment

- Appropriate PPE
- Health and Safety Plan
- 5-gallon buckets
- Water hose
- Wheel chocks to be placed behind delivery truck tires

4 Procedure

1. Loading site preparation
    1.1 Inspect subcontractor parking area for signs of settling or wear
    1.2 Confirm that necessary hoses and connections are present
2. Truck staging and hook-up

2.1 Verify the truck that arrives says Potable Water on it

1. Request paperwork to verify water is potable

2.2 Instruct truck driver not to exceed 5 miles per hour (mph) while driving in the CHQ yard

2.3 Confirm that driver and equipment meet job requirements

1. Verify that the driver has completed a pre-trip inspection on the truck and trailer
2. Verify that the driver currently driving the truck is the same driver who performed the pre-trip inspection

NOTE: If any deficiencies are discovered per Step 2.2, contact the Maintenance Supervisor before proceeding.

2.4 Use a spotter to direct truck driver during approach and alignment of truck near potable water tank

1. Spotter to use hand signals to stop truck when the front of the trailer is in position
2. Ensure that the truck is not blocking access

2.5 Establish a work zone to ensure traffic hazards in the area are mitigated

2.6 Place wheel chocks behind truck tires once truck is parked

2.7 Place 5-gallon bucket under trailer's outlet connection

2.8 Have driver hook up to the load-out hose

NOTE: Driver is responsible for:

1. Attaching the load-out hose to the truck
2. Making sure the truck tank is vented
3. Determining how many gallons are to be offloaded
4. Operating the load valve (trailer valve) on the truck
5. Disconnecting the load-out hose

Operator is responsible for:

1. All valves downstream of the load-out hose
2. Telling the driver how many gallons the tank can receive
3. Monitoring the potable water tank level

2.9 Connect load-out hose to the coupling on the potable water tank

2.10 Manually check that pipe, hose, and connections are secure

1. Secure any loose connections

2.11 Place 5-gallon buckets under hose connections in transfer equipment

2.12 Have driver check truck valves and vents

2.13 Confirm with driver that truck is ready to discharge water

2.14 Instruct the driver to begin discharge to the tank

1. Operator to visually inspect for leaks
2. Operator to monitor the level in the tank
3. Operator to instruct the driver when the tank is nearly full
4. Driver to stop discharge when instructed

2.15 Have driver close the trailer valve

3. Truck disconnection

3.1 Confirm that 5-gallon buckets are under hose connection points

3.2 Have driver open connection to truck (water may still be in the hose)

3.3 Have driver disconnect load-out hose from trailer valve

3.4 Disconnect load-out hose from the cam-lock coupling

3.5 Allow load-out hose to drain into 5-gallon buckets

3.6 Remove any adapters used

3.7 Have driver replace trailer valve cap or plug

3.8 Have driver close drip tray valve

3.9 Remove 5-gallon buckets from under connection points

3.10 Empty 5-gallon buckets into decontamination sump

3.11 Store equipment (hose, adapters, buckets) properly

4. Truck demobilization

4.1 Work with driver to inspect that truck is in safe condition

4.2 Confirm that hose, buckets, and other equipment have been removed from path of truck exiting the loading area

4.3 Unchock tires

4.4 Remind driver to stay under 5 mph while in the CHQ yard

4.5 Instruct driver to exit the utility pad area

4.6 Spot driver out to the main road

5. Post-transfer system checks

5.1 Scan/file paperwork

PG&E Topock Moabi Regional Park CHQ
Operation and Maintenance Plan

Title: Offsite Hauling of Sewage
Number: CHQ-SOP-05_Rev0
Creation Date: 2/2/2015

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS).

The objective of this Standard Operating Procedure (SOP) is to describe the procedure for a subcontracted vacuum truck to enter the Construction Headquarters (CHQ) yard at Moabi Regional Park and remove accumulated sewage from the subsurface sewage tanks.

2 Drawing Numbers

- C-15-01: Construction Headquarters Yard Layout
- C-15-03 Construction Headquarters Piping Plan

3 Equipment

- Appropriate PPE
- Health and Safety Plan
- 5-gallon buckets
- Spill kit
- Water hose
- Wheel chocks to be placed behind vacuum truck tires

4 Procedure

1. Loading site preparation
    1.1 Inspect subcontractor parking area for signs of settling or wear
    1.2 Confirm that necessary hoses and connections are present

2. Truck staging and hook-up

2.1 Instruct truck driver not to exceed 5 miles per hour (mph) while in the CHQ yard

2.2 Confirm that driver and equipment meet job requirements

1. Verify that the driver has completed a pre-trip inspection on the truck (and trailer, if applicable)
2. Verify that the driver currently driving the truck is the same driver who performed the pre-trip inspection

NOTE: If any deficiencies are discovered per Step 2.2, contact the Maintenance Supervisor before proceeding.

2.3 Use a spotter to direct truck driver during approach and alignment of truck near underground sewage tank

1. Spotter to use hand signals to stop truck when the front of the truck (or trailer) is in position
2. Ensure that the truck is not blocking access

2.4 Establish a work zone to ensure traffic hazards in the area are mitigated

2.5 Place wheel chocks behind truck tires once truck is parked

2.6 Place 5-gallon bucket under trailer's inlet connection as applicable

2.7 Have driver hook up to the load-out hose

NOTE: Driver is responsible for:

- Attaching the load-out hose to the truck
- Making sure the truck tank is vented
- Determining how many gallons are to be loaded
- Disconnecting the load-out hose
- Operating the load valve on the truck/trailer

Operator is responsible for:

- All valves upstream of the load-out hose
- Telling the driver how many gallons have been loaded

2.8 Connect load-out hose to the coupling on the sewage tank

2.9 Manually check that pipe, hose, and connections are secure

1. Secure any loose connections

2.10 Place 5-gallon buckets under hose connections in transfer equipment

2.11 Have driver check truck valves and vents

2.12 Confirm with driver that truck is ready to receive sewage

2.13 Instruct the driver to begin vacuum on the tank

1. Operator to visually inspect for leaks
2. Operator to monitor the level in the tank
3. Operator to instruct the driver when the tank is empty
4. Driver to stop vacuum when instructed

2.14 Have driver close the load valve

3. Truck disconnection
   - 3.1 Confirm that 5-gallon buckets are under hose connection points
   - 3.2 Have driver open connection to truck (sewage may still be in the hose)
   - 3.3 Have driver disconnect load-out hose from load valve
   - 3.4 Disconnect load-out hose from the cam-lock coupling
   - 3.5 Allow load-out hose to drain into sewage tank or 5-gallon buckets
   - 3.6 Remove any adapters used
   - 3.7 Have driver replace load valve cap or plug
   - 3.8 Have driver close drip tray valve
   - 3.9 Remove 5-gallon buckets from under connection points
   - 3.10 Empty 5-gallon buckets into truck
   - 3.11 Store equipment (hose, adapters, buckets) properly
4. Truck demobilization
   - 4.1 Work with driver to inspect that truck is in safe condition
   - 4.2 Confirm that hose, buckets, and other equipment have been removed from path of truck exiting the loading area
   - 4.3 Unchock tires
   - 4.4 Remind driver to stay under 5 mph while in the CHQ yard
   - 4.5 Spot driver out to the main road
5. Post-transfer system checks
   - 5.1 Scan/file paperwork

Appendix C
Select Equipment O&M Manuals

(Provided on CD-ROM Only)

APPENDIX C

Select Equipment O&M Manuals

This appendix contains the following equipment O&M manuals for the Final Groundwater Remedy at Topock Compressor Station:

- Extraction, injection, freshwater supply, and freshwater injection well pumps (Grundfos)
- Hose pumps (Bredel)
- Sand separator (Lakos)
- Centrifugal pumps (Fybroc)
- Centrifugal pumps (AMT)
- Chemical metering pumps (LMI)
- Sump pumps (Goulds)
- Air-operated diaphragm pump (ARO)
- Seal water system (Goulds)
- Cartridge filters (Harmsco)
- Air compressor (Gardner)
- Flow control valves (ASR)
- Transformers (Cooper)
- Electrical power generator (Capstone)
- Mini-split air conditioner and condenser (Mitsubishi)
- Heat pump chiller (Multiaqua)

SP

Stainless steel submersible pumps

6", 8", and 10"

Installation and operating instructions

US

LIMITED WARRANTY

US

Products manufactured by GRUNDFOS PUMPS CORPORATION (Grundfos) are warranted to the original user only to be free of defects in material and workmanship for a period of 18 months from date of installation, but not more than 24 months from date of manufacture. Grundfos' liability under this warranty shall be limited to repairing or replacing at Grundfos' option, without charge, F.O.B. Grundfos' factory or authorized service station, any product of Grundfos' manufacture. Grundfos will not be liable for any costs of removal, installation, transportation, or any other charges which may arise in connection with a warranty claim. Products which are sold but not manufactured by Grundfos are subject to the warranty provided by the manufacturer of said products and not by Grundfos' warranty. Grundfos will not be liable for damage or wear to products caused by abnormal operating conditions, accident, abuse, misuse, unauthorized alteration or repair, or if the product was not installed in accordance with Grundfos' printed installation and operating instructions.

To obtain service under this warranty, the defective product must be returned to the distributor or dealer of Grundfos' products from which it was purchased together with proof of purchase and installation date, failure date, and supporting installation data. Unless otherwise provided, the distributor or dealer will contact Grundfos or an authorized service station for instructions. Any defective product to be returned to Grundfos or a service station must be sent freight prepaid; documentation supporting the warranty claim and/or a Return Material Authorization must be included if so instructed.

GRUNDFOS WILL NOT BE LIABLE FOR ANY INCIDENTAL OR CONSEQUENTIAL DAMAGES, LOSSES, OR EXPENSES ARISING FROM INSTALLATION, USE, OR ANY OTHER CAUSES. THERE ARE NO EXPRESS OR IMPLIED WARRANTIES, INCLUDING MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, WHICH EXTEND BEYOND THOSE WARRANTIES DESCRIBED OR REFERRED TO ABOVE.

Some jurisdictions do not allow the exclusion or limitation of incidental or consequential damages and some jurisdictions do not allow limit actions on how long implied warranties may last. Therefore, the above limitations or exclusions may not apply to you. This warranty gives you specific legal rights and you may also have other rights which vary from jurisdiction to jurisdiction.

Original installation and operating instructions.

Warning

Prior to installation, read these installation and operating instructions. Installation and operation must comply with local regulations and accepted codes of good practice.

This booklet should be left with the owner of the pump for future reference and information regarding its operation.

Warning

The use of this product requires experience with and knowledge of the product. Persons with reduced physical, sensory or mental capabilities must not use this product, unless they are under supervision or have been instructed in the use of the product by a person responsible for their safety.

Children must not use or play with this product.

US

1. Product introduction

1.1 Symbols used in this document

Warning

If these safety instructions are not observed, it may result in personal injury!

Caution ***If these safety instructions are not observed, it may result in malfunction or damage to the equipment!***

Note ***Notes or instructions that make the job easier and ensure safe operation.***

1.2 Introduction

Your Grundfos SP submersible pump is of the utmost quality. Combined with proper installation, your Grundfos pump will give you many years of reliable service.

To ensure the proper installation of the pump, carefully read the complete manual before attempting to install the pump.

1.3 Delivery and handling

1.3.1 Delivery

Caution ***The pumps should remain in the packing until they are placed in vertical position during installation.***

The shipping carton should contain:

- pump end
- motor
- cable
- control box
- nameplate.

Examine the components carefully to make sure no damage has occurred to the pump end, motor, cable or control box during shipment.

1.3.2 Handling

Your Grundfos SP pump should remain in its shipping carton until it is ready to be installed. The carton is specially designed to protect it from damage.

During unpacking and prior to installation, **make sure that the pump is not dropped or mishandled.**

The motor is equipped with an electrical cable.

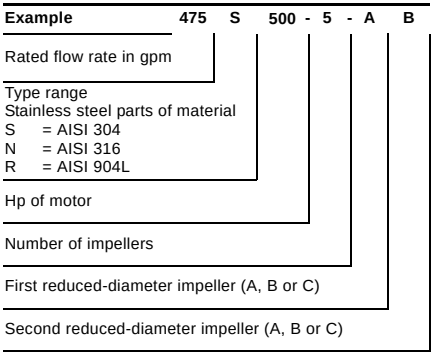
US

Caution ***Under no circumstance should the electrical cable be used to support the weight of the pump.***

You will find a loose data plate with an adhesive backing with the pump. The nameplate should be completed in pen and attached to the control box.

1.4 Applications

Grundfos Large SP submersible pumps are suitable for:



- Groundwater supply to waterworks
- irrigation in horticulture and agriculture
- groundwater lowering (dewatering)
- pressure boosting
- industrial applications
- domestic water supply.

1.5 Features and benefits

- State-of-the-art hydraulics provide high efficiency and low operating costs.
- 100 % stainless steel components inside and outside for long service life.
- Sand resistant.
- Resistant to aggressive water.
- Motor burnout protection via CU 301.
- Dry-running protection.
- Monitoring, protection and communication via protection unit MP204, and remote control, R100.

1.6 Identification

1.6.1 Type key

2. Operating conditions

Flow (Q):	Max. 1,400 gpm (318 m^3/h)
Head (H):	Max. 2,100 ft (640 m)
Liquid temp:	+ 32 °F to + 140 °F (0 °C to +60 °C)
Install. depth	Max. 1,968 ft (599 m)

3. Installation

3.1 Pre-installation checklist

Before beginning installation, the following checks should be made:

- Condition of the well
- condition of the water
- installation depth
- electrical supply
- wire cable type.

These checks are all critical for the proper installation of this submersible pump.

3.1.1 Condition of the well

If the pump is to be installed in a new well, the well should be fully developed and bailed or blown free of cuttings and sand. The stainless steel construction of the Grundfos submersible make it resistant to abrasion; however, no pump, made of any material, can forever withstand the destructive wear that occurs when constantly pumping sandy water.

If this pump is used to replace an oil-filled submersible or oil-lubricated line-shaft turbine in an existing well, **the well must be blown or bailed clear of oil.**

Determine the maximum depth of the well, and the draw-down level at the pump's maximum capacity. Pump selection and setting depth should be based on this data.

The inside diameter of the well casing should be checked to ensure that it is not smaller than the size of the pump and motor.

3.1.2 Pumped liquids

Submersible pumps are designed for pumping clear and cold water that is free of air and gasses and clean, thin **non-explosive** liquids without solid particles or fibers. Decreased pump performance and life expectancy can occur if the water is not cold and clear or contains air and gasses.

Maximum water temperature should not exceed +102 °F (+38 °C). Special consideration must be given to the pump and motor if it is to be used to pump water above 102 °F (+38 °C).

The Grundfos stainless steel submersible is highly resistant to the normal corrosive environment found in some water wells. If water well tests determine the water has an excessive or unusual corrosive quality, or exceeds 102 °F (+38 °C), contact your Grundfos representative for information concerning specially designed pumps for these applications.

3.2 Preparation

Warning

Before starting work on the pump, make sure that the electricity supply has been switched off and that it cannot be accidentally switched on.

3.2.1 Checking of liquid in motor

The SP submersible motors are factory-filled with a special non-poisonous liquid, which is frost-proof down to –4 °F (–20 °C).

Note ***The level of the liquid in the motor must be checked and the motor must be refilled, if required. Use clean water.***

Caution ***If frost protection is required, special Grundfos liquid must be used to refill the motor. Otherwise clean water may be used for refilling (however, never use distilled water).***

Refilling of liquid is carried out as described below.

3.2.2 Grundfos submersible motors MS 4000 and MS 402

The filling hole for motor liquid is placed in the following positions:

MS 4000: in the top of the motor.

MS 402: in the bottom of the motor.

1. Position the submersible pump as shown in fig. 1.
   The filling screw must be at the highest point of the motor.
2. Remove the screw from the filling hole.
3. Inject liquid into the motor with the filling syringe, fig. 1, until the liquid runs back out of the filling hole.
4. Replace the screw in the filling hole and tighten securely before changing the position of the pump.

Torques:

MS 4000: 3.0 Nm.

MS 402: 2.0 Nm.

The submersible pump is now ready for installation.

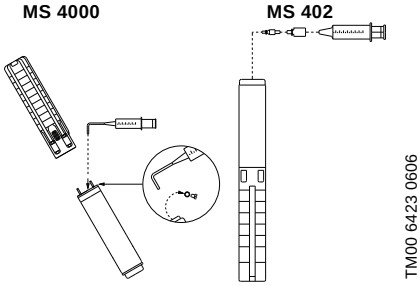


Fig. 1 Pump position during filling – MS 4000 and MS 402

3.2.3 Grundfos submersible motors MS6 and MS 6000

- If the motor is delivered from stock, the liquid level must be checked before the motor is fitted to the pump, see fig. 2.
- On pumps delivered directly from Grundfos, the liquid level has already been checked.
- In the case of service, the liquid level must be checked, see fig. 2.

Filling procedure:

The filling hole for motor liquid is placed at the top of the motor.

1. Position the submersible pump as shown in fig. 2.
   The filling screw must be at the highest point of the motor.
2. Remove the screw from the filling hole.
3. Inject liquid into the motor with the filling syringe, fig. 2, until the liquid runs back out of the filling hole.
4. Replace the screw in the filling hole and tighten securely before changing the position of the pump.

Torque: 3.0 Nm.

The submersible pump is now ready for installation.

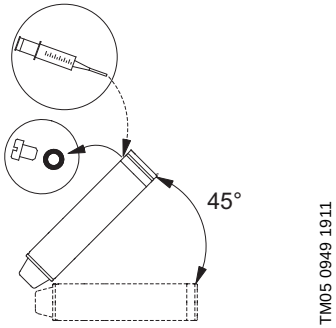

Fig. 2 Motor position during filling – MS6 and MS 6000

3.2.4 Grundfos submersible motors MMS 6000, MMS 8000, MMS 10000 and MMS 12000

Filling procedure:

1. Place the motor at a 45 ° angle with the top of the motor upwards, see fig. 3.
2. Unscrew the plug A and place a funnel in the hole.
3. Pour tap water into the motor until the motor liquid inside the motor starts running out at A.
   Caution: Do not use motor liquid as it contains oil.
4. Remove the funnel and refit the plug A.

Caution ***Before fitting the motor to a pump after a long period of storage, lubricate the shaft seal by adding a few drops of water and turning the shaft.***

The submersible pump is now ready for installation.

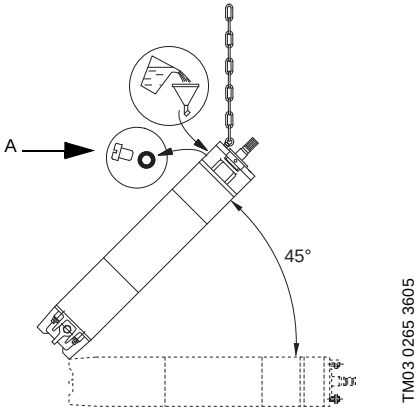

Fig. 3 Motor position during filling – MMS

3.2.5 Installation depth

A check should be made to ensure that the installation depth of the pump will always be at least (5) five to (10) ten feet (1.5 to 3 m) below the maximum draw-down level of the well. For flow rates exceeding 100 gpm (22.7 m^3/h), refer to performance curves for recommended minimum submergence.

The bottom of the motor should never be installed lower than the top of the well screen or within five feet of the well bottom.

If the pump is to be installed in a lake, pond, tank or large diameter well, the water velocity passing over the motor must be sufficient to ensure proper motor cooling. The minimum recommended water flow rates which ensure proper cooling are listed in section *7.1 Minimum water flow requirements for submersible pump motors* on p. 19.

3.2.6 Electrical supply

The motor voltage, phase and frequency indicated on the motor nameplate should be checked against the actual electrical supply.

3.2.7 Wire cable type

The wire cable used between the pump and control box or panel should be approved for submersible pump applications. The conductor may be solid or stranded. The cable may consist of individually insulated conductors twisted together, insulated conductors molded side by side in one flat cable or insulated conductors with a round overall jacket.

The conductor insulation should be type RW, RUW, TW, TWU or equivalent and must be suitable for use with submersible pumps. An equivalent Canadian Standards Association certified wire may also be used. See section *7.4 Submersible pump cable selection chart (60 Hz)* on p. 21 for recommended sizes of cable lengths.

3.3 Splicing the motor cable

Note ***A good cable splice is critical to proper operation of the submersible pump and must be done with extreme care.***

If the splice is carefully made, it will work as well as any other portion of the cable, and will be completely watertight. Grundfos recommends using a heat shrink splice kit. The splice should be made in accordance with the kit manufacturer's instructions. Typically a heat shrink splice can be made as follows:

1. Examine the motor cable and the drop cable carefully for damage.
2. Cut the motor leads off in a staggered manner. Cut the ends of the drop cable so that the ends match up with the motor leads; see fig. 4. On single-phase motors, be sure to match the colors.
3. Strip back and trim off 1/2 inch of insulation from each lead, making sure to scrape the wire bare to obtain a good connection. Be careful not to damage the copper conductor when stripping off the insulation.
4. Slide the heat shrink tubing on to each lead. Insert a properly sized "Sta-kon" type connector on each lead, making sure that lead colors are matched. Using a "Sta-kon" crimping pliers, indent the lugs; see fig. 5. Be sure to squeeze hard on the pliers, particularly when using large cable.
5. Center the heat shrink tubing over the connector. Using a propane torch, lighter, or electric heat gun, uniformly heat the tubing starting first in the center working towards the ends; see fig. 6.
6. Continue to apply the heat to the tubing using care not to let the flame directly contact the tubing. When the tubing shrinks and the sealant flows from the ends of the tubing, the splice is complete; see fig. 7.

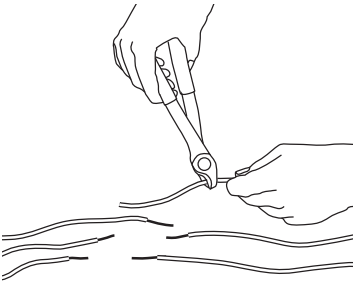

Fig. 4 Cutting and stripping the motor leads

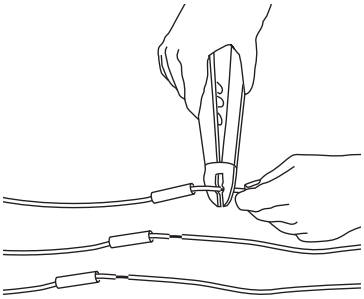

Fig. 5 Crimping the connectors

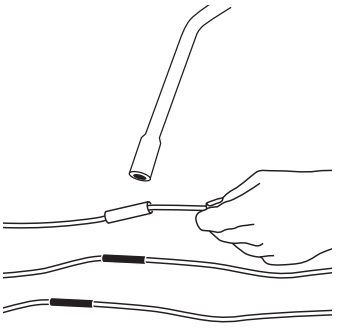

Fig. 6 Applying heat to the connector

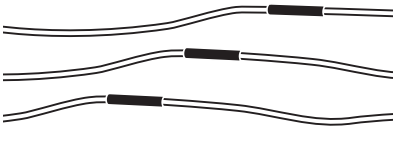

Fig. 7 Completed splices

3.4 Riser pipe

Note

The riser pipe or hose should be properly sized and selected based on estimated flow rates and friction-loss factors.

3.4.1 If an adapter is required

It is recommended to first install the drop pipe to the pipe adapter. Then install the drop pipe with the adapter to the pump discharge.

A back-up wrench should be used when the riser pipe is attached to the pump. The pump should be gripped only by the flats on the top of the discharge chamber. The body of the pump, cable guard or motor should not be gripped under any circumstance.

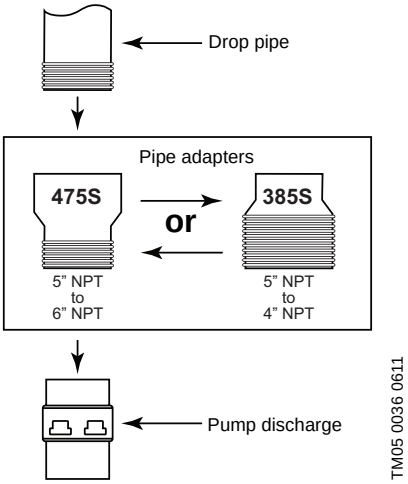

Fig. 8 Pipe adapters

3.4.2 If steel riser pipe is used

We recommend that steel riser pipes always be used with the larger submersibles. An approved pipe thread compound should be used on all joints. Make sure the joints are adequately tightened in order to resist the tendency of the motor to loosen the joins when stopping and starting.

When tightened, the first section of the riser pipe must not come in contact with the check valve retainer in the discharge chamber of the pump.

After the first section of the riser pipe has been attached to the pump, the lifting cable or elevator should be clamped to the pipe. **Do not clamp the pump.**

When raising the pump and riser section, be careful not to place bending stress on the pump by picking it up by the pump end only.

Make sure that the electrical cables are not cut or damaged in any way when the pump is being lowered in the well.

The drop cable should be secured to the riser pipe at frequent intervals to prevent sagging, looping or possible cable damage. Nylon cable clips or waterproof tape may be used. The cable splice should be protected by securing it with clips or tape just above and below the splice.

3.4.3 If plastic or flexible riser pipe is used

It is recommended that plastic type riser pipe be used only with the smaller domestic submersibles.

Caution

When plastic riser pipe is used, it is recommended that a safety cable be attached to the pump to lower and raise it.

Warning

Important: Plastic and flexible pipe tend to stretch under load. This stretching must be taken into account when securing the cable to the riser pipe. Leave 3 to 4 inches of slack between clips or taped points to allow for this stretching. This tendency for plastic and flexible pipe to stretch will also affect the calculation of the pump setting depth. As a general rule, you can estimate that plastic pipe will stretch to approximately 2 % of its length. For example, if you installed 200 feet (61 m) of plastic riser pipe, the pump may actually be down 204 feet (62 m). If the depth setting is critical, check with the manufacturer of the pipe to determine who to compensate for pipe stretch.

Note

The pipe manufacturer or representative should be contacted to insure the pipe type and physical characteristics are suitable for this use.

Use the correct joint compound recommended by the pipe manufacturer. In addition to making sure that joints are securely fastened, the use of a torque arrester is recommended when using plastic pipe.

Do not connect the first plastic or flexible riser section directly to the pump. Always attach a metallic nipple or adapter into the discharge chamber of the pump. When tightened, the threaded end of the nipple or adapter must not come in contact with the check valve retainer in the discharge chamber of the pump.

The drop cable should be secured to the riser pipe at frequent intervals to prevent sagging, looping and possible cable damage. Nylon cable clips or waterproof tape may be used. The cable splice should be protected by securing it with clips or tape just above each joint.

Check valves:

A check valve should always be installed at the surface of the well. In addition, for installations deeper than 200 feet (61 m), check valves should be installed at no more than 200 foot (61 m) intervals.

Protect the well from contamination:

To protect against surface water entering the well and contaminating the water source, the well should be finished off above grade, and a locally approved well seal or pitless adapter unit utilized.

3.5 Electrical

Warning

USA: All electrical work should be performed by a qualified electrician and installed in accordance with the National Electrical Code, local codes and regulations.

Warning

Canada: All electrical work should be performed by a qualified electrician and installed in accordance with the Canadian Electrical Code, local codes and regulations.

Warning

To reduce the risk of electrical shock during operation of this pump requires the provision of acceptable grounding. If the means of connection to the supply connected box is other than grounded metal conduit, ground the pump back to the service by connecting a copper conductor, at least the size of the circuit supplying the pump, to the grounding screw provided within the wiring compartment.

Verification of the electrical supply should be made to ensure the voltage, phase and frequency match that of the motor. Motor voltage, phase, frequency and full-load current information can be found on the nameplate attached to the motor.

Motor electrical data can be found in section *7.6.1 Grundfos submersible pump motors - 60 Hz* on p. 24.

Warning

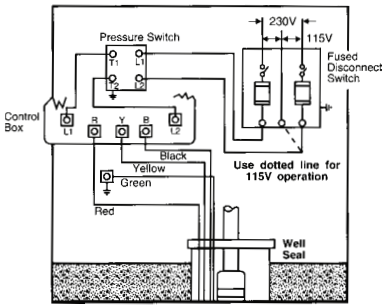
If voltage variations are larger than +/-10%, do not operate the pump.

Direct on-line starting is used due to the extremely fast run-up time of the motor (0.1 second maximum), and the low moment of inertia of the pump and motor. Direct on-line starting current (locked rotor amp) is between 4 and 6.5 times the full-load current.

If direct on-line starting is not acceptable and reduced starting current is required, an autotransformer or resistant starters should be used for 5 to 30 Hp motors (depending on cable length). For motors over 30 Hp, use auto-transformer starters.

3.5.1 Engine-driven generators

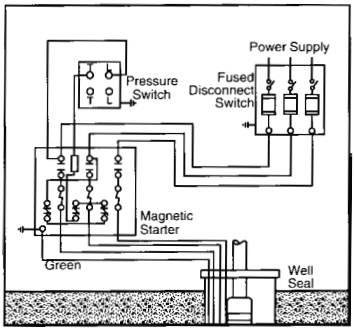
If the submersible pump is going to be operated using an engine driven generator, we suggest the manufacturer of the generator be contracted to ensure the proper generator is selected and used. See section *7.2 Guide for engine-driven generators in submersible pump applications* on p. 19 for generator sizing guide.



If power is going to be supplied through transformers, section *7.3 Transformer capacity required for three-phase submersible pump motors* on p. 20 outlines the minimum KVA rating and capacity required for satisfactory pump operation.

3.5.2 Control box/panel wiring

Single-phase motors



Single-phase motors must be connected as indicated in the motor control box.

A typical single-phase wiring diagram using a Grundfos control box is shown in fig 9.

TM05 0037 0611

Fig. 9 Single-phase wiring diagram for Grundfos control boxes

TM05 0038 0611

Fig. 10 Three-phase wiring diagram for Grundfos and Franklin motors

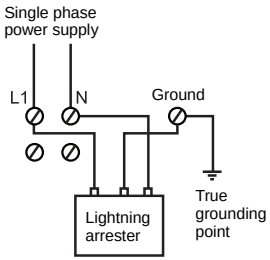
Three-phase motors

Three-phase motors must be used with the proper size and type of motor starter to ensure the motor is protected against damage from low voltage, phase failure, current unbalance and overload current.

A properly sized starter with ambient-compensated extra quick-trip overloads must be used to give the best possible motor winding protection.

Each of the three motor legs must be protected with overloads. The thermal overloads must trip in less than 10 seconds at locked rotor (starting) current. A three-phase motor wiring diagram is shown in fig. 10.

