2b. For 3/8" or 1/2" OD tubing: Position a Female Ferrule about one inch (25 mm) from end of tubing. Orient the raised collar of the Female Ferrule toward the Coupling Nut. Then, insert the Male Ferrule onto the end of the tube, pushing the tube into the bottom of the groove in the Male Ferrule. Then slide the Female Ferrule down the tubing and with your fingers, press tightly into the Male Ferrule (reference FIGURE 2).

3. Firmly hand tighten the Coupling Nut onto the fitting. Note: Tightening with pliers may cause the Ferrules to break.

CAUTION

A. USE ONLY LMI TUBING—ALWAYS use LMI supplied tubing with your pump, as the tubing is specifically designed for use with the pump fittings.

B. *DO NOT USE CLEAR VINYL TUBING ON THE DISCHARGE SIDE OF THE PUMP.* The pressure created by the pump can rupture vinyl tubing.

C. Before installation, all tubing must be cut with a clean square end.

D. Valve and head connections from the factory are capped or plugged to retain pre-prime water. Remove and discard these caps or plugs before connecting tubing.

DO NOT USE PLIERS OR PIPE WRENCH ON COUPLING NUTS OR FITTINGS.

DO NOT REUSE FERRULES—USE ONLY NEW FERRULES.

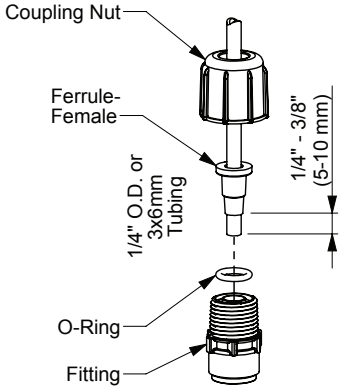

FIGURE 1

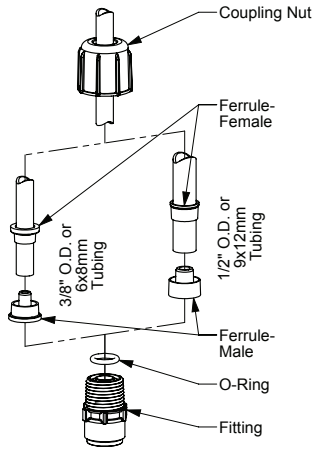

FIGURE 2

4.4 Multi-Function Valves

Your pump may be equipped with one of the following multi-function valves: 3-FV, 4-FV, or standard discharge valve. If your pump is not equipped with a multi-function valve and you feel it is needed in your application, it can be purchased as an accessory. Contact your local LMI stocking distributor.

4.4.1 Three Function Valve (3-FV)

1. **Pressure Relief**

   If the discharge line is over pressurized, the valve opens sending solution back to the supply tank.

2. **Line Depressurization**

   Opening the relief knob provides line drain back to the supply tank.

3. **Priming Aid**

   Opening the relief knob assists in priming the pump by venting the discharge line to the atmosphere.

4.4.2 Four Function Valve (4-FV)

1. **Pressure Relief**

   If the discharge line is over pressurized, the valve opens sending solution back to the supply tank.

2. **Line Depressurization**

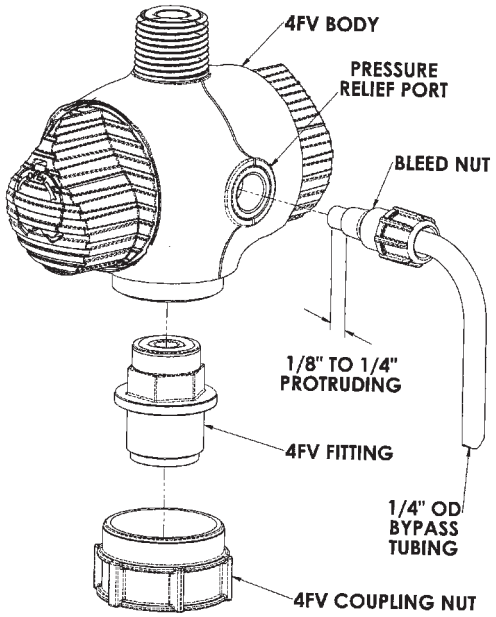
   Opening the relief knob provides line drain back to the supply tank.

3. **Anti-Syphon**

   Prevents syphoning when pumping solution downhill or into a vacuum.

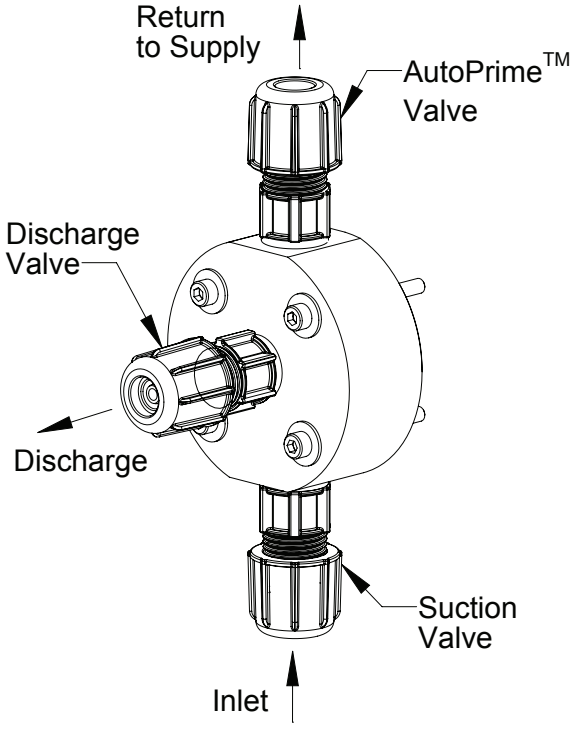
4. **Back Pressure**

   Supplies approximately 25 psi back pressure to prevent overpumping when little or no system back pressure is present.



Typical 4-FV Installation

4.5 4-Function Valve Installation



- To mount to a pump, remove the discharge fitting from the pump (if present) leaving the cartridges in the pump head. Position the 4FV coupling nut on pump head over cartridges with threads up, and insert 4FV fitting and thread into pump head over cartridges. Tighten the fitting to 50 in-lbs using a 13/16" or 20 mm socket. Insert the large opening on the 4-Function valve into the 4FV coupling nut and hand tighten. You can position the valve to have the pressure relief port in any convenient location by tightening the 4FV coupling nut with the pressure relief port positioned 90º CCW from desired location, then holding the nut stationery while turning the valve the final 90º to desired position.
- Connect 1/4" tubing to the pressure relief port and route to supply container.
- Connect discharge line using LMI tubing connection system or 1/2" pipe thread.

  The 4-Function Valve is designed for double¬ballchecks. A second valve cartridge is required when mounting a new 4-Function Valve to an existing pump with a 300, 400 or 700 liquid end.

4-Function Valve Tubing Connection

4.6 AutoPrime™ Liquid End

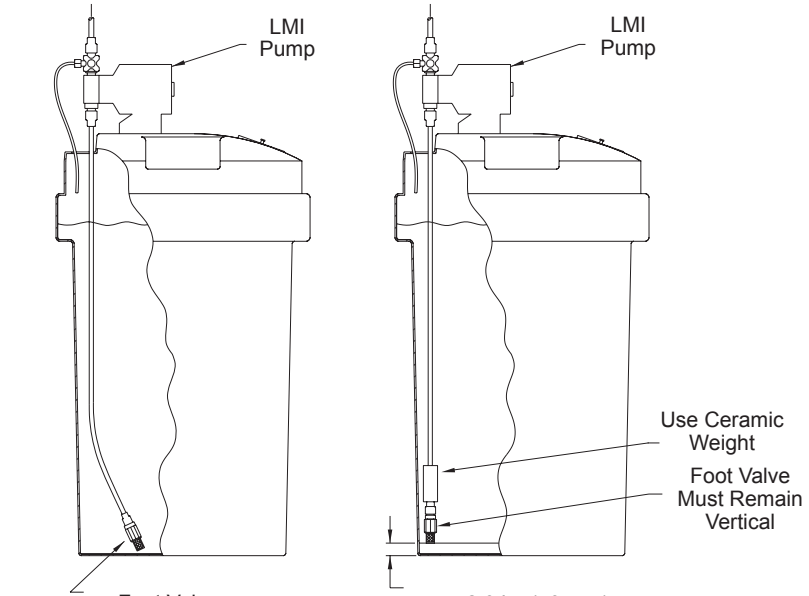
AutoPrime™ Liquid End

AutoPrime™

Pumps installed with the AutoPrime™ Liquid End are equipped with a valve that allows for constant removal of vapors and gasses inherent with effervescent chemicals such as Sodium Hypochlorite and Hydrogen Peroxide. The valve keeps the pump primed automatically. When installing a pump equipped with an AutoPrime™ Liquid End, connect the 1/2" OD Polyethylene tubing to the top vertical fitting, and route this line back to the supply tank. To ensure priming, this tubing should not be submerged in the solution. The horizontal fitting is the discharge, and the bottom vertical fitting is the suction.

4.7 Foot Valve/Suction Tubing Installation

The Foot Valve acts as a check valve to keep the pump primed in suction lift applications.



The foot valve is designed to be submersed in the solution tank or drum and must sit in a vertical position at the bottom. Position approximately 2 inches (50 mm) off the bottom if the tank or drum contains sediment.

Pump models equipped with high-viscosity liquid ends are not equipped with foot valves. Flooded suction is recommended. A 1/2" NPT connector is included for flooded suction installations.

The ceramic weight, when installed, positions the foot valve in a vertical position.

1. Attach the foot valve to one end of the suction tubing (see Tubing Connections, Section 4.3).
2. Slide the ceramic weight over the tubing end until it contacts the top of the foot valve coupling nut.
3. Place foot valve and tubing into the solution tank. Check that the foot valve is vertical and approximately 2 inches (50 mm) from the bottom of the tank or drum (see illustration). Connect the other end of the tubing to the suction side of the pump head (bottom side) (see Tubing Connections, Section 4.3).

Proper Foot Valve Position

4.8 Injection Check Valve and Discharge Tubing Installation

A. Installing Injection Check Valve (Figure 1)

1. The Injection Check Valve prevents backflow from a treated line. Install the injection check valve at the location where chemical is being injected into the system.
2. Any size Female NPT fitting or pipe tee with a reducing bushing to ½" Female NPT will accept the injection check valve. PTFE tape should only be used on threads that are connected with pipes.
3. When installing the Injection Check Valve, be sure to position it so that the valve enters the bottom of your pipe in a vertical position. Variations 40° left and right are acceptable.

B. Connecting Discharge Tubing

Note: ***Cut tubing to length needed for discharge line.***

1. Route tubing from the injection check valve to the metering pump, making sure it does not touch hot or sharp surfaces, or is bent so sharply that it kinks.
2. Reference 4.3 Tubing Connections.

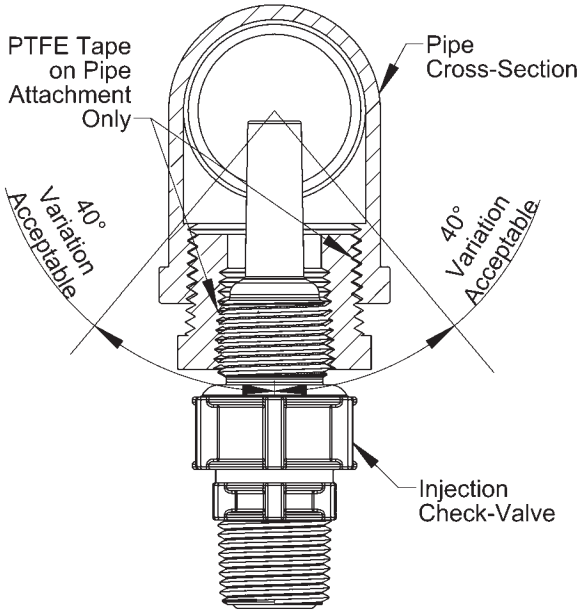


FIGURE 1

5.0 Liquid End Parts List

Reference Liquid End Sheets on LMI Online Library at: www.lmipumps.com.

1. Select “Online Literature Library” in the Navigation Bar on left.
2. Once on Online Literature Library use “Product” drop down to select “Liquid Handling Assemblies.”
3. Select “Gallery” or ”Index” to view Liquid End sheets.

6.0 Start-up and Adjustment

a.) The pump is normally self-priming if suction lift is 5 ft (1.5m) or less and the steps below are followed.

b.) Pumps are shipped from the factory with water in the pump head to aid in priming.

6.1 Output Adjustment Controls

Manual series pump controls are not equipped with pressure control.

1. Pressure Control Adjustment (if equipped): Pressure control provides the adjustment of the pump's pressure capability and power consumption, reducing heat, pipe shock and pulsation while increasing pump life. See Section 7.0 after priming for proper adjustment settings.
2. Speed Adjustment (Upper Knob) (if equipped): Speed control provides adjustment of the percent of maximum strokes per minute. Turning this knob clockwise increases stroke frequency (speed).
3. Stroke Adjustment (Lower Knob): Stroke control provides adjustment of the percent maximum of solution discharged during each pump actuation. Turning this knob clockwise ↻ increases solution displacement.

***A7 and P7 Only**: When operating the pump in external mode, the speed control knob should be turned fully counter-clockwise ↺.*

6.2 Start-Up/Priming for Pump Supplied with Multi-Function Valve

Read this entire section completely before proceeding.

When all precautionary steps have been taken, the pump is mounted, and the tubing is securely attached, you may now start priming the pump.

1. Plug in or switch the pump on.
2. While the pump is running, set the speed knob at 80% and the stroke knob at 100%.

If the pump is equipped with pressure control, turn fully clockwise. ↷

3. 1/4 turn open the relief side (black knob) of the multi-function valve.
4. The suction tubing should begin to fill with solution from the tank.
5. A small amount of solution will begin to discharge out the return line of the multi-function valve. Once this happens, 1/4 turn or release the knob and **SHUT THE PUMP OFF**. (If pump is not equipped with an on/off switch, disconnect the power cord.)
6. The pump is now primed.
7. Proceed to output adjustment, Section 6.4.

If the pump does not self-prime, remove the multi-function valve on the discharge side of the pump head. Remove the check valve and pour water or solution into the port until the head is filled. Replace valve, then follow start up/priming steps.

6.3 Start-Up/Priming without Multi-Function Valve

Read this entire section completely before proceeding.

When all precautionary steps have been taken, the pump is mounted, and the tubing is securely attached, you may now prime the pump.

1. Plug in or switch on the pump.
2. While the pump is running, set the speed knob at 80% and the stroke knob at 100%.

If the pump is equipped with pressure control, turn fully clockwise ↻.

3. The suction tubing should begin to fill with solution from the tank.
4. Once the solution begins to exit the pump head on the discharge side, **SHUT THE PUMP OFF**. (If pump is not equipped with an on/off switch, disconnect the power cord).
5. The pump is now primed.
6. Proceed to output adjustment, Section 6.4.

If the pump does not self-prime, remove the fitting on the discharge side of the pump head. Remove the ball and pour water or solution into the port until the head is filled. Replace valve, then follow start up/priming steps.

Start-Up/Priming for AutoPrime™ Heads

Read this entire section completely before proceeding.

When all precautionary steps have been taken, the pump is mounted, and the tubing is securely attached, you may prime the pump.

1. Plug in or switch on the pump.
2. While the pump is running, set the speed knob and the stroke knob at 100%.
3. The suction tubing should begin to fill with solution from the tank as the AutoPrime™ valve purges air from the pump head.
4. Once the solution begins to exit the pump head through both the discharge valve and the AutoPrime™ valve, **SHUT THE PUMP OFF**.
5. The pump is now primed.
6. Proceed to output adjustment, Section 6.4.

6.4 Output Adjustment

Once the pump has been primed, an appropriate output adjustment **MUST** be made. Pump output should be calculated and adjustments made accordingly.

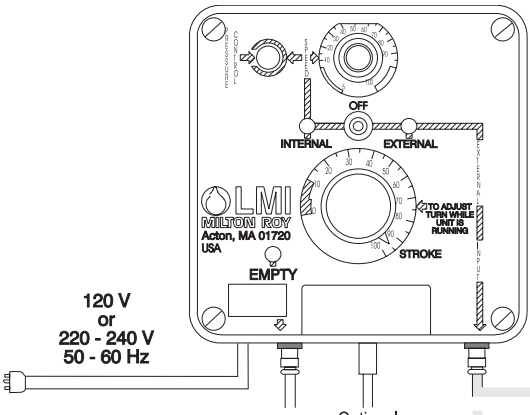
6.5 Total Pump Output

Calculate the total output of the pump as follows:

PUMP OUTPUT = MAX PUMP OUTPUT x % SPEED x % STROKE

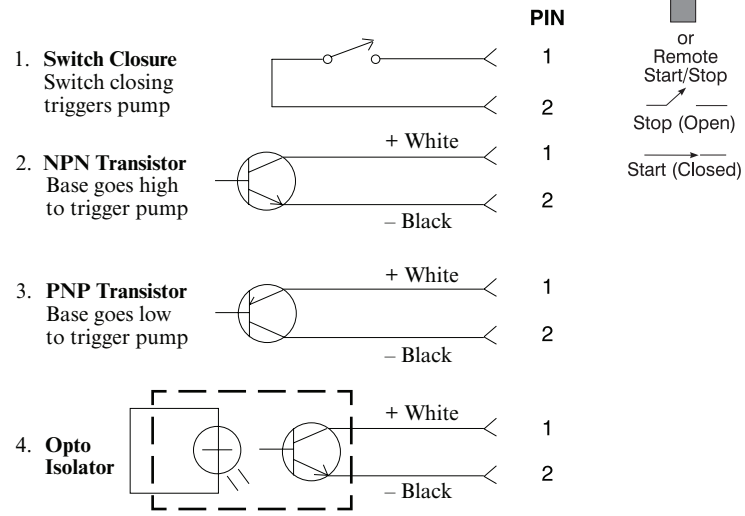
Example: P151-392SI

Use MAX Output (from dataplate on bottom center of pump control panel) = 24 GPD (24 gallons per day).



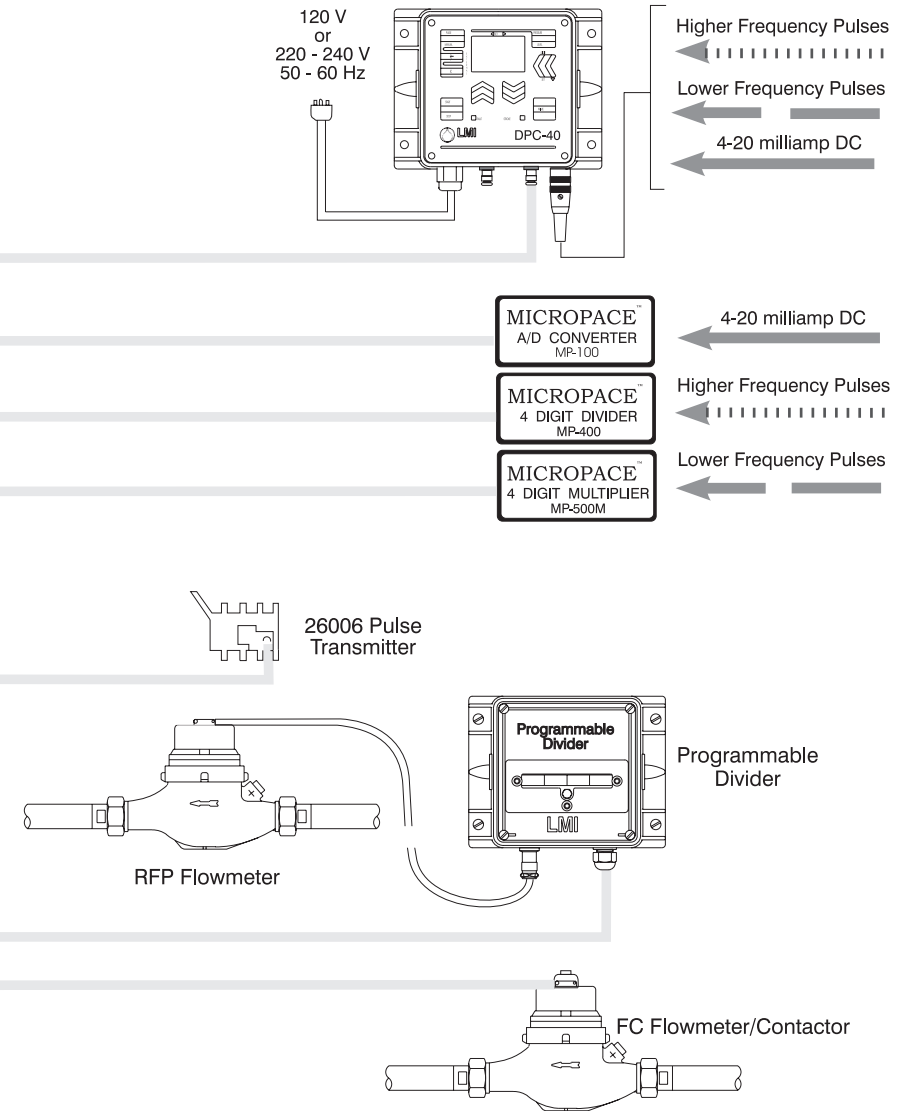
If the pump is set at 60% speed and 70% stroke length, the approximate pump output is:

24.0 x 0.60 x 0.70 = 10.08 GPD (gallons per day). Divide by 24 (hours in one day) to calculate in gallons per hour.



*If pump is not equipped with speed adjustment, calculate by **Max Pump Output x % Stroke** only.*

7.0 Methods of Externally Triggering



Method of Triggering LMI Pump Through 4-Pin Connector

Switch or transistors must be capable of switching 15V DC at 2 milliamperes. Minimum time in low impedance state (ON) is 50 milliseconds. Minimum time in high impedance state (OFF) is 100 milliseconds.

or Pacing B7, C7 and P7 Pumps

8.0 Calibration

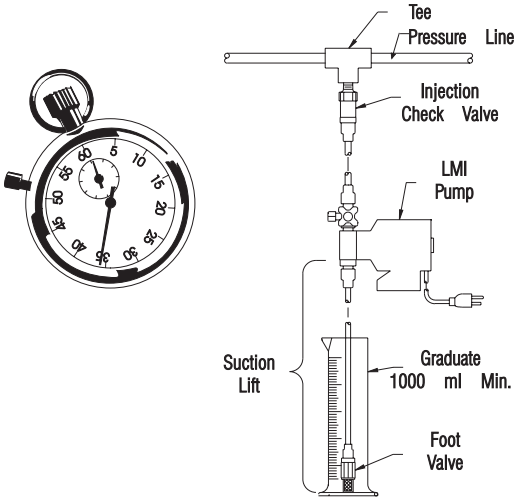
Once installation is complete and the approximate output has been determined, the pump should be calibrated to adjust speed and stroke for your actual desired output. (Calibration cylinders may be purchased from your local LMI distributor, ref. publication 1798.)

. **1**. Be sure the pump is primed, and discharge tubing and Injection Check Valve are installed as they would be in normal service (i.e., including factors such as injection pressure, fluid viscosity, and suction lift).

2. Place the Foot Valve in a graduated container with a volume of 1000 ml or more.

3. Plug in and switch pump to Internal Mode. Pump until all the air is exhausted from the suction line and head.

4. Turn the pump off. Refill graduated container to a level starting point.

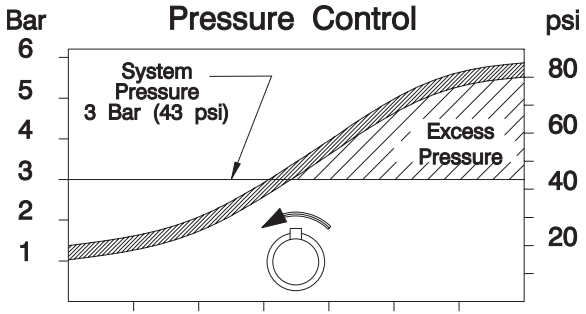


If pump is equipped with pressure control, see Section 8.1 before proceeding.

5. Using a stopwatch or timer, turn the pump on for a measured amount of time (50 pump strokes minimum). The longer the time period, the more confident you can be of the results. Be sure to count the number of strokes during the calibration period when making comparisons.

6. Turn the pump off. Note the time elapsed in relation to volume displaced in the graduate. Now, calculate the output in the time unit you choose (minutes, hours, days, etc.).

7. If the output is too low or too great, adjust speed and or stroke, estimating required correction and repeat steps 1-7.



8.1 Pressure Control

Adjust Pressure Control: While unit is running, turn Pressure Control Potentiometer slowly counter-clockwise ↶ until unit just begins to stall. From this stall point, now turn Pressure Control Potentiometer clockwise ↷ halfway between the stall point and maximum setting. This is the optimum pressure control setting for your application.

Increase setting if back pressure is increased. Adjusting pressure control decreases pressure rating of pump.

Adjust pressure control to reduce heat, shock, and pulsations; and to prolong pump life.

8.2 Calibration Procedure - On-Site Volumetric Calibration in External Mode

1. Since pump output is governed by an external device such as Flowmeter-Pulser, Liquitron™ Controller, or 4-20 mA DC signal from an instrument with an LMI Analog-to-Digital Converter, **only the output per stroke may be calibrated**.
2. With pump primed and discharge tubing connected to the injection point as it would be in normal service, place Foot Valve Assembly in a graduated container with a volume of 1000 ml or more.
3. Switch pump to **Internal** mode with Speed Knob set at 100 until air is exhausted from suction line and pump head.
4. **Adjust Pressure Control (if desired)** - See Section 8.1.
5. Switch pump **OFF** and note solution level in graduated container. Refill graduate to a starting point.
6. Switch pump **ON** and **count the number of strokes** for exactly one minute, then switch pump **OFF**.
7. Note volume pumped during the calibration period of one minute. Divide into this the number of strokes to determine the volume of solution pumped per stroke.

   Example: 500 ml in 100 strokes = 5.0 ml per stroke.

Multiply this by your expected stroke rate per minute, per hour or per day and compare with desired output requirements.

8. Adjust Stroke Length Knob (lower knob) to your best estimate of required correction and repeat calibration procedure.

9.0 Spare Parts Replacement Routine Maintenance

9.1 Depressurizing the Discharge Line (For Pumps Equipped with a 3-FV or a 4-FV only)

ALWAYS wear protective clothing, face shield, safety glasses and gloves when performing any maintenance or replacement on your pump.

Read steps 1 and 2 below before proceeding.

1. Be sure the Injection Check Valve is properly installed and is operating. If a shut off valve has been installed downstream of the Injection Valve, it should be closed.

Be sure your relief tubing is connected to your multi-function valve and runs back to your solution drum or tank.

2. 1/4 turn the black knob on the valve. The discharge line is now depressurized. Keep valve open until solution drains back down the discharge tubing into solution drum or tank. Then 1/4 turn knob to normal position.

9.2 Liquifram™ (Diaphragm) Replacement

ALWAYS wear protective clothing, face shield, safety glasses and gloves when working near or performing any maintenance or replacement on your pump. See MSDS information from solution supplier for additional precautions.

LMI metering pumps are designed for trouble-free operation, yet routine maintenance of elastomeric parts is essential for optimum performance. This involves replacing the Liquifram™, cartridge valves or seal rings/valve balls, multi-function valve cap assemblies and the injection check valve spring. LMI recommends replacing these parts at least once a year; however, frequency will depend on your particular application.

When replacing the Liquifram™ and the cartridge valves or seal rings/valve balls, the injection check valve spring should also be replaced (see next Section 9.3). A Spare Parts Kit (SP-#) or RPM Pro Pac™ kit containing these parts may be obtained from your local distributor.

Replacing the Liquifram™:

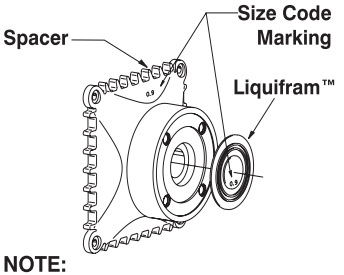
1. Carefully depressurize, drain, and disconnect the discharge line (see Section 8.1 in this manual). Place the Foot Valve into a container of water or other neutralizing solution. Turn the pump on to flush the head assembly. Once the pump head has been flushed, lift the Foot Valve out of the solution and continue to pump air into the pump head until the pump head is purged of water or neutralizing solution.

If the liquid cannot be pumped due to Liquifram™ rupture using protective clothing, gloves and face shield, carefully disconnect the suction and discharge tubing. Remove the four screws to the head and immerse the head in water or other neutralizing solution.

2. Start the pump. While running, set the stroke knob to zero and turn the pump off.

See Section 10.0 for proper zero

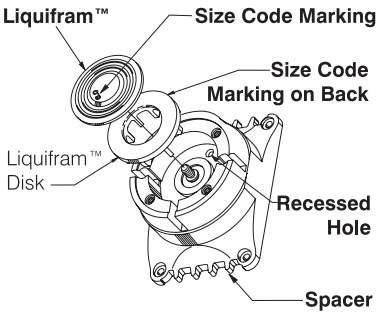
.



3. With the unit off, unscrew the Liquifram™ by carefully grasping the outer edge and turning it counter-clockwise ↶ . Discard old Liquifram™. Remove the Liquifram™ disk if so equipped (located behind the Liquifram™) and check that the size code matches the size code on the replacement Liquifram™ (see illustration).

4. Reinstall the disk so the alignment pin on the disk (if present) seats in the recessed hole in the EPU.

CAUTION

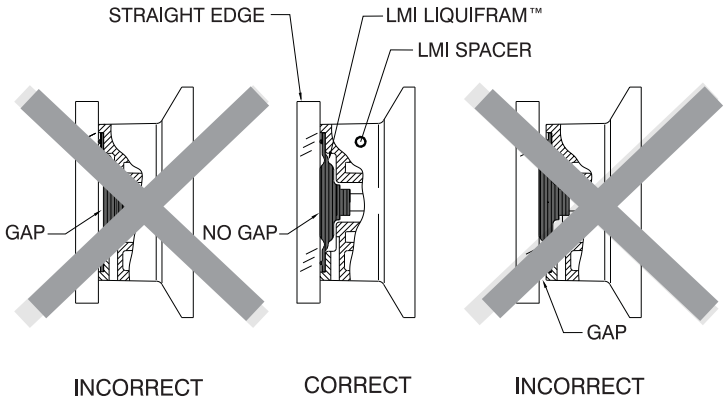


Be careful not to scratch the Teflon® face of the new Liquifram™.

For Series B, C, & E

NOTE:
Size code markings for pumps supplied with 6.0 Liquiframs™ (diaphragms) should be referenced to the 6.0 Black Adapter, not the 3.0 Spacer

For Series AA, J, & P



5. Start the pump and turn the stroke knob to the setting indicated on the following Stroke Setting Chart which matches the pump series number located on the pump dataplate. With the pump stroking (running), screw on the new Liquifram™ clockwise ↷ until the center begins to buckle inwards. Stop the pump.

Liquifram™ Stroke Setting Chart

Pump Series	Stroke Knob Setting
All AA, B, J, P Series C10, C11, C12, C70, C71, C72, C76, C90, C91, C92, E70, E71, E72	90%
C78	50%
C13, C14, C73, C74, C77, C93, C94, E73, E74	70%

* Liquifram™ on M Series pumps only, must be bottomed completely (turned all the way in). ***Do Not Use Straight Edge***.

6. Grasp the outer edge of the Liquifram™ and adjust by screwing it in or out so that the center of the Liquifram™ is flush with the outside of the spacer edge (see illustration below).

(Liquifram™ is flush with spacer and straight edge.)

7. Once the Liquifram™ is properly positioned, remount the pump head to the spacer using the four (4) screws. Tighten in a criss-cross pattern. After one week of operation, recheck the screws and tighten if necessary.

9.3 Cartridge Valves, Seal Rings/Valve Balls and Injection Check Valve Spring Replacement

ALWAYS wear protective clothing, face shield, safety glasses and gloves when working on or performing any maintenance or replacement on your pump. See MSDS information from solution supplier for additional precautions.

1. Refer to the LMI Metering Pump Price List for the proper Spare Parts Kit or RPM Pro Pac™ kit number or contact your local LMI stocking distributor.
2. Carefully depressurize and disconnect the discharge line (see Section 9.1 in this manual). Place the Foot Valve into a container of water or other neutralizing solution. Turn the pump on to flush the head assembly. Once the pump has been flushed, lift the Foot Valve out and continue to pump to let air into the pump head until pump is purged of water or neutralizing solution.

   Once the pump has been flushed, lift the Foot Valve out and continue to let air into the pump head until pump is purged of water or neutralizing solution.

   If the liquid cannot be pumped due to Liquifram™ rupture, with protective clothing, gloves and face shield, carefully disconnect the tubing and four screws to remove the head. Immerse the head in water or other neutralizing solution.

   Spare part replacement kits include specific instructions for valve replacement. Please follow the instructions included with the replacement kit.

***IMPORTANT**: Before disassembling the check valves, note the orientation of the valve.*

3. Carefully disconnect one tubing connection and fitting at a time, then remove and replace the worn valve.

   If necessary, carefully loosen stuck valves by prying side to side using a small screwdriver through the center hole of the valve.
4. Install new check valves in each location.

IMPORTANT: *Note correct orientation of each check valve.*

5. Install the new spring in the Injection Check Valve.

Depressurize and drain pipeline (or isolate I.C.V. point using valves) so that I.C.V. can safely be disassembled.

10.0 Checking Pump for Proper Zero Position (Stroke Knob)

1. With pump running, turn stroke knob counter-clockwise ↶ toward zero or end of black or red band on dial.

2. LISTEN to the clicking as the pump is running. The pump should operate quietly at the zero position (no clicking).

3. If the pump continues to click at zero or stops clicking before zero is reached, the pump zero must be reset (see Section 10.1 or 10.2).

10.1 Type I - Push on Knob Re-Zeroing and Stroke Knob Disassembly and Assembly

`

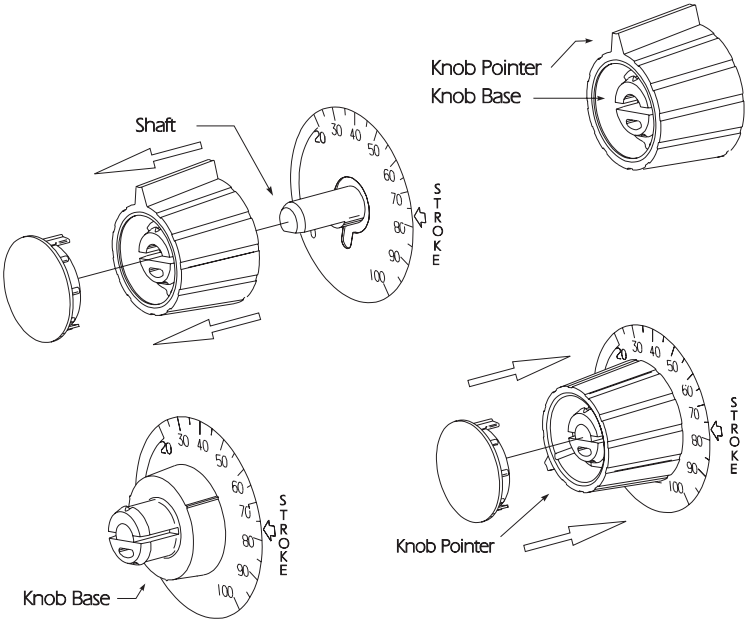
1. Remove stroke knob from the pump by grasping the knob firmly and pulling it toward you.

2. Pry off the yellow cap.

3. Place the knob on a flat surface.

4. Using needle-nose pliers, squeeze the inner section together while lifting the outer section up.

5. Push the inner section back onto the “D” shaped stroke shaft.



6. With the pump running, zero the pump by turning the inner section of the knob counter-clockwise ↶ until the pump stops clicking.

7. Position the outer section of the knob so that the pointer aligns with zero on the nameplate or end of the black or red band.

8. Push down on the outer section (a snap sound indicates parts are locked together).

9. Replace the yellow cap over the outer section of the knob, aligning the tabs on the cap with the slots inside the knob.

Stroke Knob Assembly (Type I)

11.0 Troubleshooting

PROBLEM	POSSIBLE CAUSE
Pump Will Not Prime	1. Pump not turned on or plugged in.
	2. Output dials not set properly.
	3. Foot Valve not in vertical position on bottom of tank.
	4. Pump suction lift too high.
	5. Suction tubing is curved or coiled in tank.
	6. Fittings are over tightened.
	7. Air trap in suction valve tubing.
	8. Too much pressure at discharge. (Pumps without multi-function valve.)
Pump Loses Prime	1. Solution container ran dry.
	2. Foot Valve is not in a vertical position on the bottom of the tank.
	3. Pump suction lift is too high.
	4. Suction tubing is curved or coiled in tank.
	5. Fittings are over tightened.
	6. Air trap in suction valve tubing.
	7. Air leak on suction side.

	SOLUTION
	1. Turn on pump/plug in pump.
	2. Always prime pump with speed at 80% and stroke at 100%.
	3. Foot Valve must be vertical (see Foot Valve Installation, Section 4.6).
	4. Maximum suction lift is 5 ft (1.5 m). Pumps with High Viscosity Liquid Handling Assemblies require flooded suction.
	5. Suction tubing must be vertical. Use LMI tubing straightener supplied with pump (see Section 4.6).
	6. Do not overtighten fittings. This causes seal rings to distort and not seat properly which causes pump to leak back or lose prime.
	7. Suction tubing should be as vertical as possible. AVOID FALSE FLOODED SUCTION! (see Section 4.2.1).
	8. Shut off valves in pressurized line. Disconnect tubing at injection check valve (see Priming Section 6.0). When pump is primed, reconnect discharge tubing.
	1. Refill container with solution and reprime (see Section 6.0).
	2. Foot Valve must be vertical (see Foot Valve Installation, Section 4.6).
	3. Maximum suction lift is 5 ft (1.5 m). Pumps with High Viscosity Liquid Handling Assemblies require flooded suction.
	4. Suction tubing must be vertical. Use LMI tubing straightener supplied with pump (see Section 4.6).
	5. DO NOT OVERTIGHTEN FITTINGS. This causes seal rings to distort and not seat properly which caused pump to leak back or lose prime.
	6. Suction tubing should be as vertical as possible. AVOID FALSE FLOODED SUCTION! (see Section 4.2.1).
	7. Check for pinholes, cracks. Replace if necessary.

Troubleshooting (continued)

PROBLEM	POSSIBLE CAUSE
Leakage at tubing	1. Worn tubing ends.
	2. Loose or cracked fitting.
	3. Worn seal rings.
	4. Solution attacking Liquid Handling Assembly material.
Low Output or Failure to Pump Against Pressure	1. Pump's maximum pressure rating is exceeded by injection pressure.
	2. Worn Seal Rings.
	3. Ruptured Liquifram™.
	4. Incorrect stroke length.
	5. Tubing run on discharge may be too long.
	6. Clogged Foot Valve strainer.
Failure to Run	1. Pump not turned on or plugged in.
	2. EPU failure.
	3. Pulser failure.
Excessive Pump Output	1. Syphoning. (Pumping downhill without a multi-function valve).
	2. Little or no pressure at injection point.
	3. Excessive strokes per minute.

	SOLUTION
	1. Cut about 1 in (25 mm) off tubing and then replace as before.
	2. Replace fitting if cracked. Carefully hand tighten fittings. *DO NOT USE PIPE WRENCH.* Once fitting comes into contact with seal ring, tighten an additional 1/8 or 1/4 turn.
	3. Replace balls and seal rings (see Section 8.3) Spare Parts (SP-#).
	4. Consult your local distributor for alternate materials.
	1. Injection pressure cannot exceed pump's maximum pressure. See pump data plate.
	2. Worn seal rings or cartridge valves may need replacement (see Section 9.3). Spare Parts (SP- #), or RPM Pro Pac™ kit.
	3. Replace Liquifram™ (see Section 9.2).
	4. Check zero on pump/Re-zero pump (see Section 10.0).
	5. Longer tubing runs may create frictional losses sufficient to reduce pump's pressure rating. Consult factory for more information.
	6. Remove Foot Valve strainer when pumping slurries or when solution particles cause strainer to clog.
	1. Turn on or plug in pump.
	2. Disassemble pump and measure the resistance of the EPU across the EPU wires. Resistance reading should be in accordance to the EPU Resistance Chart (see Section 12.0). Also, check EPU leads to ground. Consult supplier or factory.
	3. The pulser should be replaced if EPU checks out OK. Consult supplier or factory.
	1. Move injection point to a pressurized location or install an LMI 4-FV (see Section 4.4).
	2. If pressure at injection point is less than 25 psi (1.7 Bar), an LMI 4-FV should be installed (see Section 4.4).
	3. Replace pulser or resistor. Consult factory.

12.0 EPU Resistance Chart

Pump Series	Voltage	Coil Resistance (Ohms) @ 20° C (68° F)*
PW4, PW5, PW6 P04, P05, P06 P14, P15 P16 P74, P75, P76	115 VAC 230 VAC	76 - 87 307 - 353
(see Note 1) P02, P03 P12, P13	115 VAC 230 VAC	152 - 176 583 - 671
(see Note 2) AA14, AA74, AA94 AA15, AA75, AA95 AA16, AA76, AA96 AA17, AA77, AA97 P02, P03 P12, P13	115 VAC 230 VAC	76- 87 291- 335

SAFETY INSTRUCTIONS

TO AVOID SERIOUS OR FATAL PERSONAL INJURY OR MAJOR PROPERTY DAMAGE, READ AND FOLLOW ALL SAFETY INSTRUCTIONS IN MANUAL AND ON PUMP.

THIS MANUAL IS INTENDED TO ASSIST IN THE INSTALLATION AND OPERATION OF THIS UNIT AND MUST BE KEPT WITH THE PUMP.

This is a **SAFETY ALERT SYMBOL.** When you see this symbol on the pump or in the manual, look for one of the following signal words and be alert to the potential for personal injury or property damage.

⚠ DANGER Warns of hazards that **WILL** cause serious personal injury, death or major property damage.

⚠ WARNING Warns of hazards that **CAN** cause serious personal injury, death or major property damage.

⚠ CAUTION Warns of hazards that **CAN** cause personal injury or property damage.

NOTICE: INDICATES SPECIAL INSTRUCTIONS WHICH ARE VERY IMPORTANT AND MUST BE FOLLOWED.

THOROUGHLY REVIEW ALL INSTRUCTIONS AND WARNINGS PRIOR TO PERFORMING ANY WORK ON THIS PUMP.

MAINTAIN ALL SAFETY DECALS.

⚠ WARNING All electrical work must be performed by a qualified technician. Always follow the National Electrical Code (NEC), or the Canadian Electrical Code, as well as all local, state and provincial codes. Code questions should be directed to your local electrical inspector. Failure to follow electrical codes and OSHA safety standards may result in personal injury or equipment damage. Failure to follow manufacturer's installation instructions may result in electrical shock, fire hazard, personal injury or death, damaged equipment, provide unsatisfactory performance, and may void manufacturer's warranty.

⚠ WARNING Standard units are not designed for use in swimming pools, open bodies of water, hazardous liquids, or where flammable gases exist. These fluids and gases may be present in containment areas. Tank or wetwell must be vented per local codes.

Only pumps specifically Listed for Class 1, Division 1 are allowable in hazardous liquids and where flammable gases may exist. *See specific pump catalog bulletins or pump nameplate for all agency Listings*.

⚠ WARNING Disconnect and lockout electrical power before installing or servicing any electrical equipment. Many pumps are equipped with automatic thermal overload protection which may allow an overheated pump to restart unexpectedly.

⚠ CAUTION All three phase (3Ø) control panels for submersible pumps must provide Class 10, quick-trip, overload protection.

PRE-INSTALLATION CHECKS

Open all cartons and inspect for shipping damage. Report any damage to your supplier or shipping carrier immediately.

Important: Always verify that the pump nameplate Amps, Voltage, Phase and HP ratings match your control panel and power supply.

Many of our sewage pumps are oil-filled. If there are any signs of oil leakage or if the unit has been stored for an extended period check the oil level in the motor dome and the seal housing, if so equipped.

Check the motor cover oil level through the pipe plug on top of the unit. The motor chamber oil should just cover the motor. Do not overfill, leave room for expansion!

To check the seal housing oil level, where used, lay the unit on its side with the fill plug at 12 o'clock. Remove the plug. The oil should be within ½" (13mm) of the top. If low, refill with an ASTM 150 turbine oil. Replace the plug.

Oil is available in 5 gallon cans through our distributors. You can also source oil locally at motor repair shops. Typical oil brands are: Shell Turbo 32, Sunoco Sunvis 932, Texaco Regal R&O 32, Exxon Nuto 32 and Mobil DTE Light.

Check the strain relief nut on power cable strain assemblies. Power cables should be torqued to 75 in. lbs. for #16 cables and 80 in. lbs. for all other cable assemblies. Seal/heat sensor cables, where used, should be torqued to 75 in. lbs.

Warranty does not cover damage caused by connecting pumps and controls to an incorrect power source (voltage/phase supply).

Record the model numbers and serial numbers from the pumps and control panel on the front of this instruction manual for future reference. Give it to the owner or affix it to the control panel when finished with the installation.

LIFTING OF PUMP

⚠WARNING

Hazardous voltage can shock, burn or cause death.

DO NOT LIFT, CARRY OR HANG PUMP BY THE ELECTRICAL CABLES. DAMAGE TO THE ELECTRICAL CABLES CAN CAUSE SHOCK, BURNS OR DEATH.

Lift the pump with an adequately sized chain or cable attached to the lifting eye bolt. **DO NOT** damage electrical and sensor cables while raising and lowering unit.

OPTIONAL GUIDE RAIL OR LIFT-OUT SYSTEM

In many effluent and sewage basins or lift stations it is advisable to install the pump on a guide rail system or on a lift-out adapter to facilitate installation and removal for inspection and/or service. Most codes do not allow personnel to enter a wetwell without the correct protective equipment and training. Guide rails are designed to allow easy removal of the pump without the need for entry into the wetwell or need to disturb piping. The guide rail or lift-out adapter should locate the pump opposite the influent

opening preventing stagnate areas where solids can settle. The basin or pit must be capable of supporting the weight of the pump and guide rail. The pit floor must be flat.

NOTICE: FOLLOW THE INSTRUCTIONS THAT ARE PROVIDED WITH THE GUIDE RAIL ASSEMBLY.

PIPING

Discharge piping should be no smaller than the pump discharge diameter and kept as short as possible, avoiding unnecessary fittings to minimize friction losses.

Install an adequately sized check valve matched to the solids handling capability of the pump to prevent fluid backflow. Backflow can allow the pump to "turbine" backwards and may cause premature seal and/or bearing wear. If the pump is turning backwards when it is called on to start the increased torque may cause damage to the pump motor and/or motor shaft and some single-phase pumps may actually run backwards.

Install an adequately sized gate valve **AFTER** the check valve for pump, plumbing and check valve maintenance.

Important – Before pump installation. Drill a $\frac{3}{16}$" (4.8mm) relief hole in the discharge pipe. It should be located within the wetwell, 2" (51mm) above the pump discharge but below the check valve. The relief hole allows any air to escape from the casing. Allowing liquid into the casing will insure that the pump can start when the liquid level rises. Unless a relief hole is provided, a bottom intake pump could "air lock" and will not pump water even though the impeller turns.

All piping must be adequately supported, so as not to impart any piping strain or loads on the pump.

The pit access cover must be of sufficient size to allow for inspection, maintenance and crane or hoist service.

WIRING AND GROUNDING

Important notice: Read Safety Instructions before proceeding with any wiring.

⚠ Use only stranded copper wire to pump/motor and ground. The ground wire must be at least as large as the power supply wires. Wires should be color coded for ease of maintenance and troubleshooting.

⚠ Install wire and ground according to the National Electrical Code (NEC), or the Canadian Electrical Code, as well as all local, state and provincial codes.

⚠ Install an all leg disconnect switch where required by code.

⚠ Disconnect and lockout electrical power before performing any service or installation.

⚠ The electrical supply voltage and phase must match all equipment requirements. Incorrect voltage or phase can cause fire, motor and control damage, and voids the warranty.

⚠ All splices must be waterproof. If using splice kits follow manufacturer's instructions.

⚠ WARNING Select the correct type and NEMA grade junction box for the application and location. The junction box must insure dry, safe wiring connections.

⚠ WARNING Seal all controls from gases present which may damage electrical components.

⚠WARNING Hazardous voltage

FAILURE TO PERMANENTLY GROUND THE PUMP, MOTOR AND CONTROLS BEFORE CONNECTING TO POWER CAN CAUSE SHOCK, BURNS OR DEATH.

SELECTING AND WIRING PUMP CONTROL PANELS AND SWITCHES

FLOAT SWITCH TYPES

There are two basic float switch designs; single-action and wide-angle. Single-action switches operate over a range of 15° so they open and close quickly. Wide-angle floats operate over a 90° swing with the tether length between the float body and the pivot point controlling the On-Off range. The design determines how many floats are required with different systems or controls.

Floats may be normally open (NO) for pump down applications or to empty a tank. Normally closed (NC) switches are used to pump up or to fill a tank.

A single-action control switch may be used only with a control panel, never direct connected to a pump.

The wide-angle, pump down switches may be used as direct connected pump switches or as control switches.

SETTING THE FLOAT SWITCHES

There are no absolute rules for where to set the float switches, it varies from job to job.

Suggested Rules to Follow:
All floats should be set below the Inlet pipe!

Off Float: Best: set so the water level is always above the top of the pump (motor dome). **Next Best:** set so the water level is not more than 6" below the top of the pump.

On Float: set so the volume of water between the On and Off floats allows pumps of 1½ HP and under to operate for 1 minute minimum. Two (2) HP and larger pumps should run a minimum of 2 minutes. Basin literature states the gallons of storage per inch of basin height.

Lag/Alarm Float(s): should be staggered above the Off and On floats. Try to use most of the available storage provided by the basin, save some space for reserve storage capacity. *See Diagrams and Charts in Float Switch Chart Section.*

PANEL WIRING DIAGRAMS

Our control panels are shipped with instructions and wiring diagrams. Use those instructions in conjunction with this IOM. Electrical installation should be performed only by qualified technicians. Any problem or questions pertaining to another brand control must be referred to that control supplier or manufacturer. Our technical people have no technical schematics or trouble shooting information for other companies' controls.

ALARMS

We recommend the installation of an alarm on all Wastewater pump installations. Many standard control panels come equipped with alarm circuits. If a control panel is not used, a stand alone high liquid level alarm is available. The alarm alerts the owner of a high liquid level in the system so they can contact the appropriate service personnel to investigate the situation.

SINGLE PHASE PUMPS
Single phase (1Ø) pumps may be operated using a piggyback or hard wired float switch, a contactor, or a Simplex or Duplex control panel. *See Figures 1, 2 and 5*.

All 1/3 and ½ HP, 115 or 230 volt pumps, and some ¾ and 1 HP pumps, are supplied with plug style power cords. They may be plugged into piggyback float switches for simple installations. It is allowable to remove the plugs in order to hardwire or connect to a Simplex or Duplex controller. Removing the plug neither voids the warranty nor violates the agency Listings. *See Figure 5*.

PLUG-CONNECTED UNITS MUST BE CONNECTED TO A PROPERLY GROUNDED, GROUNDING TYPE RECEPTACLE.

ON NON-PLUG UNITS, DO NOT REMOVE CORD AND STRAIN RELIEF. DO NOT CONNECT CONDUIT TO PUMP.

Pumps with bare lead power cords can be hard-wired to a float switch, wired to a 1Ø contactor, a Simplex controller or a Duplex controller. Always verify that the float switch is rated for the maximum run amperage, maximum starting amperage, and the HP rating on the pump. Single-phase wastewater pumps contain on-winding overloads, unless noted on the pump nameplate. *See Figures 1 and 2*.

THREE PHASE PUMPS:
As a Minimum a 3Ø pump requires a 3 pole circuit breaker/fused circuit, an across the line magnetic starter rated for the pump HP, and ambient compensated Quick Trip Class 10 overloads.

SINGLE AND THREE PHASE CONTROL PANELS:
Control panels are available as Simplex (controls 1 pump) or Duplex (controls 2 pumps). Our standard SES Series Panels are available with many standard features and can be built with our most popular options. We also custom build panels which offer many more design options than the SES panels. Custom control panels are available in many different configurations. Custom panel quote requests may be forwarded to Customer Service through any authorized distributor.

Our "SES" Duplex panels feature a solid-state printed circuit board design with standard high level alarm circuits. Other standard features are: an auxiliary dry alarm contact for signaling a remote alarm and float switch position indicator lights. Our 3Ø panels have built-in, adjustable, Class 10 overloads. The adjustable overloads on all our 3Ø panels mean less labor for the installer and no need to order specific overloads. Most SES panels are in stock for immediate delivery.

On pumps equipped with seal fail and/or heat (high temperature) sensors it is recommended that you use our control panel with the appropriate options. The pump sensors do not function without a seal fail relay or terminal connection in the control panel and a warning device such as a bell, horn or light.

Seal Failure Circuit - Some dual seal pumps are equipped with a standard, built-in seal failure circuit, which may also be called a moisture detection circuit. This circuit must be connected to a control panel with an optional seal fail relay. The panel must be special ordered with the seal fail relay and alarm. There are also stand alone seal fail panels such as the A4-3 or A4-4 available as standard items. The pumps can be identified by an extra control cable exiting the motor cover. The cable contains two wires, a black wire, connects to panel "terminal" going to "probe"; and a white wire, connects to the panel "terminal" going to the relay ground. Do not connect to the panel ground screw. Follow the wiring instructions supplied with the panel.

Heat Sensor and Seal Failure Circuit - Some pumps are equipped with a seal fail and normally closed, on-winding high temperature thermostats (heat sensors). The pumps have a control cable with four (4) leads, black (probe) and green (relay ground) for the seal fail circuit and red and white for the high temperature circuit. Connect the high temperature (heat sensor) circuit to the panel terminal strip as indicated on the panel drawing using the red and white wires. The high temperature panel circuit is also an optional item which you must specifically order when you order your control panel. The high temperature circuit is different from the Class 10 overloads which are always required on three phase pumps. *Follow the wiring instructions supplied with the panel*.

INSTALLATION

Connect the pump(s) to the guide rail pump adapters or to the discharge piping. Slide rail bases should be anchored to the wetwell floor.

Complete all wiring per the control panel wiring diagrams and NEC, Canadian, state, provincial and/or local codes. This a good time to check for proper rotation of the motors/impellers.

DO NOT PLACE HANDS IN PUMP SUCTION WHILE CHECKING MOTOR ROTATION. TO DO SO WILL CAUSE SEVERE PERSONAL INJURY.

Always verify correct rotation. Correct rotation is indicated on the pump casing. Three phase motors are reversible. It is allowable to bump or jog the motor for a few seconds to check impeller rotation. It is easier to check rotation before installing the pump. Switch any two power leads to reverse rotation.

Lower the pump(s) into the wetwell.

Check to insure that the floats will operate freely and not contact the piping.

OPERATION

Once the piping connections are made and checked you can run the pumps.

Piggyback Switch Operation – Plug the piggyback switch into a dedicated grounded outlet and then plug the pump into the switch. Test the pump by filling the wetwell until the pump goes On. If the pumps run but fail to pump, they are probably air locked, drill the relief holes per the instructions in the Piping Section.

Check the operating range to insure a minimum one minute run time and that the pump goes Off in the correct position.

Control Panel Operation – Fill the wetwell with clear water.

Use the pump H-O-A (Hand-Off-Automatic) switches in Hand to test the pumps. If they operate well in Hand proceed to test Automatic operation. If the pumps run but fail to pump, they are probably air locked, drill the relief holes per the instructions in the Piping Section.

Place Control Panel switch(es) in Automatic position and thoroughly test the operation of the ON, OFF, and Alarm floats by filling the wetwell with clear water. **Important:** Failure to provide a Neutral from the power supply to a 1Ø, 230 volt Control Panel will not allow the panel control circuit to operate. The Neutral is necessary to complete the 115 volt control circuit.

Check voltage and amperage and record the data on the front of this manual for future reference. Compare the amperage readings to the pump nameplate maximum amperage. If higher than nameplate amperage investigate cause. Operating the pump off the curve, i.e. with too little head or with high or low voltage will increase amperage. The motor will operate properly with voltage not more than 10% above or below pump nameplate ratings. Performance within this range will not necessarily be the same as the published performance at the exact rated nameplate frequency and voltage. Correct the problem before proceeding. Three phase unbalance is also a possible cause. *See Three Phase Power Unbalance and follow the instructions*.

Reset the Alarm circuit, place pump switch(es) in the Automatic position and Control Switch in ON position. The system is now ready for automatic operation.

Explain the operation of the pumps, controls and alarms to the end user. Leave the paperwork with the owner or at the control panel if in a dry, secure location.

FLOAT SWITCH AND PANEL CHART

The purpose of this chart is to show the required switch quantities and the function of each switch in a typical wastewater system. The quantities required vary depending on the switch type, single-action or wide-angle. Switch quantities also vary by panel type: simplex with and without alarms, and duplex with alarms.

Duplex Panels using single-action switches:

Three Float Panel Wiring

SW1	Bottom	Pumps Off
SW2	Middle	1st Pump On
SW3	Top	2nd Pump & Alarm On

Four Float Panel Wiring ②

SW1	Bottom	Pumps Off
SW2	2nd	1st Pump On
SW3	3rd	2nd Pump On
SW4	Top	Alarm On

Duplex Panels using wide-angle switches:

Three Float Panel Wiring

SW1	Bottom	1st Pump On/Both Off
SW2	Top	2nd Pump & Alarm On

Four Float Panel Wiring

SW1	Bottom	1st Pump On/Both Off
SW2	Middle	2nd Pump On
SW3	Top	Alarm On

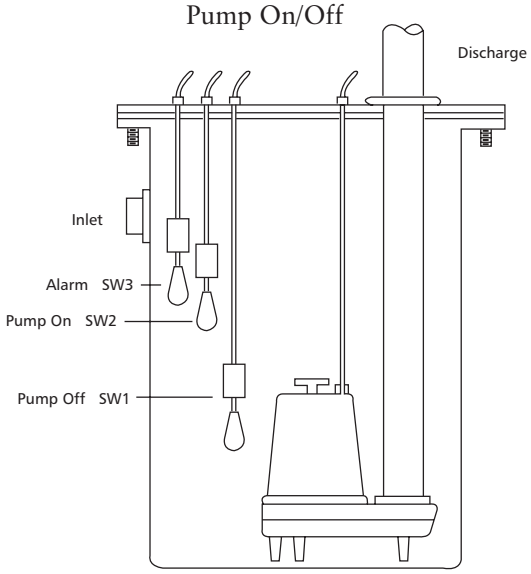
Simplex Panel using single-action switches:

Simplex Panel with Alarm ①

SW1	Bottom	Pump Off
SW2	Middle	Pump On
	SW3	Top Alarm On/Off

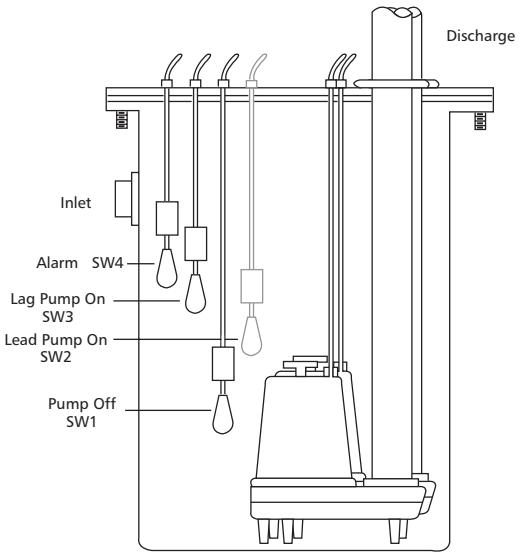
Simplex Panel with No Alarm

SW1	Bottom	Pump Off
SW2	Top	Pump On



Simplex Panel using wide-angle switches:

Simplex Panel with Alarm



SW1	Bottom	Pump On/Off
SW2	Top	Alarm On/Off

Simplex Panel with No Alarm

SW1	Pump On/Off

Simplex ①

Duplex ②

THREE PHASE POWER UNBALANCE

A full three phase supply consisting of three individual transformers or one three phase transformer is recommended. "Open" delta or wye connections using only two transformers can be used, but are more likely to cause poor performance, overload tripping or early motor failure due to current unbalance.

Check the current in each of the three motor leads and calculate the current unbalance as explained below.

If the current unbalance is 2% or less, leave the leads as connected.

If the current unbalance is more than 2%, current readings should be checked on each leg using each of the three possible hook-ups. Roll the motor leads across the starter in the same direction to prevent motor reversal.

To calculate percent of current unbalance:

A. Add the three line amp values together.

B. Divide the sum by three, yielding average current.

C. Pick the amp value which is furthest from the average current (either high or low).

D. Determine the difference between this amp value (furthest from average) and the average.

E. Divide the difference by the average. Multiply the result by 100 to determine percent of unbalance.

Current unbalance should not exceed 5% at service factor load or 10% at rated input load. If the unbalance cannot be corrected by rolling leads, the source of the unbalance must be located and corrected. If, on the three possible hookups, the leg farthest from the average stays on the same power lead, most of the unbalance is coming from the power source.

Contact your local power company to resolve the imbalance.

	Hookup 1			Hookup 2			Hookup 3		
Starter Terminals	L1	L2	L3	L1	L2	L3	L1	L2	L3
Motor Leads	R	B	W	W	R	B	B	W	R
	T3	T1	T2	T2	T3	T1	T1	T2	T3

Example:

T3-R = 51 amps	T2-W = 50 amps	T1-B = 50 amps
T1-B = 46 amps	T3-R = 48 amps	T2-W = 49 amps
T2-W = 53 amps	T1-B = 52 amps	T3-R = 51 amps
Total = 150 amps	Total = 150 amps	Total = 150 amps
÷ 3 = 50 amps	÷ 3 = 50 amps	÷ 3 = 50 amps
– 46 = 4 amps	– 48 = 2 amps	– 49 = 1 amps
4 ÷ 50 = .08 or 8%	2 ÷ 50 = .04 or 4%	1 ÷ 50 = .02 or 2%

INSULATION RESISTANCE READINGS

Normal Ohm and Megohm Values between all leads and ground

Condition of Motor and Leads	Ohm Value	Megohm Value
A new motor (without drop cable).	20,000,000 (or more)	20 (or more)
A used motor which can be reinstalled in well.	10,000,000 (or more)	10 (or more)
Motor in well. Readings are for drop cable plus motor.		
New motor.	2,000,000 (or more)	2 (or more)
Motor in good condition.	500,000 - 2,000,000	.5 - 2
Insulation damage, locate and repair.	Less than 500,000	Less than .5

Insulation resistance varies very little with rating. Motors of all HP, voltage and phase ratings have similar values of insulation resistance.

Insulation resistance values above are based on readings taken with a megohmmeter with a 500V DC output. Readings may vary using a lower voltage ohmmeter, consult factory if readings are in question.

Engineering data for specific models may be found in your catalog and on our website (address is on the cover).

Control panel wiring diagrams are shipped with the control panels. Please use the control panel drawings in conjunction with this instruction manual to complete the wiring.

PUMP OPERATION			
Minimum Submergence		**Maximum Fluid Temperature**	
Continuous Duty	Fully Submerged	Continuous Operation	104º F 40º C
Intermittent Duty	6" Below Top of Motor	Intermittent Operation	140º F 60º C

⚠WARNING
Hazardous voltage

FAILURE TO DISCONNECT AND LOCKOUT ELECTRICAL POWER BEFORE ATTEMPTING ANY SERVICE CAN CAUSE SHOCK, BURNS OR DEATH.

SYMPTOM	PROBABLE CAUSE	RECOMMENDED ACTION
MOTOR NOT RUNNING	Motor thermal protector tripped.	Allow motor to cool. Insure minimum pump submergence. Clear debris from casing and impeller.
NOTE: If circuit breaker "OPENS" repeatedly, **DO NOT** reset. Call qualified electrician.	Open circuit breaker or blown fuse.	Determine cause, call a qualified electrician.
	Pump impeller binding or jammed.	Check motor amp draw. If two or more times higher than listed on pump nameplate, impeller is locked, motor bearings or shaft is damaged. Clear debris from casing and impeller, consult with dealer.
a) Manual operation	Power cable is damaged.	
	Inadequate electrical connection in control panel.	
b) Automatic operation	No neutral wire connected to control panel.	Resistance between power leads and ground should read infinity. If any reading is incorrect, call a qualified electrician.
	Inadequate electrical connection in control panel.	Inspect control panel wiring. Call a qualified electrician.
NOTE: Check the pump in manual mode first to confirm operation. If pump operates, the automatic control or wiring is at fault. If pump does not operate, see above.	Defective liquid level switch.	With switch disconnected, check continuity while activating liquid level switch. Replace switch, as required.
	Insufficient liquid level to activate controls.	Allow liquid level to rise 3" to 4" (76 mm - 101 mm) above turn-on level.
	Liquid level cords tangled.	Untangle cords and insure free operation.
PUMP WILL NOT TURN OFF	Liquid level cords tangled.	Untangle cords and insure free operation.
	Pump is air locked.	Shut off pump for approximately one minute, then restart. Repeat until air lock clears. If air locking persists in a system with a check valve, a $\frac{3}{16}$" (4.8 mm) hole may be drilled in the discharge pipe approximately 2" (51 mm) above the discharge connection.
	Influent flow is matching pump's discharge capacity.	Larger pump may be required.
LITTLE OR NO LIQUID DELIVERED BY PUMP	Check valve installed backwards, plugged or stuck closed.	Check flow arrow on valve and check valve operation.
	Excessive system head.	Consult with dealer.
	Pump inlet plugged.	Inspect and clear as required.
	Improper voltage or wired incorrectly.	Check pump rotation, voltage and wiring. Consult with qualified electrician.
	Pump is air locked.	See recommended action, above.
	Impeller is worn or damaged.	Inspect impeller, replace as required.
	Liquid level controls defective or improperly positioned.	Inspect, readjust or replace as required.
PUMP CYCLES CONSTANTLY	Discharge check valve inoperative.	Inspect, repair or replace as required.
	Sewage containment area too small.	Consult with dealer.
	Liquid level controls defective or improperly positioned.	Inspect, readjust or replace as required.
	Influent excessive for this size pump.	Consult with dealer.

Typical Effluent, Sewage and
Dewatering Pump Installations

GOULDS PUMPS LIMITED WARRANTY

This warranty applies to all water systems pumps manufactured by Goulds Pumps.

Any part or parts found to be defective within the warranty period shall be replaced at no charge to the dealer during the warranty period. The warranty period shall exist for a period of twelve (12) months from date of installation or eighteen (18) months from date of manufacture, whichever period is shorter.

A dealer who believes that a warranty claim exists must contact the authorized Goulds Pumps distributor from whom the pump was purchased and furnish complete details regarding the claim. The distributor is authorized to adjust any warranty claims utilizing the Goulds Pumps Customer Service Department.

The warranty excludes:

(a) Labor, transportation and related costs incurred by the dealer;
(b) Reinstallation costs of repaired equipment;
(c) Reinstallation costs of replacement equipment;
(d) Consequential damages of any kind; and,
(e) Reimbursement for loss caused by interruption of service.

For purposes of this warranty, the following terms have these definitions:

(1) "Distributor" means any individual, partnership, corporation, association, or other legal relationship that stands between Goulds Pumps and the dealer in purchases, consignments or contracts for sale of the subject pumps.
(2) "Dealer" means any individual, partnership, corporation, association, or other legal relationship which engages in the business of selling or leasing pumps to customers.
(3) "Customer" means any entity who buys or leases the subject pumps from a dealer. The "customer" may mean an individual, partnership, corporation, limited liability company, association or other legal entity which may engage in any type of business.

THIS WARRANTY EXTENDS TO THE DEALER ONLY.

INSTRUCCIONES DE SEGURIDAD

PARA EVITAR LESIONES PERSONALES GRAVES O AÚN FATALES Y SERIOS DAÑOS MATERIALES, LEA Y SIGA TODAS LAS INSTRUCCIONES DE SEGURIDAD EN EL MANUAL Y EN LA BOMBA.

ESTE MANUAL HA SIDO CREADO COMO UNA GUÍA PARA LA INSTALACIÓN Y OPERACIÓN DE ESTA UNIDAD Y SE DEBE CONSERVAR JUNTO A LA BOMBA.

Éste es un **SÍMBOLO DE ALERTA DE SEGURIDAD**. Cuando vea este símbolo en la bomba o en el manual, busque una de las siguientes palabras de señal y esté alerta a la probabilidad de lesiones personales o daños materiales.

⚠ PELIGRO Advierte los peligros que **CAUSARÁN** graves lesiones personales, la muerte o daños materiales mayores.

⚠ ADVERTENCIA Advierte los peligros que **PUEDEN** causar graves lesiones personales, la muerte o daños materiales mayores.

⚠ PRECAUCIÓN Advierte los peligros que **PUEDEN** causar lesiones personales o daños materiales.

AVISO: INDICA INSTRUCCIONES ESPECIALES QUE SON MUY IMPORTANTES Y QUE SE DEBEN SEGUIR.

EXAMINE BIEN TODAS LAS INSTRUCCIONES Y ADVERTENCIAS ANTES DE REALIZAR CUALQUIER TRABAJO EN ESTA BOMBA.

MANTENGA TODAS LAS CALCOMANÍAS DE SEGURIDAD.

⚠ ADVERTENCIA Todo el trabajo eléctrico debe ser realizado por un técnico calificado. Siempre siga el Código Eléctrico de EE.UU. (NEC) o el Código Eléctrico Canadiense, además de todos los códigos locales, estatales y provinciales. Las preguntas acerca del código deben ser dirigidas al inspector eléctrico local. Si se hace caso omiso a los códigos eléctricos y normas de seguridad de OSHA, se pueden producir lesiones personales o daños al equipo. Si se hace caso omiso a las instrucciones de instalación del fabricante, se puede producir electrochoque, peligro de incendio, lesiones personales o aún la muerte, daños al equipo, rendimiento insatisfactorio y podría anularse la garantía del fabricante.

⚠ ADVERTENCIA Las unidades estándar no están diseñadas para usarse en albercas, masas abiertas de agua, líquidos peligrosos o donde existan gases inflamables. Estos fluidos y gases podrían estar presentes en áreas de contención. El tanque o pozo debe ser ventilado de acuerdo con los códigos locales.

En lugares con líquidos inflamables o donde pudiese haber gases inflamables sólo deben usarse bombas específicamente clasificadas para áreas de Clase 1, División 1. *Consulte los boletines de catálogos de bombas específicas o la placa de identificación de la bomba con respecto a las listas de agencias.*

⚠ ADVERTENCIA Desconecte y bloquee la corriente eléctrica antes de instalar o dar servicio a cualquier equipo eléctrico. Muchas bombas están equipadas con protección automática contra la sobrecarga térmica, la cual podría permitir que una bomba demasiado caliente rearranque inesperadamente.

⚠ PRECAUCIÓN Todos los paneles de control trifásicos (3Ø) para bombas sumergibles deben incluir protección contra sobrecarga de Clase 10, de disparo rápido.

VERIFICACIONES PRELIMINARES A LA INSTALACIÓN

Abra todas las cajas e inspeccione el equipo para determinar si se ocasionaron daños durante el envío. Notifique cualquier daño a su proveedor o a la compañía de transporte de inmediato.

Importante: Siempre verifique que las clasificaciones de corriente, tensión, fase y potencia en la placa de identificación de la bomba correspondan con las del panel de control y fuente de alimentación.

Muchas de nuestras bombas para alcantarillado están llenas con aceite. Si hay alguna señal de fuga de aceite o si la unidad estuvo almacenada durante largo tiempo, verifique el nivel de aceite en la cúpula del motor y la caja del sello, en caso de haberla.

Verifique el nivel de aceite de la cubierta del motor a través del tapón de la tubería en el extremo superior de la unidad. El aceite en la cámara del motor debe cubrir apenas el motor. ¡No llene en exceso, deje espacio para expansión!

Para verificar el nivel de aceite de la caja del sello, en caso que se use, coloque la unidad de lado con el tapón de llenado en la posición de las 12:00 horas. Retire el tapón. El aceite debe estar a menos de ½ pulg. (13 mm) del borde superior. Si el nivel está bajo, agregue aceite para turbinas ASTM 150. Reinstale el tapón.

Puede obtenerse aceite en latas de 5 galones de nuestros distribuidores. También puede obtener aceite a nivel local en talleres de reparación de motores. Las marcas típicas de aceite son: Shell Turbo 32, Sunoco Sunvis 932, Texaco Regal R&O 32, Exxon Nuto 32 y Mobil DTE Light.

Inspeccione la tuerca de alivio de tensión en los conjuntos de protección contra tirones de los cables de alimentación. Torsión de los cables de alimentación: 75 pulg.-lbs. para cables #16 y 80 pulg.-lbs. para todos los otros tipos de cable. La torsión de los cables de sensores de sello/calor, cuando se usen, debe ser de 75 pulg.-lbs.

La garantía no cubre daños causados por conectar bombas y controles a la fuente de energía incorrecta (fuente de tensión/fase).

Anote los números de modelos y números de serie de las bombas y del panel de control en la sección delantera de este manual de instrucciones para referencia futura. Entregue el manual al propietario o adjúntelo al panel de control una vez finalizada la instalación.

LEVANTAMIENTO DE LA BOMBA

⚠ ADVERTENCIA

Un voltaje peligroso puede producir golpes eléctricos, quemaduras o la muerte.

NO LEVANTE NI TRANSPORTE NI CUELGUE LA BOMBA DE LOS CABLES ELÉCTRICOS. EL DAÑO A LOS CABLES ELÉCTRICOS PUEDE PRODUCIR ELECTROCHOQUE, QUEMADURAS O AÚN LA MUERTE.

Levante la bomba con una cadena o cable de tamaño adecuado conectado al perno de ojo de levantamiento. **NO** dañe los cables eléctricos o de los sensores al subir y bajar la unidad.

RIEL CORREDIZO O SISTEMA DE LEVANTAMIENTO OPCIONAL

En muchos estanques de efluente y aguas negras o estaciones de levantamiento se recomienda instalar la bomba en un sistema de riel corredizo o sobre un adaptador de levantamiento para facilitar la instalación y retiro para inspección y/o servicio. La mayoría de los códigos no permiten que el personal entre al pozo sumidero sin el equipo de protección y la capacitación correctos. Los rieles corredizos están diseñados para facilitar el retiro de la bomba sin necesidad de entrar al pozo o perturbar la tubería. El riel corredizo o el adaptador de levantamiento debe situar la bomba opuesta a la abertura para el líquido de entrada, evitando las áreas estancadas donde pudiesen asentarse sólidos. El estanque o fosa debe ser capaz de soportar el peso de la bomba y del riel de deslizamiento. El piso de la fosa debe ser plano.

AVISO: SIGA LAS INSTRUCCIONES INCLUIDAS CON EL CONJUNTO DEL RIEL CORREDIZO.

TUBERÍAS

La tubería de descarga no debe ser más pequeña que el diámetro de descarga de la bomba y debe mantenerse lo más corta posible, evitando los accesorios innecesarios para reducir al mínimo las pérdidas por fricción.

Instale una válvula de retención de tamaño adecuado que corresponda con la capacidad de manejo de sólidos de la bomba para evitar el contraflujo de fluido. El contraflujo puede hacer que la bomba "gire" en dirección inversa, produciendo un desgaste prematuro del sello y/o del cojinete. Si la bomba gira en sentido inverso al arrancar, el aumento de torsión puede dañar el motor y/o el eje del motor de la bomba y algunas bombas monofásicas hasta podrían funcionar en sentido inverso.

Instale una válvula de compuerta de tamaño adecuado **DESPUÉS** de la válvula de retención para facilitar el mantenimiento de la bomba, las tuberías y la válvula de retención.

Importante – antes de instalar la bomba. Perfore un orificio de alivio de $^{3}/_{16}$ pulg. (4.8 mm) en la tubería de descarga. Debe situarse dentro del pozo, a 2 pulg. (51 mm) sobre la descarga de la bomba, pero debajo de la válvula de retención. El orificio de alivio permite el escape de aire de la carcasa. Al permitir que entre líquido a la carcasa se asegura que la bomba pueda arrancar cuando el nivel de líquido aumente. A menos que se proporcione un orificio de alivio, una bomba de toma inferior podría "obstruirse con aire" y no bombear agua, a pesar de que el impulsor gire.

Todas las tuberías deben estar apoyadas correctamente, de modo que no se apliquen esfuerzos o cargas de las tuberías a la bomba.

La cubierta de acceso a la fosa debe ser de tamaño suficiente para permitir realizar el servicio de inspección, mantenimiento y levantamiento con grúa o montacargas.

CABLEADO Y CONEXIÓN A TIERRA

Aviso importante: Lea las instrucciones de seguridad antes de proseguir con el cableado.

⚠ Use únicamente alambre trenzado de cobre para la bomba/motor y la conexión a tierra. El alambre de conexión a tierra debe ser al menos del mismo tamaño que los alambres de la fuente de alimentación. Los alambres deben codificarse con colores para facilitar el mantenimiento y la identificación y resolución de problemas.

⚠ Instale los cables y la conexión a tierra de acuerdo con el Código Eléctrico de EE.UU. (NEC) o el Código Eléctrico Canadiense, además de los códigos locales, estatales y provinciales.

⚠ Instale un desconectador de todos los circuitos donde el código lo requiera.

⚠ Desconecte y bloquee la corriente eléctrica antes de instalar o dar servicio.

⚠ La tensión y fase de la fuente de alimentación debe corresponder con todos los requerimientos del equipo. La tensión o fase incorrecta puede producir incendio, daño al motor o a los controles y anula la garantía.

⚠ Todos los empalmes debe ser impermeables. Si utiliza juegos de empalme, siga las instrucciones del fabricante.

⚠ADVERTENCIA Seleccione una caja de conexiones NEMA del tipo correcto para la aplicación y ubicación. La caja de conexiones debe garantizar conexiones de cableado seguras y secas.

⚠ADVERTENCIA Selle todos los controles de los gases presentes que pudiesen dañar los componentes eléctricos.

⚠ADVERTENCIA
Tensión peligrosa

LA FALLA DE CONECTAR A TIERRA PERMANENTEMENTE LA BOMBA, EL MOTOR Y LOS CONTROLES, ANTES DE CONECTAR LA CORRIENTE ELÉCTRICA, PUEDE CAUSAR ELECTROCHOQUE, QUEMADURAS O LA MUERTE.

SELECCIÓN Y CABLEADO DE LOS INTERRUPTORES Y PANELES DE CONTROL DE LA BOMBA

TIPOS DE INTERRUPTORES DE FLOTADOR

Hay dos tipos de diseños de interruptor de flotador: de acción simple y de ángulo amplio. Los interruptores de acción simple funcionan en un rango de 15º, de manera que pueden abrirse y cerrarse con rapidez. Los flotadores de ángulo amplio funcionan con un giro de 90º con el largo de la traba entre el cuerpo del flotador y el punto de pivote controlando al rango de encendido-apagado. El diseño determina cuántos flotadores se requieren con los diferentes sistemas o controles.

Los flotadores pueden estar normalmente abiertos (NO) para aplicaciones de reducción de nivel o para vaciar un tanque. Los interruptores normalmente cerrados (NC) se utilizan para aumentar el nivel o para llenar un tanque.

Un interruptor de control de acción simple sólo puede usarse con un panel de control, pero nunca directamente conectado a una bomba.

Los interruptores de ángulo ancho de reducción de nivel pueden usarse como interruptores directamente conectados a la bomba o como interruptores de control.

INSTALACIÓN DE LOS INTERRUPTORES DE FLOTADOR

No hay reglas absolutas acerca de dónde instalar los interruptores de flotador, varía de trabajo a trabajo.

Reglas sugeridas a seguir:
¡Todos los flotadores deben instalarse debajo de la tubería de entrada!

Flotador de apagado: Primera preferencia: instálelo de manera que el nivel del agua quede siempre sobre el extremo superior de la bomba (cúpula del motor). Segunda preferencia: instálelo de manera que el nivel del agua quede a no más de 6 pulg. por debajo del extremo superior de la bomba.

Flotador de encendido: instálelo de manera que el volumen de agua entre los flotadores de encendido y apagado permita bombas de 1½ HP y menores funcionar al menos 1 minuto. Las bombas de dos (2) HP y mayores deben funcionar al menos 2 minutos. La literatura sobre estanques establece los galones de almacenaje por pulgada de altura del estanque.

Flotador(es) de retardo/alarma: deben escalonarse sobre los flotadores de apagado y encendido. Trate de utilizar la mayoría del almacenaje disponible ofrecido por el estanque, ahorre espacio para la capacidad de almacenaje de reserva. *Consulte los diagramas y tablas en la Sección de Tablas de Interruptores de Flotador.*

DIAGRAMAS DE CABLEADO DEL PANEL
Nuestros paneles de control se envían con instrucciones y diagramas de cableado. Utilice dichas instrucciones en conjunto con este manual de instrucciones (IOM). La instalación eléctrica debe ser realizada por técnicos calificados únicamente. Cualquier problema o preguntas con respecto al control de otras marcas debe dirigirse a ese proveedor o al fabricante del control. Nuestro personal técnico no tiene diagramas esquemáticos técnicos o información de identificación y resolución de problemas de los controles de otras compañías.

ALARMAS
Recomendamos la instalación de una alarma en todas las bombas para aguas residuales. Muchos paneles de control estándar vienen equipados con circuitos de alarma. Si no se usa un panel de control, se ofrece una alarma por alto nivel de líquido independiente. La alarma alerta al propietario acerca de una situación de alto nivel de líquido en el sistema, de manera que pueda comunicarse con el personal de servicio apropiado para que investigue la situación.

BOMBAS MONOFÁSICAS
Las bombas monofásicas (1Ø) pueden operarse utilizando un interruptor de flotador en tándem o de conexión directa, un contactador o un panel de control simple o doble. *Ver las Figuras 1,2 y 5*.

Todas las bombas de ⅓ y ½ HP, de 115 ó 230 voltios y algunas bombas de ¾ y de 1 HP están equipadas con cables de alimentación estilo enchufe. Pueden enchufarse a interruptores de flotador en tándem para instalaciones sencillas. Se permite quitar los enchufes para conectar directamente o conectar a un controlador simple o doble. El retiro del enchufe no anula la garantía ni viola las aprobaciones de las agencias. *Ver la figura 5*.

LAS UNIDADES CON ENCHUFE DEBEN CONECTARSE A UN TOMACORRIENTES TIPO TIERRA CONECTADO CORRECTAMENTE A TIERRA.

EN EL CASO DE UNIDADES SIN ENCHUFE, NO QUITE EL CABLE NI EL PROTECTOR CONTRA TIRONES. NO CONECTE EL TUBO-CONDUCTO A LA BOMBA.

Las bombas con cables de alimentación con conductores desnudos pueden conectarse directamente a un interruptor de flotador, cablearse a un contactador de 1 fase, a un controlador simple o doble. Siempre verifique que el interruptor de flotador esté clasificado para el amperaje de funcionamiento máximo, amperaje de arranque máximo y la capacidad nominal de potencia de la bomba. Las bombas monofásicas para aguas residuales contienen sobrecargas de devanado de encendido, a menos que se especifique lo contrario en la placa de identificación de la bomba. *Ver las Figuras 1 y 2*.

BOMBAS TRIFÁSICAS:
Como mínimo, una bomba trifásica requiere un cortacircuitos/circuito con fusible trifásico, un arrancador magnético en la línea clasificado para la potencia de la bomba y sobrecargas Clase 10, de disparo rápido y compensación ambiental.

PANELES DE CONTROL MONOFÁSICOS Y TRIFÁSICOS:
Los paneles de control pueden ser simples (controlan 1 bomba) o dobles (controlan 2 bombas). Nuestros paneles Serie SES se ofrecen con muchas características estándar y pueden construirse con nuestras opciones más populares. También construimos paneles de acuerdo con las especificaciones del cliente, los cuales ofrecen muchas más opciones que los paneles SES. Los paneles de control construidos de acuerdo con las especificaciones del cliente se ofrecen en muchas configuraciones diferentes. Las solicitudes de cotizaciones para paneles a la medida pueden enviarse a Servicio a los Clientes mediante nuestro distribuidor autorizado.

Nuestros paneles "SES" dobles presentan un diseño de tablero de circuito impreso de estado sólido con circuitos de alarmas de alto nivel estándar. Otras características estándar son: un contacto de alarma seco auxiliar para señalizar una alarma remota y luces indicadoras de posición del interruptor de flotador. Nuestros paneles trifásicos tienen sobrecargas Clase 10 incorporadas y ajustables. Las sobrecargas ajustables en todos nuestros paneles trifásicos significa menos trabajo para el instalador y la eliminación de la necesidad de ordenar sobrecargas específicas. La mayoría de los paneles SES se mantienen en inventario para entrega inmediata.

En el caso de bombas equipadas con sensores de falla de sello y/o sensores de calor, se recomienda que use su panel de control con las opciones apropiadas. Los sensores de la bomba no funcionan sin un relé de falla de sello o una conexión terminal en el panel de control y un dispositivo de alarma tal como una campana, bocina o luz.

Circuito de falla de sello – Algunas bombas de sello doble están equipadas con un circuito de falla de sello que también se denomina circuito de detección de humedad. Este circuito debe estar conectado a un panel de control con un relé de falla de sello opcional. El panel debe ordenarse especialmente con el relé de falla de sello y la alarma. También hay paneles de falla de sello independientes como los A4-3 o A4-A disponibles como artículos estándar. Las bombas pueden identificarse por un cable de control adicional que sea de la tapa del motor. El cable contiene dos alambres, un alambre negro que se conecta al "terminal" del panel que va a la "sonda", y un alambre blanco que se conecta al "terminal" del panel que va a la tierra del relé. No los conecte al tornillo de tierra del panel. *Siga las instrucciones de cableado incluidas con el panel.*

Sensor de calor y circuito de falla de sello – Algunas bombas están equipadas con termostatos de falla de sello y de alta temperatura, de devanado de encendido, normalmente cerrados (sensores de calor). Las bombas tienen un cable de control con cuatro (4) conductores: negro (sonda) y verde (tierra del relé) para el circuito de falla del sello y rojo y blanco para el circuito de alta temperatura. Conecte el circuito de alta temperatura (sensor de calor) a la regleta de terminales del panel, tal como se indica en el dibujo del panel, con los alambres rojo y blanco. El circuito del panel de alta temperatura también es un artículo opcional que debe ordenar específicamente cuando ordene su panel de control. El circuito de alta temperatura es diferente de las sobrecargas Clase 10 que son siempre requeridas en las bombas trifásicas. *Siga las instrucciones de cableado incluidas con el panel.*

INSTALACIÓN

Conecte la(s) bomba(s) a los adaptadores de riel corredizo o a la tubería de descarga. Las bases del riel corredizo deben anclarse al piso del pozo.

Todas las conexiones deben realizarse de acuerdo con los diagramas de cableado del panel de control, el código eléctrico de EE.UU., el código canadiense y los códigos estatales, provinciales y/o locales. Éste es un buen momento para verificar la rotación apropiada de los motores/impulsores.

NO COLOQUE LAS MANOS EN LA SUCCIÓN DE LA BOMBA MIENTRAS VERIFICA LA ROTACIÓN DEL MOTOR. EL HACERLO PRODUCIRÁ GRAVES LESIONES PERSONALES.

Siempre verifique la rotación correcta. La rotación correcta se indica en la carcasa de la bomba. Los motores trifásicos son reversibles. Se permite arrancar brevemente o en marcha lenta el motor durante unos segundos para verificar la rotación del impulsor. Es más fácil verificar la rotación antes de instalar la bomba. Intercambie dos de los conductores de potencia cualquiera para invertir la rotación.

Baje la(s) bomba(s) al pozo sumidero.

Inspeccione para verificar que los flotadores funcionen libremente y que no hagan contacto con la tubería.

OPERACIÓN

Una vez que se hayan hecho y verificado las conexiones de las tuberías, se pueden poner en funcionamiento las bombas.

Operación de interruptor en tándem – Enchufe el interruptor en tándem a un tomacorrientes dedicado conectado a tierra y luego enchufe la bomba al interruptor. Pruebe la bomba llenando el pozo hasta que la bomba se active. Si las bombas funcionan pero no bombean, probablemente estén obstruidas con aire; perfore los orificios de alivio de acuerdo con las instrucciones en la Sección de Tuberías.

Verifique el intervalo de operación para asegurar un tiempo de funcionamiento mínimo de un minuto y que la bomba se apague en la posición correcta.

Operación del panel de control – Llene el pozo con agua limpia.

Utilice los interruptores H-O-A (manual – apagado – automático) de la bomba en la posición manual para probar las bombas. Si funcionan bien en la posición manual, pruebe la posición automática. Si las bombas funcionan pero no bombean, probablemente estén obstruidas con aire; perfore los orificios de alivio de acuerdo con las instrucciones en la Sección de Tuberías.

Coloque el (los) interruptor(es) del panel de control en la posición automática y pruebe minuciosamente el funcionamiento de los flotadores de ENCENDIDO, APAGADO y alarma llenando el pozo con agua limpia. **Importante:** Si no se proporciona un neutro desde la fuente de alimentación a un panel de control monofásico de 230 voltios, el circuito de control del panel no operará. Es necesario el neutro para completar el circuito de control de 115 voltios.

Verifique la tensión y la corriente y anote los datos en la sección delantera de este manual para referencia futura. Compare las lecturas de amperaje con el amperaje máximo indicado en la placa de identificación de la bomba. Si es más alto que el amperaje de la placa de identificación, investigue la causa. Si la bomba se hace funcionar fuera de la curva; es decir, con demasiado poca carga o con tensión alta o baja, aumentará el amperaje. El motor funcionará correctamente con tensión no más de un 10% por encima o por debajo de las clasificaciones en la placa de identificación de la bomba. El rendimiento dentro de este rango no será necesariamente igual al rendimiento publicado a la frecuencia y tensión exactas indicadas en la placa de identificación. Corrija el problema antes de continuar. También es posible que la causa sea un desbalance trifásico. *Consulte la sección de Desbalance de potencia trifásica y siga las instrucciones.*

Reposicione el circuito de alarma, coloque el (los) interruptor(es) de la bomba en posición automática y el interruptor de control en la posición de encendido. Ahora la unidad está lista para la operación automática.

Explique la operación de las bombas, controles y alarmas al usuario final. Entregue la documentación al propietario o déjela en un lugar seco y seguro en el panel de control.

TABLA DEL PANEL E INTERRUPTORES DE FLOTADOR

El propósito de esta tabla es mostrar las cantidades de interruptores requeridas y la función de cada interruptor en un sistema de aguas residuales típicas. Las cantidades requeridas varían dependiendo del tipo de interruptor: de acción simple o de ángulo amplio. Las cantidades de interruptores varían también de acuerdo con el tipo de panel: simple con y sin alarmas y doble con alarmas.

Paneles dobles utilizando interruptores de acción simple:

Cableado del panel de tres flotadores

SW1	Fondo	Bombas apagadas
SW2	Medio	Primera bomba del medio encendida
SW3	Extremo superior	Segunda bomba y alarma encendidas

Cableado del panel de cuatro flotadores ②

SW1	Fondo	Bombas apagadas
SW2	Segundo	Primera bomba encendida
SW3	Tercero	Segunda bomba encendida
SW4	Extremo superior	Alarma encendida

Paneles dobles utilizando interruptores de ángulo amplio:

Cableado del panel de tres flotadores

SW1	Fondo	Primera bomba encendida/ ambas apagadas
SW2	Extremo superior	Segunda bomba y alarma encendidas

Cableado del panel de cuatro flotadores

SW1	Fondo	Primera bomba encendida/ ambas apagadas
SW2	Medio	Segunda bomba encendida
SW3	Extremo superior	Alarma encendida

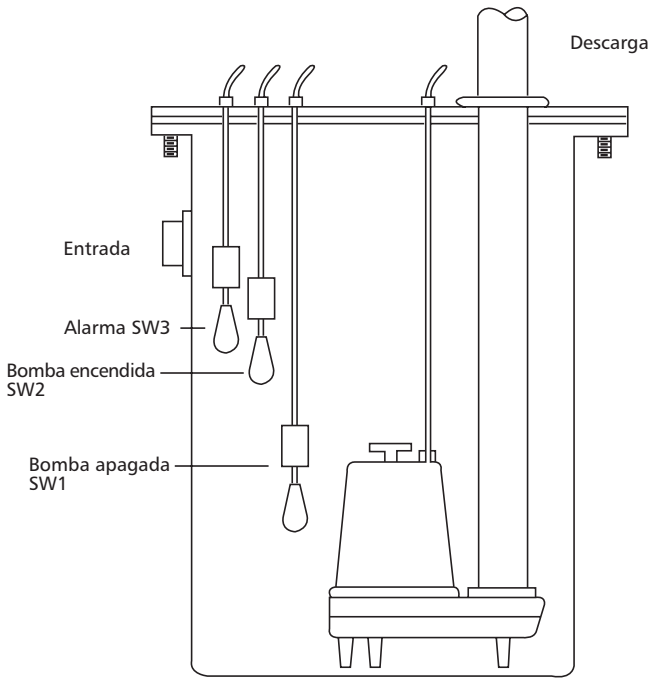
Paneles simples utilizando interruptores de acción simple:

Panel simple con alarma ①

SW1	Fondo	Bomba apagada
SW2	Medio	Bomba encendida
SW3	Extremo superior	Alarma encendida/apagada

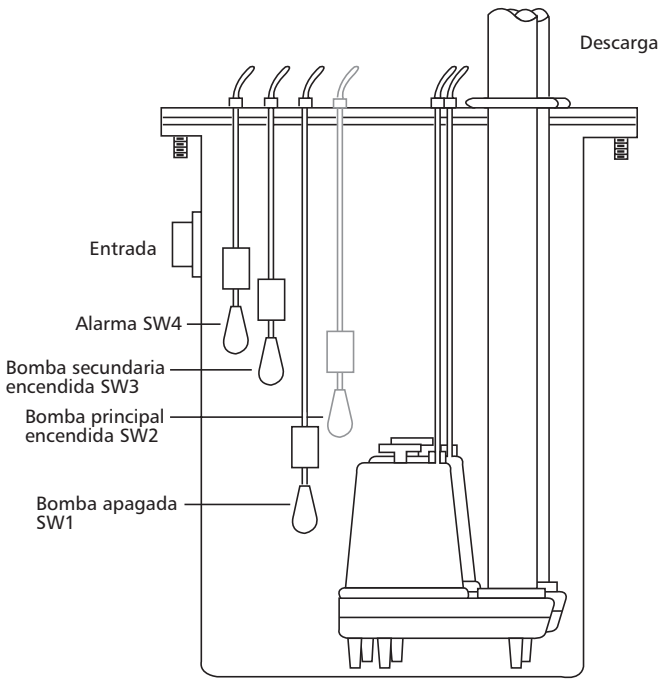
Panel simple sin alarma

SW1	Fondo	Bomba apagada
SW2	Extremo superior	Bomba encendida



Paneles simples utilizando interruptores de ángulo amplio:

Panel simple con alarma



SW1	Fondo	Bomba encendida/apagada
SW2	Extremo superior	Alarma encendida/apagada

Panel simple sin alarma

SW1	Bomba encendida/apagada

Simple ①

Doble ②

DESBALANCE DE POTENCIA TRIFÁSICA

Se recomienda un suministro trifásico completo incluyendo tres transformadores individuales o un transformador trifásico. Se pueden usar conexiones en estrella o en triángulo "abierto" empleando sólo dos transformadores, pero hay más posibilidad de que produzcan un rendimiento inadecuado, disparo por sobrecarga o falla prematura del motor debido al desbalance de corriente.

Mida la corriente en cada uno de los tres conductores del motor y calcule el desbalance de corriente en la forma que se explica abajo.

Si el desbalance de corriente es del 2% o menos, deje los conductores tal como están conectados. Si el desbalance de corriente es de más del 2%, hay que verificar las lecturas de corriente en cada derivación empleando cada una de las tres conexiones posibles. Enrolle los conductores del motor en el arrancador en la misma dirección para evitar una inversión del motor.

Para calcular el porcentaje de desbalance de corriente:

A. Sume los tres valores de corriente de línea.

B. Divida la suma por tres, con lo cual se obtiene la corriente promedio.

C. Seleccione el valor de corriente más alejado de la corriente promedio (ya sea alto o bajo).

D. Determine la diferencia entre este valor de corriente (más alejado del promedio) y el promedio.

E. Divida la diferencia por el promedio. Multiplique el resultado por 100 para determinar el porcentaje de desbalance.

El desbalance de corriente no debe exceder el 5% con la carga del factor de servicio o el 10% con la carga de entrada nominal. Si el desbalance no puede corregirse enrollando los conductores, la causa del desbalance debe determinarse y corregirse. Si, en las tres conexiones posibles, la derivación más alejada del promedio está en el mismo conductor de potencia, entonces la mayoría del desbalance proviene de la fuente de potencia.

Contacte a la compañía de electricidad local para solucionar el desbalance.

	Conexión 1			Conexión 2			Conexión 3		
Terminales del arrancador	L1	L2	L3	L1	L2	L3	L1	L2	L3
	⊥ T	⊥ T	⊥ T	⊥ T	⊥ T	⊥ T	⊥ T	⊥ T	⊥ T
Conductores del motor	R T3	B T1	W T2	W T2	R T3	B T1	B T1	W T2	R T3

Ejemplo:

T3-R = 51 amps	T2-W = 50 amps	T1-B = 50 amps
T1-B = 46 amps	T3-R = 48 amps	T2-W = 49 amps
T2-W = 53 amps	T1-B = 52 amps	T3-R = 51 amps
Total = 150 amps	Total = 150 amps	Total = 150 amps
÷ 3 = 50 amps	÷ 3 = 50 amps	÷ 3 = 50 amps
− 46 = 4 amps	− 48 = 2 amps	− 49 = 1 amps
4 ÷ 50 = .08 or 8%	2 ÷ 50 = .04 or 4%	1 ÷ 50 = .02 or 2%

LECTURAS DE RESISTENCIA DEL AISLAMIENTO

Valores normales en ohmios y megaohmios entre todos los conductores y tierra

Condición del motor y los conductores	Valor en ohmios	Valor en Megaohmios
Un motor nuevo (sin cable de bajada).	20,000,000 (o más)	20 (o más)
Un motor usado que puede reinstalarse en el pozo.	10,000,000 (o más)	10 (o más)
Motor en el pozo. Las lecturas son para el cable de bajada más el motor.		
Motor nuevo.	2,000,000 (o más)	2 (o más)
El motor está en buenas condiciones.	500,000 - 2,000,000	.5 - 2
Daño de aislamiento, localícelo y repárelo.	Menos de 500,000	Menos de 0.5

La resistencia del aislamiento varía muy poco con la clasificación. Los motores de todas las clasificaciones de potencia, tensión y fase tienen valores similares de resistencia de aislamiento.

Los valores de resistencia de aislamiento anteriores están basados en lecturas obtenidas con un megaohmiómetro con salida de 500 V CC. Las lecturas pueden variar utilizando un ohmiómetro de tensión más baja; consulte con la fábrica si tiene dudas acerca de las lecturas.

Los datos de ingeniería para modelos específicos pueden encontrarse en su catálogo y en nuestro sitio Web (dirección en la cubierta).

Los diagramas de cableado del panel de control se envían con los paneles de control. Utilice los dibujos del panel de control junto con este manual de instrucciones para completar el cableado.

OPERACIÓN DE LA BOMBA

Sumersión mínima	
Servicio continuo	Sumergida totalmente
Servicio intermitente	6 pulg. por debajo del extremo superior del motor

Temperatura máxima del fluido	
Operación continua	104º F 40º C
Operación intermitente	140º F 60º C

⚠ADVERTENCIA
Tensión peligrosa

LA FALLA DE DESCONECTAR Y BLOQUEAR LA CORRIENTE ELÉCTRICA ANTES DE INTENTAR CUALQUIER SERVICIO, PUEDE CAUSAR ELECTROCHOQUE, QUEMADURAS O LA MUERTE.

SÍNTOMA	CAUSA PROBABLE	ACCIÓN RECOMENDADA
EL MOTOR NO ESTÁ FUNCIONANDO **NOTA:** Si el cortacircuitos se "ABRE" repetidamente, **NO** lo reposicione. Llame a un electricista calificado.	Se disparó el protector térmico del motor	Deje que se enfríe el motor. Asegure la sumersión mínima de la bomba. Limpie los residuos de la carcasa y el impulsor.
	Cortacircuitos abierto o fusible quemado.	Determine la causa, llame a un electricista calificado.
	Impulsor de la bomba rozando o atascado.	Determine el consumo de corriente del motor. Si es dos veces más alto que el indicado en la placa de identificación de la bomba, el impulsor está trabado, los cojinetes del motor o el eje está dañado. Limpie los residuos de la carcasa y el impulsor, consulte con el agente.
a) Operación manual	El cable de alimentación está dañado.	
	Conexiones eléctricas inadecuadas en el panel de control.	
b) Operación automática	No hay alambre neutro conectado al panel de control.	La resistencia entre los conductores de alimentación y tierra debe indicar infinito. Si alguna lectura es incorrecta, llame a un electricista calificado.
	Conexiones eléctricas inadecuadas en el panel de control.	Inspeccione las conexiones del panel de control. Llame a un electricista calificado.
NOTA: Inspeccione la bomba en modo manual primero para confirmar el funcionamiento. Si la bomba funciona, el control automático o el cableado está defectuoso. Si la bomba no funciona, vea arriba.	Interruptor de nivel de líquido defectuoso para activar los controles.	Con el interruptor desconectado, verifique la continuidad mientras activa el interruptor de nivel de líquido. Reemplace el interruptor, según se requiera.
	Nivel de líquido insuficiente para activar los controles.	Deje que el nivel de líquido aumente de 3 a 4 pulgadas (76 mm –101 mm) sobre el nivel de activación.
	Cordones de los sensores de nivel de líquido enredados.	Desenrede los cordones y asegure el funcionamiento libre.
LA BOMBA NO SE APAGA	Cordones de los sensores de nivel de líquido enredados.	Desenrede los cordones y asegure el funcionamiento libre.
	La bomba está atascada con aire.	Apague la bomba durante aproximadamente un minuto y arránquela nuevamente. Repita hasta que se despeje la obstrucción de aire. Si la obstrucción de aire persiste en un sistema con tubo con válvula de retención, puede perforarse un agujero de 3/16 pulg. (4.8 mm) en el tubo de descarga aproximadamente a 2 pulgadas (51 mm) de la conexión de descarga.
	El flujo de líquido entrante coincide con la capacidad de descarga de la bomba.	Podría requerirse una bomba más grande.
LA BOMBA ENTREGA POCO O NADA DE LÍQUIDO	La válvula de retención está instalada invertida, está obstruida o atascada en posición cerrada.	Verifique la flecha de flujo en la válvula y verifique el funcionamiento de ésta.
	Carga excesiva del sistema.	Consulte con el agente.
	Entrada a la bomba obstruida.	Inspeccione y despeje, según sea requerido.
	Tensión incorrecta, o conectada incorrectamente.	Verifique la rotación, la tensión y las conexiones de la bomba. Consulte con un electricista calificado.
	La bomba está atascada con aire.	Consulte la acción recomendada, arriba.
	El impulsor está gastado o dañado.	Inspeccione el impulsor, reemplácelo según sea necesario.
	Los controles de nivel de líquido están defectuosos o instalados incorrectamente.	Inspeccione, reajuste o reemplace, según sea requerido.
LA BOMBA CICLA CONSTANTEMENTE	La válvula de retención de la descarga no funciona.	Inspeccione, repare o reemplace, según sea requerido.
	El área de contención de aguas negras es demasiado pequeña.	Consulte con el agente.
	Los controles de nivel de líquido están defectuosos o instalados incorrectamente.	Inspeccione, reajuste o reemplace, según sea requerido.
	Cantidad excesiva de líquido entrante para una bomba de este tamaño.	Consulte con el agente.

Instalaciones típicas de bombas de efluente, para alcantarillado y de extracción de agua

GARANTÍA LIMITADA DE GOULDS PUMPS

Esta garantía es aplicable a todas las bombas para sistemas de agua fabricadas por Goulds Pumps.

Toda parte o partes que resulten defectuosas dentro del período de garantía serán reemplazadas sin cargo para el comerciante durante dicho período de garantía. Tal período de garantía se extiende por doce (12) meses a partir de la fecha de instalación, o dieciocho (18) meses a partir de la fecha de fabricación, cualquiera se cumpla primero.

Todo comerciante que considere que existe lugar a un reclamo de garantía deberá ponerse en contacto con el distribuidor autorizado de Goulds Pumps del cual adquiriera la bomba, y ofrecer información detallada con respecto al reclamo. El distribuidor está autorizado a liquidar todos los reclamos por garantía a través del Departamento de Servicios a Clientes de Goulds Pumps.

La presente garantía excluye:

(a) La mano de obra, el transporte y los costos relacionados en los que incurra el comerciante;

(b) los costos de reinstalación del equipo reparado;

(c) los costos de reinstalación del equipo reemplazado;

(d) daños emergentes de cualquier naturaleza; y

(e) el reembolso de cualquier pérdida causada por la interrupción del servicio.

A los fines de esta garantía, los términos "Distribuidor", "Comerciante" y "Cliente" se definen como sigue:

(1) "Distribuidor" es aquel individuo, sociedad, corporación, asociación u otra entidad jurídica que opera entre Goulds Pumps y el comerciante para la compra, consignación o contratos de venta de las bombas en cuestión.

(2) "Comerciante" es todo individuo, sociedad, corporación, asociación u otra entidad jurídica que realiza negocios de venta o alquiler-venta (leasing) de bombas a clientes.

(3) "Cliente" es toda entidad que compra o que adquiere bajo la modalidad de leasing las bombas en cuestión de un comerciante. El término "cliente" puede significar un individuo, una sociedad, una corporación, una sociedad de responsabilidad limitada, una asociación o cualquier otra entidad jurídica con actividades en cualquier tipo de negocios.

LA PRESENTE GARANTÍA SE EXTIENDE AL COMERCIANTE ÚNICAMENTE

GOULDS PUMPS

Goulds Pumps y el símbolo ITT Engineered Blocks son marcas registradas y marcas comerciales de ITT Industries.

LAS ESPECIFICACIONES ESTÁN SUJETAS A CAMBIO SIN PREVIO AVISO.

OPERATING AND SAFETY PRECAUTIONS

READ, UNDERSTAND, AND FOLLOW THIS INFORMATION TO AVOID INJURY AND PROPERTY DAMAGE.

EXCESSIVE AIR PRESSURE
STATIC SPARK

HAZARDOUS MATERIALS
HAZARDOUS PRESSURE

⚠ WARNING EXCESSIVE AIR PRESSURE. Can cause personal injury, pump damage or property damage.

- Do not exceed the maximum inlet air pressure as stated on the pump model plate.
- Be sure material hoses and other components are able to withstand fluid pressures developed by this pump. Check all hoses for damage or wear. Be certain dispensing device is clean and in proper working condition.

⚠ WARNING STATIC SPARK. Can cause explosion resulting in severe injury or death. Ground pump and pumping system.

- Sparks can ignite flammable material and vapors.
- The pumping system and object being sprayed must be grounded when it is pumping, flushing, recirculating or spraying flammable materials such as paints, solvents, lacquers, etc. or used in a location where surrounding atmosphere is conducive to spontaneous combustion. Ground the dispensing valve or device, containers, hoses and any object to which material is being pumped.
- Secure pump, connections and all contact points to avoid vibration and generation of contact or static spark.
- Consult local building codes and electrical codes for specific grounding requirements.
- After grounding, periodically verify continuity of electrical path to ground. Test with an ohmmeter from each component (e.g., hoses, pump, clamps, container, spray gun, etc.) to ground to insure continuity. Ohmmeter should show 0.1 ohms or less.
- Submerse the outlet hose end, dispensing valve or device in the material being dispensed if possible. (Avoid free streaming of material being dispensed.)
- Use hoses incorporating a static wire.
- Use proper ventilation.
- Keep inflammables away from heat, open flames and sparks.
- Keep containers closed when not in use.

⚠ WARNING Pump exhaust may contain contaminants. Can cause severe injury. Pipe exhaust away from work area and personnel.

- In the event of a diaphragm rupture, material can be forced out of the air exhaust muffler.
- Pipe the exhaust to a safe remote location when pumping hazardous or inflammable materials.
- Use a grounded 3/8" min. i.d. hose between the pump and the muffler.

⚠ WARNING HAZARDOUS PRESSURE. Can result in serious injury or property damage. Do not service or clean pump, hoses or dispensing valve while the system is pressurized.

- Disconnect air supply line and relieve pressure from the system by opening dispensing valve or device and / or carefully and slowly loosening and removing outlet hose or piping from pump.

⚠ WARNING HAZARDOUS MATERIALS. Can cause serious injury or property damage. Do not attempt to return a pump to the factory or service center that contains hazardous material. Safe handling practices must comply with local and national laws and safety code requirements.

- Obtain Material Safety Data Sheets on all materials from the supplier for proper handling instructions.

⚠ WARNING EXPLOSION HAZARD. Models containing aluminum wetted parts cannot be used with Ill.-Trichloroethane, Methylene Chloride or other Halogenated Hydrocarbon solvents which may react and explode.

- Check pump motor section, fluid caps, manifolds and all wetted parts to assure compatibility before using with solvents of this type.

⚠ WARNING MISAPPLICATION HAZARD. Do not use models containing aluminum wetted parts with food products for human consumption. Plated parts can contain trace amounts of lead.

⚠ CAUTION Verify the chemical compatibility of the pump wetted parts and the substance being pumped, flushed or recirculated. Chemical compatibility may change with temperature and concentration of the chemical(s) within the substances being pumped, flushed or circulated. For specific fluid compatibility, consult the chemical manufacturer.

⚠ CAUTION Maximum temperatures are based on mechanical stress only. Certain chemicals will significantly reduce maximum safe operating temperature. Consult the chemical manufacturer for chemical compatibility and temperature limits. Refer to PUMP DATA on page 1 of this manual.

⚠ CAUTION Be certain all operators of this equipment have been trained for safe working practices, understand it's limitations, and wear safety goggles / equipment when required.

⚠ CAUTION Do not use the pump for the structural support of the piping system. Be certain the system components are properly supported to prevent stress on the pump parts.

- Suction and discharge connections should be flexible connections (such as hose), not rigid piped, and should be compatible with the substance being pumped.

⚠ CAUTION Prevent unnecessary damage to the pump. Do not allow pump to operate when out of material for long periods of time.

- Disconnect air line from pump when system sits idle for long periods of time.

⚠ CAUTION Use only genuine ARO replacement parts to assure compatible pressure rating and longest service life.

NOTICE RE-TORQUE ALL FASTENERS BEFORE OPERATION. Creep of housing and gasket materials may cause fasteners to loosen. Re-torque all fasteners to insure against fluid or air leakage

⚠WARNING	=	Hazards or unsafe practices which could result in severe personal injury, death or substantial property damage.
⚠ CAUTION	=	Hazards or unsafe practices which could result in minor personal injury, product or property damage.
NOTICE	=	Important installation, operation or maintenance information.

GENERAL DESCRIPTION

The ARO Diaphragm Pump offers high volume delivery even at low air pressure and a broad range of material compatibility options available. Refer to the model and option chart. ARO pumps feature stall resistant design, modular air motor / fluid sections.
Air operated double diaphragm pumps utilize a pressure differential in the air chambers to alternately create suction and positive fluid pressure in the fluid chambers, ball checks insure a positive flow of fluid.
Pump cycling will begin as air pressure is applied and it will continue to pump and keep up with the demand. It will build and maintain line pressure and will stop cycling once maximum line pressure is reached (dispensing device closed) and will resume pumping as needed.

AIR AND LUBE REQUIREMENTS

⚠ **WARNING** **EXCESSIVE AIR PRESSURE. Can cause pump damage, personal injury or property damage.**

- A filter capable of filtering out particles larger than 50 microns should be used on the air supply. There is no lubrication required other than the "O" ring lubricant which is applied during assembly or repair.
- If lubricated air is present, make sure that it is compatible with the Nitrile seals in the air motor section of the pump.

INSTALLATION

- Verify correct model / configuration prior to installation.
- Retorque all external fasteners per specifications prior to start up.
- Pumps are tested in water at assembly. Flush pump with compatible fluid prior to installation.
- When the diaphragm pump is used in a forced-feed (flooded inlet) situation, it is recommended that a "Check Valve" be installed at the air inlet.
- Material supply tubing should be at least the same diameter as the pump inlet manifold connection.
- Material supply hose must be reinforced, non-collapsible type compatible with the material being pumped.
- Piping must be adequately supported. Do not use the pump to support the piping.
- Use flexible connections (such as hose) at the suction and discharge. These connections should not be rigid piped and must be compatible with the material being pumped.
- Secure the diaphragm pump legs to a suitable surface (level and flat) to insure against damage by vibration.
- Pumps that need to be submersed must have both wet and non-wet components compatible with the material being pumped.
- Submersed pumps must have exhaust pipe above liquid level. Exhaust hose must be conductive and grounded.
- Flooded suction inlet pressure must not exceed 10 p.s.i.g. (0.69 bar).

OPERATING INSTRUCTIONS

- Always flush the pump with a solvent compatible with the material being pumped if the material being pumped is subject to "setting up" when not in use for a period of time.
- Disconnect the air supply from the pump if it is to be inactive for a few hours.

PARTS AND SERVICE KITS

Refer to the part views and descriptions as provided on page 4 through 7 for parts identification and Service Kit information.

- Certain ARO "Smart Parts" are indicated which should be available for fast repair and reduction of down time.
- Service kits are divided to service two separate diaphragm pump functions: 1. AIR SECTION, 2. FLUID SECTION. The FLUID SECTION is divided further to match typical part MATERIAL OPTIONS.

MAINTENANCE

- Provide a clean work surface to protect sensitive internal moving parts from contamination from dirt and foreign matter during service disassembly and reassembly.
- Keep good records of service activity and include pump in preventive maintenance program.
- Before disassembling, empty captured material in the outlet manifold by turning the pump upside down to drain material from the pump.

FLUID SECTION DISASSEMBLY

1. Remove (60) inlet manifold, (61) outlet manifold.
2. Remove (22) balls, (19 and 33) "O" rings and (21) seats.
3. Remove (15) fluid caps.

NOTE: Only Teflon diaphragm models use a primary diaphragm (7) and a backup diaphragm (8). Refer to the auxiliary view in the Fluid Section illustration.

4. Remove the (6) diaphragm washer, (7) or (7 / 8) diaphragms, and (5) backup washer.

NOTE: Do not scratch or mar the surface of (1) diaphragm rod.

FLUID SECTION REASSEMBLY

- Reassemble in reverse order. Refer to the torque requirements on page 5.
- Clean and inspect all parts. Replace worn or damaged parts with new parts as required.
- Lubricate (1) diaphragm rod and (144) "U" cup with Lubriplate® FML-2 grease (94276 grease packet is included in service kit).
- For models with Teflon diaphragms: Item (8) Santoprene diaphragm is installed with the side marked "AIR SIDE" towards the pump center body. Install the Teflon diaphragm (7) with the side marked "FLUID SIDE" towards the (15) fluid cap.
- Re-check torque settings after pump has been re-started and run a while.

AIR MOTOR SECTION SERVICE

Service is divided into two parts – 1. Pilot Valve, 2. Major Valve.

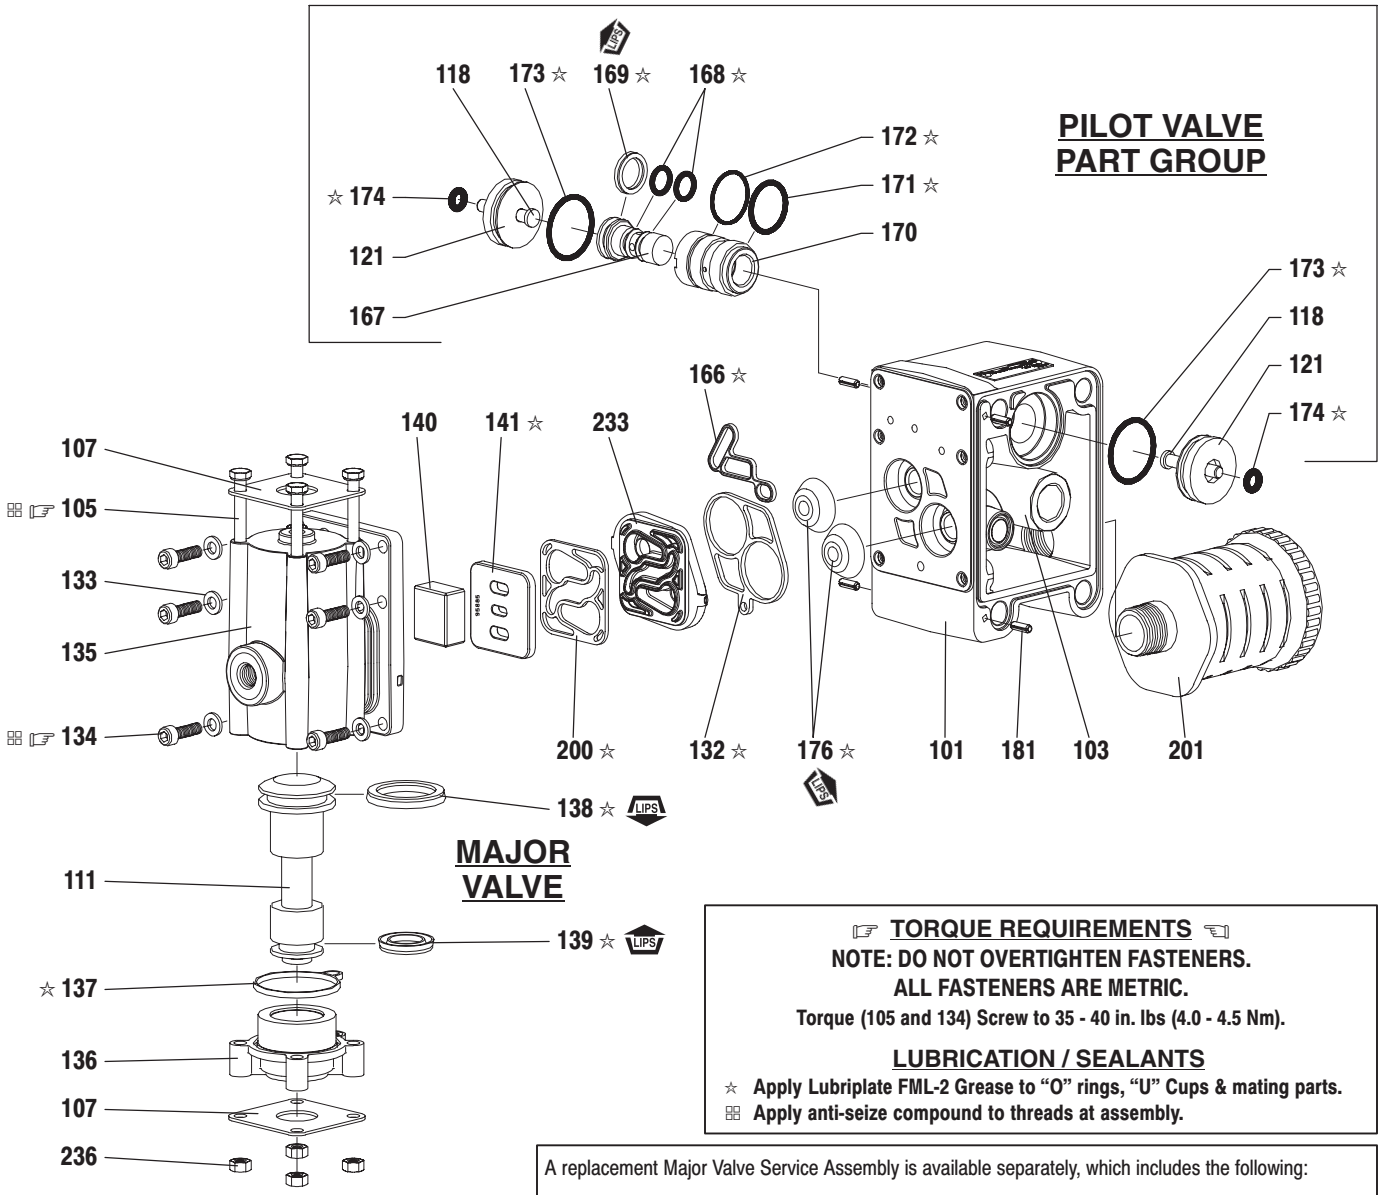
GENERAL REASSEMBLY NOTES:

- Air Motor Section Service is continued from Fluid Section repair.
- Inspect and replace old parts with new parts as necessary. Look for deep scratches on surfaces, and nicks or cuts in "O" rings.
- Take precautions to prevent cutting "O" rings upon installation.
- Lubricate "O" rings with Lubriplate FML-2 grease.
- Do not over-tighten fasteners, refer to torque specification block on view.
- Re-torque fasteners following restart.
- SERVICE TOOLS – To aid in the installation (168) "O" rings onto the (167) pilot piston, use Tool # 204130-T, available from Aro.

PILOT VALVE DISASSEMBLY

1. A light tapping on (118) should expose the opposite (121) sleeve, (167) pilot piston and other parts.
2. Remove (170) sleeve, inspect inner bore of sleeve for damage.

PILOT VALVE REASSEMBLY



1. Clean and lubricate parts not being replaced from service kit.
2. Install new (171 and 172) "O" rings, replace (170) sleeve.
3. Install new (168) "O" rings and (169) seal - Note the lip direction. Lubricate and replace (167).
4. Reassemble remaining parts, replace (173 and 174) "O" rings.

MAJOR VALVE DISASSEMBLY

1. Remove (135) valve block and (233) adapter plate, exposing (132 and 166) gaskets and (176) checks.
2. Remove (233) adapter plate, releasing (140) valve insert, (141) valve plate and (200) gasket.
3. Remove (136) end cap and (137) gasket, releasing (111) spool.

MAJOR VALVE REASSEMBLY

1. Install new (138 and 139) "U" cups on (111) spool – **LIPS MUST FACE EACH OTHER.**
2. Insert (111) spool into (135) valve block.
3. Install (137) gasket on (136) end cap and assemble end cap to (135) valve block, securing with (107) end plates and (105) screws. NOTE: Tighten (105) screws to 35 - 40 in. lbs (4.0 - 4.5 Nm).
4. Install (140) valve insert and (141) valve plate into (135) valve block. NOTE: Assemble (140) valve insert with "dished" side toward (141) valve plate. Assemble (141) valve plate with part number identification toward (140) valve insert.
5. Assemble (200) gasket and (233) adapter plate to (135) valve block.
6. Assemble (132 and 166) gaskets and (176) checks and to (101) body.
7. Assemble (135) valve block and components to (101) body, securing with (134) screws. NOTE: Tighten (134) screws to 35 - 40 in. lbs (4.0 - 4.5 Nm).

☞ TORQUE REQUIREMENTS ☜

NOTE: DO NOT OVERTIGHTEN FASTENERS.
ALL FASTENERS ARE METRIC.

Torque (105 and 134) Screw to 35 - 40 in. lbs (4.0 - 4.5 Nm).

LUBRICATION / SEALANTS

☆ **Apply Lubriplate FML-2 Grease to "O" rings, "U" Cups & mating parts.**
☐ **Apply anti-seize compound to threads at assembly.**

A replacement Major Valve Service Assembly is available separately, which includes the following:

637395-1 for models PD10P-X: 105 (4), 107 (2), 111, 132, 135, 136, 137, 138, 139, 140, 141, 166, 176 (2), 200, 233 and 236 (4)

637395-2 for models PE10P-X: 76, 105 (4), 107 (2), 111, 132, 135, 136, 137, 138, 139, 140, 141, 166, 176 (2), 200, 233 and 236 (4)

Figure 3

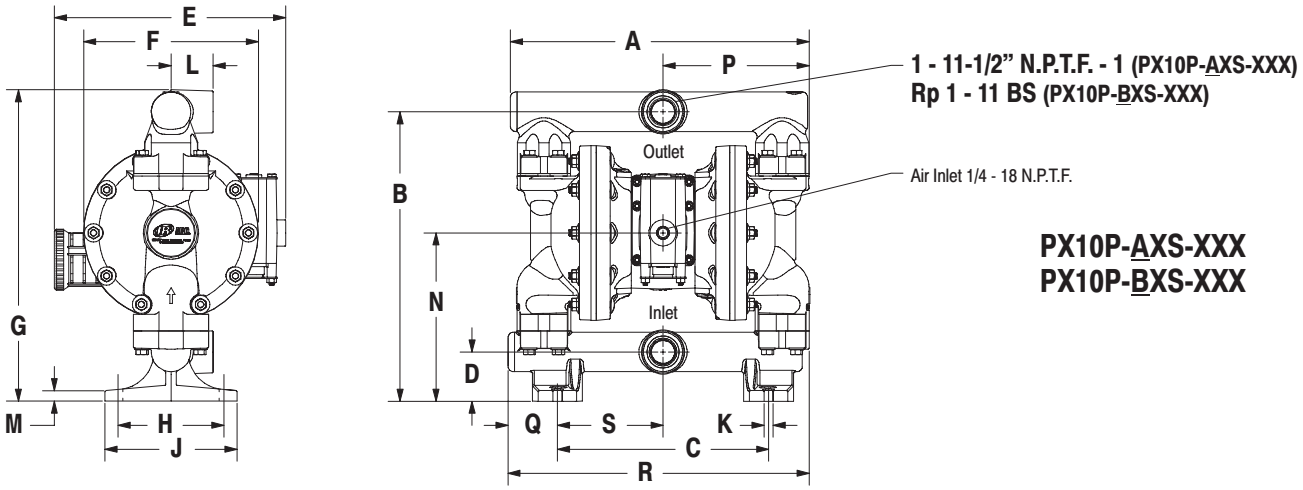
TROUBLE SHOOTING

Product discharged from exhaust outlet.
- Check for diaphragm rupture.
- Check tightness of (6) diaphragm screw.

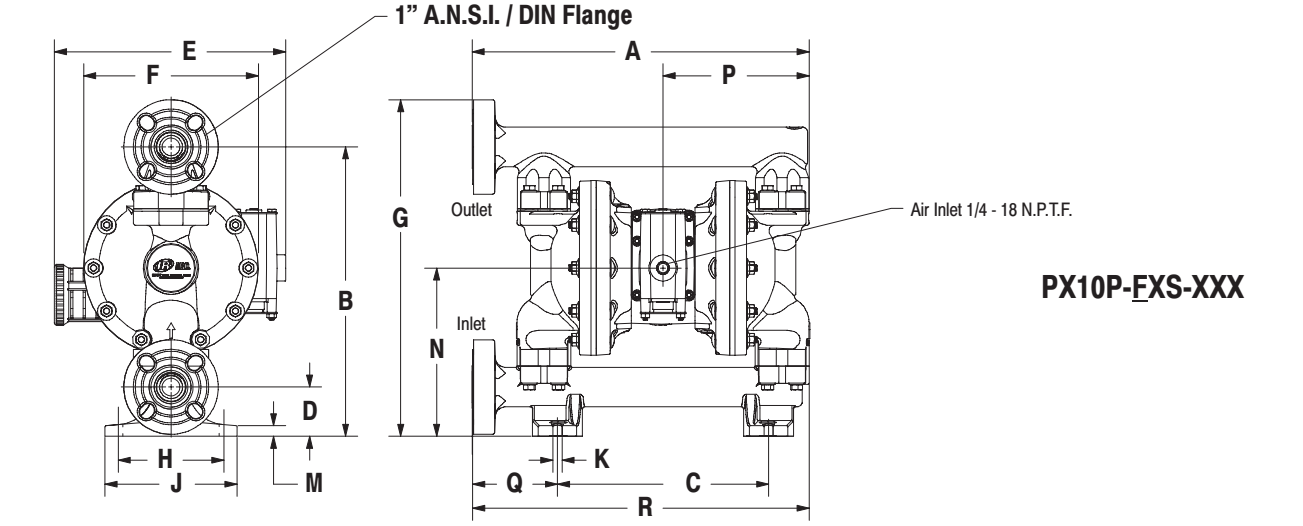
Air bubbles in product discharge.
- Check connections of suction plumbing.
- Check "O" rings between intake manifold and inlet side fluid caps.
- Check tightness of (6) diaphragm screw.

Motor blows air or stalls.
- Check (176) check valve for damage or wear.
- Check for restrictions in valve / exhaust.

Low output volume, erratic flow, or no flow.
- Check air supply.
- Check for plugged outlet hose.
- Check for kinked (restrictive) outlet material hose.
- Check for kinked (restrictive) or collapsed inlet material hose.
- Check for pump cavitation – suction pipe should be sized at least as large as the inlet thread diameter of the pump for proper flow if high viscosity fluids are being pumped. Suction hose must be a non-collapsing type, capable of pulling a high vacuum.
- Check all joints on the inlet manifolds and suction connections. These must be air tight.
- Inspect the pump for solid objects logged in the diaphragm chamber or the seat area.



DIMENSIONAL DATA



(Dimensions shown are for reference only, they are displayed in inches and millimeters (mm).

Introduction and Safety

Introduction

Purpose of this manual

The purpose of this manual is to provide necessary information for:

- Installation
- Operation
- Maintenance

CAUTION:

Read this manual carefully before installing and using the product. Improper use of the product can cause personal injury and damage to property, and may void the warranty.

NOTICE:

Save this manual for future reference, and keep it readily available at the location of the unit.

Safety

WARNING:

- The operator must be aware of safety precautions to prevent physical injury.
- Any pressure-containing device can explode, rupture, or discharge its contents if it is over-pressurized. Take all necessary measures to avoid over-pressurization.
- Operating, installing, or maintaining the unit in any way that is not covered in this manual could cause death, serious personal injury, or damage to the equipment. This includes any modification to the equipment or use of parts not provided by Xylem. If there is a question regarding the intended use of the equipment, please contact an Xylem representative before proceeding.
- This manual clearly identifies accepted methods for disassembling units. These methods must be adhered to. Trapped liquid can rapidly expand and result in a violent explosion and injury. Never apply heat to impellers, propellers, or their retaining devices to aid in their removal.
- Do not change the service application without the approval of an authorized Xylem representative.

CAUTION:

You must observe the instructions contained in this manual. Failure to do so could result in physical injury, damage, or delays.

Safety terminology and symbols

About safety messages

It is extremely important that you read, understand, and follow the safety messages and regulations carefully before handling the product. They are published to help prevent these hazards:

- Personal accidents and health problems
- Damage to the product
- Product malfunction

Hazard levels

Hazard level	Indication
 DANGER:	A hazardous situation which, if not avoided, will result in death or serious injury
 WARNING:	A hazardous situation which, if not avoided, could result in death or serious injury
 CAUTION:	A hazardous situation which, if not avoided, could result in minor or moderate injury
NOTICE:	• A potential situation which, if not avoided, could result in undesirable conditions • A practice not related to personal injury

Hazard categories

Hazard categories can either fall under hazard levels or let specific symbols replace the ordinary hazard level symbols.

Electrical hazards are indicated by the following specific symbol:

Electrical Hazard:

These are examples of other categories that can occur. They fall under the ordinary hazard levels and may use complementing symbols:

- Crush hazard
- Cutting hazard
- Arc flash hazard

Environmental safety

The work area

Always keep the station clean to avoid and/or discover emissions.

Waste and emissions regulations

Observe these safety regulations regarding waste and emissions:

- Appropriately dispose of all waste.
- Handle and dispose of the processed liquid in compliance with applicable environmental regulations.
- Clean up all spills in accordance with safety and environmental procedures.
- Report all environmental emissions to the appropriate authorities.

WARNING:
Do NOT send the product to the Xylem manufacturer if it has been contaminated by any nuclear radiation. Inform Xylem so that accurate actions can take place.

Electrical installation

For electrical installation recycling requirements, consult your local electric utility.

Recycling guidelines

Always follow local laws and regulations regarding recycling.

User safety

General safety rules

These safety rules apply:

- Always keep the work area clean.
- Pay attention to the risks presented by gas and vapors in the work area.
- Avoid all electrical dangers. Pay attention to the risks of electric shock or arc flash hazards.
- Always bear in mind the risk of drowning, electrical accidents, and burn injuries.

Safety equipment

Use safety equipment according to the company regulations. Use this safety equipment within the work area:

- Hard hat
- Safety goggles, preferably with side shields
- Protective shoes
- Protective gloves
- Gas mask
- Hearing protection
- First-aid kit
- Safety devices

NOTICE:
Never operate a unit unless safety devices are installed. Also see specific information about safety devices in other chapters of this manual.

Electrical connections

Electrical connections must be made by certified electricians in compliance with all international, national, state, and local regulations. For more information about requirements, see sections dealing specifically with electrical connections.

Precautions during work

Observe these safety precautions when you work with the product or are in connection with the product:

- Never work alone.
- Always wear protective clothing and hand protection.
- Stay clear of suspended loads.
- Always lift the product by its lifting device.
- Beware of the risk of a sudden start if the product is used with an automatic level control.
- Beware of the starting jerk, which can be powerful.

- Rinse the components in water after you disassemble the pump.
- Do not exceed the maximum working pressure of the pump.
- Do not open any vent or drain valve or remove any plugs while the system is pressurized. Make sure that the pump is isolated from the system and that pressure is relieved before you disassemble the pump, remove plugs, or disconnect piping.
- Never operate a pump without a properly installed coupling guard.

Wash the skin and eyes

Follow these procedures for chemicals or hazardous fluids that have come into contact with your eyes or your skin:

Condition	Action
Chemicals or hazardous fluids in eyes	1. Hold your eyelids apart forcibly with your fingers. 2. Rinse the eyes with eyewash or running water for at least 15 minutes. 3. Seek medical attention.
Chemicals or hazardous fluids on skin	1. Remove contaminated clothing. 2. Wash the skin with soap and water for at least 1 minute. 3. Seek medical attention, if necessary.

Product warranty

Coverage

Xylem undertakes to remedy faults in products from Xylem under these conditions:

- The faults are due to defects in design, materials, or workmanship.
- The faults are reported to an Xylem representative within the warranty period.
- The product is used only under the conditions described in this manual.
- The monitoring equipment incorporated in the product is correctly connected and in use.
- All service and repair work is done by Xylem-authorized personnel.
- Genuine Xylem parts are used.
- Only Ex-approved spare parts and accessories authorized by Xylem are used in Ex-approved products.

Limitations

The warranty does not cover faults caused by these situations:

- Deficient maintenance
- Improper installation
- Modifications or changes to the product and installation made without consulting Xylem
- Incorrectly executed repair work
- Normal wear and tear

Xylem assumes no liability for these situations:

- Bodily injuries
- Material damages
- Economic losses

Warranty claim

Xylem products are high-quality products with expected reliable operation and long life. However, should the need arise for a warranty claim, then contact your Xylem representative.

Transportation and Storage

Inspect the delivery

Inspect the package

1. Inspect the package for damaged or missing items upon delivery.
2. Note any damaged or missing items on the receipt and freight bill.
3. File a claim with the shipping company if anything is out of order.
   If the product has been picked up at a distributor, make a claim directly to the distributor.

Inspect the unit

1. Remove packing materials from the product.
   Dispose of all packing materials in accordance with local regulations.
2. Inspect the product to determine if any parts have been damaged or are missing.
3. If applicable, unfasten the product by removing any screws, bolts, or straps.
   For your personal safety, be careful when you handle nails and straps.
4. Contact your sales representative if anything is out of order.

Transportation guidelines

Lifting methods

WARNING:

- Assembled units and their components are heavy. Failure to properly lift and support this equipment can result in serious physical injury and/or equipment damage. Lift equipment only at the specifically identified lifting points. Lifting devices such as eyebolts, slings, and spreaders must be rated, selected, and used for the entire load being lifted.
- Crush hazard. The unit and the components can be heavy. Use proper lifting methods and wear steel-toed shoes at all times.

Storage guidelines

Storage location

The product must be stored in a covered and dry location free from heat, dirt, and vibrations.

NOTICE:

- Protect the product against humidity, heat sources, and mechanical damage.
- Do not place heavy weights on the packed product.

Long-term storage

If the unit is stored for more than 6 months, these requirements apply:

- Store in a covered and dry location.
- Store the unit free from heat, dirt, and vibrations.
- Rotate the pump shaft by hand several times at least every three months.

Treat bearings and machined surfaces so that they are well preserved. Refer to the drive unit and coupling manufacturers for their long-term storage procedures.

For questions about possible long-term storage treatment services, please contact your local Xylem sales representative.

Product Description

General description

AquaBoost CS pumping package

Depending upon the pumping capacity required, a simplex (one-pump) type or a duplex (two-pump) type is used. In both types, a pressure switch starts and stops the pump.

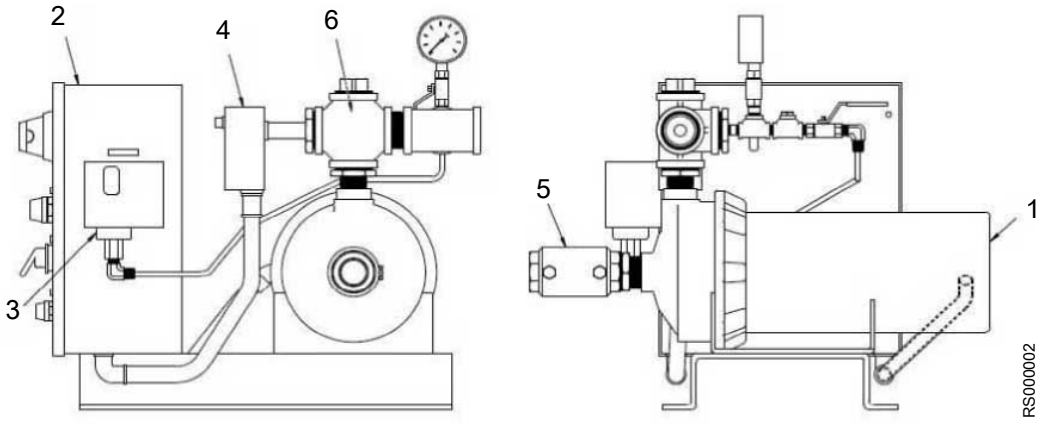
The AquaBoost Constant Speed pumping package operates pumps across the line to increase the domestic water pressure up to 55 psi above that of the city water pressure.

AquaBoost VS pumping package

The AquaBoost Variable Speed pumping package can precisely match the pump discharge pressure to the system pressure by varying the speed of the pump. This is accomplished by using the variable-speed controllers such as the AquaBoost II and Aquavar CPC.

The pressure transducer monitors the system pressure, allowing the controller to start and regulate the pump speed. AquaBoost VS is available in simplex and duplex configurations.