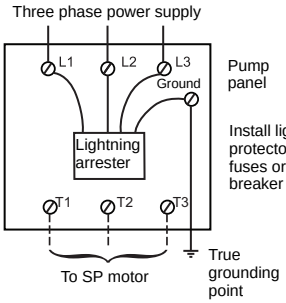
Caution ***Pumps should NEVER be started to check rotation unless the pump is totally submerged. Severe damage may be caused to the pump and motor if they are run dry.***



3.5.3 High voltage surge arresters

A high voltage surge arrester should be used to protect the motor against lightning and switching surges.

Lightning voltage surges in power lines are caused when lightning strikes somewhere in the area.



Switching surges are caused by the opening and closing of switches on the main high-voltage distribution power lines.

The correct voltage-rated surge arrester should be installed on the supply (line) side of the control box; see fig. 11 and fig. 12. The arrester must be grounded in accordance with the National Electrical Code and local codes and regulations.

TM05 0039 0611

Fig. 11 Single-phase hookup

TM05 0040 0611

Fig. 12 Three-phase hookup

The warranty on all three-phase submersible motors is VOID if:

1. The motor is operated with single-phase power through a phase converter.

Note ***2. Three-leg ambient compensated extra quick-trip overload protectors are not used.***

3. Three-phase current unbalance is not checked and recorded; see section 4. Startup on p. 11.

4. High voltage surge arresters are not installed.

3.5.4 Control box/panel grounding

Warning

The control box or panel shall be permanently grounded in accordance with the National Electrical Code and local codes or regulations.

The ground wire should be a bare copper conductor at least the same size as the drop cable wire size.

The ground wire should be run as short a distance as possible and be securely fastened to a true grounding point.

True grounding points are considered to be:

- a grounding rod driven into the water strata
- steel well casing submerged into the water lower than the pump setting level
- steel discharge pipes without insulating couplings.

If plastic discharge pipe and well casing are used or if a grounding wire is required by local codes, a properly sized bare copper wire should be connected to a stud on the motor and run to the control panel.

Warning

Do not ground to a gas supply line. Connect the grounding wire to the ground point first and then to the terminal in the control box or panel.

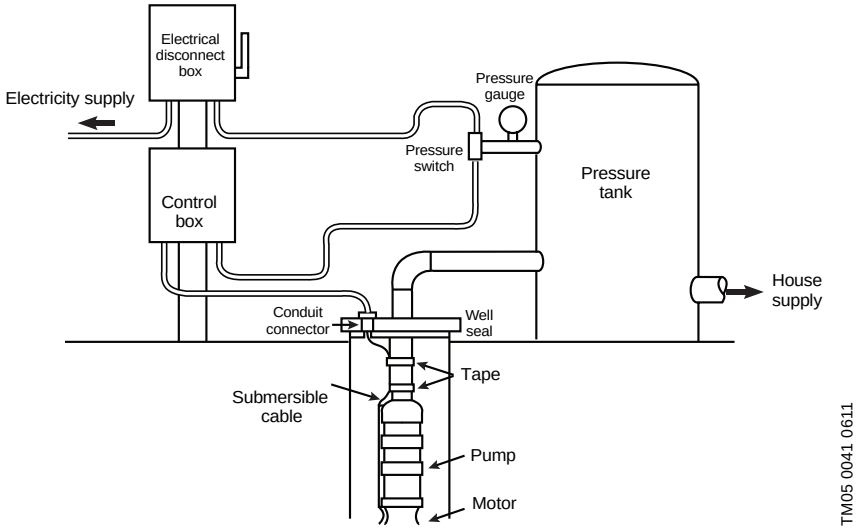


Fig. 13 Wiring and installation diagram

3.5.5 Wiring checks and installation

Before making the final surface wiring connection of the drop cable to the control box or panel, it is a good practice to check the insulation resistance to ensure that the cable and splice are good. Measurements for a new installation must be at least 2,000,000 ohm. **Do not start the pump if the measurement is less than this.**

If it is higher than 2,000,000 ohm, the drop cable should then be run through the well seal by means of a conduit connector in such a way as to eliminate any possibility of foreign matter entering the well casing.

Conduit should always be used from the pump to the control box or panel to protect the drop cable; see fig. 13.

Finish wiring and verify that all electrical connections are made in accordance with the wiring diagram.

Check to ensure the control box or panel and high voltage surge arrester have been grounded.

4. Startup

After the pump has been set into the well and the wiring connections have been made, the following procedures should be performed:

1. Attach a temporary horizontal length of pipe with installed gate valve to the riser pipe.
2. Adjust the gate valve one-third of the way open.
3. On three-phase units, check direction of rotation and current unbalance according to the instructions below. For single-phase units proceed directly to *4.1.3 Developing the well* on p. 11.
4. Under no circumstances should the pump be operated for any prolonged period of time with the discharge valve closed. This can result in motor and pump damage due to overheating. A properly sized relief valve should be installed at the well head to prevent the pump from running against a closed valve.

4.1 Startup with three-phase motors

4.1.1 Check the direction of rotation

Three-phase motors can run in either direction depending on how they are connected to the power supply. When the three cable leads are first connected to the power supply, there is a 50 % chance that the motor will run in the proper direction. To make sure the motor is running in the proper direction, carefully follow these procedures:

1. Start the pump and check the water quantity and pressure developed.
2. Stop the pump and interchange any two leads.
3. Start the pump and again check the water quantity and pressure.
4. Compare the results observed. The wire connection which gave the highest pressure and largest water quantity is the correct connection.

4.1.2 Check for current unbalance

Current unbalance causes the motor to have reduced starting torque, overload tripping, excessive vibration and poor performance which can result in early motor failure. It is very important that current unbalance be checked in all three-phase systems. **Current unbalance between the legs should not exceed 5 % under normal operating conditions.**

The supply power service should be verified to see if it is a two or three transformer system. If two transformers are present, the system is an “open” delta or wye. If three transformers are present, the system is true three-phase.

Make sure the transformer ratings in kilovolt amps (KVA) is sufficient for the motor load; see section *7.3 Transformer capacity required for three-phase submersible pump motors* on p. 20.

The percentage of current unbalance can be calculated by using the following formulas and procedures:

$$\text{Average current} = \frac{\text{Total of current values measured on each leg}}{3}$$

$$\text{\% Current unbalance} = \frac{\text{Greatest amp difference from the average}}{\text{average current}} \times 100$$

To determine the percentage of current unbalance:

1. Measure and record current readings in amps for each leg (Hookup 1). Disconnect power.
2. Shift or roll the motor leads from left to right so the drop cable lead that was on terminal 1 is now on 2, lead on 2 is now on 3, and lead on 3 is now on 1 (Hookup 2). Rolling the motor leads in this manner will not reverse the motor rotation. Start the pump, measure and record current reading on each leg. Disconnect power.
3. Again shift drop cable leads from left to right so the lead on terminal 1 goes to 2, 2 to 3 and 3 to 1 (Hookup 3). Start pump, measure and record current reading on each leg. Disconnect power.
4. Add the values for each hookup.
5. Divide the total by 3 to obtain the average.
6. Compare each single leg reading from the average to obtain the greatest amp difference from the average.
7. Divide this difference by the average to obtain the percentage of unbalance.

Use the wiring hookup which provides the lowest percentage of unbalance. See section *7.6.4 Correcting for three-phase power imbalance* on p. 25 for a specific example of correcting for three-phase power unbalance.

4.1.3 Developing the well

After proper rotation and current unbalance have been checked, start the pump and let it operate until the water runs clear of sand, silt and other impurities.

Slowly open the valve in small increments as the water clears until the desired flow rate is reached. Do not operate the pump beyond its maximum flow rating. **The pump should not be stopped until the water runs clear.**

If the water is clean and clear when the pump is first started, the valve should still be s**lowly opened until the desired flow rate is reached.** As the valve is being opened, the drawdown should be checked to ensure the pump is always submerged. **The dynamic water level should always be more than 3 feet (0.9 m)above the inlet strainer of the pump.**

Disconnect the temporary piping arrangements and complete the final piping connections.

US

Warning

Under no circumstances should the pump be operated for any prolonged period of time with the discharge valve closed. This can result in motor and pump damage due to overheating. A properly sized relief valve should be installed at the well head to prevent the pump from running against a closed valve.

Caution

Start the pump and test the system. Check and record the voltage and current draw on each motor lead.

5. Operation

The pump and system should be periodically checked for water quantity, pressure, drawdown, periods of cycling and operation of controls.

If the pump fails to operate, or there is a loss of performance, refer to section *6. Troubleshooting* on p. 12.

6. Troubleshooting

The majority of problems that develop with submersible pumps are electrical, and most of these problems can be corrected without pulling the pump from the well. The following chart covers most of the submersible service work. As with any troubleshooting procedure, start with the simplest solution first; always make all the above ground checks before pulling the pump from the well.

Usually only two instruments are needed:

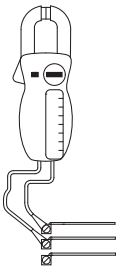
- a combination voltmeter/ammeter
- an ohmmeter.

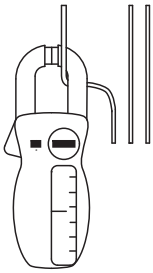
These are relatively inexpensive and can be obtained from most water systems suppliers.

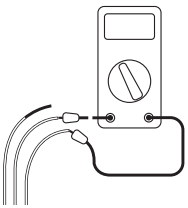
Warning

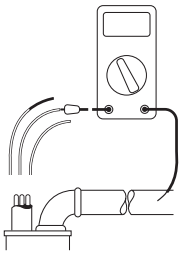
WHEN WORKING WITH ELECTRICAL CIRCUITS, USE CAUTION TO AVOID ELECTRICAL SHOCK.

It is recommended that rubber gloves and boots be worn and that care is taken to have metal control boxes and motors grounded to power supply ground or steel drop pipe or casing extending into the well.









Warning

Submersible motors are intended for operation in a well. When not operated in a well, failure to connect motor frame to power supply ground may result in serious electrical shock.

6.1 Preliminary tests

US

Test	How to measure	What it means
Supply voltage  TM00 1371 5092	By means of a voltmeter, which has been set to the proper scale, measure the voltage at the control box or starter. • **On single-phase units,** measure between line and neutral. • **On three-phase units,** measure between the legs (phases).	When the motor is under load, the voltage should be within ± 10% of the nameplate voltage. Larger voltage variation may cause winding damage. Large variations in the voltage indicate a poor electrical supply and the pump should not be operated until these variations have been corrected. If the voltage constantly remains high or low, the motor should be changed to the correct supply voltage.
Current  TM00 1372 5082	• By use of an ammeter, set on the proper scale, measure the current on each power lead at the control box or starter. See section *7.6 Electrical data* on p. 24 for motor amp draw information. • Current should be measured when the pump is operating at a constant discharge pressure with the motor fully loaded.	If the amp draw exceeds the listed service factor amps (SFA) or if the current unbalance is greater than 5 % between each leg on three-phase units, check for the following: • Burnt contacts on motor starter. • Loose terminals in starter or control box or possible cable defect. Check winding and insulation resistances. • Supply voltage too high or low. • Motor windings are shorted. • Pump is damaged, causing a motor overload.
Winding resistance  TM05 0028 0511	• Turn off power and disconnect the drop cable leads in the control box or starter. • Using an ohmmeter, set the scale selectors to Rx1 for values under 10 ohms and Rx10 for values over 10 ohms. • Zero-adjust the meter and measure the resistance between leads. Record the values. • Motor resistance values can be found in section *7.6 Electrical data* on p. 24. Cable resistance values are in section *7.6.5 Total resistance of drop cable (OHMS)* on p. 26.	If all the ohm values are normal, and the cable colors correct, the windings are not damaged. If any one ohm value is less than normal, the motors may be shorted. If any one ohm value is greater than normal, there is a poor cable connection or joint. The windings or cable may also be open. If some of the ohm values are greater than normal and some less, the drop cable leads are mixed. To verify lead colors, see resistance values in section *7.6 Electrical data* on p. 24.
Insulation resistance  TM05 0029 0511	• Turn off power and disconnect the drop cable leads in the control box or starter. • Using an ohm or mega ohmmeter, set the scale selector to Rx 100K and zeroadjust the meter. • Measure the resistance between the lead and ground (discharge pipe or well casing, if steel).	For ohm values, refer to section *6.1.1 Ohm value chart* on p. 14. Motors of all hp, voltage, phase and cycle duties have the same value of insulation resistance.

6.1.1 Ohm value chart

Ohm value chart			
	Ohm value	**Megaohm value**	**Condition of motor and leads/ recommended procedure**
Motor not yet installed	2,000,000 (or more)	2.0	New motor.
	1,000,000 (or more)	1.0	Used motor which can be reinstalled in the well.
Motor in well (Ohm readings are for drop cable plus motor)	500,000 - 1,000,000	0.5 - 1.0	A motor in reasonably good condition.
	20,000 - 500,000	0.02 - 0.5	A motor which may have been damaged by lightning or with damaged leads. Do not pull the pump for this reason.
	10,000 - 20,000	0.01 - 0.02	A motor which definitely has been damaged or with damaged cable. The pump should be pulled and repairs made to the cable or the motor replaced. The motor will still operate, but probably not for long.
	Less than 10,000	0 - 0.01	A motor which has failed or with completely destroyed cable insulation. The pump must be pulled and the cable repaired or the motor replaced. The motor will not run in this condition.

6.2 Checking pump performance

The troubleshooting chart on p.15 may require that you test the pump's performance against its curve. To do so, perform these steps:

1. Install pressure gauge
2. Start pump
3. Gradually close the discharge valve
4. Read pressure at shut-off.
5. After taking reading, open valve to its previous position.
6. To calculate pump performance, first convert psi reading to feet.
   (For water: PSI x 2.31 = ____ ft.).
7. Add this to the total vertical distance from the pressure gauge to the water level in the well while the pump is running.
8. Refer to the specific pump curve for the shut-off head for that pump model. If the measured head is close to the curve, pump is probably OK.

6.3 Troubleshooting chart

Problem	Possible cause/how to check	Possible remedy
1. Pump does not run.	a) No power at pump panel. How to check: Check for voltage at panel.	If no voltage at panel, check feeder panel for tripped circuits.
	b) Fuses are blown or circuit breakers are tripped. How to check: Remove fuses and check for continuity with ohmmeter.	Replace blown fuses or reset circuit breaker. If new fuses blow or circuit breaker trips, the electrical installation and motor must be checked.
	c) Motor starter overloads are burnt or have tripped out (three-phase only). How to check: Check for voltage on line or load side of starter.	Replace burnt heaters or reset. Inspect starter for other damage. If heater trips again, check the supply voltage and starter holding coil.
	d) Starter does not energize (three-phase only). How to check: Energize control circuit and check for voltage at the holding coil.	If no voltage, check control circuit. If voltage, check holding coil for shorts. Replace bad coil.
	e) Defective controls. How to check: Check all safety and pressure switches for operation. Inspect contacts in control devices.	Replace worn or defective parts.
	f) Motor and/or cable are defective. How to check: Turn off power. Disconnect motor leads from control box. Measure the lead-tolead resistances with the ohmmeter (Rx1). Measure lead-to-ground values with ohmmeter (Rx100K). Record measured values.	If open motor winding or ground is found, remove pump and recheck values at the surface. Repair or replace motor or cable.
	g) Defective capacitor (single-phase only). How to check: Turn off the power, then discharge capacitor. Check with an ohmmeter (Rx100K). When meter is connected, the needle should jump forward and slowly drift back.	If there is no ohmmeter needle movement, replace the capacitor.

US

Problem	Possible cause/how to check	Possible remedy
2. Pump runs but does not deliver water.	a) Groundwater level in well is too low or well is collapsed. How to check: Check well draw-down. Water level should be at least 3 ft. above pump inlet during operation.	If water level is not at least 3 ft. above pump inlet during operation, then lower the pump if possible, or throttle discharge valve and install water level control.
	b) Integral pump check valve is blocked. How to check: Check the pump's performance against its curve; see section *6.2 Checking pump performance* on page 14.	If the pump is not operating close to the pump curve, remove pump and inspect discharge section. Remove blockage, repair valve and valve seat if necessary. Check for other damage. Rinse out pump and re-install.
	c) Inlet strainer is clogged. How to check: Check the pump's performance against its curve; see section *6.2 Checking pump performance* on page 14.	If pump is not operating close to the pump curve, remove pump and inspect. Clean strainer, inspect integral check valve for blockage, rinse out pump and re-install.
	d) Pump is damaged. How to check: Check the pump's performance against its curve; see section *6.2 Checking pump performance* on page 14.	If pump is damaged, repair as necessary. Rinse out pump and re-install.
3. Pump runs but at reduced capacity.	a) Wrong rotation (three phase only). How to check: Check for proper electrical connection in control panel.	Correct wiring and change leads as required.
	b) Draw-down is larger than anticipated. Check draw-down during pump operation.	Lower the pump if possible. If not, throttle discharge valve and install water level control.
	c) Discharge piping or valve leaking. How to check: Examine system for leaks.	Repair leaks.
	d) Pump strainer or check valve are clogged. How to check: Check the pump's performance against its curve; see section *6.2 Checking pump performance* on page 14.	If not close to the pump curve, remove pump and inspect. Clean strainer, inspect integral check valve for blockage, rinse out pump and re-install.
	e) Pump is worn. How to check: Check the pump's performance against its curve; see section *6.2 Checking pump performance* on page 14.	If not close to pump curve, remove pump and inspect.

Problem	Possible cause/how to check	Possible remedy
4. Pump cycles too much.	a) Pressure switch is not properly adjusted or is defective. How to check: Check pressure setting on switch and operation. Check voltage across closed contacts.	Re-adjust switch or replace if defective.
	b) Level control is not properly set or is defective. How to check: Check setting and operation.	Re-adjust setting (refer to manufacturer data.) Replace if defective.
	c) Insufficient air charging or leaking tank or piping. How to check: Pump air into tank or diaphram chamber. Check diaphram for leak. Check tank and piping for leaks with soap and water solution. Check air to water volume.	Repair or replace damaged component.
	d) Plugged snifter valve or bleed orifice. How to check: Examine valve and orifice for dirt or corrosion.	Clean and/or replace snifter valve or bleed orifice if defective.
	e) Tank is too small. How to check: Check tank size. Tank volume should be approximately 10 gallons for each gpm or pump capacity.	If tank is too small, replace with proper size tank.
5. Fuses blow or circuit breakers trip	a) High or low voltage. How to check: Check voltage at pump panel. If not within ± 10%, check wire size and length of run to pump panel.	If wire size is correct, contact power company. If not, correct and/or replace as necessary.
	b) Three-phase current unbalance. How to check: Check current draw on each lead. Unbalance must be within ± 5%.	If current unbalance is not within ± 5%, contact power company.
	c) Control box wiring and components (single-phase only). How to check: Check that control box parts match the parts list. Check to see that wiring matches wiring diagram. Check for loose or broken wires or terminals.	Correct as required.

US

Problem	Possible cause/how to check	Possible remedy
5. Fuses blow or circuit breakers trip (con't).	d) Defective capacitor (single-phase only). How to check: Turn off power and discharge capacitor. Check using an ohmmeter (Rx100K). When the meter is connected, the needle should jump forward and slowly drift back.	If there is no ohmmeter needle movement, replace the capacitor.
	e) Starting relay (Franklin single-phase motors only). How to check: Check resistance of relay coil with an ohmmeter (Rx1000K). Check contacts for wear.	Replace defective starting relay.

7. Technical data

7.1 Minimum water flow requirements for submersible pump motors

Motor diameter	Casing or sleeve I.D. [inches]	Min. flow past the motor [gpm]
4”	4	1.2
	5	7
	6	13
	7	21

125.0	375.0	175.0
150.0	450.0	200.0
200.0	600.0	275.0

Notes:

- Table is based on typical 176 °F (80 °C) rise continuous duty generators with 35 % maximum voltage dip during start-up of single-phase and three-phase motors.
- Contact the manufacturer of the generator to assure the unit has adequate capacity to run the submersible motor.
- If the generator rating is in KVA instead of kilowatts, multiply the above ratings by 1.25 to obtain KVA.

US

7.3 Transformer capacity required for three-phase submersible pump motors

125	150	85	50
150	175	100	60
200	230	130	75

Notes:

- Pump motor KVA requirements only, and does not include allowances for other loads.

7.4 Submersible pump cable selection chart (60 Hz)

The following tables list the recommended copper cable sizes and various cable lengths for submersible pump motors.

These tables comply with the 1978 edition of the National Electric Table 310-16, Column 2 for 167 °F (75 °C) wire. The ampacity (current carrying properties of a conductor) have been divided by 1.25 per the N.E.C., Article 430-22, for motor branch circuits based on motor amps at rated horsepower.

To assure adequate starting torque, the maximum cable lengths are calculated to maintain 95 % of the service entrance voltage at the motor when the motor is running at maximum nameplate amps. Cable sizes larger than specified may always be used and will reduce power usage.

Caution ***The use of cables smaller than the recommended sizes will void the warranty. Smaller cable sizes will cause reduced starting torque and poor motor operation.***

Single-phase motor maximum cable length [ft]
(Motor to service entrance) (2)

Volts	Hp	Max. cable length [ft]	Wire size												
			14	12	10	8	6	4	2	0	00	000	0000	250	300
115	.33		130	210	340	540	840	1300	1960	2910					
	.5		100	160	250	390	620	960	1460	2160					
230	.33		550	880	1390	2190	3400	5250	7960						
	.5		400	650	1020	1610	2510	3880	5880						
	.75		300	480	760	1200	1870	2890	4370	6470					
	1		250	400	630	990	1540	2380	3610	5360	6520				
	1.5		190	310	480	770	1200	1870	2850	4280	5240				
	2		150	250	390	620	970	1530	2360	3620	4480				
	3		120	190	300	470	750	1190	1850	2890	3610				
	5				180	280	450	710	1110	1740	2170				
	7.5					200	310	490	750	1140	1410				
	10						250	390	600	930	1160				

Notes:

1. If aluminum conductor is used, multiply lengths by 0.5. Maximum allowable length of aluminum is considerably shorter than copper wire of same size.
2. The portion of the total cable which is between the service entrance and a 3Ø motor starter should not exceed 25 % of the total maximum length to assure reliable starter operation. Single-phase control boxes may be connected at any point of the total cable length.
3. Cables #14 to #0000 are AWG sizes, and 250 to 300 are MCM sizes.

7.5 Three-phase motor maximum cable length

Caution ***Use of wire size smaller than listed will void warranty.***

US

Three-phase motor maximum cable length [ft]

	100									1190	1460	1770	2150	2440	2790

Caution ***Use of wire size smaller than listed will void warranty.***

Notes:

- If aluminum conductor is used, multiply lengths by 0.5. Maximum allowable length of aluminum is considerably shorter than copper wire of same size.
- The portion of the total cable which is between the service entrance and a 3Ø motor starter should not exceed 25 % of the total maximum length to assure reliable starter operation. Single-phase control boxes may be connected at any point of the total cable length.
- Cables #14 to #0000 are AWG sizes, and 250 to 300 are MCM sizes.

Hitachi motors

Refer to the Hitachi submersible motors application maintenance manual.

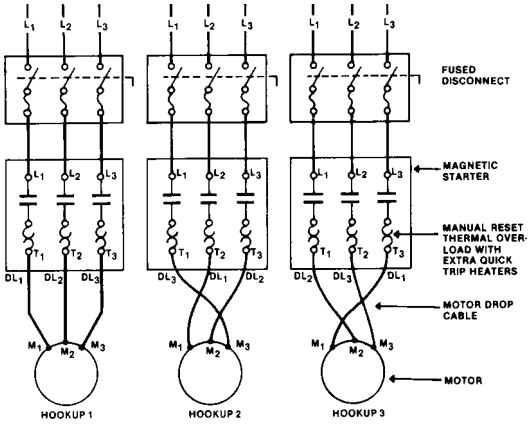
7.6.3 Franklin motors

Refer to the Franklin submersible motors application maintenance manual.

7.6.4 Correcting for three-phase power imbalance

Example: Check for current unbalance for a 230 volt, three-phase, 60 Hz submersible pump motor, 18.6 full load amps.

Solution: Steps 1 to 3 measure and record amps on each motor drop lead for Hookups 1, 2 and 3.



Observe that Hookup 3 should be used since it shows the least amount of current unbalance. Therefore, the motor will operate at maximum efficiency and reliability.

By comparing the current values recorded on each leg, you will note the highest value was always on the same leg, L_3. This indicates the unbalance is in the power source. If the high current values were on a different leg each time the leads were changed, the unbalance would be caused by the motor or a poor connection.

If the current is greater than 5 %, contact your power company for help.

*For a detailed explanation of three-phase balance procedures, see section *4.1 Startup with three-phase motors* on p. 11.

	Step 1 (Hookup 1)	Step 2 (Hookup 2)	Step 3 (Hookup 3)
(T_1)	DL_1 = 25.5 amps	DL_3 = 25 amps	DL_2 = 25.0 amps
(T_2)	DL_2 = 23.0 amps	DL_1 = 24 amps	DL_3 = 24.5 amps
(T_3)	DL_3 = 26.5 amps	DL_2 = 26 amps	DL_1 = 25.5 amps
Step 4	Total = 75 amps	Total = 75 amps	Total = 75 amps
Step 5	Average Current =	total current = 3 readings	75 / 3 = 25 amps
Step 6	Greatest amp difference from the average:	(Hookup 1) = 25-23 = 2 (Hookup 2) = 26-25 = 1 (Hookup 3) = 25.5-25 = .5	
Step 7	% Unbalance	(HOOKUP 1) = 2/25 X 100 = 8 (HOOKUP 2) = 1/25 X 100 = 4 (HOOKUP 3) = .5/25 X 100 = 2

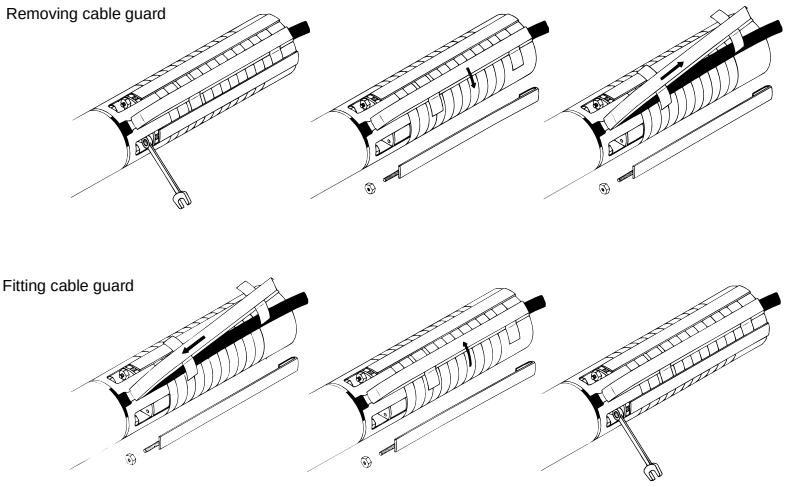
7.6.5 Total resistance of drop cable (OHMS)

The values shown in this table are for copper conductors. Values are for the total resistance of drop cable from the control box to the motor and back.

To determine the resistance:

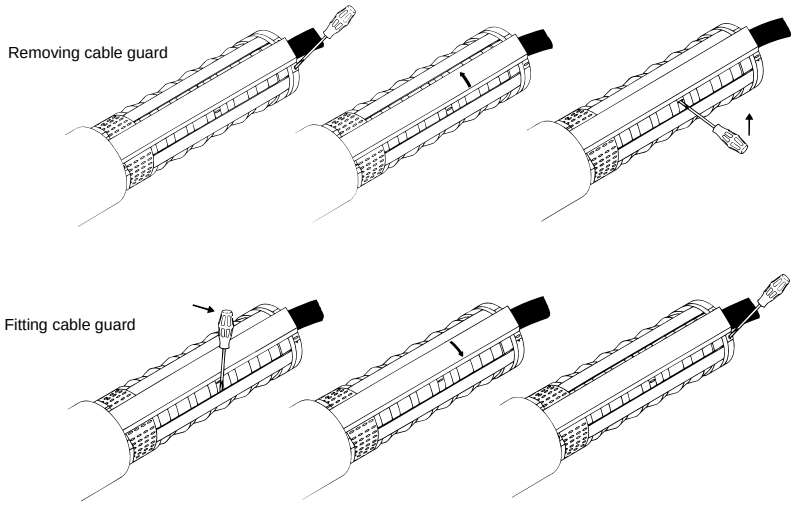
1. Disconnect the drop cable leads from the control box or panel.
2. Record the size and length of drop cable.
3. Determine the cable resistance from the table.
4. Add drop cable resistance to motor resistance. Motor resistances can be found in section *7.6 Electrical data* on p. 24.
5. Measure the resistance between each drop cable lead using an ohmmeter. Meter should be set on Rx1 and zero-balanced for this measurement.
6. The measured values should be approximately equal to the calculated values.



TM05 0043 0611

8. Disposal

This product or parts of it must be disposed of in an environmentally sound way:



1. Use the public or private waste collection service.
2. If this is not possible, contact the nearest Grundfos company or service workshop.

9. Removal and fitting of cable guard

CD

The disc, which is inserted in the cover, contains the user manuals of the APEX10, APEX15 and APEX20 hose pumps. The disc also contains a replacement instruction for the pump hose. This replacement instruction is only for users that are familiar with the replacement procedures in the user manual.

System requirements

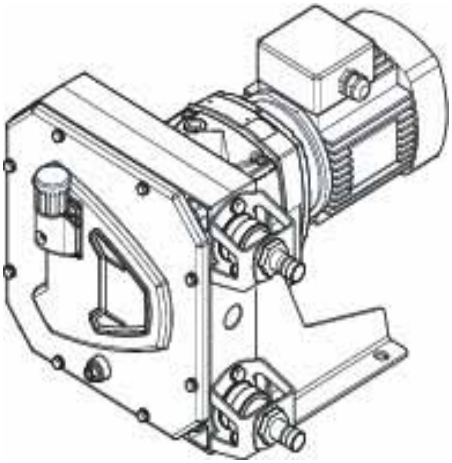
The program on the disc requires a PC with the following minimum system requirements:

- CD drive

The following software must be installed on the PC:

- PDF reader program
- an internet browser
- a mediaplayer that can play .avi files

How to use the disc



1 Put the disc in the disc drive.
2 Close the disc drive.
The disc will start automatically.
3 Wait until the various pump manuals appear on screen.
4 Select the required pump manual (click 1x with the left mouse button).
The PDF reader program will automatically start and the required user manual appears on screen.

Shortcuts

In the left margin you will find the various chapters and paragraphs. These can be accessed directly by clicking on the required chapter or paragraph.
In the text you will find hyperlinks to chapters or paragraphs. These hyperlinks are linked with the required chapters or paragraphs. By clicking a shortcut the required chapter or paragraph appears on screen.