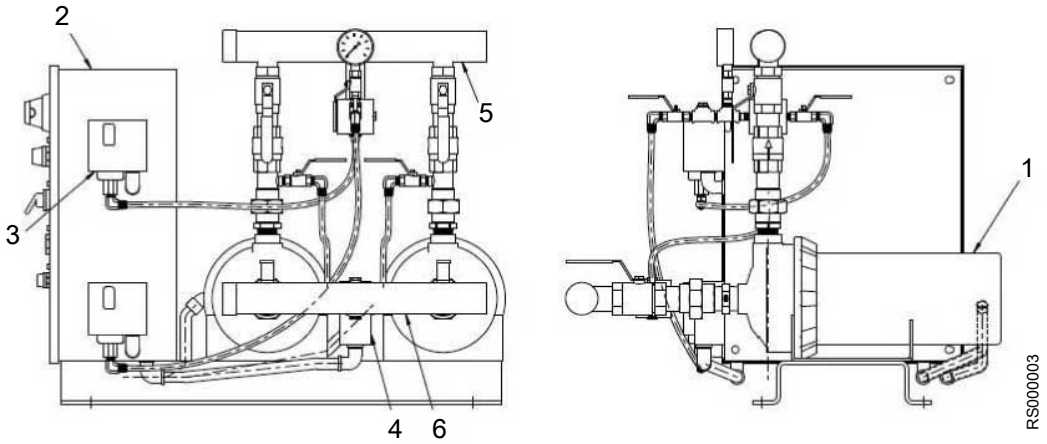
Operational limits



Ambient temperature and humidity

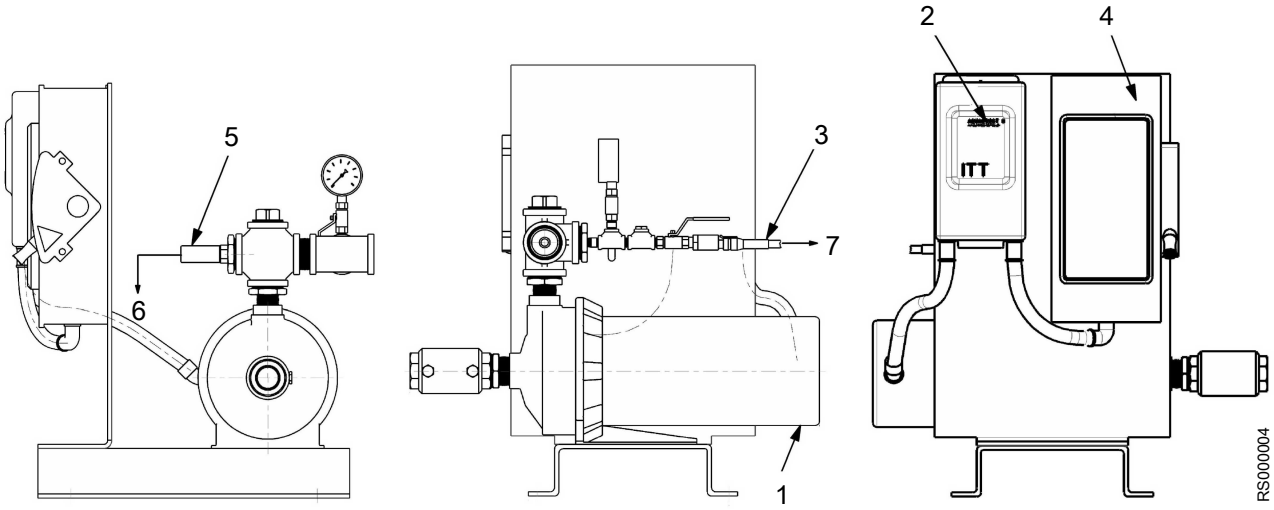
All electrical equipment is susceptible to failure if operated in ambient temperatures outside of its rating. Do not operate the unit outside these extremes.

Characteristic	Specification
Operating temperature range	32°F to 105°F (0°C to 40°C)
Maximum relative humidity	95% non-condensing



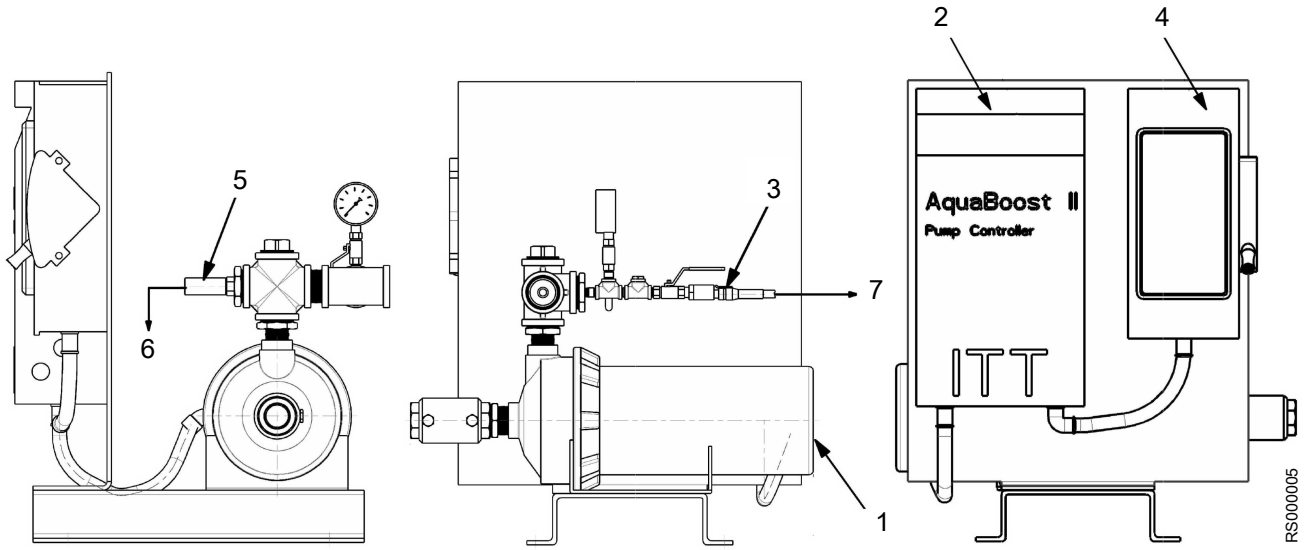
Package information

AquaBoost CS simplex



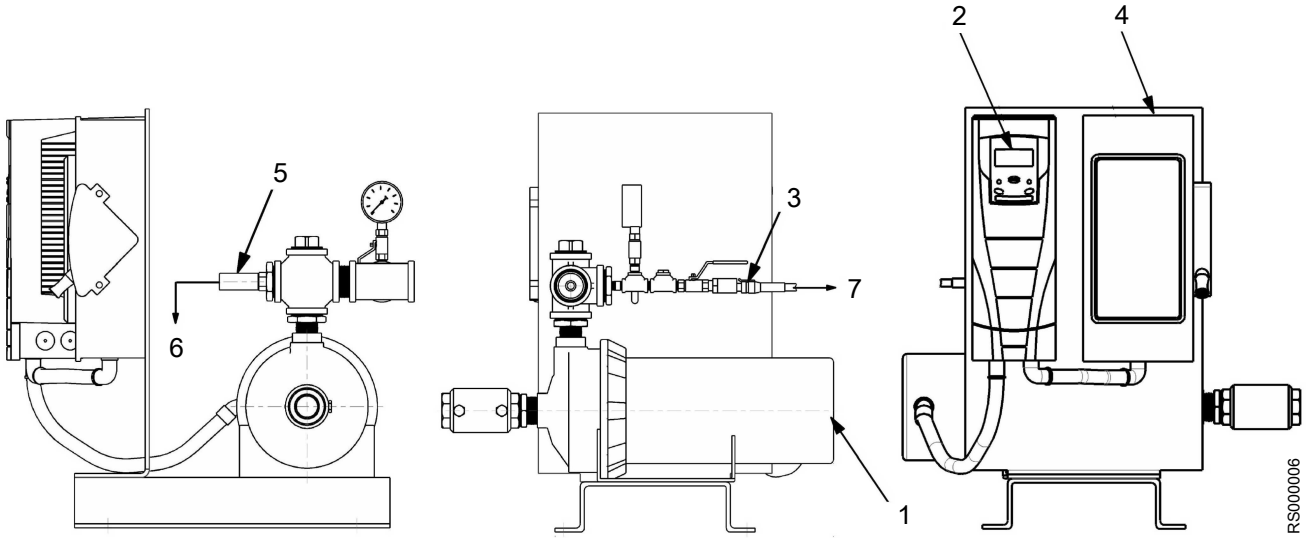
1. Pump: NPE with TEFC motor
2. Control panel with disconnect switch
3. Pressure switch
4. Temperature limit switch
5. Check valve, stainless steel
6. Stainless steel pump trim assembly

AquaBoost CS duplex



1. Pump: NPE with TEFC motor
2. Control panel with disconnect switch
3. Pressure switch, one per pump
4. Temperature limit switch
5. Discharge header: copper L-type
6. Suction header: copper L-type

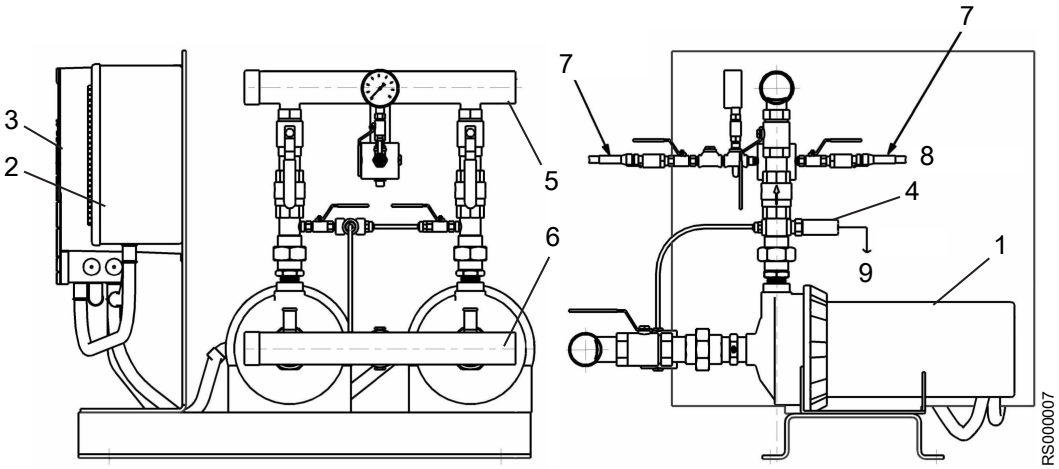
AquaBoost VS simplex



This variable-speed configuration uses the AquaBoost II controller model 1151AB2 or 2AB2 (for single-phase power supply: 115V – 0.75 hp; 230V – 1.5 to 2 hp range).

1. Pump: NPE with TEFC motor
2. AquaBoost II controller
3. Transducer assembly
4. Safety switch
5. Temperature relief valve
6. To drain
7. To controller

This variable-speed configuration uses the AquaBoost II controller model 3AB2 or 5AB2 (for single-phase power supply: 3V – 5 hp motors).



1. Pump: NPE with TEFC motor
2. AquaBoost II controller
3. Transducer assembly
4. Safety switch
5. Temperature relief valve
6. To drain
7. To controller

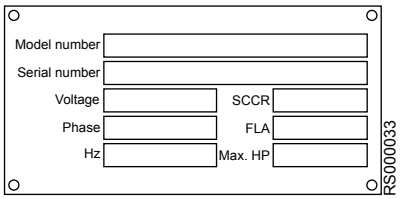
This variable-speed configuration uses the Aquavar CPC controller (for 3–phase power supply: 1.5 to 5 hp range).

1. Pump: NPE with TEFC motor
2. Temperature relief valve
3. Transducer assembly
4. Aquavar CPC controller
5. Safety switch
6. To drain
7. To controller

AquaBoost VS duplex

This variable-speed duplex configuration uses the Aquavar CPC controller (for 3–phase power supply: 1.5 to 5 hp range).

1. Pump: NPE with TEFC motor
2. Safety switch single-point power panel
3. Aquavar CPC controller
4. Temperature relief valve
5. Discharge header: copper L-type
6. Suction header: copper L-type
7. Pressure transducer assembly
8. To controller
9. To drain



Nameplate information

Nameplate

Every pump station has a nameplate that provides information about the pump station. The pump station nameplate is located on the outside of the control enclosure door.

When ordering spare parts, please be prepared to identify the nameplate information when contacting the factory.

- Model
- Size
- Serial number
- Item numbers of the required parts

Nameplate field	Explanation
Model number	The model number of the pump station
Serial number	The serial number of the pump station
Voltage	Input voltage required for the pump station
Phase	Single-phase or 3–phase
Hz	Frequency

Nameplate field	Explanation
SCCR	Short circuit current rating
FLA	Full load amps
Max. HP	Maximum horsepower

Model number designation

Number of pumps	Pump model / rpm	HP	Voltage / Phase	Impeller diameter (inches)	Control
1	A (1x1-1/4, 3600)	05 = 1/2	1 = 115/1/60	A = 4-5/8	–CS = constant speed
2	B (1-1/4x1-1/2, 3600)	07 = 3/4	2 = 208/3/60	B = 5-1/16	–VS = variable speed
		10 = 1	3 = 380/3/50	C = 5-3/16	
		15 = 1.5	4 = 460/3/60	D = 5-3/4	
		20 = 2	5 = 575/3/60	E = 5-15/16	
		30 = 3	6 = 230/1/60	F = 6-1/8	
		50 = 5	7 = other	Z = other	
			8 = 230/3/60		
			A = 208–230/3/60*		
			B = 208–230/1/60*		
*Variable speed only					

Owner's information

Fill in the right-hand column with the information specific to your pump station.

Installation

Field connections

Review the field piping diagrams and wiring diagrams before you install and operate the unit.

Electrical precautions

WARNING:

Electrical shock hazard. The electrical supply must match the control panel nameplate specification. Incorrect voltage can cause a fire, which damages the electrical components and voids the warranty. Failure to follow these instructions could result in serious personal injury or death, or property damage.

NOTICE:

Electrical connections must be made by certified electricians in compliance with all international, national, state, and local rules.

Power wiring

Select power wire types and sizes based upon conformance with the National Electrical Code and all local codes and restrictions. In addition, only copper (Cu) wire rated for at least 167°F (75°C) can be used for the power connections. Refer to the input current as listed on the motor nameplate when sizing wire.

Power supply requirements

The power supply required for the AquaBoost CS unit depends on its model number. It can be one of the following with a dedicated ground wire:

- 115/1/60
- 230/1/60
- 208, 230, 460/3/60
- 380/3/50
- 575/3/60

The power supply required for the AquaBoost VS unit depends on its model number. It can be one of the following with a dedicated ground wire:

- 115/1/60
- 230/1/60
- 208, 230, 460, 575/3/60
- 380/3/50

WARNING:

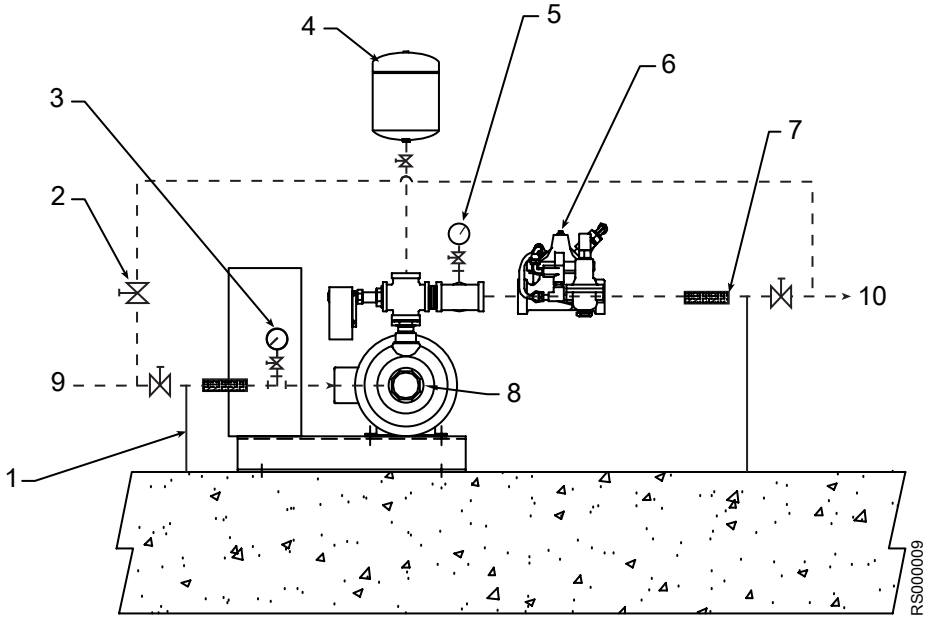
Electrical shock hazard. Conduit grounds are not adequate. You must attach a separate earth (ground) wire to the earth (ground) lug provided in the enclosure in order to avoid potential safety hazards. Failure to follow these instructions can result in serious personal injury, death, or property damage.

Input voltage tolerance

The input voltage tolerance is – 10% of the voltage indicated on the nameplate.

Overload protection for constant-speed units

Motor type	Overload protection	Description
Single-phase	Internal	• Disconnecting means • Fuses for short-circuit protection
Three-phase	External in the control panel	• Disconnecting means • GV2Ps / manual starters with thermal overload for short-circuit protection in the control panel



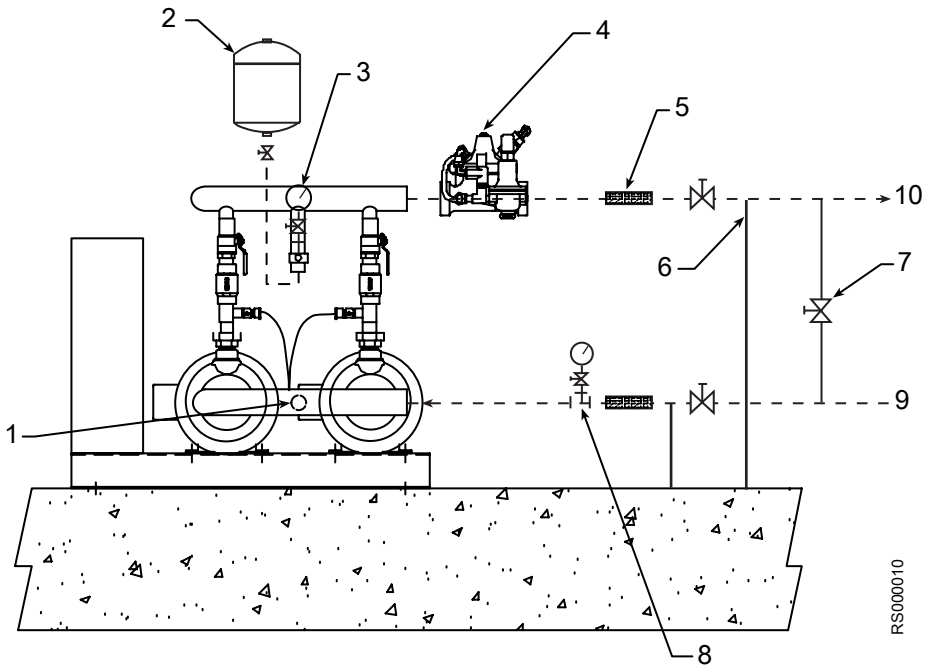
Overload protection for variable-speed units

Variable-speed units have a single-point power panel with fuses for protection against voltage spikes. In addition, the controllers have inherent features that protect the unit against:

- short circuit
- undervoltage
- overload
- motor temperature
- dead heading
- run out
- suction loss
- sensor fault
- bound pump
- overvoltage
- static discharge

Field piping diagrams

AquaBoost CS simplex



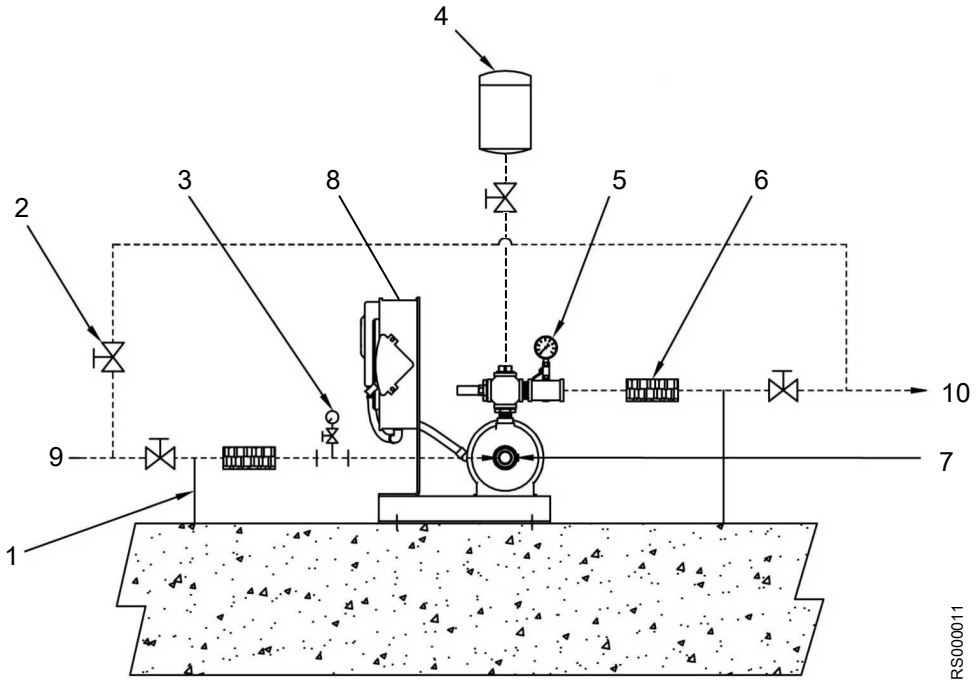
Typical field piping arrangement for the AquaBoost Constant Speed simplex pumping package.

1. Anchor the pipe securely if vibration eliminators are used.
2. If a bypass line is installed, then this valve must be kept closed during normal operation. Do not install a check valve.
3. Suction gauge, recommended
4. Optional tank

5. Discharge gauge
6. Optional pressure reducing valve
7. Vibration eliminator
8. 1/4 in. inlet tap on the check valve for low-suction pressure switch
9. City supply
10. To system

_ _ _ _ Dashed lines indicate field installation.

AquaBoost CS duplex

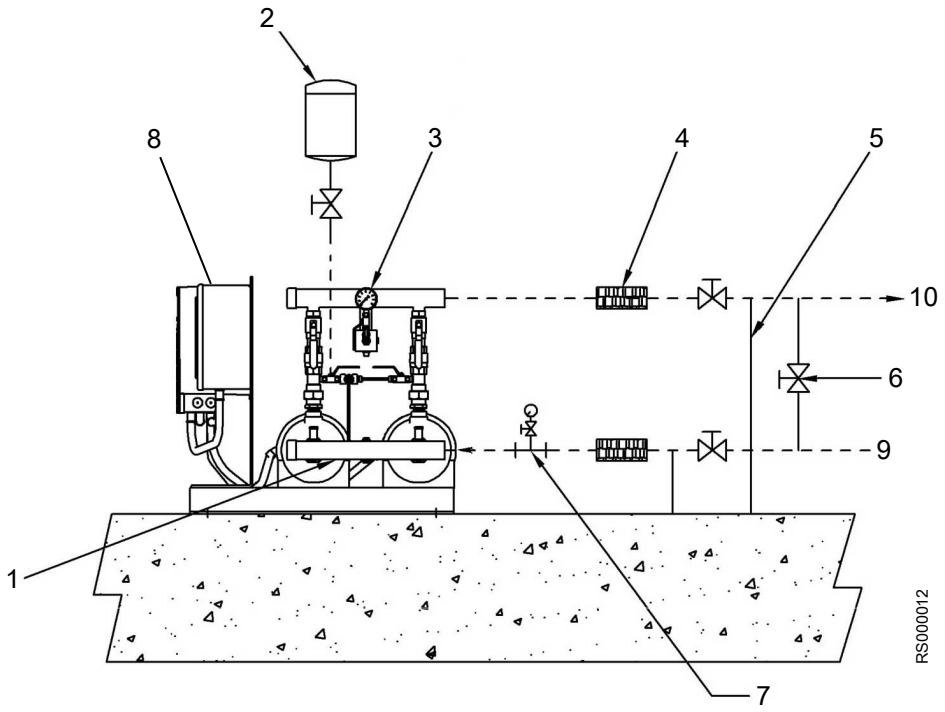


Typical field piping arrangement for the AquaBoost Constant Speed duplex pumping package.

1. 1/4 in. tap on the suction manifold for low-suction pressure switch
2. Optional tank
3. Discharge gauge
4. Optional pressure reducing valve
5. Vibration eliminator
6. Anchor the pipe securely if vibration eliminators are used.
7. If a bypass line is installed, then this valve must be kept closed during normal operation. Do not install a check valve.
8. Suction gauge, recommended
9. City supply
10. To system

_ _ _ _ Dashed lines indicate field installation.

AquaBoost VS simplex

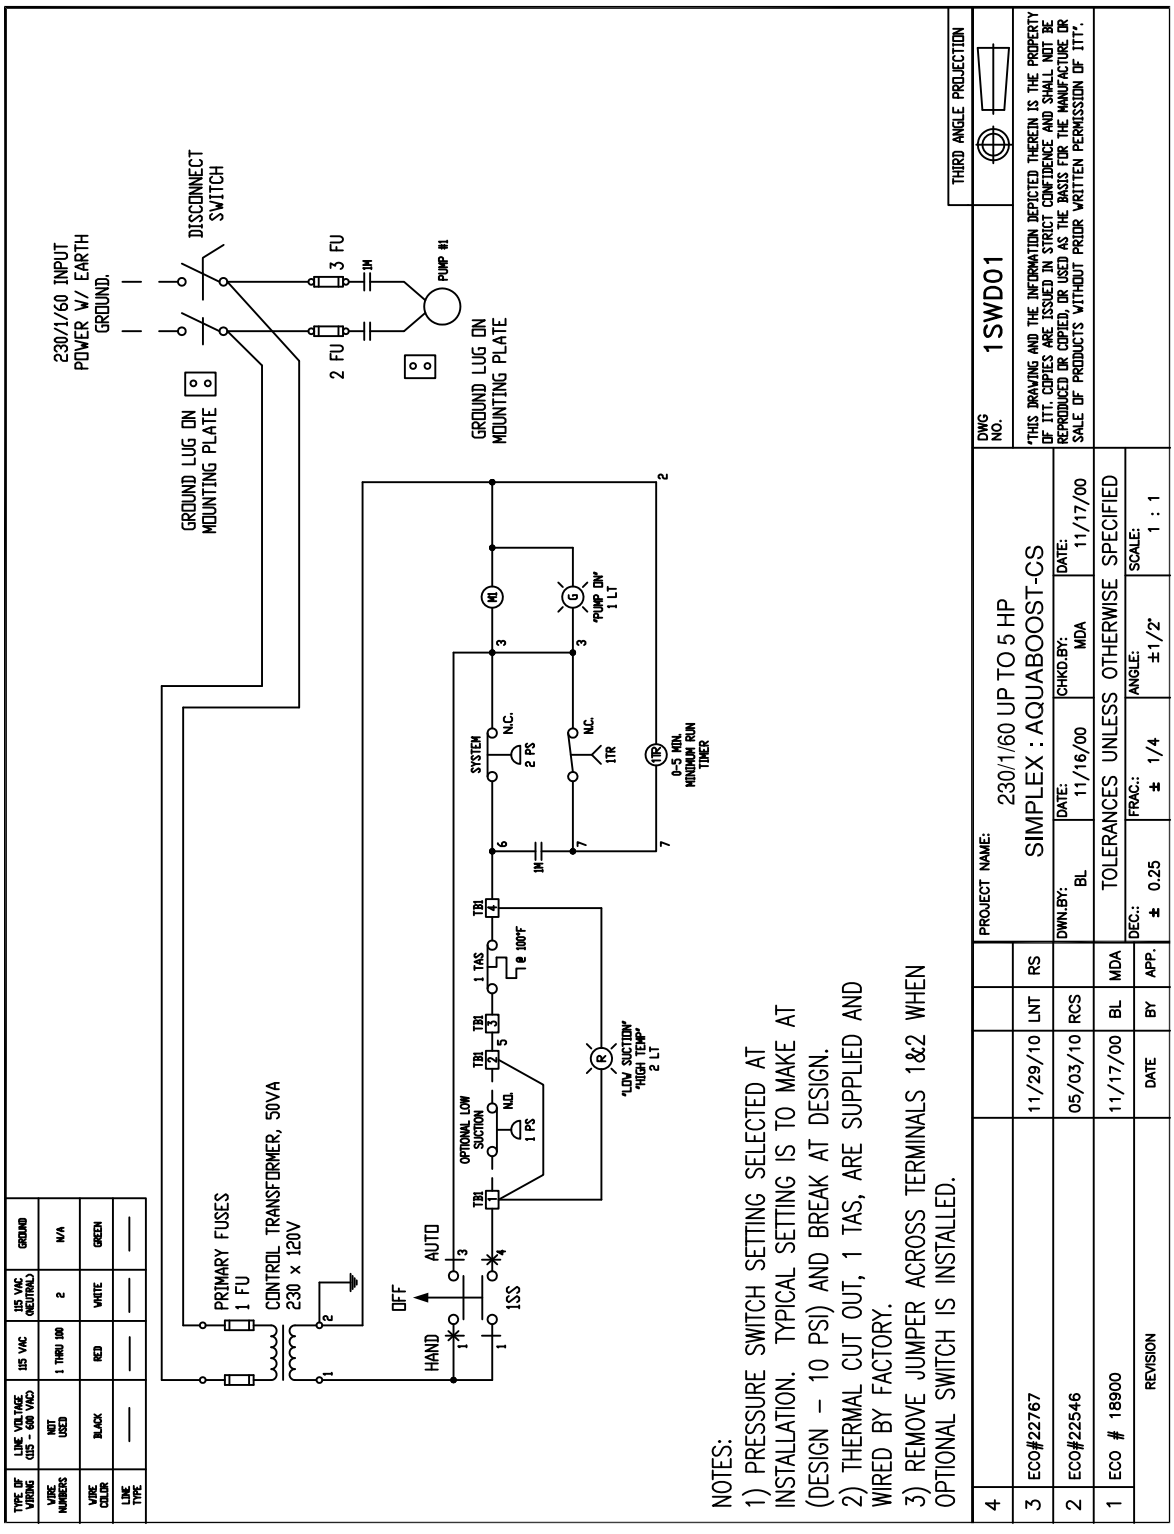


Typical field piping arrangement for the AquaBoost Variable Speed simplex pumping package.

1. Anchor the pipe securely if vibration eliminators are used.
2. If a bypass line is installed, then this valve must be kept closed during normal operation. Do not install a check valve.
3. Suction gauge, recommended
4. Optional tank
5. Discharge gauge
6. Vibration eliminator
7. 1/4 in. inlet tap on the check valve for low-suction pressure switch
8. Controller: AquaBoost II or Aquavar CPC
9. City supply
10. To system

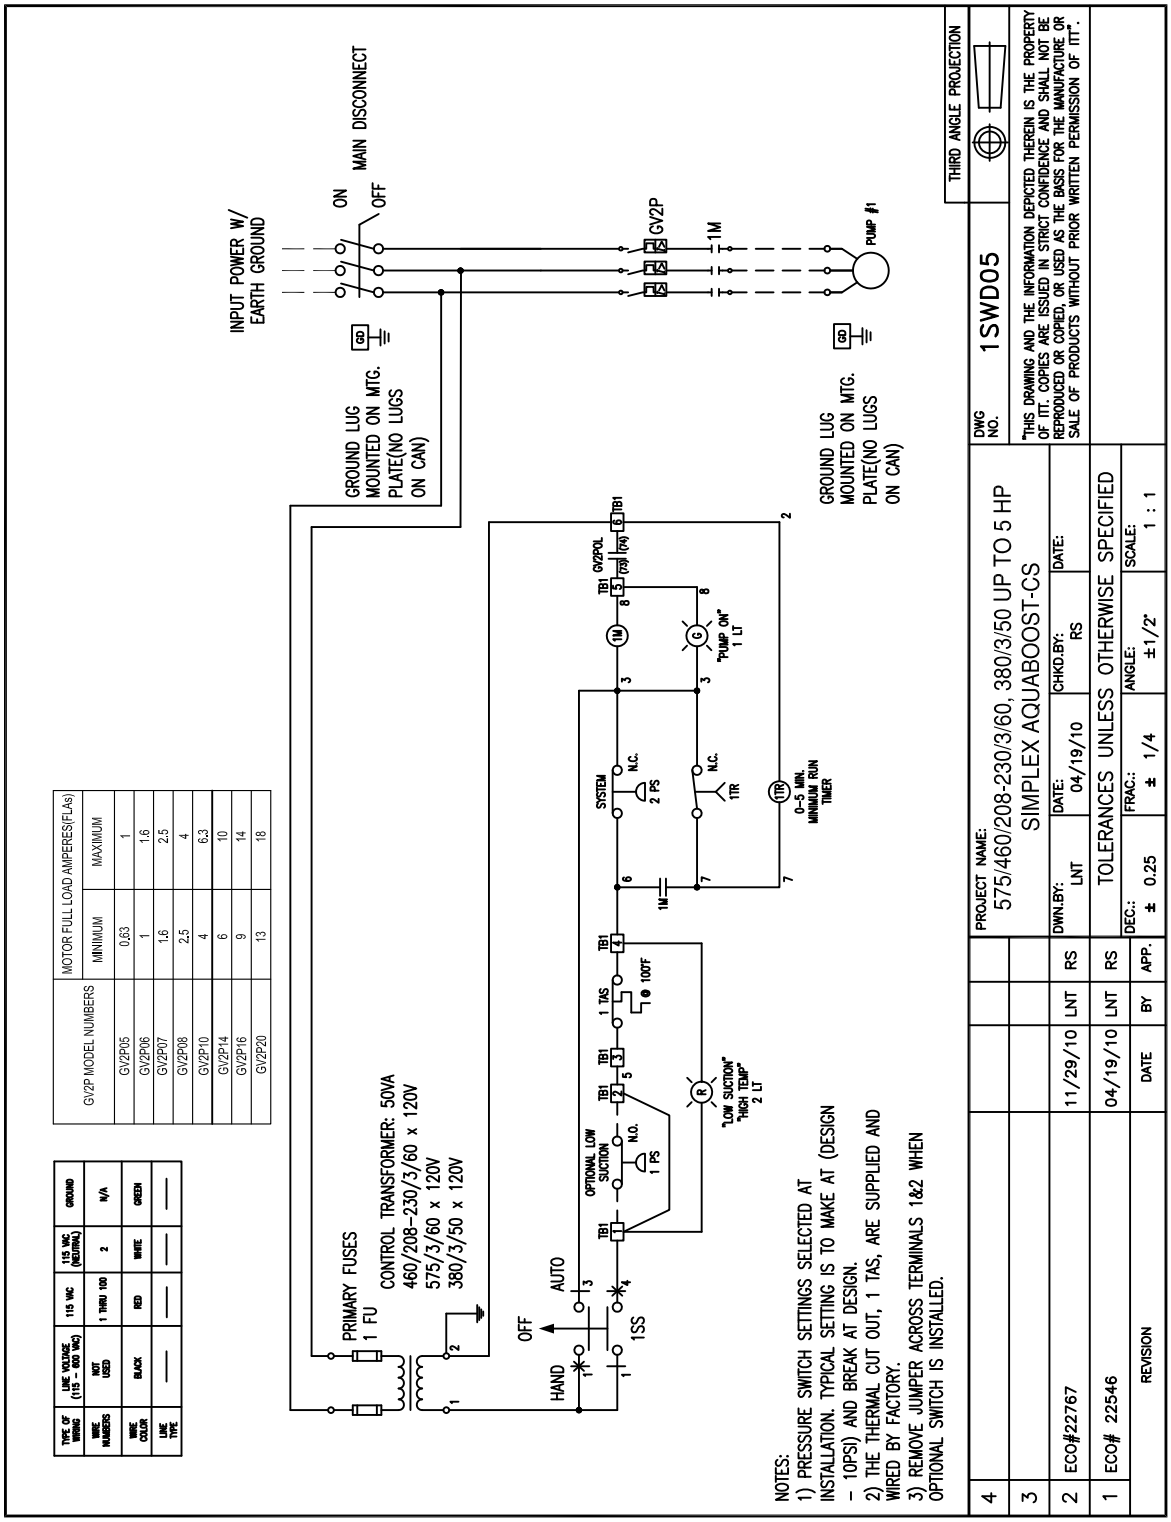
_ _ _ _ Dashed lines indicate field installation.

AquaBoost VS duplex



Typical field piping arrangement for the AquaBoost Variable Speed duplex pumping package.

1. 1/4 in. tap on the suction manifold for low-suction pressure switch
2. Optional tank
3. Discharge gauge
4. Vibration eliminator
5. Anchor the pipe securely if vibration eliminators are used.
6. If a bypass line is installed, then this valve must be kept closed during normal operation. Do not install a check valve.
7. Suction gauge, recommended
8. Controller: Aquavar CPC
9. City supply
10. To system



_ _ _ _ Dashed lines indicate field installation.

Earth (ground) connections

WARNING:

Electrical shock hazard. Conduit grounds are not adequate. You must attach a separate earth (ground) wire to the earth (ground) lug provided in the enclosure in order to avoid potential safety hazards. Failure to follow these instructions can result in serious personal injury, death, or property damage.

A grounding terminal is provided for a dedicated earth (ground) wire connection. You must follow all provisions of the National Electrical Code and local codes.

Pump package location guidelines

WARNING:

Assembled units and their components are heavy. Failure to properly lift and support this equipment can result in serious physical injury and/or equipment damage. Lift equipment only at the specifically identified lifting points. Lifting devices such as eyebolts, slings, and spreaders must be rated, selected, and used for the entire load being lifted.

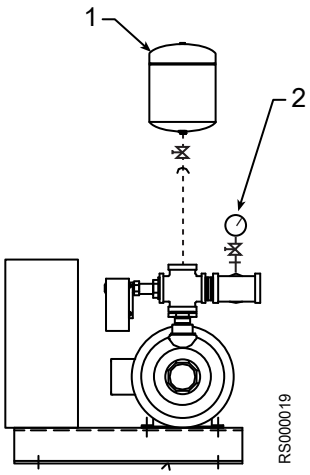
Guideline	Explanation/comment
Make sure that the space around the pump package is sufficient.	This facilitates ventilation, inspection, maintenance, and service.
If you require lifting equipment such as a hoist or tackle, make sure that there is enough space above the pump package.	This makes it easier to properly use the lifting equipment and safely remove and relocate the components to a safe location.
Protect the unit from weather and water damage due to rain, flooding, and freezing temperatures.	This is applicable if nothing else is specified.
Do not install and operate the equipment in closed systems unless the system is constructed with properly-sized safety and control devices.	Acceptable devices: • Pressure relief valves • Compression tanks • Pressure controls • Temperature controls • Flow controls If the system does not include these devices, consult the engineer or architect in charge before you operate the pump.
Take into consideration the occurrence of abnormal noise and vibration.	The best pump location for noise and vibration absorption is on a concrete floor with subsoil underneath.

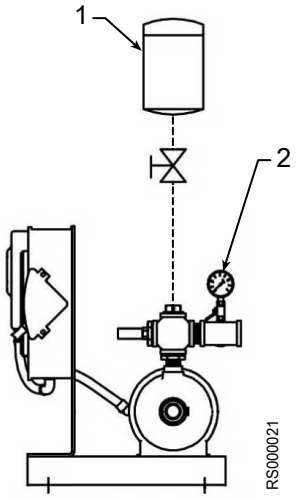
Foundation requirements

Requirements

- The foundation must be able to absorb any type of vibration and form a permanent, rigid support for the unit.
- The foundation must weigh at least 2-1/2 times the weight of the pump unit.
- Provide a flat, substantial concrete foundation in order to prevent strain and distortion when you tighten the foundation bolts.
- Sleeve-type and J-type foundation bolts are most commonly used. Both designs allow movement for the final bolt adjustment.
- Tie the concrete pad in with the finished floor.

Level the base on a concrete foundation





1. Place the pump package on its concrete foundation.
2. Place 1.00 in./(25.40 mm) thick steel shims or wedges on both sides of each anchor bolt in order to support the pump package.

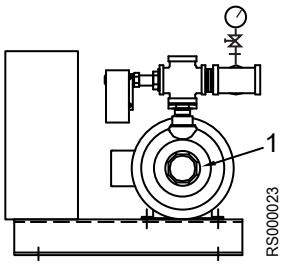
   Make sure you also place the shims or wedges midway between the bolts.

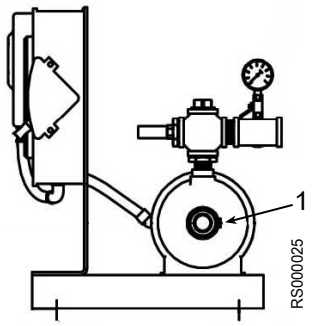
   This also provides a means of leveling the base.

Connect the optional storage tank

1. If the unit is a simplex configuration, then install the tank to the top connection of the discharge cross as shown:

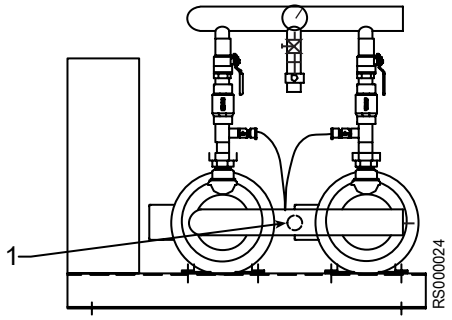
Constant speed	Variable speed
 1. Storage tank 2. Discharge gauge	 1. Storage tank 2. Discharge gauge

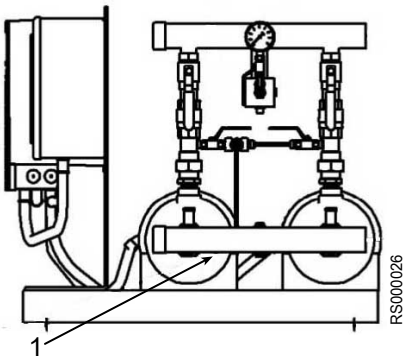




2. If the unit is a duplex configuration, then connect the tank to the discharge manifold as shown:

Constant speed	Variable speed
 1. Storage tank 2. Discharge gauge	 1. Storage tank 2. Discharge gauge





3. Precharge the tank according to the tank-specific IOM.

Connect the optional low-suction pressure switch

1. If the unit is a simplex configuration, then install the low-suction pressure switch piped to the 1/4 in. inlet tap on the check valve as shown:

Constant speed	Variable speed
	
1. 1/4 in. inlet tap on check valve	1. 1/4 in. inlet tap on check valve

2. If the unit is a duplex configuration, then install the low-suction pressure switch piped to the 1/4 in. tap on the suction manifold as shown:

Constant speed	Variable speed
	
1. 1/4 in. inlet tap on check valve	1. 1/4 in. inlet tap on check valve

Piping checklist

WARNING:

- The heating of water and other fluids causes volumetric expansion. The associated forces can cause the failure of system components and the release of high-temperature fluids. In order to prevent this, install properly sized and located compression tanks and pressure-relief valves. Failure to follow these instructions can result in serious personal injury or death, or property damage.
- Avoid serious personal injury and property damage. Make sure that the flange bolts are adequately torqued.
- Never force piping to make a connection with a pump.

Check	Explanation/comment	Checked
Check that the suction and discharge pipes are supported independently by use of pipe hangers near the pump station.	This eliminates pipe strain on the pump station.	

Check	Explanation/comment	Checked
Check that there is a strong, rigid support for the suction and discharge lines.	As a rule, ordinary wire or band hangers are not adequate to maintain proper alignment.	
Check that the suction or discharge lines are not forced into position.	Component failure will result if suction or discharge lines are forced into position.	
Check that fittings for absorbing expansion are installed in the system when considerable temperature changes are expected.	This helps to avoid strain on the pump.	
Check that eccentric reducers, if used, are installed with the flat side on top.	This eliminates air pockets.	
Check that a three-valve bypass has been installed between the suction and discharge connections.	This is a recommended field option.	
Check that the piping to which optional vibration eliminators are connected is properly anchored to the floor.	This is necessary for maximum effectiveness.	

Fastening

WARNING:

- Only use fasteners of the proper size and material.
- Replace all corroded fasteners.
- Make sure that all fasteners are properly tightened and that there are no missing fasteners.

Commissioning, Startup, Operation, and Shutdown

Preparation for startup

DANGER:

Electrical hazard sufficient to kill. Always disconnect and lock out the power before you service the unit.

WARNING:

- Failure to follow these precautions before you start the unit will lead to serious personal injury and equipment failure.
- Always disconnect and lock out power to the driver before you perform any installation or maintenance tasks. Failure to disconnect and lock out driver power will result in serious physical injury.
- Operating the pump in reverse rotation can result in the contact of metal parts, heat generation, and breach of containment.

Precautions

NOTICE:

- Verify the driver settings before you start any pump.

You must follow these precautions before you start the pump:

- Flush and clean the system thoroughly to remove dirt or debris in the pipe system in order to prevent premature failure at initial startup.
- If temperatures of the pumped fluid will exceed 200°F (93°C), then warm up the pump prior to operation. Circulate a small amount of fluid through the pump until the casing temperature is within 100°F (38°C) of the fluid temperature.

At initial startup, do not adjust the variable-speed drivers or check for speed governor or over-speed trip settings while the variable-speed driver is coupled to the pump. If the settings have not been verified, then uncouple the unit and refer to instructions supplied by the driver manufacturer.

Final installation checks

Installation checklist

CAUTION:

Serious damage to the pump may result if it is started dry. Make sure that the pump is completely filled with liquid before it is started.

Check	Checked
Check that the unit base is properly leveled and secured.	
Check that all lubrication points are properly lubricated.	
Check that the shut-off valves to the suction and discharge lines are open.	
Check that the system is purged of debris and air. This includes the pumps and PRVs.	
Check that the pump and motor shafts are properly aligned.	

Check	Checked
Check that the pump rotation is correct.	

Final piping checklist

Check	Checked
Check that the bypass valve is closed, if used.	
Check that the piping is properly supported. This prevents strain on the unit.	

Electrical wiring and control checklist

WARNING:

- Electrical shock hazard. Conduit grounds are not adequate. You must attach a separate earth (ground) wire to the earth (ground) lug provided in the enclosure in order to avoid potential safety hazards. Failure to follow these instructions can result in serious personal injury, death, or property damage.
- Always disconnect and lock out power to the package and the driver before you perform any installation or maintenance tasks. Failure to disconnect and lock out driver power will result in serious physical injury.

NOTICE:

Electrical connections must be made by certified electricians in compliance with all international, national, state, and local rules.

Check	Checked
Check that the feeder line voltage corresponds to the unit voltage. Check the unit nameplate or motor terminal connection.	
Check that the feeder wires are correctly sized according to local and NEC codes.	

Final adjustments

Make the final adjustments on these adjustable devices in order to match the exact system requirements.

Low-suction pressure switch (optional)

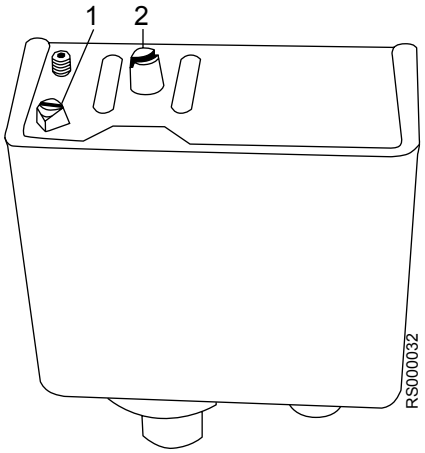
WARNING:

Always disconnect and lock out power to the package and the driver before you perform any installation or maintenance tasks. Failure to disconnect and lock out driver power will result in serious physical injury.

The pressure switch is piped into the suction line. An adjusting dial is located inside of the control. This adjustment controls the low-suction cutout. The differential pressure setting is fixed at 1.5 psi. Therefore cut-in pressure will be the switch setting plus 1.5 psi.

Although the scale is calibrated in psi, it may not correspond exactly to the actual suction gauge indication. Therefore, for critical installations, the setting should be adjusted according to the gauge reading. The approximate settings should be set prior to placing the unit in operation in order to suit the pressure conditions at the installation.

System pressure switches for constant speed units



WARNING:

Always disconnect and lock out power to the package and the driver before you perform any installation or maintenance tasks. Failure to disconnect and lock out driver power will result in serious physical injury.

The simplex unit has one switch and the duplex unit has two switches: one for each pump. Each switch is piped to the discharge piping.

Two adjusting screws are located on the top of the control. Facing the switch, the screw on the right-hand side sets the cutout pressure. Make this adjustment first.

The screw to the left and towards the front sets the cut-in point. Turn this screw until the proper cut-in pressure is obtained.

1. The silver adjusting screw on the left front is for cut-in adjustment.
2. The yellow adjusting screw on the right is for cutout adjustment.

Although the scales are calibrated in psi, they may not correspond exactly to the actual discharge gauge indication. Therefore, for critical installations, adjust the settings according to the gauge reading.

For the proper settings of the system pressure switches on a duplex unit, see the wiring diagram for *AquaBoost CS duplex – 575/460/208-230/3/60, 380/3/50 up to 5 hp* (page 22).

Minimum run timer

For a constant speed simplex unit the minimum run timer is set at the factory to 5 minutes. Verify the setting before placing the unit into operation; adjust if a shorter minimum run time is desired.

For the constant speed duplex unit, use the programmable pump sequence control module to set the minimum run timer for each pump.

Programmable pump sequence control module settings

The constant speed duplex package uses a smart relay as its control module.

This table shows the user-adjustable settings of the smart relay. You can manually set parameters using the backlit LCD display and buttons.

Parameter description	Default setting (seconds)	Variable range (seconds)	Field setting
Lead pump minimum run timer	30	0-999	
Lag pump minimum run timer	30	0-999	
Lead pump start delay timer	1	0-99	
Lag pump start delay timer	5	0-99	

Parameter description	Default setting (seconds)	Variable range (seconds)	Field setting
Pump fail to start proof timer	5	0-99	
Low suction/high temperature off proof timer	5	0-99	
Low suction/high temperature on proof timer	5	0-99	
Duty/standby	0	0 = disabled 1 = enabled	
Staging on proof timer	30	0-99	

For more details on these settings see *Sequence of operation for the duplex pumping system* (page 36).

Aquastat

The aquastat for high temperature cutout is set at the factory for 100°F (38°C). Adjust the setting if a different cutout temperature is desired. Do not set the switch above 225°F (107°C).

Optional tank

A variety of different tanks can be used with either the simplex or duplex units. Refer to the specific IOM that was shipped with the tank for installation and operating instructions.

Pump package operation description

CAUTION:

A unit that shows symptoms of possible problems, such as overflow, noise, leaks, vibrations, or continual operation, must be corrected immediately.

Constant speed operation

Constant speed simplex – for capacities up to 110 gpm

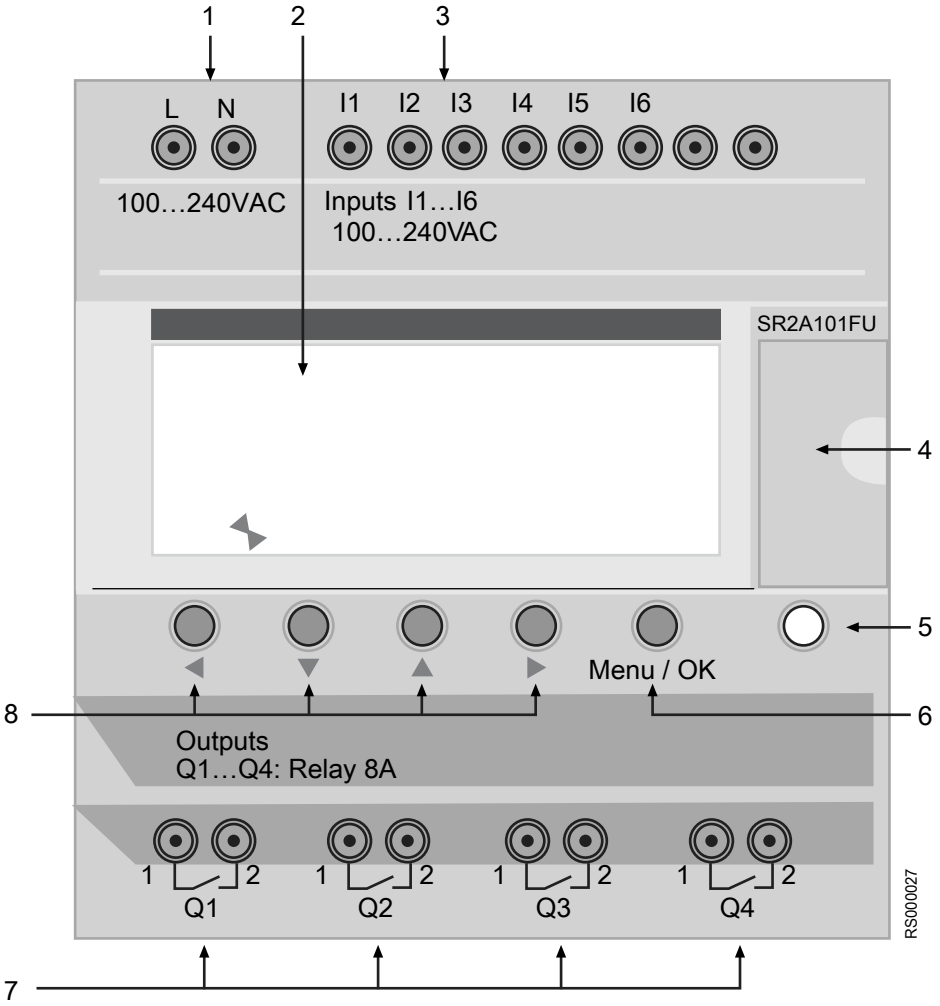
Condition	Description
The city water pressure falls below the setting of the system suction pressure switch (2PS).	The pump starts through a power relay.
The system pressure rises above the setting of the system pressure switch.	The pump stops, provided the minimum run timer has expired.

Constant speed duplex – for capacities up to 220 gpm

Condition	Description
The city water pressure falls below the setting of the system suction pressure switch (2PS).	The lead pump starts through a power relay.
The system pressure rises above the setting of the system pressure switch.	The lead pump stops, provided the minimum run timer has expired.
The system demand increases beyond the capacity of the lead pump and the system pressure does not satisfy the pressure switch settings.	The system automatically starts the lag pump and both pumps run.
The system pressure rises above the settings of Pump 1 and Pump 2 discharge pressure switches (2PS and 3PS).	Both pumps stop, provided the minimum run timers have expired.

Condition	Description
The lead pump fails.	The lag pump starts and acts as the lead pump. To reinstate the lead pump do the following: 1. Before fixing the failed pump, turn the HOA switch to the OFF position. 2. After the lead pump has been fixed, place the lead pump HOA into the AUTO position and then press the RESET button to reset the unit. 3. The pump returns to its operational state.

Conditions that cause the unit to cut out

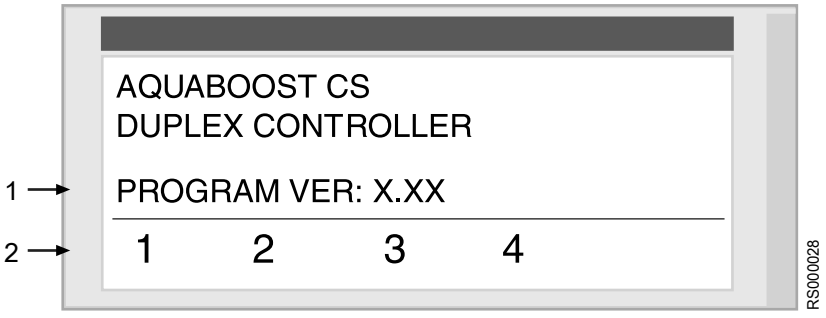


Simplex and duplex units run when there is demand unless one of the following conditions occurs:

Condition	Description	Resolution
Low city pressure	The optional low-suction pressure switch (1PS) trips.	The low suction condition resets automatically when the city pressure returns to an acceptable level.
Pump deadheading	The high temperature cutout switch trips.	The unit resets automatically when there is demand by drawing cooler water through the unit and across the temperature sensor. This cools the sensor and causes it to change state and restart the pump. For a manual purge run the unit in Hand mode for about 5 seconds. Then put the unit back into Auto mode for normal operation.

The smart relay control module

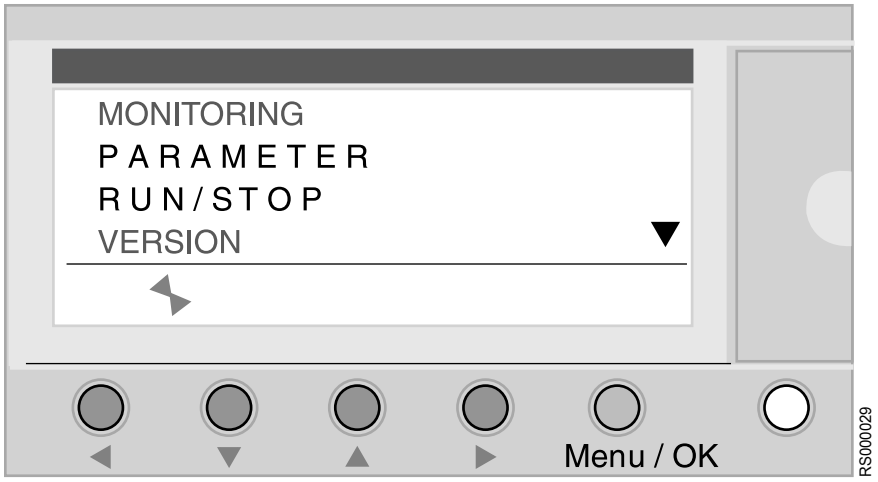
The AquaBoost CS duplex pumping package uses a smart relay for its control module. You can adjust control settings via the front panel of the smart relay.



Smart relay front panel

1. Screw terminal block for the power supply
2. LCD display
3. Screw terminal block for discrete inputs
4. Slot for backup memory or PC connection cable
5. Shift key, white
6. Menu/OK key, green, for selection and confirmation
7. Relay output screw terminal block
8. Navigation Z push buttons, gray

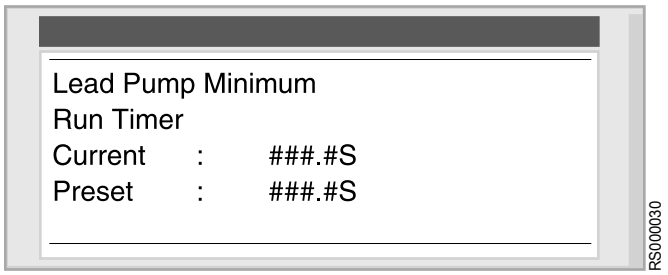
LCD display



This illustration show an example of LCD display elements in the input-output screen:

1. Program version
2. Contextual menus, pushbuttons, icons that indicate operating modes

Control keys



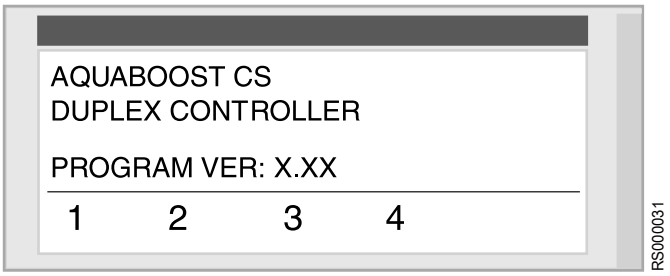
The keys located on the front panel of the smart relay are used to configure, program, and control the application and to monitor the progress of the application.

- The shift key is the white key located on the right side of the LCD screen.
- The green Menu/OK key is used for all confirmations: menu, sub-menu, program, parameter.
- The gray keys, labeled Z1 through Z4, have arrows below them indicating the directions of navigation.

Navigate through user-adjustable parameters

When the controller is turned on, the Lead Pump Minimum Run Timer screen appears:

- Press the left-most gray key, Z1, in order to navigate to other user-adjustable parameters.



Modify parameters

1. In order to modify the preset value, press and hold the white shift key and press the right-most navigation key, Z4.

   The current preset value will start to blink.
2. Modify the parameter value with the up and down arrow keys.
3. When the desired value is displayed, confirm the changes by pressing the green Menu/OK button.

Navigate to and from the main screen

- Continuously press the Z1 left arrow key until the main screen appears:

- From the main screen, press the Z1 left arrow key two times to go to the user-adjustable parameters screen.

  The Lead Pump Minimum Run Timer screen will appear.

Sequence of operation for the duplex pumping system

Starting the lead pump

The lead pump can be started from either of the two pressure switches (2PS or 3PS) that are provided on the right-hand side of the controller. The same applies to the lag pump. This provides redundancy in the event of a failure of either pressure switch. Fully automatic alternation is included in the standard controller. Pumps alternate any time that both pumps stop.

Staging pumps together

Pumps can stage together if the pressure switch indicates that the system pressure is unable to meet the required demand. This is the default setting of 0, which means that the duty/standby switch is disabled. The pump stage/de-stage function is disabled when the duty/standby switch is enabled by switching the setting to 1. When the duty/standby switch is enabled, only one pump can run at a time; the other pump remains in standby state.

Maintaining system pressure

If two pumps are running together to maintain the required system pressure, and the system pressure increases, the system de-stages (stops) the lag pump. After the lag pump has been de-staged and system pressure is still maintained, the system then stops the lead pump as well.

The time interval between the lead pump stop and the lag pump stop must be at least 30 seconds. This is a fixed timer and no adjustments can be made.

Start delay

The start delay timer for both lead and lag pumps is a user-adjustable parameter that prevents short cycling of pumps or false starting of pumps. The start delay timer for the lag pump starts after the lead pump starts so that it is impossible for both pumps to be started at the same time.

Minimum run time

Each pump has a minimum run timer. Pumps continue to run during that minimum run time unless a failure occurs, such as pump failure or overload. The pump minimum run timer is a user-adjustable parameter. Pump failure can be detected by a differential pressure switch or by an overload failure. The pump fail proof timer is a user-adjustable parameter.

Pump failure

When one pump is running and the system detects a failure on that pump, the system stops the failed pump. The system then automatically switches to the other pump and replaces the failed pump in order to meet the system demand. When pump failure occurs, the pump failure indicator light illuminates.

Before you fix the failed pump, put the HOA switch in the OFF position. After the failed pump is fixed, put the HOA switch in the Auto position.

You must manually reset the pump. Press the RESET button to turn off the pump failure indicator light and return that pump to operational state.

Low-suction or high-temperature shutdown

A low-suction/high-temperature shutdown proof timer provides instantaneous shutdown and prevents immediate restarting of the pumps. The proof time is adjustable between 0 to 99 seconds; the default setting is 5 seconds.

When a low-suction or high-temperature thermal cutout situation occurs, the red light indicator illuminates. An auto reset feature is provided in order to return the pumps to operational state.

Variable speed operation

Variable speed simplex – for capacities up to 110 gpm

The pressure transducer monitors the system pressure and sends a feedback signal to the controller. Depending upon the feedback, the controller then changes the speed of the pump.

Condition	Description
The system pressure falls below the set point.	The pump starts automatically and pump speed continues to ramp up until the system pressure satisfies the set point.
The system pressure rises above the set point.	The pump automatically reduces speed until the system pressure reaches the set point, provided the minimum run timer has expired.

Variable speed duplex – for capacities up to 220 gpm

The pressure transducer monitors the system pressure and sends feedback signal to the controller. Depending upon the feedback, the controller changes the speed of the pump or stages/de-stages the other pump.

Condition	Description
The system pressure falls below the set point.	The pump starts automatically and pump speed continues to ramp up until the system pressure satisfies the set point.
The system pressure rises above the set point.	The pump automatically reduces speed until the system pressure reaches the set point, provided the minimum run timer has expired.

Low-suction pressure switch

Simplex and duplex units will run when there is demand unless the optional low-suction pressure switch trips due to low city pressure.

The low-suction condition resets automatically when city pressure returns to an acceptable level.

Temperature relief valve

The variable-speed units have a temperature relief valve that senses water temperature inside the pump.

The valve opens and closes depending on the water temperature. This modulating action maintains a relatively constant fluid temperature even as operating conditions vary.

Condition	Description
The water temperature exceeds the valve opening temperature, typically 120°F (49°C).	The valve automatically opens to allow relatively cooler supply water to refill the pump as the hot water is discharged to the drain or low pressure return.
The water temperature falls below the opening temperature by 10° F (5.5°C).	The valve automatically closes in order to conserve water and reduce waste.

Maintenance

Precautions

DANGER:

Electrical hazard sufficient to kill. Always disconnect and lock out the power before you service the unit.

WARNING:

- This manual clearly identifies accepted methods for disassembling units. These methods must be adhered to. Trapped liquid can rapidly expand and result in a violent explosion and injury. Never apply heat to impellers, propellers, or their retaining devices to aid in their removal.
- Make sure that each pump and the package are isolated from the system and that pressure is relieved before you disassemble the pump, remove plugs, open vent or drain valves, or disconnect the package piping.
- Always disconnect and lock out power to the package and the driver before you perform any installation or maintenance tasks. Failure to disconnect and lock out driver power will result in serious physical injury.
- Crush hazard. The unit and the components can be heavy. Use proper lifting methods and wear steel-toed shoes at all times.

Monthly maintenance

Motor lubrication checks

- For grease-filled bearings, make sure that grease is not all over the inside of the motor and in the bottom of the motor. This could be a sign of overfilling. Refer to the lubrication instructions from the motor manufacturer.

Close-coupled pumps

- For a horizontal pump, verify that the mechanical seal is not leaking between the pump and the motor.

Sound and visual checks of the whole station

- Listen for any odd sounds that rub or grind, electrical arcing, and check for anything that is binding or unusual. These conditions can indicate a serious problem.

  Note that there is going to be some harmonic vibration with the pumps and motor. Listen for excessive vibration or noise as this requires immediate service. Do not operate the pump if there is excessive vibration.
- Confirm that the building cooling and ventilation systems are operating and clear of all obstructions. The maximum operating range for equipment is 104°F (40°C).
- Verify that water, grease, oil, and hardware are not leaking or loose on the pump station.

Station skid

- Visually inspect for leaks in the station piping, valves, and other components.
- Visually inspect the piping and skid for any stress cracks in the welds.
- Visually inspect the station for loose or damaged paint or areas of rust.

Troubleshooting

Pump station troubleshooting

DANGER:

- Personal injury hazard. Troubleshooting a live control panel exposes personnel to hazardous voltages. Electrical troubleshooting must be done by a qualified electrician. Failure to follow these instructions will result in serious personal injury, death, and/or property damage.
- Electrical hazard sufficient to kill. Always disconnect and lock out the power before you service the unit.

WARNING:

Electrical connections must be made by certified electricians in compliance with all international, national, state, and local rules.

Note that some troubleshooting procedures apply to only constant speed systems or only variable speed systems.

The pump station does not power up

Cause	Remedy
The site voltage does not match the pump station voltage.	Make sure that the site voltage matches the pump station design voltage.
Line-to-line voltage is not balanced.	Check incoming voltage and amperage. Line-to-line voltage should be balanced. Line-to-ground voltage should also be balanced.
The power fuses are blown or breakers are tripped.	Check power fuses and breakers. Breakers are shipped in the OFF position. Replace blown fuses.
The pump station is not properly grounded (earthed).	Check that proper grounding (earthing) techniques have been used for the pump station.
There is a fault.	Check for fault codes or fault lights on the PLC. Correct the fault.

The station powers up, but the pumps do not run

Cause	Remedy
Pumps are not enabled.	Check the PLC to make sure that the pumps are enabled. Check for faults. Correct any faults.
The desired pressure is satisfied.	Check to see if the desired pressure is satisfied. If the actual pressure is greater than the set point pressure, then the pumps are automatically stopped.
There is a fault.	Check for fault codes or fault lights on the PLC. Correct the fault.
The motor is tripped.	Check for a tripped motor thermal protector. Allow motor to cool, and then reset the thermal protector.
The fuses are blown or breakers are tripped.	Check circuit breaker and fuses.
Transducer isolation valves are closed.	Make sure that the transducer isolation valves are in the open position.
Automatic mode is faulty.	Check to see if the pump can be run in Manual mode on the PLC.

Cause	Remedy
The impeller is bound.	Check to see if you can turn the pump by hand. Check for a bound impeller.
A pressure transducer is faulty.	Replace faulty pressure transducers.
Motor wiring is loose.	Make sure that motor wiring is securely connected.
Motor windings have lost insulation strength.	Test the motor leads with a megger in order to check the motor windings.
Variable speed drive is wired incorrectly.	Check corresponding variable speed drive. Make sure drive is wired correctly.
Motor is defective.	Repair or replace motor.

Troubleshoot the pump operation

If the pump still does not operate after you have checked initial causes, then use this procedure to further investigate and correct the problem.

1. Momentarily turn the HOA switch to the HAND position and then back to OFF. Does the starter pull in?
   - If the starter does not pull in, then go to the next step.
   - If the starter does pull in, then go to the last step.
2. Turn the HOA switch to the HAND position. Check the voltage across the terminals for the coil in the starter.
   - If voltage is present and the starter is not pulled in, the coil is defective and must be replaced.
   - If no voltage is present, then go to the next step.
3. With the HOA still in the HAND position, check the voltage between the hot side of the starter coil and the neutral (white) wire. 120 volts should be measured.
   - If no voltage is measured, then check incoming power and fuses.
   - If voltage is measured, then go to the next step.
4. With the HOA still in the HAND position, check the voltage between the hot side of the coil and the neutral (white) wire for overload block. 120 volts should be measured.
   - If voltage is measured, then replace the GV2P block.
   - If no voltage is present, then contact your local Goulds Pumps representative to service the control circuit.
5. With the starter pulled in, check the voltage at the bottom of the GV2P block. The voltage should be the same as the incoming power.
   - If no voltage is present, then replace the starter.
   - If voltage is present, then contact an electrician to check the leads and motor.

For electrical troubleshooting of variable speed units, refer to the manuals of the corresponding variable speed controllers.

The pumps run but do not build desired pressure

Cause	Remedy
Pumps are running off their design curve.	Check the application. Is the system running in an open discharge condition (excessive flow rate)? For example, is the system filling a large irrigation line for the first time of the season?
Pumps are running at less than full speed.	Check to see if the pumps are running at full speed. If they are running less than full speed, they could be experiencing electrical issues. Check the panel for power status.
The inlet pressure does not match the project specifications.	Check to see if the inlet pressure matches the project specifications. Variations in inlet pressure can have detrimental effects on performance.
A pipe is broken.	Check for broken pipes.

Cause	Remedy
The transducer isolation valves are closed.	Check to be sure that the transducer isolation valves are in the open position.
The NPSH is insufficient.	Check the NPSH. Are proper flooded conditions or positive pressure being delivered to the pump station? Check for air in the supply lines. Check for properly filled supply tanks (if applicable). Excessive suction lift or piping losses will limit the life expectancy of the pumps.
The pump station has lost its prime.	Check to be sure that the pump station has been primed properly. Make sure that all pumps and components are properly filled with water.
The pump rotation is incorrect.	Check the pump rotation. Proper rotation is indicated on the pump volute. (See the pump IOM.)
A suction or discharge valve is closed or clogged.	Check the isolation valves and check valves. Are all suction/discharge valves open? Could any valves be plugged? Could the pumps be plugged?
The motor is not operating at the rated RPM.	Check the voltage and amperage. Check for possible phase loss to the motor.
The impeller is worn or plugged.	Take the pump to an authorized pump repair facility.
The pump bearings are worn.	Take the pump to an authorized pump repair facility.