SAFETY FORM

NOTES

1 GENERAL

1.1 How to use this manual

This manual is intended as a reference book by means of which qualified users are able to install, commission and maintain the hose pumps mentioned on the front cover.

1.2 Original instructions

The original instructions for this manual have been written in English. Other language versions of this manual are a translation of the original instructions.

1.3 Other supplied documentation

Documentation of components such as the gearbox, the motor and the frequency controller is not included in this manual. However, if additional documentation is supplied, you must follow the instructions in this additional documentation.

1.4 Service and support

For information with respect to specific adjustments, installation, maintenance or repair jobs which fall beyond the scope of this manual, contact your distributor. Make sure you have the following data at hand:

- Serial number of the hose pump
- Article number of the pump hose
- Article number of the gearbox
- Article number of the electric motor
- Article number of the frequency controller

You will find these data on the identification plates or stickers on the pumphead, the pump hose, the gearbox and the electric motor. Refer to § 4.1.1.

1.5 Environment and disposal of waste

	**CAUTION** Always observe the local rules and regulations with respect to processing (non reusable) parts of the hose pump.

Enquire within your local government about the possibilities for reuse or environment friendly processing of packaging materials, (contaminated) lubricant and oil.

2 SAFETY

2.1 Symbols

In this manual the following symbols are used:

	**WARNING** Procedures which, if not carried out with the necessary care, may result in serious bodily harm.

	**CAUTION** Procedures which, if not carried out with the necessary care, may result in serious damage to the hose pump, the surrounding area or the environment.

	Remarks, suggestions and advice.

2.2 Intended use

The hose pump is exclusively designed for pumping suitable products. Every other or further use is not in conformance with the intended use.
Flammable fluids are not suitable products to be pumped by this hose pump. This pump is not intended to operate in potentially explosive atmospheres.
The "Intended use" as laid down in EN 292-1 is "... the use for which the technical product is intended in accordance with the specifications of the manufacturer, inclusive of his indications in the sales brochure". In case of doubt it is the use, which appears to be its intended use judging from the construction, execution and function of the product, and its description in the user's documentation.
Only use the pump in conformance with the intended use described above. The manufacturer cannot be held responsible for damage or harm resulting from use that

is not in conformance with the intended use. If you want to change the application of your hose pump, contact your distributor first.

2.3 Responsibility

The manufacturer does not accept any responsibility for damage or harm caused by not observing the safety regulations and instructions in this manual and other supplied documentation, or by negligence during installation, use, maintenance and repair of the hose pumps mentioned on the front cover. Depending on the specific working conditions or accessories used, additional safety instructions can be required.
Immediately contact your distributor if you notice a potential danger while using your hose pump.

	**WARNING** The user of the hose pump is fully responsible for observing local safety regulations and directives. Observe these safety regulations and directives when using the hose pump.

2.4 Qualification of the user

The installation, use and maintenance of the hose pump should only be performed by well-trained and qualified users. Temporary staff and persons in training may use the hose pump only under the supervision and responsibility of trained and qualified users.

2.5 Regulations and instructions

- Everyone who works with the hose pump must be aware of the contents of this manual and observe the instructions with great care.
- Never change the order of the actions to be carried out.
- Always store the manual near the hose pump.

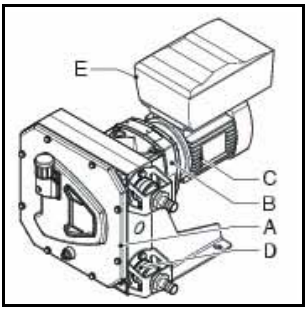
3 WARRANTIES

The manufacturer offers a two-year warranty on proper workmanship of all parts of the hose pump. Exclusion is made for normal wear and tear of consumables such as pump hoses, lubricant, hose clamps, pressing shoes, ball bearings, wear rings, and seals, or parts which have been misused or damaged through negligence.

This manufacturer's warranty is null and void for any user who has substituted the parts of an alternate manufacturer into a Watson-Marlow Bredel (hereafter called Bredel) hose pump.

Damaged parts may be returned to the manufacturer for warranty analysis. If failure was determined caused by faulty workmanship, the manufacturer will repair or replace the faulty component.
The parts must be accompanied by a fully completed and signed health and safety form, as present in the back of this manual. The form must be applied to the outside of the shipping carton.
Parts which have been contaminated or which have been corroded by chemicals or other substances that can pose a health risk must be cleaned before they are returned to the manufacturer. Furthermore, it should be indicated on the health and safety form, which specific cleaning procedure has been followed, and it should be indicated that the equipment has been decontaminated. The safety form is required at all items, even if the parts have not been used.

Warranties purporting to be on behalf of Bredel B.V. made by any person, including representatives of Bredel B.V., its subsidiaries, or its distributors, which do not accord with the terms of this warranty shall not be binding upon Bredel B.V. unless expressly approved in writing by a Director or Manager of Bredel B.V.

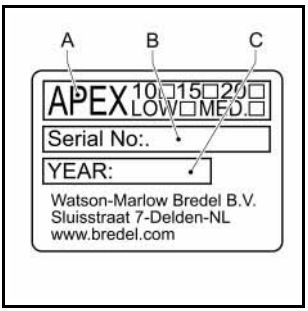


4 DESCRIPTION

4.1 Identification of the product

4.1.1 Identification of the product

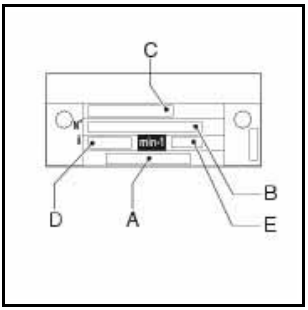
The hose pump can be identified by identification plates or stickers on:



A: Pumphead
B: Gearbox
C: Electric motor
D: Pump hose
E: Frequency controller (option)

4.1.2 Identification of the pump

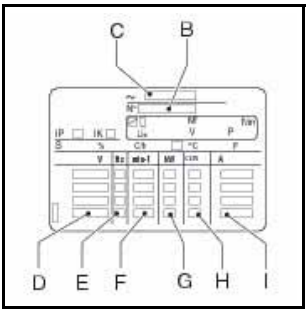
The identification plate on the pumphead contains the following data:



A: Pump type
B: Serial number
C: Year of manufacture

4.1.3 Identification of the gearbox

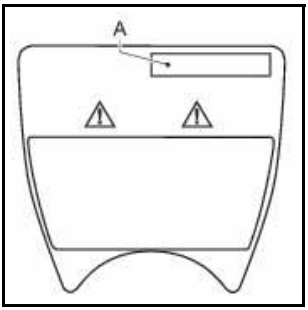
The identification plate on the gearbox contains the following data:



A: Article number
B: Serial number
C: Type number
D: Reduction ratio
E: Number of revolutions per minute

4.1.4 Identification of the electric motor

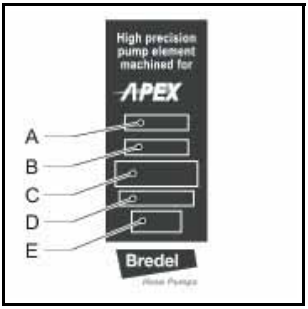
The identification plate on the electric motor contains the following data:



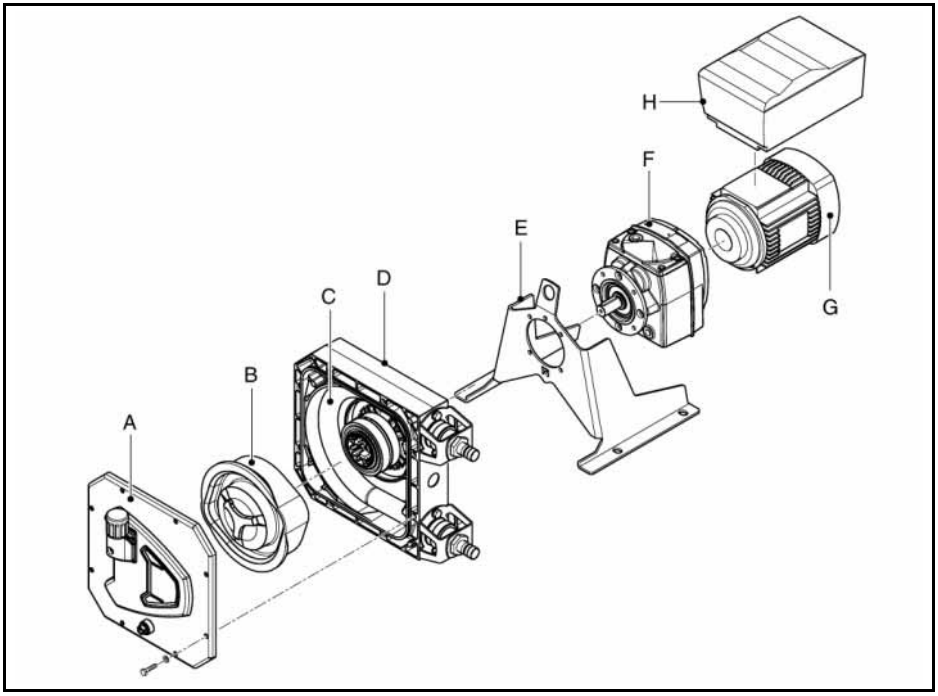
B: Serial number
C: Article number
D: Mains
E: Frequency
F: Speed
G: Power
H: Power factor
I: Current

4.1.5 Identification of the frequency controller

The identification plate on the Bredel Variable Frequency Drive (VFD) contains the following data:



A: Article number

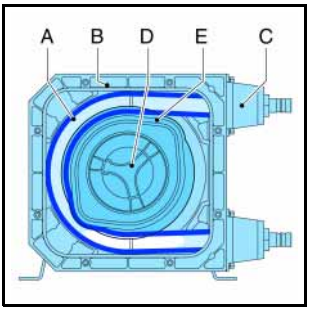


4.1.6 Identification of the pump hose

The identification sticker on the pump hose contains the following data:

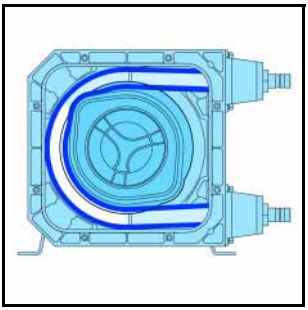
A: Article number
B: Internal diameter
C: Material of inner liner
D: Maximum permissible working pressure
E: Production code

4.2 Construction of the pump



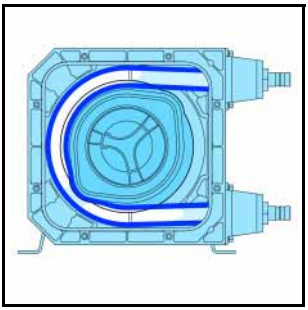
A: Cover
B: Rotor
C: Pump hose
D: Pump housing
E: Support
F: Gearbox
G: Electric motor
H: Frequency controller

4.3 Operation of the pump



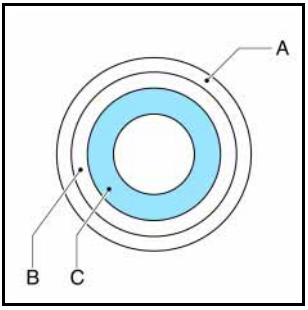
The heart of the pumphead consists of a specially constructed pump hose (A) which lies against the inside of the pump housing (B). The ends of the hose are connected to the suction and discharge lines (C). A

bearing-mounted rotor (D) with two facing integral pressing shoes (E) is in the centre of the pumphead. It rotates clockwise.



In phase 1 the lower shoe compresses the pump hose by the rotational movement of the rotor, forcing fluid through the hose. As soon as the shoe has passed, the hose recovers to its original shape due to the mechanical properties of the material and fluid is drawn into the hose.

In phase 2 fluid is drawn through the hose by the (continuous) turning motion of the rotor.



In phase 3, the second integral pressing shoe compresses the pump hose. Due to the continuous rotating movement of the rotor new fluid is sucked in and fluid that is previously drawn in is pressed out by the shoe. When the first shoe leaves the pump hose, the second shoe has already occluded the pump hose and fluid is prevented from flowing back. This method of liquid displacement is known as the "positive displacement principle".

4.4 Pump hose

4.4.1 General

A: Extruded outer layer made of natural rubber
B: Two nylon reinforcement layers
C: Extruded inner liner

The pump hose liner material should be chemically resistant to the product being pumped. For each pump model various hose types are available. Choose the most appropriate for your application.
The material of the inner liner of the pump hose determines the hose type. Each hose type is marked by a unique colour code.

Hose type	Material	Colour code
NR	Natural rubber	Purple
NBR	Perbunan	Yellow
EPDM	EPDM	Red
CSM	CSM	Blue

	Consult your distributor for more detailed information about the chemical and temperature resistance of pump hoses.

Bredel pump hoses have been carefully machined to achieve minimum tolerances in wall thickness. It is very important to guarantee the correct compression of the pump hose, because:

- When the compression is too high, it creates an excessive load on the pump and pump hose, which may reduce the life of the pump hose and bearings.
- When the compression is too low, it cuts capacity and causes backflow. Backflow reduces the life of the pump hose.

4.4.2 Hose compression force adjustment

The compression force on the pump hose can be adjusted by installing a rotor with a different dimension between the tips of the integral pressing shoes. The rotor is chosen to achieve an optimal life of the pump hose for the intended use of the hose pump. Each hose size (10, 15 or 20 mm inner diameter) has its own low-pressure and medium-pressure rotors. This means there are six types of rotors available. If you want to change the application of your hose pump or if you want to change the hose size, contact your distributor.

4.4.3 Lubrication and cooling

The pumphead, in which the rotor and pump hose can be found, is filled with Bredel Genuine Hose Lubricant. This lubricant lubricates the movement between the hose and the pressing shoes and dissipates the generated heat via the pump housing and the cover.

The lubricant is food grade. Refer to § 11.1.4 for the required quantity and NSF registration.

	Consult your distributor for lubrication recommendations when operating the hose pump below 2 rpm.

4.5 Gearbox

The hose pump types described in this manual use helical gearbox units. The gearboxes are fitted with a flange connection. Refer to § 11.2 for specifications. Refer to the documentation supplied with the gearbox for installation and maintenance information. In case of doubt, consult your distributor.

4.6 Electric motor

The standard electric motor is a completely enclosed three-phase asynchronous motor. The motor connection must meet the local applicable regulations.

Refer to the documentation supplied with the electric motor for installation and maintenance information. In case of doubt consult your distributor. Refer to § 5.3.4 and § 11.3 for installation and connection information.

4.7 Available options

The following options are available for the hose pump:

- High (lubricant) level float switch
- Revolution counter
- Medium- or low-pressure rotor
- Frequency controller[1]
- Three hose sizes
- Various nipples and flanges

1 Refer to the supplier's documentation and § 11.4.

5 INSTALLATION

5.1 Unpacking

Follow the unpacking instructions on the packaging or on the hose pump, the gearbox and the electric motor.

5.2 Inspection

Check that your delivery is correct and check it for any transport damage. When replacing parts, check that the delivery is correct and check these parts for any transport damage. Refer to § 4.1.1. Report any damage immediately to your distributor.

5.3 Installation conditions

5.3.1 Ambient conditions

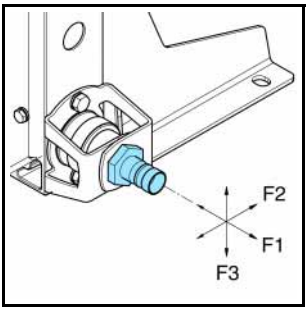
Make sure that the hose pump is in an area where the ambient temperature during operation is not lower than -20 °C (-4 °F) and not higher than +45 °C (+113 °F).

5.3.2 Set-up

- The pump materials and protective layers are suitable for indoor set-up and a protected outdoor set-up. Under certain conditions the pump is suitable for limited outdoor set-up or a salty or aggressive atmosphere. Consult your distributor for more information.
- Make sure that the floor surface has a maximum slope of 1 mm per meter (0.012 in per foot).
- Make sure that there is sufficient room around the pump to carry out the necessary maintenance.
- Make sure that the room is sufficiently ventilated, so that the heat developed by the pump and drive can be dissipated. Keep some

distance between the ventilation cover of the electric motor and the wall to allow the supply of cooling air.

5.3.3 Pipework



When determining and connecting suction and discharge lines consider the following points:

- The bore size of the suction and discharge lines must be larger than the bore size of the pump hose. For more information consult your distributor.
- Limit the presence of sharp bends in the discharge line. Make sure that the radius of any bend is as large as possible. Use Y-connections instead of T-connections.
- It is recommended to use a minimum of three quarters (3/4) of the hose length as flexible hose in the suction or discharge line. This avoids the need to remove the connection lines when changing a pump hose.
- Keep the delivery and suction lines as short and direct as possible.
- Select the correct mounting material for flexible hoses and make sure that the installation is suited for the design pressure of the system.
- Do not exceed the maximum working pressure of the hose pump. Refer to § 11.1.1. If necessary fit a pressure relief valve.

	**CAUTION** Consider the maximum permissible working pressure on the discharge side. Exceeding the maximum working pressure may lead to serious damage to the pump.

- Make sure that the maximum forces on the flanges are not exceeded. The permissible loads are given in the following table.

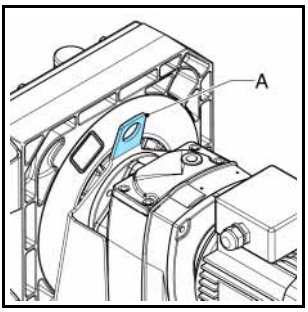
Maximum permissible loads [N / lbf] on the pump connections		
Force	**[N]**	**[lbf]**
F1	600	135
F2	120	27
F3	300	67

5.3.4 Motor

The motor connection must meet the local applicable regulations. A thermal safety device should reduce the risk of a motor overload. For connecting PTC thermistors (if present) a special thermistor relay must be used. In case of doubt, contact your distributor for advice. Refer to § 11.3 for specifications.
Refer to the documentation supplied with the electric motor for information on how to connect the motor to your power supply.

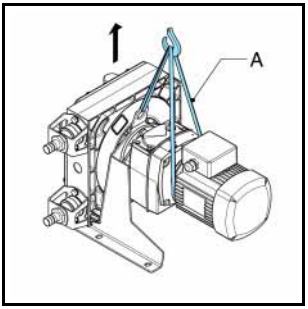
5.3.5 Frequency controller

⚠	**WARNING** A frequency controller that is fitted *without manual control* can start the pump automatically when power is applied.



If the hose pump is fitted with a frequency controller, consider the following points:

- Take precautions so the motor does not re-start automatically after an unscheduled stop.
  In the event of a power or mechanical failure, the frequency controller stops the motor. When the cause of the failure is removed, the motor can restart automatically. The automatic restart can be dangerous in certain pump installations.



- All control cables outside the enclosure must be shielded and have a cross sectional area between 0.22 and 1 mm^2 (23 and 18 AWG). The shielding must be connected to earth at both ends. In case of doubt, consult your distributor.

5.4 Lifting and moving the pump

The pump support has a lifting eye (A) for lifting and moving the hose pump.

The complete hose pump, i.e. pumphead, gearbox and electric motor, must be lifted using the lifting eye plus additional support using suitably rated straps or slings (A). For the weights, refer to § 11.1.5.

⚠	**WARNING** If the pump is to be lifted ensure that all standard lifting practices are adhered to and carried out by qualified personnel only.

5.5 Placing the pump

Position the pump on a horizontal surface. Use suitable anchor bolts to attach the pump to the floor surface.

6 COMMISSIONING

6.1 Preparations

	**WARNING** A frequency controller that is fitted *without manual control* can start the pump automatically when power is applied.

	**WARNING** Disconnect and lock the power supply to the pump drive before any work is carried out. Wait two minutes to make sure that the capacitors have discharged. This is necessary when the motor is fitted with a frequency controller and has single phase power supply.

1. Connect the electric motor and, if present, the frequency controller in conformance with the locally applicable rules and regulations. Refer to § 5.3.5. Have the electrical installation work carried out by qualified personnel.

2. Check that the lubricant level is above the minimum level line in the inspection window. If necessary refill with Bredel Genuine Hose Lubricant via the breather plug. See also § 8.4.

6.2 Commissioning

1. Connect the pipework.

2. Make sure that there are no obstructions such as closed valves.

3. Switch on the hose pump.

4. Check the rotation of the rotor.

5. Check the capacity of the hose pump. If the capacity differs from your specification, follow the instructions in chapter 10 or consult your distributor.

6. If a frequency controller is present, check the capacity range. In case of any deviations consult the supplier's documentation.

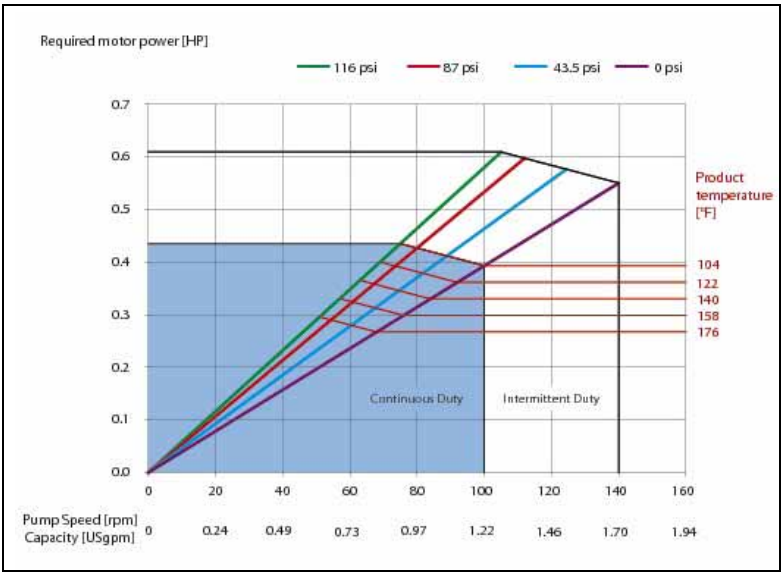
7. Check the hose pump in accordance with points 2 to 4 of the maintenance table at § 8.2.

7 OPERATION

7.1 Temperature

The pump will heat up during normal operation. Heat is generated in the contact zone between the pressing shoe and the hose. The heat is removed by the lubricant and transported to the pump casing and cover. This will result in a temperature higher than the ambient temperature.

	**WARNING** Avoid contact with the casing and cover under conditions of high pressure and running speed.

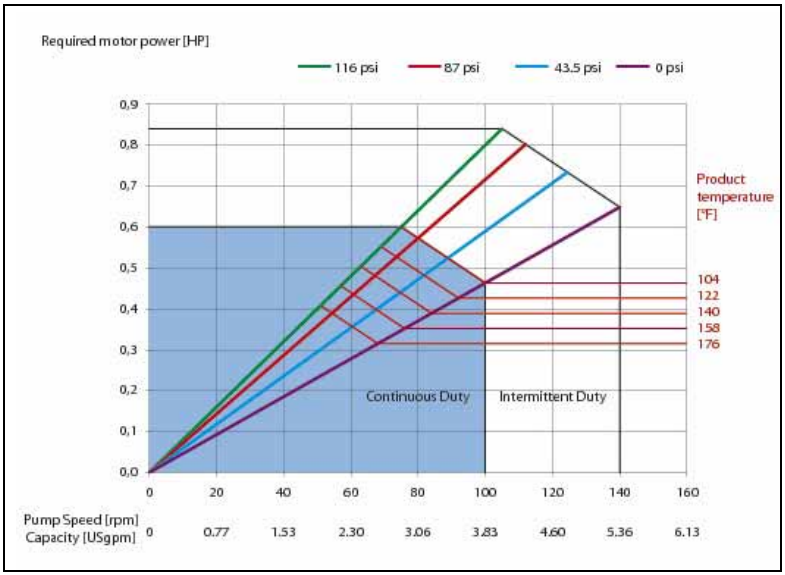


7.2 Power rating

The pump requires a certain amount of power for the specified operating condition(s). The gearbox and motor should be capable of handling that power at the given revolution speeds.

	**WARNING** Overloading the motor can lead to serious motor damage. Do not exceed the maximum power rating of the motor.

	**WARNING** Overloading the gearbox leads to increased tooth wear and shortened bearing life. This can lead to serious gearbox damage. Do not exceed the maximum power rating of the gearbox.



7.2.1 Performance graph APEX10:

7.2.2 Performance graph APEX15:

7.2.3 Performance graph APEX20:

7.3 Dry running

Dry running is a running condition of the pump when no fluid is flowing through the pump. Bredel peristaltic pumps are very suitable for dry running.
Dry running imposes an additional thermal load on the pump hose, because the internal heat associated with repetitive hose compression is normally removed by the process fluid. So dry running increases the wear on the hose. The thermal load depends on the running speed of the pump, the hose size (10, 15, 20 mm) as well as the rotor type (low-pressure or medium-pressure). To minimize the extra wear, it is advisable to minimize dry running periods.

7.4 Hose failure

Cause of a hose failure
The hose in a peristaltic pump has to withstand many load cycles of considerable magnitude. The repetitive stress cycles will cause the hose to deteriorate and eventually fail.

Result of a hose failure
A hose failure will result in direct contact between the pump lubricant and the pumped fluid.

Consequences of a hose failure
In general, this will not cause a hazardous situation because the Bredel Genuine Hose Lubricant is harmless (approved by the United States Food and Drug Administration). However, there is an exception in case of pumping a strong oxidizer or a strong acid.

- Hazardous situations

	**WARNING** Avoid direct contact between a strong oxidizer or a strong acid and Bredel Genuine Hose Lubricant. This can cause unwanted chemical reactions. Use an alternative lubricant to avoid hazardous situations. Contact your distributor for more details.

- Additional downtime
  Hose failure will result in additional downtime, because you must clean the pump before a new hose installation.

	Regularly replace the hose to avoid hose failure and additional downtime. Hose life depends on the operating condition, process fluid and hose material. The end-user should be aware of this and establish the frequency of preventive hose replacement. Contact your distributor for advice.

- Large spill of product
  In case the pressure in the process line (reservoir) is above the pressure in the pump housing (ambient pressure), the process fluid can enter the pump housing. If there is no check valve in the process line a serious amount of fluid can flow from the reservoir into the pump housing and escape through the breather onto the floor. This could lead to a large spill of product outside the pump. Reversed flow protection is advised. This is not part of the scope of delivery.

7.5 Fluid leakage

The APEX pump uses a lubricated rotor to compress the hose. This means the pumphead must be filled with sufficient lubricant during operation. This lubricant is contained in the pump housing by the front cover and by a dynamic seal on the back. The gearbox is filled with gearbox lubricant.

Seal damage can occur due to normal wear in time, but is seriously accelerated if the seal gets in contact with contaminated lubricant. Thorough cleaning of the pump housing after a hose failure and regular replacement of the lubricant is strongly advised.

The pumphead and gearbox are directly coupled to each other. A special feature is included in the pumphead to allow early detection of seal damage of the pump or gearbox.

This feature is called the leakage zone. Drops of lubricant visible at the back of the pump indicate likely seal failure. To avoid consequential damage, the pump

must be stopped and lubricant levels of the pumphead and gearbox must be checked. The damaged seal should be replaced.

	Regularly inspect the pump for fluid leakage.

	**WARNING** Risk of injury from falling! Process fluid mixed with pump lubricant that is leaking from the pump can make floors slippery.

8 MAINTENANCE

8.1 General

	**WARNING** Disconnect and lock the power supply to the pump drive before any work is carried out. Wait two minutes to make sure that the capacitors have discharged. This is necessary when the motor is fitted with a frequency controller and has single-phase power supply.

	**WARNING** Do not remove the pump cover if the power cable is connected to the motor. Do not connect the power cable to the motor if the pump cover is removed.

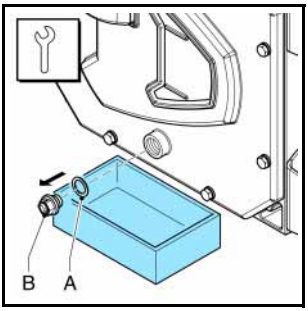
Only use original Bredel parts when maintaining the hose pump. Bredel cannot guarantee correct operation and any consequential damage that occurs from the use of non-original Bredel components. See also chapters 2 and 3.
Check that your delivery of original parts is correct and check it for any transport damage. If parts are damaged, consult your distributor.

	Before installation, always check the condition of the supplied parts. Do not install damaged parts. In case of doubt, contact your distributor.

8.2 Maintenance and periodic inspections

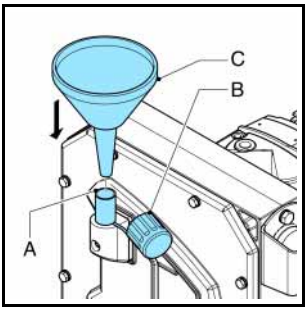
The following diagram shows the maintenance and periodic inspection that need to be carried out on the hose pump to guarantee optimal safety, operation and life of the pump.

Point	Action	To be carried out	Remark
1	Checking the lubricant level.	Before starting the pump and at scheduled intervals during operation.	Make sure that the lubricant level is above the minimum level line in the inspection window. If necessary refill the lubricant. See also § 8.4.
2	Checking the pump-head for any leakage of lubricant around the cover, the brackets and the rear of the pump-head.	Before starting the pump and at scheduled intervals during operation.	See § 10.
3	Checking the gearbox for any leakage.	Before starting the pump and at scheduled intervals during operation.	In case of leakage consult your distributor.
4	Checking the pump for deviating temperature or strange noises.	At scheduled intervals during operation.	See § 10.
5	Checking the rotor with integral pressing shoes for excessive wear.	When replacing the pump hose.	See § 8.5.
6	Internal cleaning of the pump hose.	Cleaning of the system or fluid change.	See § 8.3.
7	Replacing the pump hose.	Preventive, this means after 75% of the hose life of the first hose.	See § 8.5.



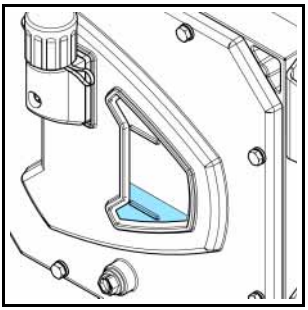
Point	Action	To be carried out	Remark
8	Changing lubricant.	After every second hose change or after 5,000 service hours, whichever comes first, or after hose rupture.	See § 8.4
9	Replacing the seal ring.	If necessary.	See § 8.6.1.
10	Replacing the rotor with integral pressing shoes.	Wear on the running surface of the pump hose and/or seal ring.	
11	Replacing the bearings.	If necessary.	See § 8.6.1.