The pump station experiences excessive vibration

Cause	Remedy
The motor, pump, or piping is loose.	Make sure that all fasteners and components are properly tightened.
Pump station vibration dampers are missing or improperly installed.	Check for properly installed pump station vibration dampers.
Pumps are running off their design curve.	Check the application. Is the system running in an open discharge condition (excessive flow rate)? For example, is the system filling a large irrigation line for the first time of the season?
Air or gases are present in the pumped liquid.	Check water supply lines and tanks. Check for air or gases in liquid. Bleed the lines.
Discharge piping is plugged.	Check discharge piping/valves. Could the piping be plugged? Could the pump be plugged? Are the isolation valves open? Clear any clogs.
Supply piping has excessive suction/lift conditions or friction loss.	Check for excessive suction/lift conditions or friction loss on supply piping.
The impeller is bound or worn.	Take the pump to an authorized pump repair facility.
Pumps and pipes are not properly aligned.	Correct the alignment between pumps and pipes.

The pump station does not shut down and no water is used

Cause	Remedy
The pump station is in Hand or Manual mode.	Put the system in the AUTO position.
The system pressure is set beyond capability of the station.	Check the system set pressure. Is this duty point beyond the capability of the pump station?
The RTDs are incorrectly installed.	Check to make sure that the RTDs are installed correctly. (CS only)
There are leaks or broken pipes.	Check for broken pipes or leaks. Does the system pressure decrease if the pump station is turned off?

Cause	Remedy
The diaphragm tank is faulty.	Check for a properly installed diaphragm tank. Has the tank failed? Has the tank been charged to the proper operating pressure before installation? (~10 psi below the desired set point)
The pressure transducers are faulty.	Check the pressure transducers. Does the actual mechanical gauge pressure match the pressure displayed on the VFDs and the PLC?
The VFDs are in Local mode.	Put the VFDs in Remote mode.
A check valve is malfunctioning.	Check for malfunctioning check valves. Does the system hold pressure when the pump package is shut down? Replace faulty valves.

The pump station cycles or hunts erratically

Cause	Remedy
The pumps are oversized for the current demand.	Check the application. Possibly increase the size of the bladder tank for low demand situations.
The inlet pressure is fluctuating.	–
There are leaks or broken pipes.	Check for broken pipes or leaks. Does the system pressure decrease when the pump station is turned off?
The diaphragm tank is faulty.	Check for a properly installed diaphragm tank. Has the tank failed? Has the tank been charged to the proper operating pressure before installation? (~10 psi below the desired set point)
The pressure transducers are faulty.	Check the pressure transducers. Does the actual mechanical gauge pressure match the pressure displayed on the VFDs and the PLC?
A check valve is malfunctioning.	Check for malfunctioning check valves. Replace faulty valves.
There is an error in the PLC programming.	Check the customer programming on the PLC. Correct any errors.

Xylem |'zīləm|

1) The tissue in plants that brings water upward from the roots
2) A leading global water technology company

We're 12,500 people unified in a common purpose: creating innovative solutions to meet our world's water needs. Developing new technologies that will improve the way water is used, conserved, and re-used in the future is central to our work. We move, treat, analyze, and return water to the environment, and we help people use water efficiently, in their homes, buildings, factories and farms. In more than 150 countries, we have strong, long-standing relationships with customers who know us for our powerful combination of leading product brands and applications expertise, backed by a legacy of innovation.

INSTALLATION & OPERATION MANUAL

HARMSCO® HURRICANE® FILTERS

HARMSCO® Hurricane® Filters provide exceptionally long filter runs, reduced maintenance and lower filtration costs when used as combination centrifugal separator and cartridge filter or in conventional filtration applications.

HOW THEY WORK

Centrifugal Separation to Remove Dense Particles from Liquids

Liquid enters the Hurricane filter's outer chamber tangentially, producing a rotational flow. This flow pattern creates a centrifugal force which is used to separate dense particles such as sand, rust, grit and metal fines from liquids. Heavy particles drop to the bottom of the filter's outer chamber where they are discharged manually, automatically or continuously. With the dense particles removed, liquid and light solids rise up, over and into an inner chamber where the rotational flow is continued.

Up-flow Cartridge Filtration and Angled Pleats for Lightweight Particle Removal

Trapped air is automatically purged due to principal of up-flow filtration. Filtered liquid exits the filter at the highest point, as it is filtered. A secure top plate prevents cross contamination of filtered and unfiltered liquid. This patented up-flow design allows Harmsco to utilize 100% of cartridge surface area, providing efficient filtration. Filter efficiencies are dramatically improved to provide longer filter runs and reduced filtration costs. Harmsco® Hurricane® filter cartridges for the Waterbetter® filters are available in a wide range of micron ratings and may be cleaned and re-used in most applications and most micron ratings.

Models & Specifications

Three Hurricane® Filter models are available for a wide range of applications. Models and specifications are as follows:

SPECIFICATION	HUR 40 HP	HUR 90 HP	HUR 170 HP
Flow rate (GPM)	Up to 50	Up to 100	Up to 150
Filter area (pleated)	40 sq. ft.	90 sq. ft.	170 sq. ft.
Pipe sizes, inlet & outlet	2" NPT	2" NPT	2" NPT
Pipe size, drain	1" NPT	1" NPT	1" NPT
Filter height	21"	31"	41"
Filter diameter	13"	13"	13"
Floor space required	15"x15"	15"x15"	15"x15"
Service height clearance	31"	51"	72"
Shipping weight (approx.)	40 lbs.	51 lbs.	64 lbs.
Temperature rating*	140° (60°C)	140° (60°C)	140° (60°C)

**Varies based on pressure and time under load.*

Features

Product features include:

- 304 stainless steel filter housings
- Electro-polished for superior finish
- Resistant coatings available
- Fail-safe lids with individual studs for security
- Brass wing-nuts for convenience
- 90˚ elbow and 45˚ sweep on outlet for in-line vertical installation
- CPVC standpipe for up-flow design
- Choice of cartridges available

HUR 40 HP

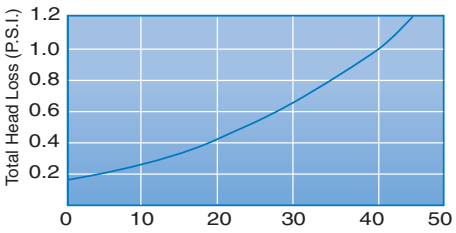
HUR 90 HP

HUR 170 HP

Temperature & Pressure Ratings

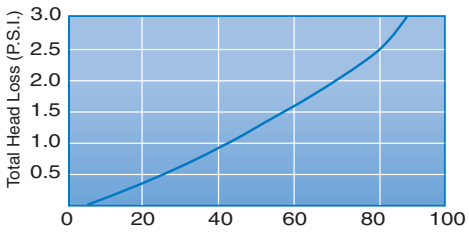
Hurricane® Filters are rated for pressures to 150 psi and temperatures to 140°F.

Sizing



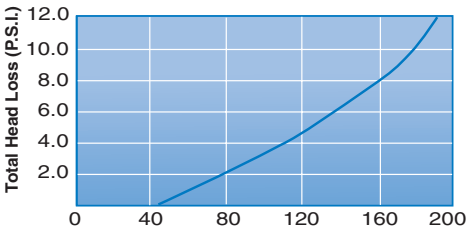
Use the chart shown below to size Hurricane® Filters for your application:

Flow Rate	Recommended Model	Pleated Filter Area
Up to 50 GPM	HUR 40 HP	40 sq. ft.
Up to 100 GPM	HUR 90 HP	90 sq. ft.
Up to 150 GPM	HUR 170 HP	170 sq. ft.
Up to 300 GPM	HUR 170 HP (two filters*)	340 sq. ft. (two filters*)
Up to 450 GPM	HUR 170 HP (three filters*)	510 sq. ft. (three filters*)
Up to 600 GPM	HUR 170 HP (four filters*)	680 sq. ft. (four filters*)
Up to 750 GPM	HUR 170 HP (five filters*)	850 sq. ft. (five filters*)



**Parallel installation with valves to isolate filters for service while other filters are operational.*

Pressure Drop



The total head loss data shown below was developed by NSF International and indicates pressure drop with Hurricane® Filter and one micron filter cartridge in clean water.

Pressure drop HUR 40 HP

Pressure drop HUR 90 HP

Pressure drop HUR 170 HP

Harmsco® Hurricane® Replacement Cartridges

Hurricane® replacement cartridges are available in a wide range of nominal ratings, shown right.

Cartridges are rated for temperatures to 140˚F and may be used to separate solids in liquids with a pH of 3 to 11.

Packaged one cartridge per carton.

Filter Model	Cartridge Product Code	Nominal Micron	Cartridge Dimensions			Ship Wt./Ctn. (One Cartridge)
HUR 40 HP	HC/40-0.35	0.35	9 5/8”	7 3/4”	3” FPT	4 lbs.
	HC/40-1	1	9 5/8”	7 3/4”	3” FPT	4 lbs.
	HC/40-5	5	9 5/8”	7 3/4”	3” FPT	4 lbs.
	HC/40-10	10	9 5/8”	7 3/4”	3” FPT	4 lbs.
	HC/40-20	20	9 5/8”	7 3/4”	3” FPT	4 lbs.
	HC/40-50	50	9 5/8”	7 3/4”	3” FPT	4 lbs.
	HC/40-100	100	9 5/8”	7 3/4”	3” FPT	4 lbs.
	HC/40-150	150	9 5/8”	7 3/4”	3” FPT	4 lbs.
	HC/40-EZ-CLEAN	NR*	9 5/8”	7 3/4”	3” FPT	4 lbs.
HUR 90 HP	HC/90-0.35	0.35	19 1/2”	7 3/4”	3” FPT	7 lbs.
	HC/90-1	1	19 1/2”	7 3/4”	3” FPT	7 lbs.
	HC/90-5	5	19 1/2”	7 3/4”	3” FPT	7 lbs.
	HC/90-10	10	19 1/2”	7 3/4”	3” FPT	7 lbs.
	HC/90-20	20	19 1/2”	7 3/4”	3” FPT	7 lbs.

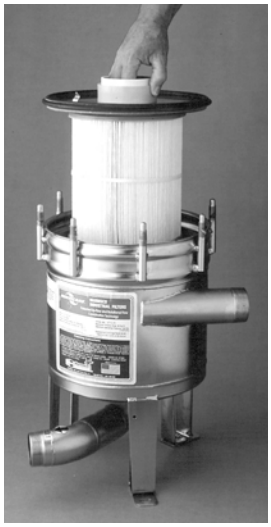
Activated carbon and Poly-Pleat Hurricane® cartridges available. Please see catalog. ** NR - not rated*

Cartridge Cleaning Instructions

Hurricane® cartridges are made of Polyester Plus™, a proprietary blend of polyester fibers which can be cleaned in most applications and micron ratings to make Hurricane® filter elements reusable! For best results, follow the directions described below:

When Cartridge Cleaning is Possible



Clean cartridge when pressure differential is 12 psi above startup differential.

Non-cleanable Applications

Replace cartridge when pressure differential is 30 psi above start-up differential or when flow has diminished to an unacceptable level, indicating cartridge is at capacity.

Cartridge Removal

To remove filter cartridge, drain filter housing. Remove wing-nuts and lid. Hold cross-bar in retainer nut and pull upward to remove filter cartridge and top plate from filter housing. Follow cleaning instructions described herein.

Lid Replacement

Replace wing-nuts systematically, rotating around filter. "Finger tight" is normally sufficient. However, in extreme duty applications it may be necessary to tighten to 75 inch lbs. of torque. Overtightening can cause damage to the rim gasket.

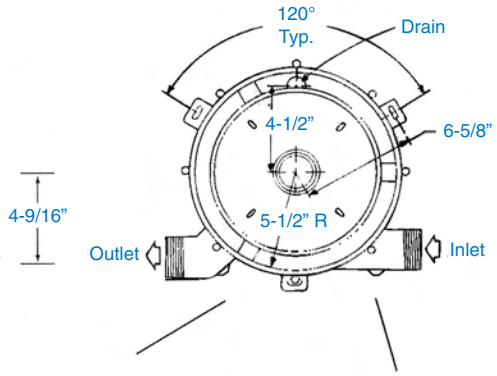
Cartridge Cleaning in Aqueous Applications

For best results, clean cartridges with pressure nozzle using standard hose. Direct spray at an angle to remove particulate (see photo). Follow these directions to remove oils, organic matter, algae and mineral deposits.

OILS: Soak cartridge in a solution of tri-sodium phosphate or similar strong detergent (2 lbs. to 10 gallons of water). Soak up to 12 hours for best results. Rinse after bath.

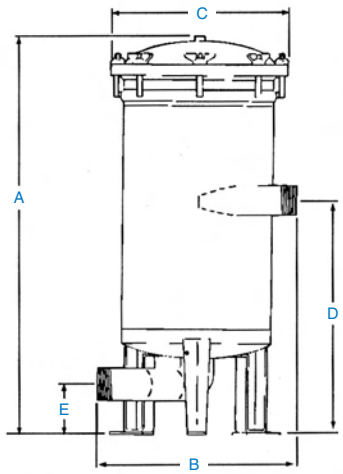
Caution: Do not rinse cartridges with acid until oils and organic matter are removed. Use detergent first and follow with acid bath for mineral removal. Flush cartridges with water after muriatic or tri-sodium phosphate baths.

ORGANIC MATTER, ALGAE: Use tri-sodium phosphate solution as described above, plus 1 pint of liquid chlorine to kill organic matter and algae. Soak cartridge one hour or longer until surface is no longer "slippery." Rinse after bath.

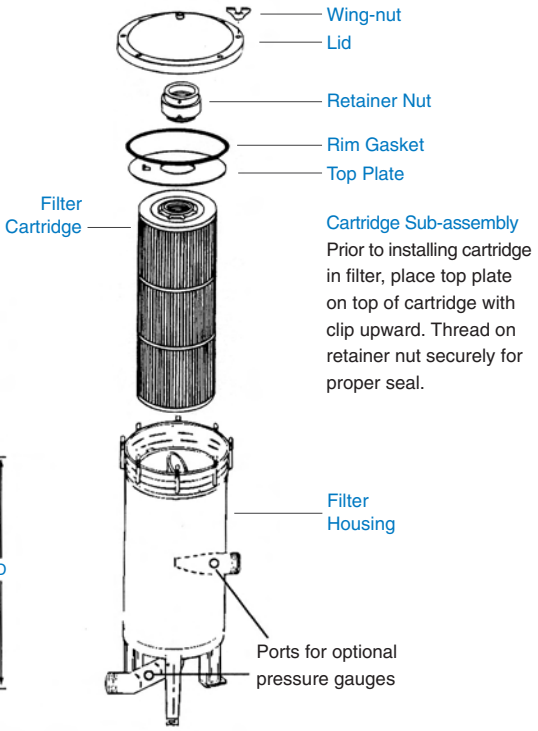


CALCIUM MINERAL DEPOSITS: Follow directions for "oils" described above. Soak cartridge for approximately ten minutes in a solution of one part of muriatic acid to twenty parts of water. Rinse cartridge thoroughly with water.

When Cartridge Cleaning is Not Possible



Generally, it is not possible to clean Hurricane® filter cartridges when filtering petroleum-base liquids, toxic substances, and one and below micron applications.



Note: Pressure gauges are recommended to indicate when cartridge cleaning or replacement is necessary.

Model	A Height	B Width	C Diameter	D Inlet	E Outlet
HUR 40 HP	19 1/2"	14 5/8"	13"	12 3/4"	3 7/16"
HUR 90 HP	29 7/8"	14 5/8"	13"	17 3/4"	3 7/16"
HUR 170 HP	40 1/2"	14 5/8"	13"	23 5/8"	3 7/16"

Pressure Gauges
Install optional pressure gauges in gauge ports as shown above. Use pressure differential to indicate when to clean or replace cartridge.

Cartridge Sub-assembly
Prior to installing cartridge in filter, place top plate on top of cartridge with clip upward. Thread on retainer nut securely for proper seal.

Installation

Install filter using 2” couplers for inlet and outlet with 1” coupler for drain pipe. Shut-off valves should be installed on inlet, outlet and on drain pipe to be able to service the filter and isolate it when necessary.
Pressure gauges are also recommended before and after the filter to easily calculate the pressure differential and to know when cartridge should be cleaned or replaced. Threaded flanged fittings for inlet and outlet are available by special order.

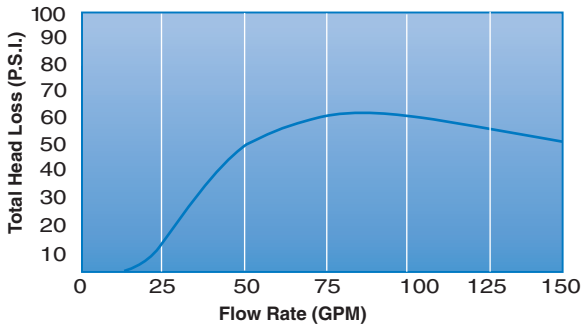
1/4” FPT Lid Fitting

One-quarter inch FPT fittings are installed in Waterbetter® Filter lids for a number of customer supplied options, including petcock for pressure relief, pressure gauge, sensor, thermocouple, etc. This fitting should be plugged at time of installation if one of these options is not installed.

Harmsco, Inc. Industrial Filters Limited Warranty

1. Harmsco, Inc. warrants its line of Industrial Filters to be free of defects in material and workmanship for a period of one year from the date of installation.
2. The warranty for Industrial Filters ordered with special coatings is limited only to the recoating of the defective parts due to failure in materials or workmanship for one year from date of installation.
3. This warranty does not cover any equipment purchased for use in applications in which the product is not suited. It is the responsibility of the buyer to determine if a product is suitable for a particular application.
4. THIS WARRANTY EXCLUDES THE FOLLOWING:
   a. Any fresh water unit installed for salt water use.
   b. Damage caused by improper installation, operation or care.
   c. Chemical attack.
   d. Rubber type parts and normal wear items, i.e. “o” rings, rim gaskets, wing nuts, pipe caps, holding rods.
   e. Any costs of labor or expenses incurred in the removal and/or installation of Unit, or any surrounding device.
   f. Damage caused by galvanic or electrolytic attack.
   g. Altering or removing the Harmsco, Inc. information label.
   h. Any unit not grounded.
5. Service under this warranty is to be provided by the dealer/distributor who sold the unit to the distributor. If the dealer/distributor is unable to provide warranty service, contact:

Harmsco, Inc. P.O. Box 14066
North Palm Beach, Florida 33408, U.S.A.
Phone (561) 848-9628 • Fax (561) 845-2474



A Returned Goods Authorization (RGA) number must be received from the above office and placed on all shipments to and correspondence with Harmsco, Inc. Please be prepared with the following information:

1. Model number and serial number
2. Date of installation
3. Name of installer
4. Nature of problem
5. Your address and telephone number.

Particle Separation

Particle separation with Hurricane® filters is influenced by particle weight and flow rate. For optimum separation, the drain valve should be opened routinely by hand or automatically using a timer actuated valve. Automatic purge valves are not available from Harmsco. However, for more information regarding this equipment, please contact the Authorized Harmsco Distributor in your area.

The data shown below was developed through tests conducted with Hurricane® filters and twenty micron filter cartridges to determine optimum flow rates for particle separation. Sand was used as the test’s particulate with a specific gravity of 2.6 relative to water at 1.0. This data is provided for general sizing purposes only. Results vary and depend on the particulate being filtered, viscosity and other variables.

Tests indicate the separation of performance of all three Hurricane® filters were essentially the same up to the rated flow rate of each model.

Part List

Hurricane® Filter parts and components are listed below:

Part No.	Material	Description
550-E	EPDM	Rim gasket to seal filter
905-P	PVC	Retainer nut for filter cartridge
309SS	Stainless steel	Top plate
312	PVC	Retainer nut insert
530-AC	Stainless steel	Lid with vent
316-C	CPVC	Standpipe for HUR 40 HP
317-C	CPVC	Standpipe for HUR 90 HP
315-C	CPVC	Standpipe for HUR 170 HP
202-B	Brass	Wing-nut
329	CPVC	Inner vessel isolator
330	Stainless steel	Screw 1/4” x 1/2” for isolator
Options:		
550-B	Buna-N	Rim gasket to seal filter
550-V	Viton	Rim gasket to seal filter
327	Stainless steel	2” Flange fittings (set of 2)

GARDNER DENVER

MAINTAIN COMPRESSOR RELIABILITY AND PERFORMANCE WITH GENUINE GARDNER DENVER® COMPRESSOR PARTS AND SUPPORT SERVICES

Gardner Denver® Compressor genuine parts, manufactured to design tolerances, are developed for optimum dependability – specifically for Gardner Denver compressor systems. Design and material innovations are the result of years of experience with hundreds of different compressor applications. Reliability in materials and quality assurance is incorporated in our genuine replacement parts.

Your authorized Gardner Denver Compressor distributor offers all the backup you'll need. An AirSmart™ network of authorized distributors provides the finest product support in the air compressor industry.

Your authorized distributor can support your Gardner Denver air compressor with these services:

1. Trained parts specialists to assist you in selecting the correct replacement parts.
2. Factory warranted new and remanufactured rotary screw airends. Most popular model remanufactured airends are maintained in stock at the Remanufacturing Center in Indianapolis, IN., for purchase on an exchange basis with liberal core credit available for the replacement unit.
3. A full line of factory tested AEON™ compressor lubricants specifically formulated for use in Gardner Denver compressors.
4. Repair and maintenance kits designed with the necessary parts to simplify servicing your compressor.

Authorized distributor service technicians are factory trained and skilled in compressor maintenance and repair. They are ready to respond and assist you by providing fast, expert maintenance and repair services.

For the location of your local authorized Gardner Denver Air Compressor distributor, refer to the yellow pages of your phone directory, check the Gardner Denver Web Site at www.gardnerdenver.com or contact:

Gardner Denver
1800 Gardner Expressway
Quincy, IL 62305

Phone: (217) 222-5400

Fax: (217) 224-7814

INSTRUCTIONS FOR ORDERING REPAIR PARTS

When ordering parts, specify Compressor MODEL, Method of Cooling, HORSEPOWER and SERIAL NUMBER (see nameplate on unit). The Airend Serial Number is also stamped on top of the discharge bearing carrier casting.

All orders for Parts should be placed with the nearest authorized distributor.

Where NOT specified, quantity of parts required per compressor or unit is one (1); where more than one is required per unit, quantity is indicated in parenthesis. SPECIFY EXACTLY THE NUMBER OF PARTS REQUIRED.

DO NOT ORDER BY SETS OR GROUPS.

To determine the Right-Hand and Left-Hand side of a compressor, stand at the motor end and look toward the compressor. Right-Hand and Left- Hand are indicated in parenthesis following the part name, i.e. (RH) and (LH), when appropriate.

FOREWORD

Gardner Denver Rotary Screw compressors are the result of advanced engineering and skilled manufacturing. To be assured of receiving maximum service from this machine the owner must exercise care in its operation and maintenance. This book is written to give the operator and maintenance department essential information for day-to-day operation, maintenance and adjustment. Careful adherence to these instructions will result in economical operation and minimum downtime.

DANGER

Danger is used to indicate the presence of a hazard which will cause severe personal injury, death, or substantial property damage if the warning is ignored.

WARNING

Warning is used to indicate the presence of a hazard which can cause severe personal injury, death, or substantial property damage if the warning is ignored.

CAUTION

Caution is used to indicate the presence of a hazard which will or can cause minor personal injury or property damage if the warning is ignored.

NOTICE

Notice is used to notify people of installation, operation or maintenance information which is important but not hazard-related.

This book covers the following models:

SECTION 1
GENERAL INFORMATION

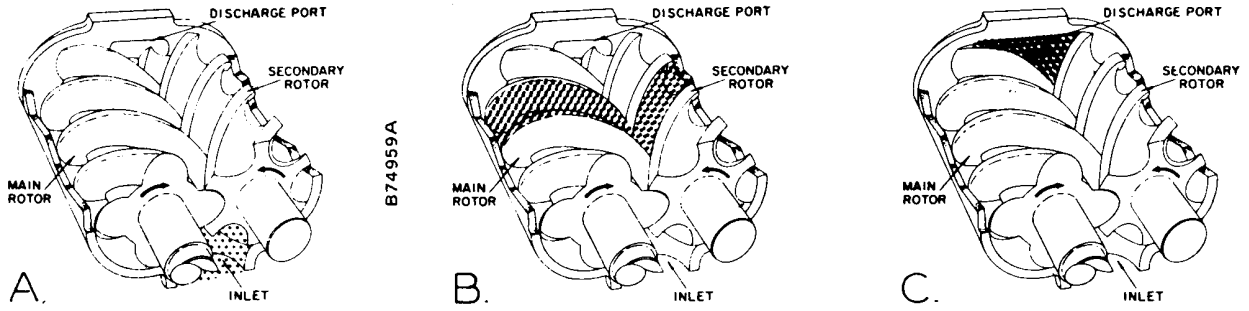

Figure 1-1 – COMPRESSOR CYCLE

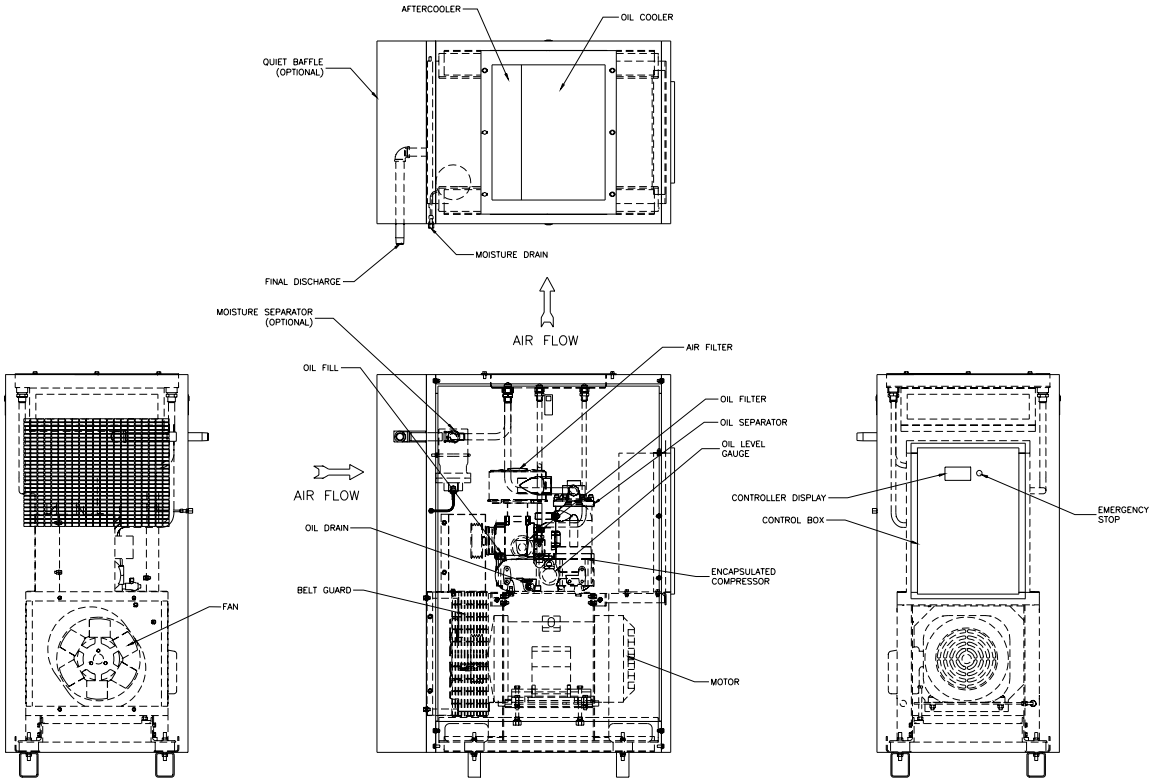
COMPRESSOR - The rotary screw compressor is a single stage, positive displacement rotary machine using meshing helical rotors to effect compression. Both rotors are supported between high capacity roller bearings located outside the compression chamber. Single width cylindrical roller bearings are used at the inlet end of the rotors to carry part of the radial loads. Ball and roller bearings at the discharge end locate each rotor axially and carry all thrust loads and the remainder of the radial loads.



COMPRESSION PRINCIPLE (Figure 1-1) - Compression is accomplished by the main and secondary rotors synchronously meshing in a one-piece cylinder. The main rotor has four (4) helical lobes 90° apart. The secondary rotor has five (5) matching helical grooves 72° apart to allow meshing with main rotor lobes.

The air inlet port is located on top of the compressor cylinder near the drive shaft end. The discharge port is near the bottom at the opposite end of the compressor cylinder. *Figure 1-1 is an inverted view to show inlet and discharge ports*. The compression cycle begins as the rotors unmesh at the inlet port and air is drawn into the cavity between the main rotor lobes and the secondary rotor grooves (A). When the rotors pass the inlet port cutoff, air is trapped in the interlobe cavity and flows axially with the meshing rotors (B). As meshing continues, more of the main rotor lobe enters the secondary rotor grove, normal volume is reduced and pressure increases.

Oil is injected into the cylinder to remove the heat of compression and seal internal clearances. Volume reduction and pressure increase continues until the air/oil mixture trapped in the interlobe cavity by the rotors passes the discharge port and is released to the oil reservoir (C). Each rotor cavity follows the same “fill-compress-discharge” cycle in rapid succession to produce a discharge air flow that is continuous, smooth and shock free.

AIR FLOW IN THE COMPRESSOR SYSTEM (Figure 5-1, page 44) - Air enters the air filter and passes through the inlet unloader valve and on into the compression chamber where oil is injected into the air. After compression, the air/oil mixture passes into the oil reservoir where most of the entrained oil is removed by velocity change and impingement and drops back into the reservoir. The air and remaining oil then passes through the air/oil separator. The air then passes through the minimum pressure/check valve, the aftercooler and the moisture separator and into the plant air lines.

LUBRICATION, COOLING AND SEALING - Oil is forced by air pressure from the oil reservoir through the oil cooler, thermostatic mixing valve, and oil filter and discharge into the compressor main oil gallery. A portion of the oil is directed through internal passages to the bearings and shaft oil seal. The balance of the oil is injected directly into the compression chamber to remove heat of compression, seal internal clearances and lubricate the rotors.

SAFETY PRECAUTIONS

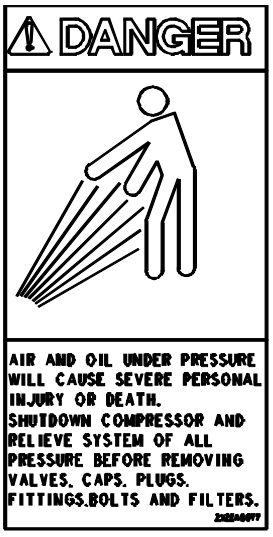
Safety is everybody's business and is based on your use of good common sense. All situations or circumstances cannot always be predicted and covered by established rules. Therefore, use your past experience, watch out for safety hazards and be cautious. Some general safety precautions are given below:

DANGER

Failure to observe these notices could result in injury to or death of personnel.

- **Keep fingers and clothing away from revolving fan, drive coupling, etc.**
- **Do not use the air discharge from this unit for breathing – not suitable for human consumption.**
- **Do not loosen or remove the oil filler plug, drain plugs, covers, the thermostatic mixing valve or break any connections, etc., in the compressor air or oil system until the unit is shut down and the air pressure has been relieved.**
- **Electric shock can and may be fatal.**
- **Perform all wiring in accordance with the National Electrical Code (NFPA-70) and any applicable local electrical codes. Wiring and electrical service must be performed only by qualified electricians.**
- **Open the main disconnect switch, lockout and tagout before working on the control.**
- **Disconnect the compressor unit from its power source, lockout and tagout before working on the unit – this machine is automatically controlled and may start at any time.**

⚠ WARNING



Failure to observe these notices could result in damage to equipment.

- **<u>Stop the unit</u> if any repairs or adjustments on or around the compressor are required**
- **<u>Disconnect the compressor</u> unit from its power source, lockout and tagout before working on the unit – this machine is automatically controlled and may start at any time.**
- **<u>An Excess Flow Valve</u> should be on all compressed air supply hoses exceeding 1/2 inch inside diameter. (OSHA Regulation, Section 1926.302, or local regulations)**
- **<u>Do not exceed the rated maximum pressure values</u> shown on the nameplate.**
- **<u>Do not operate unit</u> if safety devices are not operating properly. Check periodically. Never bypass safety devices.**

SECTION 2
INSTALLATION

GENERAL - On receipt of the unit, check for any damage that may have been incurred during transit. Report any damage or missing parts as soon as possible.

CAUTION
Do not electric weld on the compressor or base; bearings can be damaged by passing of current.

LIFTING UNIT - Proper lifting and/or transporting methods must be used to prevent damage. Unit may be moved into location by lift truck.

CAUTION
Lift compressor unit under base only. Do not use other places such as motor, compressor or discharge manifold piping as lifting points.

DANGER
The eyebolts or lugs provided on the motor are for lifting the motor only and should not be used to lift any additional weight. All eyebolts must be securely tightened. When lifting the motor the lifting angle must not exceed 15 degrees. Failure to observe this warning may result in damage to equipment or personal injury.

LOCATION (Figure 2-1**,** page 14) - The compressor should be installed where it is protected from rain, snow and freezing temperatures, in a clean, well-lighted, well-ventilated area with ample space all around for maintenance. Select a location that provides a cool, clean, dry source of air. In some cases it may be necessary to install the air filter at some distance from the compressor to obtain proper air supply.

AIR-COOLED UNIT - A combination oil/aftercooler is supplied as standard equipment on all air-cooled units. The air-cooled unit with the standard enclosure requires sufficient flow for the compressor oil/aftercooling system and electric motor cooling (Figure 1-2, page 8). Air is drawn into the unit above the motor and discharged through the cooler. Do not block the air flow to and from the unit. Allow three and one half (3-1/2) feet to the nearest obstruction on the control box end of the unit. Allow two (2) feet to the nearest obstruction above and on other sides of unit.

For continuous efficiency, oil cooler cores must be periodically cleaned with either vacuum or compressed air. If wet cleaning is required, shield motor and spray on a mild soap solution and flush with clean water.

⚠ WARNING

For aluminum oil coolers, do not use any cleaning solution that is not compatible with aluminum. Use of improper solution may result in damage to the cooler.

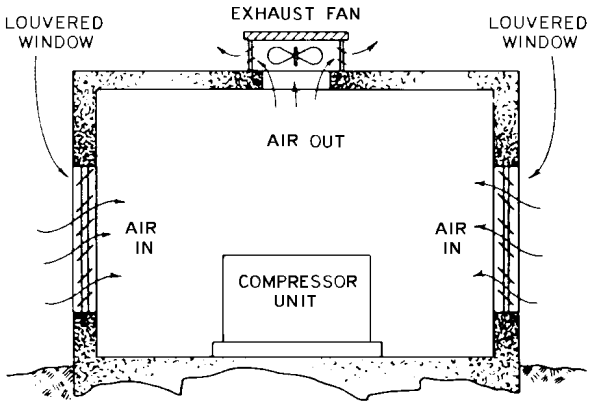

Figure 2-1 – TYPICAL COMPRESSOR ROOM

Minimum Air Flow* For Compressor And Cooling (cubic Feet/Minute)	
	Air Cooled
All Models	3000 cfm

* 80° F Inlet Air

Figure 2-2 – AIR FLOW CHART

FOUNDATION - The rotary screw compressor requires no special foundation, but should be mounted on a smooth, solid surface. Whenever possible install the unit near level. Temporary installation may be made at a maximum 5° angle lengthwise or 5° sidewise. Mounting bolts are not normally required. However, installation conditions such as piping rigidity, angle of tilt, or danger of shifting from outside vibration or moving vehicles may require the use of mounting bolts and shims to provide uniform support for the base. Belt alignment and tension should be checked after installation. (For information on belt alignment and tension, see SECTION 7, page 57.

OIL RESERVOIR DRAIN - The oil drain is piped from the bottom of the reservoir to the side of the frame. This drain is approximately 20 inches above the floor level.

CAUTION

If the compressor unit base is raised above floor level, the space between the floor and the base bottom must be closed with solid material all around to prevent recirculation of hot air from the oil cooler end and over temperature operation.

ENCLOSURE - The compressor, electric motor, oil cooler and aftercooler are mounted inside the enclosure.

Service panels are provided for maintenance access. Be sure to allow enough space around the unit for the panels to be removed. Any of the enclosure panels may be removed by opening the latch and lifting it up slightly.

DANGER

Do not operate the compressor with the fan and belt guard removed. Exposed fan and belts may cause injury to personnel.

CAUTION

The enclosure doors and panels must be closed and latched while the compressor is operating. Failure to close and latch the doors and panels will cause high temperature shutdowns.

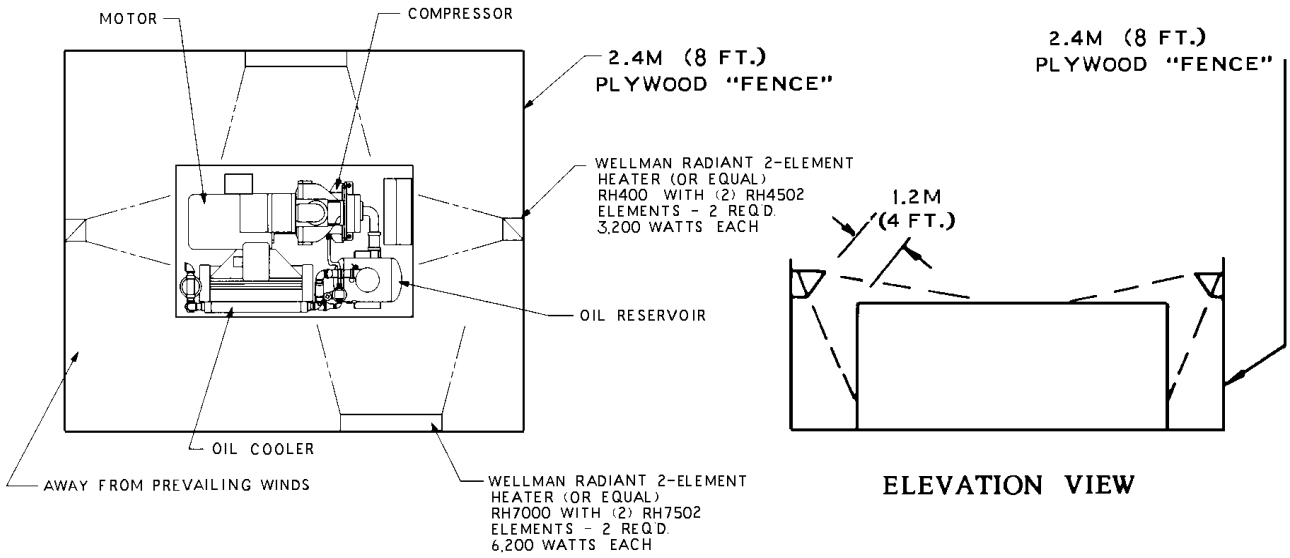

Figure 2-3 – COLD WEATHER INSTALLATION

INSTALLATION FOR COLD WEATHER OPERATION (Figure 2-3, page 15) - It is recommended that the unit be installed inside a shelter that will be heated to temperatures above freezing (32^{o} F, 0^{o} C). This will eliminate many of the problems associated with operating units in cold climates, such as freezing in control lines and downstream of the cooler.

Refer to Engineering Data Sheet 13-9-411 for the advantages of using the heat recovered from rotary compressors. This heat recovery could easily pay for an adequate shelter for the unit.

When an outside installation must be made, the precautions required will depend on the severity of the environment. The following are general guidelines for outside installations:

Cold Weather (Down To $+10^{o}$ F)

1. Be sure all drains, traps, and control lines, including pressure transducer lines are heated to avoid freezing of condensate. Heat tape with thermostat control is generally satisfactory for this purpose and can be obtained at various local plumbing or hardware outlets at nominal cost.

2. Provisions to bypass the aftercooler must be made. Since cold air contains very little moisture, successful operation can be achieved without the aftercooler.

3. Provide at least some simple shelter such as a plywood windbreak to protect against drifting snow.

4. Use only Gardner Denver AEON 9000SP lubricant.

5. Monitor unit carefully during start-up and operation to be sure it is functioning normally.

Remember unsheltered (outside) installations should be avoided where possible. Installation next to a heated building where enough heat can be used to keep the compressor room above freezing will save many complications in the operation and installation of the unit.

AUXILIARY AIR RECEIVER - An auxiliary air receiver is not required if the piping system is large and provides sufficient storage capacity to prevent rapid cycling. When used, an air receiver should be of adequate size, provided with a relief valve of proper setting, a pressure gauge and a means of draining condensate

STANDARD MOISTURE SEPARATOR/TRAP - The unit is equipped with a built-in aftercooler, a combination moisture separator and trap piped into the system down stream of the aftercooler.

CONTROL PIPING - Control piping is not necessary since the rotary screw unit is factory wired and piped for the control system specified.

INLET LINE - Where an inlet line is used between the air filter and the compressor, it must be thoroughly cleaned on the inside to prevent dirt or scale from entering the compressor. **If welded construction is used, the line must be shot blasted and cleaned to remove welding scale**. In either case, the inlet line must be coated internally by galvanizing or painting with a moisture and oil-proof sealing lacquer. Up to ten (10) feet in length, the inlet line should be the full size of the inlet opening on the compressor. If an extra-long line is necessary, the pipe size should be increased according to “Inlet Line Length Chart”, page 17.

Accessibility for inlet air filter servicing must be considered when relocating the filters from the unit to a remote location.

INLET LINE LENGTHS

Length of Inlet Line	Diameter of Pipe Size
0 to 10 Feet	Same as Compressor Inlet Opening
10 to 17 Feet	One Size Larger Than Inlet Opening
17 to 38 Feet	Two Sizes Larger Than Inlet Opening

DISCHARGE SERVICE LINE - The discharge service line connection is made at the left hand corner of the package when viewed from the control box end. A hand operated valve, (air service valve) must be installed between the unit and the customer's air system. If a fast operating valve such as a ball valve is used, it must be closed slowly to give the intake valve time to shut and keep the discharge pressure from spiking.

⚠ WARNING

The controller has an automatic start/stop sequence built in. You do NOT need to close the air service valve. Closing the air service valve on start-up or prior to shutdown will cause rapid cycling, and could cause a high pressure shutdown.

When manifolding two or more rotary screw units on the same line, each unit is isolated by the check valve in the unit discharge line.

If a rotary screw unit is manifolded to another compressor, be sure the other compressor has a check valve in the line between the machine and the manifold.

If a rotary screw and a reciprocating compressor are manifolded together, an air receiver must be located between the two units.

⚠ DANGER

Discharge air used for breathing will cause severe injury or death.

Consult filtration specialists for additional filtration and treatment equipment to meet health and safety standards.

ELECTRICAL WIRING - Standard Units - The compressor package is factory wired for all connections from the starter to the motor, for the horsepower and voltage specified on the order. The standard unit is supplied with open drip proof motors, and a NEMA 4 starter and controls enclosure. Totally enclosed motors are available as factory options. See "Location" paragraph on page 13, for distance to the nearest obstruction on the control box side of the package.

Perform all wiring in accordance with the National Electrical Code (NFPA-70) and any applicable local electrical codes. Wiring must be performed only by qualified electricians.

⚠ WARNING

Electrical shock can cause injury or death. Open main disconnect switch, lockout and tagout before working on control box.

GROUNDING - Equipment must be grounded in accordance with Section 250 of the National Electrical Code.

⚠ WARNING

Failure to properly ground the compressor package could result in injury or death. Install ground wiring in accordance with the National Electrical Code and any applicable local codes.

MOTOR LUBRICATION - Long time satisfactory operation of an electric motor depends in large measure on proper lubrication of the bearings. The following charts show recommended grease qualities and regreasing intervals for ball bearing motors. For additional information, refer to the motor manufacturer's instructions.

The following procedure should be used in regreasing:

1. Stop the unit.
2. Disconnect, lockout and tagout the unit from the power supply.
3. Remove the relief plug and free hole of hardened grease.
4. Wipe lubrication fitting clean and add grease with a hand-operated grease gun.
5. Leave the relief plug temporarily off. Reconnect unit and run for about 20 minutes to expel the excess grease.
6. Stop the unit. Replace the relief plug.
7. Restart the unit.

⚠ WARNING

Rotating machinery can cause injury or death. Open main disconnect, lockout and tagout power supply to starter before working on the electric motor.

ELECTRIC MOTOR GREASE RECOMMENDATIONS (-30° TO 50° C)

MANUFACTURER	TRADE NAME
CHEVRON	SRI #2
SHELL	DOLIUM R
EXXON	UNIREX #2
EXXON	POLYREX

ELECTRIC MOTOR REGREASING INTERVAL

Type of Service	Typical	Rating	Relubrication Interval
Standard	One or Two Shift Operation	Up to 150 HP (112 KW)	18 Months
		Above 150 HP (112 KW)	12 Months
Severe	Continuous Operation	Up to 150 HP (112 KW)	9 Months
		Above 150 HP (112 KW)	6 Months
Very Severe	Dirty Locations, High Ambient Temperature	Up to 150 HP (112 KW)	4 Months
		Above 150 HP (112 KW)	2 Months

SECTION 3
STARTING & OPERATING PROCEDURES

PRESTART-UP INSTRUCTIONS - A new unit as received from the factory has been prepared for shipping only. Do not attempt to operate the unit until checked and serviced as follows:

1. **Compressor Oil** - The oil must be checked before starting the unit and every 8 hours of operation. For instructions on checking the oil and the proper oil level, refer to “Compressor Oil Filter”, SECTION 5, page 44.

   Do not mix different type oils. Unit is shipped filled with Gardner Denver AEON 4000 Lubricating Coolant which is suitable for the first 4000 hours under normal operating conditions. AEON 9000SP is also available. Check the decal on the reservoir to be sure which lubricant is in the machine.

   REPLACE OIL FILTER EVERY 1000 HOURS.

NOTICE
Regular maintenance and replacement at required intervals of the oil filter, air filter and air/oil separator is necessary to achieve maximum service and extended drain intervals of AEON 4000 lubricant. Use only genuine Gardner Denver filters designed and specified for this compressor.

DANGER
Always stop the unit and release air pressure before removing oil filler plug. Failure to release pressure may result in personal injury or death.

2. **Air Filter** - Inspect the air filter to be sure it is clean and tightly assembled. Refer to SECTION 6, page 55 for complete servicing instructions. Be sure the inlet line, if used, is tight and clean.

3. **Piping** – Refer SECTION 2, page 17 “Discharge Service Line” and make sure all piping meets all recommendations.

4. **Electrical** - Check the wiring diagrams furnished with the unit to be sure it is properly wired. See **Error! Reference source not found.** thru **Error! Reference source not found.**, pages **Error! Bookmark not defined.** thru **Error! Bookmark not defined.**, for general wiring diagrams and SECTION 2, page 13, for “Electrical Wiring”.

5. **Grounding** - Unit must be properly grounded according to Section 250 of the National Electrical Code.

WARNING
Failure to properly ground the compressor package could result in controller malfunction.

6. **Rotation** - Check for correct motor rotation by jogging the motor. See “Unit Setup Adjust Menu” in Controller Operating and Service Manual. Compressor drive shaft rotation must be counterclockwise, standing facing the compressor sheave.

⚠ WARNING

Operation with incorrect motor rotation can damage equipment and cause oil eruption from the compressor inlet. When checking motor rotation, induce minimum rotation (less than one revolution if possible). Never allow motor to reach full speed.

⚠ WARNING

The compressor unit’s direction of rotation must be check every time the compressor is reconnected to the power supply.

7. **System Pressure** - The discharge pressure of the unit is set at the factory. To change the discharge pressure, set the controls to the desired load pressure. DO NOT EXCEED THE MAXIMUM OPERATING PRESSURE ON THE COMPRESSOR NAMEPLATE. See "Operation Adjustments Menu" in Controller Operating and Service Manual.

⚠ WARNING

Operation at excessive discharge air pressure can cause personal injury or damage to equipment. Do not adjust the full discharge air pressure above the maximum stamped on the unit nameplate.

8. **Operating Mode** - Refer to SECTION 4, page 25 for detailed information on the control system.

9. **Enclosure** - Check for damaged panels or doors. Check all screws and latches for tightness. Be sure doors are closed and latched.

⚠ DANGER

The compressor starts and stops automatically. Automatic restarting can cause injury or death. Open, lockout and tagout main disconnect and any other circuits before servicing the unit.

⚠ WARNING

The enclosure doors must be in place and fastened down to keep the compressor package from overheating when the compressor is running.

⚠ WARNING

After an emergency stop, be sure that the pressure in the air/oil reservoir is less than 5 psig. Wait one minute or more before restarting.

⚠ WARNING

The controller has an automatic start/stop sequence built in. You do NOT need to close the air service valve. Closing the air service valve on start-up or prior to shutdown will cause rapid cycling, and could cause a high pressure shutdown.

STARTING THE UNIT - Observe the following starting procedures:

Unit Cold:

1. Open the air service valve (customer furnished) between the main air system and the check valve on the package.

2. Turn on power to the compressor package. To start press STOP/RESET, then press RUN.

3. Run for approximately five minutes or until the temperature stabilizes.

   The unit is equipped with a minimum (45 psig) pressure/check valve. No special procedure is required to maintain the unit reservoir pressure.

Unit Hot (No warm-up period is required):

1. Open the air service valve (customer furnished) between the main air system and the check valve on the package.

2. Run for approximately one minute. The unit is equipped with a minimum (45 psig) pressure/check valve, no special procedure to maintain the unit reservoir pressure is required.

DAILY CHECK - Refer to “Maintenance Schedule,” SECTION 8 page 60.

STOPPING THE UNIT:

1. To stop compressor operation, press STOP/RESET.

2. Wait approximately one minute to allow the compressor to stop. The oil reservoir will automatically blow down as the motor stops.

Quick Start Guide

Operation of the AirSmart controller is easy. Simply select a Target Pressure and then press the Run 

button to start the compressor, no other settings are required. The Target Pressure comes preset to 100 PSI from the factory. The Unload Pressure is preset to 110 PSI. If a different pressure setting is desired, the following steps can be used as a guide.

Setting the Target Pressure

The Target Pressure setting is used to set the operating point of the compressor. To make any adjustments in the operation of the compressor, the machine must be stopped and in the Ready mode. Stop the compressor by pressing the Stop/Reset 

button. The front panel display should read “READY” on line 3.

```
0 PSI                    75°F
10 HRS          AUTOMATIC
                READY
NO SERVICE ADVISORY
```

Next, press the Enter 

button to access the Adjustment Menu tree

```
ADJUSTMENT MENU
OPERATION ADJUSTMENT

(SELECT SUB MENU)
```

Since the Target Pressure setting is under the Operation Adjustment menu, press Enter 

again to access that sub-menu

```
OPERATION ADJUSTMENT
LANGUAGE-LANGUAGE
ENGLISH (US)
(SELECT PARAMETER)
```

The Target Pressure is the second item in the Operation Adjustment sub-menu so press the Down 
button to navigate to the Target Pressure setting.

```
OPERATION ADJUSTMENT
TARGET PRESSURE
100 PSI
(SELECT PARAMETER)
```

To change the Target Pressure, press the Enter  button to edit the value.

A flashing cursor will appear covering the least significant digit in the Target Pressure value, use the Plus  and Minus  buttons to change its value. Use the Right  and Left  buttons to move the cursor to other digits in the Target Pressure value. When the desired Target Pressure value is displayed, press the Enter  button to save the new value. Pressing the Stop/Reset  button will abort the change and restore the previous value.

In order to save the changes made to parameters, press the Stop/Reset button to go back to the heading of the current menu and then press the Stop/Reset button again. If parameter changes have been made, the following screen will appear.

To permanently save the changes that were made, press the Enter  button. If the Stop/Reset button is pressed, the parameter changes will be lost the next time the compressor power is turned off.

Setting The Unload and Load Pressure

After setting the Target Pressure, set the Unload and Load Pressures values in a similar fashion. The Unload pressure is the third item in the Operation Adjustment sub-menu so press the Down  button to navigate to the Unload Pressure setting. The Unload Pressure will control at which pressure the compressor unload and stops.

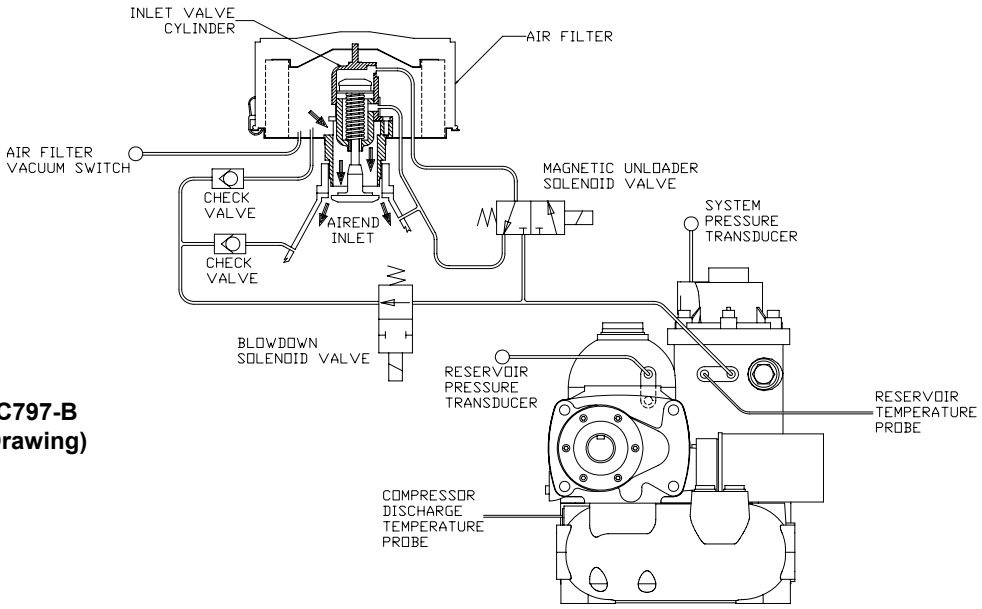
The Load pressure is the fourth item in the Operation Adjustment sub-menu so press the Down  button to navigate to the Load Pressure setting. The Load Pressure will control at which pressure the compressor will startup again after unloading.

SECTION 4
CONTROLS & INSTRUMENTATION

GENERAL DESCRIPTION

The Gardner Denver rotary screw compressor is prewired with all controls, motor, and starter for the voltage and horsepower at the time of ordering. It is necessary only to connect the compressor unit to the correct power supply and to the shop air line. A standard compressor unit consists of the compressor, oil reservoir, oil cooling system and filter, motor type as specified, NEMA 4 starter / control box, and control components as described below.

AirSmart® OPERATION



Operation of the "AirSmart" is dependent on selection of an operating mode from the controller keypad. Prior to starting, the STOP/RESET key must be pressed to place the controller into its READY state (as indicated on the display). Compressor operation may then be started by pressing the RUN key. While in any operating mode, the display will indicate the mode, and the operating light will be on.

Press the STOP/RESET key at any time to stop the compressor under normal conditions.

AUTOMATIC is the most common selected mode of operation, as it automatically will operate the compressor unit in the most efficient manner for the demand of the air system. Refer to the controller manual for descriptions of other modes.

⚠ WARNING

Automatic restarting or electrical shock can cause injury or death. Open, lockout and tagout main disconnect and any other circuits before servicing unit.

303EFC797-B
(Ref. Drawing)

Figure 4-1 – CONTROL SCHEMATIC

CONTROL DEVICES

Controller - This compressor unit features the "AirSmart" controller, which integrates all the control functions under microprocessor control. Its functions include safety and shutdown, compressor regulation, operator control, and advisory/maintenance indicators. The keypad and display provide the operator with a logical and easily operated control of the compressor and indication of its condition. The controller is factory adjusted for the compressor package, but allows tuning for specific applications.

Detailed instructions for the controller are found in the “AirSmart” Controller Operating and Service Manual.

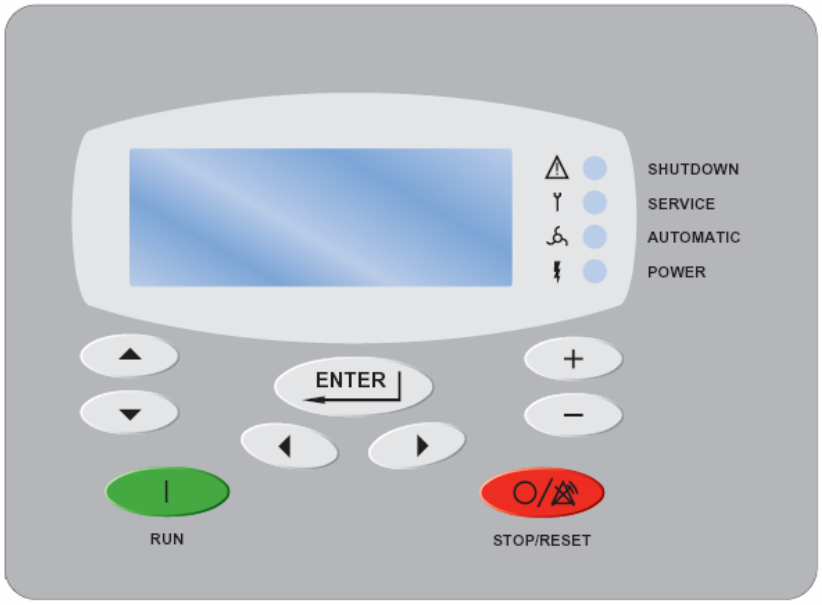


Figure 4-2 – KEY PAD

Relief Valve - A pressure relief valve is installed in the final discharge line and set to approximately 120-125% of the unit's full load operating pressure for protection against overpressure. Periodic checks should be made to ensure its operation.

The relief valve should be tested for proper operation at least once every year. To test the relief valve, raise the system operating pressure to 75% of the relief valve set pressure and manually open the valve by turning the cap.

⚠ WARNING

When the relief valve opens, a stream of high velocity air is released, resulting in a high noise level and possible discharge of accumulated dirt or other debris. Always wear eye and ear protection and stand clear of the discharge port when testing the relief valve to prevent injury.

⚠ CAUTION

Never paint, lubricate or alter a relief valve. Do not plug vent or restrict discharge.

⚠ WARNING

Operation of the unit with improper relief valve setting can result in severe personal injury or machine damage. Ensure properly set valves are installed and maintained.

Oil Level Gauge - This gauge is located on the oil reservoir and indicates the oil level. See “Oil Level Gauge”, Figure 5-4, page 50, for how to read oil level.

Minimum Discharge Pressure/Check Valve - An internal spring-loaded minimum pressure valve is used in the final discharge line to provide a positive pressure on the coolant system of the compressor even if the air service valve is fully open to atmospheric pressure. This valve also functions as a check valve to prevent back flow of air from the shop air line when the unit stops, unloads, or is shut down.

The valve incorporates an orifice which, when air is flowing through it, maintains pressure in the oil reservoir. A spring-loaded piston valve senses air pressure on the upstream (reservoir) side of the valve. When the system pressure rises, the spring is overridden and the valve opens to full porting.

Inlet Valve (Figure 4-1, page 25) **-** The Inlet valve restricts the inlet to control delivery and closes to unload the compressor. At shutdown, the inlet valve closes to prevent the back flow of air.

The inlet valve position is controlled by air pressure in its piston cylinder, which is controlled by the "AirSmart" through the magnetic unloader solenoid valve. When the top of the cylinder is pressurized, the inlet opens for full air delivery. When pressure is relieved from the cylinder, the inlet valve closes to restrict air flow and compressor delivery.

Magnetic Unloader Solenoid Valve (Figure 4-1, page 25) **-** This valve controls the position of the inlet valve in response to signals from the "AirSmart". When de-energized, pressure is relieved from the top of the inlet valve cylinder to unload the compressor. When the solenoid valve is energized, reservoir pressure is supplied to the top of the cylinder to load the compressor.

Check Valve (Figure 4-1, page 25) **-** This valve is normally closed while the compressor is loaded or stopped. While running unloaded, it opens to admit a small amount of purge air to the compressor inlet. This reduces compressor knock, and provides enough air to pressurize the controls during startup.

Blowdown Valve (Figure 4-1, page 25) **-** The blowdown valve is a two-way solenoid valve which is piped into the oil reservoir outlet ahead of the minimum pressure valve. When the solenoid is de-energized, the valve opens and the coolant system is blown down. When the solenoid is energized, the valve closes to allow the coolant system to pressurize.

System Pressure Transducer (Figure 4-1, page 25) **-** This transducer is connected after the minimum pressure valve. It converts the pressure in the plant air system into an electrical signal for use by the "AirSmart" controller for modulation and control.

Reservoir Pressure Transducer (Figure 4-1, page 25) **-** This transducer is connected to the coolant system. Its signal is used to prevent loaded starts, monitor oil pressure, and to monitor the condition of the separator.

Air Filter Vacuum Switch (Figure 4-1, page 25) **-** This switch is used to monitor air filter condition and alert the user if the filter requires service or replacement.

CAUTION

Machine damage will occur if compressor is repeatedly restarted after any one of the shutdown modes stops operation of the unit. Find and correct the malfunction before resuming operation.

Discharge Thermistor (Figure 4-1, page 25) **-** This sensor is located directly in the compressor discharge. Its signal is used to monitor compressor temperature and shut down the compressor if a coolant problem is detected.

Reservoir Thermistor (Figure 4-1, page 25) **-** This sensor is located in the reservoir/separator housing and is used to monitor temperature and shut down the compressor if temperature problems occur at the separator.

Emergency Stop Pushbutton - This is a maintained pushbutton, and removes power from the controller outputs regardless of controller status. It is located on the middle section of the control box door, below the keypad. This should be used for emergency purposes only - use the keypad [STOP/RESET] for normal controlled stopping.

WARNING

Automatic restarting or electrical shock can cause injury or death. Open and lock main disconnect and any other circuits before servicing unit.

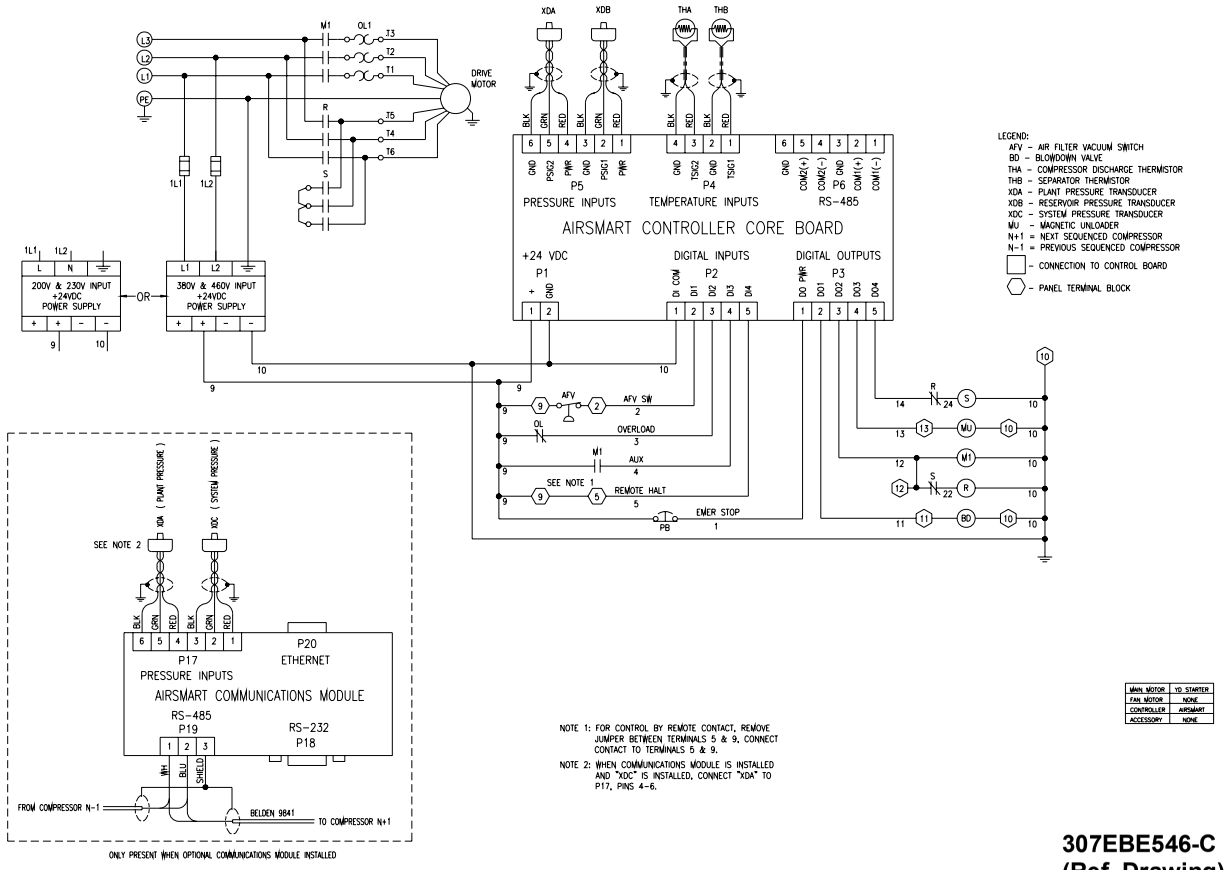
Power Supply – This device changes the incoming AC supply voltage to 24 volts DC for use by all unit control devices. For 575 volt AC units only, a control transformer is provided to supply 230-240 volts AC input to the power supply. A secondary fuse is provided on the control transformer. Refer to adjacent labeling for replacement information.

Fuse Blocks – Two class CC fuse blocks provide line side protection for the power supply and control transformer, as applicable.

Terminal Strip - This provides connections for all 24 volt DC controlled devices not directly connected to the “AirSmart” controller.

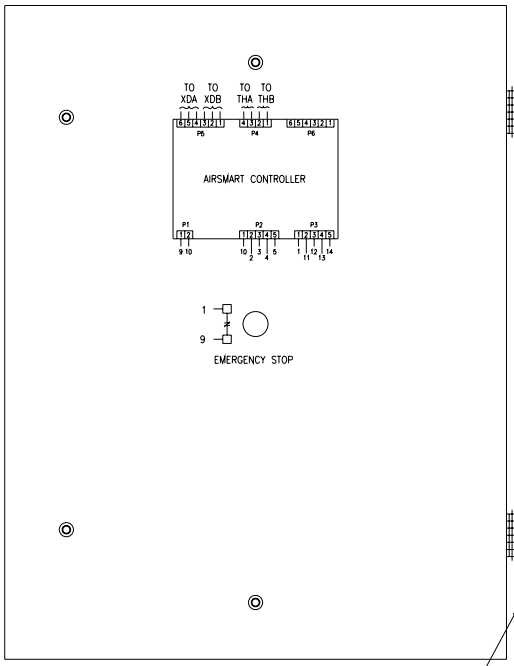
Main Starter - This starter is used to provide control and overload protection for the main drive motor. Wiring diagrams for typical full boltage applications are illustrated on pages **Error! Bookmark not defined.** thru **Error! Bookmark not defined.**. For Wye Delta and less starter applications, refer to the wiring diagram included in each control box enclosure.

Overload protection is provided for each motor on full voltage and Wye Delta applications. The overloads are adjustable and are factory set based on the motor nameplate amps and the instructions located inside the control box door. Less starter applications utilize a control relay for control of a remote mounted motor starter (not provided with compressor package).



Changing Minimum Pressure/Check Valve Seals

DANGER



Air/oil pressure will cause severe personal injury or death. Shut down compressor, relieve system of all pressure, disconnect, lockout and tagout power supply to the starter before removing valves, caps, plugs, fittings, bolts and filters.

1. Be sure the unit is completely off and that no air pressure is in the oil reservoir.
2. Disconnect, lockout and tagout the power supply to the starter.
3. Tighten the nut down on the minimum pressure/check valve cover.
4. Remove the six (6) bolts holding the cover onto the separator housing.
5. Remove the snap ring in the cover.
6. Remove the internal parts (see Parts List Book) and replace the seals in the minimum pressure/check valve.
7. Re-assemble valve, including the snap ring.
8. Tighten the cover down to the separator housing.
9. Loosen the nut on top of the minimum pressure/check valve .05 to .08 inches.
10. Run the unit and check for leaks.

SECTION 5
LUBRICATION
OIL COOLER, OIL FILTER & SEPARATOR

COMPRESSOR OIL SYSTEM (Figure 5-1) The compressor oil system cools the compressor, lubricates moving parts and seals internal clearances in the compression chamber.

Air pressure in the oil reservoir forces oil through the oil cooler, thermostatic mixing valve, oil filter and into the compressor main oil gallery.

The oil passes through internal passages for lubrication, cooling and sealing. The air-oil mixture is then discharged to the oil reservoir where a large part of the entrained oil drops out of the air stream. The remaining mixture then passes through the final oil separator where most of the remaining oil is removed. The air then passes to the aftercooler. The oil separated from the air is sent to the oil cooler and recirculated throughout the system. Oil separated at the air/oil separator is sent via an oil return line through an orifice and back into the compressor.

RECOMMENDED LUBRICANT - Gardner Denver compressors are factory filled with AEON lubricants. These lubricants are formulated to the highest quality standards and are factory authorized, tested and approved for use in rotary screw compressors. AEON lubricants are available through your authorized Gardner Denver compressor distributor.

Ref. No.	Description
1	Air/oil Separators
2	Oil Scavenge Line
3	Orifice
4	Oil Filter
5	Thermostatic Mixing Valve
6	Minimum Pressure/Check Valve
7	Aftercooler
8	Oil Cooler
9	Moisture Separator
10	Electronic Drain
11	Pressure Relief Valve

Figure 5-1 – FLOW DIAGRAM

OIL SPECIFICATIONS - The recommended compressor lubricant is Gardner Denver AEON 4000 Lubricating Coolant which can be used for year-round operation except as noted in the “High Temperature Operation” paragraph, page 45, or low temperature, see “Installation for Cold Weather Operation,” page 16. AEON 4000 Lubricating Coolant is a superior petroleum base lubricant formulated and containing additives for use in Gardner Denver compressors.

CAUTION

Specific AEON™ lubricants are recommended for use in this equipment. Other lubricants may cause excessive carryover or compressor damage. Do not mix different types of lubricants or use inferior lubricants. Check the decal on the oil reservoir for lubricating coolant specification.

HIGH TEMPERATURE OPERATION - If the discharge temperature is sustained between 200-210° F. for a period of more than four (4) hours due to continuing high ambient air temperature, use Gardner Denver AEON 9000SP Lubricating Coolant which is a superior synthetic lubricant. Short periods of up to four (4) hours of sustained discharge temperatures up to 210° F. do not require a change from the recommended year-round lubricant AEON 4000.

COLD AMBIENT OPERATION - See "Installation for Cold Weather Operation," page 16 and Figure 2-3, page 15.

PROCEDURE FOR CHECKING OIL LEVEL (Figure 5-4, page 50) - Check the oil level when the compressor is shutdown and the oil/air mixture has separated. The oil should be visible between the min. and max. range, shown in Figure 5-4, page 50. If the oil level is above the max. range, the oil must be drained. If the oil level is below the min. range, oil must be added.

ADDITION OF OIL BETWEEN CHANGES - Oil must be added when the oil level is below the min. range on the oil gauge. The oil must be checked with the machine shutdown, blowndown and the air/oil mixture settled out to air and oil.

DANGER

Air/oil under pressure will cause severe personal injury or death. Shut down compressor, relieve system of all pressure, disconnect, lockout and tagout power supply to the starter before removing valves, caps, plugs, fittings, bolts and filters.

DANGER

Compressor, air/oil reservoir, separation chamber and all piping and tubing may be at high temperature during and after operation.

CAUTION

Excessive oil carryover can damage equipment. Never fill oil reservoir above the max. range of the gauge.

To add oil, follow these steps:

1. Be sure the unit is completely off and that no air pressure is in the oil reservoir.

2. Disconnect, lockout and tagout the power supply to the starter.

3. Wipe away all dirt around the oil filler plug. It is located by the oil filter.

4. Remove the oil filler plug and add oil as required to return the oil level to the max. line on the site glass.

5. Install the oil filler plug, run and check for leaks.

DO NOT OVERFILL. The quantity required to raise the oil level from the min. line to the max. line, (See Figure 5-4, page 50), is two (2) quarts (Figure 5-2, page 46). Repeated addition of oil between oil changes may indicate excessive oil carryover and should be investigated.

Use only CLEAN containers and funnels so no dirt enters the reservoir. Provide for clean storage of oils. Changing the oil will be of little benefit if done in a careless manner.

	20 to 30 HP (15 – 22 kW)
Refill Capacity For Normal Oil Change	2.00 U. S. Gallons (8.5 Liters)
Bottom of Site Glass to Top of Site Glass	2 U. S. Quart (2 Liters)

Figure 5-2 – APPROXIMATE OIL SYSTEM CAPACITIES

OIL CHANGE INTERVAL - Recommended oil change intervals are based on oil temperature. Figure 5-3, shows how the change interval is affected by temperature.

When operating conditions are severe (very dusty, high humidity, etc.), it will be necessary to change the oil more frequently. Operating conditions and the appearance of the drained oil must be surveyed and the oil change intervals planned accordingly by the user. Gardner Denver offers a free oil analysis program with the AEON lubricants and we recommend a sample be sent in at 100 hours on a new unit.

Discharge Temperature	AEON™ 4000 Change Interval	AEON™ 9000SP Change Interval
Up to 180° F (82° C)	4000 hrs.	8000 hrs.
180° F to 190° F (82° C to 88° C)	3000 hrs.	6000 hrs.
190° F to 200° F (88° C to 93° C)	2000 hrs.	4000 hrs.
200° F+ (93° C)	1000 hrs.	2000 hrs.

Figure 5-3 – OIL CHANGE INTERVAL

DRAINING AND CLEANING OIL SYSTEM

DANGER

Air/oil under pressure will cause severe personal injury or death. Shut down compressor, relieve system of all pressure, disconnect, lockout and tagout power supply to the starter before removing valves, caps, plugs, fittings, bolts and filters.

Always drain the complete system. Draining when the oil is hot will help to prevent varnish deposits and carry away impurities.

To drain the system:

1. Be sure the unit is completely off and that no air pressure is in the air/oil reservoir.
2. Disconnect, lockout and tagout the power supply to the starter.
3. Stick the end of the drain tube into a suitable container, such as a 5 gallon pail.
4. Open the drain valve and allow oil to drain out of the air/oil reservoir.
5. Close the drain valve.

If the drained oil and/or the oil filter element are contaminated with dirt, flush the entire system: the reservoir, oil cooler and lines. Inspect the air/oil separator element for dirt accumulation; replace if necessary. If a varnish deposit exists, contact the factory for recommendations for removal of the deposit and prevention of varnish.

FILLING OIL RESERVOIR

DANGER

Air/oil under pressure will cause severe personal injury or death. Shut down compressor, relieve system of all pressure, disconnect, lockout and tagout power supply to the starter before removing valves, caps, plugs, fittings, bolts and filters.

DANGER

Compressor, air/oil reservoir, separation chamber and all piping and tubing may be at high temperature during and after operation.

1. Be sure the unit is completely off and that no air pressure is in the oil reservoir.
2. Disconnect, lockout and tagout the power supply to the starter.

3. Wipe away all dirt around the oil filler plug.

4. Remove the oil filler plug and add oil as required to return the oil level to the max. range on the oil gauge.

5. Install the oil filler plug and operate the unit for about a minute allowing oil to fill all areas of the system. Check for leaks.

6. Shut down unit, allowing the oil to settle, and be certain all pressure is relieved.

7. Add oil, if necessary, to bring level to the max. range on the oil level gauge (Figure 5-4, page 50).

DO NOT OVERFILL as oil carryover will result. The quantity of oil required to raise the oil level from the min. range to the max range on the site glass is shown in Figure 5-2, page 46. Repeated addition of oil between oil changes may indicate excessive oil carryover and should be investigated.

Use only CLEAN containers and funnels so no dirt enters the reservoir. Provide for clean storage of oils. Changing the oil will be of little benefit if done in a careless manner.

CAUTION

Excessive oil carryover can damage equipment. Never fill oil reservoir above the top of the site glass.

LUBRICANT UPGRADE PROCEDURE - Upgrading to a longer life lubricant is essentially a very worthwhile practice. The following are the primary steps to be completed when upgrading or changing the type of lubricant.

CAUTION

Improper equipment maintenance with use of synthetic lubricants will damage equipment. Oil filter and oil separator change intervals remain the same as for AEON 4000 -- See Maintenance Schedule, Page 60 .

DANGER

Air/oil under pressure will cause severe personal injury or death. Shut down compressor, relieve system of all pressure, disconnect, lockout and tagout power supply to the starter before removing valves, caps, plugs, fittings, bolts and filters.

WARNING

High temperature operation can cause damage to equipment or personal injury. Do not repeatedly restart the unit after high temperature stops operation. Find and correct the malfunction before resuming operation.

⚠ WARNING

All materials used in Gardner Denver® compressor units are compatible with AEON 9000SP Lubricating Coolant. Use caution when selecting downstream components such as air line lubricating bowls, gaskets and valve trim.

AEON 9000SP Synthetic Lubricant is not compatible with low nitrile Buna N or acrylic paints. AEON 9000SP is compatible with most air system downstream components.

1. Be sure the unit is completely off and that no air pressure is in the air/oil reservoir.

2. Disconnect, tag and lock out the power supply to the starter.

3. Thoroughly drain system:
   - Drain oil from airend and cooler while hot.
   - Break low point connections and drain oil from pipe runs.
   - Dump Oil from filter and reinstall used filter.

4. Fill system with a 50 percent charge of the new lubricant:
   - Start the machine and stay there to observe.
   - Allow the machine to run about five minutes at temperature, or until temperature stabilizes, then shut down

5. Thoroughly drain machine.

6. Change to a new filter and separator.

7. Fill system with a full charge of the new lubricant.

8. Machine should then be run normally; however, total run time after the initial changeouts should be 50 percent of normal anticipated service life of the new lubricant.
   - Drain all lubricant from system, change filter and separator, and replace with full charge of the new lubricant.

9. Subsequent lubricant changeouts should be at normal intervals. (See “Oil Change Interval” and chart, page 46.

Material Safety Data Sheets (MSDS) are available for all AEON lubricants from your authorized Gardner Denver distributor or by calling (901) 542-6100.

OIL LEVEL GAUGE (Figure 5-4, page 50) - The oil level gauge indicates the amount of oil in the air/oil reservoir. Read oil level only when the unit is shut down and the air/oil mixture has separated. Add oil only when the oil level is below the min. range on the site glass. Drain oil only when the oil level is above the max. range on the site glass.

Ref. No.	Name
1	Oil Fill
2	Pressure Relief Valve
3	Oil Drain

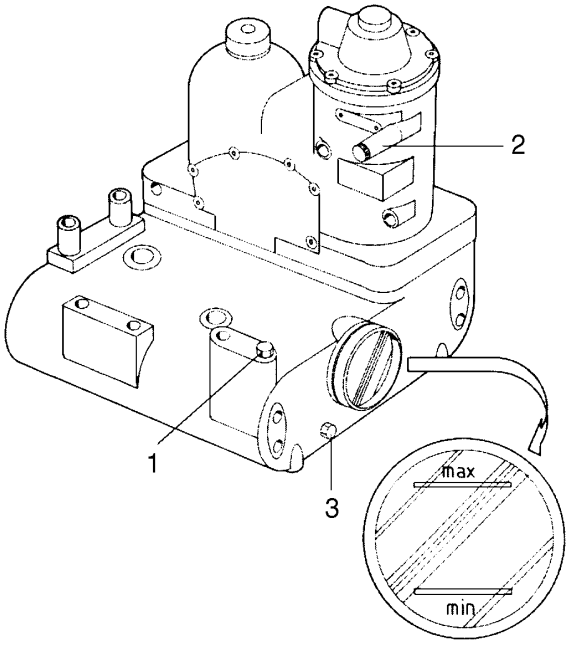

Figure 5-4 – OIL LEVEL GAUGE, OIL FILL AND OIL DRAIN

MOISTURE IN THE OIL SYSTEM - In normal humidity and with normal operating temperatures and pressures, the thermal mixing valve controls the oil temperature and prevents moisture contamination of the oil. Unusual cooling of the oil reservoir, short loaded cycle in high humidity or malfunctions of the thermal valve may result in moisture in the oil system which is detrimental to compressor lubrication and could cause oil carryover. If moisture is observed in the oil reservoir, drain the moisture and correct the condition causing the accumulation.

See “Compressor Oil System Check”, page 54 and “Thermal Control Valve", page 52.

COMPRESSOR OIL FILTER (Figure 1-2, page 8 and Figure 5-5, page 51) - This replaceable element filter is a vital part in maintaining a trouble-free compressor, since it removes dirt and abrasives from the circulated oil.

CAUTION

Improper oil filter maintenance will cause damage to equipment. Replace filter element every 1000 hours of operation. More frequent replacement could be required depending on operating conditions. A filter element left in service too long may damage equipment.

Use only the replacement element shown on the filter tag or refer to the parts list for the part number. Use the following procedure to replace the filter element. Do not disturb the piping.

DANGER

Air/oil under pressure will cause severe personal injury or death. Shut down compressor, relieve system of all pressure, disconnect, lockout and tagout power supply to the starter before removing valves, caps, plugs, fittings, bolts and filters.

DANGER

Compressor, air/oil reservoir, separation chamber and all piping and tubing may be at high temperature during and after operation.

1. Stop unit and be sure no air pressure is in the oil reservoir.
2. Disconnect, tag and lock out the power supply to the starter.
3. Remove the spin-on element.
4. Clean the gasket face of the filter body.
5. Coat the new element gasket with clean lubricant used in the unit.
6. Screw new element on filter body and tighten clockwise by hand 3/4 turn after contact. DO NOT OVERTIGHTEN ELEMENT.
7. Reset the filter life setting to 1000 hours, see “Maintenance Adjustments” in Controller Operating and Service Manual.
8. Run the unit and check for leaks.

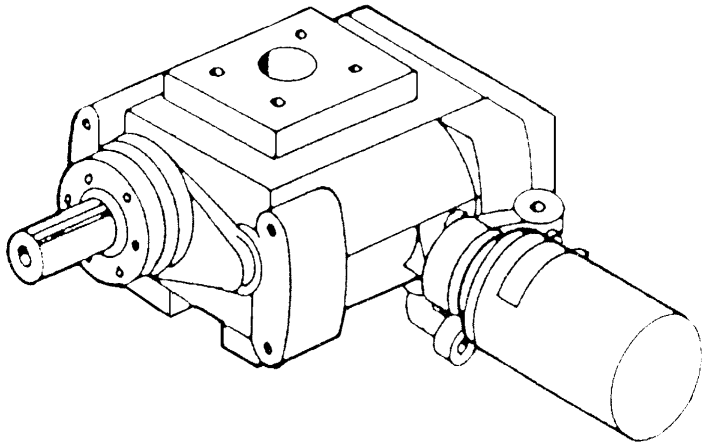

Figure 5-5 – OIL FILTER

COMPRESSOR OIL COOLER - The cooler fan is mounted on the compressor motor shaft; air is exhausted through the oil cooler and away from the unit. Do not obstruct air flow to and from the oil cooler. Allow a minimum of two (2) feet (.6M) clearance around the cooler. Keep both faces of the cooler core clean for efficient cooling of compressor oil.

THERMAL CONTROL (THERMOSTATIC MIXING) VALVE (Figure 5-1 page 44) - is installed in the system. This valve is used to control the temperature of the oil. On start-up with unit cold, the element is open to bypass, allowing oil to pass directly from the reservoir to the compressor during warm-up. As oil warms, the element gradually closes to the bypass allowing more of the oil from the cooler to mix with oil from the bypass.

After the unit is warmed up, the mixing valve maintains oil injection temperature into the compressor at a minimum of 150° F (66° C). This system provides proper compressor warm-up and prevents moisture contamination of the oil.

To check the element, heat it in oil - it should be fully extended at 150° F (66° C). If the unit shuts down due to high air discharge temperature, the cause may be that the element is stuck open to the bypass. When flushing the oil system, remove the mixing valve and clean all parts thoroughly.

OIL RESERVOIR - The oil reservoir-separator combines multiple functions into one vessel. The lower half is the oil reservoir, providing oil storage capacity for the system and the top portion, a primary oil separation means. The reservoir also provides limited air storage for control and gauge actuation.

COMPRESSOR AIR/OIL SEPARATOR (Figure 5-6, page 54) - Located in a separate housing, consists of a renewable cartridge-type separator element and provides the final removal of oil from the air stream.

Oil impinging on the inside of the separator element drains directly back into the oil reservoir by gravity. Oil collected outside the element is returned through tubing to the compressor cylinder.

Oil carryover through the service lines may be caused by a faulty oil separator, overfilling of the oil reservoir, oil that foams, oil return line malfunction, or water condensate in the oil. If oil carryover occurs, inspect the separator only after it is determined that the oil level is not too high, the oil is not foaming excessively, the oil return tube from the bottom of the separator to the compressor cylinder is not clogged or pinched off, the check valve in the oil return is functioning properly, and there is not water or an oil/water emulsion in the oil.

Oil carryover malfunctions of the oil separator are usually due to using elements too long, heavy dirt or varnish deposits caused by inadequate air filter service, use of improper oil, or using oil too long for existing conditions. Excessive tilt angle of the unit will also hamper separation and cause oil carryover.

Oil separator element life cannot be predicted; it will vary greatly depending on the conditions of operation, the quality of the oil used and the maintenance of the oil and air filters. The condition of the separator can be determined by pressure differential or by inspection.

Pressure Differential Gauging – The “CHANGE SEPARATOR” advisory will flash when the pressure differential across the oil separator reaches approximately 8 psid (.55 bar). Replace the oil separator element at this time. If ignored, the unit will shutdown and the advisory will illuminate steadily when the pressure differential reaches 15 psid (1 bar).

CAUTION

Using an oil separator element at excessive pressure differential can cause damage to equipment. Replace the separator when the differential pressure is greater than 8 psi or every 4,000 hours (at least once a year).

NOTICE

A sudden drop of zero pressure differential or sudden heavy oil carryover may indicate a ruptured element.

Inspection - After removal of separator element, shine a light inside the element to reveal areas of heavy dirt or varnish deposits or breaks (ruptures) in element media.

Removal of Oil Separator For Inspection or Replacement:

DANGER

Air/oil under pressure will cause severe personal injury or death. Shut down compressor, relieve system of all pressure, disconnect, lockout and tagout power supply to the starter before removing valves, caps, plugs, fittings, bolts and filters.

DANGER

Compressor, air/oil reservoir, separation chamber and all piping and tubing may be at high temperature during and after operation.

1. Be certain the unit is off and that no air pressure is in the oil reservoir. The compressor package will automatically blowdown in about 2 minutes.
2. Close the air service valve located after the compressor package discharge.
3. Disconnect, lockout and tagout the power supply to the starter.
4. Remove the minimum pressure/check valve, see Item 1, Figure 5-6, page 54 (air/oil separator housing) cover.
5. Lift out the air/oil separator element. See Item 2, Figure 5-6, page 54.
6. Inspect and/or replace the separator as necessary.
7. Clean the sealing surfaces on the air/oil separator and the minimum pressure/check valve.
8. Clean the orifice, Item 3, Figure 5-6, page 54, in the oil return line, the strainer, Item 4, Figure 5-6, page 54, in the oil return line, and if necessary, the air/oil separator housing.
9. Grease the O-Ring on the separator element and install the separator into the housing.
10. Replace the O-Ring, Item 5, Figure 5-6, page 54, between the minimum pressure/check valve and the air/oil separator housing.
11. Replace the sealing kit in the minimum pressure/check valve. After the assembling of the valve, leave about .08 inch gap between the nut, Item 6, Figure 5-6, page 54, and the cover of the valve. See “Changing Minimum Pressure/Check Valve Seals,” Section 4, page 29.

12. Install the minimum pressure/check valve assembly and tighten the bolts alternately for even tightness.

13. Open the air service valve.

14. Run the unit and check for leaks.

COMPRESSOR OIL SYSTEM CHECK - The following readings are based on ambient temperature of 80° F (27° C) with the system in good condition. The compressor should be at operating temperature at the time of the checks. One-half hour of loaded operation is usually sufficient to reach level-out operating temperatures.

Air and Oil Discharge Temperature - 160° F to 180° F (71°C to 82° C) - Check with a thermometer at the discharge housing.

Compressor Oil Inlet Temperature - 150° F to 165° F (66° C to 74° C) - Install a tee at the oil filter outlet and check with a thermometer.

Oil Inlet Pressure - Check at the fitting in the line near the compressor oil inlet. With air receiver pressure at 100 psi (6.9 Bar), oil inlet pressure should be 80 to 90 psig (5.5 to 6.2 Bar).

Oil Cooler Oil Pressure Differential (Air-Cooled Radiator) - Check differential across the oil system by measuring oil inlet pressure as described above.

Oil Cooler Temperature Differential (Air-Cooled Radiator) - The oil temperature differential depends on the temperature of the air at the oil cooler fan and cleanliness of the core faces. As ambient temperatures and core restrictions increase, the oil cooler outlet temperature will increase. The oil inlet temperature is approximately the same as the air discharge temperature.

SECTION 6
AIR FILTER

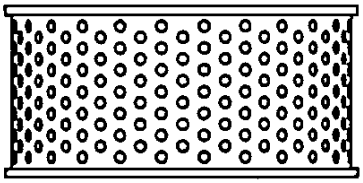

Figure 6-1 – AIR FILTER

STANDARD DUTY AIR FILTER (Figure 6-1) - Replacement instructions are given in the following sections:

DANGER

Compressor, air/oil reservoir, separation chamber and all piping and tubing may be at high temperature during and after operation.

WARNING

The air filter element can not be cleaned or reused.

Filter Element - The element should be replaced when inspection indicates an accumulation of dirt on the outside of the element. Inspect every few days until experience determines the proper time interval for servicing.

To Service:

1. Be certain the unit is off and that no air pressure is in the air/oil reservoir. The compressor package will automatically blow down in about 2 minutes.
2. Close the air service valve located after the compressor package discharge.
3. Disconnect, lockout and tagout the power supply to the starter.
4. Remove the air filter cover (Figure 6-1).
5. Clean the inside of the air filter housing.
6. Install new air filter element and the air filter cover.
7. Open the air service valve.

Filter Element Life - The element should be replaced if visual inspection indicates an accumulation of dirt, or a rupture, crack or pin holes in the pleated media. Inspection should be done by placing a bright light inside the element.

⚠ WARNING

Do not oil this element. Never operate unit without element. Never use elements that are damaged or ruptured. Never use elements that won't seal. Keep spare elements on hand to reduce downtime. Store elements in a protected area free from damage, dirt and moisture. Handle filter parts with care.

SECTION 7
BELT DRIVE

Proper drive belt tension and alignment are provided at the factory, however, good practice dictates checking the drive alignment and tension after shipment and before initial start-up.

Sheaves should align straight across the front with a straight edge. The best tension is just enough tension to keep belts from “squealing” on start-up.

CAUTION

Excessive belt tension can damage the equipment. Tension the belts as shown in Figure 7-1, page 59.

REPLACING THE COMPRESSOR BELTS

1. Disconnect, lockout and tagout the power supply to the starter.
2. Remove the belt guards.
3. Using adjusting screws, jack the motor base up to loosen the belt tension. Remove the belts.
4. Install new belts, tighten belts using the adjust screws. Check for correct belt tension.
5. Check sheave alignment. (See “SHEAVE ALIGNMENT”).
6. Assemble the guards.

SHEAVE ALIGNMENT

The sheave alignment and belt tightening system consists of a hinged plate for the motor which is supported between (2) posts and a slotted platform for the Tempest units. To achieve proper sheave alignment the sheaves must be adjusted for both parallel and angular alignment. The alignment between the motor and air-end sheaves should be confirmed with the use of a straight edge. If the sheaves are properly aligned, the straight edge should touch the two outer edges of each sheave for a total of four points of contact. Gaps between the outer edges of either of the sheaves and the straight edge indicate sheave misalignment.

The airend sheave is set in the parallel and angular direction by mounting it on the air-end shaft that is part of the Tempest unit that is bolted to the platform. The platform has been set in the parallel and angular directions by its inherent design. The motor sheave is set in the parallel direction by sliding it on the motor shaft to position it in line with the airend sheave. (Check for alignment with straight edge.) **Note**: It may be necessary to loosen the Tempest unit and slide it in the platform mounting slots to keep the motor sheave fan blades in the correct position in the cooler orifice ring.

The motor sheave is set in the angular direction by means of (2) jack bolts and the hinged plate. To start the angular alignment process check to make sure the locking nuts on the jack bolts are loose. The motor sheave can be aligned in the angular direction to the same plane as the airend sheave by turning down the jack bolts on one side or the other of the hinged plate. (Check for alignment with straight edge.) It also may be necessary to use the nuts that are on the jack bolts to push up on one side or the other of the hinged plate. **Note**: At this point it may also be necessary to make minor adjustments of the position of the sheave on the motor shaft to get proper alignment. Once proper alignment has been obtained, lock

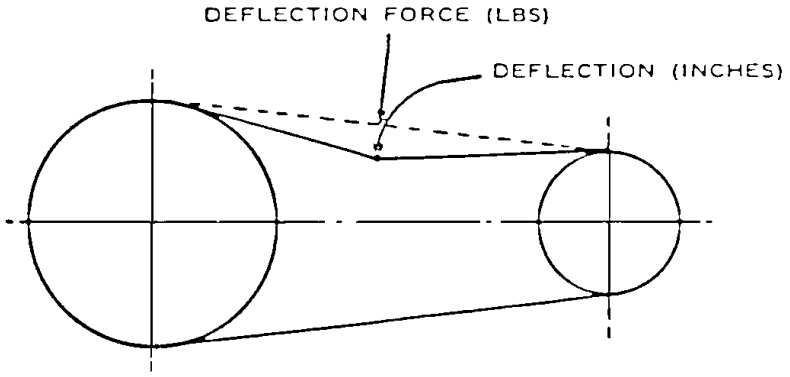
the sheave in place on the motor shaft; then the jack bolt lock nuts must be tightened. One set of nuts is tightened down against the base to lock the jack bolts in place. The second set is locked down to sandwich the hinged plate against the jack bolt heads. When lock nuts are in place, a final alignment check should be made with the straight edge.

Note: Any of the following actions will require the sheave alignment be checked and any or all of the above steps repeated. (Initial start up at customer site, compressor change, motor change, unit relocation, or when the belts are replaced.)

It's important to note that the belts should not be over tightened. To check belt tension use a Gardner Denver Belt Tension Gauge, Part Number 00543217. V-belt tension will drop after the first 8-24 hrs of unit run time. Failure to check and re-tension the belts after the initial run-in period will result in belt slippage and premature belt failure. Please see Figure 7-1, page 59, for proper belt tension.

CAUTION

Interference between the fan and the orifice can damage equipment. Be certain the orifice has even clearance around the fan before starting the unit.



REPLACING THE COMPRESSOR SHEAVE

1. Disconnect, lockout and tagout the power supply to the starter.
2. Remove the guards.
3. Using the adjusting screws, jack the motor base up to loosen the belt tension, Remove the belts.
4. Remove bolts from tapered bushing.
5. Pull the sheave off the rotor shaft with a gear puller, if necessary.
6. Install new sheave and tapered bushing.
7. Install new belts. Check for correct belt tension and reattach the wire guard.
8. Align sheaves with a straight edge. (See "SHEAVE ALIGNMENT", page 57).
9. Assemble the guards.

CHECKING BELT TENSION - Using a spring scale, apply a perpendicular force to each belt at the midpoint of the span and measure the deflection. Correct deflection force and deflection are shown in Figure 7-1. To tighten belts, merely increase the center distance.

NOTICE

When a new set of belts is installed on a drive, the initial deflection force should be 1/3 greater than shown in Figure 7-1. Recheck tension frequently during the first 24 hours of operation

Motor H.P.	No. of Belts	Deflection Force Pounds	Deflection In Inches
20	4	6 – 8.5	3/8
25	4	6 – 8.5	3/8
30	4	6 – 8.5	3/8

Figure 7-1 – BELT TENSION – J SECTION MICRO-V BELTS

SECTION 8
MAINTENANCE SCHEDULE

SERVICE CHECK LIST –

Air Filter - Operating conditions determine frequency of service. See "Air Filter," SECTION 6, page 55.

Motor Lubrication - Refer to SECTION 2, page 18.

Every 8 Hours Operation

1. Check the reservoir oil level - add oil if required. See SECTION 5, page 44. If oil consumption is high, refer to "Excessive Oil Consumption," page 63.

2. Observe if the unit loads and unloads properly.

3. Check discharge pressure and temperature.

Every 125 Hours Operation

1. Check for dirt accumulation on oil/aftercooler core faces and the cooling fan. If cleaning is required, clean the exterior fin surfaces of the cores by blowing compressed air carrying a nonflammable safety solvent in a direction opposite that of the cooling fan air flow. This cleaning operation will keep the exterior cooling surfaces clean and ensure effective heat dissipation.

Every 1000 Hours Operation

1. Change oil filter element.

Every 4000 Hours Operation

1. Change the compressor lubricant. UNDER ADVERSE CONDITIONS, CHANGE MORE FREQUENTLY (refer to "Oil Change Interval", Figure 5-3, page 46). Flush system if required.

Every Year

1. Check the relief valve for proper operation. See Section 4, page 25.

2. Change oil separator, see "Removal of Oil Separator for Inspection or Replacment", Section 5, page 44, for further details (or when 8 psid pressure differential across the element).

MAINTENANCE SCHEDULE (See Detail Notes above)

Maintenance Action	As Indicated by AirSmart Controller	Every 8 Hours	Every 125 Hours	Every 1000 Hours	Every 4000 Hours	Every Year
Check/Change Air Filter	•					
Change Oil Separator	•					•
Check Reservoir Oil Level **		•				
Check for Proper Load/Unload		•				
Check Dirt Accumulation on Cooler			•			
Change Oil Filter Element & Clean Oil Return Strainer				•		
Change Compressor Lubricant (AEON 4000) *					•	
Check Relief Valve						•
Check Condition of Hoses					•	•
Check Operation of Condensate Removal Solenoid Valve		•				
Change Inlet Valve Seals						•

* See “Oil Change Interval Chart”, Figure 5-3, page 46, for specific lubricant life.

** Must be checked when the compressor is stopped and the air/oil mixture is separated.

SECTION 9
TROUBLESHOOTING

SYMPTOM		POSSIBLE CAUSE		REMEDY
Compressor fails to start	1.	Wrong lead connections.	1.	Change leads.
	2.	Blown fuses in control box.	2.	Replace fuse.
	3.	Motor starter overload heaters tripped .	3.	Reset and investigate cause of overload.
	4.	Pressure in reservoir.	4.	Inspect blowdown valve.
	5.	Emergency stop depressed.	5.	Release button.
Compressor starts but stops after a short time	1.	High discharge temperature.	1.	See “High Discharge Air Temperature,” this section.
	2.	High separator/ high compressor temperature light on.	2.	See “High Discharge Air Temperature”, this section.
	3.	Blown fuse in starter/ control box.	3.	Replace fuse (investigate if fuses continue to blow).
	4.	Motor starter overload heaters trip.	4.	Reset and investigate cause of overload.
Compressor does not unload (or load)	1.	Improperly adjusted control.	1.	Refer to Control Manual 13-17-600 and adjust control.
	2.	Air leak in control lines.	2.	Determine source of leak and correct.
	3.	Restricted control line.	3.	Clean control lines.
	4.	Faulty inlet valve solenoid.	4	Replace solenoid valve.
Compressor cycles from load to unload excessively	1.	Insufficient receiver capacity.	1.	Increase receiver size.
	2.	Restriction in service piping.	2.	Inspect and clean service piping.
	3.	Restriction in control tubing.	3.	Inspect and clean control tubing.
	4.	Plugged aftercooler.	4.	Inspect and clean aftercooler.
Compressor runs unloaded too often	1.	Volume of compressed air system too small.	1.	Check the volume of the piping and air receivers. An additional air receiver may be required.
	2.	Pressure range too narrow.	2.	Extend pressure range.

SYMPTOM		POSSIBLE CAUSE		REMEDY
Compressor starts too slowly	1.	Wye Delta switch time set too long.	1.	Contact your Gardner Denver distributor.
	2.	Minimum Pressure/Check Valve is faulty.	2.	Repair or replace.
	3.	Supply voltage is too low.	3.	Check the supply voltage.
Compressor is low on delivery and pressure	1.	Restricted air filter.	1.	Clean or replace filter.
	2.	Sticking inlet valve.	2.	Inspect and clean inlet valve.
	3.	Minimum pressure valve stuck closed.	3.	Replace valve.
	4.	Oil separator clogged.	4.	Replace.
	5.	Intervals of moisture separator drainage incorrectly set.	5.	Check the setting in the AirSmart controller.
	6.	Condensate drain solenoid valve is faulty.	6.	Replace.
	7.	Leaks in the compressed air system.	7.	Check for leaks, fix any leaks found.
	8.	V-Belts broken.	8.	Replace.
	9.	V-Belts slipping.	9.	Test belt tensioning.
	10.	Pressure limits incorrectly set.	10.	Check/correct pressure limits in the AirSmart Controller.
	11.	Aftercooler is frozen	11.	Thaw out. This machine cannot operate in temperatures below 32° F (0° C).
High discharge air temperature	1.	Dirty or clogged cooler face.	1.	Clean cooler.
	2.	Insufficient cooling air flow.	2.	Provide unrestricted supply of cooling air.
	3.	Clogged oil filter or cooler (interior).	3.	Replace filter or clean cooler.
	4.	Low compressor oil.	4.	Add oil to proper level.
	5.	Faulty temperature sensor.	5.	Replace sensor.
	6.	Thermostatic mixing valve stuck open.	6.	Repair or replace valve.
Excessive oil consumption	1.	Oil carryover through lines.	1.	See “Oil Carryover”, in this section.

SYMPTOM		POSSIBLE CAUSE		REMEDY
	2.	Oil leaks at all fittings and gaskets.	2.	Tighten or replace fittings or gaskets.
	3.	Shaft seal leaking.	3.	Replace shaft seal.
Oil carryover	1.	Overfilling the reservoir.	1.	Drain excess oil from system.
	2.	Clogged, broken or loose oil return lines.	2.	Tighten or replace faulty lines.
	3.	Ruptured oil separator element.	3.	Replace element.
	4.	Loose assembly.	4.	Tighten all fittings and gaskets.
	5.	Foam caused by use of incorrect oil.	5.	Use Gardner Denver AEON 2000, 4000 or 9000SP lubricating coolant.
	6.	Inoperative minimum pressure valve.	6.	Replace seals in valve.
	7.	Operation at elevated discharge temperatures.	7.	Reduce temperature. See “High Discharge Air Temperature”, this section.
	8.	Scavenge line check valve failure.	8.	Replace check valve.
	9.	Water condensate in oil.	9.	Check oil reservoir temperature and if low, change thermal mixing valve element to higher temperature.

DANGER

Air/oil under pressure will cause severe personal injury or death. Shut down compressor, relieve system of all pressure, disconnect, lockout and tagout power supply to the starter before removing valves, caps, plugs, fittings, bolts and filters

TROUBLESHOOTING VOLTAGE PROBLEMS

The compressor package has been designed, built, and tested to operate within one of the following standard ranges:

200-208 Volts, 60 Hertz

230-240 Volts, 60 Hertz

460-480 Volts, 60 Hertz

575-600 Volts, 60 Hertz

Connection to higher voltages will reduce the life of electrical devices within the compressor package. As voltages get further above the design range, other symptoms may show up.

High voltages may lead to high motor currents. The overload relay will sense these and shut down the compressor to protect the motor.

If the power supply and/or control transformer primary fuses blow, check that the devices are properly connected for the incoming line voltage.

Operation with lower voltages will reduce motor life and load capacity. As voltages get further below the design range, other symptoms may show up.

Low voltages may lead to high motor currents. The overload relay will sense these and shut down the compressor to protect the motor. If voltage is low while the compressor is off, locate and correct the cause. If the voltage drops low only while the compressor is running, look for poor connections or undersized wiring.

If any of the starters or contactors within the box chatter, or if the electronic controller drops out while attempting to start, it is a clear indication that the wiring is inadequate for the compressor. Look for poor connections or undersized wiring.

NOTICE
Gardner Denver factory remanufactured replacement compressor airend units are available from your authorized distributor, on an exchange basis, for all rotary screw compressor units.

WARRANTY
ROTARY SCREW COMPRESSORS AND VACUUM PACKAGES
OIL INJECTED – OIL FREE

GENERAL PROVISIONS AND LIMITATIONS
Gardner Denver (the "Company") warrants to each original retail purchaser ("Purchaser") of its new products from the Company or its authorized distributor that such products are, at the time of delivery to the Purchaser, made with good material and workmanship. No warranty is made with respect to:

1. Any product which has been repaired or altered in such a way, in the Company's judgment, as to affect the product adversely.

2. Any product which has, in the Company's judgment been subject to negligence, accident, improper storage, or improper installation or application.

3. Any product which has not been operated or maintained in accordance with the recommendations of the Company.

4. Components or accessories manufactured, warranted and/or serviced by others.

5. Any reconditioned or prior owned product.

Claims for items described in (4) above should be submitted directly to the manufacturer.

WARRANTY PERIOD
The Company's obligation under this warranty is limited to repairing or, at its option, replacing, during normal business hours at an authorized service facility of the Company, and part which in its judgment proved not to be as warranted within the applicable Warranty Period as follows.

AIRENDS
Airends, consisting of all parts within and including the cylinder and gear housing, are warranted for 24 months from date of initial use or 27 months from date of shipment to the purchaser, whichever occurs first.

Any disassembly or partial disassembly of the airend, or failure to return the "unopened" airend per Company instructions, will be cause for denial of warranty.

MAJOR PACKAGE COMPONENTS
Air or water cooled coolers and the AutoSentry Controllers are warranted for 24 months from date of initial use or 27 months from date of shipment to the first purchaser, whichever occurs first, as provided in, and subject to the terms of the original component manufacturer's warranty.

DRIVE AND FAN MOTOR
The drive and fan motor (if applicable) are warranted for 60 months from start-up or 63 months from shipment, whichever occurs first. The warranty is applicable only to Toshiba low voltage motors (600 Volts or less). High voltage motors and other manufacturer motors furnished due to customer request or special requirements carry the motor manufacturer's warranty.

OTHER COMPONENTS
All other components are warranted for 12 months from date of initial use or 15 months from date of shipment to first purchaser, whichever occurs first.

LABOR TRANSPORTATION AND INSPECTION
The Company will provide labor, by Company representative or authorized service personnel, for repair or replacement of any product or part thereof which in the Company's judgment is proved not to be as warranted. Labor shall be limited to the amount specified in the Company's labor rate schedule.

Labor costs in excess of the Company rate schedule amounts or labor provided by unauthorized service personnel is not provided for by this warranty.

All costs of transportation of product, labor or parts claimed not to be as warranted and, of repaired or replacement parts to or from such service facilities shall be borne by the Purchaser. The Company may require the return of any part claimed not to be as warranted to one of its facilities as designated by Company, transportation prepaid by Purchaser, to establish a claim under this warranty.

Replacement parts provided under the terms of the warranty are warranted for the remainder of the Warranty Period of the product upon which installed to the same extent as if such parts were original components.

DISCLAIMER
THE FOREGOING WARRANTY IS EXCLUSIVE AND IT IS EXPRESSLY AGREED THAT, EXCEPT AS TO TITLE, THE COMPANY MAKES NO OTHER WARRANTIES AND HEREBY EXPRESSLY DISCLAIMS ALL OTHER WARRANTIES, INCLUDING WITHOUT LIMITATION, EXPRESSED, IMPLIED OR STATUTORY WARRANTIES, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE.

THE REMEDY PROVIDED UNDER THIS WARRANTY SHALL BE THE SOLE, EXCLUSIVE AND ONLY REMEDY AVAILABLE TO PURCHASER AND IN NO CASE SHALL THE COMPANY BE SUBJECT TO ANY OTHER OBLIGATIONS OR LIABILITIES. UNDER NO CIRCUMSTANCES SHALL THE COMPANY BE LIABLE FOR SPECIAL, INDIRECT, INCIDENTAL OR CONSEQUENTIAL DAMAGES, EXPENSES, LOSSES OR DELAYS HOWSOEVER CAUSED.

NO STATEMENT, REPRESENTATION, AGREEMENT, OR UNDERSTANDING, ORAL OR WRITTEN, MADE BY ANY AGENT, DISTRIBUTOR, REPRESENTATIVE, OR EMPLOYEE OF THE COMPANY WHICH IS NOT CONTAINED IN THIS WARRANTY WILL BE BINDING UPON THE COMPANY UNLESS MADE IN WRITING AND EXECUTED BY AN OFFICER OF THE COMPANY.

THIS WARRANTY SHALL NOT BE EFFECTIVE AS TO ANY CLAIM WHICH IS NOT PRESENTED WITHIN 30 DAYS AFTER THE DATE UPON WHICH THE PRODUCT IS CLAIMED NOT TO HAVE BEEN AS WARRANTED. ANY ACTION FOR BREACH OF THIS WARRANTY MUST BE COMMENCED WITHIN ONE YEAR AFTER THE DATE UPON WHICH THE CAUSE OF ACTION OCCURRED.

ANY ADJUSTMENT MADE PURSUANT TO THIS WARRANTY SHALL NOT BE CONSTRUED AS AN ADMISSION BY THE COMPANY THAT ANY PRODUCT WAS NOT AS WARRANTED.

ASR Resources, LLC

V-Smart Control Valve
Installation, Operation & Maintenance Manual

Groundwater Remediation Wells
PG&E Topock
CH2M-Hill, Oakland, CA

Project Overview

The Topock Groundwater remediation project utilizes (8) 4” multi-port V-Smart down hole control valves. These valves will be contractor installed with each valve including one set of continuous length dual line hydraulic hose connected to Nema-3R enclosed hydraulic power units (HPU). The HPU’s include internal mounted control panels which features local/off/remote selector switch, push buttons for pump start/stop, open/off/closed selector switch for manual operation and valve closed/pump running status lights.

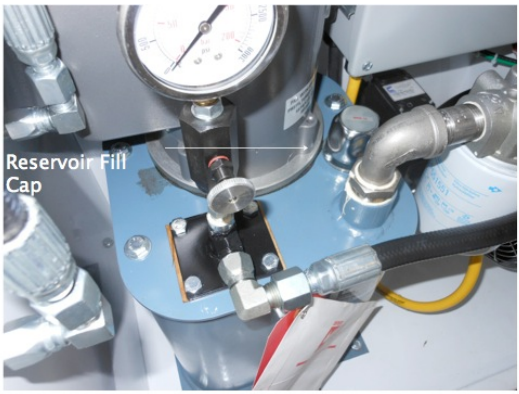
Valve Installation

The V-Smart valve has 4” female standard straight threads in both the upper and lower integral couplings. The valve is installed below the pump bowls and above the check valve. It threads onto to the male standard straight threads of the column pipe. Care must be exercised when tightening the valve. Only strap-type wrenches should be used to avoid marring the surface of the valve body. The strap wrench should only be positioned on the upper coupling, while avoiding the hydraulic fittings. It should never be positioned on the sliding sleeve section of the valve.

Hydraulic Power Unit Installation

The hydraulic power unit is mounted in a Nema-3R enclosure with a hinged lockable door for easy access.

V SMART POSITION CONTROL



The 120VAC pump should be wired per the wiring diagram and checked for proper rotation by observing the motor shaft direction located at the top of the pump. An enclosure-mounted fan provides ventilation. The pump enclosure has two hydraulic hose fittings located on the left side of the enclosure for the open and closed hydraulic hose connections.

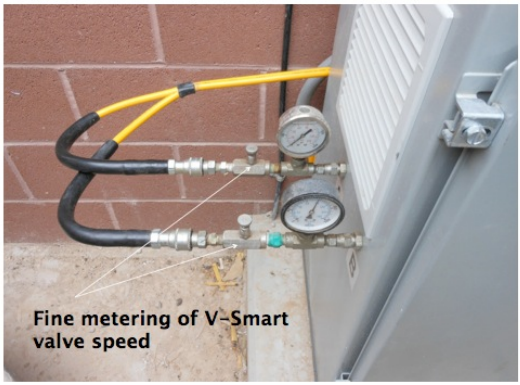
Fill the reservoir with the supplied food grade mineral oil until full as indicated on the level indicating gage located on the side of the pump reservoir. Remove the filler cap located on the top of the

reservoir and fill using a flexible oil funnel or a small drill pump with a filler hose.

Adding Fluid to Reservoir

Remove cap by turning left and lifting up.
Use approved USDA Food Grade mineral oil ONLY.

Checking Reservoir Level



Maintain FULL level in oil level site glass

Hose Connections

Hydraulic power unit connections

Once the hydraulic power unit reservoir is filled, connect the external flow limiting (speed control) needle valves and gage assemblies.

External Flow Controls

The external flow controls adjust the travel speed of the V-Smart valve when opening or closing. Valves are independently adjustable, clockwise to slow down the valve operating speed, counter-clockwise to speed up valve operating speed.

After tightening the fittings, start the hydraulic power unit at the front cabinet control panel by placing the selector switch in the local (HAND) setting and pushing pump start button.

Then, briefly select the open position on the manual selector switch (lower left) to fill the open needle valve/gage assemblies with hydraulic oil and repeat for the closed needle valve/gage assemblies by placing the manual selector switch in the closed position. Select the off position when complete.

Remove the fitting plugs on both the open and closed fittings at one end of the dual line hydraulic hose set that will run from the HPU to the V-Smart Valve. The hose marked with red tape is for the closed (B) connection; green tape is for the open (A) connection. Install the quick disconnect fittings. Connect the quick disconnect fittings to the needle valve/gage assemblies. Remove the open fitting plug on the valve end of the hose set, then place the manual operation selector switch in the open position to allow the oil to flow through the hose, purging air and discharging into a clean bucket (Reuse this oil). Repeat for the closed hose, placing the manual operation selector switch in the closed position. Run each hose for at least two minutes then cap the valve end of the hoses to keep the hoses full and air-free.

V-Smart valve connections

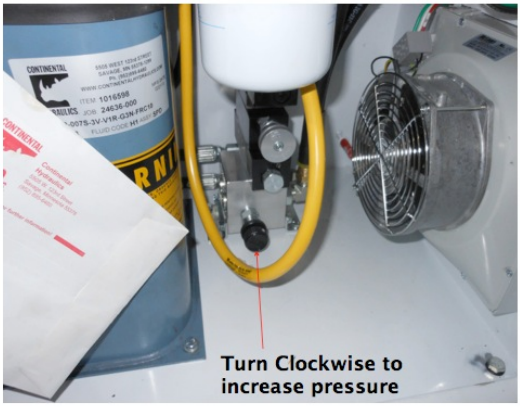
Once the valve is connected to the column pipe and lowered into position above the well-head, the hydraulic hoses can be attached to the valve. First, identify the correct valve fittings for the open and closed hydraulic connections. The open fitting, marked “O”, is to the right (with the valve in a vertical position) with the closed fitting, marked “C” on the left.

While holding the open hose fitting in a vertical position to prevent oil from leaking, remove the “open” fitting cap on the valve and “open” plug on the hose fitting. Start the pump at the control panel by placing the selector switch in the local (HAND) setting and push the pump start button. Then place the manual operation selector switch in the open position until oil is flowing at the top of the hose fitting, then quickly connect the open hose fitting (marked with green tape) to the open fitting on the valve and loosely tighten the fitting.

Make sure oil is flowing past the fitting to eliminate any air at the fitting connection, then tighten. Repeat the same process for the closed hose (marked with red tape), by placing the manual operation selector switch in the closed position.

With the selector switch still in the local (HAND) setting and the pump running, place the manual operation selector switch in the open position to observe the valve moving to the open position (valve sleeve will rise up exposing the injection ports. Once the valve reaches the end of travel, place the selector switch in the off position. [Note: The pressure relief valve on the hydraulic pump is set for 900 psi and will automatically bypass pressure once the valve reaches end of travel.] Repeat the procedure for the closed position. Run the valve several times full open and closed in the local (HAND) mode to verify operation. While running the valve, observe that there are no leaks at the fitting connections on the valve, at the internal hydraulic hose fittings inside the valve, or at the quick disconnect fittings where the two hose sections are connected and tighten fittings as required.

Slightly loosen the bleed screw on the side of the valve when the valve is both fully open and fully closed to make sure there is no air inside the pressure chamber of the valve.



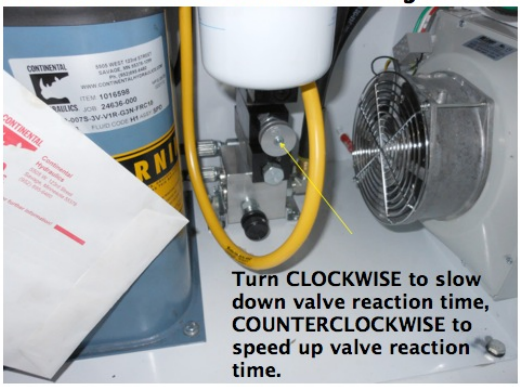
Apply a bead of Lock-Tite 545 hydraulic thread sealant and securely tighten the bleed screw when finished. Once the valve has cycled several times and has been observed for smooth consistent operation, the HPU can be powered down by pressing the pump stop button and rotating the selector switch to the OFF position.

At this point the hoses can be disconnected at the quick disconnect fittings, where the hoses are connected at the HPU, with hose ends bagged and taped to prevent any foreign debris from getting into the fittings. The hoses can be coiled back onto a spool to assist with the valve installation into the well. As the valve is installed into the well casing, the hoses should be taped or strapped along each section of joint pipe.

Start up

The pump is factory set to relieve pressure back to the reservoir in excess of 900 psi as verified on the pump gage. This pressure setting only be changed if directed by ASR Resources.

Adjusting System Pressure



Warning: Do not exceed 1200 PSI Gauge pressure

With the hoses re-connected at the HPU, start the pump at the control panel by placing the selector switch in the local (HAND) setting and pushing the pump start button. Verify all pipeline isolation valves are closed for the “dry run” operation prior to pressurizing the column pipe. Place the manual operation selector switch in the open position while the valve moves to the open position. Repeat the procedure for the closed position, placing the manual operation selector switch in the closed position. Run the valve several times full open and closed in the local (HAND) mode to verify operation and confirm valve closed position via the panel display light. With the selector switch in the remote (AUTO) setting, open and close the valve via the PLC or computer (supplied by others) to verify operation. The valve is now ready to

operate either manually in the local (HAND) mode or remotely in the (AUTO) setting to commence pumping or injection operation. Once the valve is operating in a flowing condition the speed control hydraulic needle valves can be adjusted to the desired setting to speed up or slow down the valve travel response time. The external speed control adjustments typically address all speed of operation requirements. If larger adjustments need to be made, the internal flow control adjustment knob, which is factory pre-set, can be rotated to provide the required response time.

Internal Flow Control Adjustment

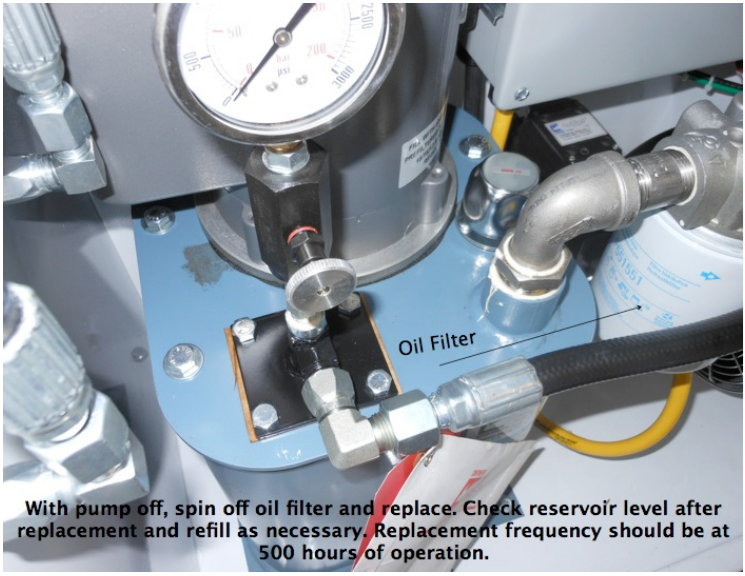
This flow control is factory set. It should not be readjusted unless external needle valve adjustments to not provide sufficient speed range settings.

V-Smart Valve Maintenance

There are no owner-serviceable components on the V-Smart valve itself. Any valve repairs will require the valve to be returned to ASR Resources for disassembly, repair, re-assembly and testing.

Cooling Air Filter

Filter pad may be cleaned with soft soap and water



Cooling Fan Maintenance

Advisory: Cooling Fan Starter control is thermostat, do not attempt to service when power unit is active.

HPU Pump Maintenance

Oil Filter Replacement

Troubleshooting

Pump does not develop pressure - Confirm wiring and pump rotation is correct. Confirm internal pressure adjustment knob has not been changed. Rotate clockwise to increase pressure

Pump shows pressure on the internal gage but no pressure on the external hose gages - Make sure flow control needle valves in the hose assembly are not fully closed.

Valve operates too slow or too fast - Adjust external flow control needle valves in the hose assembly. If required, adjust internal flow limiting knob.

Reservoir level drops during operation - A leak is present in the between the HPU and the valve. If not above ground leaks are noted, the valve will need to be pulled.

V-Smart drawing and flow performance data, HPU drawing, Wiring Diagram, Bill of Materials are located in the valve submittal drawings furnished on the project.

Three-phase pad-mounted compartmental type installation and maintenance instructions

Cooper Power Systems
by EATON

DISCLAIMER OF WARRANTIES AND LIMITATION OF LIABILITY

The information, recommendations, descriptions and safety notations in this document are based on Eaton Corporation's ("Eaton") experience and judgment and may not cover all contingencies. If further information is required, an Eaton sales office should be consulted. Sale of the product shown in this literature is subject to the terms and conditions outlined in appropriate Eaton selling policies or other contractual agreement between Eaton and the purchaser.

THERE ARE NO UNDERSTANDINGS, AGREEMENTS, WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING WARRANTIES OF FITNESS FOR A PARTICULAR PURPOSE OR MERCHANTABILITY, OTHER THAN THOSE SPECIFICALLY SET OUT IN ANY EXISTING CONTRACT BETWEEN THE PARTIES. ANY SUCH CONTRACT STATES THE ENTIRE OBLIGATION OF EATON. THE CONTENTS OF THIS DOCUMENT SHALL NOT BECOME PART OF OR MODIFY ANY CONTRACT BETWEEN THE PARTIES.

In no event will Eaton be responsible to the purchaser or user in contract, in tort (including negligence), strict liability or otherwise for any special, indirect, incidental or consequential damage or loss whatsoever, including but not limited to damage or loss of use of equipment, plant or power system, cost of capital, loss of power, additional expenses in the use of existing power facilities, or claims against the purchaser or user by its customers resulting from the use of the information, recommendations and descriptions contained herein. The information contained in this manual is subject to change without notice.

Safety for life

Eaton's Cooper Power Systems products meet or exceed all applicable industry standards relating to product safety. We actively promote safe practices in the use and maintenance of our products through our service literature, instructional training programs, and the continuous efforts of all Eaton's Cooper Power Systems employees involved in product design, manufacture, marketing, and service.

We strongly urge that you always follow all locally approved safety procedures and safety instructions when working around high voltage lines and equipment, and support our "Safety For Life" mission.

Safety information

The instructions in this manual are not intended as a substitute for proper training or adequate experience in the safe operation of the equipment described. Only competent technicians who are familiar with this equipment should install, operate, and service it.

A competent technician has these qualifications:

- Is thoroughly familiar with these instructions.
- Is trained in industry-accepted high and low-voltage safe operating practices and procedures.
- Is trained and authorized to energize, de-energize, clear, and ground power distribution equipment.
- Is trained in the care and use of protective equipment such as flash clothing, safety glasses, face shield, hard hat, rubber gloves, clampstick, hotstick, etc.

Following is important safety information. For safe installation and operation of this equipment, be sure to read and understand all cautions and warnings.

Hazard Statement Definitions

This manual may contain four types of hazard statements:

DANGER

Indicates a hazardous situation which, if not avoided, will result in death or serious injury.

WARNING

Indicates a hazardous situation which, if not avoided, could result In death or serious injury.

CAUTION

Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

CAUTION: Indicates a hazardous situation which, if not avoided, could result in equipment damage only.

Safety Instructions

Following are general caution and warning statements that apply to this equipment. Additional statements, related to specific tasks and procedures, are located throughout the manual.

DANGER

Hazardous voltage. Contact with hazardous voltage will cause death or severe personal injury. Follow all locally approved safety procedures when working around high- and low-voltage lines and equipment. **G103.3**

WARNING

Before installing, operating, maintaining, or testing this equipment, carefully read and understand the contents of this manual. Improper operation, handling or maintenance can result in death, severe personal injury, and equipment damage. **G101.0**

WARNING

This equipment is not intended to protect human life. Follow all locally approved procedures and safety practices when installing or operating this equipment. Failure to comply can result in death, severe personal injury and equipment damage. **G102.1**

WARNING

Power distribution and transmission equipment must be properly selected for the intended application. It must be installed and serviced by competent personnel who have been trained and understand proper safety procedures. These instructions are written for such personnel and are not a substitute for adequate training and experience in safety procedures. Failure to properly select, install or maintain power distribution and transmission equipment can result in death, severe personal injury, and equipment damage. **G122.3**

IMPORTANT

Do not Exceed Transformer Ratings. Transformers should be operated only at the ratings specified on the transformer nameplate. Prolonged overload operation will measurably shorten the projected service life of a mineral oil-filled transformer. PEAK™ transformers have extended life and can be operated at overload conditions while still exceeding ANSI standard insulation life.

Introduction

These transformers are designed for installation on three-phase underground systems. All units are constructed for weather-exposed mounting on a concrete pad with high- and low-voltage cable entering the operating compartments through an opening in the pad.

Read this manual first

Read and understand the contents of this manual and follow all locally approved procedures and safety practices before installing or operating this equipment.

Additional information

These instructions cannot cover all details or variations in the equipment, procedures, or process described, nor to provide directions for meeting every possible contingency during installation, operation, or maintenance. For additional information, contact your Eaton's Cooper Power Systems representative.

Acceptance and initial inspection

Receiving Inspection

It is important that a thorough inspection of the transformer be made before it is unloaded from the carrier.

1. Ensure that *all* parts listed on the bill of lading are present.
2. Before unloading the transformer, inspect for signs of damage or mishandling. Locate accessory parts that may have been shipped separately.
3. If damage is detected or shortages are noticed, write a brief description on the freight bill. Normally, the transformer is shipped FOB point of manufacture, and it is the customer's responsibility to file a claim against the carrier. If the transformer was shipped FOB destination, notify your Eaton's Cooper Power Systems representative. He or she will, with the inspector's report, take the necessary steps to file a claim against the carrier.

⚠ WARNING

Heavy Equipment. Improper handling can cause severe injury, death, or damage to transformer. Before moving the transformer, read the handling instructions provided in this manual.

Handling

Special procedures must be followed when handling transformer in ambient temperatures below -20 °C. Contact your Eaton's Cooper Power Systems representative for further instructions. Failure to follow special handling procedures may cause premature failure of transformer and its components.

Transformer weight

The transformer weight is shown on the transformer nameplate. Most of the weight in a pad-mounted transformer assembly is in the main tank that holds the core and coil assembly and the insulating liquid.

Moving transformers shipped on pallets

Transformers shipped on pallets may be lifted or moved by forklift trucks of proper capacity. When using a forklift, lift with the transformer tank closest to the mast of the forklift since most of the transformer weight is in the tank. Pallet-mounted equipment may also be moved by crane or hoist.

Lifting transformers by crane or hoist

Check the weight of the transformer and the capacity and condition of all hoisting or lifting equipment. Do not use worn, frayed or damaged cables or slings. Do not use hoisting machinery with load capacity less than the weight of the transformer. Improper use of hoist or jack could seriously damage the transformer or its attachments or cause serious personal injury.

For unloading, lifting lugs are provided near the top of the transformer tank. Lifting chain or cable angles should not be over 30° from vertical. Otherwise, spreaders should be used to hold the lifting cables apart to avoid any bending of the structure or lifting lugs.

Do not attempt to lift the transformer by placing a continuous loop of chain or cable around the unit or lifting lugs. This can damage the transformer and can cause accidents resulting in serious personal injury.

If the transformer cannot be lifted by crane, it may be skidded or moved by rollers.

Using jacks

Place jacks under the tank base on the open ends of the transformer tank. Jacking pads are provided for transformers with bases greater than 6". Do not place jacks under radiators or terminal compartment frames.

When jacking a transformer for insertion of rollers underneath it, ensure that four jacks are used and that two adjacent corners are raised simultaneously and evenly to avoid warping the base. When using rollers, use as many as necessary to distribute the weight uniformly.

Do not attach pulling lines to moldings or other sheet metal parts of the transformer.

Storage

Transformers that will not be placed in service immediately should be stored with terminal compartment doors closed and sealed to prevent damage to bushings or other attachments.

Quality standards

ISO 9001 certified quality management system

Installation

Installation location

The transformer must be located to meet applicable fire codes. For indoor installations, the installation location must meet the requirements of the National Electrical Code (NEC®) with sufficient space requirements and proper overcurrent protection as specified by the listing body that has jurisdiction over the installation.

These pad-mounted transformers are built to operate at altitudes up to 3300 feet at 30 °C average and 40 °C maximum ambient, unless otherwise specified. Before operating a standard transformer at higher altitudes, contact your Eaton's Cooper Power Systems representative.

Mounting the transformer

The transformer should be mounted on a level concrete pad. The pad should be strong enough to support the weight of the transformer. The site must be adequately prepared to prevent the transformer from tilting beyond two degrees from horizontal.

⚠ WARNING

Fire Hazard. Non-level installation of transformer can result in fire and cause severe personal injury or death. Prepare transformer installation site such that transformer does not tilt more than two (2.0) degrees from horizontal while the transformer is in service at the site.

Tilting beyond two degrees may cause internal components to come out of the oil and/or cables to mechanically stress the bushings and bushing gaskets. Excessive tilt (beyond two degrees) can result in a lower dielectric strength for the transformer than the basic insulation level (BIL) listed on the nameplate. Reduced BIL can result in an internal dielectric breakdown with a risk of explosion, tank rupture, or fire.

To maintain full cabinet security, the transformer tank and cabinet base have provisions for installing cleats to secure transformer to pad. If gaps still exist between the cabinet and pad after cleating the cabinet, the installation will not provide the security needed to prevent tampering by the public. Add a permanent mortar seal to fill the gaps.

Pre-service inspection (exterior)

New transformers, or transformers which are being activated after a period of storage, should be thoroughly inspected before being connected to the power distribution system to identify damage which may have occurred during storage.

1. The transformer exterior should be inspected for nicks, dents, and scratches. Repair damage to weather-resistant finishes promptly.
2. The tank cover and manhole/handhole cover seals and all gaskets or seals at bushings, gauges, fuses, operating devices, etc., should be inspected for evidence of insulating liquid seepage. Repair leaking or improperly tightened gaskets and seals before the transformer is placed in service.
3. Under normal conditions, the transformer leaves the factory with a slight vacuum (negative pressure) in the tank over the oil. However, positive pressure may have been requested or have developed in the tank during shipment or storage. Continued absence of either negative or positive pressure may indicate a leak at a gasket seal or tank seam, and require further investigation. To leak test transformer, remove the pressure relief valve (see Figure 1) and pressurize the headspace to ensure that there are no leaks. The test pressure should not exceed 7 psig. The established pressure should be maintained for at least four hours to ensure that all the seals are proper.

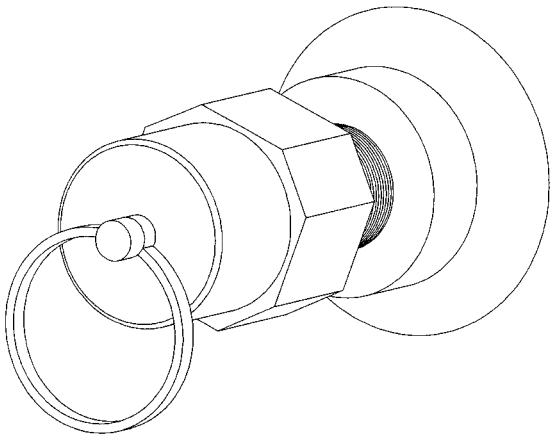

Figure 1. Pressure Relief Valve.

⚠ CAUTION

Elevated Pressure. Can cause severe personal injury. Do not remove liquid level plug before venting transformer to zero pressure. Pull ring on pressure relief valve to relieve pressure (see Figure 2).

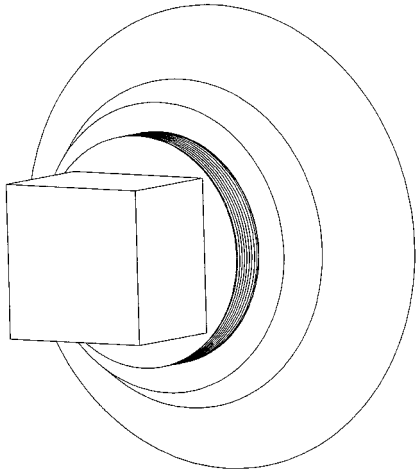

Figure 2. Liquid Level Plug.

4. The liquid level inside the tank must be checked (see Insulating Liquid Maintenance section of this manual). On transformers equipped with a liquid level gauge, the liquid level may be read directly from the gauge. On transformers that are not gauge equipped, the tank liquid level must be determined by removing the liquid level plug (see Figure 2). At 25 °C liquid temperature, the liquid level should be at the bottom edge of the liquid level plug hole.

   If the tank temperature is greater than ambient air temperature, the transformer tank must be vented to zero pressure before the liquid level plug is removed. Failure to do so may cause hot oil to be sprayed from the plug hole and may result in severe personal injury.

⚠ WARNING

Fire Hazard. Energizing transformer in ambient temperatures below -20 °C can result in fire and cause severe personal injury or death. Contact your Eaton's Cooper Power Systems representative for further instructions on energizing transformer in ambient temperatures below -20 °C.

5. Special procedures must be followed when energizing a transformer in ambient temperatures below -20 °C. Contact your Eaton's Cooper Power Systems representative for further instructions. Failure to follow special start-up procedures may cause premature failure of the transformer and its components. Also, note warning and caution statements in Switches and Protective Devices section of this manual for further precautions when operating under-oil loadbreak accessories in insulating liquid temperatures below 0 °C.

Pre-service inspection (interior)

Pre-service interior inspection may not be required if exterior inspection reveals no evidence of damage.

CAUTION

Before opening the transformer tank for Pre-Service Inspection, read the Insulating Liquid Maintenance section in this manual. This section explains safety precautions that should be taken and gives instructions on how to prevent insulating liquid contamination.

If interior inspection is required, the transformer must be opened by removing the manhole/handhole or tank cover. See the Tank Cover Removal and Installation section of this manual.

Pre-service interior inspections should be restricted to noting defects or damage that may prevent proper operation of the transformer.

Inspect for:

1. Moisture on underside of the tank cover or man-hole cover.
2. Loose, shifted, or damaged parts (bushings, fuse holders, etc.).
3. Broken or loose connections.
4. Contaminated insulating liquid (sediment or foreign objects on the tank bottom, dirt or air bubbles suspended in the liquid).

Internal damage

If concealed internal damage is suspected, it may be necessary to lower the insulting liquid level to complete the inspection. Refer to the Insulating Liquid Maintenance section of this manual.

Contaminated insulating liquid

If moisture is found inside the tank, or there is evidence that the insulating liquid may be otherwise contaminated, a liquid sample should be taken for analysis. Samples should be drawn from the bottom of the tank. For instruction on sampling the insulating liquid please see the Insulating Liquid Maintenance section of this manual.

If moisture is present in the liquid, the transformer must be dried out. Contact your Eaton's Cooper Power Systems representative for special instructions on dry-out or other decontamination processes.

External connections

⚠ WARNING

Hazardous voltage. Can cause severe injury, death, or damage to equipment. Ground transformer following industry-accepted safe grounding practices before making other electrical connections. De-energize power distribution wires that will be connected to transformer. Verify that wires are de-energized at the transformer before connecting to transformer.

Transformers that require no internal inspection or repair may be connected to the system. Transformers must be connected and operated as indicated by the transformer nameplate. Clean bushings and terminals before making connections. Remove dirt, grease or foreign material. Contamination can cause failure of the bushings.

Cables connected to the transformer terminals are to have sufficient flex to allow normal pad movement due to ground freeze/thaw and settling. Insufficient cable flex may cause premature failure of the bushings.

Ground connections

The transformer tank must be connected to a permanent, low-resistance ground. If the tank is not solidly grounded and the transformer is connected to the power distribution system, then the tank should be regarded as energized. An energized tank is extremely dangerous. Contact with an energized tank can shock, burn, or cause death.

Three-phase pad-mounted transformers are equipped with two grounding pads for making the ground connection. The pads (see Figures 3 and 4) are located on the faceplate of the transformer behind the terminal compartment doors. One pad is in the primary compartment and the other in the secondary compartment.

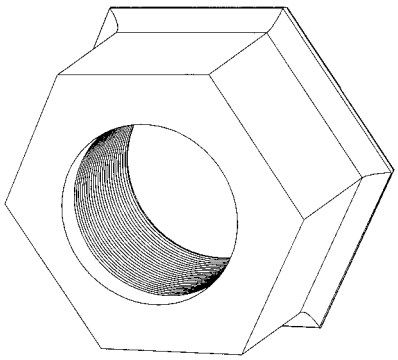

Figure 3. Grounding Pad (≤500 kVA).

Grounded wye-grounded wye transformer connections

Grounded Wye-Grounded Wye winding connection transformers are designed for power distribution systems that have a grounded neutral connector. All windings designed for grounded neutral operation must be permanently and solidly grounded to the system neutral without electrical resistance.

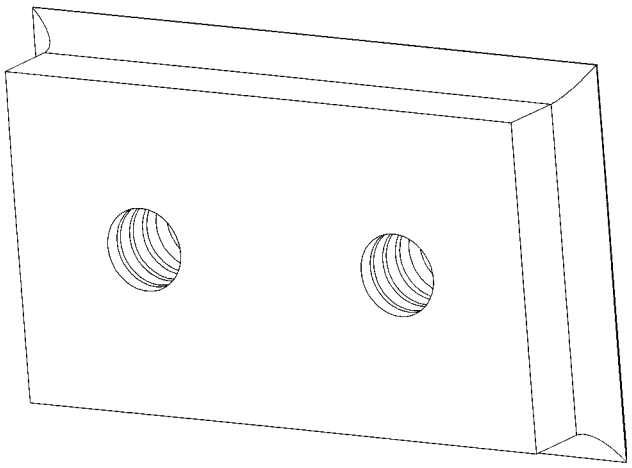

Figure 4. Grounding Pad (>500 kVA).

High voltage connections

Make connections as shown in the diagrams and information on the transformer nameplate. Transformer neutrals must be connected to system neutrals. Leads and connections that are not used must be insulated from ground and all other leads.

Livefront transformer connections

Externally clamped porcelain bushings are normally provided for high voltage connection to three-phase pad-mounted livefront transformers. The bushings have tin-plated eyebolt terminals suitable for both copper and aluminum conductors. The bushings are positioned to allow vertical takeoff of primary cables entering from below.

Deadfront transformer connections

Deadfront three-phase pad-mounted transformers are equipped with universal bushing wells, one-piece bushings, or bushing wells with factory-installed inserts. Universal bushing wells must be field equipped with bushing well inserts before loadbreak cable connections can be made. Bushing well inserts must be compatible with the universal bushing well. Use of improperly rated inserts can cause premature failure of the transformer or its components. Read the manufacturer's instructions furnished with the inserts before installing to determine if they are compatible.

Low voltage connections

Spade terminals are the standard low voltage connectors used for three-phase pad-mounted transformers. The low voltage bushings are externally clamped to the transformer tank wall.