8.3 Cleaning the pump hose



The inside of the pump hose can be easily cleaned by rinsing the pump with clean water. If a cleaning fluid is added to the water, check if the hose liner material is resistant to it. Also check if the pump hose can resist the cleaning temperature. Special cleaning balls (pigs) are also available. Contact your distributor for more details.

8.4 Changing lubricant

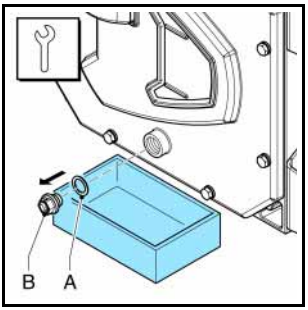


1. Place a tray (A) under the drain plug in the cover of the pump. Remove the drain plug (B). Drain the lubricant from the pump housing into the tray. Replace the drain plug and tighten it firmly.

2. The pump housing can be filled with lubricant via the breather (A) on the cover. For this purpose remove the breather cap (B) and position a funnel (C) in the breather. Pour the lubricant into the pump housing through the funnel.

3. Keep on pouring until the lubricant level has risen above the level line in the inspection window. Replace the breather cap.

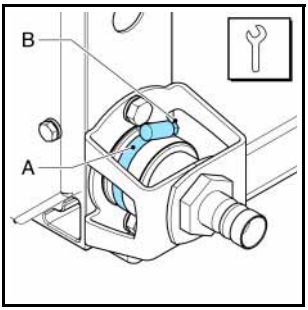
	For the required quantity of lubricant, refer to § 11.1.4.



8.5 Replacing the pump hose

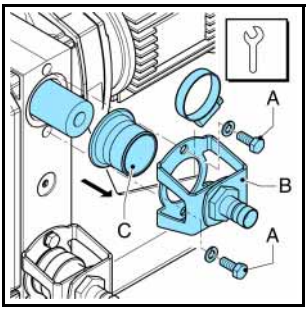
8.5.1 Removing the pump hose

1. Isolate the pump from the electrical supply.



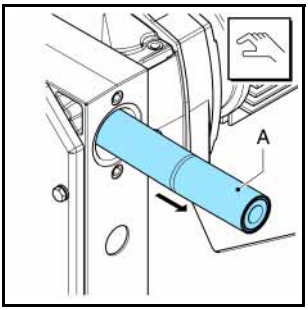
2. Close any shut-off valves in the suction and discharge line to minimize product loss.

3. Place a tray (A) under the drain plug in the bottom of the pumphead. The tray must be large enough to contain the lubricant, possibly contaminated with product fluid, from the pumphead. Remove the drain plug (B). Catch the lubricant from the pump housing in the tray. Check that the breather mounted on the cover is not obscured. Position the drain plug and tighten it firmly.



4. Disconnect the suction and discharge lines.

5. Loosen hose clamp (A) of the inlet and outlet ports by loosening bolt (B).

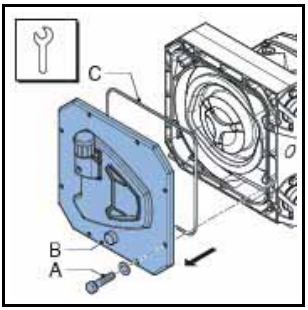


6. Loosen the retaining bolts (A) of the bracket (B) and remove the bolts.

7. Pull the bracket and hose clamp from the hose. Then pull off the rubber bush (C).
Do steps 6 to 7 for both the inlet and outlet ports.

8. Switch on the electrical supply.

9. Drive out the hose (A) from the pump chamber by jogging the drive motor.



⚠	**WARNING** During jogging the drive: - Do not stand in front of the pump ports. - Do not try to guide the hose by hand.

8.5.2 Cleaning the pumphead

1. Isolate the pump from the electrical supply.

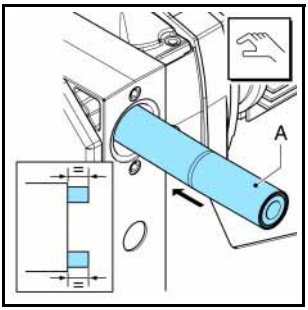
2. Remove the cover (B) by loosening the retaining bolts (A).

3. Check the cover seal (C) and replace it if necessary.

4. Rinse the pumphead with clean water and remove all residues. Clean the pockets in the pump housing. Make sure that no rinsing water remains in the pumphead.

5. Check the rotor for wear or damage and replace the rotor if necessary. Also see the maintenance diagram in § 8.2.

⚠	**CAUTION** When the rotor is worn the compression force of the hose decreases. If the compression force is too low, this results in a loss of capacity because of the backflow of the liquid to be pumped. Backflow results in a reduction of the life of the pump hose.

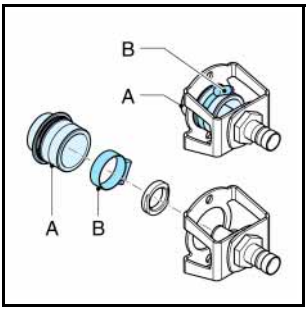


6. Replace the cover and fasten the retaining bolts to the correct torque. Refer to § 11.1.6.

7. Switch on the electrical supply to the pump.

8.5.3 Fitting the pump hose

1. Clean the (new) pump hose on the outside and fully lubricate it with Bredel Genuine Hose Lubricant.

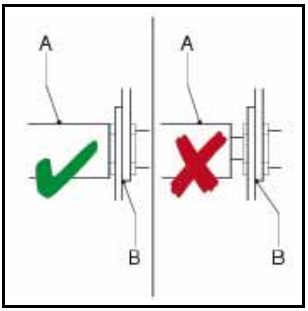


2. Fit the pump hose (A) via one of the ports.

3. Run the motor so that the rotor pulls the hose into the pump housing. Stop the motor when the hose sticks out equally from both sides of the pump housing.

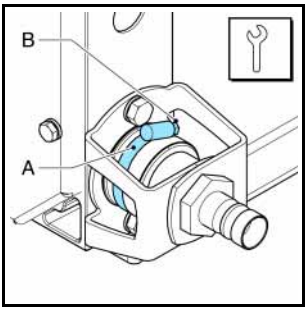
	WARNING During jogging the drive: - Do not stand in front of the pump ports. - Do not try to guide the hose by hand.

4. Check that the rubber bushes (A) are not deformed or damaged and replace them if necessary.



5. Check that the hose clamps (B) are not damaged and replace them if necessary.

6. First fit the inlet port.
Slide the rubber bush (D) over the hose. Push the bracket (A) and the hose clamp (B) over the hose together. Align the holes in the bracket with the ones at the front of the port. Position the two retaining bolts (C) and tighten them. Make sure the bolts are tightened to the correct torque. Refer to § 11.1.6.



7. Fit the suction line.

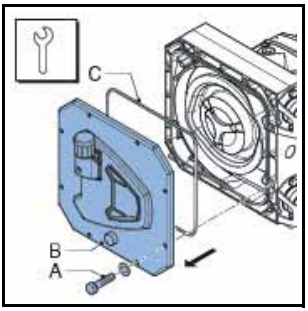
8. Turn the rotor in such a way that the hose (A) is pressed firmly against the bracket (B).

9. Place the hose clamp accurately on the track in the rubber bush. Tighten the bolt (A) of the hose clamp (B). Make sure the bolt is tightened to the correct torque. Refer to § 11.1.6.

10. Now fit the other port in the same way.

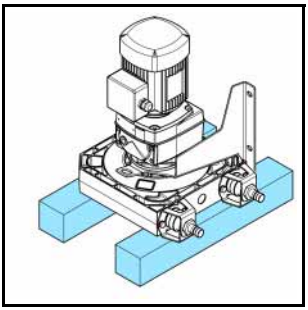
11. Fill the pump housing with Bredel Genuine Hose Lubricant. Refer to § 8.4.

8.6 Exchanging replacement parts



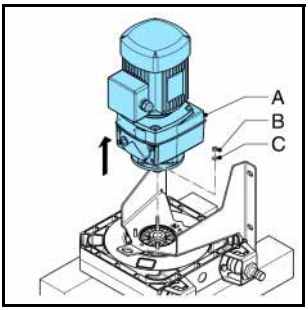
8.6.1 Replacing rotor, bearings and seal ring

1. Remove the pump hose. Refer to § 8.5.1.



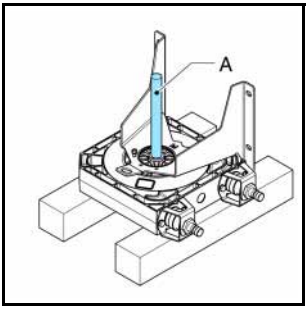
2. Isolate the pump from the electrical supply.

3. Remove the cover (B) by loosening the retaining bolts (A).

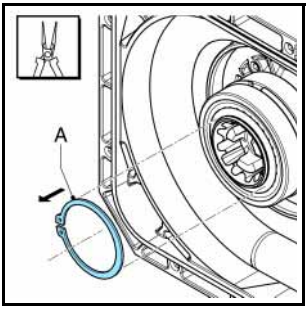


4. Check the cover seal (C) and replace it if necessary.

5. Put the hose pump on blocks, on its side as shown. Make sure the space between the blocks is wide enough for the rotor to fall into.

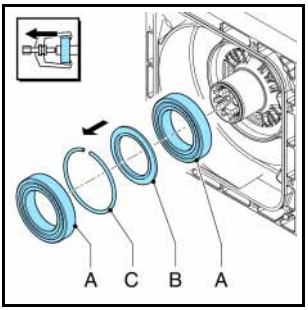


6. Remove the nuts (B), the washers (C) and the pump drive (A).

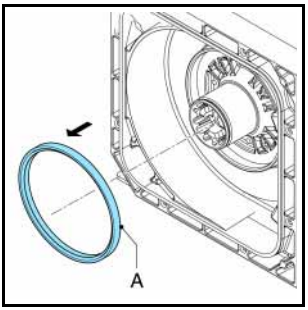


7. Put a plastic or wooden drive pin (A) on the rotor.

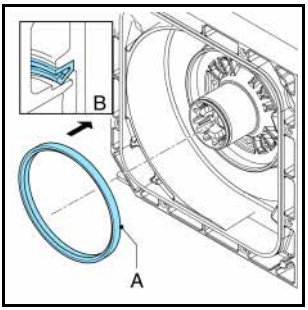
8. Hit the drive pin firmly with a hammer to remove the rotor.



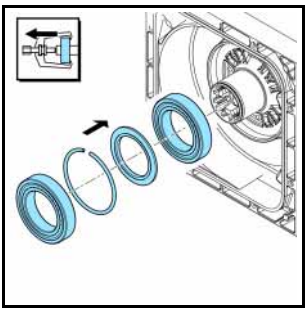
9. Put the hose pump upright on the support.



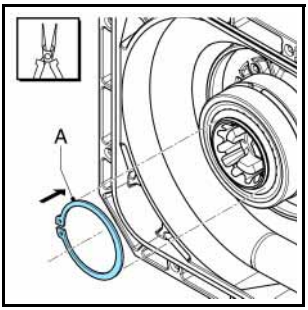
10. Dismount the circlip (A) with the correct tool.



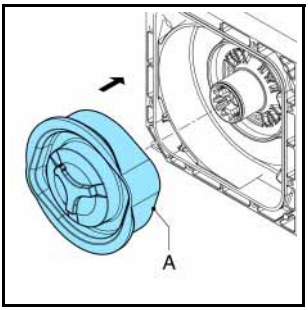
11. Dismount the bearings (A), the spacer ring (B) and the retaining ring (C) with the correct tool. Clean the hub.



12. Remove the seal ring (A). Clean and degrease the bore.



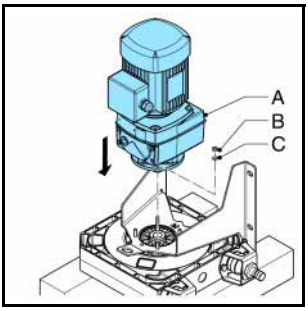
13. Fit a new seal ring (A) using good engineering practices. The seal ring must be fitted in the correct orientation (B). Make sure that the open side points to the pump cover.



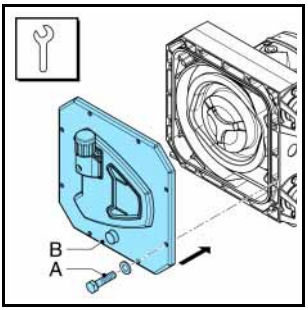
14. Slightly oil the inner ring of the (new) bearings and the seat on the hub. Fit the bearings and the rings.
The bearings are placed on the hub with a slight interference fit. Use a pressing tool to press the bearings on the hub.

15. Mount the circlip (A).

16. Fit the rotor (A). The rotor is placed on the bearings with a loose fit. Press the rotor on the hub until it clicks on the retaining ring.



17. Put the hose pump on two blocks, on its side as shown.

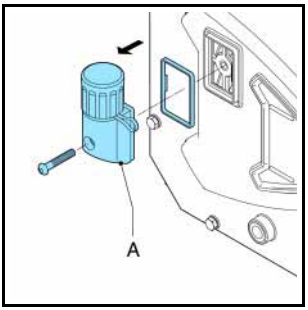


18. Fit the pump drive (A) with the nuts (B) and washers (C). Tighten to the specified torque settings. Refer to § 11.1.6.

19. Put the hose pump upright on the support.

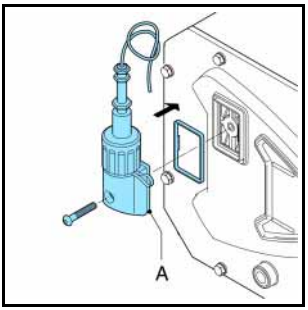
20. Check the position of the rotor. If necessary press the rotor on the hub until it clicks on the retaining ring.

21. Refit the cover (B). Make sure that the eight bolts (A) are refitted and that they are tightened in the correct order, diagonally opposite each other. Refer to § 11.1.6.



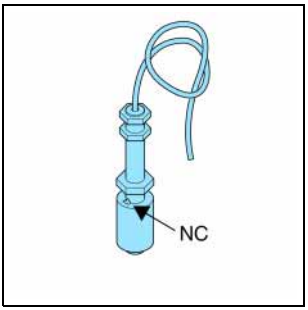
22. Switch on the electrical supply to the pump.

23. Fit the (new) pump hose. Refer to § 8.5.3.



8.7 Fitting options

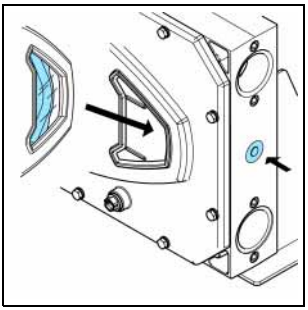
8.7.1 Fitting a high-level float switch



1. Dismount the standard breather (A) on the cover of the pumphead.

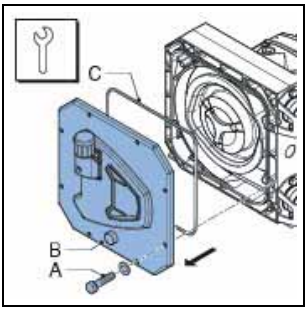
2. Mount the breather (A) with high-level float switch.

3. Connect the high-level float switch to the auxiliary power circuit via the 1.5 meter (5 feet) long PVC cable (2 x 0.34 mm^2, 2 x 22 AWG). Bear in mind that the electrical contact of the float switch is normally closed (NC). The knob is upwards for normally closed operation. When the lubricant level is (too) high the contact will open.



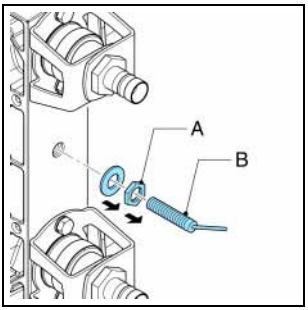
Specifications	
Voltage:	Max. 230 V AC/DC
Current:	Max. 2 A
Power:	Max. 40 VA

	Where the float switch is constructed to stop the equipment, operating has to be arranged so that the stop function locks-out, preventing the equipment from being re-started without re-setting. Check if the float switch is mounted with the NC sign at the top.



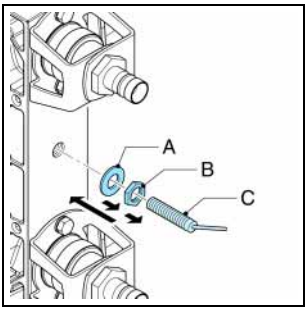
8.7.2 Replacing the revolution counter

1. Jog the rotor until the pressing shoe is clearly visible through the inspection window. Now the pressing shoe faces the position of the sensor.

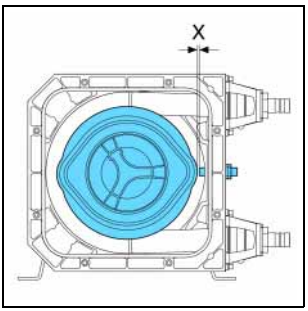


2. Remove the lubricant. Refer to 8.4.

3. Remove the cover (B) by loosening the retaining bolts (A).

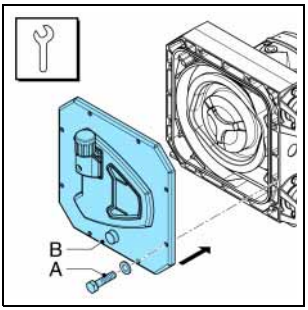


4. Remove the nut (A) and the old sensor (B).



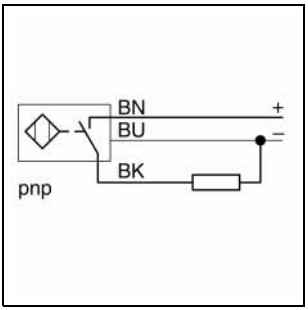
5. Mount the nut (B) and the sealing ring (A) on the new sensor (C).

6. Place the sensor (C) in the pump housing.



7. Tighten the nuts so that the distance between the sensor and the rotor (X) is between 0.75 mm (0.03 in) and 1.25 mm (0.05 in).

8. Check if the revolution counter works properly:
   1 The sensor needs to send signals.
   2 The rotor should be able to rotate freely.



9. Refit the cover (B). Make sure that the eight bolts (A) are refitted and that they are tightened in the correct order, diagonally opposite each other. Refer to § 11.1.6.

10. Refill the pumping house with lubricant. Refer to 8.4.

11. Connect the sensor electrically via the 2 meter (7 feet) long PVC cable (3 x 0.34 mm^2, 3 x 22 AWG). Refer to the connection scheme, right.

Specifications	
Voltage	10 ... 30 V DC
Current	Max. 200 mA

9 STORAGE

9.1 Hose pump

- Store the hose pump or pump parts in a dry area. Make sure that the hose pump or pump parts are not exposed to temperatures lower than -40 °C (-40 °F) or higher than +70 °C (+158 °F).
- Cover the openings of the inlet and outlet ports.
- Prevent corrosion of untreated parts. For this purpose use the correct protection or packaging.
- After a long period of standstill or storage, the static load on the pump hose may have caused permanent deformation, which will reduce the life of the pump hose. To prevent this, remove the pump hose when the pump is not going to be used for a period of time.

9.2 Pump hose

- Store the pump hose in a cool and dark room. After two years the hose material will age, which will reduce the life of the hose.

10 TROUBLESHOOTING

WARNING
Disconnect and lock the power supply to the pump drive before any work is carried out.
Wait two minutes to make sure that the capacitors have discharged. This is necessary when the motor is fitted with a frequency controller and has single phase power supply.

If the hose pump does not function (correctly), consult the following checklist to see if you can remedy the error yourself. If you cannot, contact your distributor.

Problem	Possible cause	Correction
Failure to operate.	No voltage.	Check that the supply power switch is on.
		Check the electrical supply is available at the pump.
	Stalled rotor.	Check if the pump is stalled by incorrect fitting of the hose.
		Check the VFD settings, if applicable.
	Lubricant level monitoring system has been activated.	Check if the lubricant level monitoring system has stalled the pump. Check the functioning of the lubricant level monitoring system, and check the lubricant level.

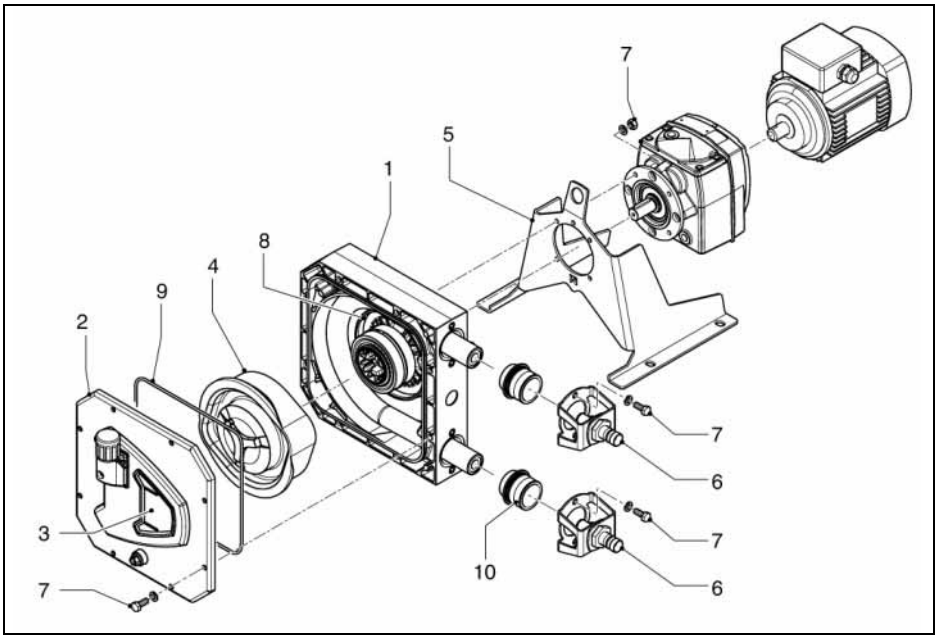
Problem	Possible cause	Correction
High pump temperature.	Non standard hose lubricant used.	Consult the distributor for the correct lubricant.
	Low lubricant level.	Add Bredel Genuine Hose Lubricant. For the required amount of lubricant refer to § 11.1.4.
	Fluid temperature too high.	Consult the distributor about the maximum temperature range of the fluid.
	Internal friction on the hose caused by blocked or poor suction characteristics.	Check pipework/valves for blockages. Ensure that the suction pipework is as short as possible and that the diameter is large enough.
	High pump speed.	Reduce pump speed to a minimum. Consult your distributor for advice on optimum pump speeds.

Problem	Possible cause	Correction
Low capacity / pressure.	Shut-off valve in the suction line (partly) closed.	Fully open the shut-off valve.
	Hose rupture or badly worn hose.	Replace the hose. Refer to § 8.5.
	(Partial) blockage of the suction line or too little fluid on the suction side.	Ensure that the suction line is clear of blockages and that sufficient fluid is available.
	Connections and hose clamps not correctly mounted, which makes the pump suck air.	Tighten connections and hose clamps.
	The filling degree of the pump hose is too low, because the speed is too high in relation to the viscosity of the product to be pumped and the inlet pressure. The suction line can be too long or too narrow or a combination of these factors.	Consult your distributor for a recommendation.
Vibration of the pump and pipework.	Suction and discharge lines are not secured correctly.	Check and secure pipework.
	High pump speed with long suction and discharge lines or high relative density or a combination of these factors.	Reduce pump speed. Reduce the line lengths on both suction and discharge where possible. Consult your distributor for a recommendation.
	Too narrow diameter of suction and/or discharge line.	Increase the diameter of the suction/discharge lines.

Problem	Possible cause	Correction
Short hose life.	Chemical attack of the hose.	Check the compatibility of the hose material with the fluid to be pumped. Consult your distributor for correct hose selection.
	High pump speed.	Reduce pump speed.
	High discharge pressures.	Maximum working pressure 800 kPa (116 psi). Check that the discharge line is not blocked, the shut-off valves are fully opened and the pressure relief valve functions properly (if present in the discharge line).
	High product temperature.	Consult your distributor for correct hose selection.
	High pulsations.	Restructure the discharge and inlet conditions.
Hose pulled into the pump.	Insufficient or no hose lubricant in the pumphead.	Add extra lubricant. Refer to § 8.4.
	Incorrect lubricant: no Bredel Genuine Hose Lubricant in the pumphead.	Consult the distributor for the correct lubricant.
	Extremely high inlet pressure - larger than 300 kPa (43.5 psi).	Reduce the inlet pressure.

Problem	Possible cause	Correction
Lubricant leakage at bracket.	Hose blocked by an incompressible object in the hose. The hose cannot be compressed and will be pulled into the pump housing.	Remove hose, check for blockages and replace if necessary.
	Bolts of bracket loose.	Tighten to the specified torque settings. Refer to § 11.1.6.
	Bolts of hose clamps loose.	Tighten to the specified torque settings. Refer to § 11.1.6.
Leakage from the rear of the pump housing "Buffer zone".	Damaged seal ring.	Replace seal ring.
Lubricant leakage at cover.	Damaged seal ring.	Replace seal ring.
	Bolts not tightened.	Tighten to the specified torque settings. Refer to § 11.1.6.
	Bolting torque too low.	Tighten to the specified torque settings. Refer to § 11.1.6.

11 SPECIFICATIONS



11.1 Pumphead

11.1.1 Performance

Description		Unit	APEX10	APEX15	APEX20
			∅ 10 mm	∅ 15 mm	∅ 20 mm
Max. capacity, continuous		m^3/h	0.28	0.55	0.87
		US gpm	1.23	2.42	3.83
Max. capacity, intermittent*		m^3/h	0.39	0.77	1.20
		US gpm	1.72	3.39	5.28
Capacity per revolution		l/rev	0.046	0.091	0.145
		US gal/rev	0.012	0.024	0.038

		psi	58	58	58
	with medium-pressure rotor	kPa	800	800	800
		psi	116	116	116
Permissible ambient temperature		°C	-20 to +45		
		°F	-4 to +113		
Permissible fluid temperature		°C	-10 to +80		
		°F	+14 to +176		
Sound level at 1 m (4 ft)		dB(A)	60		

* Intermittent duty: "Let the pump stand still to cool down for at least one hour after two hours of operation".

11.1.2 Materials

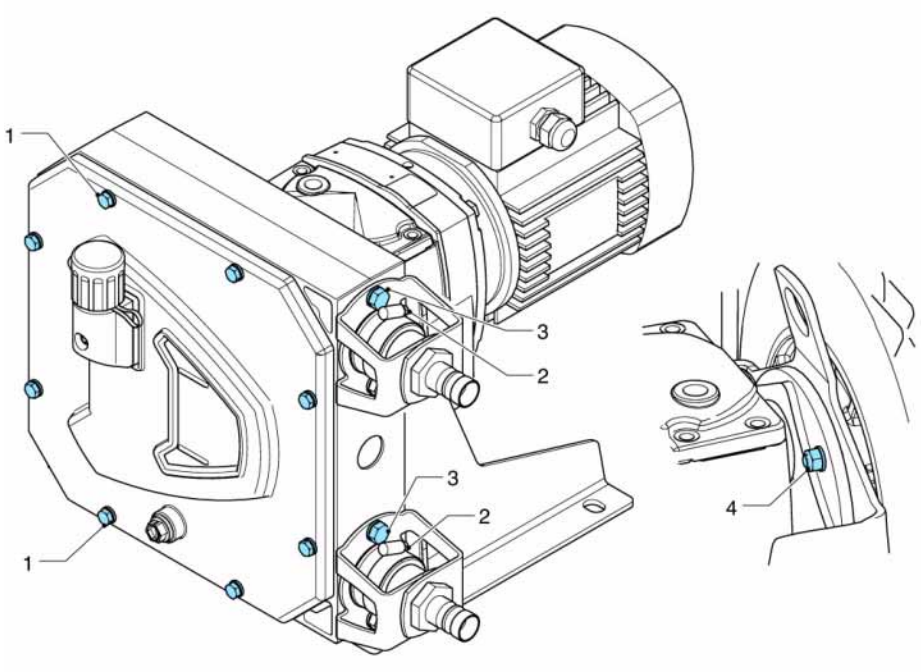
Pos	Description	Material
1	Pump housing	Aluminium EN-AC-46000
2	Cover	Copolyester
3	Cover window	PMMA
4	Pump rotor	Cast-iron
5	Pump support	Galvanized steel (AISI 316 optional)
6	Bracket	AISI 316
7	Fasteners	AISI 316
8	Dynamic sealing behind the rotor	NBR
9	Cover seal	EPDM
10	Sealing bush at hose connection	EPDM

11.1.3 Surface treatment

- After surface preparation, one layer of two-component acrylate is used for surface protection. Standard colour is RAL 3011.
- All galvanized parts, exclusive of mounting articles, have been provided with an electrolytic zinc layer of 15 - 20 microns (0.6 - 0.8 mil).

11.1.4 Lubricant table pump

	Unit	APEX
Lubricant	-	Bredel Genuine Hose Lubricant
Required quantity	litres	1.0
	gallons	0.26



Bredel Genuine Hose Lubricant is registered at NSF: NSF Registration N^{o} 123204; Category Code H1. See also: www.NSF.org/USDA.

	Consult your distributor if you should require additional information with respect to the safety data sheet.

11.1.5 Weights

Description		Unit	Weight
Pumphead (inclusive of hose, lubricant and pump support)		kg	16.5
		lbs	36.4
Pump support		kg	2.4
		lbs	5.3
Rotor		kg	4.8 ... 5.6
		lbs	10.6 ... 12.3
Hose		kg	0.5 ... 0.7
		lbs	1.1 ... 1.5
Pump cover (complete)		kg	0.7
		lbs	1.5
Coupling		kg	0.4
		lbs	0.9
Gearbox	GA52...	kg	4.7
		lbs	10.4
	GA53...	kg	4.8
		lbs	10.6
Electric motor		kg	5.0 ... 8.3
		lbs	11.0 ... 18.3

11.1.6 Torque figures

Pos	Description	Bolt size*	Unit	Torque
1	Cover	M6x25	Nm	1.5
			lbf in	13
2	Hose clamp**		Nm	3
			lbf in	27
3	Bracket	M8x20	Nm	25
			lbf in	221
4	Support + Gearbox	nut M6	Nm	10
			lbf in	89

* All bolts are class 8.8.

** Due to creeping of the hose material, the hose clamp force initially reduces in time. If leakage starts, re-tighten the hose clamp to the specified torque level. The listed torque values apply to a new and properly greased hose clamp. See also § 8.5.3 for extra instructions and hose clamp installation.

11.2 Gearbox

Type	Co-axial gearbox with helical gears
Number of stages	Two or three
Lubrication	Lubricated for life
Mounting position	IM 3001 (IM B5) flanged gearbox with keyed shaft in horizontal position.
Motor adapter	Integrated
Optional motor adapter	Adapter in conformance with IEC-B5 or NEMA C.