Accessories

Three-phase pad-mounted transformers can be equipped with a variety of optional equipment. Most such accessories are factory installed and no fieldwork is required to prepare them for operation.

Liquid level gauge

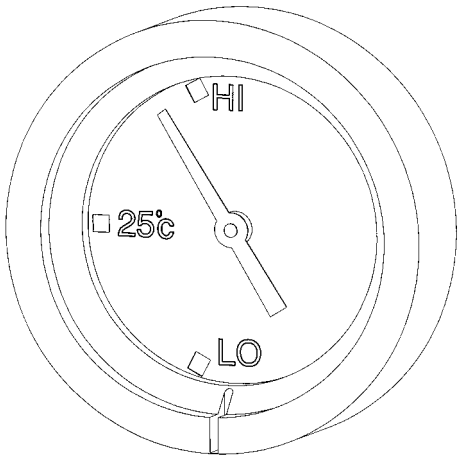

Figure 5. Liquid Level Gauge.

Transformers may be furnished with a liquid level indicator as optional equipment to aid in the systematic inspection of the transformer under load. It consists of a float-arm inside the tank, an indicating pointer and a magnetic coupling between the two across a liquid-tight separation.

The gauge may have two SPDT (Single Pole Double Throw) alarm contacts to give a remote annunciation of low liquid level. For wiring and contact ratings, refer to the schematic furnished with the transformer.

Liquid temperature gauge

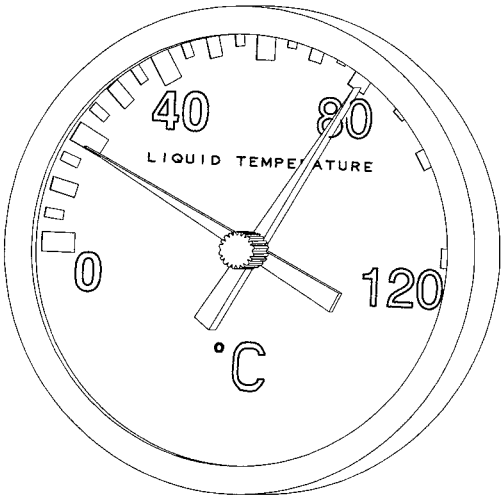

Figure 6. Liquid Temperature Gauge.

Transformers may be furnished with a temperature gauge as optional equipment to indicate the top liquid temperature in the tank in degrees Centigrade. The temperature-sensitive element is mounted in a leak-proof well, permitting removal of the thermometer without lowering the oil level. The device is furnished with an additional red pointer to show the highest temperature attained since the last reset. To reset the maximum indicator, turn the knob in the center of the dial.

The thermometer may have two SPDT contacts for a high temperature alarm, for energizing a fan circuit or for a low temperature alarm. For wiring and contact ratings, refer to the schematic furnished with the transformer.

Pressure-vacuum gauge

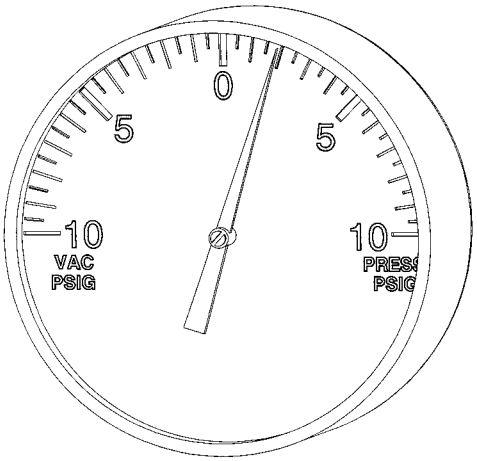

Figure 7. Pressure-Vacuum Gauge.

Transformers may be furnished with a pressure-vacuum gauge as optional equipment to indicate whether the gas space in the tank is under positive or negative pressure. The pressure will vary depending on the transformer temperature. If the transformer is de-energized or operating under light load in low ambients, the pressure may be negative.

CAUTION

If the indicator reads zero and does not change under any load condition, the transformer should be checked for a possible leak in the seal.

If sufficient air has been absorbed by the liquid during shipment or storage, the transformer may operate indefinitely in the vacuum range, depending upon the loading conditions. This, in itself, is not cause for concern, provided the pressure vacuum gauge does not remain on zero for any length of time - an indication of a leak.

The transformer may have pressure vacuum switches with two SPDT contacts for remote alarm on positive and negative pressure. For wiring and contact ratings, refer to the schematic furnished with the transformer.

Pressure relief device

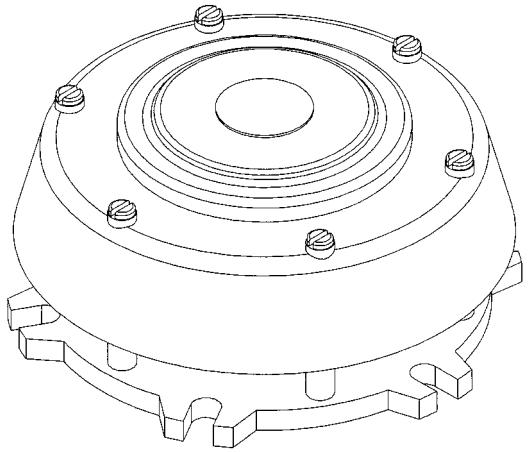

Figure 8. Pressure Relief Device.

Transformers may have a cover-mounted pressure relief device (PRD) in addition to the faceplate-mounted pressure relief valve (PRV) standard on all three-phase pad-mounted designs. The cover-mounted PRD consists of a self-resetting, spring-loaded diaphragm and a mechanical operation indicator. Should the tank pressure increase above that for which the device is set, the gas pressure will lift the diaphragm and let the gas escape quickly. Immediately after the pressure returns to normal, the diaphragm will reset and reseal the transformer. A mechanical indicator will protrude vertically. This must be reset manually to indicate subsequent operations.

The PRD may have SPDT alarm contacts for remote signaling of device activation. For wiring and contact ratings, refer to the schematic furnished with the transformer.

Switches and protective devices

Bay-O-Net fuse

⚠ WARNING

Hazardous voltage. Can cause severe injury, death, or damage to equipment.

- **Do not operate loadbreak equipment if a fault condition is suspected. Doing so can cause an explosion or fire.**
- **Use a hotstick to operate transformer loadbreak equipment.**
- **After operating transformer loadbreak equipment, check that voltages at transformer terminals are the expected values. Checking voltages verifies that loadbreak equipment operated properly and that electrical circuit conditions are as expected.**
- **Before servicing transformer secondary connected equipment, verify that all transformer secondary terminals have zero voltage and ground the transformer secondary terminals following industry accepted safe grounding practices. Grounding secondary terminals protects against situations such as a standby generator energizing transformer from the secondary circuit.**
- **Before servicing transformer, ALWAYS de-energize the transformer from a remote upstream source and then proceed to ground all primary and secondary transformer terminals following industry accepted safe grounding practices. Grounding secondary terminals protects against situations such as a standby generator energizing transformer from the secondary circuit.**
- **Follow industry accepted safety practices. Utilize protective clothing and equipment when working with loadbreak equipment.**

⚠ WARNING

Three-phase pad-mounted trans-formers use conventional transformer oil, R-Temp fluid, or Envirotemp™ FR3™ fluid for an insulating liquid. When the insulating liquid temperature is less than -20 °C (-4 °F) for conventional transformer oil, less than 0 °C (32 °F) for R-Temp fluid, or less than -10 °C (14 °F) for Envirotemp™ FR3™ fluid, viscosity is reduced, which may reduce make and break capabilities of loadbreak devices. Below these temperatures, under-oil loadbreak accessories should not be used to make or break a load. Instead, de-energize transformer from a remote upstream source before operating under-oil loadbreak devices.

⚠ WARNING

Hazardous voltage. Can cause severe injury, death, or damage to equipment. Use a hotstick to service a Bay-O-Net fuse. Do not install a Bay-O-Net fuse to complete an electrical circuit if a fault condition is suspected. Do not re-energize suspected failed equipment. After installing Bay-O-Net fuse, energize transformer from a remote upstream source.

Eaton's Cooper Power Systems Bay-O-Net fuse assemblies are used to protect transformers and distribution systems. The assemblies are mounted on the faceplate of pad-mounted transformers and combine the ease of hotstick operation with the safety of deadfront construction (see Figure 9).

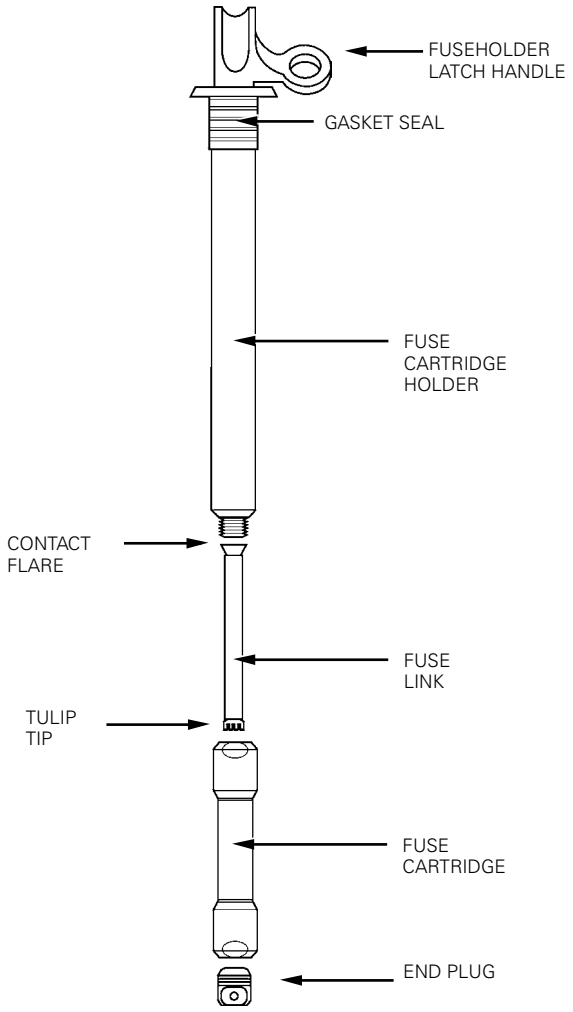

Figure 9. Bay-O-Net fuse assembly.

A Bay-O-Net fuse is not recommended for fault closing. Do not re-energize suspected failed equipment; serious personal injury may result. Internal fault conditions can cause the transformer to rupture or the cover to blow off. Always energize transformer from a remote upstream source.

When replacing a blown fuse, the feed circuit should be opened and closed from a remote location. The Bay-O-Net fuse should be replaced using the procedure described below and re-energized from a remote upstream source. If equipment is re-fused while energized, the fuse could close in on the system's maximum fault current. Any equipment that has a suspected failure should not be closed in with the fuse.

For additional information on the Eaton's Cooper Power Systems Bay-O-Net fuse assembly, including loadbreak ratings, refer to Electrical Apparatus bulletins 240-40, S240-40-2, and S240-40-3.

Current sensing, dual sensing, dual element, and high ampere overload links can be used in a Bay-O-Net fuse assembly. For additional information on these links, including interrupting ratings, see Electrical Apparatus bulletins 240-45, 240-46, 240-48, and 240-49 respectively.

Bay-O-Net fuse re-fusing instructions

Remove fuse holder
Step 1 - Relieve tank pressure.

Use a hotstick to perform the following steps:

1. Pull ring on pressure relief valve to open valve. Hold the valve open for 30 seconds after pressurized air can no longer be heard hissing through the valve.

⚠ CAUTION

If tank pressure has not been released, the fuse holder may be forced out of the Bay-O-Net housing. Maintain control of fuse holder at all times.

2. Close pressure relief valve and wait 30 seconds.
3. Pull pressure relief valve open. Hold the valve open until hissing stops, and then for another 5 seconds. Pulling the valve open again allows any residual pressure to be released from tank.

Step 2 - Unlock fuseholder and break seal.

Use a hotstick to perform the following steps:

1. Stand to one side of the Bay-O-Net being removed.
2. Attach hotstick to fuseholder eye.
3. Twist hotstick to unlock fuseholder (see Figure 10).
4. Turn fuseholder 90° in the Bay-O-Net housing to break seal between seal gasket and Bay-O-Net housing (see Figure 11).

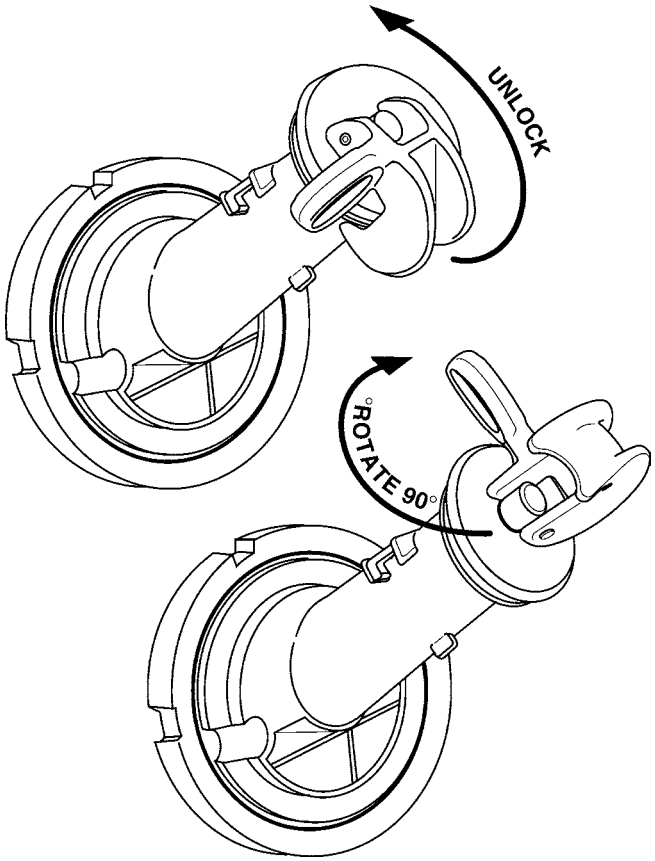

Figure 10. Unlock and Turn Fuseholder 90° in the Bay-O-Net Housing.

Step 3 - Draw fuseholder out.

Use a hotstick to perform the following steps:

1. Draw fuseholder out quickly 8 to 10 inches to interrupt load (see Figure 11).
2. Wait several seconds for fluid to drain from fuseholder.

⚠ CAUTION

If fluid is coming out of the Bay-O-Net assembly, open the pressure relief valve again to equalize pressure inside the tank.

Step 4 - Remove fuseholder from Bay-O-Net housing.

1. Remove fuseholder from Bay-O-Net housing.
2. Wipe off fuse cartridge holder and fuse cartridge (see Figure 12).

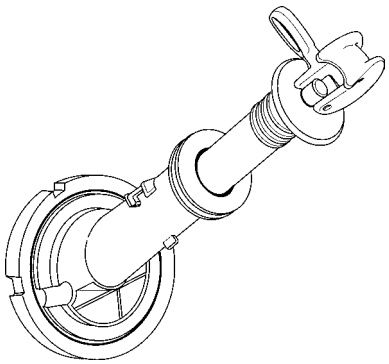

Figure 11. Draw Fuseholder Out 8 to 10 Inches.

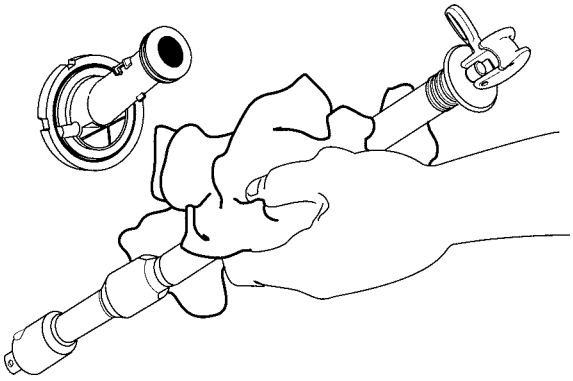

Figure 12. Remove Fuseholder From Bay-O-Net Housing and Wipe Clean.

Replace fuse link

A separate replaceable fuse link, fuse cartridge, and end plug are available for all Eaton's Cooper Power Systems Bay-O-Net fuses except catalog numbers 4000358C16CB and C18CB, 4038361C03CB, C04CB, C05CB, and solid link 4038361C10CB. These catalog numbers are integral assembles which include the link, cartridge and end plug. For the above listed integral assemblies follow Step 5 and then tighten new cartridge/fuse/end plug against fuse holder using 50 to 70 in-lbs. torque; then, proceed to Step 9. For all other Bay-O-Net fuses, follow Steps 5 through 9.

Step 5 - Remove fuse cartridge.

Use a 3/4 inch wrench to remove fuse cartridge from fuse cartridge holder (see Figure 13).

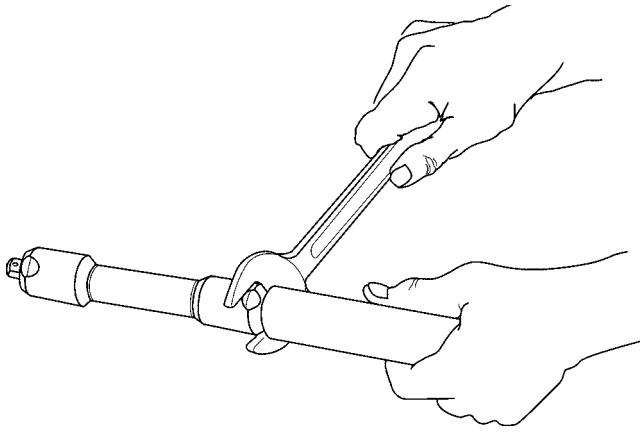

Figure 13. Remove Fuse Cartridge Holder.

Step 6 - Remove end plug and fuse link from fuse cartridge.

1. Use 3/4 inch and 1/2 inch wrenches to remove end plug (see Figure 14).
2. Use screwdriver or other tool to straighten tulip tip end of fuse link and push fuse link out of fuse cartridge. Replace fuse cartridge if damaged.

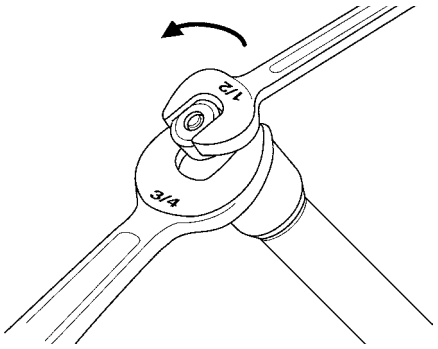

Figure 14. Remove End Plug from Fuse Cartridge.

Step 7 - Insert replacement fuse link into fuse cartridge (see Figure 15).

1. A slight resistance may occur when inserting fuse link into cartridge.
2. If the catalog number of the fuse being replaced is not known, consult specifications or contact your Eaton's Cooper Power Systems representative. Fuse catalog numbers may also be indicated on the transformer door and/or nameplate.

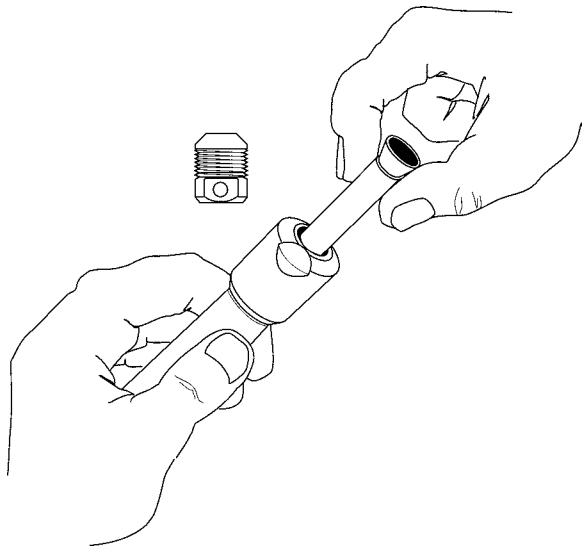

Figure 15. Insert Replacement Fuse Link.

Step 8 - Tighten cartridge to fuse cartridge holder.

1. Tighten fuse contact flare end against fuse cartridge holder using 50 to 70 in-lbs. torque.
2. Replace end plug on the other end of fuse cartridge and tighten to 50 to 70 in-lbs. torque.
3. Remove end plug and ensure that petals of tulip tip have spread uniformly.
4. Replace end plugs, applying 50 to 70 in-lbs. torque to both connections.

Step 9 - Install fuse holder.

Use a hotstick to perform the following steps.

1. Pull pressure relief valve, holding it open until hissing stops, and then for another five seconds.
2. Attach end of fuseholder assembly to hotstick and insert holder assembly firmly into Bay-O-Net housing.
3. Twist locking handle so that latch engages Bay-O-Net housing's shoulder, and steel washer seats tightly on end of tube of Bay-O-Net holder assembly.

⚠ CAUTION

Visually inspect entire fuseholder assembly to ensure it is installed properly.

Internal cartridge fuse

⚠ WARNING

Hazardous voltage. Can cause severe injury, death, or damage to equipment. Turn off power to transformer before servicing internal cartridge fuses. Ground transformer following industry accepted safe grounding practices.

Internal cartridge fuses are "weak link" expulsion-type fuses used to protect transformers and distribution systems. Internal cartridge fuse assemblies are mounted inside the transformer tank and are compatible for use in many insulating liquids. See fuse manufacturer's product literature for maximum interrupting ratings.

Internal cartridge fuse replacement

1. Verify that tank is grounded. De-energize transformer from a remote upstream source. Ground all bushings and terminals.
2. Remove tank cover as outlined in Tank Cover Removal and Installation section of this manual.
3. Locate cartridge fuse assembly (see Figure 16) on back tank wall.

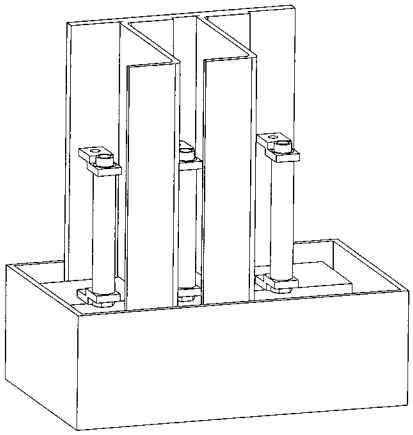

Figure 16. Cartridge Fuse Assembly.

4. Carefully remove all nuts that attach wire leads to fuse, making sure not to drop nuts into the transformer tank. Note position of all nuts, flat washers, spring washers, etc., so that they can be reinstalled in the same locations.
5. Replace fuses as required. Reconnect leads and reinstall washers and nuts in original locations.
6. Re-install cover as outlined in Tank Cover Removal and Installation section of this manual.

Internal loadbreak switches

⚠ WARNING

Hazardous voltage. Can cause severe injury, death, or damage to equipment.

- **Do not operate loadbreak equipment if a fault condition is suspected. Doing so can cause an explosion or fire.**
- **Use a hotstick to operate transformer loadbreak equipment.**
- **After operating transformer loadbreak equipment, check that voltages at transformer terminals are the expected values. Checking voltages verifies that loadbreak equipment operated properly and that electrical circuit conditions are as expected.**
- **Before servicing transformer secondary connected equipment, verify that all transformer secondary terminals have zero voltage and ground the transformer secondary terminals following industry accepted safe grounding practices. Grounding secondary terminals protects against situations such as a standby generator energizing transformer from the secondary circuit.**
- **Before servicing transformer, ALWAYS de-energize the transformer from a remote upstream source and then proceed to ground all primary and secondary transformer terminals following industry accepted safe grounding practices. Grounding secondary terminals protects against situations such as a standby generator energizing transformer from the secondary circuit.**
- **Follow industry accepted safety practices. Utilize protective clothing and equipment when working with loadbreak equipment.**

⚠ WARNING

Three-phase pad-mounted transformers use conventional transformer oil, R-Temp fluid, or Envirotemp™ FR3™ fluid for an insulating liquid. When the insulating liquid temperature is less than -20 °C (-4 °F) for conventional transformer oil, less than 0 °C (32 °F) for R-Temp fluid or less than -10 °C (14 °F) for Envirotemp™ FR3™ fluid, viscosity is reduced, which may reduce make and break capabilities of loadbreak devices. Below these temperatures, under-oil loadbreak accessories should not be used to make or break a load. Instead, de-energize transformer from a remote upstream source before operating under-oil loadbreak devices.

It is recommended that remote energization be used whenever possible. Operate loadbreak switches using hotstick tool. After loadbreak switch is switched to "OPEN" position, verify that transformer secondary terminals have zero voltage and then ground the secondary terminals to prevent transformer backfeed energization.

Two-position loadbreak switch

The operating mechanism of the Eaton's Cooper Power Systems two-position loadbreak switch employs a manually-charged over-toggle stored spring assembly which performs independent of operator speed. The spring-loaded activating mechanism ensures quick loadbreak or loadmake operations in less than one cycle. Incorporated into the switch mechanism are internal stops that restrict the handle orientation to only two positions: "OPEN" and "CLOSED" (see Figure 17). The switch should be hotstick-operated and will require 15 ft-lbs. minimum input torque to operate.

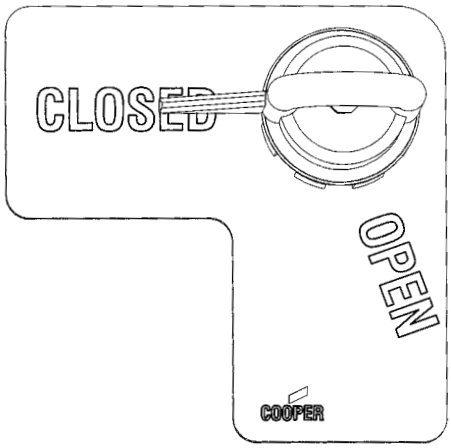

Figure 17. Two-Position Loadbreak Switch Handle and Indicator Plate.

Refer to Catalog Section 800-65 for two-position loadbreak switch ratings.

External visible loadbreak switch

⚠ CAUTION

Always fully cover and lock external visible loadbreak switch window during operation. Failure to cover and lock this window could cause personal injury. Before operating the on/off/ground switch, it is important to ensure the transformer tank has been fully grounded. Always check fluid temperature before operating loadbreak devices.

The Eaton's Cooper Power Systems external visible loadbreak switch is a great way to verify isolation of internal transformer circuitry. Having visual confirmation that the secondary bushings are de-energized saves both time and money, while providing an added safety feature. It is strongly recommended that if breaking load with this switch, the viewing window be fully covered and locked into place. Viewing this switch during operation under load could be dangerous to the human eye. The external visible loadbreak

switch is always shipped with a padlockable cover box. It is also important to remember that even after breaking load, the incoming high voltage cables are still live and dangerous.

Sectionalizing loadbreak switch

The Eaton's Cooper Power Systems sectionalizing loadbreak switch rotates 360° in either direction for alternate source selection. An externally-installed index plate prevents rotation to positions other than the one desired. The switch cannot be switched more than one position without resetting the index plate.

A spring-loaded activating mechanism ensures quick loadbreak action and positive contact engagement through all positions. Switching can be accomplished in less than one cycle, and should be performed with a hotstick. To follow are operation examples for the two most common sectionalizing switch configurations.

The following is a V-blade switch operation example (see Figure 18):

If "A" is the feeder and it is desired to switch to "B" feeder, then the V-blade switch can be rotated as follows:

1. Set index stop plate between "line A only" and "Open".
2. Rotate switch handle counterclockwise to "Open". Transformer and loop conductor are now "Open".
3. Move index plate between "Open" and "line B only".
4. Rotate switch handle counterclockwise to "line B only". Transformer is now energized for "B" feeder.

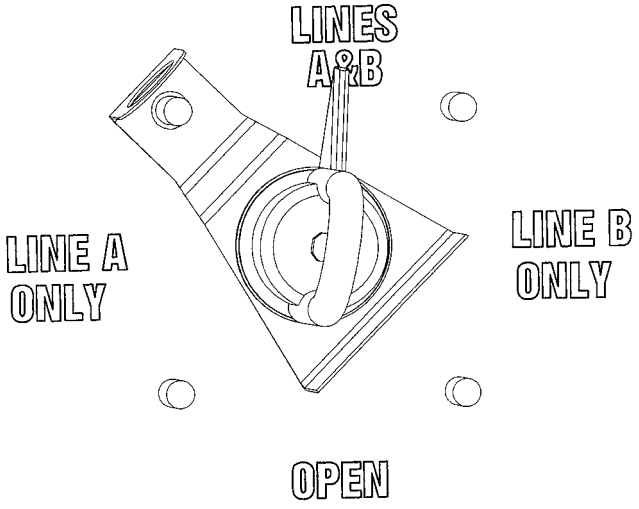

Figure 18. V-Blade Four-Position Sectionalizing Switch Handle and Index Plate.

The following is a T-blade switch operation example (see Figure 19):

If "A" is the feeder and it is desired to switch to "B" feeder, the T-blade switch can be rotated as follows:

1. Set index stop plate between "line A only" and "loop thru transformer open".
2. Rotate switch handle counterclockwise to "loop thru transformer open". The transformer is now "OPEN" and the loop conductor is electrically connected.
3. Move index plate between "loop thru transformer open"" and "line b only".
4. Rotate switch handle counterclockwise to "line b only". The transformer is now energized for "B" feeder.

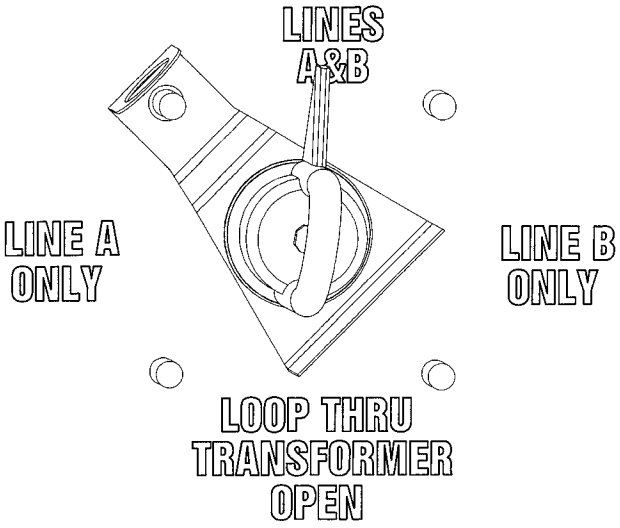

Figure 19. T-Blade Four-Position Sectionalizing Switch Handle and Index Plate.

For switch ratings and additional switch configurations refer to Catalog Section 800-64.

Tap-changer

⚠ WARNING

Hazardous voltage. Can cause severe injury, death, or damage to equipment. De-energize transformer from a remote upstream source before operating non-loadbreak tap-changers, dual-voltage switches, or delta-wye switches.

Transformers equipped with a tap-changer can be changed from one operating voltage to another. The transformer must be de-energized and grounded before the tap-changer is operated. Operating voltages accessible through use of the tap-changer are indicated on the transformer nameplate.

On most three-phase pad-mounted transformers equipped with tap-changers, the tap-changer operating handle is located on the faceplate in the high-voltage terminal compartment.

The standard style of tap-changer will have a hotstick-operable handle. There are two styles of tap-changer with this type of handle, each requiring a slightly different method for changing tap settings.

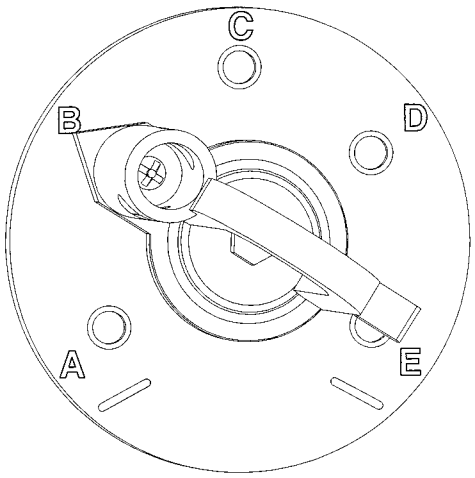

Figure 20. Hotstick-Operable Tap-Changer (Style I).

The tap-changer shown in Figure 20 can be switched to a new tap position as follows:

1. Verify that tank is grounded. De-energize transformer from a remote upstream source. Ground all bushings and terminals before operating the tap switch.
2. Back out lock screw to clear index plate.
3. Rotate handle to desired position.
4. Secure handle in its new position by tightening lock screw through index plate until it bottoms.
5. Padlocking may be accomplished through hole provided.

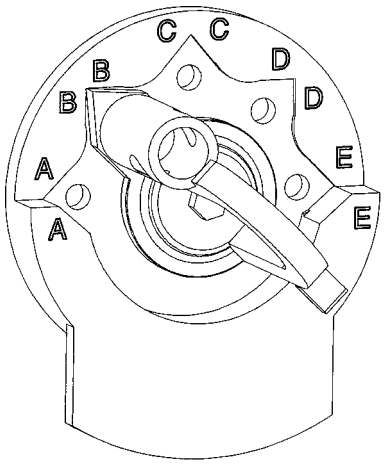

Figure 21. Hotstick-Operable Tap-Changer (Style II).

The tap-changer shown in Figure 21 can be switched to a new tap position as follows:

1. Verify that tank is grounded. De-energize transformer from a remote upstream source. Ground all bushings and terminals before operating the tap switch.
2. Back out lock screw to clear index plate.
3. Pull handle out to clear index plate.
4. Rotate handle to desired position and allow pointer to drop into slot of index plate.
5. Secure handle in its new position by tightening lock screw through index plate until it bottoms.
6. Padlocking may be accomplished through hole provided.

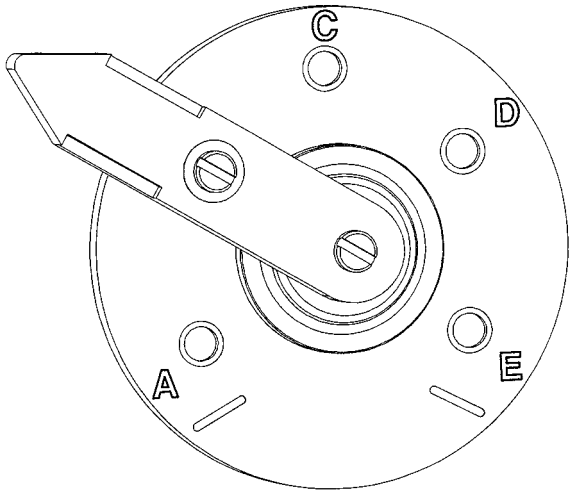

Figure 22. Lever Handle Tap-Changer.

On some transformers, tap-changers have a lever handle (see Figure 22). A lock screw secures the handle at a particular setting. Such tap-changers can be switched to a new position as follows;

1. Verify that tank is grounded. De-energize transformer from a remote upstream source. Ground all bushings and terminals before operating the tap switch.
2. Back out lock screw to clear index plate.
3. Rotate handle to desired position.
4. Secure handle in its new position by tightening lock screw through index plate until it bottoms.

Dual-voltage and delta-wye switch

⚠ WARNING

Hazardous voltage. Can cause severe injury, death, or damage to equipment. De-energize transformer from a remote upstream source before operating non-loadbreak tap-changers, dual-voltage switches, or delta-wye switches.

⚠ CAUTION

Excessive current. Can cause damage to transformer winding. When dual-voltage or delta-wye switches are set to connect transformer windings in parallel, tap-changers must be in the position shown on the transformer nameplate.

Transformers equipped for dual-voltage or delta-wye (reconnectable winding) operations usually have an externally-operable switch mounted on the faceplate in the high-voltage terminal compartment. Units combining dual-voltage and delta-wye may have two separate switches. The transformer must be de-energized and grounded before dual-voltage or delta-wye switches are operated. Attempting to change dual-voltage or delta-wye switches on an energized transformer may result in damage to the equipment and severe personal injury.

Dual-voltage windings are either connected in series (for the higher voltage) or in parallel (for the lower voltage). Dual-voltage and delta-wye switches have two positions. Switch positions are identified on the transformer nameplate and marked by corresponding numerals on the switch mounting plate.

When dual-voltage or delta-wye switches are set to connect transformer windings in parallel, tap-changers must be in the position shown on the transformer nameplate. Tap-changers cannot be used to adjust voltage when transformer windings are connected in parallel. Improper tap-changer settings will cause circulating currents in the windings, which will damage the windings and cause failure of the transformer.

To change dual winding switch settings:

The standard type of dual-voltage or delta-wye switch will have a hotstick-operable handle (see Figure 23).

This type of dual-voltage or delta-wye switch can be switched to a new position as follows:

1. Verify that tank is grounded. De-energize trans-former from a remote upstream source. Ground all bushings and terminals before operating dual-voltage or delta-wye switch.
2. Back out lock screw to clear index plate.
3. Pull handle out to clear index plate and rotate handle 90°. Drop handle into new position.
4. Secure handle in its new position by tightening lock screw through index plate until it bottoms.

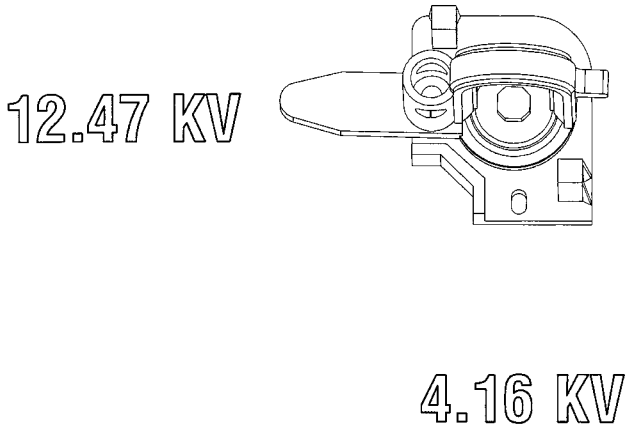

Figure 23. Dual-Voltage/Delta-Wye Switch (Hotstick-Operable).

5. Padlocking may be accomplished through hole provided.

On some transformers, dual-voltage or delta-wye switches have a lever handle (see Figure 24).

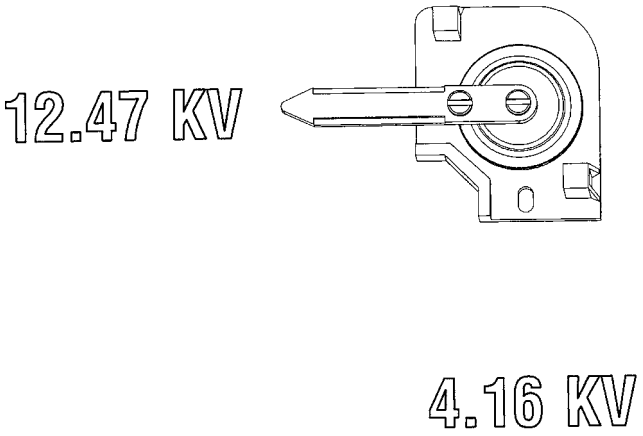

Figure 24. Dual-Voltage/Delta-Wye switch (Lever Handle).

This type of dual-voltage or delta-wye switch can be switched to a new position as follows:

1. Verify that tank is grounded. De-energize trans-former from a remote upstream source. Ground all bushings and terminals before operating dual-voltage or delta-wye switch.
2. Back out lock screw to clear index plate.
3. Rotate handle 90° to new position.
4. Secure handle in its new position by tightening lock screw through index plate until it bottoms.

Vacuum Fault Interrupter (VFI)

⚠ WARNING

Hazardous voltage. Can cause severe injury, death, or damage to equipment.

- **Do not operate loadbreak equipment if a fault condition is suspected. Doing so can cause an explosion or fire.**
- **Use a hotstick to operate transformer loadbreak equipment.**
- **After operating transformer loadbreak equipment, check that voltages at transformer terminals are the expected values. Checking voltages verifies that loadbreak equipment operated properly and that electrical circuit conditions are as expected.**
- **Before servicing transformer secondary connected equipment, verify that all transformer secondary terminals have zero voltage and ground the transformer secondary terminals following industry accepted safe grounding practices. Grounding secondary terminals protects against situations such as a standby generator energizing transformer from the secondary circuit.**
- **Before servicing transformer, ALWAYS de-energize the transformer from a remote upstream source and then proceed to ground all primary and secondary transformer terminals following industry accepted safe grounding practices. Grounding secondary terminals protects against situations such as a standby generator energizing transformer from the secondary circuit.**
- **Follow industry accepted safety practices. Utilize protective clothing and equipment when working with loadbreak equipment.**

⚠ WARNING

Three-phase pad-mounted transformers use conventional transformer oil, R-Temp fluid, or Envirotemp™ FR3™ fluid for an insulating liquid. When the insulating liquid temperature is less than -20 °C (-4 °F) for conventional transformer oil, less than 0 °C (32 °F) for R-Temp fluid or less than -10 °C (14 °F) for Envirotemp™ FR3™ fluid, viscosity is reduced, which may reduce make and break capabilities of loadbreak devices. Below these temperatures, under-oil loadbreak accessories should not be used to make or break a load. Instead, de-energize transformer from a remote upstream source before operating under-oil loadbreak devices.

IMPORTANT

For 75 °C AWR transformers, applications with maximum ambient temperatures exceeding 30 °C or loading in excess of nameplate rating, contact your Eaton's Cooper Power Systems representative.

Eaton's Cooper Power Systems VFI transformers utilize vacuum interrupters to provide fault current interruption and load make/break switching capabilities. The VFI transformer uses the same technology used in VFI Pad-Mounted Switchgear from Eaton's Cooper Power Systems.

VFI transformers can be configured for either transformer protection or loop protection. A VFI transformer with transformer protection protects the transformer and provides proper coordination with upstream protective devices. A VFI transformer with loop protection protects the loop or downstream section of a feeder. Consequently, when a fault occurs downstream, the VFI breaker trips and isolates the fault, leaving the transformer load uninterrupted.

The VFI interrupter mechanism in a VFI transformer has a hotstick-operable handle located on the faceplate of the transformer, with the operating mechanisms configured for ganged three-phase operation (see Figure 25). The VFI interrupter mechanism is opened by pulling the operation handle down to the open position. The VFI interrupter mechanism is closed by briskly pushing the handle up, into the closed position. If the VFI interrupter mechanism has tripped as the result of a fault or overload condition, the mechanism must be reset before it can be closed. To reset the mechanism, firmly pull the operation handle down toward the ground until the latch resets. After the latch has been successfully re-set, the VFI interrupter mechanism can be closed normally.

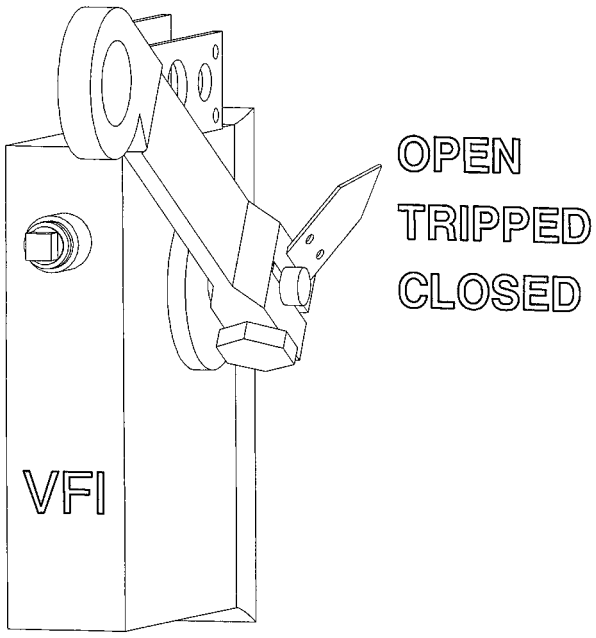

Figure 25. VFI Operating Handle.

Current-sensing transformers (CTs) located inside the VFI transformer provide line current information to the electronic control. When line current exceeds the minimum trip setting, the control initiates a signal which causes the VFI interrupter mechanism to trip and then interrupt the circuit. All three phases will open when the VFI interrupter mechanism is tripped, regardless of whether the trip was single-phase or three-phase initiated.

Refer to *Service Information S285-75-1, Tri-Phase, TPG, and TPG with SCADA Electronic Control Installation and Operation Instructions* for electronic control operation instructions.

Electrical ratings for Eaton's Cooper Power Systems VFI transformers are as follows:

Continuous Current (max) . . . . . 600 A
Interrupting Current (sym./asym.). . . . . 12 kA/20 kA
Momentary Current 10 cycles (asym.) . . . . . 20 kA
1-Second Withstand Current (sym.). . . . . 12 kA
Making Current (sym.) . . . . . 12 kA

For further information on Eaton's Cooper Power Systems VFI transformers, contact your Eaton's Cooper Power Systems representative.

Air switches (Arc-Strangler™)

⚠ WARNING

Hazardous voltage. Can cause severe injury, death, or damage to equipment.

- **Do not operate loadbreak equipment if a fault condition is suspected. Doing so can cause an explosion or fire.**
- **Use a hotstick to operate transformer loadbreak equipment.**
- **After operating transformer loadbreak equipment, check that voltages at transformer terminals are the expected values. Checking voltages verifies that loadbreak equipment operated properly and that electrical circuit conditions are as expected.**
- **Before servicing transformer secondary connected equipment, verify that all transformer secondary terminals have zero voltage and ground the transformer secondary terminals following industry accepted safe grounding practices. Grounding secondary terminals protects against situations such as a standby generator energizing transformer from the secondary circuit.**
- **Before servicing transformer, ALWAYS de-energize the transformer from a remote upstream source and then proceed to ground all primary and secondary transformer terminals following industry accepted safe grounding practices. Grounding secondary terminals protects against situations such as a standby generator energizing transformer from the secondary circuit.**
- **Follow industry accepted safety practices. Utilize protective clothing and equipment when working with loadbreak equipment.**

⚠ WARNING

Three-phase pad-mounted transformers use conventional transformer oil, R-Temp™ fluid, or Envirotemp™ FR3™ fluid for an insulating liquid. When the insulating liquid temperature is less than -20 °C (-4 °F) for conventional transformer oil, less than 0 °C (32 °F) for R-Temp fluid or less than -10 °C (14 °F) for Envirotemp™ FR3™ fluid, viscosity is reduced, which may reduce make and break capabilities of loadbreak devices. Below these temperatures, under-oil loadbreak accessories should not be used to make or break a load. Instead, de-energize transformer from a remote upstream source before operating under-oil loadbreak devices.

⚠ WARNING

Hazardous voltage. Can cause severe injury, death, or damage to equipment. Depending on configuration, Arc-Strangler fuses or switchblades may be energized even when in the "open" position. Refer to Electrical Apparatus bulletin 240-60 for further information.

Arc-Strangler loadbreaking device with NX™ fusing

NX™ full-range current-limiting fuses up to 15.5 kV can be ordered with an integral Arc-Strangler™ loadbreaking device. These in-air devices are mounted on the faceplate of the transformer. The Arc-Strangler device has the same operating characteristics as the basic NX clip-style fuse, along with loadbreaking capabilities.

The Arc-Strangler loadbreaking device is a spring-loaded sliding sleeve that extinguishes the arc drawn between the mounting contacts and the fuse conductor when the fuse is opened while load current is flowing. All magnitudes of current through the continuous current rating of the fuse can be interrupted positively and safely under proper conditions. A pullring at the top of the fuse assembly (for hotstick operation) and a hinge at the bottom complete the loadbreak device.

Arc-Strangler switchblades

Switchblades with integral Arc-Strangler loadbreaking devices are available for use in NX type fuse mountings. Arc-Strangler switchblades are designed to break load current only (up to 200 A) and do not incorporate a fuse of any type for overload or fault interruption.

Surge arresters

⚠ WARNING

Hazardous voltage. Can cause severe injury, death, or damage to equipment. De-energize transformer from a remote upstream source before servicing or operating surge arresters or disconnect switches. Check that all transformer terminals and bushings have zero voltage. Ground transformer following industry accepted safe grounding practices.

⚠ CAUTION

Excessive test voltage can damage surge arresters. Disconnect surge arresters before running impulse or applied potential tests on the transformer.

Surge arresters are used in three-phase pad-mounted transformers to protect underground distribution equipment and cable from overvoltage surges. During steady state conditions, line-to-ground voltage is applied continuously across the arrester terminals. When surges occur, the arrester immediately limits the overvoltage to the required protective level by conducting the surge current to ground. Upon passage of the surge, the arrester returns to its initial state, conducting minimal leakage current.

Surge arresters should be installed only on systems where the power frequency voltage at the arrester does not exceed published maximum continuous operating voltage (MCOV) values.

The transformer should not be tested (impulse or applied potential) with the arrester connected. If connected during impulse tests, the arrester will clamp the discharge voltage applied by the test equipment. If the arrester is connected to the transformer during an applied potential test, there is a possibility that the arrester will be damaged. Disconnect surge arresters before tests are performed on the transformer. Arresters should be reconnected immediately after tests are completed.

Under-oil MOV arrester

The Eaton's Cooper Power Systems heavy-duty distribution-class under-oil MOV arrester is designed to be mounted inside the transformer tank (see Figure 26). Internal, under-oil mounting of the arrester prevents shortened arrester life due to surface contamination, wildlife damage, vandalism, or moisture ingress.

Under-oil arresters are designed to operate when submerged in oil. It is recommended that the average oil temperature not exceed 90 °C and that the maximum oil temperature not exceed 125 °C.

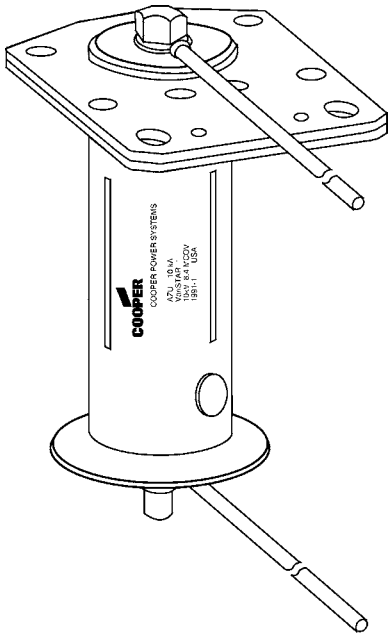

Figure 26. Heavy-Duty Distribution-Class Under-Oil MOV Arrester.

Under-oil arrester disconnection during test (with arrester disconnect switch)

The Eaton's Cooper Power Systems Arrester Disconnector provides a means of disconnecting and reconnecting an under-oil arrester ground for transformer testing. Separate disconnectors are used for each arrester in the transformer, and are located on the transformer faceplate.

The arrester disconnector is operated as follows:

Operating from closed to open position (see Figure 27):

1. Verify that tank is grounded. De-energize transformer from a remote upstream source. Ground all bushings and terminals.
2. Unscrew handle from shaft.
3. Re-attach small diameter end of handle to shaft.
4. Push handle and shaft toward transformer until shaft flange (adjacent to handle) is flush to sealing gland.
5. Transformer is now ready for Impulse or Applied Potential testing.

Operating from open to closed position:

1. Verify that tank is grounded. De-energize transformer from a remote upstream source. Ground all bushings and terminals.
2. Pull handle and shaft away from transformer completely.
3. Unscrew handle and re-attach with large diameter end toward the transformer. To assure good ground contact, the handle should be re-tightened by rotating handle 3/4 to 1 turn after handle has come in contact with seal gland.

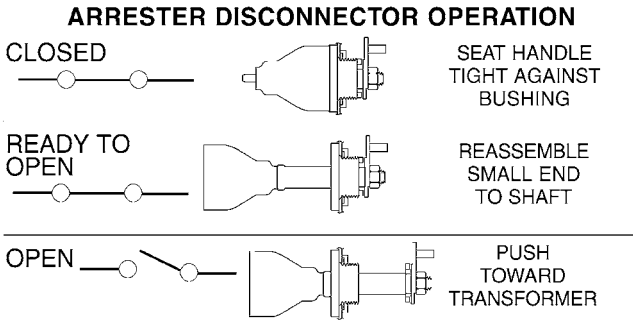

Figure 27. Arrester Disconnector Operation.

Under-oil arrester disconnection during test (without arrester disconnect switch)

CAUTION

Before opening the transformer tank for internal maintenance, read the Insulating Liquid Maintenance section in this manual. This section explains safety precautions that should be taken and gives instructions on how to prevent insulating liquid contamination.

To disconnect arresters without a disconnect switch:

1. Verify that tank is grounded. De-energize transformer from a remote upstream source. Ground all bushings and terminals.
2. Remove tank cover following procedures in Tank Cover Removal and Installation section of this manual.
3. Locate arrester ground lead pad (see Figure 28) attached to tank wall.
4. Disconnect arrester ground leads from ground lead pad and separate leads ends a minimum of 5" from each other and from any part of the transformer.
5. Transformer is now ready for impulse or applied potential testing.

To reconnect:

1. Reconnect arrester ground leads to ground lead pad.
2. Re-install tank cover as outlined in Tank Cover Removal and Installation section of this manual.

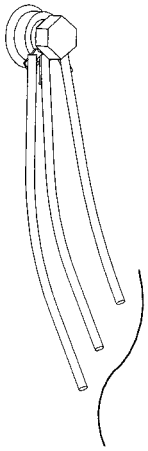

Figure 28. Under-oil Arrester Jumper Ground Lead Pad with Ground Leads.

External arrester

External surge arresters ordered with the transformer must be installed and connected in the field before the transformer is put into service.

Arrester and tank ground connections must be completed before the transformer is connected to the high-voltage or low-voltage lines. Proper connection places the arrester in a direct shunt relationship to the transformer insulation.

Maintenance

Exterior maintenance

On an annual or more frequent interval, inspect all exposed surfaces for evidence of tampering, battered metal, gouges, etc. Dents or deformities should be repaired at once. Scratched or weathered paint or protective coatings should be touched up promptly.

Keep the area around the transformer clean. Do not store tools, materials or equipment on or against the transformer.

Cabinet interior maintenance

⚠ WARNING

Hazardous voltage. Can cause severe injury, death, or damage to equipment. De-energize transformer from a remote upstream source before opening cabinet and doing cabinet interior inspection or maintenance. Check that all transformer terminals and bushings have zero voltage. Ground transformer following industry accepted safe grounding practices.

Periodically inspect the terminal compartment interior and all operating equipment. Check all gauges and controls for proper operation. Repair or replace damaged or defective equipment.

Inspect drain cocks, plugs, fuse mountings, and switches. Look for evidence of insulating liquid seepage around tank-wall gaskets, seals, etc. Repair as required.

Replacement of gaskets or seals in the tank wall may require that the tank be opened and the insulating liquid lowered to the appropriate level. For instruction on opening the tank and for draining and replacing the insulating liquid, refer to the Insulating Liquid Maintenance section in this manual.

Tank internal maintenance

(For Envirotran™ Transformers see the Envirotran Transformers section of this manual before continuing)

⚠ CAUTION

Elevated Pressure. Can cause personal injury or damage to transformer. Release internal pressure with pressure relief device before removing tank cover, manhole cover or handhole cover.

⚠ WARNING

Hazardous voltage. Can cause severe injury, death, or damage to equipment. De-energize transformer from a remote upstream source before opening cabinet and doing internal tank inspection or maintenance. Check that all transformer terminals and bushings have zero voltage. Ground transformer following industry accepted safe grounding practices.

Service to bushings or equipment inside the transformer tank will require that the tank be opened and the insulating liquid lowered to the appropriate level. Before opening the transformer tank, read the Insulating Liquid Maintenance section in this manual. The Liquid Maintenance section explains safety precautions that should be taken and gives instructions on how to prevent insulating liquid contamination. Precautions must be taken to prevent dirt or moisture from entering the opened transformer tank. Contamination of the insulating liquid will prevent the transformer from operating properly and may cause serious damage to the transformer.

Three-phase pad-mounted transformers may have either bolt-on or weld-on main tank covers. Bolt-on covers can be removed to access the tank interior. Access to the interior of a transformer with a weld-on tank cover is typically through a manhole/handhole. To gain additional internal access to tanks with weld-on tank covers, the tank cover must be cut open.

Tank cover removal and installation

(For Envirotran Transformers see the Envirotran Transformers section of this manual before continuing)

⚠ CAUTION

Elevated Pressure. Can cause personal injury or damage to transformer. Release internal pressure with pressure relief device before removing tank cover, manhole cover or handhole cover.

⚠ WARNING

Hazardous voltage. Can cause severe injury, death, or damage to equipment. De-energize transformer from a remote upstream source before opening cabinet and doing internal tank inspection or maintenance. Check that all transformer terminals and bushings have zero voltage. Ground transformer following industry accepted safe grounding practices.

Transformers that have been system-connected should be de-energized, grounded, and disconnected before being opened for inspection.

If the tank seal is broken, it is recommended that a leak test be performed to verify that the tank is properly sealed. To leak test, remove the pressure relief device and pressurize the headspace. The test pressure should not exceed 7 psig. The established pressure should be maintained for at least four hours to insure that all the seals are proper.

Bolt-On tank cover removal

Transformer tanks are factory-sealed to prevent ingress of ambient air and moisture. Do not open under any precipitation conditions.

1. Verify that tank is grounded. De-energize transformer from a remote upstream source. Ground all bushings and terminals before removing cover.
2. Thoroughly clean tank cover to help prevent contamination of insulating liquid when removing the cover. Remove all dirt, grease, and moisture.
3. From within the cabinet, remove the hardware (3/8" nuts using a 9/16" socket) which attaches the cover nutguard to the faceplate.
4. Relieve internal tank pressure by operating the pressure relief valve. Remove the hardware (3/8" nuts using a 9/16" socket) which attaches the cover to the tank.
5. Gently pry the cover upward. Do not allow the cover gasket to come in contact with the transformer insulating liquid. Allowing the gasket to contact the liquid will make it slippery and difficult to hold in position during cover installation. Lift cover straight up to prevent damage to cover, bolts, and tank gasket.
6. Note the location and orientation (up/down) of each gasket section as they are removed from the tank flange so that they can be reinstalled properly.

Bolt-On tank cover installation

1. Return the gasket sections to their original positions and orientation.
2. Re-install the cover, using 25 ft-lbs. torque to tighten the cover hardware. After installing all the nuts, re-torque each nut to ensure proper torque is achieved.
3. Remove the pressure relief valve and pressurize the headspace through the pressure relief valve coupling to ensure that there are no leaks. Test pressure should not exceed 7 psig. Established pressure should be maintained for at least four hours to insure that all seals are proper.
4. Re-install the nutguard using 25 ft-lbs. torque to tighten nutguard access hardware.
5. Re-install pressure relief valve.

Bolt-On manhole/handhole cover removal

Transformer tanks are factory-sealed to prevent ingress of ambient air and moisture. Do not open under any precipitation conditions.

1. Verify that tank is grounded. De-energize transformer from a remote upstream source. Ground all bushings and terminals before removing cover.
2. From within cabinet, remove hardware (3/8" nuts using a 9/16" socket) attaching manhole/handhole access cover to cabinet.
3. Remove manhole/handhole access cover.
4. Thoroughly clean tank and manhole/handhole cover to help prevent contamination of insulating liquid when removing manhole/handhole cover. Remove all dirt, grease, and moisture.
5. Relieve internal tank pressure by operating pressure relief valve.
6. Remove hardware (3/8" nuts using a 9/16" socket) attaching manhole/handhole cover to tank.
7. Gently pry cover upward. Do not allow cover gasket to come in contact with transformer insulating liquid. Allowing the gasket to contact the liquid will make it slippery and difficult to hold in position during cover installation. Lift cover straight up to prevent damage to cover, bolts, and tank gasket.
8. Note location and orientation (up/down) of each gasket section as they are removed from tank flange so they can be re-installed properly.

Bolt-On manhole/handhole cover installation

1. Return gasket sections to their original positions and orientation.
2. Re-install manhole/handhole, using 25 ft-lbs. torque to tighten hardware. After installing all nuts, re-torque each nut to ensure proper torque is achieved.
3. Remove pressure relief valve and pressurize headspace through pressure relief valve coupling to ensure that there are no leaks. Test pressure should not exceed 7 psig. Established pressure should be maintained for at least four hours to ensure that all seals are proper.
4. Re-install access cover using 25 ft-lbs. torque to tighten access cover hardware.
5. Re-install pressure relief valve.

Weld-On tank cover removal

⚠ WARNING

Explosive gas. Can cause severe injury, death, or damage to equipment. Before cutting open a weld-on tank cover, fill tank headspace with nitrogen gas. Keep nitrogen gas flowing while cutting. Keep tank headspace filled with nitrogen until cutting is finished.

Transformer tanks are factory-sealed to prevent ingress of ambient air and moisture. Do not open under any precipitation conditions.

Explosive gases can develop inside a transformer tank headspace during the life of the transformer. It is strongly recommended that weld-on cover removal be done only in a controlled repair facility by experienced maintenance personnel. To prevent explosions, the following procedures must be followed during weld-on cover removal:

1. Verify that tank is grounded. De-energize transformer from a remote upstream source. Ground all bushings and terminals before removing cover.
2. Relieve internal tank pressure by operating pressure relief valve.
3. Remove manhole/handhole cover as outlined in the Tank Cover Removal and Installation section of this manual.
4. Drain insulating liquid to the top of core clamp as outlined in the Insulating Liquid Maintenance section of this manual.
5. Allow transformer to sit with manhole/handhole removed for a minimum of 24 hours to allow explosive gases to escape.
6. Place a rubberized blanket on top of core clamp and completely cover core/coil assembly to protect core/coil assembly from weld spatter contamination during cover cutting.
7. Remove pressure relief valve and attach a nitrogen source in its place.
8. Fill headspace with nitrogen with manhole/ handhole cover still removed. Nitrogen gas will help prevent a volatile gas explosion while tank cover is being cut off.
9. While continuing to keep nitrogen flowing into the headspace, use carbon air arc machinery or a hard-wheel grinder to cut cover weld.
10. Thoroughly clean tank cover to help prevent contamination of insulating liquid when removing cover. Remove all dirt, grease, and moisture.
11. Remove tank cover from tank.

Weld-On tank cover installation

1. Grind smooth and then clean cover, removing all weld spatter accumulated during cover removal.
2. It is recommended that the tank weld rope gasket be replaced around the tank lip prior to re-installing cover. The tank weld rope gasket helps prevent weld spatter from entering the tank during cover weld. The rubberized blanket installed during cover removal should still be covering the core/coil assembly.
3. Re-position cover on tank.
4. Fill headspace with nitrogen through pressure relief valve coupling, with manhole/handhole still removed.
5. Continue to keep nitrogen source flowing into headspace, and weld cover fully around the tank lip.
6. Remove rubberized blanket that was installed during cover removal.
7. Refill insulating liquid as outlined in Insulating Liquid Maintenance section of this manual.
8. Re-install manhole/handhole cover as outlined in Tank Cover Removal and Installation section of this manual.
9. Pressurize headspace through pressure relief valve coupling to insure that there are no leaks. The test pressure should not exceed 7 psig. The established pressure should be maintained for at least four hours to ensure that all seals are proper.
10. Re-install pressure relief valve.

Bushing removal and replacement

1. Verify that tank is grounded. De-energize transformer from a remote upstream source. Ground all bushings and terminals before performing maintenance on bushings.
2. Open tank by removing tank cover or manhole/ handhole cover as outlined in Tank Cover Removal and Installation section of this manual.
3. Lower insulating liquid level as outlined in Insulating Liquid Maintenance section of this manual. Lower liquid level to completely expose the bushing.
4. Disconnect all internal and external cable and leads. Note position of all nuts, flat washers, spring washers, etc., so they can be re-installed in same locations.
5. Remove all bushing clamp hardware, noting position of all nuts, flat washers, spring washers, etc., so they can be re-installed in same locations.
6. Remove external bushing clamp, bushing, and gasket.
7. Install a new bushing and gasket. Center bushing and gasket to obtain an effective seal. Install exterior bushing clamp and clamp hardware. Tighten clamp nuts per torque specified in Table 1.
8. Re-connect all external and internal cables and leads. Replace all nuts, flat washers, spring washers, etc., in their original position. Tighten all connections per torque specified in Table 1.
9. Restore insulating liquid to appropriate level as outlined in Insulating Liquid Maintenance section of this manual. Close, reseal, and leak test tank as outlined in the Tank Cover Removal and Installation section of this manual. Inspect bushing-to-tank seal for leaks or seepage.

Cabinet removal and installation

Cabinet removal

⚠ CAUTION

Potential Falling Object. Can cause personal injury or damage to transformer. Do not open cabinet doors when cabinet is removed from transformer tank. Opening cabinet doors will cause cabinet to fall forward.

⚠ WARNING

Hazardous voltage. Can cause severe injury, death, or damage to equipment. De-energize transformer from a remote upstream source before opening cabinet and doing cabinet interior inspection or maintenance. Check that all transformer terminals and bushings have zero voltage. Ground transformer following industry accepted safe grounding practices.

Table 1. Bushing Hardware Tightening Torque

Bushing Clamps	
Clamp Type	**Hardware Tightening Torque**
Cast Aluminum Clamp	70-80 in-lbs.
Molded Polymer Tri-Clamp	40-60 in-lbs.
All other 3 & 4 hole Clamps	40-60 in-lbs.

Bushings With Internal Spade Connections	
Bushing Hardware	**Hardware Tightening Torque**
1/2" Steel (Grade 8)	50 ft-lbs.
3/8" Steel (Grade 8)	50 ft-lbs.

Bushings With Internal Stud Connections	
Bushing Hardware	**Hardware Tightening Torque**
3/8"-16 Brass Nuts	16 ft-lbs.
5/8"-11 Aluminum Nuts	60 ft-lbs.
5/8"-11 Brass Nuts	75 ft-lbs.
1"-14 Brass Nuts	121 ft-lbs.
Bushing Lead Block, 1/2" Steel Hardware	110 ft-lbs.

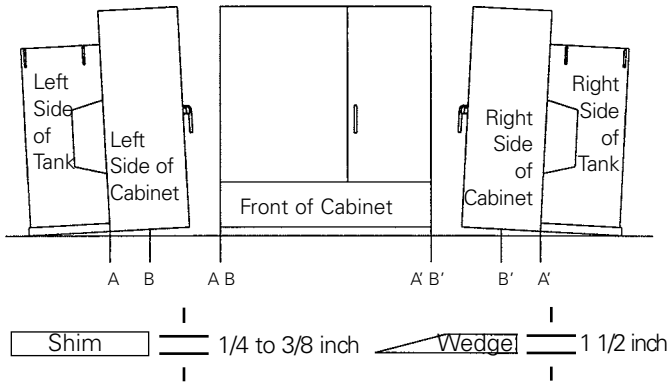

Figure 29. Cabinet Removal Diagram.

1. Verify that tank is grounded. De-energize transformer from a remote upstream source. Ground all bushings and terminals before performing maintenance on cabinet.
2. Place one 1/4 to 3/8 inch shim directly below faceplate on both sides of tank at points A and A' (see Figure 29).
3. Place one 1 1/2 inch wedge under each side of cabinet at points B and B' to relieve strain on the cabinet.
4. Note position and orientation of gasket that is between top of cabinet and tank so it can be re-installed in same fashion.
5. Disconnect HV-LV barrier from vertical bracket of faceplate.

6. Remove hardware attaching cabinet to faceplate on left and right sides of faceplate. Note position of all nuts, flat washers, spring washers, etc., so they can be re-installed in same locations.
7. Fully close HV and LV doors.
8. Slide cabinet assembly away from tank.

Cabinet installation

Reverse removal procedure to re-install cabinet. Re-attach cabinet using shims under front of tank and wedges under sides of cabinet, making sure cabinet gasket is inserted into cabinet back channel prior to attaching cabinet. Tighten cabinet hardware to 20 ft-lbs. torque.

Insulating liquid maintenance

Transformer tanks are factory-sealed to prevent ingress of ambient air and moisture. Do not open under any precipitation conditions.

If it is necessary to drain and refill the transformer, special care should be taken to avoid the entrapment of gas bubbles in the system. Gas bubbles have lower dielectric integrity than the insulating liquid and will degrade the performance characteristics of the insulating system.

Conventional oil-filled transformers

Refer to IEEE Std C57.106™-2002 standard, "Guide For Acceptance and Maintenance of Insulating Oil in Equipment", for additional guidelines when testing and handling conventional transformer oil. Periodic maintenance tests should be performed.

R-Tran™ transformers

R-Tran™ transformers are filled with R-Temp fluid. R-Temp fluid is a non-toxic, readily biodegradable, less-flammable (high fire point), high molecular weight hydrocarbon dielectric fluid.

Refer to IEEE Std C57.121™-1998 standard, "Guide for Acceptance and Maintenance of Less Flammable Hydrocarbon Fluids in Transformers." Periodic maintenance tests should be performed on the same schedule as would be used for transformers of similar application filled with conventional transformer oil.

Contact your Eaton's Cooper Power Systems representative for additional handling guidelines for R-Temp fluid.

Mixtures of R-Temp fluid and conventional transformer oil

R-Temp fluid is fully miscible with conventional transformer oil. There is no known detrimental performance impact when R-Temp fluid is mixed with conventional transformer oil. Conversely, except for some reduction in flash and fire points, the same is true for conventional transformer oil mixed with R-Temp fluid. Conventional transformer oil content of >3% in R-Temp fluid lowers the fire point below 300 °C. Measure the ASTM flash and fire points if the presence of conventional transformer oil is suspected. If flash or fire points fall below the minimum values required, retrofilling may be required.

Envirotran™ transformers

Envirotran™ transformers are filled with Envirotemp™ FR3™ fluid. Envirotemp™ FR3™ fluid is a less-flammable (high fire point) dielectric fluid based on edible seed oils.

Periodic maintenance should be performed on the same schedule as would be used for transformers of similar application filled with conventional transformer oil. Basic recommended tests for Envirotemp™ FR3™ fluid are dielectric strength, moisture content, and flash and fire points.

Envirotran transformer tanks are shipped from the factory with a dry nitrogen-filled headspace. Internal pressure should not be equalized with atmosphere by manually opening the pressure relief valve device unless access to Bay-O-Net fuses or other internal tank components is required.