11.3 Electric motor

Standard electric motor design is an enclosed three-phase asynchronous motor. A thermal safety device to prevent motor overload is optional.

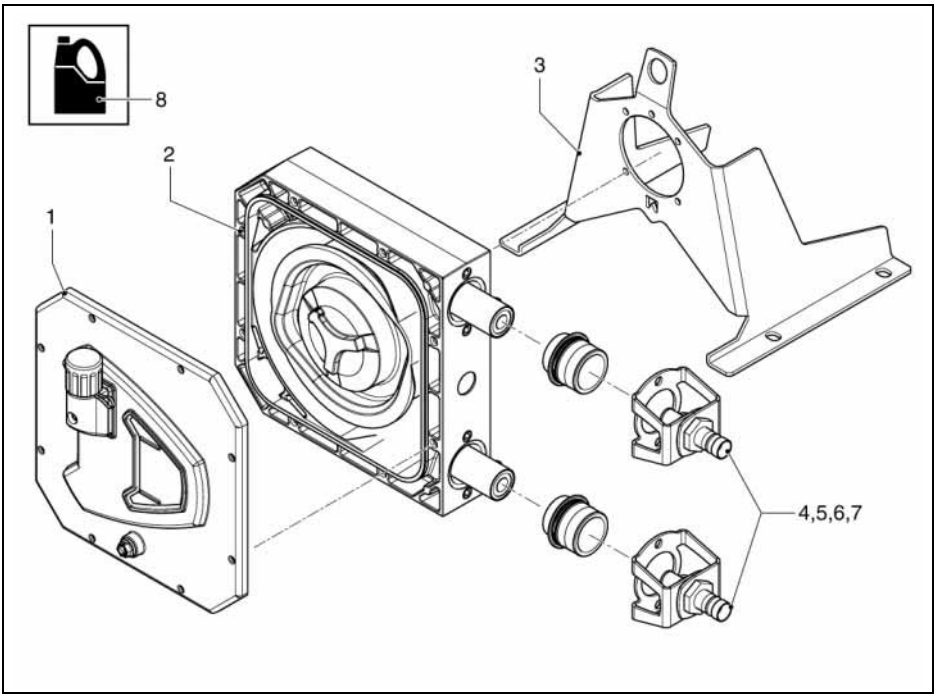
In case of doubt about the local applicable regulations for the drive connection, contact your distributor.

Protection class	IP55/IK08
Insulation class	F
Increase in temperature	Within class B
Voltage/frequency	Refer to identification plate on motor.

11.4 Variable Frequency Drive (VFD) (optional)

The Bredel Variable Frequency Drive (VFD) has been preprogrammed and only needs to be connected to the mains.

RFI filter	Integrated RFI filter B (industrial applications).
Control	Manual control for setting the speed and the keys for starting forward, stop and starting reverse.

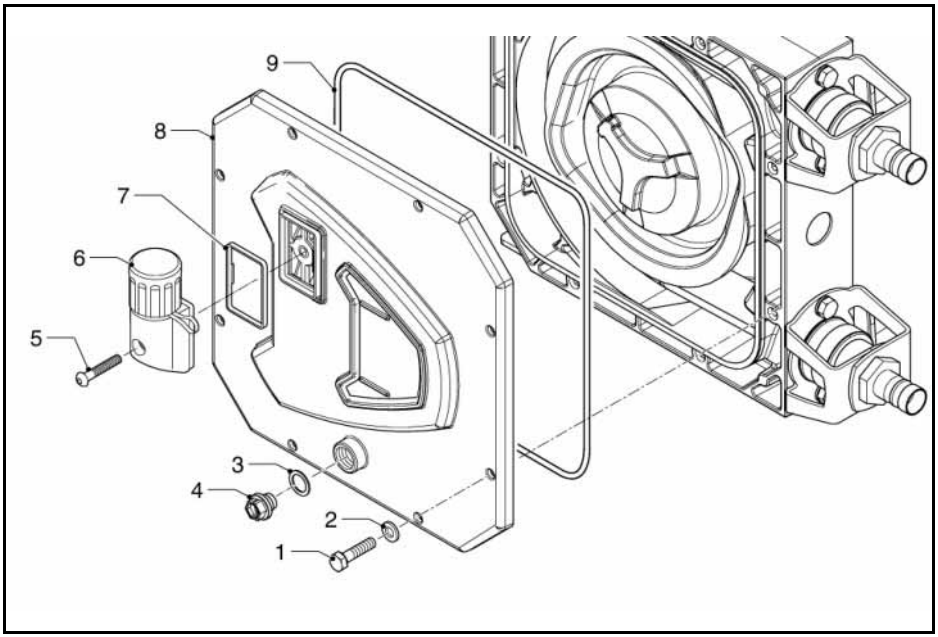


Protection class	IP65
Mains power supply	There are three types available; the choice depends on the local electricity grid: • 200-240 V ± 10%; 50/60 Hz ± 5%; 1 ph • 200-240 V ± 10%; 50/60 Hz ± 5%; 3 ph • 400-480 V ± 10%; 50/60 Hz ± 5%; 3 ph

11.5 Parts list

11.5.1 Ordering parts

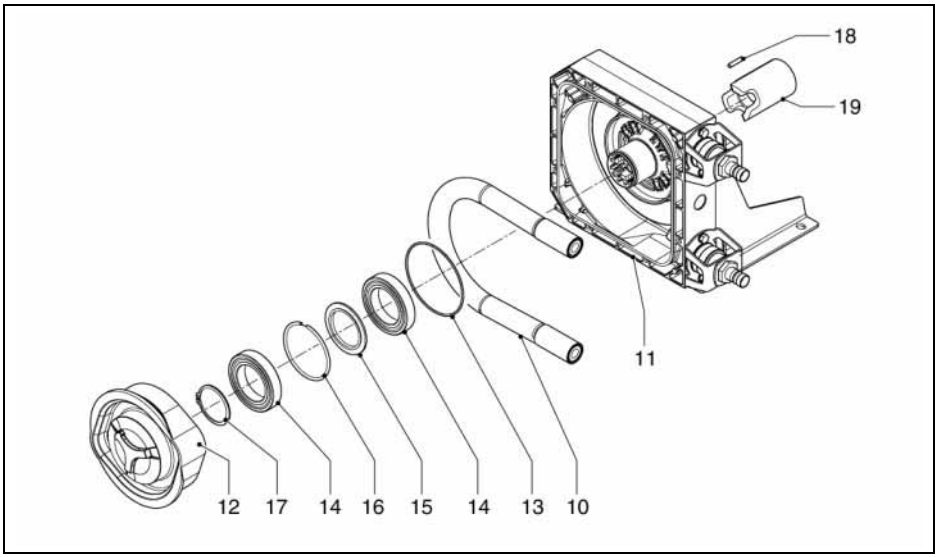
Specify the item number, description and pump size (APEX10, APEX15 or APEX20) to identify the component you need. Also specify the quantity you need.



11.5.2 Overview

Pos.	Description
1	Cover assembly. Refer to § 11.5.3.
2	Pumphead assembly. Refer to § 11.5.4.

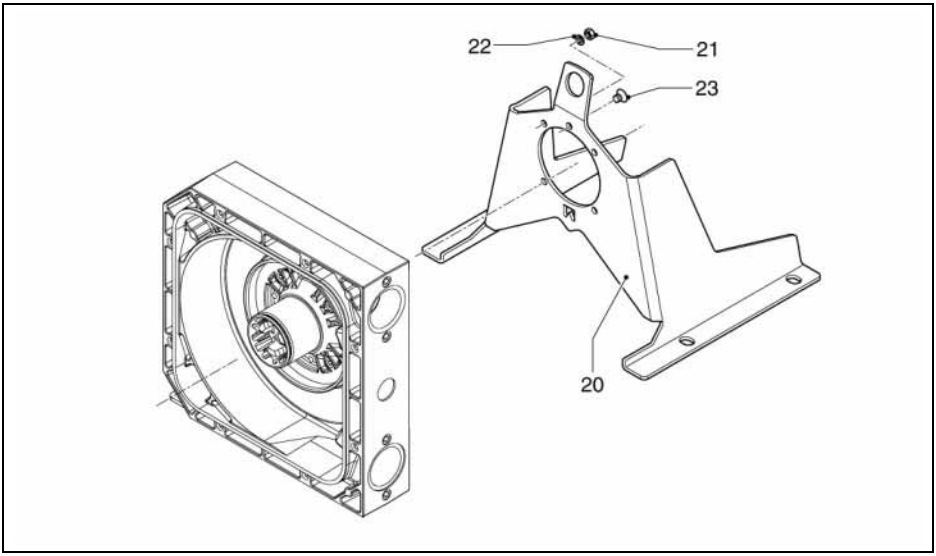
Pos.	Description
3	Pump support assembly. Refer to § 11.5.5.
4	Barbed nipple assembly. Refer to § 11.5.6.
5	Threaded nipple assembly. Refer to § 11.5.7.
6	Flange assembly (1). Refer to § 11.5.8.
7	Flange assembly (2). Refer to § 11.5.9.
8	Lubricant. Refer to § 11.5.10.



11.5.3 Cover assembly

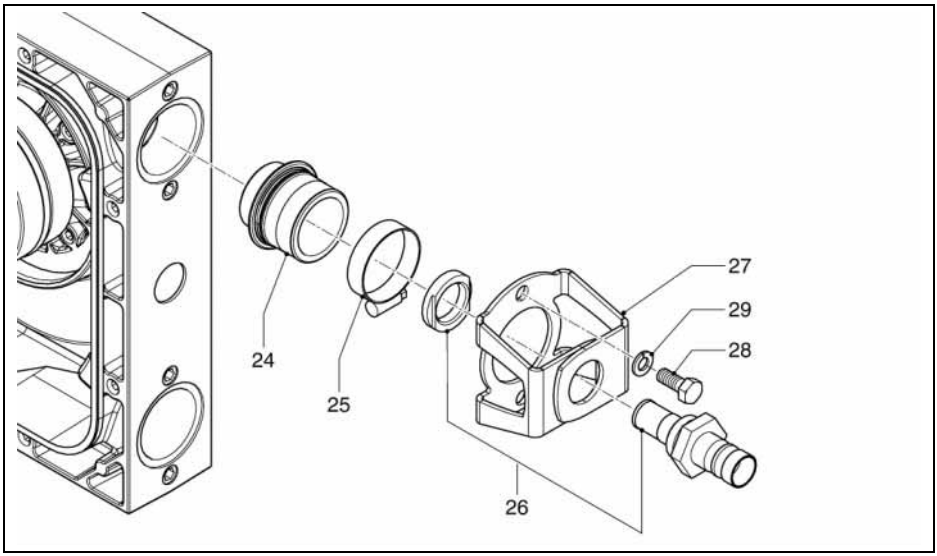
Pos.	Qty.	Description
1	8	Cover screw
2	8	Cover screw washer
3	1	Drain plug O-ring
4	1	Drain plug
5	1	Breather screw
6	1	Breather

Pos.	Qty.	Description
7	1	Breather gasket
8	1	Cover
9	1	Cover seal



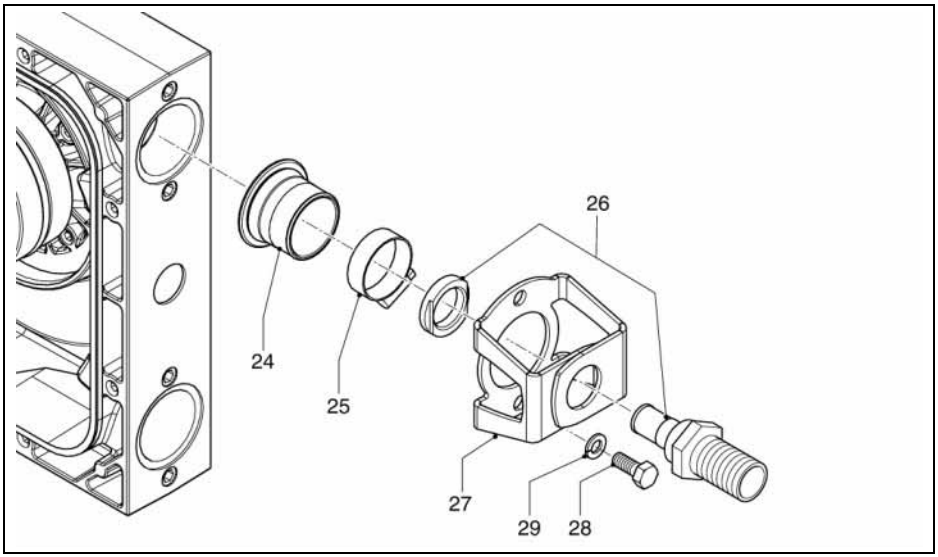
11.5.4 Pumphead assembly

Pos.	Qty.	Description
10	1	Hose NR
	1	Hose NBR
	1	Hose EPDM
	1	Hose CSM
11	1	Pump housing
12	1	Rotor, low-pressure (L)
		Rotor, medium-pressure (M)
13	1	Seal ring
14	2	Bearing
15	1	Spacer ring
16	1	Retaining ring
17	1	Circlip



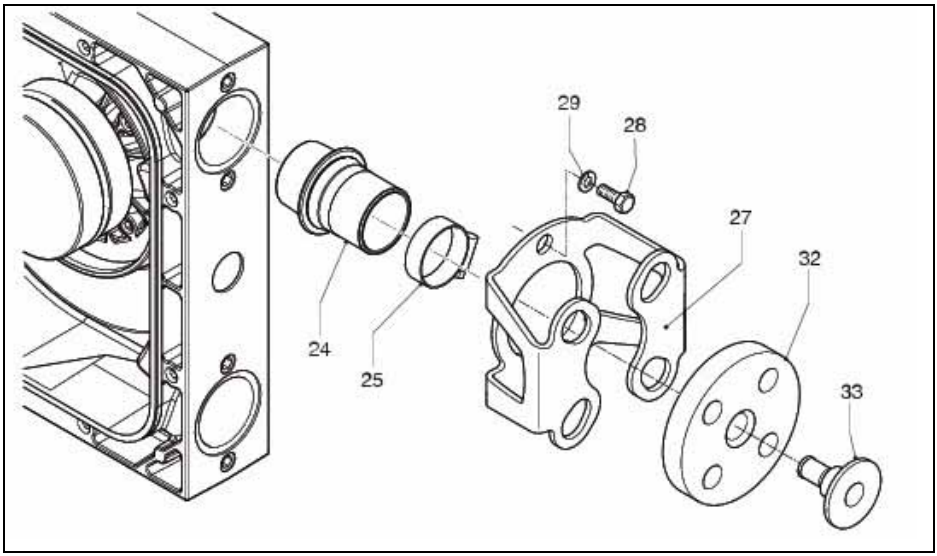
Pos.	Qty.	Description
18	4	Support stud
19	1	Coupling, ∅ 20 x 63 mm
		Coupling, ∅ 25 x 63 mm

11.5.5 Support assembly



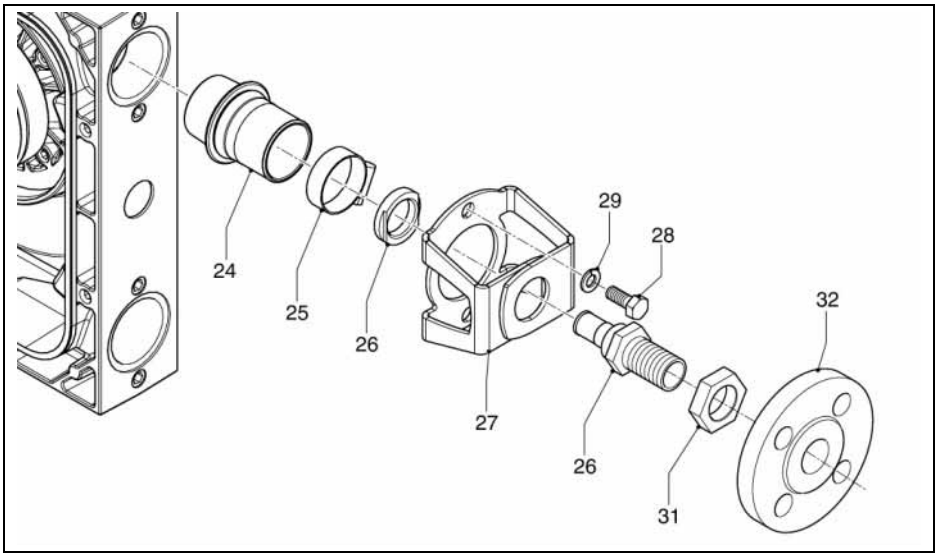
Pos.	Qty.	Description
20	1	Pump support
21	4	Support nut
22	4	Support nut washer
23	1	Orientation screw

11.5.6 Barbed nipple assembly (PTFE/PDVF)



Pos.	Qty.	Description
24	2	Rubber bush
25	2	Hose clamp
26	2	Barbed nipple PTFE
		Barbed nipple PVDF
27	2	Bracket
28	4	Bracket bolt
29	4	Bracket bolt washer

11.5.7 Hose or threaded nipple assembly (AISI 316/PP/PVC)



Pos.	Qty.	Description
24	2	Rubber bush
25	2	Hose clamp
26	2	Barbed nipple SS
		Threaded nipple BSP SS
		Threaded nipple DIN 11851 SS
		Threaded nipple NPT SS
		Threaded nipple NPT PP
		Threaded nipple NPT PVC
27	2	Bracket
28	4	Bracket bolt
29	4	Bracket bolt washer

11.5.8 Flange assembly with insert

Pos.	Qty.	Description
24	2	Rubber bush
25	2	Hose clamp
27	2	Flange bracket
28	4	Bracket bolt
29	4	Bracket bolt washer
32	2	Flange ASA
33	2	Insert PP

11.5.9 Flange assembly with threaded nipple

Pos.	Qty.	Description
24	2	Rubber bush
25	2	Hose clamp
26	2	Threaded nipple (BSP) SS
27	2	Bracket
28	4	Bracket bolt
29	4	Bracket bolt washer
31	2	Nipple nut
32	2	Threaded flange DIN SS
	2	Threaded flange ASA SS

11.5.10 Lubricant

Pos.	Qty.	Description
	1	1 l can Bredel Genuine Hose Lubricant

SAFETY FORM

Product Use and Decontamination Declaration

In compliance with the **Health and Safety Regulations**, the user is required to declare those substances that have been in contact with the item(s) you are returning to Watson-Marlow Bredel B.V. or any of its subsidiaries or distributors. Failure to do so will cause delays in servicing the item or in issuing a response. Therefore, **please complete this form** to make sure we have the information before receipt of the item(s) being returned. A completed copy must be attached to **the outside of the packaging** containing the item(s). You, the user, are responsible for cleaning and decontaminating the item(s) before returning them.

Please complete a separate Decontamination Certificate for each item returned. **RGA no**.....

1 Company ....

Principle of Operation "How it Works"

LAKOS *e*HTX Separators are designed specifically to remove solids from liquids. Each model is calculated for use within a prescribed flow range for maximum performance and solids removal. Flow rates above and below the recommended range may affect such performance.

Upon tangential entry, the liquid/solids are drawn through internal tangential slots and accelerated into the separation chamber where solids heavier than the carrying liquid are centrifugally separated and allowed to accumulate in the unit's collection chamber for eventual purging. The liquid (free of separable solids) is then drawn to the vortex and up through the separator's outlet.

Flow vs. Pressure Drop Chart

*e*HTX Separator Model and Flow Chart

Model	Flow Range		Inlet/Outlet Grooved Size	Collection Chamber Capacity		Weight Empty		Weight with Water	
	US gpm	m³/hr		gal	liters	lbs	kg	lbs	kg
*e*HTX-0040-V	40-95	9-21	1-1/2 inch	0.6	2.3	184	83	257	117
*e*HTX-0060-V	60-140	13-31	2 inch	0.6	2.3	221	100	305	138
*e*HTX-0080-V	80-185	18-42	2-1/2 inch	1.2	4.5	298	135	456	207
*e*HTX-0090-V	90-230	20-52	3 inch	1.2	4.5	328	149	508	230
*e*HTX-0140-V	140-325	32-74	4 inch	1.7	6.4	486	220	772	350
*e*HTX-0185-V	185-450	42-102	4 inch	1.7	6.4	498	226	807	336

Installation Instructions

1. LAKOS Separators are shipped on steel skids or in wooden crates. Support legs (22 ½° low profiles only) are detached. Lifting lugs, located on the unit's side and/or flanges, are provided for hoisting as necessary.

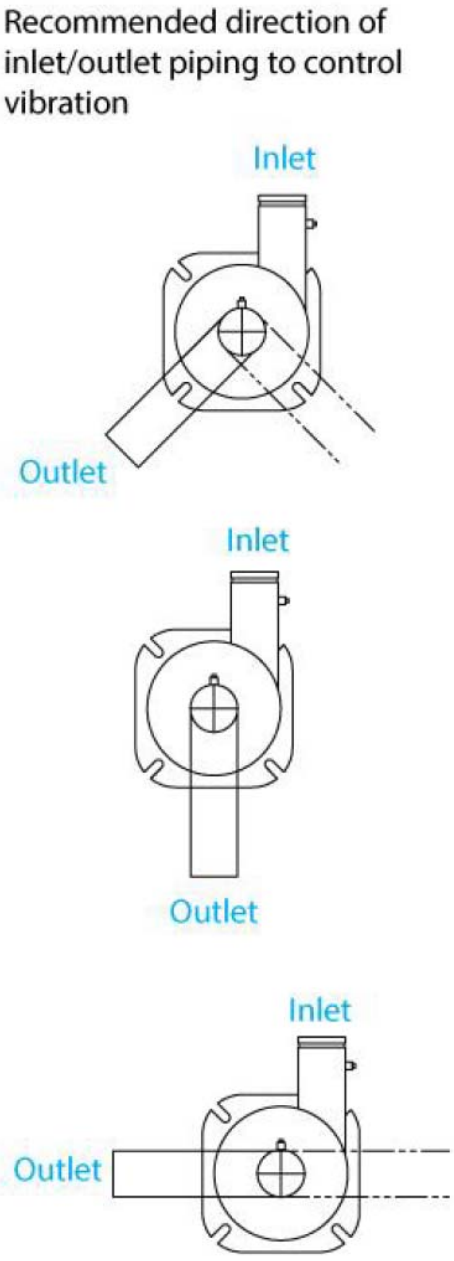
2. A suitable foundation is necessary to accommodate the LAKOS Separator's weight *including liquid*. Anchor bolts are recommended in the base of the legs (low profile) or skirt (vertical profile).

3. Prior to installation, inspect the inlet/outlet/purge connections for foreign objects inserted during shipping/storage.

4. It is recommended that the inlet/outlet pipe connections to the LAKOS Separator should be a straight run of at least five pipe diameters (if possible) to minimize turbulence and enhance performance. It is best to keep pipe runs as straight as possible and minimize the number of elbows in the piping.

5. Proper purge hardware and/or solids-handling equipment is required to flush separated solids from the separator.

6. All LAKOS Separators operate within a prescribed flow range (pipe size is not a factor in model selection). Use appropriate hardware to match the inlet/outlet size. Grooved couplings are not included with the separator. Optional flanged connections are available upon request.



7. Inlet pressure to the LAKOS Separator must be at least equal to or greater than the anticipated pressure loss through the separator plus 15 psi (1 bar) plus whatever downstream pressure is required. See page 4 for "Flow vs. Pressure Loss" chart.

8. Pressure gauges are required at both the inlet and outlet of the separator in order to monitor pressure loss and proper flow. If the separator operates with an open discharge, a valve should be installed to create a back pressure of at least 5 psi (0.3 bar).

9. Winterizing is important if the LAKOS Separator is to remain idle in freezing temperatures. Drain liquid as necessary to avoid expansion of water to ice and related damage. Heat tracing and insulation can also be used to keep liquid from freezing in the separator and causing damage.

Recommended Inlet & Outlet Piping

The inlet and outlet piping of a separator are important for controlling vibration of the unit. The vibration is more prevalent in units larger than 6", however, LAKOS recommends the illustration configuration below be followed on all units. The factory should be consulted on units larger than 6" if configurations cannot be followed.

Maintenance/Purging

1. ***LAKOS Separators must be purged regularly.*** The over-accumulation of separated solids will overfill the separator's collection chamber, substantially affecting performance and causing undue wear.

2. Several purging options are available and all may be performed while the LAKOS Separator is in full operation.
   a. **Manual:** A full-port, straight-through valve may be installed on the standard purge opening and actuated manually as necessary to purge separated solids.
   b. **Semi-Automatic:** The use of LAKOS Separators in a given application typically implies the need for heavy or unusual solids removal. ***A LAKOS Solids Recovery Vessel System (SRV)*** is therefore recommended. The SRV-816 or SRV-833 allows for continuous purging of the solids collected into a separate collection bag. Once the bag is full with solids, the bag is emptied. The bag (10 micron recommended) can be cleaned and reused or simply replaced. Consult your LAKOS representative for details on the solids recovery vessel and accessories.
   c. **Automatic:** The use of LAKOS Separators in a given application typically implies the need for heavy or unusual solids removal. ***A LAKOS Auto-Purge System*** is therefore recommended. The Automated Ball Valve (ABV) and Electric Fail-Safe Valves (EFS) are electric actuated ball valve assemblies with timer controls to allow for the adjustment of the purge frequency and duration based on a job specific application. The EFS is a battery backup style failsafe actuator that will ensure closure of the valve even if there is a loss of power to the controller. Consult your LAKOS representative for details.

3. *e*HTX Separators feature standard purge outlets. Prior to start-up, the installation of a manual valve on the purge is recommended so that this outlet may be serviceable at any time for either supplemental purging or as a stand-by, should the primary purge line ever require servicing.

4. ***Important:*** All purge hardware should be installed prior to any elbows or turns in the purge piping. Avoid "uphill" purging, which can clog piping and hinder effective solids evacuation.

5. To determine the necessary ABV or EFS purging frequency, purge often at first and calculate the proper rate with regard to the actual volume of separated solids. Purge duration should be long enough to evacuate the purge chamber of solids. Frequency of purge should not exceed the time it takes to over fill the collection chamber. Consult your LAKOS representative for specific recommendations regarding your application.

6. When operating in sub-freezing temperatures, be sure to protect the separator's collection chamber and all purge line piping from freezing. Heat tracing and insulation can also be used to keep liquid from freezing in the separator and causing damage.

Maintenance Recommendations

LAKOS recommends periodic inspections of the separator to keep performance at an optimum level.

1. Flange gaskets or victaulic gaskets should be checked for leaks and replaced as necessary. Gaskets should be replaced at disassembly of separator.

2. Hand hole clean-out: Hand hole should be removed to inspect the collection chamber for unwanted build up. Inspection should be conducted annually (or when separator is shut-down for other system service routines), open the hand hole clean-out and inspect for solids accumulation or unwanted build-up in the separator's collection chamber. If necessary, remove excessive debris. Inspect gasket and replace if necessary. Check purge programming (if applicable) to be sure it is adequate to remove separated solids; if not, re-set to extend duration and/or frequency of valve actuation.

3. Pressure gauges: The gauges installed on the inlet & outlet of the LAKOS Separator help monitor proper liquid flow through the separator. They are NOT indicative of solids accumulation and should NOT be used to determine when to purge the separator. Gauges should read a pressure differential loss of 2-15 psi from inlet to outlet and that differential should remain steady with the flow of water through the separator. Fluctuations in gauge readings indicate:
    a. A change in pump flow – Inspect pump for proper operation and/or downstream piping/equipment for conditions that could create backpressure on the system flow.
    b. An obstruction in the separator – Internal slots may be clogged by unusual solids. Use a video scope to examine & remove blockages from internal slotting. Consult LAKOS if necessary.
    c. Gauge blockage – Close petcock valve, remove gauge and check for debris clogging the gauge port, which could affect an accurate gauge reading.

4. Separator slots should be inspected during facility pipe inspection. Inspection of slots is recommended when separator performance is suspect. Slots should be checked for obstruction and wear.

5. Visual inspection of the separator should be conducted at least once a month. Visual inspection should also include observing the inlet and outlet gauges on the separator. This inspection will indicate the pressure drop across the separator. The pressure drop and actual flow rate can be compared to the product brochure to determine if the separator is operating within its expected performance range. Automatic purge or manual purge should be checked for leaks and operation. Purge valve seats or diaphragms should be changed as necessary.

Trouble-Shooting Guidelines for Separator Installations

1. **Verify Actual Flow Rate:** Use pressure gauges to indicate differential pressure and flow meter to verify flow rate. (Multiple pumps used to increase flow are installed in parallel (into common manifold); multiple pumps to increase pressure are installed in series (one after another).

   Flow meters should be installed prior to the separator. Flow meters installed after the separator will indicate erroneous data.

2. **Plumbing Two Separators:** Do not plumb two separators from two independent pumps into the same outlet header without installing balancing valves on the discharge of each separator. The balancing valves must be set to achieve a pressure loss across each separator that indicates a flow rate (according to that model's published flow chart) equal to the flow rate anticipated through the pump that feeds each separator.

3. **Verify Actual Inlet Pressure:** Actual inlet pressure must be at least 15 psi (1.03 bar). A minimum backpressure of 5 psi (.34 bar) must be created at the separator discharge. This may be accomplished via process equipment, piping, or a valve. Unrestricted open discharge to a pit, sump, etc.,will result in unacceptable performance.

   Be sure that no source of vacuum/suction exists in the piping arrangement. If vacuum/suction exists (i.e. downward piping after the separator, pump suction installation, booster pump etc.), put a valve between the separator and the suction source and pressure gauges on either side of the valve. Throttle the flow until the pressure loss across the separator indicates the published flow rate which most closely resembles the anticipated flow rate through the separator.

4. **Vibration:** Check installation piping inlet & outlet configurations (see appropriate product sheets for model of separator installed). Mild vibration is possible in some installations and should be considered normal. Excessive vibration is typically due to entrained air (use air vents), improper piping (follow the installation instructions) or system vibration (amplified at the separator).

   Units should be secured properly to the floor or wall. If separator is hung, stabilizers may need to be added. The foundation must be sturdy enough to support the weight of the product (expected wet weight can be obtained from the product literature).

   The use of expansion joints is advisable with all separator installations. It is particularly recommended that these devices be employed when piping arrangements cannot comply with the configurations suggested by LAKOS product literature.

5. **Vertical Units:** Be aware that solids may accumulate within the separator for a period of time until the solids reach the level of the purge outlet. The purge outlet is not flush with the bottom of the solids collection chamber.