If internal service is required

If the tank cover or manhole/handhole must be removed for internal service, exposure time to ambient air should be minimized. Avoid exposure times greater than 24 hours. Immediately after service is completed, replace the cover or manhole/handhole. The tank headspace must then be purged and recharged with dry nitrogen. Envirotran transformers are equipped with two 1/4" fill valves on the upper left and upper right corners of the face plate and are intended for the recharging process. The following steps should be followed when purging and recharging Envirotran transformers:

1. Verify that tank is grounded. De-energize transformer from a remote upstream source. Ground all bushings and terminals.
2. Release internal pressure by operating pressure relief device.
3. Fill headspace with dry nitrogen through one of the 1/4" fill valves to a pressure of 2-3 psig.
4. Release internal pressure by operating pressure relief device.
5. Refill headspace with dry nitrogen through one of the 1/4" fill valves to a pressure of 2-3 psig. Internal pressure must be maintained for at least four hours prior to transformer energization to verify seal integrity.

Bay-O-Net fuse replacement

When replacing fuses in Flapper™ style Bay-O-Net fuse assembles, refer to Bay-O-Net Fuse Re-Fusing Instructions in this manual. Follow the same procedure as with conventional oil-filled transformers.

Operation

Transformers from Eaton's Cooper Power Systems are designed to operate at rated load with a temperature rise equal to or less than the temperature rise printed on the transformer's nameplate. Operating transformers in excess of IEEE Std C57.91™-2011 standard will result in accelerated loss of insulation system life. The coil insulation has been carefully made with thermally-upgraded materials to ensure long life at rated loads. Severe and prolonged overloads of mineral oil-filled transformers will result in overheating and accelerated aging of the insulation, which may lead to premature failure®. PEAK™ transformers have extended life and can be operated at overload conditions while still exceeding ANSI standard insulation life.

Mixtures of Envirotemp™ FR3™ fluid and conventional transformer oil

Envirotemp™ FR3™ fluid is fully miscible with conventional transformer oil. There is no known detrimental performance impact when Envirotemp™ FR3™ fluid is mixed with conventional transformer oil. Conversely, except for some reduction in flash and fire points, the same is true for conventional transformer oil mixed with Envirotemp™ FR3™ fluid. Conventional transformer oil content of >7% in Envirotemp™ FR3™ fluid lowers the fire point below 300 °C. Measure the ASTM flash and fire points if the presence of conventional transformer oil is suspected. If flash or fire points fall below the minimum values required, retrofilling may be required. To maintain its exceptional environmental classification, mixing of Envirotemp™ FR3™ dielectric coolant with any other fluids should be avoided.

Contact your Eaton's Cooper Power Systems representative for additional handling guidelines for Envirotemp™ FR3™ fluid.

Sampling insulating liquid

Before sampling the insulating liquid, verify that the tank is grounded. De-energize the transformer from a remote upstream source. Ground the bushings and terminals.

Refer to ASTM D923 "Standard Practices for Sampling Electrical Insulating Liquids" for sampling techniques.

A sample of the liquid should be taken when the liquid temperature is equal to or greater than the surrounding air to avoid condensation of moisture on the liquid.

Containers used for sampling liquid should be clean and dry large mouth glass bottles. Make sure that the liquid being sampled is representative of the liquid in the unit. Sufficient liquid must first be drawn off to ensure that the sample will be from the bottom of the tank, and not the liquid stored in the sampling pipe

Testing insulating liquid

For the dielectric strength of the insulating liquids, follow the technique as specified by ASTM D877, "Standard Test Method for Dielectric Breakdown Voltage of Insulating Liquids Using Disk Electrodes".

If the dielectric strength of the liquid drops below 26 kV, it should be filtered until it tests at 26 kV or better.

Filtering insulating liquid

Conventional transformer oil, R-Temp, or Envirotemp™ FR3™ fluids can be filtered by means of a filter press. The filter press is effective for removing all types of foreign matter, including finely divided carbon and small amounts of moisture. The purifier equipment consists of a specifically proportioned filter press, a positive volume gear pump, driving motor, combined drip pan and mixing tank, necessary piping, valves, strainer, gauges and drying oven. Follow manufacturer's instructions for purifier equipment operation.

Filtration should be continued until the dielectric test of the insulating liquid is 26 kV or better.

When filtering R-Temp or Envirotemp™ FR3™ fluid, the filtering equipment must be free of contaminants and other liquids. The presence of other liquids may alter the physical and electrical characteristics of R-Temp or Envirotemp™ FR3™ fluid. This could result in a reduction of fire point.

Lowering insulating liquid level

1. Verify that tank is grounded. De-energize transformer from a remote upstream source. Ground all bushings and terminals.
2. If cover removal is required, remove cover as outlined in Tank Cover Removal and Installation section of this manual.
3. Prepare a clean, dry storage container to receive liquid.
4. Use pumps and hoses that have not been contaminated by contact with dissimilar liquids. Use a metal or non-rubber hose. Oil dissolves the sulfur found in rubber and will prove harmful to conductor material.
5. Attach pump intake line to drain valve on transformer tank.
6. Place output line nozzle on bottom of storage container. Do not permit liquid to splash into receiving container. Splashing will introduce air and moisture into liquid.
7. Do not lower liquid below top of core clamp unless absolutely necessary. Exposing coils may allow moisture to contaminate coil insulation.

Restoring insulating liquid level

If it is necessary to drain and refill the transformer, special care should be taken to avoid the entrapment of gas bubbles in the system. Sufficient time should be allowed

CAUTION

It may be necessary to add extra liquid to the storage container from a reserve supply to replace the small quantity lost in the pump and lines and to prevent aeration of replacement liquid.

between refilling and energization of the transformer to be sure that any gas bubbles created during the process have been dissipated.

1. Pump from bottom of temporary storage tank. Do not permit intake line to draw in air, since air bubbles will lower dielectric integrity of insulating system.
2. To prevent aeration at hose output, locate hose output below liquid surface
3. Pump slowly. If tank cover is not attached to tank, fill transformer to fill line marked on inside of transformer faceplate. If the tank cover is attached to tank, liquid level gauge may be read directly. On transformers that are not gauge-equipped, liquid level should be filled to bottom edge of liquid level plug hole (see Figure 3).

Applicable standards

1. ASTM D92, "Standard Test Method for Flash and Fire Points by Cleveland Open Cup."
2. ASTM D877, "Standard Test Method for Dielectric Breakdown Voltage of Insulating Liquids Using Disk Electrodes."
3. ASTM D923, "Standard Practices for Sampling Electrical Insulating Liquids."
4. IEEE Std C57.106™-2002 standard, "Guide For Acceptance and Maintenance of Insulating Oil in Equipment."
5. IEEE Std C57.121™-1998 standard, "Guide for Acceptance and Maintenance of Less Flammable Hydrocarbon Fluids in Transformers."

Spare parts and service

We suggest that one spare set of gaskets for manhole/handhole and any gasket-type bushings be kept on hand. Other renewal parts may be ordered through your Eaton's Cooper Power Systems representative. When ordering parts, describe to your Eaton's Cooper Power Systems representative the maintenance being performed or the problem experienced. Also, tell the Eaton's Cooper Power Systems representative the complete transformer catalog number and serial number listed on the transformer nameplate.

Three-phase pad-mounted compartmental type transformer

General

At Eaton's Cooper Power Systems, we are constantly striving to introduce new innovations to the transformer industry, bringing you the highest quality, most reliable transformers. Eaton's Cooper Power Systems Transformer Products are ISO 9001 compliant, emphasizing process improvement in all phases of design, manufacture, and testing. In order to drive this innovation, we have invested both time and money in the Thomas A. Edison Technical Center, our premier research facility in Franksville, Wisconsin. Headquarters for the Systems Engineering Group of Eaton's Cooper Power Systems, such revolutionary products as distribution-class UltraSIL™ Polymer-Housed Evolution™ surge arresters and Envirotemp™ FR3™ fluid have been developed at our Franksville lab.

With transformer sizes ranging from 45 kVA to 12 MVA and high voltages ranging from 2400 V to 46 kV, Eaton's Cooper Power Systems has you covered. From fabrication of the tanks and cabinets to winding of the cores and coils, to production of arresters, switches, tap changers, expulsion fuses, current limit fuses, bushings (live and dead) and molded rubber goods, Eaton's Cooper Power Systems does it all. Eaton's Cooper Power Systems transformers are available with electrical grade mineral oil or Envirotemp™ FR3™ fluid, a less-flammable and bio-degradable fluid. Electrical codes recognize the advantages of using Envirotemp™ FR3™ fluid both indoors and outdoors for fire sensitive applications. The bio-based fluid meets Occupational Safety and Health Administration (OSHA) and Section 450.23 NEC Requirements.

Standard features

Connections and neutral configurations

- Delta - Wye: Low voltage neutral shall be a fully insulated X0 bushing with removable ground strap.
- Grounded Wye-Wye: High voltage neutral shall be internally tied to the low voltage neutral and brought out as the H0X0 bushing in the secondary compartment with a removable ground strap.
- Delta-Delta: Transformer shall be provided without a neutral bushing.
- Wye-Wye: High voltage neutral shall be brought out as the H0 bushing in the primary compartment and the low voltage neutral shall be brought as the X0- bushing in the secondary compartment.
- Wye-Delta: High voltage neutral shall be brought out as the H0 bushing in the primary compartment. No ground strap shall be provided (line to line rated fusing is required).

High and low voltage bushings

- 200 A bushing wells (15, 25, and 35 kV)
- 200 A, 35 kV Large Interface
- 600 A (15, 25, and 35 kV) Integral bushings (dead-front)
- Electrical-grade wet-process porcelain bushings (live-front)

Tank/cabinet features

- Bolted cover for tank access (45-1750 kVA)
- Welded cover with hand hole (2000-12,000 kVA)
- Three-point latching door for security
- Removable sill for easy installation
- Lifting lugs (4)
- Stainless steel cabinet hinges and mounting studs
- Steel divider between HV and LV compartment
- 20" Deep cabinet (45-1000 kVA)
- 24" Deep cabinet (1500-7500 kVA)
- 30" Deep cabinet (34.5/19.92 kV)
- Pentahead captive bolt
- Stainless steel 1-hole ground pads (45-500 kVA)
- Stainless steel 2-hole ground pads (750-10,000 kVA)
- Parking Stands

Valves/plugs

- One-inch upper filling plug
- One-inch drain plug (45-500 kVA)
- One-inch combination drain valve with sampling device in low voltage compartment (750-12,000 kVA)
- Automatic pressure relief valve

Nameplate

- Laser-scribed anodized aluminum nameplate

Figure 3. Drain valve with sampler.

Figure 4. Automatic Pressure relief valve.

Figure 5. Liquid level gauge.

Figure 6. External Gauges.

Figure 7. External visible break with gauges.

Optional features

High and low voltage bushings

- 200 A (15, 25 kV) bushing inserts
- 200 A (15, 25 kV) feed thru inserts
- 200 A (15, 25 kV) (HTN) bushing wells with removable studs
- High-voltage 600 A (15, 25, 35 kV) deadbreak one-piece bushings
- Low voltage 6-, 8-holes spade
- Low voltage 12-, 16-, 20-holes spade (750-2500 kVA)
- Low voltage bushing supports

Tank/cabinet features

- Stainless steel tank base and cabinet
- Stainless steel tank base, cabinet sides and sill
- 100% stainless steel unit
- Service entrance (2 inch) in sill or cabinet side
- Touch-up paint (domestic)
- Copper ground bus bar
- Kirk-Key provisions
- Nitrogen blanket
- Bus duct cutout

Special designs

- Factory Mutual (FM)
- UL® Classified
- Triplex
- High altitude
- K-Factors
- Step-up
- Critical application
- Modulation transformers
- Seismic applications (including OSHPD)

Switches

- One, two, or three On/Off loadbreak switches
- 4-position loadbreak V-blade switch or T-blade switch
- Delta-wye switch
- 3-position V-Blade selector switch
- 100 A, 150 A, 300 A tap changers
- Dual voltage switch
- Visible break with VFI interrupter interlock
- External visible break (15, 25, and 35 kV, up to 3 MVA)
- External visible break with gauges (15, 25, and 35 kV, up to 3 MVA)

Gauges and devices

- Liquid level gauge (optional contacts)
- Pressure vacuum gauge (optional contacts and bleeder)
- Dial-type thermometer (optional alarm contacts)
- Cover mounted pressure relief device
- Ground connectors
- Hexhead captive bolt
- Breaker mounting provisions
- External gauges in padlockable box

Overcurrent protection

- Bay-O-Net fusing (Current sensing, dual sensing, dual element, high amperage overload)
- Bay-O-Net expulsion fuse in series with a partial range under-oil ELSP current limiting fuse (below 23 kV)
- Cartridge fusing in series with a partial range under-oil ELSP current limiting fuse (above 23 kV)
- MagneX™ interrupter with ELSP current-limiting fuse
- Vacuum Fault Interrupter (VFI)
- Visible break window
- Fuse/switch interlock

Valves/plugs

- Drain/sampling valve in high-voltage compartment
- Globe type upper fill valve

Overvoltage protection

- Distribution-, intermediate-, or station-class surge arresters
- Elbow arresters (for dead-front connections)

Metering/fan/control

- Full metering package
- Current Transformers (CTs)
- Metering Socket
- NEMA® 4 control box (optional stainless steel)
- NEMA® 7 control box (explosion proof)
- Fan Packages

Testing

- Customer test witness
- Customer final inspection
- Zero Sequence Impedance Test
- Heat Run Test
- ANSI® Impulse Test
- Audible Sound Level Test
- RIV (Corona) Test
- Dissolved Gas Analysis (DGA) Test
- 8- or 24-Hour Leak Test

Coatings (paint)

- ANSI® Bell Green
- ANSI® #61 Light Gray
- ANSI® #70 Sky Gray
- Special paint available per request

Nameplate

- Stainless steel nameplate

Decals and labels

- High voltage warning signs
- Mr. Ouch
- Bi-lingual warning
- DOE compliant
- Customer stock code
- Customer stenciling
- Shock and arc flash warning decal
- Non-PCB decal

Construction

Core

The three-legged, step-lap mitered core construction is manufactured using a high-quality cutting machine. For maximum efficiency, cores are precisely stacked, virtually eliminating gaps in the corner joints.

Five-legged wound core or shell-type triplex designs are used for wye-wye connected transformers, and other special transformer designs.

Cores are manufactured with precision cut, burr-free, grain-oriented silicon steel. Many grades of core steel are available for optimizing core loss efficiency.

Coils

Pad-mounted transformers feature a rectangular coil configuration with wire-wound, high-voltage primaries and sheet-wound secondaries. The design minimizes axial stress developed by short circuits and provides for magnetic balancing of tap connections.

Coils are wound using the highest quality winding machines providing exacting tension control and conductor placement for superior short-circuit strength and maximum efficiency.

Extra mechanical strength is provided by diamond pattern, epoxy-coated paper insulation, used throughout the coil, with additional epoxy at heavy stress points. The diamond pattern distribution of the epoxy and carefully arranged ducts, provide a network of passages through which cooling fluid can freely circulate.

Coil assemblies are heat-cured under calculated hydraulic pressure to ensure performance against short-circuit forces.

Core and coil assemblies

Pad-mounted transformer core and coil assemblies are braced with heavy steel ends to prevent the rectangular coil from distorting under short-circuit conditions. Plates are clamped in place using presses, and welded or bolted to form a solid core and coil assembly. Core and coil assemblies exceed ANSI® and IEEE® requirements for short-circuit performance. Due to the rigidity of the design, impedance shift after short-circuit is comparable to that of circular wound assemblies.

Tanks

Transformer tanks are designed for high strength and ease of handling, installation, and maintenance. Tanks are welded using precision-cut, hot rolled, pickled and oiled steel. They are sealed to protect the insulating fluid and other internal components.

Transformer tanks are pressure-tested to withstand 7 psig without permanent distortion and 15 psig without rupture.

Tank finish

An advanced multi-stage finishing process exceeds IEEE Std C57.12.28™-2005 standards. The eight-stage pre-treatment process assures coating adhesion and retards corrosion. It converts tank surfaces to a nonmetallic, water insoluble iron phosphate coating.

The paint method consists of two distinct layers of paint. The first is an epoxy primer (E-coat) layer which provides a barrier against moisture, salt and corrosives. The two-component urethane final coat seals and adds ultraviolet protection.

Vacuum processing

Transformers are dried and filled with filtered insulating fluid under vacuum, while secondary windings are energized. Coils are heated to drive out moisture, ensuring maximum penetration of fluid into the coil insulation system.

Insulating fluid

Transformers from Eaton's Cooper Power Systems are available with electrical-grade mineral insulating oil or Envirotemp™ FR3™ fluid. The highly refined fluids are tested and degassed to assure a chemically inert product with minimal acid ions. Special additives minimize oxygen absorption and inhibit oxidation. To ensure high dielectric strength, the fluid is re-tested for dryness and dielectric strength, refiltered, heated, dried, and stored under vacuum before being added to the completed transformer.

Eaton's Cooper Power Systems transformers filled with Envirotemp™ FR3™ fluid enjoy unique fire safety, environmental, electrical, and chemical advantages, including insulation life extending properties.

A bio-based, sustainable, natural ester dielectric coolant, Envirotemp™ FR3™ fluid quickly and thoroughly biodegrades in the environment and is non-toxic per acute aquatic and oral toxicity tests.

Building for Environmental and Economic Sustainability (BEES) total life cycle assessment software, utilized by the US Dept. of Commerce, reports its overall environmental performance impact score at 1/4th that reported for mineral oil. Envirotemp™ FR3™ fluid has also earned the EPA Environmental Technology Verification of transformer materials.

With a fire point of 360 °C, Envirotemp™ FR3™ fluid is FM Approved® and Underwriters Laboratories (UL®) Classified "Less-Flammable" per NEC® Article 450-23, fitting the definition of a Listed Product per NEC®.

Figure 8. VFI transformer with visible break.

Pad-mounted VFI transformer

The VFI transformer combines a conventional distribution transformer from Eaton's Cooper Power Systems with the proven Vacuum Fault Interrupter (VFI). This combination provides both voltage transformation and transformer over current protection in one space saving and money saving package. The pad-mounted VFI transformer protects the transformer and provides proper coordination with upstream protective devices. When a transformer fault or overload condition occurs, the VFI breaker trips and isolates the transformer.

The three-phase VFI breaker has independent single-phase initiation, but is three-phase mechanically gang-tripped. A trip signal on any phase will open all three phases. This feature eliminates single-phasing of three phase loads. It also enables the VFI breaker to be used as a three-phase load break switch.

Due to the resettable characteristics of the VFI breaker, restoring three-phase service is faster and easier.

The sealed visible break window and switch is an option that can be installed to provide visible break contact. This feature provides enhanced safety and allows an operator to see if the loadbreak switch contacts are in an open or closed position before performing maintenance.

Envirotran™ FM Approved special protection transformer

The Envirotran™ transformer from Eaton's Cooper Power Systems is FM Approved and suitable for indoor locations. Factory Mutual Research Corporation's (FMRC) approval of the Envirotran transformer line makes it easy to comply with and verify compliance with Section 450.23, 2008 NEC, Less-Flammable Liquid-Filled Transformer Requirements for both indoor and outdoor locations.

Envirotran FM Approved transformers offer the user the benefit of a transformer that can be easily specified to comply with NEC, and makes FM Safety Data Sheet compliance simpler, while also providing maximum safety and flexibility for both indoor and outdoor installations.

Because the "FM Approved" logo is readily visible on the transformer and its nameplate, NEC compliance is now easily verifiable by the inspector.

Envirotran FM Approved transformers are manufactured under strict compliance with FMRC Standard 3990 and are filled with FM Approved Envirotemp™ FR3™ fluid, a fire-resistant dielectric coolant.

FM APPROVED

Special application transformers

Data Center transformer

With focus rapidly shifting from simply maximizing uptime and supporting demand to improving energy utilization, the data center industry is continually looking for methods to increase its energy efficiency and reliability. Utilizing cutting edge technology, Eaton's Cooper Power Systems Hardened Data Center (HDC) transformers are the solution. Designed with special attention given to surge protection, HDC liquid-filled transformers provide superior performance under the harshest electrical environments. Contrary to traditional dry-type units, HDC transformers provide unsurpassed reliability, overloadability, operational life, efficiency, thermal loading and installed footprint. These Eaton's Cooper Power Systems units have reliably served more than 100 MW of critical data center capacity for a total of more than 6,000,000 hours without any reported downtime caused by a thermal or short-circuit coil failure.

The top priority in data center operations is uninterrupted service. Envirotran HDC transformers from Eaton's Cooper Power Systems, having substantially higher levels of insulation, are less susceptible to voltage surges. Eaton's Cooper Power Systems has experienced zero failures due to switching transients. The ANSI® and IEEE® standard impulse withstand ratings are higher for liquid-filled transformers, making them less susceptible to insulation failure. The Envirotran HDC transformer provides ultimate protection by increasing the BIL rating one level higher than standard liquid-filled transformer ratings. The cooling system of liquid-filled transformers provides better protection from severe overloads—overloads that can lead to significant loss of life or failure.

Data center design typically includes multiple layers of redundancy, ensuring maximum uptime for the critical IT load. When best in class transformer manufacturing lead times are typically weeks, not days, an unexpected transformer failure will adversely affect the facility's reliability and profitability. Therefore, the ability to determine the electrical and mechanical health of a transformer can reduce the probability of costly, unplanned downtime. Routine diagnostic tests, including key fluid properties and dissolved gas analysis (DGA), can help determine the health of a liquid-filled transformer. Although sampling is not required for safe operation, it will provide the user with valuable information, leading to scheduled repair or replacement, and minimizing the duration and expense of an outage. With a dry-type transformer, there is no reliable way to measure the health or likelihood of an impending failure.

Solar transformer

As a result of the increasing number of states that are adopting aggressive Renewable & Alternative Energy Portfolio Standards, the solar energy market is growing—nearly doubling year over year. Eaton's Cooper Power Systems, a key innovator and supplier in this expanding market, is proud to offer Envirotran transformers specifically designed for Solar Photovoltaic medium-voltage applications. Eaton's Cooper Power Systems is working with top solar photovoltaic developers, integrators and inverter manufacturers to evolve the industry and change the way we distribute power.

In accordance with this progressive stance, every Eaton's Cooper Power Systems Envirotran Solar transformer is filled with non-toxic, biodegradable Envirotemp™ FR3™ dielectric fluid, made from renewable seed oils. On top of its biodegradability, Envirotemp™ FR3™ fluid substantially extends the life of the transformer insulation, saving valuable resources. What better way to distribute green power than to use a green transformer. In fact, delaying conversion to Envirotran transformers places the burden of today's environmental issues onto tomorrow's generations. Eaton's Cooper Power Systems can help you create a customized transformer, based on site specific characteristics including: temperature profile, site altitude, solar profile and required system life. Some of the benefits gained from this custom rating include:

- Reduction in core losses
- Improved payback on investment
- Reduction in footprint
- Improved fire safety
- Reduced environmental impact

For the solar photovoltaic industry, Eaton's Cooper Power Systems is offering standard step up transformers and dual secondary designs, including 4-winding, 3-winding (Low-High-Low) and 3-winding (Low-Low-High) designs.

Wind transformer

Eaton's Cooper Power Systems is offering custom designs for renewable energy power generation. Eaton's Cooper Power Systems manufactures Generator Step-Up (GSU) transformers for installation at the base of every wind turbine. Additionally, grounding transformers are available for wind power generation.

DOE efficiency

The United States Department of Energy (DOE) has mandated efficiency values for most liquid type, medium voltage transformers. As a result, all applicable Eaton's Cooper Power Systems transformers are designed to meet or exceed the standard efficiency values per DOE 2010; Final Ruling, 10 CFR Part 431.

Underwriters Laboratories® (UL®) Listed and Labeled/ Classified

The Envirotran transformer from Eaton's Cooper Power Systems can be specified as UL® Listed & Labeled, and/or UL® Classified. Underwriters Laboratories (UL®) listing is a verification of the design and construction of the transformer to the ANSI® and IEEE® standards. UL® listing generally is the most efficient, cost-effective solution for complying with relevant state and local electrical codes. UL® Combination Classification/Listing is another way in which to comply with Section 450.23, 2008 NEC® requirements. This combines the UL® listed transformer with a UL® Classified Less-Flammable Liquid and complies with the use restrictions found within the liquid Classification.

c UL US LISTED

K-Factor transformer

With a drastic increase in the use of ferromagnetic devices, arcing devices, and electric power converters, higher frequency loads have increased significantly. This harmonic loading has the potential to generate higher heat levels within a transformer's windings and leads by as much as 300%. Harmonic loading has the potential to induce premature failure in standard-design distribution transformers.

In addition to standard UL® "K-Factor" ratings, transformers can be designed to customer-provided specifications detailing precise loading scenarios. Onsite measurements of magnitude and frequency, alongside harmonic analysis of the connected load can be performed by Eaton's Cooper Power Systems engineers or a third party consultant. These field measurements are used to determine exact customer needs and outline the transformer specifications.

Eaton's Cooper Power Systems will design harmonic-resistant transformers that will be subjected to the unique harmonic loads. These units are designed to maintain normal temperature rise under harmonic, full-load conditions. Standard UL® "K-Factor" designs can result in unnecessary costs when the "next-highest" K-Factor must be selected for a calculated design factor. To save the customer these unnecessary costs, Eaton's Cooper Power Systems can design the transformer to the specific harmonic spectrum used in the application. K-factor transformers from Eaton's Cooper Power Systems are filled with mineral oil or Envirotemp™ FR3™ fluid and enjoy the added benefits of dielectric cooling such as higher efficiencies than dry-type transformers.

Modulation transformer

Bundled with an Outboard Modulation Unit (OMU) and a Control and Receiving Unit (CRU), a Modulation Transformer Unit (MTU) is designed to remotely achieve two way communication.

The use of an MTU reduces travel time and expense versus traditional meter reading performed by high voltage electricians. Additionally, with MTU it is possible to manage and evaluate energy consumption data, providing reduced metering costs and fewer tenant complaints.

An MTU utilizes existing utility infrastructure, therefore eliminating the need to engineer and construct a dedicated communication network.

Figure 9. Modular transformer.

Inverter/rectifier bridge

Eaton's Cooper Power Systems complements its range of applications for transformers by offering dual winding designs. These designs are intended for connection to 12-pulse rectifier bridges.

Product attributes

To set us apart from other transformer manufactures, Eaton's Cooper Power Systems includes the following guarantees with every three-phase pad-mounted transformer.

Engineered to order (ETO)

Providing the customer with a well developed, cost-effective solution is the number one priority at Eaton's Cooper Power Systems. Using customer specifications, Eaton's Cooper Power Systems will work with the customer from the beginning to the end to develop a solution to fit their needs. Whether it is application specific, site specific, or a uniquely specified unit, Eaton's Cooper Power Systems will provide transformers with the best in class value and performance, saving the customer time and money.

Made in the U.S.A.

Eaton's Cooper Power Systems three-phase pad-mounted transformers are produced right here in the United States of America. Our manufacturing facilities are positioned strategically for rapid shipment of products. Furthermore, should the need arise, Eaton's Cooper Power Systems has a broad network of authorized service repair shops throughout the United States.

Superior paint performance

Protecting transformers from nature's elements worldwide, Eaton's Cooper Power Systems E-coat system provides unrivaled transformer paint life, and exceeds IEEE Std C57.12.28™-2005 and IEEE Std C57.12.29™-2005 standards. In addition to the outside of the unit, each transformer receives a gray E-coat covering in the interior of the tank and cabinet, providing superior rust resistance and greater visibility during service.

If the wide range of standard paint selections does not suit the customer's needs, Eaton's Cooper Power Systems will customize the paint color to meet their requirements.

Rectangular coil design

Eaton's Cooper Power Systems utilizes a rectangular coil design. This winding technique results in a smaller overall unit footprint as well as reducing the transformer weight. The smaller unit size does not hinder the transformer performance in the least. Units have proven short circuit withstand capabilities up to 12 MVA.

Testing

Eaton's Cooper Power Systems performs routing testing on each transformer manufactured including the following tests:

- Insulation Power Factor: This test verifies that vacuum processing has thoroughly dried the insulation system to required limits.
- Ratio, Polarity, and Phase Relation: Assures correct winding ratios and tap voltages; checks insulation of HV and LV circuits. Checks entire insulation system to verify all live-to-ground clearances.
- Resistance: This test verifies the integrity of internal high-voltage and low-voltage connections; provides data for loss upgrade calculations.
- Applied Potential: Applied to both high-voltage and low-voltage windings, this test stresses the entire insulation system to verify all live-to-ground clearances.
- Induced Potential: 3.46 times normal plus 1000 volts for reduced neutral designs.
- Loss Test: These design verification tests are conducted to assure that guaranteed loss values are met and that test values are within design tolerances. Tests include no-load loss and excitation

current along with impedance voltage and load loss.

- Leak Test: Pressurizing the tank to 7 psig assures a complete seal, with no weld or gasket leaks, to eliminate the possibility of moisture infiltration or fluid oxidation.

Design performance tests

The design performance tests include the following:

- Temperature Rise: Our automated heat run facility ensures that any design changes meet ANSI® and IEEE® temperature rise criteria.
- Audible Sound Level: Ensures compliance with NEMA® requirements.
- Lightning Impulse: To assure superior dielectric performance, this test consists of one reduced wave, two chopped waves and one full wave in sequence, precisely simulating the harshest conditions.

Thomas A Edison Research and Test Facility

We are constantly striving to introduce new innovations to the transformer industry, bringing you the highest quality transformer for the lowest cost. Eaton's Cooper Power Systems Transformer Products are ISO 9001 compliant, emphasizing process improvement in all phases of design, manufacture, and testing. We have invested millions of dollars in the Thomas A. Edison Technical Center, our premier research facility in Franksville, Wisconsin affirming our dedication to introducing new innovations and technologies to the transformer industry. Headquarters for the Systems Engineering group of Eaton's Cooper Power Systems, this research facility is fully available for use by our customers to utilize our advanced electrical and chemical testing labs.

1. Introduction

This document provides user instructions to operate and maintain the Capstone Turbine Corporation Model C30 Microturbine. This document is intended for user personnel who may not have specific training on the Microturbine. Capstone Authorized Service Providers (ASPs) have received rigorous training and have been certified to perform commissioning, troubleshooting, and repair of the microturbine. This document reflects C30 microturbine software version 5.30 and higher for gaseous fuel, and version 5.16 and higher for liquid fuel. This software version adds power factor adjustment capability and VDE compliance for grid connect operation.

Basic troubleshooting is included in this manual, but only Capstone Authorized Service Providers are permitted to perform detailed troubleshooting and repair of the equipment. For detailed technical data, or for service to the microturbine, contact your Capstone Authorized Service Provider.

User personnel who have not received certification of satisfactory completion of the Authorized Service Provider training should not attempt any procedures other than those specifically described in this document.

1.1. Safety Information

This section presents safety information for the user of Capstone Turbine Corporation microturbines. The user must read and understand this manual before operation of the equipment. Failure to obey all safety precautions and general instructions may cause personal injury and/or damage to the equipment.

The Capstone microturbine is an advanced power generation system with user and material safety foremost in mind. Fail-safe operation includes mechanical systems, electrical systems, and engine control software.

It is the user's responsibility to read and obey all safety procedures and to become familiar with these procedures and how to safely operate this equipment.

1.1.1. Symbols

There are three very important symbols used in this document: Warnings, Cautions, and Notes. WARNINGs and CAUTIONs alert you to situations and procedures that can be dangerous to people and/or cause equipment damage. NOTEs provide additional information relating to a specific operation or task.

	ELECTRICAL WARNING: Identifies an electrical hazard that can result in personal injury or death.
	WARNING: Identifies a hazard that can result in personal injury or death.
	CAUTION: Alerts you to a hazard that can result in equipment damage.
	NOTE: Clarifies instructions or highlights important information.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

1.1.2. General Precautions

The following general precautions must be observed and followed at all times. Failure to do so may result in personal injury and/or equipment damage.

	NOTE: Some of the following precautions do not directly apply to users, but it is important for users to be aware of them.

- Only Capstone Authorized Service Providers are permitted access to the inside of the enclosure.
- Read and understand the User's Manual before operating the equipment.
- Read and obey all warnings and cautions.
- Make sure all fuel connections are tight, free from leaks, and protected from damage.
- Make sure all electrical connections are tight, clean, dry, and protected from weather and damage.
- The microturbine may be equipped with a heat recovery system. Use caution around relief valves where hot water and steam may be present.
- A pressurized enclosure (e.g., hazardous location package) should not be opened: 1) Unless the area is known to be free of flammable materials; 2) All devices have been de-energized from the utility. Power should not be restored until the enclosure has been purged for three minutes.
- Use hearing protection when you work on or near an operating microturbine for extended time periods.
- The microturbine is heavy. Be careful when you move or lift the microturbine.
- Keep the equipment clean.
- Keep all flammable materials away from the microturbine and its components.
- Do not operate or work on the equipment if mentally or physically impaired, or after consumption of alcohol or drugs.
- Make sure all fasteners are installed and properly tightened.
- Keep an ABC rated fire extinguisher near the microturbine.
- Obey all applicable local, state, and national codes and regulations.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

1.1.3. Electrical Precautions

	ELECTRICAL WARNING: The microturbine system contains and produces high voltage. High voltage can injure or kill. Obey all safety procedures when you work around electrical equipment.

	ELECTRICAL WARNING: Make sure the system is off and the dedicated disconnect switch is in the open position and is locked. This will help prevent injury and damage to the equipment.

	NOTE: Some of the following precautions do not directly apply to users, but it is important for users to be aware of them.

The output voltage and residual capacitor voltage of this equipment is dangerous. Use caution when you work on electrical equipment. The microturbine system can include multiple sources of power. Make sure to turn off the system and lock out all sources of power prior to doing any work on the equipment.

- Command the microturbine system to OFF.
- Open and lock the dedicated disconnect switch to isolate the microturbine from the electric utility grid or loads.
- If the microturbine is equipped with battery packs (i.e., if the microturbine includes the Stand Alone Option), open the battery isolation switches and unplug the battery cables.
- Wait five (5) minutes for any capacitive stored voltage to dissipate.
- Always disconnect all power sources.
- Use a voltmeter to make sure that all circuits are de-energized.
- All output connections must be made in accordance with applicable codes.

1.1.4. Fuel Precautions

	WARNING: Microturbine fuel is flammable and explosive. An explosion can cause death or injury to personnel and/or damage to equipment. No open flame or smoking is allowed near the microturbine.

	WARNING: Gaseous fuels can be corrosive. Concentrations of Hydrogen Sulfide (H_2S) can be found in Sour Natural Gas and Sour High Btu Gas. Injury to personnel and/or damage to equipment can occur. Minimize exposure to gaseous fuels and provide satisfactory fresh airflow when you are around equipment.

The Capstone microturbine operates on approved gaseous fuels. Keep flames, sparks, pilot lights, equipment that produces electrical arcs, switches or tools, and all other sources of ignition away from areas where fuel and fumes are present. If there is a fire, use a multi-purpose dry chemical or CO_2 fire extinguisher, and contact the appropriate fire officials.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

Fuel lines must be secure and free of leaks. Fuel lines must also be separated or shielded from electrical wiring. If you smell fuel fumes, immediately stop operation of the equipment, close the fuel isolation valve, and locate and repair the source of the leak or call a qualified professional.

Make sure to isolate the fuel supply prior to doing any work on the equipment.

- Command the microturbine system to OFF.
- Isolate the fuel supply.

1.1.5. Exhaust Precautions

	WARNING: The microturbine exhaust contains nitrogen dioxide and carbon monoxide, which are poisonous at high concentrations. Make sure there is satisfactory fresh airflow when you work around the equipment.

	WARNING: The exhaust airflow and pipes are hot enough to cause personal injury or fire. The exhaust airflow can reach temperatures as high as 371 °C (700 °F). Keep people, equipment, and other items away from the exhaust airflow and pipes. Always vent exhaust away from personnel.

	WARNING: Hot surfaces and hot exhaust can be dangerous. Personal injury and/or damage to equipment are possible. Be careful when you work on equipment.

The microturbine exhaust is clean and oxygen rich (approximately 18% O_2), with very low levels of air pollutants. Like all fossil fuel combustion technologies, the microturbine produces oxides of nitrogen (NO_X) and carbon monoxide (CO) emissions from the fuel combustion process. Although the microturbine has ultra low NO_X and CO emission levels, make sure precautions are taken to prevent personnel from being exposed to these pollutants while the system is operating.

When installed indoors, the microturbine exhaust must be vented to the outside. Make sure there is a satisfactory fresh air supply. An exhaust system must be added to direct the exhaust away from the system to reduce the risk of exposure to dangerous emissions.

For exhaust connection data, temperatures, pipe requirements, and other related information, contact your Capstone Authorized Service Provider.

When installed outdoors, the microturbine should be located where there is a satisfactory fresh airflow so the exhaust emissions will be dissipated.

1.1.6. Acoustic Emissions Precautions

The Capstone microturbine is designed to produce safe acoustic emissions. However, when working at a radius of 10 meters (or 33 feet) from an enclosed Capstone microturbine, sound level exposure will average approximately 65 dBA.

Capstone recommends that hearing protection be worn when working on or in the immediate vicinity of operating microturbines for extended time periods.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

Other acoustic emissions regulations may apply to your specific installation location. Always check to be certain that your installation complies with all codes required by the local jurisdiction.

1.2. Certifications, Permits, and Codes

Your Capstone Microturbine is designed and manufactured in accordance with a variety of national and international standards.

The Capstone Microturbine operates on approved gaseous fuels; thus installation frequently requires one or more permits from local regulatory agencies.

It is not practical to list in the User's Manual the requirements of each authority having jurisdiction and how the Capstone microturbine meets those requirements. For certification data, such as weights, dimensions, required clearances, noise levels, and the Capstone Microturbine Compliance List, please contact your Capstone Authorized Service Provider.

1.3. Output Measurements

The measurements presented in this document are in metric units (with U.S. standard units in parentheses). Refer to the sections below for more data.

1.3.1. ISO Conditions

Combustion turbine powered devices (including the Capstone Microturbine) are typically rated at 15 °C (59 °F) at sea level, or 1 atmosphere (1 atm) which is 760 mm Hg (14.696 psia) and identified as International Organization for Standardization (ISO) conditions. For a complete definition of ISO testing conditions, refer to ISO 3977-2.

1.3.2. Pressure

Pressure figures assume gauge pressure, or 1 standard atmosphere (1 atm) 760 mm Hg (14.696 psia) less than absolute pressure, unless otherwise indicated.

1.3.3. Volume

Fuel gas and exhaust gas volumetric measurements are given in normalized cubic meters (Nm^3) defined at 0 °C (32 °F), and standard cubic feet (SCF) defined at 15.6 °C (60 °F). Both volumes are defined at 1 atm (760 mm Hg, 14.696 psia).

1.3.4. Heating Values

Heat contents and heat rates will be found in either Lower Heating Value (LHV) (dry) or Higher Heating Value (HHV), depending upon the application. Capstone calculates heating values at 1 atmosphere (atm) and 15.6 °C (60 °F), according to ASTM D3588.

1.3.5. Microturbine Performance

The microturbine electrical output capability is reduced when operating in higher ambient temperatures or elevations, and by intake or exhaust restrictions. Contact your Capstone Authorized Service Provider for data on performance specifications.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

1.3.6. Grid Connect Output

The microturbine electrical output in Grid Connect mode is 3-phase, 400 to 480 VAC and 45 to 65 Hz (both voltage and frequency are determined by the electric utility grid). The connection type for Grid Connect mode is 4-wire Wye with solidly grounded neutral.

1.3.7. Stand Alone Output

When equipped with the Stand Alone option, the electrical output is user adjustable from 150 to 480 Volts AC and from 10 to 60 Hz. The connection type for Stand Alone mode is 4-wire Wye with solidly grounded neutral.

The output power need not be balanced. Loads can be connected in three phases, or single phase and phase-to-phase, or phase-to-neutral, so long as the current limits are respected. A Ramp Start feature can assist in starting loads with large in-rush currents.

1.3.8. Power Quality

The microturbine output conforms to IEEE 519-1992, IEEE Recommended Practices, and Requirements for Harmonic Control in Electrical Power Systems.

1.3.9. Heat Output

The recuperated microturbine can produce up to 327,000 kJ/hr (310,000 Btu/hr) of clean, usable exhaust heat at 275 °C (530 °F). The microturbine exhaust stack diameter is 127 mm (5 in.) in diameter, flowing 0.31 kg/s (0.68 lbm/s).

Contact your Capstone Authorized Service Provider for data on heat output performance for specific system variations and/or ambient conditions.

1.4. Referenced Documents

The following table contains a list of Capstone documents that are referenced in this User's Manual.

Document Part No	Description
410000	Model C30 Electrical Technical Reference
410028	Stand Alone Operation Technical Reference
410027	Grid Connect Operation Technical Reference
410032	MultiPac Operation Technical Reference
410033	Protective Relay Functions
410065	MicroTurbine Systems Emissions Technical Reference
440000	Standard Maintenance Schedule Work Instructions
480010	C30/C65 Offshore and Hazardous Location Application Guide
518834	C30 Industrial Package Outline and Installation (O&I) Drawing

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

2. Microturbine Description

The Capstone Microturbine is an adaptable, low-emission, and low maintenance power generation system. A turbine-driven high-speed generator is coupled with digital power electronics to produce high quality electrical power. Capstone's proprietary design allows users to optimize energy costs while operating in parallel with an electric utility grid. The microturbine can provide prime power generation where the electric utility grid is not readily available or where service is unreliable.

The Alternating Current (AC) electrical power output from the microturbine can be paralleled with an electric utility grid or with another generation source. The microturbine can act as a Stand Alone generator for standby, backup, or remote off-grid power. Multiple systems can be combined and controlled as a single larger power source, called a MultiPac.

The microturbine can efficiently use a wide range of approved hydrocarbon-based gaseous fuels. It also produces dry, oxygen-rich exhaust with ultra-low emissions. Utilizing both the generated electric power and the exhaust heat can provide even greater energy cost savings.

Refer to Figure 1 and O&I drawing 518834 for external features and envelope dimensions of the Capstone C30 Microturbine.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

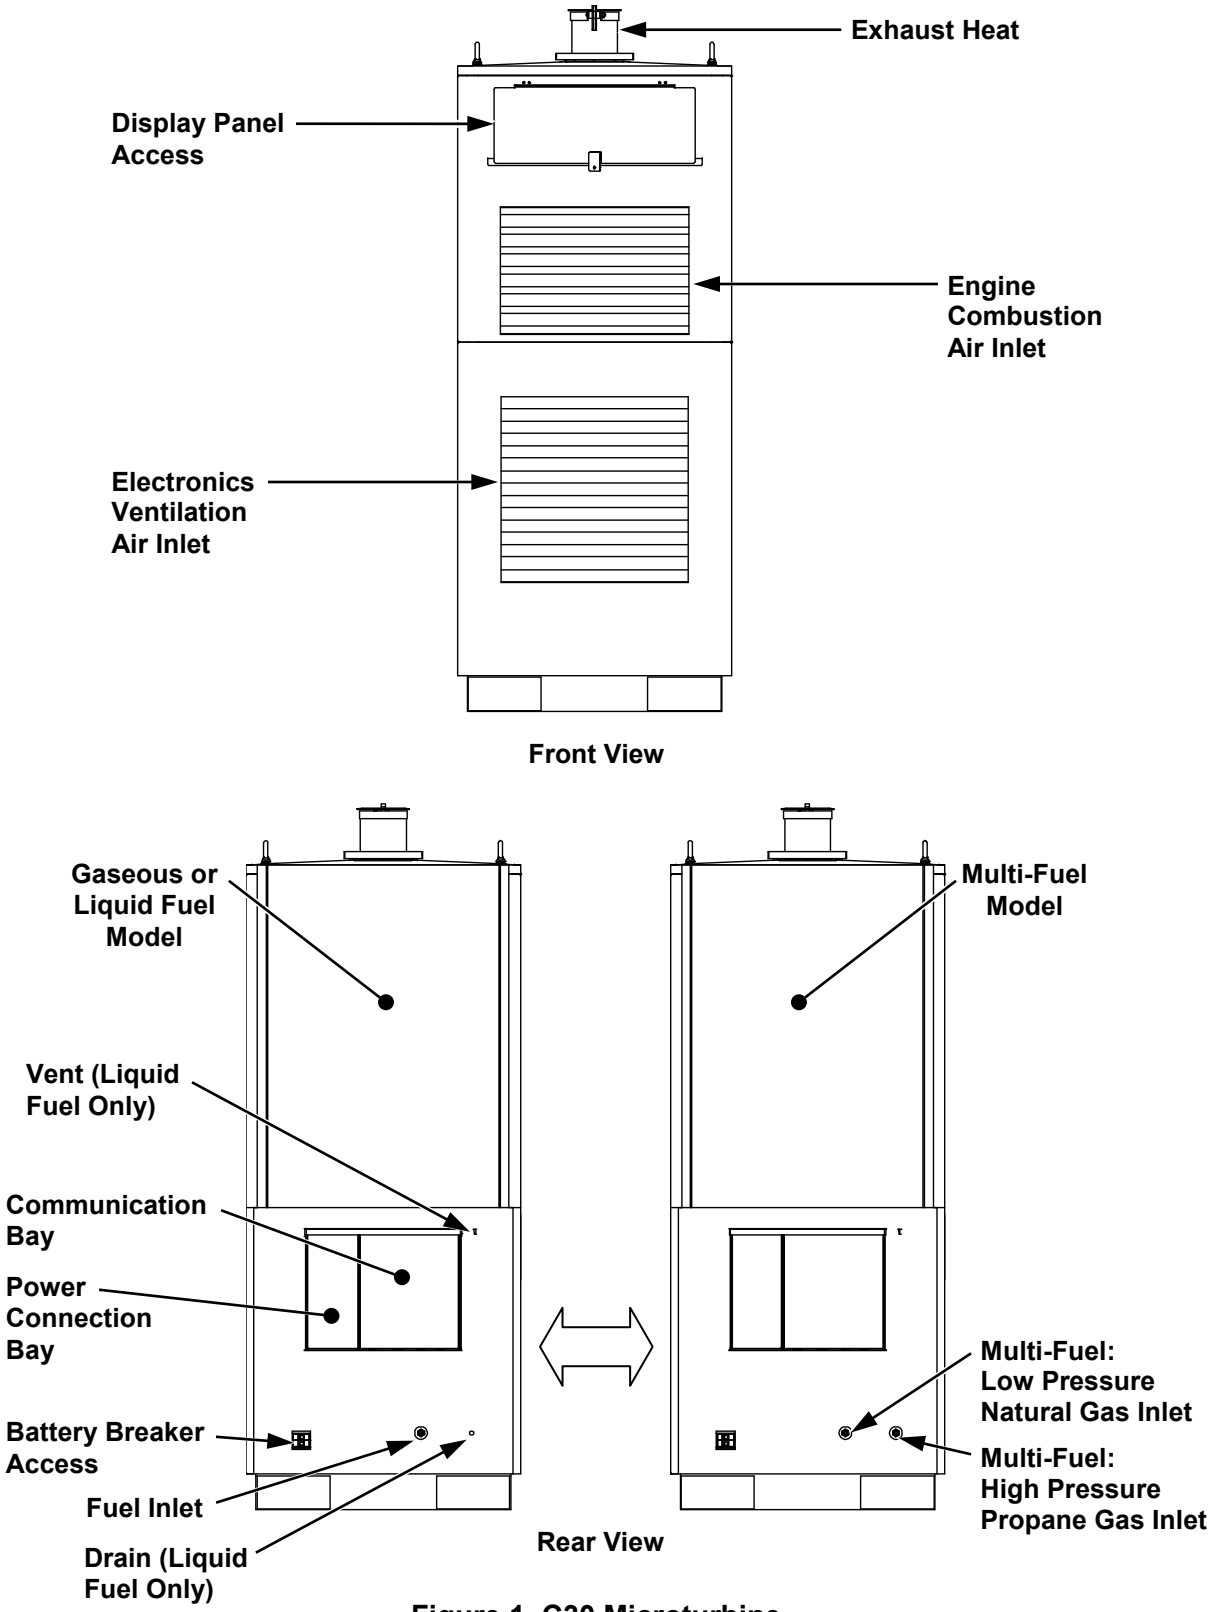

Figure 1. C30 Microturbine

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

2.1. User Interface

⚠	ELECTRICAL WARNING: The User should NOT open bays other than the Communications Bay. Potentially lethal voltages exist inside the other bays.

The user port is a DB9 RS-232 serial communications connector located on the User Connection Board (UCB) in the Communications Bay on the rear of the microturbine, and is available for remote microturbine operation. Figure 2 shows the location of the user port connector J6.

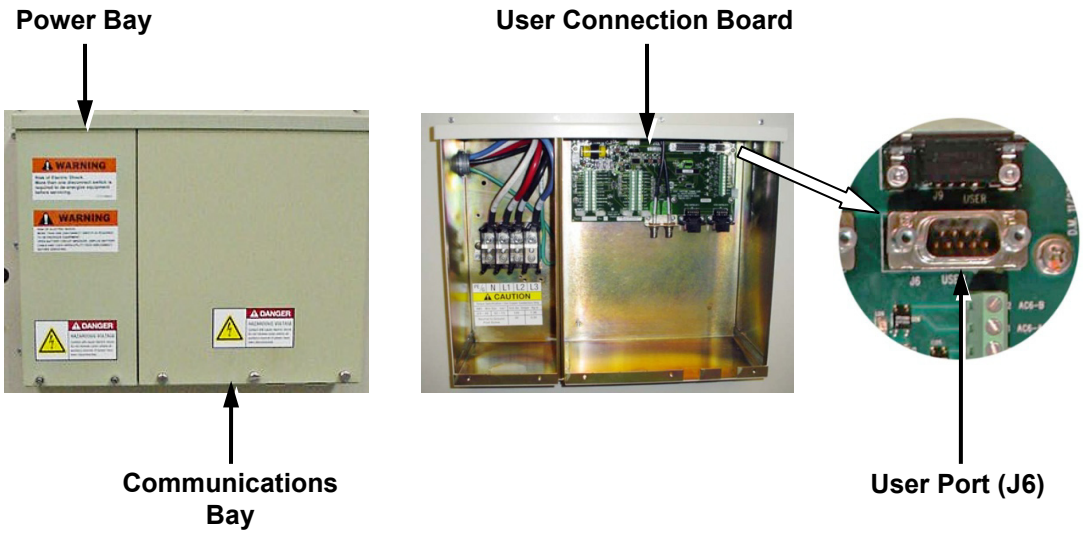

Figure 2. User Port Location (Microturbine Rear View)

You can communicate with the microturbine via the user port by using a Windows 98/2000/NT or later computer with RS-232 null modem cable or Serial to Ethernet Converter and CRMS. Optionally, a modem may be connected to the user port for remote operation via a phone line at a baud rate up to 56k bps.

▷	NOTE: The communication software is not compatible with Windows Vista or Windows 7 as this time.

▷	NOTE: The default user port user password is set to USR123P; the user can change it by using the Capstone Remote Monitoring Software on a computer connected either directly to the user port or remotely via a modem. In the event of a lost user password, your Capstone Authorized Service Provider can reset the user password to this default.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

2.2. Microturbine Features

The various features of the Capstone Microturbine are listed below:

- A state-of-the-art digital power controller with built-in protective relay functions provides two output choices:
  - Built-in synchronous AC
  - Stand Alone AC output (optional)
- Patented air bearings eliminate the need for oil or other liquid lubricants.
- Air-cooled design of the entire system (turbine and controller) eliminates the need for liquid coolants.
- The engine has only one moving part. No gears, belts, or turbine-driven accessories.
- Advanced combustion control eliminates the need for ceramics or for other costly materials or for catalytic combustion, and provides ultra-low emissions.
- The integral annular recuperator (heat exchanger) doubles thermal efficiency.
- Digital control technology facilitates advanced control or Ethernet monitoring, and diagnostic capabilities, both on-board and remotely.

2.2.1. Microturbine Engine

The microturbine engine is a combustion turbine that includes a compressor, combustor, turbine, generator, and a recuperator. The rotating components are mounted on a single shaft supported by patented air bearings and spin at up to 96,000 RPM. The permanent magnet generator is cooled by the airflow into the microturbine. The output of the generator is variable voltage, variable frequency AC. The generator is used as a motor during start-up and cooldown cycles.

The key mechanical components that make up the Capstone Microturbine engine are shown in Figure 3.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

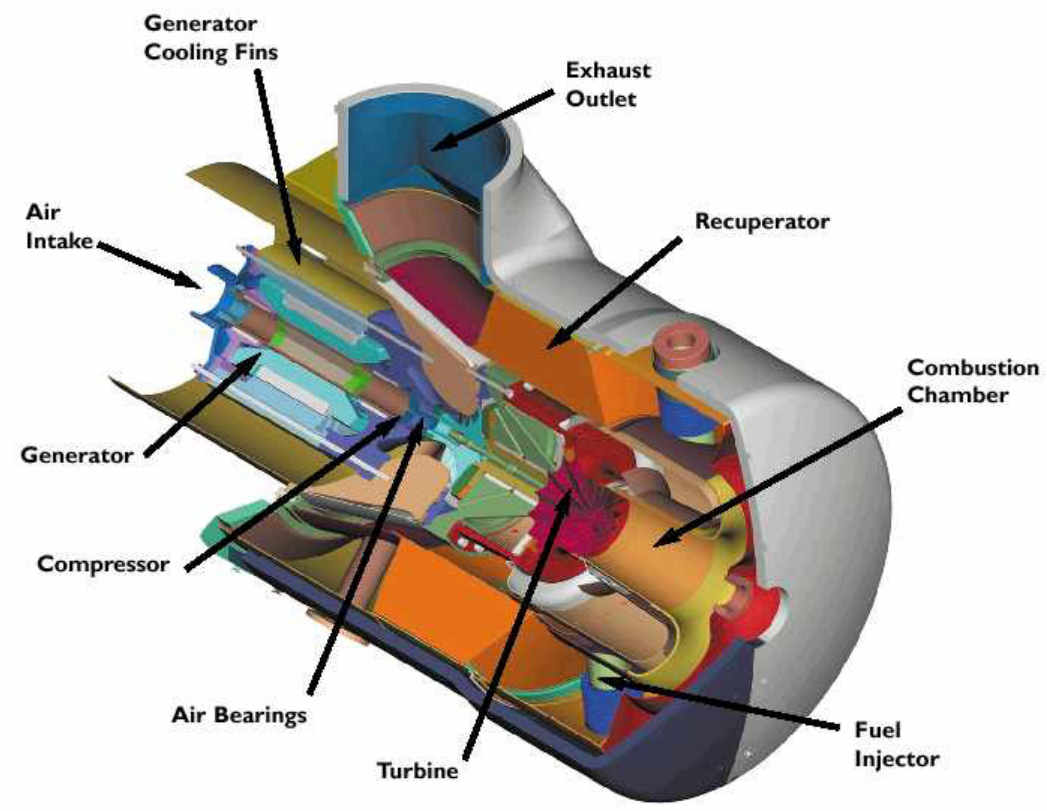

Figure 3. Typical Capstone Model C30 Microturbine Engine (Cutaway View)

2.2.2. Air Bearings

The microturbine utilizes gas foil bearings (air bearings) for high-reliability, low maintenance, and safe operation. This allows fewer parts and the absence of any liquid lubrication to support the rotating group. When the microturbine is in operation, a gas film separates the shaft from the bearings and protects them from wear.

2.2.3. Digital Power Electronics

The digital power electronics control the microturbine system operation and all subsystem operations. The digital power electronics change the variable frequency AC power from the generator to DC voltage, and then to constant frequency AC current.

During start up, the digital power electronics operate as a variable frequency drive, and motor the generator until the microturbine has reached ignition and power is available from the microturbine. The digital power electronics again operate as a drive during cooldown to remove heat stored in the recuperator and within the microturbine engine in order to protect the system components.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

2.2.4. Fuel System

The microturbine can efficiently use a wide range of approved hydrocarbon-based gaseous and liquid fuels. The microturbine includes an integral fuel delivery and control system. The available microturbine models include the following fuel types:

- High pressure natural gas (HPNG)
- Low pressure natural gas (LPNG)
- High pressure sour gas (HPSG)
- Landfill gas
- Digester gas
- Liquid fuel
- Propane (HD-5)
- Multi-fuel model enables use of LPNG and high pressure propane in a single microturbine

Contact your Capstone Authorized Service Provider for data on approved fuels and performance specifications.

2.2.5. Emissions

The Capstone Microturbine is designed to produce very clean emissions. The exhaust is clean and oxygen rich (approximately 18% O_2) with very low levels of air pollutants. Like all fuel combustion technology, the microturbine produces emissions (like nitrogen dioxide and carbon monoxide) from the fuel combustion process. The microturbine has ultra low nitrogen dioxide (NO_2) and carbon monoxide (CO) emission levels. Refer to the Emissions Technical Reference (410065) for detailed emission specifications.

2.2.6. Enclosure

The microturbine standard enclosure is designed for indoor and outdoor use, and conforms to NEMA 3R requirements.

The C30 hazardous location microturbine has a stainless steel pressurized enclosure, which houses the microturbine system, and is certified for Class I, Division 2 (CID2), or Class I, Zone 2 (CIZ2) environments. Refer to the C30/C65 Hazardous Location Application Guide (480010) for details.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

2.2.7. Combined Heating and Power (CHP)

Combined Heating and Power (CHP) allows the user to realize the benefits of usable electrical and thermal power from a single fuel source. The electricity provides on-site power generation, and the heat offsets or replaces local thermal loads such as space heating, pool heating and industrial process hot water. CHP requires an additional Heat Recovery Module (HRM). The HRM is provided by third party suppliers. In addition, the oxygen-rich exhaust together with ultra-low emissions makes the direct exhaust applicable for some food processing and greenhouse uses, such as heating, cooling (by absorption), dehumidifying, baking, or drying. Contact your Capstone Authorized Service Provider for details.

2.2.8. Hazardous Location Option

The hazardous location option enables use of the C30 microturbine in hazardous (CID2 or CIZ2) environments such as offshore oil platforms. It also provides for extended operation in high humidity environments. The stainless steel pressurized enclosure contains equipment to maintain correct pressurization, monitor gas and heat levels, and prevent corrosion. The hazardous location option is available as a Dual Mode (battery equipped) model for Stand Alone operation only. The battery contains internal contactors that are controlled remotely so that it can be completely disconnected during the purge cycle and in the event of a safety shutdown. Refer to the C30/C65 Offshore and Hazardous Location Application Guide (480010) for details.

2.2.9. Offshore Option

The offshore option enables use of the C30 microturbine in high humidity environments, including offshore oil platforms, but only in areas classified as non-hazardous. The offshore option contains heaters and specially treated electrical connectors to prevent corrosion. This option is available as a Dual Mode (battery equipped) model for Stand Alone operation only. The battery pack (with internal contactors) and fuel shutoff valve are operated by a hazardous location controller to ensure isolation on a shutdown. Refer to the C30/C65 Offshore and Hazardous Location Application Guide (480010) for details.

2.2.10. Capstone Remote Monitoring Software

Capstone Remote Monitoring Software (CRMS) is the optional Capstone proprietary software that can operate and control the microturbine from the RS-232 user port. This allows communication interface devices (a laptop plugged in with a null-modem cable or Serial to Ethernet Converter or a remote computer via a modem) to communicate via the RS-232 port.

CRMS is an easy to use, menu driven Windows-based software for a remote computer to monitor and control the Capstone Microturbine. The software can control from 1 to 30 microturbine systems, by direct connection or remotely via a modem. Copies of and licenses for this software are available for purchase from Capstone.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

2.2.11. Grid Connect Mode

When connected to a utility grid (Grid Connect mode), the microturbine operates according to three available dispatch modes: Base Loading, Load Following, and Time of Use. These dispatch modes are described in the following paragraphs.

2.2.11.1 Base Loading

Base Loading is the default dispatch mode for the microturbine in Grid Connect operation. In this mode, the microturbine generates power up to the value of the stored power demand, and the electric utility grid provides the remaining power to meet the total customer load.

2.2.11.2 Load Following

Load Following is implemented in applications where the microturbine produces more power than the customer facility can use. A setting called Utility Power Setpoint is used to fix the power provided by the utility grid until the microturbine reaches its power capacity. The Utility Power Setpoint also acts as a buffer to allow the microturbine to react to large swings in the facility load. An external power meter is required for this dispatch mode.

2.2.11.3 Time of Use

The Time of Use mode allows the microturbine user to selectively determine start/stop commands and/or power output levels for up to 20 timed events. Events are programmed by day of week, time of day, and power demand. When the microturbine is operating, the programmed events occur in sequential order according to the time of day. This enables efficient use of the microturbine to supplement power only during periods of the day when electricity from the utility is at a premium.

2.2.12. Dual Mode

The C30 Dual Mode microturbine includes a large battery pack used for unassisted start and for transient electrical load management, as well as a power converter and battery management system. The battery pack is a lead-acid type and completely sealed.

The Dual Mode model can function in Stand Alone mode to power connected loads at user selected voltage and frequency setpoints. It can power remote facilities such as construction sites, oil fields, offshore platforms, and other locations where the electric utility grid is not available.

With the Dual Mode System Controller (DMSC), the microturbine can be used for both Grid Connect power and Stand Alone power applications. The microturbine can be programmed to switch automatically upon loss/restoration of electric utility grid power.

2.2.13. MultiPac Power

C30 microturbines can be installed in groups of up to 20 units using a standard Capstone MultiPac communications cable. This MultiPac capability enables connected microturbines to operate as a single power generation source. A MultiPac configuration features a single control point and synchronous voltage and frequency output for all units. Individual microturbines share power, current, and load on both a dynamic and steady state basis.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

3. Microturbine Operation

The following paragraphs provide instructions required for the operation of the Capstone C30 Microturbine. Refer to Using the Display Panel on page 32 for details about operating the microturbine via the display panel.

3.1. Basic Microturbine Operation

Most microturbine applications require no regular interaction with an operator during normal operation. Built-in dispatch features include user (local) or remote functions with load management modes such as base loading, load following, and time of use.

Applications with the C30 hazardous location microturbine require the use of the Capstone hazardous location controller to monitor external inputs such as gas detection and pressure sensing and to intelligently control normal operation. The hazardous location microturbine operates in Stand Alone mode only, but all built-in microturbine dispatch modes remain the same, except for auto restart functionality, which is unavailable. Refer to the C30/C65 Offshore and Hazardous Location Application Guide (480010) for details.

3.1.1. Communications

There are two ways to communicate with the microturbine, either (1) via manual operation of the display panel (user), or (2) via digital communications through the user port or maintenance port on the UCB (remote).

A PC may be connected to the user port directly (with an RS-232 null modem cable or using a Serial-to-Ethernet converter) or via a phone line and optional modem. Communication is then possible by use of the optional Capstone Remote Monitoring Software (CRMS) on the PC, or other program that uses Capstone's open communication protocol.

The setup, control, and basic performance of the microturbine can be monitored and adjusted through the user or maintenance port on the UCB.

Primary user communications include:

- Start and stop functions
- Adjustment of power output
- Storage and display of operation history
- The configuration of operational parameters
- Battery management functions

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

3.1.2. Operational Data

The display panel (or a computer connected directly or via modem) can be used to monitor many operational parameters during system operation. Only some of the routine operation and performance data items available for monitoring are listed below:

- Power Output (in kilowatts, or kW)
- Turbine Speed (in revolutions per minute or RPM)
- Turbine Exit Temperature (in °C or °F)
- Phase Voltages (in Volts) and Currents (in Amperes)

3.1.3. Control Device Authority and Priority

A PC connected to the user or maintenance port can function as a control device for the microturbine. A PC can view system data at any time, but only one device can control the microturbine operation (that is, providing start/stop command or changes to power demand).

The display panel has default control authority to issue operational commands to the microturbine. The user can start and stop the microturbine without logging on to the system (that is, no password is required). All other system adjustments require the user to log on to the system with the user password.

The user port will take control when a password is entered either from the Capstone Remote Monitoring Software (CRMS) or other software using the Capstone open communication protocol.

All system commands via the user port, such as start, stop, and adjustment of Power Demands, require entry of a user password. When the user port has control, the Display Panel does not have control and can only be used to view information. The system automatically cancels a log on after five minutes of inactivity.

3.1.4. Startup

A Start command can be issued from the display panel (user), or remotely through a PC/CRMS interface or digital inputs. When the command has been issued, the generator operates as a motor to bring the microturbine up to ignition speed, at which point fuel is introduced into the combustion chamber and ignited. When the Turbine Exit Temperature (TET) sensors detect an increase in temperature, the system is declared lit, and the microturbine accelerates. Once the MT enters the load state, it accelerates to full load. The start-up process from a cold start to full load requires approximately six minutes. The startup process can take longer for a Stand Alone MT, which can take as long as 20 minutes to recharge the battery packs to the level needed for full load operation.

3.1.5. Shutdown

When the microturbine is issued a Stop command, power output is reduced, followed by a period that the microturbine is motored at nominal speed to remove heat stored in the recuperator and microturbine engine in order to protect the system components.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

The overall cooldown period is up to ten minutes, but is affected by microturbine model and temperature at shutdown. A restart may be attempted at any time, and a start will occur after completion of the initial cooldown period. Auto Restart is not available for hazardous location microturbines with pressurized enclosures.

If the Stand Alone battery requires a recharge (after a stop command is issued), the microturbine will continue to operate with fuel in order to recharge the battery. The microturbine will enter the cool down period after the battery has reached a 90 to 95% state of charge. The battery can require as long as 20 minutes to recharge after a stop command has been issued before entering cooldown. This will be followed by a cooldown period of up to 10 minutes.

3.1.6. Emergency Stop (E-Stop)

The UCB contains input pins to which the user can connect an Emergency Stop (E-Stop) device. The E-Stop function enables the safe and immediate shut down of the microturbine in the event of an emergency. Activation of the E-Stop immediately shuts off fuel and electrical output. This will cause the compressor bypass valve to open, vent the compressed air out of the microturbine, and the turbine will coast to a stop.

After an emergency stop, the power to the microturbine must be turned off for 30 seconds before a restart can be attempted. Emergency stops should NEVER be used for routine shutdowns. Emergency stops increase stress on the system components and will result in reduced service life of the microturbine.

	CAUTION: Repeated use of the optional Emergency Stop switch will result in damage to the microturbine. Use only in emergency situations.

Also, after an emergency stop, you may want to close the external fuel isolation valve to shut off any additional fuel flow into the microturbine. The external fuel isolation valve must be returned to the open position before a restart of the microturbine is attempted.

3.1.7. Restart

The microturbine system can normally be restarted after a shutdown, while the battery recharges, or during the cool down period before the speed of the microturbine reaches zero. This allows for faster power output and helps to eliminate wear on the bearings.

3.2. Grid Connect Operation

The microturbine in Grid Connect operation allows electric utilities to expand generating capacity in small increments. This optimizes current infrastructure and reduces the need to upgrade specific site capacity and lowers overall costs. Refer to the Grid Connect Operation Technical Reference (410027) for details.

3.2.1. Grid Connect Dispatch

Operation of the Capstone Microturbine in parallel with an electric utility grid consists only of commanding the system on or off, and commanding an output power level. In most configurations these commands are mostly or entirely automated in various ways termed dispatch modes.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

	NOTE: If grid power is removed for any reason, the auto restart dispatch mode can automatically command the system ON when grid power is restored.

3.2.2. Configuring Grid Connect

To configure the microturbine for Grid Connect operation it is necessary to enable the Grid Connect Interlock and then command the system to Grid Connect mode either through the Display Panel or RS-232 commands via the user port.

3.2.3. Grid Connect Interlock

The Grid Connect Interlock consists of a pair of 5-Volt dry circuit contact terminals located on the User Connection Board. A low resistance closed circuit between these terminals permits Grid Connect operation, opening the circuit disallows Grid Connect operation. The terminals are found in the Communications Bay at the rear of the microturbine enclosure. **Your Capstone Authorized Service Provider should make this electrical connection.**

3.2.4. Grid Connect Mode Enable

To enable the Grid Connect mode, the microturbine must be correctly connected to a suitable live electric utility grid and the Grid Connect Interlock must be closed. Your Capstone Authorized Service Provider should make this electrical connection.

To enable the Grid Connect mode from the Display Panel, requires logging on with a password; then navigate to the System Data menu, then to the System Configuration submenu, and then to the Power Connect submenu. Select Grid Connect mode and then press the ACCEPT button. If the Grid Connect Interlock is open, the system will accept the command but post a GC Interlock fault, prohibiting a start.

3.2.5. Starting a Grid Connect System

The microturbine system in Grid Connect mode must be commanded to start. Even if the system is configured for automatic operation, the initial START command is required to enable the automatic mode. If the Auto Restart feature is enabled, the ON command is stored by the system even through a loss of Grid Power.

To start the system from the Display Panel, press and hold the INTERLOCK button, and then press the START button. (If your microturbine has been configured with a remote start/stop switch, simply set the switch to Start or On to start the system.)

3.2.6. Stopping a Grid Connect System

The microturbine system can be stopped at any time. In Grid Connect operation, an OFF command will override any dispatch mode settings, and is stored by the system.

The shutdown process includes a cool down period, which can last up to 10 minutes, depending on the operating temperature at shutdown. During the cool down cycle, the power output is reduced and fuel supply is off but the microturbine continues to rotate to dissipate excess heat.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

A restart can be attempted at any time during a cool down period.

To stop the system from the Display Panel, press and hold the INTERLOCK button, and then press the STOP button. (If your microturbine has been configured with a remote start/stop switch, simply set the switch to Stop or Off to stop the system.)

3.2.7. Grid Connect Power Demand

In Grid Connect operation, the microturbine system must be commanded to a specific output power level. Each dispatch mode includes a power level setting. Some dispatch modes include automatic output power level changes.

3.3. Stand Alone Operation

Stand Alone operation provides power to remote facilities such as construction sites, offshore oil platforms, or other locations where the electric utility grid is not available.

It requires the battery-equipped Dual Mode model or hazardous location microturbine. Stand Alone operation consists of commanding the system on or off, and then enabling or disabling the power output. These commands can be automated. Refer to the Stand Alone Operation Technical Reference (410028) for details.

3.3.1. Configuring Stand Alone

To configure the microturbine for Stand Alone operation it is necessary to enable the Stand Alone Interlock and then configure the system to Stand Alone mode through the display panel or RS-232 commands over the remote communications interface via the user port.