6. **Purging:** Purge line piping should be as straight as possible to desired disposal destination. Avoid uphill piping, multiple elbows and low points where solids may accumulate and block the piping. Unless advised otherwise, do not reduce the piping size from that of the separator's purge outlet size; restrictions can cause blockage and prevent proper purging of separated solids.

   Purge duration should be long enough to not only evacuate solids from the separator, but also to push the solids through the entire length of purge line piping to desired disposal. Typically, we recommend that you program automatic valves, especially motorized ball valves, to purge for no less than 20-25 seconds. This provides time for the valve to remain fully open long enough to flush a separator's collection chamber. Consult LAKOS for unusual circumstances.

   Important: Note that the collection chamber capacity of each separator (see page 4) should typically not be exceeded. The solids must include sufficient fluid to navigate the purge valve & purge line piping. It depends on the solids' capacity to compact and the time frame it takes to accumulate in the separator. Generally, solids should not be allowed to accumulate in the separator's collection chamber for long periods of time; purging at least daily is recommended when the separator is in operation, more often if the solids tend to compact tightly/easily.
   Continuous purging should not exceed 10% of the inlet flow. The use of a valve to bleed solids from a separator must be monitored to be sure that the reduced orifice does not become clogged with solids.

   Oversizing the purge line piping may allow solids to settle in the piping; be aware that velocity is needed to flush solids through the purge line piping.

   Estimated water & solids volume through a ¾ inch purge outlet is estimated at 10-45 gallons, and a 1 ½ inch purge outlet is estimated at 35-150 gallons. That's a combination of both solids and liquid. The variable takes into account the separator size, flow rate and system pressure. Allow adequate drainage or retention capacity for this volume per purge cycle.

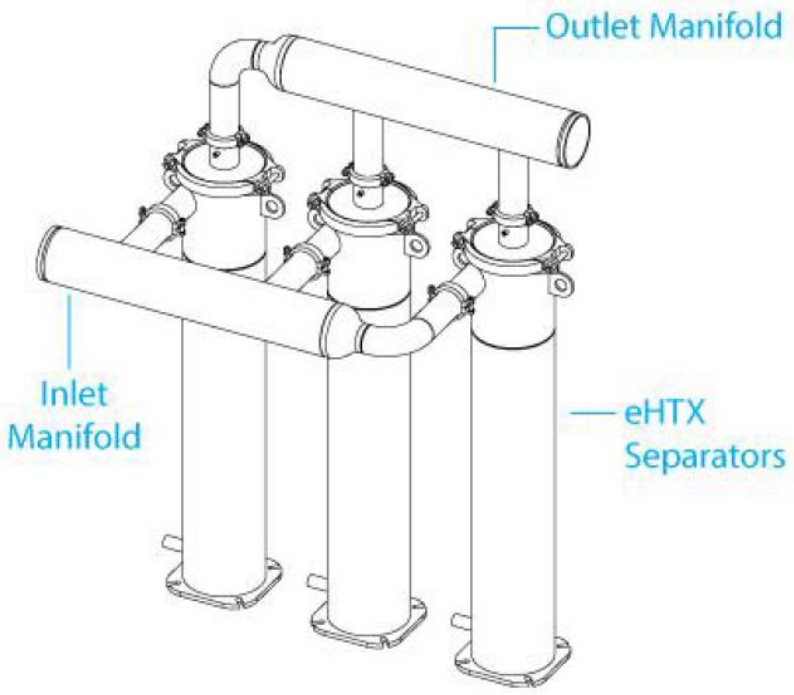
7. **Manifolding Separators:** Two or three separators in parallel (for higher flow rates, see page 12) must be purged separately…do not join purges together.

8. **Additional Installation Piping for Separator Accessiblity:** Separators which feature a removable upper chamber should be installed with a spool in order to facilitate the removal of the upper chamber.

9. **Flanges/Couplings:** All flanges and/or grooved couplings should have the appropriate gasket/seal in order to ensure a leak-free installation. All hand hole clean-out ports and other internal access devices should also be properly re-sealed after use.

10. **Air Relief Ports:** The appropriate air relief ports should be used at start-up to expel air from the separator.

    If the separator will be drained periodically or exposed to entrained air or gases from the piping system, air vents should be permanently installed.



11. **Down Stream Filtration:** The use of finer filtration (polishing) downstream from the separator is a common application. Be aware, however, that the barrier filter (as it accumulates more solids) causes an increasing pressure loss, which may cause the flow rate of the system to be reduced…sometimes below the recommended flow rate of the separator. This situation will often reveal itself when typical separable solids begin to show up regularly on the downstream barrier filter (leading the customer to possibly believe that the separator does not work). Always check for variations in the flow rate when down stream conditions change.

Separator Manifold

Manifolding in Parallel for High Flow Rates

When water system flow rates exceed that of any single LAKOS Separator, manifolding two or more separators together can help achieve large flow requirements. Manifolding multiple units keeps units smaller, easier to install and provides for future flow rate changes.

Example: Three eHTX-0185 Separators increases flow range to 555 - 1350 US gpm (126 - 307 m^3/hr)

ORDERING REPLACEMENT PARTS

For future reference fill in the following information from the pump nameplate. This will be necessary to ensure accuracy when ordering replacement parts.

Model _____
Size _____
Serial Number _____
Impeller Diameter Installed _____
Seal Type _____
Material of Construction _____

WARRANTY

FYBROC pumps are warranted by the Company, insofar as the same are of its own manufacture, against defects in materials and workmanship under proper and normal use and service, for a period of one year from the date of original shipment from the factory. FYBROC's obligation is limited, however, to furnishing without charge, F.O.B. its factory, new parts to replace any similar parts of its own manufacture so proving defective within said period, provided the Buyer has given FYBROC immediate written notice upon discovery of such defect. No allowance will be made for labor charges. FYBROC shall have the option of requiring the return of the defective material, transportation prepaid, to establish the claim.

FYBROC makes no warranty or guarantee whatsoever, either express or implied, of prime mover, starting equipment, electrical apparatus, parts or material not manufactured by Fybroc, except to the extent that warranty is made by the manufacturer of such equipment and material.

FYBROC assumes no liability for damages or delays caused by defective material, and no allowance will be made for local repair bills or expenses without the prior written approval or authority of FYBROC.

Under no circumstances will FYBROC be liable for indirect, special or consequential loss or damage of any kind and the Buyer assumes all liability for the consequences of its use or misuse by the by the Buyer, his employees, or others.

PERFORMANCE GUARANTEE

Is at the specified point of rating only and will not cover performance under conditions varying therefrom, nor for sustained performance over any period of time.

ACCEPTANCE TESTS

If required, shall be conducted in accordance with the practices as set forth in the Hydraulic Institute Standards. The expense of any such tests shall be borne by the buyer.

PERFORMANCE REPRESENTATIONS

Are based on shop laboratory tests with cold water as outlined in the Hydraulic Institute Standards.

FIELD TESTING

Due to the inaccuracies of field testing, the results of any such tests conducted by or for the Buyer shall be interpreted as being only indicative of the actual field performance of the pump. No equipment will be furnished on the basis of acceptance by results of field tests. If the buyer, after such a test, questions the performance of the pump, he may at his option request a test to establish the performance. Such tests will be conducted in accordance with the above paragraph entitled "Acceptance Tests."

ALL WARRANTIES

Are void if -

a. Pipe strains are the cause of damage.
b. Pump handles liquids other than those specified in detail.
c. NPSH lower than required by pump impeller.
d. Operating speed is higher than specified.
e. Improper field installation.

RECOMMENDATIONS FOR SPECIAL MATERIALS

To combat corrosion, abrasion, erosion, or pumping solids, foreign objects, or pumping liquids at elevated temperature, any such recommendations will be based on the best available experience of FYBROC and the supplier of the material and industry, BUT WILL NOT CONSTITUTE A GUARANTEE AGAINST THESE EFFECTS.

The foregoing warranty is made in lieu of all other warranties guarantees, obligations or liabilities, expressed or implied, by FYBROC or its representatives. All statutory or implied warranties, other than of title, are hereby expressly negated and excluded.

All illustrations and provisions in specifications are descriptive and are not intended as warranties. Penalty of any kind are not acceptable unless approved in writing by an officer of Met-Pro Corporation.

LOCATION

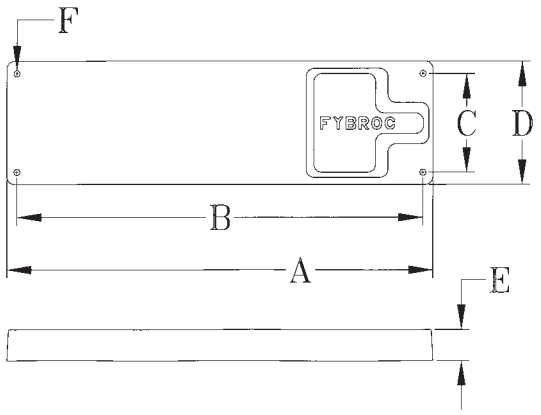
The pump should ideally be placed as close as possible to the liquid supply source. Allow sufficient space on the sides and overhead to permit inspection and maintenance work to be performed.

FOUNDATION

The foundation for the pump should be level, provide rigid support of pump and motor. It should also be of sufficient mass to dampen any vibrations developed. Typically this is accomplished by installing and grouting a Fybroc baseplate on a concrete foundation.

Foundation bolts of the proper size should be imbedded in the concrete with anti-rotation lugs, located by a drawing or template (See Table 1 below for bolt-size and locations). A pipe sleeve larger than the bolt should be used to allow enough lateral movement for final positioning of the bolts (See Figure 1 below). Leveling wedges or shims should be placed under the sides of the baseplate to level the unit and the foundation bolts slightly tightened.

FIGURE 1



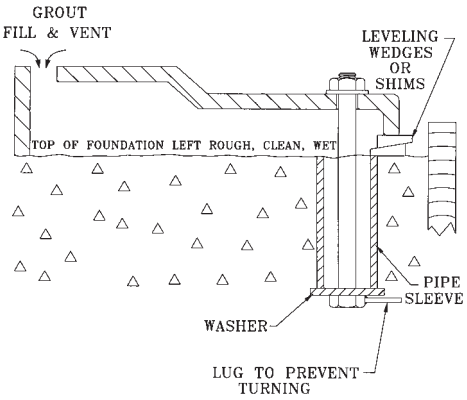


TABLE 1

Base Plate	A	B	C	D	E	F	Bolt Size
1T-22"	22	19 1/2	8	8	2 5/8	3/4	1/2
1T-24"	24	21 1/2	9	8	2 5/8	3/4	1/2
2T-30"	30	27 1/2	9	9	2 7/8	3/4	1/2
3-21"	21	18 1/2	12	7 1/2	3 3/4	3/4	1/2
3-22"	22	19 1/2	15	7 1/2	4	1	3/4
3-27"	27	24 1/2	15	7 1/2	4	1	3/4
3-29"	29	26 1/2	19	7 1/2	4	1	3/4
3-32"	32	29 1/2	19	7 1/2	4	1	3/4

A wood form can now be built around the edge of the baseplate to contain the grout. The top of the rough concrete foundation should be wetted down prior to grouting. A good grade of non-shrinking grout can now be packed through the open end of the fiberglass baseplate. Once the grout has fully hardened, usually about 48 hours after pouring, the foundation bolts can be fully tightened.

FIGURE 2

PIPING THE PUMP

All flanged connections to the pump should be full flat face with full contact gaskets. Raised face flanges or partial contact gaskets should not be used as excessive strains can be applied to the pump flanges upon tightening.

The pump has been designed with all necessary strength factors for long, reliable service life. However, due to the composite construction, care must be taken during installation to avoid unnecessary pipe strain. If severe piping strains are to be encountered, flexible connections are recommended in the suction and discharge pipe lines. When lined piping is used, flange alignment should be carefully checked. Spacer ring gaskets are recommended to assure parallel alignment of pipe and pump flanges. The following flange bolt torque values should be used:

Flange Size	Bolt Torque
1"	9-12 ft-lbs.
1 1/2"	9-12 ft-lbs.
2"	18-24 ft-lbs.
3"	23-30 ft-lbs.
4"	27-36 ft-lbs.
6"	35-50 ft-lbs.

All piping must be supported independently of the pump. The piping should always line up naturally with the pump flanges. Never draw the piping to the suction or discharge flanges of the pump. Outside installations should be properly compensated for changes in ambient temperatures. Refer to pipe manufacturers standards for proper installation. Omission of this could result in severe strain transmitted to the pump flanges.

The piping should be as short and direct as possible. Avoid all unnecessary elbows, bends and fittings, as they increase friction losses in the piping.

SUCTION PIPING

A) To minimize friction loss, the length of the suction pipe (from process to pump inlet) should be as short as possible. It is important that NPSH available to the pump is greater than the NPSH required by the pump, long suction runs greatly affect NPSH and should be considered carefully. See pump performance curve for NPSH requirements.

B) The diameter of the suction pipe should be as large as the pump suction. If long suction runs are encountered, the suction pipe diameter should be increased to reduce the NPSH required.

C) Increasers or reducers, if used, should be eccentric and installed with the eccentric side on the bottom of the pipe to prevent air traps.

D) Elbows, fittings, valves or expansion joints should be avoided at the suction flange. Allow a straight run of at least 10 pipe diameters into the suction of the pump.

E) If a valve is to be installed in the suction piping, only full flow valves offering a minimum flow disturbance should be used (ball, plug types). These valves should be for shut-off only when the pump is not running, and not for throttling or controlling flow. Centrifugal pumps should never be throttled on the suction side.

F) Provisions for a suction pressure gauge should be included.

DISCHARGE PIPING

A) Installation of a valve in the discharge line that can be used as a block for inspection and maintenance is recommended. It should be of a design to allow throttling or flow control.

B) The diameter of the discharge pipe should be as large or larger than the pump discharge.

C) Provision for a discharge pressure gauge should be included.

ANCILLARY PIPING

A) The diameter of the ancillary or seal piping should be large enough to meet the seal flushing requirements. Typically this is 1/4-1/2 GPM at a pressure of 15-25 PSI above the suction pressure for most mechanical seals. Refer to pages 25 and 26 for recommended seal flush flow rates and piping installations.

B) Where the ancillary piping is connected to the pump only plastic fittings shall be used.

WARNING: FAILURE TO USE PLASTIC FITTINGS MAY RESULT IN DAMAGE TO THE PUMP.

C) Many modern flush systems incorporate electrically actuated solenoid valves to conserve and control the flow of flush liquids, ensure that the flush liquid is flowing to the seal before the pump is started.

D) On double seal arrangements with flush in and flush out connections, flow control valves should be installed in the flush out or downstream side.

The pump shaft should turn freely by hand after the piping has been connected to the pump. This is to insure that the piping has not caused binding in the pump. If binding occurs, check for cause and correct.

ELECTRICAL CONNECTIONS

A) All electrical work done to the unit should be done by a qualified electrician. All local, state and federal electrical codes should be adhered to.

B) Wire motor according to motor manufacturers instructions. Ensure that all connections and covers are tight and that proper sized wire and switch-gear are used.

C) All pumps operate in a clockwise direction when viewed from the motor end, (see direction arrow on the pump motor adapter). Connect electric motor to power supply and jog motor to check rotation. If motor is operating in wrong direction, reverse leads and recheck.

WARNING: DO NOT START PUMP WITH LIQUID IN THE CASING UNTIL MOTOR ROTATION HAS BEEN DETERMINED AS DAMAGE COULD RESULT FROM SUSTAINED REVERSE ROTATION UNDER PUMPING LOAD.

START-UP AND OPERATING PROCEDURES

LUBRICATION

On a close coupled pump only the motor requires lubrication. Since all motors come from the factory pre-lubricated there is no action required.

SEAL FLUSHING

Mechanical Seals

Do not operate the pumps without liquid to the mechanical seal. Depending on the flush arrangement of the pump, the fluid to the seal may be piped from the pump discharge externally or internally, or from an external clean source. If the pump is fitted with an internal or bypass flush arrangement, then the pump must be flooded with liquid prior to starting to ensure that the mechanical seal is lubricated. If the pump is equipped for an external flush system, then flush liquid must be supplied to the seal prior to starting. Proper flow for external flushing will vary from 1/4 to 1/2 GPM at a pressure of 15 to 25 PSI above the stuffing box pressure.

PRIMING

Suction valve must be fully open. The pump casing and suction pipe must always be full of liquid before the pump is started. Centerline discharge designs are self-venting therefore the discharge valve should be opened to release any air trapped in the pump and then left slightly open at start-up.

STARTING

Prior to starting, turn pump shaft by hand to be sure rotating elements are free. If it rubs or binds:

A Check for piping strains on casing flanges, or other loads on casing.

B) Check impeller clearance. (See impeller adjustment).

Prior to starting pump recheck installation procedures with the operational start-up checklist found on page 14 of this manual.

Start pump and bring up to speed, open discharge valve to the rated flow.

WARNING: DO NOT RUN PUMP WITH A CLOSED DISCHARGE VALVE AS THE LIQUID IN THE PUMP WILL RAPIDLY INCREASE IN TEMPERATURE, POSSIBLY CAUSING DAMAGE TO PUMP.

Check flush water to mechanical seal, if not lubricated from the pump discharge.

OPERATIONAL CHECK LIST

A) Periodically check mechanical seals for proper operation.

B) Periodically check lubrication to the motor bearings.

C) Periodically check for excessive vibrations. Correct if necessary.

MAINTENANCE

Fybroc pumps are designed for a long service life. The only scheduled maintenance items are the lubrication intervals for the motor. Please refer to the lubrication procedures given below.

MOTOR

The motor relubrication intervals are greatly influenced by the environment it is in and the length of time it runs. Refer to the following chart for typical relubrication values for motors. Standard duty is when the motor is operated eight hours a day and the environment is free from dust. Severe duty is when the motor runs twenty-four hours per day with exposure to dirt and dust.

Sync RPM Range	Motor Frame Range	Type of Service	
		Standard Duty	Severe Duty
3600	143JM - 256JM	5 Yrs	3 Yrs
	284JM - 286JM	1 Yr	4 Mos
	324JM - 365JM	9 Mos	3 Mos
1800	143JM - 256JM	7 Yrs	3 Yrs
	284JM - 326JM	4 Yrs	1.5 Yrs
	364JM - 365JM	2.5 Yrs	10 Mos
1200	143JM - 256JM	7 Yrs	3 Yrs
	284JM - 326JM	4 Yrs	1.5 Yrs
	364JM - 447JM	3 Yrs	1 Yr

Instructions For Lubricating Motors

Before greasing, be sure fittings are clean and free from dirt. Remove grease relief plug or plate and using a low pressure grease gun pump in the required grease. Do not over-grease. After re-lubricating allow motor to run for an hour before replacing relief hardware.

TROUBLE CHECK LIST

Refer to the following diagnostic section if hydraulic problems are encountered in the pump operation.

PROBLEM: Not enough liquid, or no liquid delivered.

CHECK: Suction pipe and /or pump casing not filled with liquid.

Speed too low. (Result, reduced TDH).

Suction lift too high or insufficient NPSHA. (Cavitation).

Impeller or suction pipe plugged with solids.

Wrong rotation. (Result, reduced TDH).

Air pockets in suction line or air leaking in through packing box area.

Suction strainer plugged, if used in suction line.

PROBLEM: Not enough pressure.

CHECK: Speed too low.

Air or gases in the liquid.

Check impeller diameter.

Mechanical defects (impeller clearance too great; impeller damaged).

Wrong rotation.

Pressure gauge in a poor location.

PROBLEM: Pump runs but intermittently pumps liquid.

CHECK: Suction line leaks.

Stuffing box leakage of air.

Air pocket in suction line. Insufficient NPSH.

Air or gases in liquid.

PROBLEM: Pump takes to much power.

CHECK: Speed too high.

Head lower than rating; pumping beyond design point.

Liquid heavier than specified; check viscosity and specific gravity.

Mechanical defects (Bent shaft, rotating element binds, packing too tight, misalignment).

ASSEMBLY/DISASSEMBLY PROCEDURES FOR HORIZONTAL PUMPS

GENERAL

The Fybroc pump is designed for easy inspection and service because of its back pullout construction. For inspection or replacement of certain parts, the work can be done in place, without the necessity to remove the complete pump to a maintenance area. Refer to applicable Sectional Drawing in this manual for item numbers mentioned below.

Before any work is done the following procedures and precautions should be taken:

1) The electric motor should be either disconnected from its power source, or the switch or circuit breaker must be secured in an "off" position so that the motor cannot be accidentally started.
2) Depending upon the fluid being pumped, the proper protective equipment should be worn (gloves, mask, respirator, goggles or safety glasses, etc.) to prevent contact with the fluid in the pump or pipelines.
3) Check the valves on the suction and discharge lines to be sure they are closed and secured.
4) If the mechanical seal is flushed from an external source, turn off the valve in the supply line and disconnect the flush line.
5) The liquid trapped in the pump and piping should be drained. Care should be taken to either trap the fluid in a container or to divert it to a proper disposal area so that the area around the pump and base will not be contaminated.

DISASSEMBLY

1) If the complete pump is to be removed to a maintenance area, remove the bolts holding the motor and casing to the baseplate. Remove the bolts on the suction and discharge flange connections. Now the whole pump can be removed. If the casing is to be left in place remove the screws holding the motor to the baseplate and then remove the casing bolts, nuts, washers and shims securing the casing to the cover and motor adapter (Items 1C, 1D, 1E, 67). Now the rotating assembly can be pulled away from the casing and removed. Note the number of shims removed. Two jackscrews (Item 19D) are provided to ease disassembly.
2) If the casing was removed with the pump, remove the casing bolts, nuts, washers and shims securing the casing to the cover and frame adapter (Items 1C, 1D, 1E, 67). The rotating assembly can be pulled away from casing. Note the number of shims that were removed. Two jackscrews (Item 19D) are provided to ease disassembly. Now the pump can be placed in a convenient location to disassemble it.
3) Remove the cover o-ring (Item 73) and place in a container with the casing hardware.
4) To disassemble the impeller assembly, remove the locking ring (Item 14 B) by removing the two Allen head screws, thus exposing the segment key (Item 14A), which can now be removed from the impeller sleeve.
5) If the pump is provided with a mechanical seal utilizing set screws to drive the seal, loosen the set screws. If the mechanical seal is of the preset outside type, reinstall the seal setting clips, prior to loosening the set screws.
6) Remove rear fan cover from motor; use vise grips or pipe wrench to hold rear motor shaft extension from turning. Remove fan if required. Do not attempt to hold fan. The impeller assembly can now be removed by turning the impeller in a counter-clockwise direction facing the impeller. A strap wrench or similar device may be required to disengage the screw threads. The impeller, stuffing box cover, and seal can now be removed as a unit.
7) If the mechanical seal is a single outside seal be sure the set screws are loose and pull the rotary seal assembly off the sleeve, using a twisting motion as it is removed. The impeller (Item 2) can be removed from the cover. Remove the four bolts and washers (Item 17C, 17E) securing the gland (Item 17) to the cover (Item 11) and remove the gland and then the seal stationary from the cover. The carbon and ceramic elements of the seal should be handled carefully to prevent chipping or scratching.

If the mechanical seal is a double inside seal, remove the four bolts and washers (Item 17C, 17E) securing the gland (Item 17) to the cover (Item 11) and remove the gland. Be sure the set screws are loose, and pull the rotary seal assembly off, using a twisting motion as it is removed. The impeller (Item 2) can be removed from the cover. Next remove the stationary seal faces from the gland and cover by gently pressing them out using your thumbs. The carbon and ceramic elements of the seal should be handled carefully to prevent chipping or scratching.

8) The motor shaft adapter (Item 6) may be removed from the motor shaft by removing the Allen head screw (Item 6A). The drive key (Item 46) will slide off with the shaft adapter. In the bore of the shaft adapter there may be some shims to take up the motor manufacturer's shaft length tolerances. Be sure to note the number and thickness of the shims used.

9) Remove pump adapter (Item 71) and motor adapter (Item 71B) if provided.

ASSEMBLY

1) Inspect casing, cover and impeller for any damage and make sure all sealing surfaces are free of dirt and scratches. If pump is equipped with an internal seal flush, make sure cover flush hole is clear. Check motor end float. Excessive shaft end float (greater than .015") can result in damage to pump and or mechanical seal.

2) If equipped install the motor adapter (Item 71B). Ensure that the adapter is seated squarely on the motor before tightening adapter screws, this may require some sanding of the paint on the pilot diameters. Secure with adapter screws (Item 71C), torque to 25 ft-lbs.

3) Install the pump adapter (Item 71). Ensure that the adapter is seated squarely on the motor adapter or motor before tightening adapter screws, this may require some sanding of the paint on the pilot diameters. Secure with adapter screws (Item 71A), torque to 25 ft-lbs. end of shaft.

4) Place one .062" shim washer (Item 6B) in the shaft (Item 6) bore. Install key (Item 46) into the shaft key-way slot from the inside of the shaft bore. Slide assembly onto motor shaft and temporarily secure with shaft screw (Item 6A).

5) Place six impeller adjusting shims (Item 67, three on each side) and the cover (Item 11) on to the pump adapter. Ensure that the cover is seated squarely on the pump adapter, this may require some sanding of the paint on the pilot diameter. Clamp the cover tightly to the adapter with clamps or bolts.

6) Thread the impeller (Item 2) onto the shaft adapter until it bottoms on the shoulder of the shaft adapter. Place a feeler gauge between the cover and the balance vanes on the impeller.

7) The gauge should read approximately .035", if it does not, repeat steps 4-6 using a different washer or combination of washers until the proper clearance is obtained. Four washers are supplied by Fybroc: 2@.010", 1@.032" and 1@.062" this will provide for 0-.110" worth of shimming capabilities which will adapt to any motor used.

8) Once the proper number of shims is determined, remove the impeller, cover and plastic shims and tighten the shaft adapter screw to 35 ft-lbs. for 3/8" screws and 50 ft-lbs. for 1/2" screws.

9) Place some anti-seize lubricant on the shaft adapter impeller threads.

10) The Fybroc pump, as standard, is equipped with a single outside seal with stationary seal face and rotating compression unit, or a double inside seal with stationary seal faces and rotating double seal compression unit. The following installation instructions are based on these seal types. When other types of seals are used, please refer to the manufacturer's installation data. Determine the type of seal being used and refer to the following sections.

SINGLE OUTSIDE SEAL INSTALLATION JOHN CRANE TYPE 8B2

1) Remove the mechanical seal from its packaging, inspect for any damage, and keep seal faces clean and free from contaminants during installation. **DO NOT GREASE OR LUBRICATE SEAL FACES.**

2) Install the inboard stationary gasket and the stationary seal insert into their bores on the pump cover. Then place the outboard stationary gasket over the stationary insert. Next place the seal gland over the stationary insert and gaskets, making sure that all the gaskets have been installed properly before securing the gland bolts. Be sure that the gland pilot is properly engaged, and draw up the gland bolts evenly, cross staggering adjustment of the bolts. Proper gland bolt adjustment is especially important where clamp style inserts are used. The gland bolts should be torqued to a maximum of 10 ft/lbs.

3) Lightly coat the impeller sleeve with a suitable lubricant. Carefully slide impeller sleeve through the cover, being careful not to chip the stationary sealing face.

4) Lubricate the rotary unit o-ring with a suitable lubricant. Then engage the rotary assembly over the impeller sleeve. Use a slight twisting motion as the rotary unit is slid down the impeller sleeve until it touches the stationary sealing face. Do not tighten set screws or remove setting clips.

5) Mount the impeller, cover and seal assembly onto the pump adapter, making sure the impeller threads are firmly bottomed on the shaft threads. Install the cover shims (Item 67) between the pump adapter and cover.

6) Install the segment key (Item 14A) in the corresponding slot at the rear of the impeller sleeve. Make sure the teeth are properly engaged and install locking ring (Item 14B).

7) Install cover o-ring (Item 73), casing (Item 1) and secure with the casing bolts, nuts and washers (Items 1C, 1D, 1E). Make sure the o-ring is in place and that the impeller is not contacting the casing and tighten the casing bolts.

8) Rotate the motor shaft manually while pushing on the motor shaft to take up any shaft end float. Confirm no binding exists. Ensure that the seal faces are still contacting by sliding the seal rotary unit until it touches the stationary unit with a slight twisting motion. Tighten the rotary unit set screws and remove the setting clips.

9) Replace fan and/or fan cover on motor and make appropriate piping connections to the seal assembly.

DOUBLE SEAL INSTALLATION JOHN CRANE TYPE 8-1T

1) Remove the mechanical seal from its packaging, inspect for any damage, keep seal faces clean and free from contaminants during installation. **DO NOT GREASE OR LUBRICATE SEAL FACES.**

2) Lightly lubricate the inboard stationary insert o-ring and cover bore with a suitable lubricant and then install the inboard stationary into the pump cover bore.

3) Lightly lubricate the outboard stationary insert o-ring and gland bore and then install the outboard stationary into the gland bore.

4) Lightly coat the impeller sleeve with a suitable lubricant. Carefully slide impeller sleeve through the cover, being careful not to chip the stationary sealing face.

5) Lubricate the rotary unit o-rings with a suitable lubricant. Then engage the rotary assembly over the impeller sleeve. Use a slight twisting motion as the rotary unit is slid down the impeller sleeve until it touches the stationary sealing face. Do not tighten set screws.

6) Install the gland o-ring into its groove on the gland. Then place the gland over the rotating seal assembly, making sure the gland o-ring is in place before securing the gland bolts. Be sure that the gland pilot is properly engaged, and draw up the gland bolts evenly, cross staggering adjustment of the bolts. The gland bolts should be torqued to a maximum of 10 ft/lbs.

7) Mount the impeller, cover and seal assembly onto the pump adapter, making sure the impeller threads are firmly bottomed on the shaft threads. Install the cover shims (Item 67) between the pump adapter and cover.

8) Install the segment key (Item 14A) in the corresponding slot at the rear of the impeller sleeve. Make sure the teeth are properly engaged and install locking ring (Item 14B).

9) Install the cover o-ring (Item 73), casing (Item 1) and secure it with the casing bolts, nuts and washers (Items 1C, 1D, 1E). Make sure the o-ring is in place and that the impeller is not contacting the casing and tighten the casing bolts.

10) Rotate the motor shaft manually while pushing on the motor shaft to take up any shaft end float. Confirm no binding exists. Remove the pipe plug in the bottom of the gland and tighten the seal rotary assembly set screws, centering the set screws with the pipe plug hole. Replace pipe plug and make appropriate piping connections to the seal assembly.

11) Replace fan and or fan cover on motor, make appropriate piping connections to the seal assembly.

DOUBLE SEAL INSTALLATION JOHN CRANE TYPE 8-D

1) Remove the mechanical seal from its packaging, inspect for any damage, keep seal faces clean and free from contaminants during installation. **DO NOT GREASE OR LUBRICATE SEAL FACES.**

2) Lightly lubricate the inboard stationary insert o-ring and cover bore and install the inboard stationary into the pump cover bore.

3) Lightly lubricate the outboard stationary insert o-ring and gland bore and install the outboard stationary into the gland bore.

4) Lightly coat the impeller sleeve with a soapy water solution. Carefully slide impeller sleeve through the cover, being careful not to chip the stationary sealing face.

   NOTE: The John Crane 8-D is a friction drive type of seal, the impeller sleeve and rotary unit should be lubricated with a soapy water solution to ease installation without reducing the frictional drive of the rotary unit.

5) Lubricate the rotary unit o-rings with a soapy water solution. Then engage the rotary assembly over the impeller sleeve. Use a slight twisting motion as the rotary unit is slid down the impeller sleeve until it touches the stationary sealing face.

6) Install the gland o-ring into its groove on the gland. Then place the gland over the rotating seal assembly, making sure the gland o-ring is in place before securing the gland bolts. Be sure that the gland pilot is properly engaged, and draw up the gland bolts evenly, cross staggering adjustment of the bolts. The gland bolts should be torqued to a maximum of 10 ft/lbs.

7) Mount the impeller cover, and seal assembly onto the power frame, making sure the impeller threads are firmly bottomed on the shaft threads. Install the cover shims (Item 67) between the pump adapter and cover.

8) Install the segment key (Item 14A) in the corresponding slot at the rear of the impeller sleeve. Make sure the teeth are properly engaged and install locking ring (Item 14B).

9) Install cover o-ring (Item 73), casing (Item 1) and secure with the casing bolts, nuts and washers (Items 1C, 1D, 1E). Make sure the o-ring is in place and that the impeller is not contacting the casing and tighten the casing bolts.

10 Rotate the motor shaft manually while pushing on the motor shaft to take up any shaft end float. Confirm no binding exists.

11) Replace fan and or fan cover on motor.

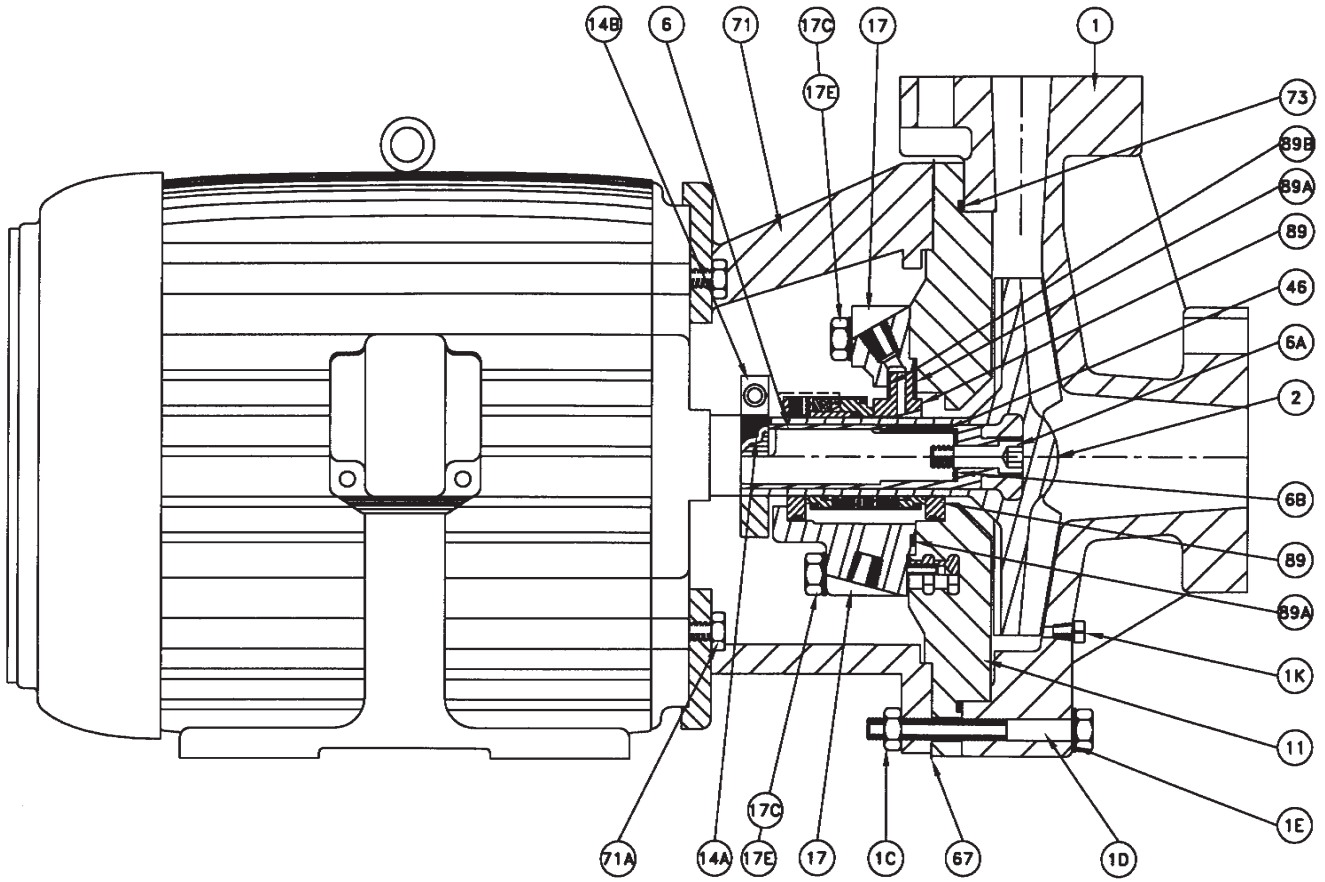
12) The 8-D seal is self centering and requires no adjustment. Make appropriate piping connections to the seal assembly.

IMPELLER ADJUSTMENT

The close coupled 1530 series design allows adjustment of the impeller clearance between the pump casing wall and the impeller face. The pump impeller is adjusted at the factory during assembly and should not require further adjustment upon installation.

Impeller adjustment will be required when a drop in head and/or capacity indicates a change in clearances, or when existing components of the pump are replaced. Refer to the following table for recommended clearance when adjusting impeller on horizontal pumps.

Impeller Diameter	Clearance
Up to 8"	.015"
8" to 10"	.020"
10" to 13"	.025"



1) When existing components of the pump are replaced with the exception of the casing, refer to the assembly section of this manual for proper impeller adjustment.
2) For impeller adjustment to compensate for wear follow the procedure below.
   A) Lock out the switch or circuit breaker in the “OFF” position so that the motor cannot be accidentally started.
   B) Loosen set screws or other holding devices if so provided on mechanical seals before adjusting impeller to prevent seal face damage.
   C) Loosen bolts holding motor to base and loosen casing bolts (Item 1D). Remove fan guard.
   D) Remove one shim (Item 67) from each side of pump by pulling outward on the extended tabs; this will decrease the impeller front clearance by .010". Slowly retighten casing bolts while turning and pushing forward on the motor shaft to be sure no binding occurs. If binding occurs from the impeller rubbing the casing, the shims that were removed will have to be replaced
   E) Continue this procedure until the impeller starts to contact the casing. At this point replace the appropriate number of shims to obtain the approximate impeller clearance shown in the table above.
   F) Reset and tighten the mechanical seal per the seal manufacturers instructions and retighten the motor mounting bolts. Replace fan guard.

WARNING: SOME MOTORS HAVE END FLOAT IN THE SHAFT. THIS MUST BE COMPENSATED FOR OR THE AXIAL LOADS DEVELOPED WHEN THE PUMP IS RUNNING WILL PULL THE IMPELLER INTO THE CASING, CAUSING PUMP DAMAGE.

OPERATIONAL START-UP CHECKLIST

- ☐ Foundation level and baseplate grouted.
- ☐ Foundation bolts tight.
- ☐ Motor and pump mounting bolts tight.
- ☐ Suction and discharge connections secure.
- ☐ Flush piping installed if required.
- ☐ Electrical connections secure and covered.
- ☐ Turn motor shaft by hand, ensure that it does not bind.
- ☐ Jog motor/Check rotation.
- ☐ Ensure seal is properly flushed.
- ☐ Suction valve is open, Discharge valve is slightly open.
- ☐ Ensure that pump is primed.
- ☐ Start pump and open discharge valve to desired flow rate.
- ☐ Check flush water flow and pressure.
- ☐ Check for excessive vibration.
- ☐ Check mechanical seal for no leaks after run-in.

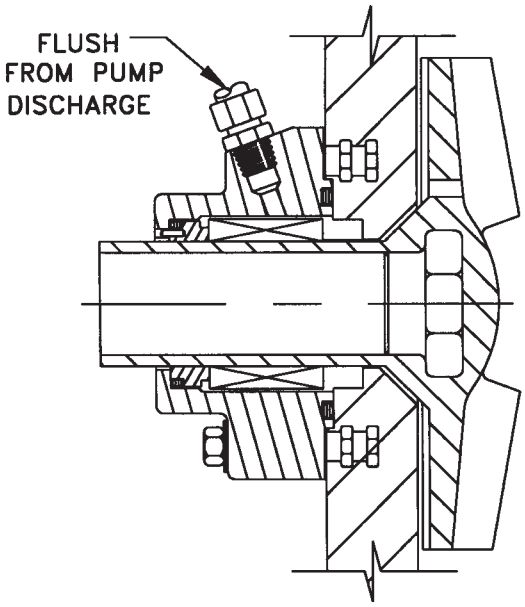
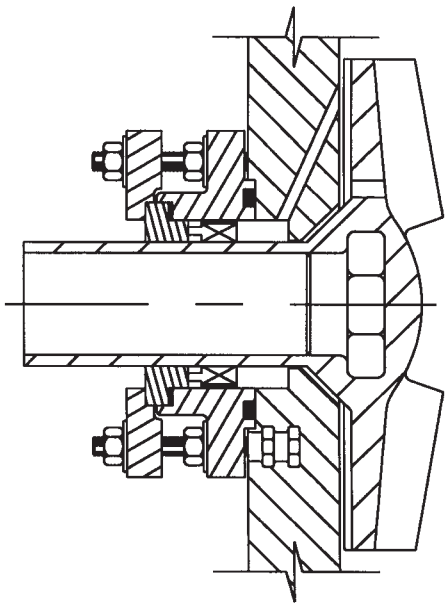
1530 SERIES SEAL AND STUFFING BOX ARRANGEMENTS

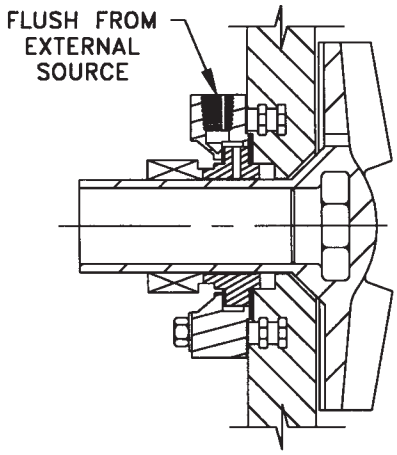


PRODUCT FLUSH: A portion of the pumped fluid is recirculated through the stuffing box to provide lubrication and cooling to the seal. Use plastic fittings only.

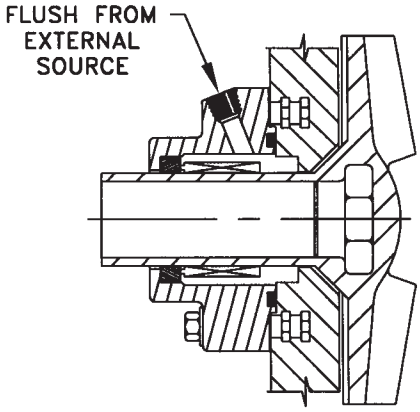


SINGLE OUTSIDE–DRILLED, CLAMPED SEAT WITH CASING BYPASS FLUSH

SINGLE OUTSIDE–SOLID CLAMPED SEAT WITH INTERNAL COVER FLUSH

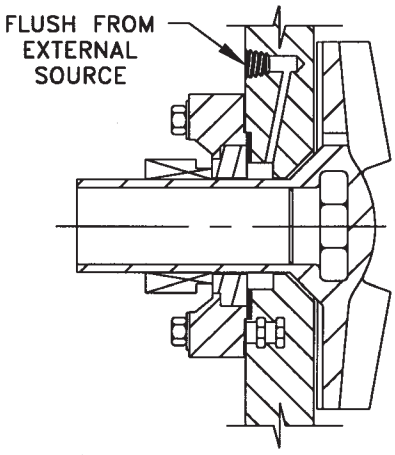


SINGLE INSIDE–SOLID O–RING SEAT WITH CASING BYPASS FLUSH

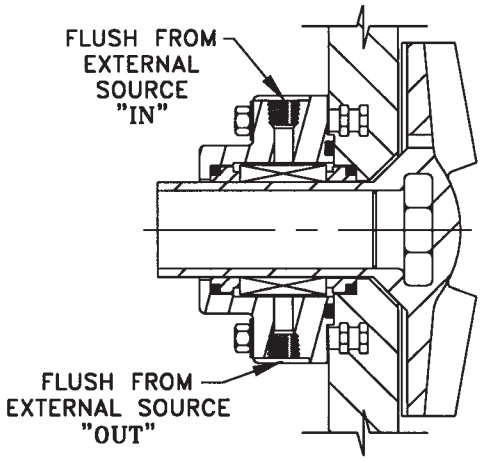


SINGLE INSIDE–SOLID CLAMPED SEAT WITH INTERNAL COVER FLUSH

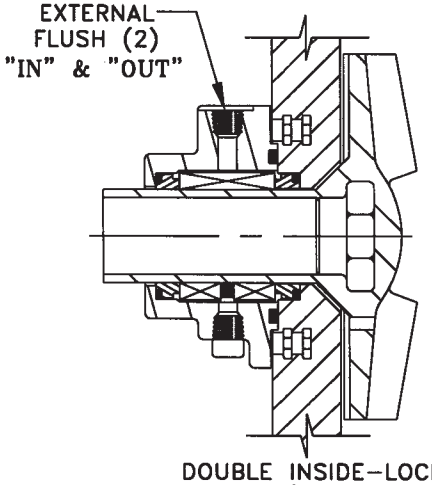
1530 SERIES SEAL AND STUFFING BOX ARRANGEMENTS



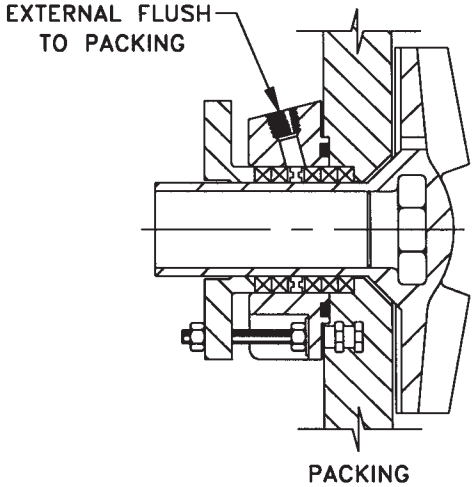
EXTERNAL FLUSH: An external source of clean fluid is required at the stuffing box to provide lubrication and cooling. Use plastic fittings only.



SINGLE OUTSIDE–DRILLED & CLAMPED SEAT W/EXTERNAL FLUSH

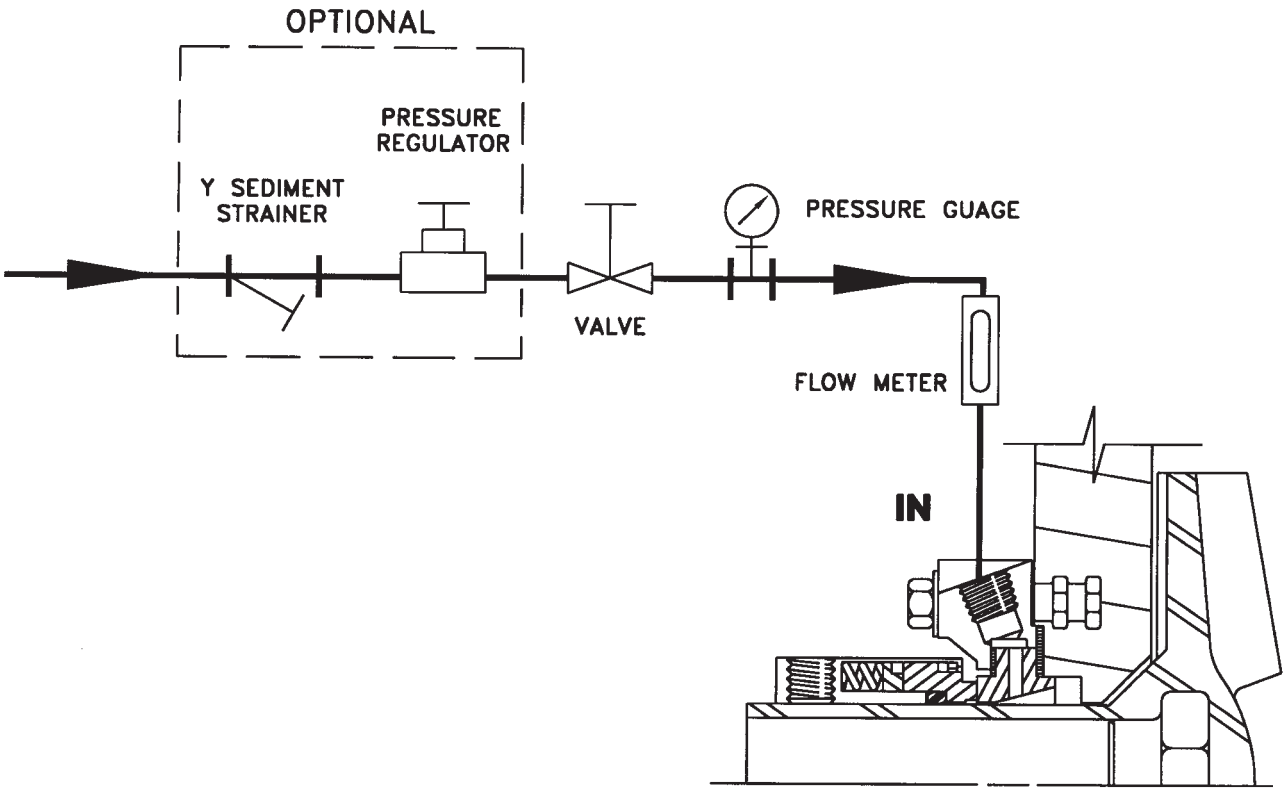


SINGLE INSIDE–SOLID O–RING SEAT W/EXTERNAL FLUSH

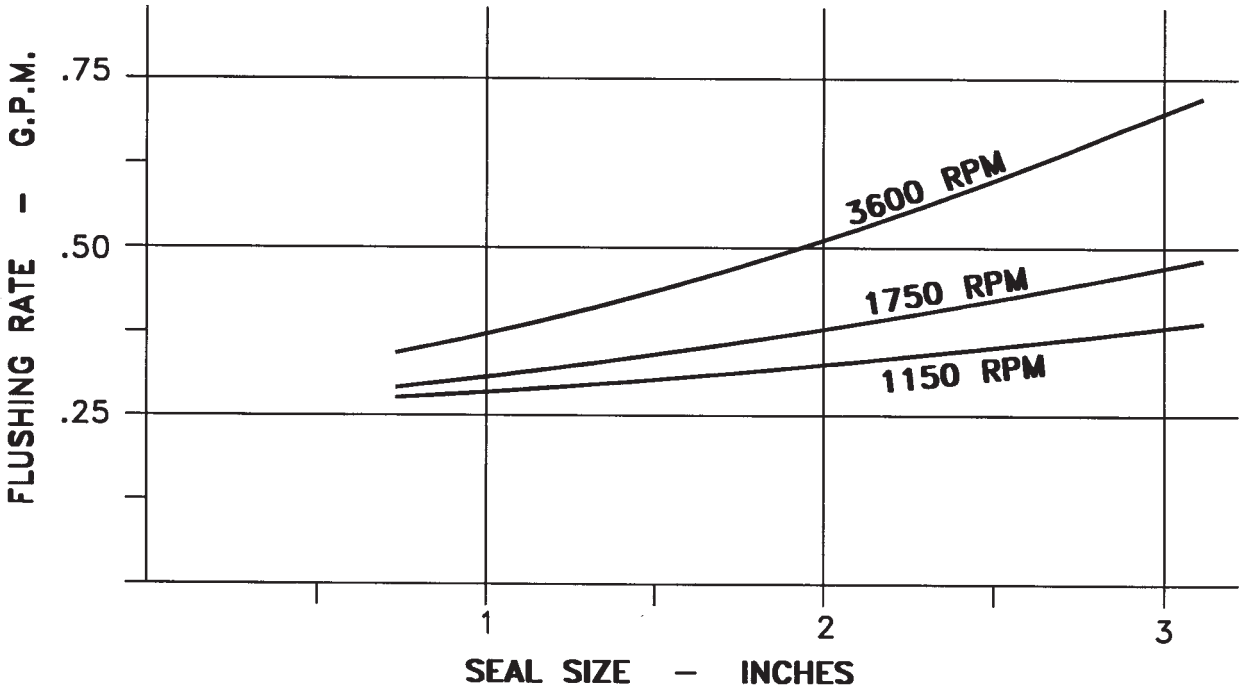


SINGLE OUTSIDE–SOLID CLAMPED SEAT W/EXTERNAL COVER FLUSH

DOUBLE INSIDE W/EXTERNAL FLUSH

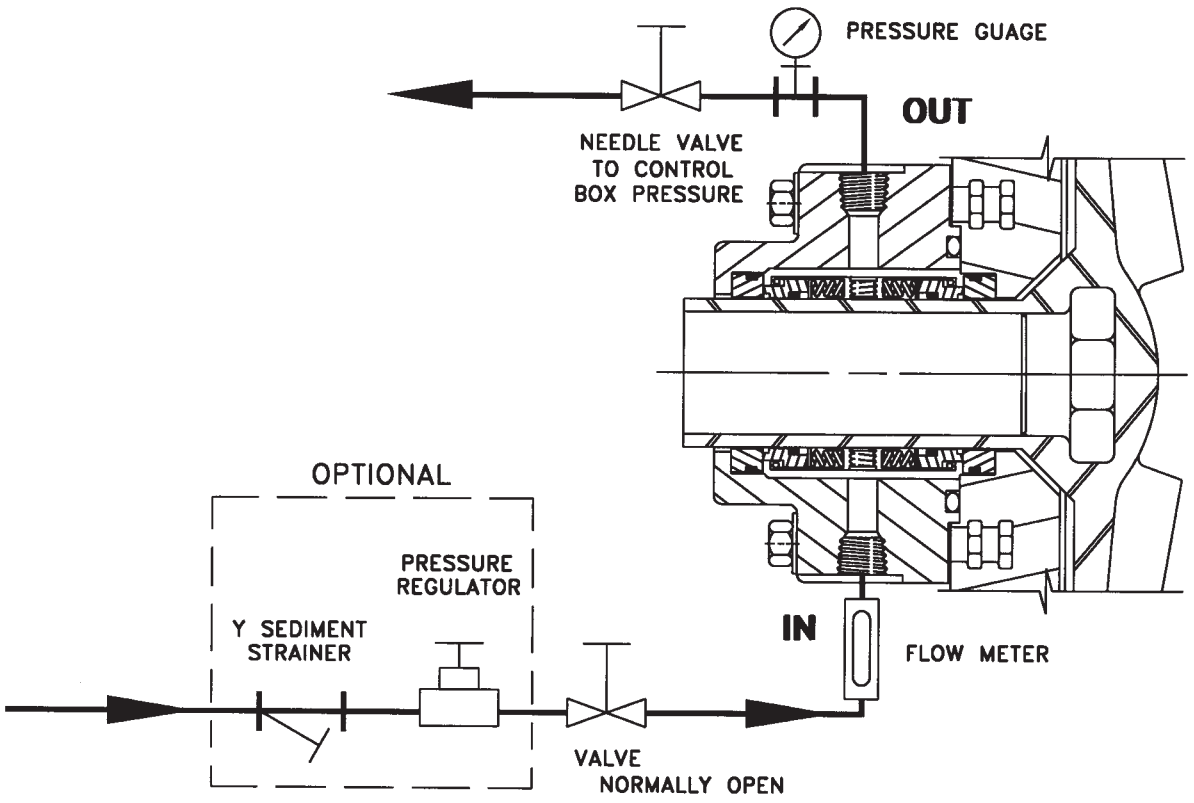


DOUBLE INSIDE–LOCKED ROTARY W/EXTERNAL FLUSH

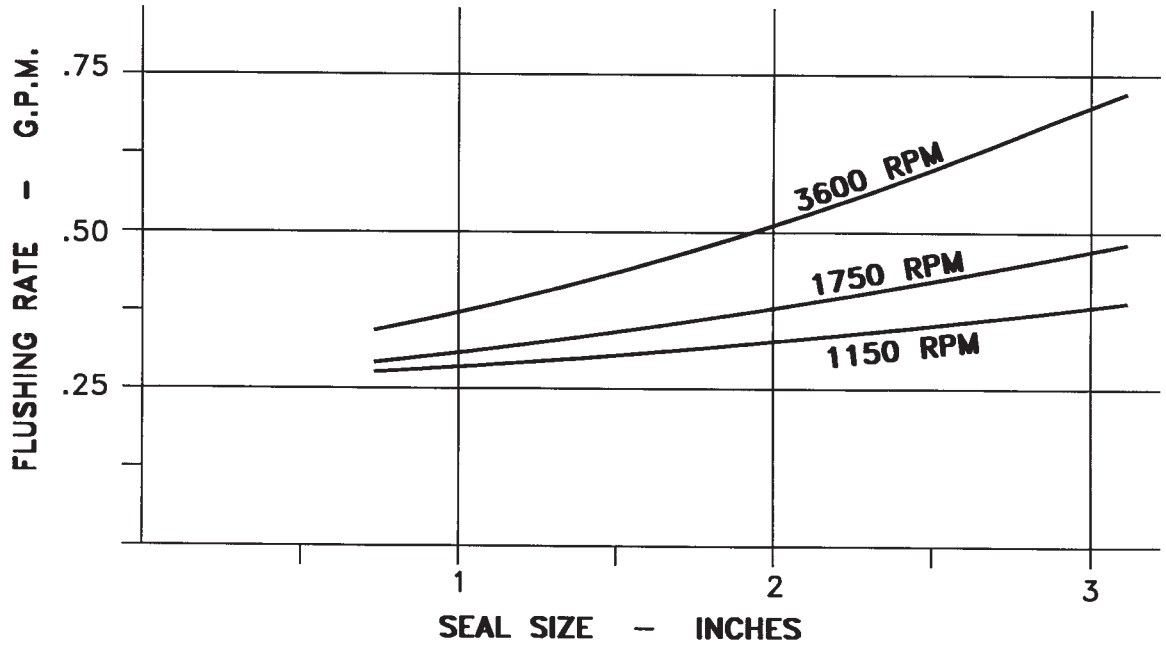


PACKING

FLUSH PIPING FOR SINGLE MECHANICAL SEAL



FLUSH FLOW RATE FOR SINGLE SEAL



FLUSH PRESSURE – 15 TO 25 PSI ABOVE STUFFING BOX PRESSURE
FLUSH LIQUID TEMPERATURE – 125°F (50°C) MAXIMUM

FLUSH PIPING FOR DOUBLE INSIDE MECHANICAL SEAL

FLUSH FLOW RATE FOR DOUBLE SEAL

FLUSH PRESSURE – 15 TO 25 PSI ABOVE STUFFING BOX PRESSURE
FLUSH LIQUID TEMPERATURE – 125°F (50°C) MAXIMUM

Please read and save this Repair Parts Manual. Read this manual and the General Operating Instructions carefully before attempting to assemble, install, operate or maintain the product described. Protect yourself and others by observing all safety information. The Safety Instructions are contained in the General Operating Instructions. Failure to comply with the safety instructions accompanying this product could result in personal injury and/or property damage! Retain instructions for future reference. AMT reserves the right to discontinue any model or change specifications at any time without incurring any obligation.

©2013 American Machine & Tool Co., Inc. of PA, A Subsidiary of The Gorman-Rupp Company, All Rights Reserved.

Periodic maintenance and inspection is required on all pumps to ensure proper operation. Unit must be clear of debris and sediment. Inspect for leaks and loose bolts. Failure to do so voids warranty.

3-Inch Self-Priming Centrifugal Pumps

Refer to pump manual 1808-634-00 for General Operating and Safety Instructions.

DESCRIPTION

These centrifugal pumps are self-priming (to 20 ft. lift) units designed for high volume liquid transfer – irrigation, de-watering, lawn sprinkling, etc. They can also accommodate semi-solids (up to 3/8" diameter), sediment laden liquids and liquids with entrained air or gases. Casing working pressure to 125 psi (862 kPa).

The units are equipped with a cast iron pump casing designed with a full dual volute, clog resistant semi-open stainless steel impeller and a cast iron adapter. Units are equipped with flapper valves to ensure a positive prime. A mechanical seal isolates the motor from the liquid in the pump casing. The units are coupled to 3450 RPM, totally enclosed fan cooled motors. All units are manual models, no controls are supplied. For use with nonflammable, non-abrasive liquids compatible with pump component materials.

⚠WARNING

All units are for use with non-flammable, non-abrasive liquids compatible with pump component materials.

MAINTENANCE

⚠WARNING

Make certain that the unit is disconnected and locked out from the power source before attempting to service or remove any components.

NOTE: Pump casing should be removed and inspected periodically to ensure that any foreign material or rust is not clogging internal pump parts. This unit is equipped with a dual volute pump casing. One of the volutes runs 180 degrees, all the way from side opposite discharge into discharge through a completely enclosed passageway. If foreign material clogs this area, it can be dislodged by using a wire or long spring.

REMOVAL OF OLD SEAL

Refer to Figure 1

IMPORTANT: Always replace both seal seat (Ref. No. 10) and seal head (Ref. No. 11) to ensure proper mating of components! Also, impeller seal washer (Ref. No. 14) should be replaced anytime impeller lock bolt (Ref. No. 15) has been removed.

1. Remove four bolts (Ref. No. 4) that connect adapter (Ref. No. 7) to casing (Ref. No. 16).
2. Remove casing and casing seal (Ref. No. 8).

⚠ CAUTION

Care should be taken not to "pinch" or "shave" the o-ring gasket (Ref. No. 8) between adapter and casing.

3. Using an Allen wrench, remove impeller lock bolt, impeller seal washer,and impeller (Ref. No. 13).

IMPORTANT: Care should be taken to ensure that same number of shim washers (Ref. No. 12) are replaced behind impeller as were removed. These shim washers are located directly behind impeller. These washers as well as impeller key (Ref. No. 2) become loose as impeller is removed.

4. Seal head and shaft sleeve can now be pulled from shaft.
5. Pry seal seat from adapter.
6. Push seal head from shaft sleeve.

INSTALLATION OF NEW SEAL

⚠ CAUTION

The precision lapped faces on mechanical seal are easily damaged. Handle your replacement seal carefully.

1. Thoroughly clean all surfaces of seal seat cavity.
2. Using a clean cloth, wipe shaft and shaft sleeve and make certain that they are perfectly clean.
3. Wet the rubber portion of new seal seat with a light coating of soapy water. While wearing clean gloves or using a clean light rag, press seal seat squarely into adapter recess. Avoid scratching polished surface. If seal will not position properly, place a cardboard washer over polished surface and use a piece of pipe to press in, firmly but gently.
4. Dispose of cardboard washer. Check again to see that polished surface is free of dirt and all other foreign particles and that it has not been scratched or damaged.
5. Wet the inside of rubber portion of new seal head with a light coating of soapy water. Slide head onto shaft sleeve. Slide shaft sleeve with seal head onto motor shaft. Seal head and seal seat will meet. Reinstall any shims which have been removed. (See SHIM ADJUSTMENT section.)

IMPORTANT: Before installing new shaft sleeve, apply a bead of non-hardening, pliable sealant (such as Permatex®, Form-A-Gasket® No. 2) to motor shaft shoulder.

6. Replace impeller key and impeller. Replace impeller seal washer before screwing impeller lock bolt in place.
7. Reassemble pump.
8. A short "run-in" period may be necessary to provide completely leak free seal operation.

3-Inch Self-Priming Centrifugal Pumps

SHIM ADJUSTMENT

When installing a replacement impeller (Ref. No. 13) or motor (Ref. No. 1), it may be necessary to adjust the number of shims (Ref. No. 12) to ensure proper running clearance between impeller and casing (Ref. No. 16). Proceed as follows:

NOTE: A proper running clearance is less than 0.010".

1. For impeller replacement, add one (1) shim in addition to those removed originally.
2. For motor replacement, add two (2) shims in addition to shims removed during disassembly.
3. Reassemble pump as described in steps 6 and 7. (See INSTALLATION OF NEW SEAL section.)

IMPORTANT: Be sure that casing is snugly in place and check shaft to make sure it is turning freely (use screwdriver slot in the motor to turn shaft). If it turns freely, check to ensure that adapter (Ref. No. 7) and casing are fitted metal -to- metal where they meet on outside. If they are not metal-to-metal, tighten fasteners (Ref. No. 4) and recheck shaft for free turning. Tighten carefully, turning shaft while tightening so that motor bearings are not damaged in the event that too many shims were installed. If shaft seizes before fasteners are completely tight, disassembly pump and remove one (1) shim and repeat reassembly.

For Repair Parts contact dealer where pump was purchased.

General Information

SALES POLICY: AMT products are sold through our established Distributors. We do not sell direct to the consumer or organization not entitled to trade recognition. Therefore, possession of our catalogs and/or price list(s) does not infer an offer to sell.

MINIMUM ORDER: We appreciate your order, however, all orders are subject to a minimum $35.00 net invoice charge (excluding freight). This applies to all pump and parts purchase orders.

PRICES: Prices are subject to change without notice. All orders accepted are subject to prices in effect at time of shipment.

PAYMENT TERMS: Terms, upon establishment of credit, are Net 30 days. Past due accounts may be subject to a service charge of 1.5% per month. Domestic or assignable letter of credit is required for all export trade.

PAST DUE ACCOUNTS: AMT reserves the right to withhold open account shipments on any past due account. Invoices are considered past due after thirty (30) days. In the interest of sound business, all orders are subject to approval of the Credit Department.

SHIPPING INSTRUCTIONS: All shipments will be made F.O.B. the factory. Where instructions for shipment do not appear on the order, the shipment will be made according to our best judgment. Full risk of loss (including transportation delays and losses) shall pass to the customer upon delivery of the products to the carrier at the F.O.B. point. When loss or delay occurs, primary responsibility for tracing rests with the customer. When there is LOSS or APPARENT VISIBLE DAMAGE to a shipment, when tendered for delivery, *DO NOT* give the carrier a clear receipt. Note such damage on the carrier's delivery receipt and *HAVE THE DRIVER SIGN THE RECEIPT.*

PRODUCT REVISIONS: AMT reserves the right to discontinue, change or improve its products or any portions thereof without being obligated to provide such a change or improvement for units sold and/or shipped prior to such a change or improvement.

LEAD TIME: Products designated "Quick Ship Product", also referred to as "QSP" will normally be shipped within 24 hours of receipt of a non-cancellable purchase order. Only limited quantities of "QSP" pumps are available.

STANDARD LEAD TIME: Lead time is two weeks for all non "QSP" product. AMT reserves the right to revise lead times as required due to availability of materials and all other causes beyond our control.

VIP SHIPMENT: Select AMT and IPT branded pumps are available for next day shipment for non-QSP (Quick Ship Products) items and subjected to a specific model surcharge per unit noted in the respective price book. Requires calling for availability, confirmation and a non-cancellable purchase order or credit card payment prior to shipment. The expedited shipping charges are an additional cost added separately from the VIP charges per item. AMT reserves the right to revise lead times as required due to availability of materials and all other causes beyond our control. QSP quantities are limited as determined by AMT.

ALL purchase orders must be submitted via hard copy sent to AMT customer service department by fax, EDI or e-mail.

RETURN GOODS POLICY: Goods shall not be returned without a return goods authorization number (RGA) issued by AMT customer service. The RGA number must be listed on the packing list. Only current model and part numbers with a valid date code may be returned (within one year from date of purchase). **A 20% restocking and packaging charge will apply to all returns. All shipping charges must be pre-paid. No exceptions.**

ORDER CHANGES BY CUSTOMER: Orders in process may not be changed except with written consent and may be subject to special charges.

12 Month Limited Warranty

EXTENT AND DURATION OF LIMITED WARRANTY

Coverage: American Machine & Tool Company (herein "AMT") or IPT Pumps by Gorman-Rupp (herein "IPT") or Gorman-Rupp Industries Division of The Gorman-Rupp Company, Patterson, or the Gorman-Rupp Company (herein referred to as "G-R Unit") each individually warrants that its products and parts shall be free from defects in material ad workmanship for twelve (12) months from the date of purchase by the original end user when installation is made and maintenance is performed in accordance with G-R Unit's recommendations. Wear and tear resulting from use and items normally consumed in use are not covered.

EXCEPTIONS

(A) This Limited Warranty shall not apply to mechanical seals in AMT or IPT pumps and the following products and parts: engines, motors, trade accessories and all other products, components, parts and materials not manufactured by the G-R Units. These items may, however, be covered by the warranties of their respective manufacturers. (B) This warranty does not extend to or apply to any unit which has been repaired or altered at any place other than by a G-R Unit, or by persons not expressly approved by a G-R Unit to make repairs or alterations, nor to any unit the serial number, model number or identification of which has been removed, defaced or altered. (C) This warranty does not extend to any product manufactured by a G-R Unit, which has been subjected to mis-use, neglect, accident, improper installation, or use in violation of instructions furnished by a G-R Unit. (D) Pump Kits: This warranty does not extend to any product sold by a G-R Unit unassembled as a Pump Kit. Pump Kits are warranted against defects in material and workmanship for 60 days from the date of shipment from a G-R Unit. Any Pump Kit parts deemed defective by a G-R Unit will be replaced free of charge within 60 days of shipment. Pump Kits are not returnable for credit.

LIMITATIONS

THE G-R UNITS' SOLE AND EXCLUSIVE WARRANTY WITH RESPECT TO THEIR PRODUCTS AND PARTS IS THIS LIMITED WARRANTY. THIS LIMITED WARRANTY IS IN LIEU OF ALL OTHER EXPRESS AND/OR IMPLIED WARRANTIES, INCLUDING IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR PARTICULAR PURPOSE.

EXCLUSIVE REMEDY AND DAMAGES

The sole and exclusive remedy for breach of this Warranty by a G-R Unit and the entire extent of its liability for such breach or for damages arising from the use of the products and parts covered under this Limited Warranty, shall be as follows:

1. **Repair or Replacement:** If inspection shows that any G-R Unit product or part covered under this Limited Warranty is defective in materials or workmanship, the G-R Unit shall repair or replace the defective or non-conforming product or part without charge, whichever the G-R Unit chooses. You must have properly maintained and used the product or part claimed to be defective in accordance with the maintenance schedule or manual, which comes with the product. No allowance will be made for labor, installation, removal, transportation or other charges incurred by you in connection with such repair or replacement.
2. To obtain the above remedy:
    A. Immediately notify the G-R Unit upon discovery of the claimed defect in materials or workmanship and provide the serial number or date code of the product and/or part(s) or provide the G-R Unit with the invoice or bill of sale referencing the product by no later than the expiration date of the warranty period.
    B. The G-R Unit will advise whether inspection will be necessary and how whether repair or replacement will be made. If inspection by the G-R Unit is necessary, the pump or defective part must be sent freight pre-paid to the G-R Unit. Return shipment will be F.O.B. the G-R Unit's plant.
    C. **Return Goods Authorization Requirement:** No product will be accepted for return or replacement without the prior written authorization of the G-R Unit. Upon such authorization, and in accordance with instructions from the G-R Unit, the product will be returned to the G-R Unit, shipping charges prepaid by the Buyer.

3. **Damages:** The G-R Unit's liability for damages for breach of this Limited Warranty shall not exceed the amount of the purchase price of the product or part(s) in respect to which Such damages are claimed. **IN NO EVENT SHALL THE G-R UNITS BE LIABLE FOR INCIDENTAL, CONSEQUENTIAL OR SPECIAL DAMAGES FOR BREACH OF THIS LIMITED WARRANTY.**

Some states do not allow the exclusion or limitation of incidental or consequential damages, so the above limitation or exclusion may not apply to you. This Limited Warranty gives you specific legal rights, and you may also have other rights, which vary from state to state.

Instruction Manual

Electronic Metering Pumps

CAUTION

Carefully read and understand all precautions before installing or servicing any metering pump.

CAUTION

For file reference, please record the following data:

Model No: _____

Serial No: _____

Installation Date: _____

Installation Location: _____

When ordering replacement parts for your LMI Metering Pump or Accessory, please include complete Model Number and Serial Number of your unit.

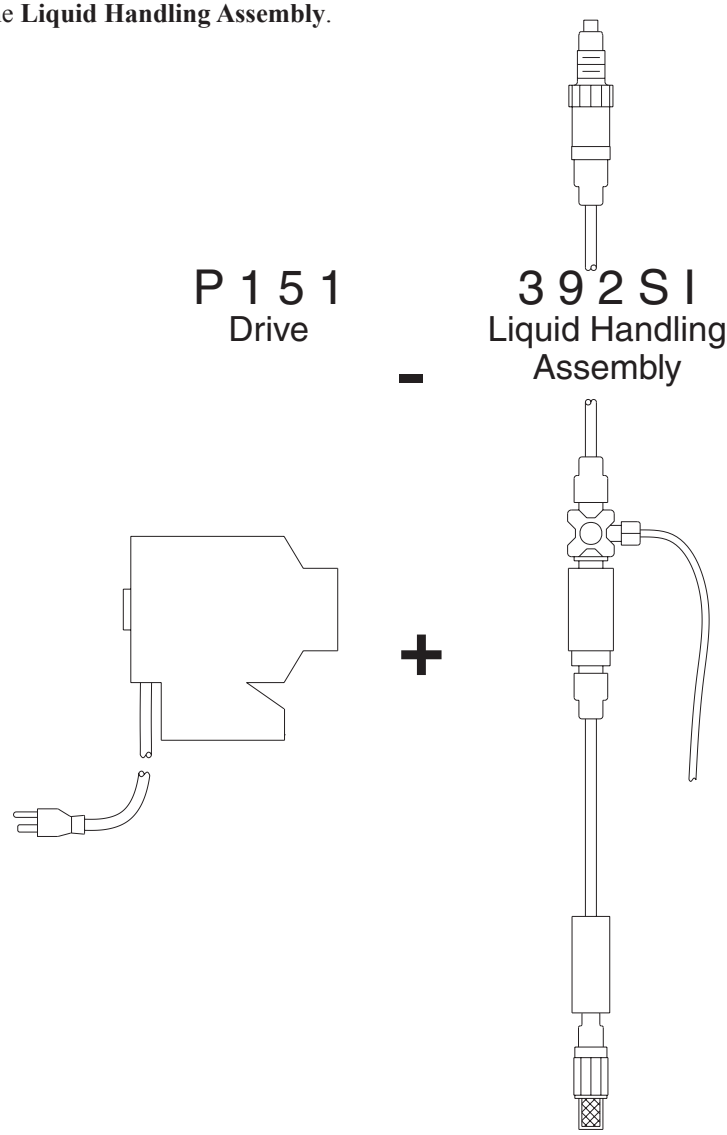
1.0 Introduction

LMI is the world's most versatile manufacturer of economical and efficient metering pumps. This manual addresses the installation, maintenance and troubleshooting procedures for manually and externally controlled pumps. LMI has a worldwide network of stocking representatives and authorized repair centers to give you prompt and efficient service.

Please review this manual carefully. Pay particular attention to warnings and precautions. Always follow good safety procedures, including the use of proper clothing, eye and face protection.

This manual is for Series AA, B, C, E, J5, and P pumps.

1.1 Spare Parts

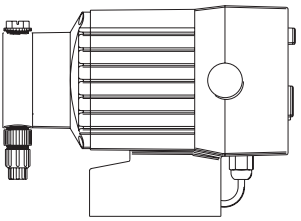


LMI recommends replacing the elastomeric components of the pump on an annual basis. RPM Pro Pacs™ and spare part kits are available from your local LMI Master Stocking Distributor.

Example:

Your pump consists of two main components:

1. The **Drive Assembly**; and

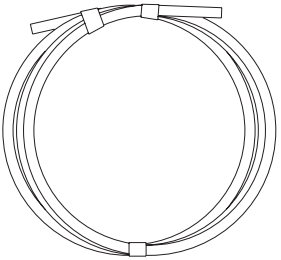


2. The **Liquid Handling Assembly**.

2.0 Unpacking Check List

Your carton will contain many or all of the following items. Please notify the carrier immediately if there are any signs of damage to the pump or its parts.

Please refer to the enclosed Instruction Supplement for an illustration and electrical diagram of your complete pump.



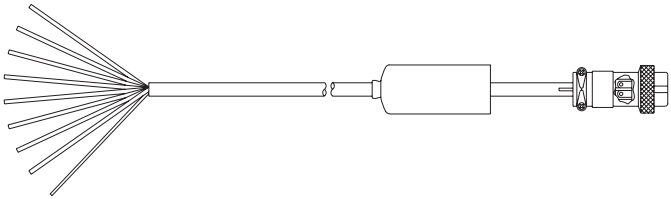
Metering Pump

Foot Valve

Ceramic Foot Valve Weight

Tubing

Depending on the model, your carton may contain 0, 1, 2 or 3 rolls of tubing. Your carton may contain a roll of vinyl tubing: DO NOT USE ON PRESSURIZED LINES. The vinyl tubing is for connection to the SUCTION SIDE OF THE PUMP HEAD OR THE 3 OR 4 FUNCTION VALVE RETURN LINE ONLY.



Tubing Connection Hardware

Injection Check Valve

Instruction Supplement

Optional Milliamp Input Cable

Optional 4-Function Valve (pictured) or
Optional 3-Function Valve

3.0 Pre-Installation Instructions

The following precautions should be taken when working with LMI metering pumps. Please read this section carefully prior to installation.

Precautions

Protective Clothing

ALWAYS wear protective clothing, face shield, safety glasses and gloves when working on or near your metering pump. Additional precautions should be taken depending on the solution being pumped. Refer to MSDS precautions from your solution supplier.

Water Pre-Prime

All LMI pumps are pre-primed with water when shipped from the factory. If your solution is not compatible with water, disassemble the Pump Head Assembly. Thoroughly dry the pump head, valves, seal rings, balls and Liquifram™ (diaphragm). Reassemble head assembly tightening screws in a crisscross pattern. Refill the pump head with the solution to be pumped before priming the pump. (This will aid in priming.)

Solution Compatibility

Determine if the materials of construction included in the liquid handling portion of your pump are adequate for the solution (chemical) to be pumped. LMI pumps are tested by NSF for use on muriatic acid (up to 37% hydrochloric acid), and sodium hypochlorite (up to 12.5% solution). Always refer to the solution supplier and the **LMI Chemical Resistance Chart** for compatibility of your specific LMI metering pump. Contact your local LMI distributor for further information.

Tubing Connections

Inlet and outlet tubing or pipe sizes must not be reduced. Make certain that all tubing is SECURELY ATTACHED to fittings prior to start-up (see Section 4.3, Tubing Connections). ALWAYS use LMI supplied tubing with your pump, as the tubing is specifically designed for use with the pump fittings. It is recommended that all tubing be shielded to prevent possible injury in case of rupture or accidental damage. If tubing is exposed to sunlight, black UV resistant tubing should be installed. Check tubing frequently for cracks and replace as necessary.

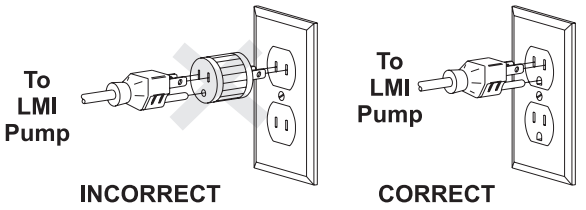
Fittings And Machine Threads

All fittings should be hand-tightened. An additional 1/8 - 1/4 turn after the fitting contacts the seal ring may be necessary to provide a leak-proof seal. Excessive overtightening or use of a pipe wrench can cause damage to the fittings, seals, or pump head.

All LMI pumps have straight screw machine threads on the head and fittings and are sealed by the seal rings or O-rings. **DO NOT use Teflon® tape or pipe dope to seal threads. Teflon® Tape may only be used on the 1/2" NPT thread side of the Injection Check Valve as well as stainless steel liquid end connections.**

Plumbing

Always adhere to your local plumbing codes and requirements. Be sure installation does not constitute a cross connection. Check local plumbing codes for guidelines. LMI is not responsible for improper installations.



Back Pressure/Anti-Syphon Valve

If you are pumping downhill or into low or no system pressure, a back pressure/anti-syphon device such as LMI's Four Function Valve should be installed to prevent overpumping or syphoning. Contact your LMI distributor for furthur information.

Electrical Connections

To reduce the risk of electrical shock, install only on a circuit protected by a ground-fault circuit-interrupter (GFCI). The metering pump must be plugged into a grounded outlet with ratings conforming to the data on the pump control panel. The pump must be connected to a good ground. **DO NOT USE ADAPTERS!** All wiring must conform to local electrical codes.

WARNING: Do not hook a US style pump plug into a non-US (UK, Aust, NZ or Swiss) wired power system. The US style 240VAC power system has two 110VAC hot legs and one neutral. The European style system has one 240VAC hot leg and a neutral. Hooking up a US pump to the European wired system will cause pump failure.

4.0 Installation

4.1 Pump Location and Installation

Locate pump in an area convenient to solution tank and electrical supply.

The pump should be accessible for routine maintenance, and should not be subjected to ambient temperatures above 122°F (50°C). If the pump will be exposed to direct sunlight, LMI black, UV resistant tubing should be installed.

4.2 Pump Mounting

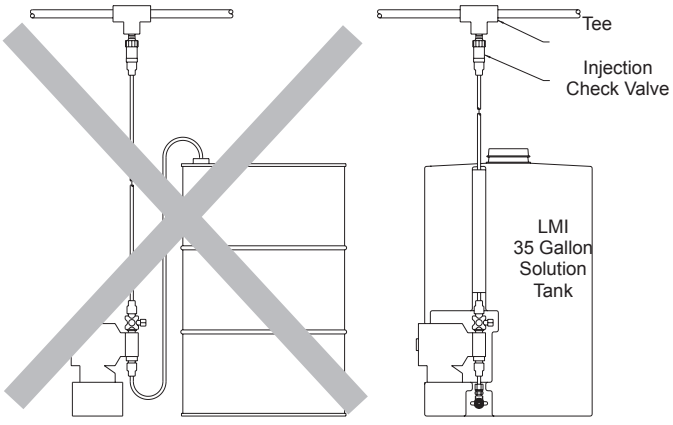
The pump can be mounted in one of two ways:

A. FLOODED SUCTION (ideal installation); or

B. SUCTION LIFT - when suction lift is less than 5 feet (1.5 m) for solutions having a specific gravity of water. For denser solutions, consult distributor.

Your LMI metering pump must be mounted so that the suction and discharge valves are vertical. **NEVER position pump head and fittings horizontally.**

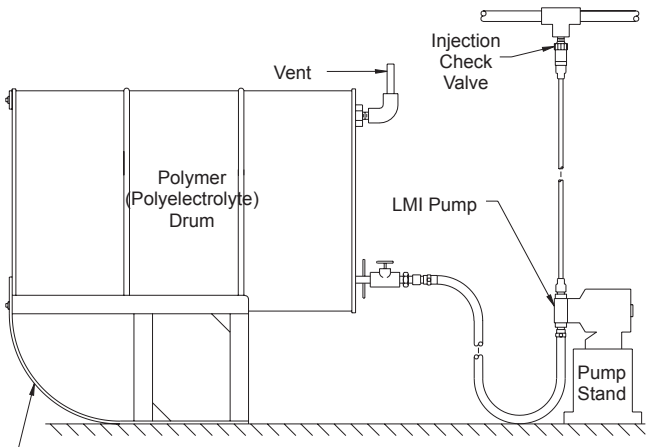
4.2.1 Flooded Suction



The pump is mounted at the base of the storage tank. This installation is the most trouble-free , and is recommended for very low outputs, solutions that gasify, and high-viscosity solutions. Since the suction tubing is filled with solution, priming is accomplished quickly and the chance of losing prime is reduced.

CAUTION

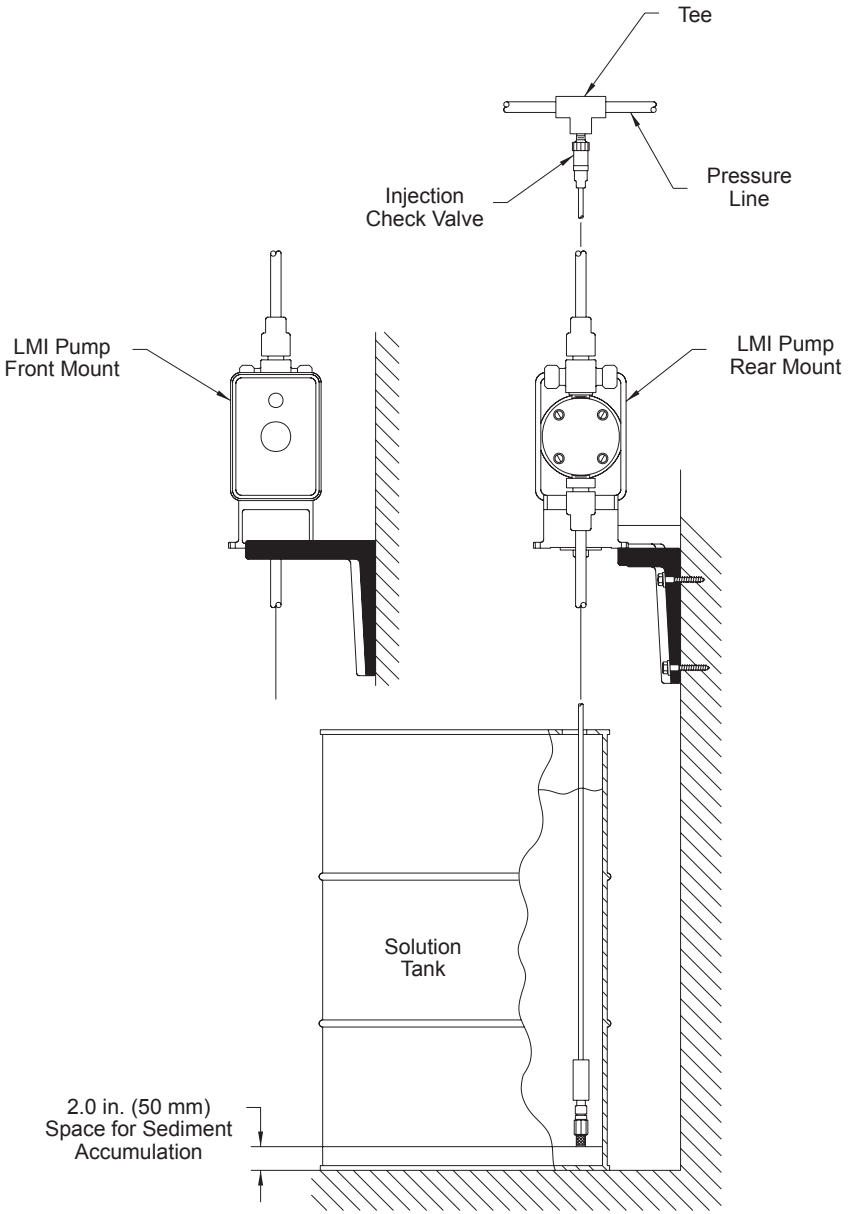
When pumping downhill or into low or no pressure system, a back pressure/anti-syphon device should be installed to prevent overpumping or syphoning.



Note

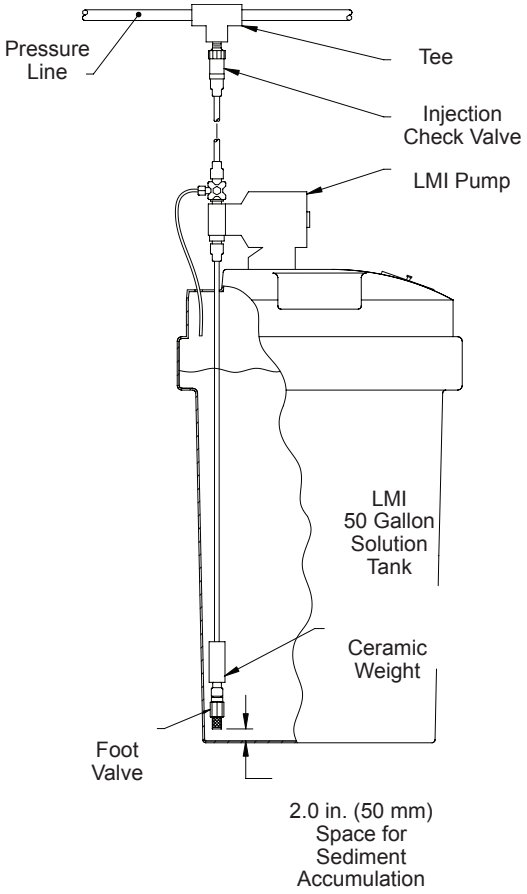
Although popular for all solutions, LMI recommends flooded suction installations for all high-viscosity fluid applications.

INCORRECT **CORRECT**

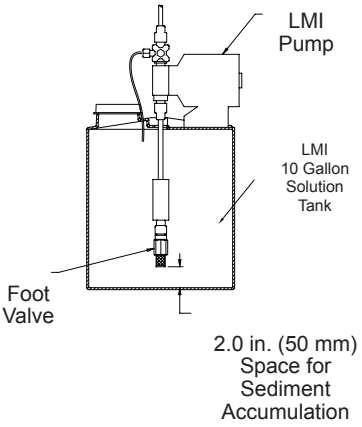


Avoid this type of false flooded suction.

CORRECT

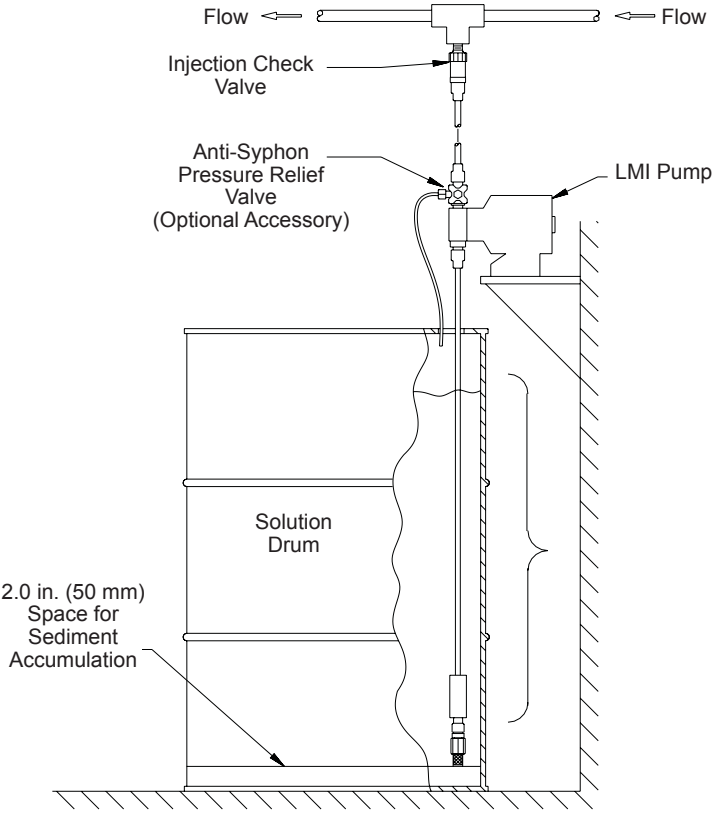


4.2.2 Suction Lift - Wall Bracket Mount



The pump may be mounted using an LMI Wall Mount Bracket Assembly (part no. 34643) directly above the solution tank. A pump mounted in this manner allows for easy changing of solution tanks or drums.

4.2.3 Suction Lift - Tank Mount



The pump may be mounted on a molded tank provided there is a recess to keep the pump stationary. LMI 10-gallon tank (part no. 27421), 35-gallon tank (part no. 27400), and 50-gallon tank (part no. 26350) have molded recesses for pump mounting.

4.2.4 Suction Lift - Shelf Mount

The pump may be mounted on a shelf (customer supplied) maintaining a suction lift of less than 5 ft (1.5 m). An LMI mounting kit (part number 10461) is available for securing the pump to a shelf.

4.3 Tubing Connections

1. Insert tubing through Coupling Nut—Tubing should enter the smaller end of the Coupling Nut first, orienting the larger opening of the Coupling Nut toward the tubing end.

2a. For 1/4" OD tubing: Position the Female Ferrule so that 1/4" to 3/8" (5-10 mm) of tubing protrudes from the Female Ferrule. Orient the raised collar of the Ferrule toward the Coupling Nut (reference FIGURE 1).