3.3.2. Stand Alone Interlock

The Stand Alone Interlock consists of a pair of 5 Volt dry circuit contact terminals. A low resistance closed circuit between these terminals permits Stand Alone operation. An opened circuit prevents Stand Alone operation. The terminals are found in the Communications Bay at the rear of the microturbine enclosure. **Your Capstone Authorized Service Provider should make this electrical connection.**

3.3.3. Stand Alone Mode Enable

To enable Stand Alone mode, the microturbine must be powered on (set the Stand Alone battery isolation switch to **ON**) and the Stand Alone Interlock closed. To enable Stand Alone mode from the display panel logon with a password; then navigate to the System Data menu, System Configuration submenu, and the Power Connect submenu. Select Stand Alone mode, then press the **ACCEPT** button. If the Stand Alone Interlock is open, the system will accept the command but post a SA Interlock fault. If no battery is detected, an internal No Battery fault will be reported.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

3.3.4. Stand Alone Battery

A microturbine configured for Stand Alone operation includes a large battery pack that stores energy for microturbine startup when disconnected from the electric utility grid. It also provides an electrical buffer for sudden increases or decreases in load during Stand Alone operation. Management of the battery and its state of charge is automatic within the microturbine. An awareness of these battery management functions will promote an understanding of why the system may appear to behave autonomously. For example, the microturbine will always attempt to fully recharge the battery after a user commanded shut down and before the microturbine enters the cool down state.

3.3.5. Stand Alone Battery Isolation Switch

The Stand Alone microturbine includes a battery isolation switch to disable the microturbine for service or transport. See Figure 4. The switch is located on the battery behind the front door at the bottom front of the enclosure. Set the switch to **ON** for system operation. Be sure to set the switch to **OFF** when not operating the system to maximize battery life.

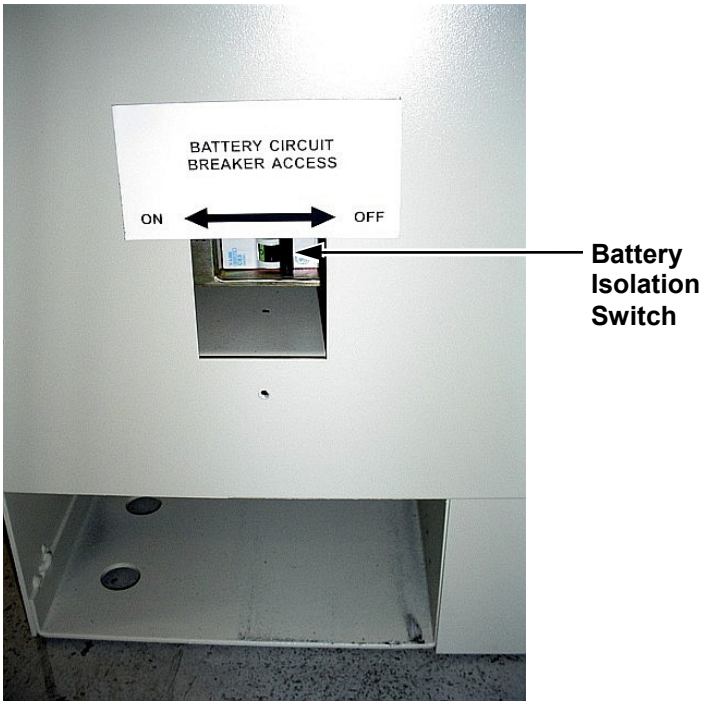

Figure 4. Battery Isolation Switch Access

3.3.6. System Sleep in Stand Alone Mode

Reducing battery draw to near zero during prolonged periods of non-use can extend the microturbine battery charge significantly. This is called Sleep Mode. Sleep Mode is automatic, but the time of inactivity can be adjusted using CRMS. If the battery isolation switch is set to **ON**, and the Display Panel is dark, the system is most likely in Sleep Mode. In Sleep Mode, the battery pack needs to be recharged periodically. Refer to the section on Battery Maintenance for more data on recharging the Battery.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

3.3.7. Waking a Stand Alone Microturbine

If the Stand Alone system is in Sleep Mode, pressing the **BATT START** button at the far left of the Display Panel (for 2 seconds or less) will wake it up. If communicating with the microturbine remotely using a modem, the modem ring indicator will wake up a sleeping Stand Alone system.

	CAUTION: Permanent closure of the battery start contacts (in the following paragraph) will completely discharge the UCB battery. Therefore, the battery start contacts may only be closed for a period of 0.1 to 2.0 seconds.

Alternately, momentarily closing the battery start contacts in the communication bay will wake up the system. This must be a momentary closure of 0.1 to 2.0 seconds only, as permanent closure of these contacts will completely discharge the battery. **Your Capstone Authorized Service Provider should make this electrical connection.**

3.3.8. Starting a Stand Alone System

The microturbine system in Stand Alone operation must be commanded to start. Even if the system is configured for automatic operation, an initial start command is required to enable the automatic mode. If the Auto Restart feature is enabled, the **ON** command is stored by the system even through a loss of system power.

To start the system from the Display Panel, press and hold the **INTERLOCK** button, and then press the **START** button. (If your microturbine has been configured with a remote start/stop digital input, simply close to start the system.)

3.3.9. Enabling Stand Alone Power Output

To enable power output, first start the microturbine, and wait for the engine to warm up and for the base battery state of charge to reach at least 60%. A Not Ready to Load message is displayed. Press and hold the **INTERLOCK** button, and then press the **ENABLE** button.

	NOTE: The Enable command can be issued at any time. The system will transition to power output when battery voltage and state of charge are ready.

When Auto Enable Power is set to ON, the microturbine will automatically issue the Enable command when the system is ready to support the connected loads. Auto Enable Power is set using CRMS.

3.3.10. Stand Alone System Power Level

In Stand Alone mode, the microturbine system will produce (up to its capacity) whatever current is necessary to maintain the commanded voltage and frequency. The output power is determined by the connected load(s).

3.3.11. Disabling Stand Alone Power Output

To disable power output, press and hold the **INTERLOCK** button, and then press the **DISABLE** button. All power output will immediately cease, but the system will continue operating with fuel.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

3.3.12. Stopping a Stand Alone System

The microturbine system can be stopped at any time. To stop the system from the Display Panel, press and hold the **INTERLOCK** button, and then press the **STOP** button. (If your microturbine has been configured with a remote start/stop switch, simply set the switch to Stop or Off to stop the system.)

A system **OFF** command first disables power output. The system then charges the battery, which can take up to 20 minutes. Finally, the turbine shutdown process includes a cool down period, which can last up to 10 minutes.

3.4. Dual Mode Operation

If the microturbine is equipped with the Stand Alone option, and the optional Dual Mode System Controller (DMSC) is installed, a setting in the microturbine system software enables the system to reconfigure itself to either Grid Connect or Stand Alone operation mode. This is called Dual Mode.

In the case of grid loss/recovery, microturbine operation in Dual Mode is identical to the operation in Grid Connect mode or Stand Alone mode, depending on the state of the utility grid. Operation of the Dual Mode feature consists of switching the microturbine (and protected loads) from Grid Connect operation to Stand Alone operation, or back.

	NOTE: Note that both the Grid Connect and Stand Alone interlock terminals must be closed for Dual Mode operation.

3.4.1. Capstone DMSC

The Capstone DMSC is an accessory that enables the microturbine to automatically transition from Grid Connect operation to Stand Alone operation when a utility power outage occurs. During a utility power outage, the microturbine normally operates in Stand Alone mode to provide power to Protected Loads. The DMSC provides the logic for an electrically-operated circuit protection device to isolate the protected loads during Stand Alone operation. When utility power is restored, the DMSC automatically returns the microturbine and protected loads to Grid Connect operation. The DMSC also allows the microturbine to be used as an automatically dispatched standby generator for protected loads.

The Dual Mode Controller can:

- Sense the loss of electric utility grid voltage, and then send a trip signal to a circuit protection device to disconnect the microturbine and its connected (protected) loads from the electric utility grid.
- Start the system to supply Stand Alone power.
- Sense the return of electric utility grid voltage, and then shut down the microturbine.
- Issue a command to close the circuit protection device to reconnect the MT and protected loads to the electric utility grid.
- Start the system to supply electric utility grid parallel power.

The microturbine can be configured to automatically start and load itself in either mode.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

3.4.2. Configuring Dual Mode

The microturbine system settings must be established for both Grid Connect parameters and Stand Alone parameters, since the system will be operating in both modes at different times. Contact your Capstone Authorized Service Provider for data on establishment of these parameters.

3.4.3. Setting the System for Dual Mode Operation

To set the system to Dual Mode, use either the Display Panel or the user port. If using the Display Panel, you must log on with a password. Navigate to the top-level System Data menu, then the System Configuration submenu, and then the Power Connect submenu, and then select **DUAL MODE** and press the **ACCEPT** button.

3.4.4. Switching Times for Dual Mode

When a utility outage occurs, protected loads will be without power for up to seven minutes as the system transitions from Grid Connect to Stand Alone mode. When utility power is restored, the protected loads return to grid power within two seconds, but the microturbine will be offline for up to 32 minutes as it reconfigures to Grid Connect Mode and recharges the internal battery.

3.5. MultiPac Operation

MultiPac operation allows controlling the individual microturbines through the master unit. Observation and control of each microturbine in a MultiPac can be accomplished by the connection of a communications interface device through the master unit. Any microturbine can be designated as the master unit. This unit then becomes the physical and logical control connection point for the entire MultiPac. The MultiPac capability features a single control point (the master unit) and the combined synchronous output of the units in the MultiPac. Individual microturbines share power, current, and load on both a dynamic and steady-state basis. Refer to the MultiPac Operation Technical Reference (410032) for details.

Standard C30 models can be configured into an array of up to 20 microturbines. Such an array will operate as a single power generation source. Refer to the C30/C65 Offshore and Hazardous Location Application Guide (480010) for details about operating multiple C30 hazardous location microturbines using the Capstone hazardous location controller.

Contact your Capstone Authorized Service Provider for additional information on establishment of a MultiPac system.

3.5.1. MultiPac Grid Connect Operation

In Grid Connect operation, each microturbine independently synchronizes to the grid. MultiPac functionality provides a single interface point for Start, Stop, and Power Demand control. It is not necessary to connect a modem or signals from an external power meter to each individual microturbine in a MultiPac, only to the master unit.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

3.5.2. MultiPac Stand Alone Operation

In Stand Alone operation, MultiPac functionality provides the capability to synchronize the voltage source outputs of the individual microturbines such that they share power and current on both a dynamic and steady state basis. The master microturbine unit broadcasts synchronization data to the other units over a dedicated Capstone-proprietary digital communications bus.

3.5.3. MultiPac Redundancy

In MultiPac operation, if an individual microturbine fails (shuts down due to a fault), the remaining units will continue to operate. If the master unit fails and communication is not possible, the entire MultiPac system will shut down. If the master unit fails, another unit in the MultiPac system can be manually programmed to be the new master unit, however the MultiPac system must not be operating while this re-configuration is performed.

3.5.4. MultiPac Enable/Disable

Individual microturbines must be disabled from a MultiPac system for service and maintenance. When service or maintenance is completed, the individual microturbines must be added back into the MultiPac system (i.e., re-enabled). Use the display panel to enable/disable a microturbine in a MultiPac system, or contact your Capstone Authorized Service Provider.

3.5.5. Changing the Master Unit in a MultiPac using the Display Panel

In a MultiPac system, one microturbine is the master unit. To assign a different microturbine to be the master unit, perform the following steps. The steps are presented in functional groups of steps for clarity.

NOTE: The following steps are performed on the microturbine that was the old master unit in the MultiPac. Alternatively, comparable steps can be performed using CRMS software on a computer connected to the microturbine user port.

1. Disable the old Master from the MultiPac:
   a. Log on with the User Password (refer to Logging On with a Password on page 35).
   b. Go to the System Data top-level menu.
   c. Navigate to the System Configuration second-level menu.
   d. Navigate to the MultiPac <Enable/Disable> third-level menu.
   e. Use the (+) or (-) buttons to select Disable; then press the ACCEPT button.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

	NOTE: The following steps are performed on the Display Panel of the microturbine that will be the new master unit in the MultiPac.

2. Set the microturbine that will be the new master unit to number 1:
   a. On the new master unit, log on with the User Password (refer to Logging On with a Password on page 35).
   b. Go to the System Data top-level menu.
   c. Navigate to the System Configuration second-level menu.
   d. Navigate to the Turbine Number <Number> third-level menu.
   e. Press the "1" Numeric Keypad button to set the Turbine Number to 1; then press the ACCEPT button.
3. Enable MultiPac from the new master unit:
   a. Go to the System Data top-level menu.
   b. Navigate to the System Configuration second-level menu.
   c. Navigate to the MultiPac <Enable/Disable> third-level menu.
   d. Use the (+) or (-) buttons to select Enable, then press the ACCEPT button.
4. Reboot the new master unit:
   a. Go to the System Settings top-level menu.
   b. Navigate to the Reboot <No/Yes> second-level menu. Use the (+) or (-) buttons to select Yes, then press the ACCEPT button.
   c. If there had been a telephone line connected to the modem in the original master unit, move the telephone line connection to the modem in the new master unit.
   d. If there are any other cables (e.g., from a power meter or a global E-Stop device) connected to the original master unit, also move these connections from the original to the new master unit.

	ELECTRICAL WARNING: Some connections require that the entire system be de-energized in order to be moved safely. To prevent injury to personnel or damage to equipment, completely remove power from the original and new master units, and from the connected equipment, before moving any cables.

5. At this point, the microturbine that had been the original master unit is not part of the MultiPac. To include it in the MultiPac, continue with these steps on its Display Panel.
   a. Go to the System Data top-level menu.
   b. Navigate to the System Configuration second-level menu.
   c. Navigate to the Turbine Number <Number> third-level menu.
   d. Use the Numeric Keypad to set the Turbine Number to a unique value; then press the ACCEPT button.
   e. Navigate to the MultiPac <Enable/Disable> third-level menu. Use the (+) or (-) buttons to select Enable, then press the ACCEPT button.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

3.6. Hazardous Location Operation

⚠	WARNING: The display panel on the Hazardous Areas unit is intended only for maintenance use. The display cover must not be opened unless the area is known to be free of flammable gases.

Refer to the C30/C65 Offshore and Hazardous Location Application Guide (480010) for details about hazardous location operation. The display panel on the C30 hazardous location microturbine is used for maintenance and troubleshooting only and is not used to operate the microturbine. Instead, the Capstone hazardous location controller is used to monitor and control the operation of the microturbine. The cover over the display panel on a hazardous location microturbine must never be opened unless the area is known to be free of flammable gases.

For hazardous location (CID2 or CIZ2) applications, the hazardous location controller is connected to the UCB user and maintenance ports on the microturbine. A connection for remote monitoring via CRMS is made available through the Ethernet switch in the controller, and not directly to the microturbine.

4. Using the Display Panel

Use of the display panel (Figure 5 and Figure 6) is described in the following paragraphs.

▷	NOTE: Depending on date of manufacture, your C30 microturbine will have the Pushbutton Display Panel shown in Figure 5 or the Touch Pad Display Panel shown in Figure 6.

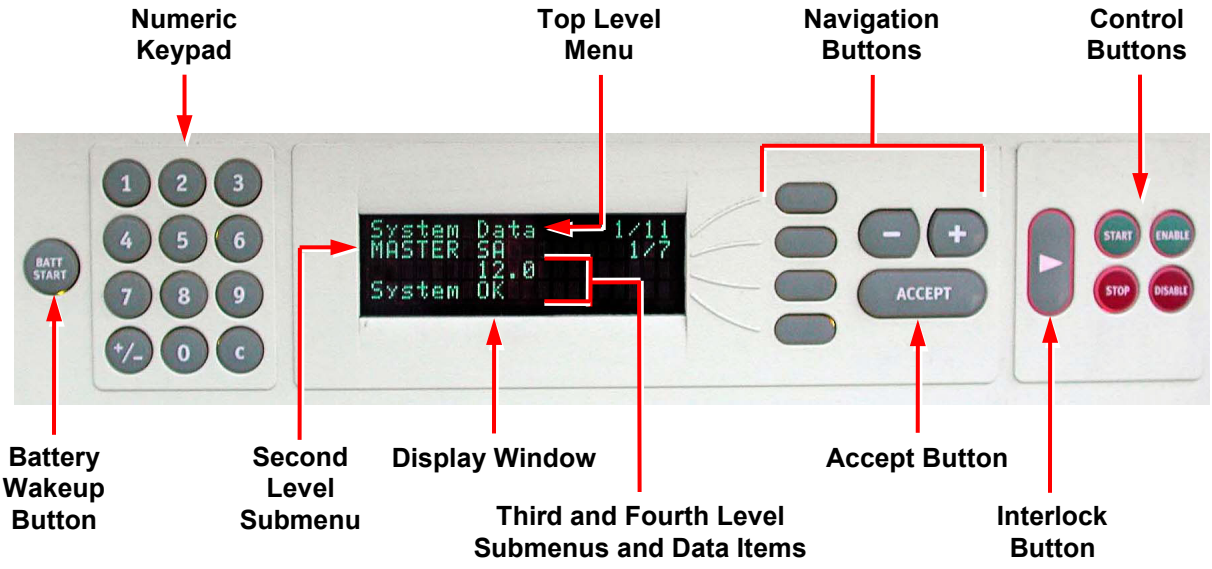

Figure 5. Pushbutton Display Panel

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

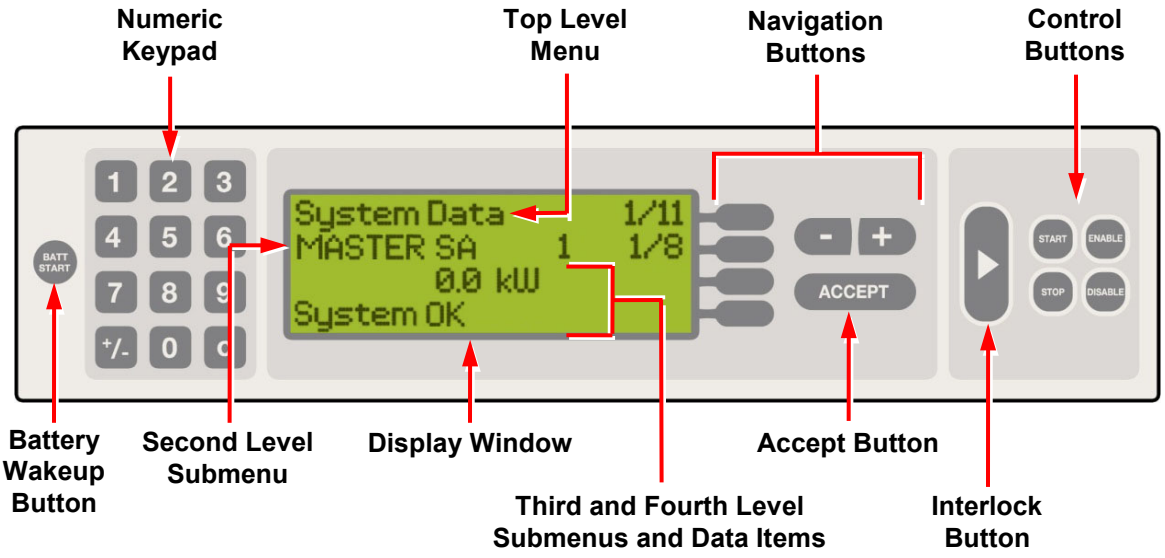

Figure 6. Touch Key Display Panel

The Display Panel is located on the front of the package above the engine air inlet, and is used to control microturbine operation and access data stored within the system. The Display Panel includes a keypad, a display window, navigation buttons, and system control buttons. The paragraphs below describe Display Panel operation.

For hazardous location (CID2 or CIZ2) applications with the pressurized enclosure, display panel information is visible through a plastic window. However, access to the panel navigation buttons and numeric keypad is only allowed during maintenance operations, and only if the area has been tested to be free of flammable gases.

4.1. Display Panel Areas

The **BATT START** button, at the far left of the Display Panel, is used to wake a Stand Alone system from sleep mode (refer to Waking a Stand Alone Microturbine on page 27).

The **Numeric Keypad**, located to the left of the Display Window, is for data input. The system accepts data input only on specific screens, and the input line must be selected, indicated by the flashing line. Data input from the Numeric Keypad requires logging-on with a password (refer to Logging On with a Password on page 35).

The **Display Window** is in the center of the Display Panel. The Display Window can display four lines of twenty characters, each of which indicate menu hierarchy position, data display, and data input.

The **Navigation Buttons** are located to the right of the Display Window, and consist of four buttons arranged vertically, each with a line to its left indicating a line of data in the Display Window. These four buttons, plus the buttons just to their right labeled (**-**), (**+**), and ACCEPT, are the navigation buttons; they are used for selecting various display screens or data items.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

The **Control Buttons** are to the right of the Navigation Buttons. The control buttons start and stop the MicroTurbine, and enable and disable power output in Stand Alone mode. For security the interlock button must be pressed along with the control button. If a control button is pressed alone, the command cannot be detected by the software.

With the exception of the BATT START button, a beep sound will be heard when any button is pressed.

The display contrast level can be changed by pressing the interlock button and a navigation button as follows:

- Press the interlock button and Line 1 button, or interlock button and Line 2 button to increase the contrast level.
- Press the interlock button and Line 3 button, or interlock button and Line 4 button to decrease the contrast level.

	NOTE: To change the contrast level, the Interlock button must be pressed before pressing a navigation button.

4.2. Menu Navigation

Movement around the top-level menu screens can be accomplished by use of the Navigation Buttons (Figure 5 and Figure 6). The top line of the display always shows the name of the current top-level menu. To move around the top-level menus, press the topmost of the four navigation buttons. The menu position indicator numbers at the right end of the top line will flash. When the numbers are flashing, press the (**-**) or (**+**) buttons to move around the menus.

Each of the top-level menu screens has a number of submenus. The second line in the display window shows the current submenu. Movement around the submenus is similar to the top-level menus except you must press the second-line navigation button to select line two of the display. When the numbers are flashing, press the (**-**) or (**+**) buttons to move around the submenus.

When you reach the desired menu, press the **ACCEPT** button to choose the menu, or wait 20 seconds for the system to automatically accept the menu selected.

The third and fourth levels display the selected performance data or allow input, like passwords or adjustment of power settings. The descriptions of each screen or submenu are grouped according to the top-level menu.

4.3. Display Panel Data Entry

Data input requires selection of the appropriate level with the Navigation Buttons, causing the display line to flash. Enter data using the Numeric Keypad, or scroll through available data entry options with the (**-**) or (**+**) buttons and press the **ACCEPT** button when finished. To make changes to any system set-up or operational mode requires the entry of a user password. Numeric entries can be cancelled by use of the (-) button.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

4.3.1. Logging On with a Password

To enter commands from some of the Display Panel menus, the user must log on with a valid password (the description of the various menus on the following pages includes whether logging on with a password is required).

	NOTE: The default user password (at the Display Panel) is set to 87712370. In the event of a lost user password, your Capstone Authorized Service Provider can reset the user password to this default.

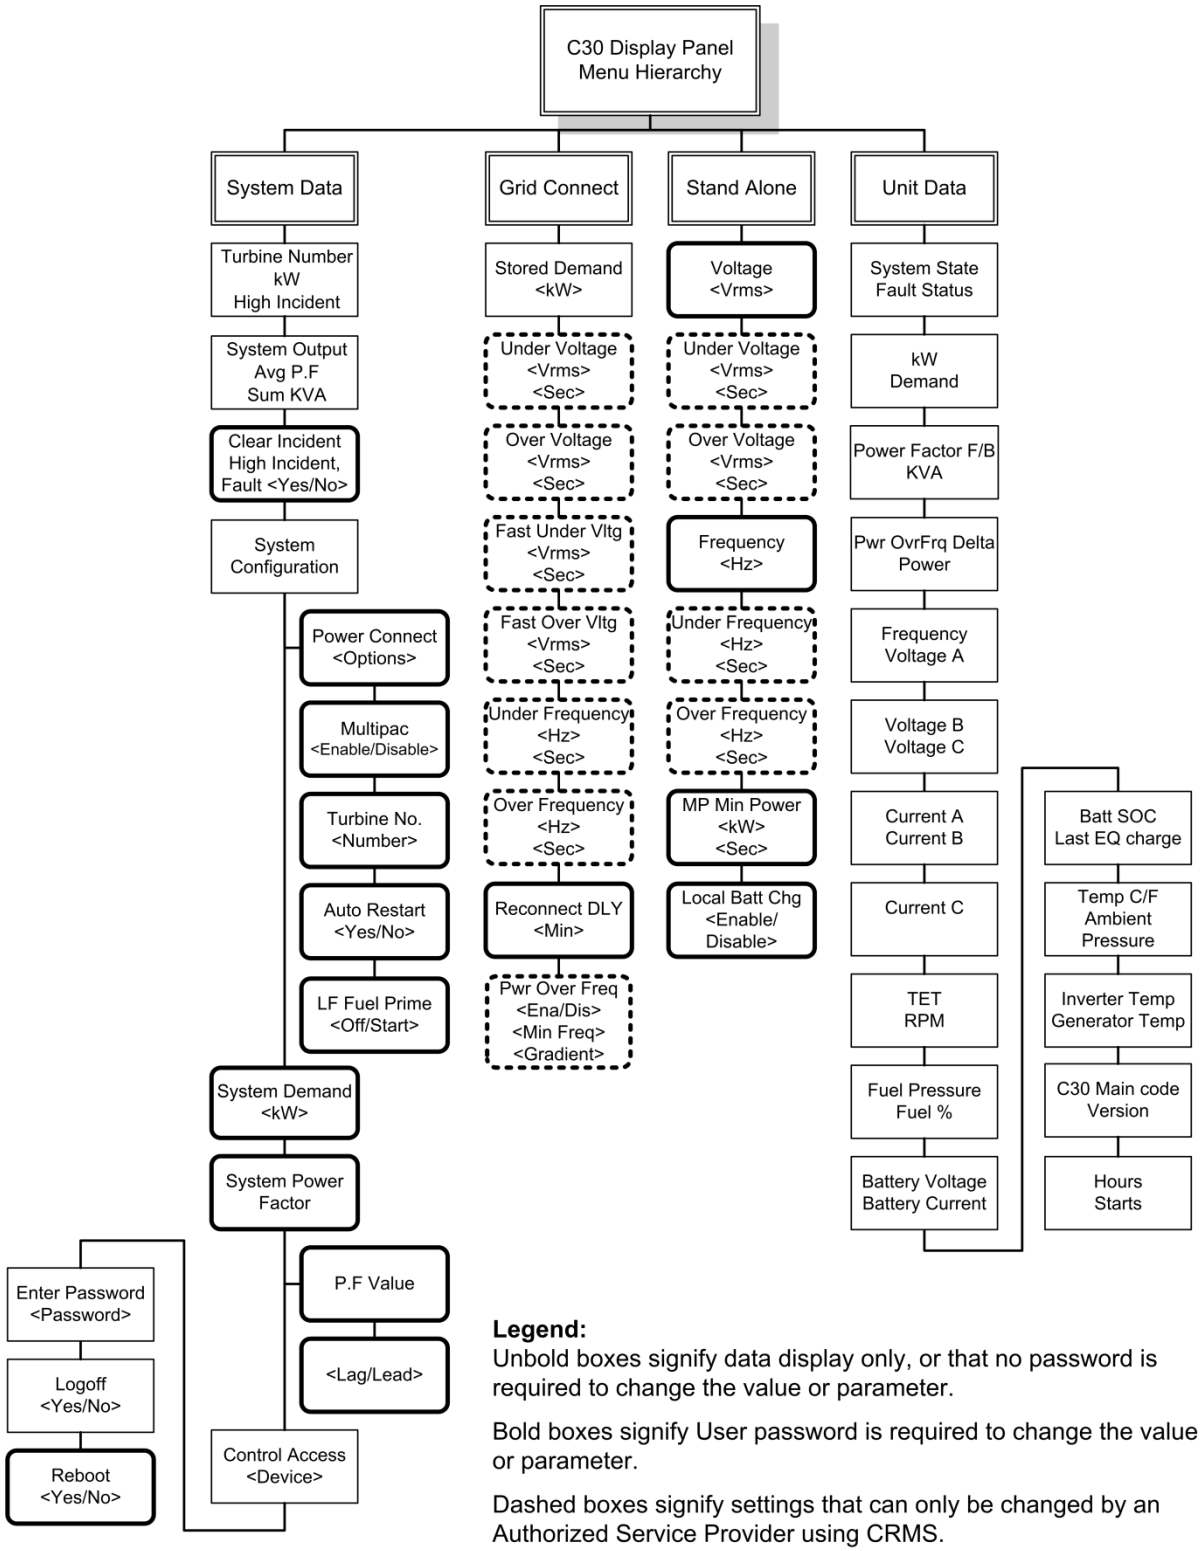
To log on with a password, follow these steps:

1. At the top-level System Data Menu, push the second level Navigation Button and the (-) or (+) buttons until you come to the Enter Password submenu.
2. Select the third level Navigation Button (the display indicates "*********"). Enter the current password (see the above notes).
3. The display of ******** becomes -------- as you enter the password.
4. Press the ACCEPT Button. The display will indicate "PROTECTED LEVEL SET".
5. You are now logged into the system.

Not all data items can be modified at the user password level.

4.3.2. Changing the Password

A user can change the user password at any time using the following steps:



1. The user must be logged-in (with a password) to change the password.
2. Go to the top-level **System Settings** menu, push the second level Navigation Button and the (**-**) or (**+**) buttons until you come to the User Password submenu.
3. Select third level Navigation Button (********Change**) and enter new password.
4. Press the ACCEPT button. A confirmation message will be posted that states the password needs to be verified.
5. Press the fourth level Navigation Button. Verify the Password on the fourth level (********Verify**); re-enter the "new" password to verify.
6. Press the ACCEPT button. A confirmation message will be displayed that states the password has been verified.

If the new password is not verified in this manner, the old password will remain in effect.

4.4. Display Panel Menus – Overview

The Display Panel menu hierarchy shown in Figure 7 represents the typical structure of the system software menus and submenus for the Model C30 microturbine. These menus and submenus are also detailed in text following the menu hierarchy chart.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

Legend:

Unbold boxes signify data display only, or that no password is required to change the value or parameter.

Bold boxes signify User password is required to change the value or parameter.

Dashed boxes signify settings that can only be changed by an Authorized Service Provider using CRMS.

Figure 7. Display Panel Menu Function Hierarchy

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

4.5. System Data Menu

	NOTE: The user will be able to view the data on various screens of the System Data Menu without logging on; to change some of the settings requires logging on with a user password.

On power-up, the display panel defaults to the top-level System Data menu. The System Data menu displays the total output for a system of 1 to 20 microturbines along with other system states.

The System Data submenus are detailed below with a sample of the actual display for each submenu. The same applies for the other top level menus, as applicable.

	NOTE: In the following submenus, the first line always displays System Data menu.

4.5.1. Turbine Number

```
System Data        1/4
MASTER SA  1      1/10
       28.6 kW
System OK
```

The Turbine Number submenu displays the microturbine number and whether it is currently configured for GC (Grid Connect) or SA (Stand Alone), and whether it is a Single unit or a MultiPac (MP) unit or the Master of a MultiPac system. This data is displayed on the second line of the display panel. This submenu also gives the Total Output of the system in kilowatts (kW) on the third line. The fourth line displays the High Incident data, which is the highest system severity level (SSL) fault code and the highest fault type currently reported by the system. This is information that must be forwarded to your Capstone Authorized Service Provider.

4.5.2. System Output

```
System Data        1/4
Power Factor      2/10
       0.00 PF
       0.00 KVA
```

The System Output submenu displays the power factor and kVA output of the microturbine system. Power factor (PF) is displayed on the third line and KVA output is displayed on the fourth line. If the microturbine is the master unit of a MultiPac, PF is the average power factor and KVA is the sum of the kVA output of all microturbines in the MultiPac. Otherwise, PF and KVA are the power factor and kVA output of the single microturbine.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

4.5.3. Clear Incident

```
System Data        1/4
Clear Incident    3/10
System OK
NO
```

The Clear Incident submenu attempts to clear the highest-level fault and to return the system to standby. The third line displays the system severity level (SSL) fault code and displays the highest fault type and the highest identification number of the faults currently reported by the system. If the fault can be cleared, the fault # line will be updated with the new highest SSL fault or System OK if all faults were cleared. If the same fault remains, the fault cannot be cleared. The user must be logged in with the current password to change any setting on the Clear Incident submenu.

4.5.4. System Configuration

	NOTE: The user will be able to view the data on the various screens of the System Configuration Menu without logging on with a password; to change any settings requires logging on with a user password.

The System Config submenu contains system settings and allows the user to adjust the third level data, as detailed below:

4.5.4.1 Power Connect Submenu

```
System Data        1/4
System Config     4/10
Power Connect      1/5
DUAL MODE
```

The Power Connect submenu allows the user to change the operating mode of the microturbine. The user must be logged in with the current password to change this setting. The operating modes are as follows:

- Invalid State (Initial Factory Setting)
- Stand Alone
- Grid Connect
- Dual Mode

	NOTE: The initial Factory Setting of INVALID is intended to ensure the true Power Connect option is set to match your specific application.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

4.5.4.2 MultiPac Submenu

```
System Data        1/4
System Config     4/10
MultiPac           2/5
DISABLE
```

The MultiPac <ENABLE/DISABLE> submenu allows the user to remove or add a microturbine to a MultiPac. This allows maintenance of a microturbine unit in a MultiPac without having to shut down all microturbines in the system. The user must be logged in with the current password to change this setting.

4.5.4.3 Turbine Number Submenu

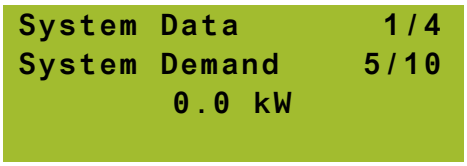
```
System Data        1/4
System Config     4/10
Turbine Number     3/5
          1
```

The main controller microturbine in a MultiPac system is designated as the "Master", and must be assigned as number "1". Other microturbines may be assigned in any order in a MultiPac system. However, each microturbine must have a unique turbine number. The user must be logged in with the current password to change this setting.

4.5.4.4 Auto Restart Submenu

```
System Data        1/4
System Config     4/10
Auto Restart       4/5
Yes
```

The Auto Restart <Yes/No> submenu enables or disables the system's ability to automatically attempt a restart after an incident-driven shutdown. The microturbine, however, will not attempt a restart if the fault that caused the shutdown is a serious (high level) fault, even if Auto Restart is enabled by this submenu. The user must be logged in with the current password to change this setting.



4.5.4.5 Liquid Fuel Prime Submenu

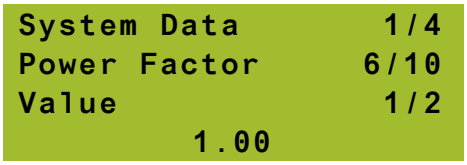
```
System Data        1/4
System Config     4/10
LF Fuel Prime      5/5
OFF
```

The Liquid Fuel Prime submenu controls liquid fuel priming on liquid fuel systems only. This parameter is set to START to begin the liquid fuel priming sequence. It is set to OFF to stop/disable liquid fuel priming. The user must be logged in with the current password to change this setting.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

4.5.5. System Demand

The System Demand submenu allows the user to set the system power demand in kW while in grid connect mode. This setting is active until the microturbine is shut down. Each time the microturbine starts up, any previous System Demand setting is no longer available and the kW value is set to zero. On startup, or any time System Demand is set to 0.0 kW, the microturbine uses the Stored Demand setting (refer to page 43). The user must be logged in with the current password to change system demand.



In a MultiPac, the system demand setting of the microturbine configured as the MultiPac master is used as the system demand setting for the entire MultiPac. When it overrides the stored demand setting, the system demand setting of the MultiPac master is used as the power output demand for the MultiPac. In this case, each microturbine in the MultiPac is commanded to supply an equal fraction of the total power output as specified by the System Demand setting of the master microturbine. For example, if the System Demand setting of the master microturbine in a MultiPac of six microturbines is 150 kW, the power demand for each microturbine would be 25 kW, or 1/6th of the System Demand setting.

In a MultiPac, the System Demand setting for the MultiPac is changeable and viewable from the master microturbine only. A microturbine operating as a MultiPac-enabled slave will only display its fractional portion of the total power demand at the System Demand submenu. Also, any change made using the System Demand submenu of a MultiPac-enabled slave microturbine during MultiPac operation will have no effect.

4.5.6. System Power Factor

The System Power Factor submenus are described in the following paragraphs. These submenus are used to enter the power factor value and select whether the power factor will be leading or lagging.

4.5.6.1 Power Factor Value Submenu

The Power Factor Value Submenu allows the user to set the value of the power factor. The value is adjustable from 0.80 to 1.00 in increments of 0.01. The Lagging/Leading Submenu described in the paragraph below is used to determine if this value will be leading or lagging. The user must be logged in with the current password to change the power factor value.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

4.5.6.2 Lagging/Leading Submenu

```
System Data          1/4
Power Factor        6/10
Lag/Lead             2/2
LAG
```

The Lagging/Leading Submenu allows the user to select lagging or leading for the power factor. On the fourth line of the display, select LAG for lagging or LEAD for leading. The user must be logged in with the current password to change this setting.

4.5.7. Control Access

```
System Data          1/4
Control Access      7/10
Display Panel
```

The Control Access submenu displays which communication device currently has control authority for changing settings of the microturbine.

- Display Panel
- User Port
- Maintenance Port

4.5.8. Enter Password Submenu

```
System Data          1/4
Enter Password      8/10
        ********
```

The Enter Password submenu allows the user to log on and access the microturbine controls. This submenu is used to enter the user password only.

	NOTE: The default user password (at the Display Panel) is set to 87712370. In the event of a lost user password, your Capstone Authorized Service Provider can reset the user password to this default. Not all data items can be modified at the user password level.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

4.5.9. Logoff

```
System Settings   1/4
Logoff           9/10
NO
```

The Logoff <NO/YES> submenu returns the system to base password mode, disabling all password protected parameter adjustments. The user should manually log off using this menu after making any required changes.

4.5.10. Reboot Submenu

```
System Settings   1/4
Reboot          10/10
NO
```

The Reboot <NO/YES> submenu allows the user to reset the system when the system is in a standby or fault state. Reboot does NOT change user-entered settings to the factory default settings. The user must be logged in with the current password to change this setting.

4.6. Grid Connect Menu

⚠	ELECTRICAL WARNING: Protective Relay settings can only be changed by a Capstone Authorized Service Provider (ASP) using CRMS. Do not attempt to change any Grid Connect Protective Relay functions yourself. Injury to personnel and/or damage to equipment can occur.

▶	NOTE: The primary Grid Connect Protective Relay function is to ensure that the microturbine does not energize utility wires de-energized by the utility.

The top-level **Grid Connect** menu establishes operation parameters for the Grid Connect mode. This menu is applicable only when the microturbine operates in Grid Connect mode. The Grid Connect Protective Relay settings are displayed here, and can only be changed using CRMS.

Refer to the following reference documents as required:

- Grid Connect Operation Technical Reference (410052)
- Model C30 Electrical Technical Reference (410000)
- Protective Relay Functions (410033)

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

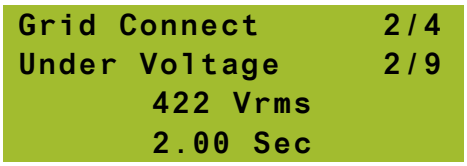
The Grid Connect submenus are described in the following paragraphs.

	NOTE: In the following submenus, the first line always displays the Grid Connect top level menu.

4.6.1. Stored Demand

```
Grid Connect        2/4
Stored Demand       1/9
       30.0 kW
```

The Stored Demand submenu allows entry of the power output demand level in kilowatts. A password is required to adjust this parameter from the Display Panel. Power output is adjustable from 0.0 to 2,000,000.0 kW to include the output capacity of the MultiPac configuration, as well as allow for future increases in the power generating capability of Capstone turbines.



This setting is permanently stored in memory, even after a shut down, and is available for use by the microturbine after it starts up. The System Demand setting (refer to page 28), if greater than zero, will override the Stored Demand setting until the microturbine is shut down.

In a MultiPac, the Stored Demand setting of the microturbine configured as the MultiPac master is used as the Stored Demand setting for the entire MultiPac. If not overridden by the System Demand setting, the Stored Demand setting of the MultiPac master is used as the power output demand for the MultiPac. In this case, each microturbine in the MultiPac is commanded to supply an equal fraction of the total power output as specified by the Stored Demand setting of the master microturbine. For example, if the Stored Demand setting of the master microturbine in a MultiPac of six microturbines is 600 kW, the power demand for each microturbine would be 100 kW, or 1/6th of the Stored Demand setting.

In a MultiPac, the Stored Demand setting for the MultiPac is changeable and viewable from the master microturbine only. Each microturbine has its own, permanently saved, Stored Demand setting, even when it is configured as a MultiPac-enabled slave. However, a microturbine operating as a MultiPac-enabled slave will only display its fractional portion of the total power demand at the Stored Demand submenu. Also, an individual microturbine's Stored Demand setting cannot be changed at its Stored Demand submenu if it is configured as a MultiPac-enabled slave.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

4.6.2. Under Voltage Submenu

	NOTE: The Under Voltage submenu is read only, and no settings can be changed using the display panel. Protective relay settings can only be changed by an Authorized Service Provider using CRMS.

The Under Voltage submenu shows the line-to-line voltage trip point and associated delay time. If the RMS voltage between any phases falls below this setting, the delay timer is started. If the voltage has not recovered at the end of this time, the system will shut down. This is adjustable from 352 up to the Over Voltage setpoint in 1 Volt increments. Initial Factory Setting is 428 VAC line-to-line.

Under Voltage Delay establishes the time allowed for any phase voltage to fall below the Under Voltage limit. The delay is adjustable from 0.3 up to 10 seconds in 0.01 second increments. Initial Factory Setting is 1.9 seconds. This setting can only be changed by a Capstone ASP using CRMS.

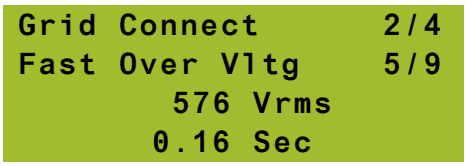
4.6.3. Over Voltage Submenu

	NOTE: The Over Voltage submenu is read only, and no settings can be changed using the display panel. Protective relay settings can only be changed by an Authorized Service Provider using CRMS.

The Over Voltage submenu shows the line-to-line voltage trip point and associated delay time. If the RMS voltage between any phases rises above this setting the delay timer is started. If the voltage has not subsided by the end of this time, the system will shut down. This is adjustable from 528 down to the Under Voltage setpoint in 1 Volt increments. Initial Factory Setting is 524 Volts.

Over Voltage Delay establishes the time allowed for any phase voltage to rise above the Over Voltage limit. The delay is adjustable from 0.3 to 10 seconds in 0.01 second increments. Initial Factory Setting is 1.9 seconds. This setting can only be changed by a Capstone ASP using CRMS.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.



4.6.4. Fast Under Voltage Submenu

	NOTE: The Fast Under Voltage submenu is read only, and no settings can be changed using the display panel. Protective relay settings can only be changed by an Authorized Service Provider using CRMS.

The Fast Under Voltage submenu shows the transient line-to-line voltage trip point and associated delay time. The system will cease power export to the grid within 1 msec if any phase RMS voltage drops below the Fast Under Voltage setting for the set time delay. If the grid voltage re-stabilizes within 1 second of the initial under voltage, then the system will resume power output; otherwise, the system will shut down. The Fast Under Voltage value at which this sequence will be triggered is adjustable from 0 VAC up to the Under Voltage setpoint. The delay time is adjustable from 0.03 to 1.00 second in 0.01 second increments. Initial Factory Settings are 264 V line-to-line and 0.095 second delay. This setting can only be changed by a Capstone ASP using CRMS.

4.6.5. Fast Over Voltage Submenu

	NOTE: The Fast Over Voltage submenu is read only, and no settings can be changed using the display panel. Protective relay settings can only be changed by an Authorized Service Provider using CRMS.

The Fast Over Voltage submenu shows the transient line-to-line voltage trip point and associated delay time. The system will cease power export to the grid within 1 msec if any phase RMS voltage exceeds the Fast Over Voltage setting for the set time delay. If the grid voltage re-stabilizes within 1 second of the initial over voltage, then the system will resume power export; otherwise, the system will shut down. The Fast Over Voltage at which this sequence will be triggered is adjustable here from the Over Voltage up to 635 Volts. The delay time is adjustable from 0.03 to 1.00 second in 0.001 second increments. Initial factory settings are 600 V line-to-line and 0.032 second delay. This setting can only be changed by a Capstone ASP using CRMS.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

4.6.6. Under Frequency Submenu

	NOTE: The Under Frequency submenu is read only, and no settings can be changed using the display panel. Protective relay settings can only be changed by an Authorized Service Provider using CRMS.

The Under Frequency submenu shows the system under frequency trip point and associated delay time. If the grid frequency falls below this under frequency trip point for the set delay time, the system will shut down. The frequency is adjustable from 45 Hz up to the Over Frequency setting, in 0.1 Hz increments. Initial Factory Setting is 59.3 Hz. For VDE compliance this setting must be 47.5 Hz.

The Under Frequency Delay is the number of seconds allowed for the Under Frequency condition before the system shuts down. This is adjustable from 0.06 to 10 seconds in 0.01 second increments. Initial Factory Setting is 0.09 second. This setting can only be changed by a Capstone ASP using CRMS.

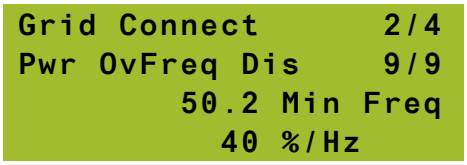
4.6.7. Over Frequency Submenu

	NOTE: The Over Frequency submenu is read only, and no settings can be changed using the display panel. Protective relay settings can only be changed by an Authorized Service Provider using CRMS.

The Over Frequency submenu shows the system over frequency trip point and associated delay time. If the grid frequency exceeds this over frequency trip point for the set delay time, the system will shut down. The frequency is adjustable from the Under Frequency setting to 65, in 0.1 Hz increments. Initial Factory Setting is 60.5 Hz.

For Active Power Foldback on Over Frequency, as described in paragraph 4.6.9, the over frequency trip point is used as the maximum frequency setting for the microturbine power reduction. For VDE compliance this setting must be 51.5 Hz.

The Over Frequency Delay is the number of seconds allowed for the Over Frequency condition before the system shuts down. This is adjustable from 0.06 to 10 seconds in 0.01 second increments. Initial Factory Setting is 0.09 second. This setting can only be changed by a Capstone ASP using CRMS.



Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

4.6.8. Reconnect Delay Submenu

The Reconnect Delay submenu applies only to Dual Mode configured systems. After a transition to Stand Alone, the microturbine checks that the utility grid voltage is within the protective relay settings for this time limit before reconnecting to the grid. It is the minimum amount of time the system will operate in the Hot Standby state. In Hot Standby, the engine is on and ready to generate power in Stand Alone mode if the utility grid loses power during the delay period. The initial factory setting for Reconnect Delay is 5 minutes. The timer can be set from 5 to 30 minutes. The user must be logged in with the current password to change this setting.

4.6.9. Active Power Foldback on Over Frequency

	NOTE: The user will be able to view the data on the Power Reduction at Over Frequency submenu without logging on with a password; to change any settings requires logging on with a user password.

The Active Power Foldback on Over Frequency submenu enables compliance with Verband der Elektrotechnik (VDE) requirements for low voltage systems. The settings for this function are adjustable so that the same features can be used in non-VDE applications as well. The submenu settings are as follows:

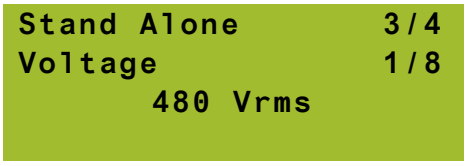
- Pwr OvFreq Ena/Dis: This setting enables or disables the Active Power Foldback on Over Frequency function.
- Min Freq: The Minimum Frequency setpoint is the grid frequency in Hz at which microturbine power reduction begins. Power reduction occurs at the rate specified by the power reduction gradient, as described below. For VDE compliance, the minimum frequency must be set to 50.2 Hz.
- %/Hz: This setting is the Power Reduction Gradient expressed as the percentage of power drop per Hz. The power reduction ramp occurs between the minimum frequency (above) and the maximum frequency. The maximum frequency is the Over Frequency setting as described in paragraph 4.6.7. For VDE compliance, the power reduction gradient must be set to 40%.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

4.7. Stand Alone Menu

⚠	ELECTRICAL WARNING: Protective Relay settings can only be changed by a Capstone Authorized Service Provider (ASP) using CRMS. Do not attempt to change any Grid Connect Protective Relay functions yourself. Injury to personnel and/or damage to equipment can occur.

The top-level Stand Alone menu establishes voltage and frequency output and is applicable only when the microturbine operates in Stand Alone mode. It also establishes the operational limits for voltage and frequency, and the rates at which voltage and frequency are increased to nominal on start up (Ramp Start). These limits are usually set when the microturbine is commissioned and are not changed once set. Contact your Capstone Authorized Service Provider for more data on the Stand Alone menu.

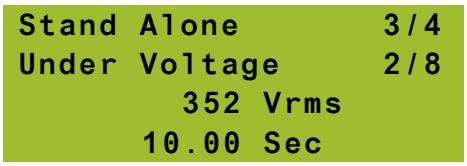


Refer to the following reference documents as required:

- Stand Alone Operation Technical Reference (410053)
- Model C30 Electrical Technical Reference (410000)

The Stand Alone submenus are described in the following paragraphs.

▶	NOTE: In the following submenus, the first line always displays the Stand Alone top level menu.



4.7.1. Voltage Submenu

The Voltage submenu is used to set the nominal RMS output voltage (line-to-line) in Stand Alone Mode. Voltage is adjustable from 150 to 480 in 1 Volt increments. Initial Factory Setting is 480 VAC line-to-line. The user must be logged in with the current password to change this setting.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

4.7.2. Under Voltage Submenu

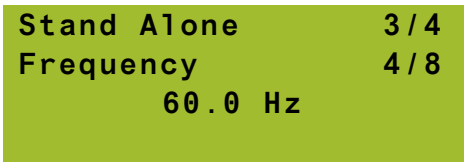
	NOTE: The Under Voltage submenu is read only, and no settings can be changed using the display panel. Protective Relay settings can only be changed by an Authorized Service Provider using CRMS.

The Under Voltage submenu shows the line-to-line voltage trip point and associated delay time. If the RMS voltage between any phases falls below this setting, the delay timer is started. If the voltage has not recovered at the end of this delay time, the system will shut down. Voltage is adjustable from 0 up to nominal. Initial Factory Setting is 352 Volts.

The Under Voltage Delay establishes the time period allowed for any phase voltage to fall below the Under Voltage limit. The delay is adjustable from 0.01 up to 10 seconds in 0.01 second increments. Initial Factory Setting is 10 seconds. This setting can only be changed by a Capstone ASP using CRMS.

4.7.3. Over Voltage Submenu

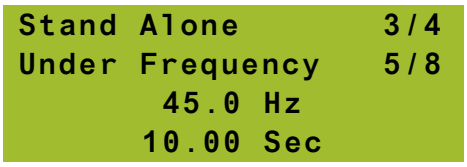
	NOTE: The Over Voltage submenu is read only, and no settings can be changed using the display panel. Protective Relay settings can only be changed by an Authorized Service Provider using CRMS.



The Over Voltage submenu shows the line-to-line voltage trip point and associated delay time.

If the RMS voltage between any phases rises above this setting the delay timer is started. If the voltage has not subsided by the end of this time span, the system will shut down. Voltage is adjustable from 528 down to nominal in 1 Volt increments. Initial Factory Setting is 528 Volts.

Over Voltage Delay establishes the time span allowed for any phase voltage to rise above the Over Voltage limit. The delay is adjustable from 0.01 to 10 seconds in 0.01 second increments. Initial Factory Setting is 10 seconds. This setting can only be changed by a Capstone ASP using CRMS.



Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

4.7.4. Frequency Submenu

The Frequency submenu establishes the nominal output frequency. This is adjustable from 45 to 65 Hz in 1 Hz increments. Initial factory setting is 60 Hz. The user must be logged in with the current password to change this setting.

4.7.5. Under Frequency Submenu

	NOTE: The Under Frequency submenu is read only, and no settings can be changed using the display panel. Protective Relay settings can only be changed by an Authorized Service Provider using CRMS.

The Under Frequency submenu shows the system under frequency trip point and associated delay time. If the output frequency falls below this under frequency trip point for the set delay time, the system will shut down. The frequency is adjustable from 45 to the nominal output frequency in 0.1 Hz increments. Initial Factory Setting is 45 Hz.

Under Frequency Delay is the time span allowed for output frequency to fall below Under Frequency (Hz) before the system will shut down. This is adjustable from 0.01 to 10 seconds in 0.01 second increments. Initial Factory Setting is 10 seconds. This setting can only be changed by a Capstone ASP using CRMS.

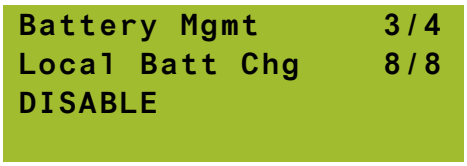
4.7.6. Over Frequency Submenu

	NOTE: The Over Frequency submenu is read only, and no settings can be changed using the display panel. Protective Relay settings can only be changed by an Authorized Service Provider using CRMS.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

The Over Frequency submenu shows the system over frequency set point and associated delay time. If the output frequency rises above this over frequency trip point for the set delay time, the system will shut down. The frequency is adjustable from 65 Hz down to the nominal output frequency, in 0.1 Hz increments. Initial Factory Setting is 65 Hz. If the output frequency exceeds the Over Frequency setting for the time delay setting, the system will shut down. The time delay is adjustable from 0.01 to 10 seconds in 0.01 second intervals. Initial Factory Setting is 10 seconds. This setting can only be changed by a Capstone ASP using CRMS.

4.7.7. MultiPac Minimum Power Submenu



The MultiPac Minimum Power submenu sets the minimum power level that a Stand Alone MultiPac must be able to provide before it switches to load operation. The kW setting is the minimum value of total power available from the MultiPac microturbines before the master microturbine commands the microturbine(s) to go into Load State and begins outputting power. This setting ensures that the system has enough power generating capability before power is allowed to be exported to the load and should be set to the maximum expected load. Initial Factory Setting is 0 kW.

The timeout period setting establishes the maximum time the MultiPac has to achieve the minimum power setting before the system shuts down automatically. This timeout setting is adjustable from 60 to 3600 seconds in 1 second intervals. Initial Factory Setting is 60 seconds.

Refer to the MultiPac Operation Technical Reference (410054) as required. The user must be logged in with the current password to change these settings.

4.7.8. Local Battery Charge Submenu

The Local Battery Charge <DISABLE/ENABLE> submenu is applicable to a microturbine that is not a MultiPac master. This submenu enables or disables a battery recharge when the microturbine is in Grid Connect mode Standby state, or in the Stand Alone mode Load state. The user must be logged in with the current password to change this setting.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

4.8. Unit Data Menu

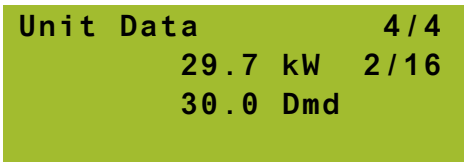
The user will be able to view the data on the various screens of the Unit Data Menu without needing to log on with a password, except when the maintenance password is required as noted in Table 1. The top-level Unit Data menu displays real-time data for each microturbine in a MultiPac system. The second line displays the unit number (1 thru 20), and the third and fourth lines displays data for that specific unit.

Data can be accessed from the master microturbine unit in a MultiPac system or from an individual microturbine using the display panel.

The Display Panel submenus related to Unit Data menu are listed in Table 1.

NOTE: In the following submenus, the first line always displays the Unit Data top level menu, and the second line displays the unit number.

Table 1. Unit Data Submenus



Submenu	Line 3	Line 4	Description
1/16	System State	Fault Status	System state and fault status.
2/16	kW	Demand	Actual kW output and commanded power level.
3/16	Power Factor	kVA	Actual power factor and kVA output.
4/16	Power Over Frequency Delta		Amount that power output is reduced during power foldback at over frequency.
5/16	Frequency	Voltage A	Output frequency and phase A voltage.
6/16	Voltage B	Voltage C	Phase B and phase C voltages.
7/16	Current A	Current B	Phase A and phase B currents.
8/16	Current C		Phase C current.
9/16	TET	RPM	Turbine Exit Temperature (°C or °F) and engine speed (RPM).
10/16	Fuel Pressure	Fuel %	Fuel pressure and fuel percentage.
11/16	Battery Voltage	Battery Current	Voltage and current of the battery pack.
12/16	Battery SOC	Last EQ Charge	Battery State of Charge percentage and last equalization charge time for battery.
13/16	Temperature	Ambient Pressure	Ambient temperature (°C or °F) and ambient pressure (psia or kPa).
14/16	Inverter Temp	Generator Temp	Inverter and generator temperatures.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

Table 1. Unit Data Submenus (Continued)

Submenu	Line 3	Line 4	Description
15/16	C30 Main Code Version		C30 main CPU software version
16/16	Hours	Starts	Running time in hours and number of starts.

Below is an example showing the kW Output and kW Demand (Dmd) submenu.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

5. Microturbine Preventive Maintenance

This section details the preventive maintenance procedures that must be performed on the Capstone Microturbine.

	ELECTRICAL WARNING: The microturbine system generates and uses voltage levels that can injure or kill. Obey all safety precautions when you work with or around electrical equipment.

	NOTE: Failure to provide proper maintenance will void the microturbine warranty. Users do not perform the following microturbine maintenance procedures, but it is important for users to be aware of them.

Only Capstone Authorized Service Providers can access the inside of the microturbine enclosure (except for accessing the User Connection Board in the UCB/JUCB).

Only Capstone Authorized Service Providers can perform maintenance on the microturbine components.

5.1. Scheduled Maintenance

Preventive maintenance of the C30 microturbine includes performing scheduled maintenance of its components at regular intervals. The list of maintenance schedules for C30 components is contained in the Microturbine Standard Maintenance Schedule Work Instructions (440000). This document is available from your Authorized Service Provider for reference. Only Authorized Service Providers are permitted to access microturbine components and perform these maintenance tasks.

5.2. Preventive Maintenance

Preventive maintenance activities for the microturbine electronics and engine filter, external fuel filter, and for the battery pack are described in the following paragraphs.

5.2.1. Microturbine Inlet Air Filter

	CAUTION: The microturbine requires clean, dust free air for operation. Do not operate the microturbine without the inlet air filter in place or damage to the equipment can occur.

The engine air inlet filter should be inspected periodically to ensure unrestricted flow of clean combustion and cooling air to the generator and turbine engine. The recommended interval for this inspection is every 4,000 hours of operation or annually, based on clean environment operation.

Outdoor operation, especially in areas subject to wind and airborne dirt or dust, will require a significant reduction in this interval. If the microturbine is operated under unusual conditions, the filters should be checked more frequently to determine a site-specific service interval. Filters may require more frequent attention based upon environment, installation, and/or air quality.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

If specifically permitted by the Capstone Authorized Service Provider, the end user can replace the inlet air filter element. The Capstone Authorized Service Provider will provide instruction and oversight.

5.2.2. External Fuel Filter

⚠	WARNING: Microturbine fuel is flammable and explosive. An explosion can cause death or injury to personnel and/or damage to equipment. No open flame or smoking is allowed near the microturbine.

The optional external fuel filter element should be replaced periodically to ensure unrestricted flow of clean fuel to the microturbine. This is necessary for microturbine optimal performance. The recommended interval for this replacement is every 8,000 hours of operation. The service interval is based on typical clean fuel supplies found in the United States. Filters may require more frequent attention based upon environment, installation, and/or fuel quality.

If specifically permitted by the Capstone Authorized Service Provider, the end user can replace the external fuel filter element. The Capstone Authorized Service Provider will provide instruction and oversight.

5.2.3. Battery Maintenance During Storage

The battery pack is a lead acid type and completely sealed. The battery pack should be fully charged prior to storage and charged again prior to being put back into service. If the microturbine is equipped with a battery, it includes a battery isolation switch.

Microturbines equipped with the Stand Alone option require maintenance for the battery pack. The battery pack is maintained through software during regular use, however battery packs stored for extended periods will become discharged and require service. Recharge intervals for battery packs in storage with the battery breaker **OPEN** are dependent upon the ambient storage temperatures.

The isolation switch should be set to OFF if the microturbine is to be serviced or transported, or if the microturbine will not be operated for a period of greater than two weeks. See Figure 4 for a view of the isolation switch.

The maximum recharge interval is specified in Table 2.

⚠	CAUTION: The recharge intervals shown in the following table also apply to the Model C30 UCB battery stored unplugged from the UCB Board.

Table 2. Maximum Recharge Intervals

Storage Temperature °C (°F)	Recharge Interval - Days
<20 °C (68 °F)	180
20 °C (68 °F) to 30 °C (86 °F)	90
30 °C (86 °F) to 40 °C (104 °F)	45
40 °C (104 °F) to 50 °C (122 °F)	20
50 °C (122 °F) to 60 °C (140 °F)	5

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

	NOTE: The maximum recommended storage temperature for a battery pack is 40 °C (104 °F). Long-term storage above this temperature may impact battery pack life.

	NOTE: Capstone does not recommend storage over six months without charging or one year with charging, as it may contribute to a shortened battery life in the field.

5.2.3.1 Sleep Mode

During the Sleep mode, the battery pack should be at a higher state of charge since it is called upon to start the microturbine and produce transient power immediately after start-up. This reduces the recharge intervals for Sleep state. Recharge intervals for battery packs in Sleep mode are dependent upon the ambient temperatures as specified in the following table:

	NOTE: The recharge intervals in the following table do not apply to the Model C30 UCB battery.

Table 3. Maximum Recharge Intervals in Sleep Mode

Ambient Temperature °C (°F)	Recharge Interval - Days
<20 °C (68 °F)	15
20 °C (68 °F) to 30 °C (86 °F)	15
30 °C (86 °F) to 40 °C (104 °F)	8
40 °C (104 °F) to 50 °C (122 °F)	4
50 °C (122 °F) to 60 °C (140 °F)	2

	NOTE: A Grid Connect Idle Recharge or the Capstone External Battery Charger option may be used to perform the recharge as required. The battery voltage must be greater than 180 VDC on the C30 to perform a Grid Connect Idle Recharge.

When the recommended recharge interval is reached, the battery pack voltage should be recorded, and the battery packs must be recharged. If the microturbine cannot be operated, the optional Capstone External Battery Charger may be used to recharge the battery pack. Contact your Capstone Authorized Service Provider for details on the Capstone External Battery Charger.

5.2.4. Battery Charge Management

The microturbine system is designed to keep the battery approximately 80% charged during operation. This allows for sourcing and sinking of power transients in Stand Alone Mode. After an OFF command the system will recharge the battery to 90% before shutting down. This recharge can take up to 20 minutes.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

During normal use, battery cells become charged unequally. Periodically, the microturbine will perform an equalization charge cycle to keep the battery in top condition. Allowable times (in 4-hour minimum windows) must be programmed for when this can occur. Use the CRMS to set these allowable time windows, or contact your Capstone Authorized Service Provider for proper setup.

5.2.4.1 Manual Battery Pack Equalization Charge

If the system is not operating or is in storage, a manual equalization charge may be commanded if the system is connected to the electric utility grid (refer to Grid Connect Operation on page 23). Initiate a Battery Pack Equalization charge as follows:

Using Display Panel:

1. System Data Menu > Enter Password. The factory default User level password is 87712370.
2. Navigate to Stand Alone > Local Batt Chg > Enable. Press Accept.

Using CRMS or APS – CRMS:

1. Select Settings > Battery Management. Set Equalization Charge Slider to Enable.

	NOTE: A battery pack equalization charge can take up to 4 hours.

5.2.5. Warranty

Each microturbine ships with a standard warranty. Extended warranties are available. Contact your Authorized Service Provider for details on Capstone warranty terms and conditions.

6. Troubleshooting

This section details basic troubleshooting procedures and steps that the user can perform on the Capstone Microturbine without accessing the inside of the enclosure. Only Capstone Authorized Service Providers are permitted access to the inside of the enclosure.

	ELECTRICAL WARNING: The microturbine system produces and contains high voltage. High voltage can injure or kill. Obey all safety procedures when you work around electrical equipment. Only Capstone Authorized Service Providers are permitted access to the inside of the enclosure.

6.1. Incidents

The microturbine continuously monitors a wide variety of parameters both internal and external to the system. An incident occurs whenever a measured parameter falls outside prescribed limits. Incidents include (but are not limited to) low fuel pressure, utility interruptions, and utility over voltages.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

6.2. Incident System Severity Levels

When the system detects an incident, it may take one of several actions, depending on the system severity level (SSL). Actions range from simply noting the occurrence and continuing to operate, to immediate shutdown of the system. The action taken depends upon the severity of the incident. The system will attempt a restart only if the severity of the incident will allow it.

Depending on the parameter and the magnitude of the incident, the event is classified as either a warning or a fault.

A warning incident is a condition that is outside normal operating parameters, but which does not require a system shut down.

A fault incident is a condition under which the system shuts down to prevent possible damage to the microturbine or unsafe operating conditions.

6.3. Incident Display Format

When an incident occurs, the display panel or hazardous location controller displays a fault description (e.g., **GC INTERLOCK**) and the fault code (e.g., **7002**). This incident message appears on line three of the System State Fault Status submenu of the Unit Data menu (refer to page 52). Refer to the C30/C65 Offshore and Hazardous Location Application Guide (480010) for a description of the incident display on the hazardous location controller.

The fault code is a number up to five digits in length that, along with the fault code description, helps the Capstone Authorized Service Provider determine the cause of the incident.

6.4. Incident Records

When an incident occurs the system records a snapshot of conditions at that time, called an Incident Record. Several incidents can occur in quick sequence, and the microturbine will continue to operate or shut down depending on the severity of the incident(s).

The Incident Record can only be accessed by an Authorized Service Provider, using CRMS. The Incident Record contains the incident name, incident code number, date and time of the incident, and conditions of the turbine at the time of the incident. Some examples of the data contained in the incident record are as follows:

- Cumulative number of starts
- Output power
- Engine speed
- Turbine exit temperature
- Fuel device command
- Ambient temperature
- Voltage and current on each phase

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

- Frequency
- DC bus and power supply voltage
- Several internal system temperatures

6.5. Isolation Messages

The Incident Record also contains an Isolation Message that describes the type of incident and if it is a Warning or a Fault. The Isolation Messages are listed below and described in the following paragraphs.

- Internal Warning or Fault
- Fuel Warning or Fault
- Grid Warning or Fault
- Lo-Temp Warning or Fault
- Hi-Temp Warning or Fault
- Hi-Alt Warning
- E-Stop Fault
- User Connection Fault

6.5.1. Internal

An Internal Incident is one that is within a major subsystem of the microturbine and is not recoverable by the user. In the case of an Internal Fault, the user should reboot the system. If unsuccessful in restoring normal operation, a Capstone Authorized Service Provider will be required to initiate repair of the microturbine.

6.5.2. Fuel

The user should initially check the fuel supply to the microturbine. Verify that the shut off valve is open. Ensure the line has the correct fuel pressure. Check the optional external filter to ensure that it is not blocked. If the problem persists, call your Capstone Authorized Service Provider.

6.5.3. Grid

This incident is likely to be due to an electric utility grid disturbance. Check all breakers and fuses to ensure they are not tripped before troubleshooting. Reboot the system and attempt a start. If the problem persists, call your Capstone Authorized Service Provider.

6.5.4. Lo-Temp/Hi-Temp/Hi-Alt

Generally, these incidents are due to ambient conditions that are outside the design envelope of the microturbine. Possible solutions would be to adjust the room temperature, ensure that adequate ventilation is provided, and verify that the air input and exhaust are not obstructed. Continued operation under these conditions may affect operation and cause damage to the microturbine.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

6.5.5. E-Stop

If the event display reads MANUAL E-STOP, fix the original problem that initiated the E-Stop, as this fault must be cleared before it is safe to resume operation. Next, check the optional emergency stop button and verify that it has been activated. If it has, reset the button, cycle power off to the microturbine for 30 seconds, and turn the power back on. The fault should clear, and the system should resume operation. If it does not, call your Capstone Authorized Service Provider.

6.5.6. User Conn (User Connection)

User Connection incidents can be due to incorrect Grid Connect / Stand Alone settings, mode transition faults when in Dual Mode operation, or to indicate a possible problem with external equipment connected to the microturbine.

6.6. Basic Troubleshooting Procedures

Basic Troubleshooting procedures are presented in the following paragraphs.

⚠	WARNING: Users do not perform some of the following microturbine troubleshooting procedures, but it is important for users to be aware of them. Only Capstone Authorized Service Providers are permitted access to the inside of the enclosure. Users are permitted to open the User Connection Bay to access the user port.

6.6.1. Troubleshooting Procedures for Standard C30 Model

6.6.1.1 No Lights on Display Panel

If no lights are present on the Display Panel, troubleshoot as follows:

⚠	WARNING: Only Capstone Authorized Service Providers can perform the following troubleshooting steps.

1. If Stand Alone equipped, open the front door. Make sure the Battery Isolation switch is set to ON. Then press the BATT START button on the Display Panel.
2. If Grid Connect, verify electric utility grid voltage is present on the phase terminals in the Power Bay.

6.6.1.2 No Attempt to Start after ON Command

If no attempt is made to Start, after an ON Command, troubleshoot as follows:

1. Verify that the current communication device (Display Panel or user port) is the control device. Refer to Control Device Authority and Priority on page 22.
2. Verify that the ON command is consistent with the currently active dispatch mode. Refer to the section on Display Panel Menus for more data.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

6.6.1.3 Start Attempt Fails

If a Start Attempt fails, troubleshoot as follows:

1. If the system attempts but fails to start, an incident code will be registered as described in the previous sections.
2. The troubleshooting procedure is the same as for Unexpected Shut Down or Warning in the next section.

6.6.1.4 Low Power Output

If Low Power Output is perceived, troubleshoot as follows:

1. Check your inlet fuel supply. Verify that the fuel isolation valve is open, and that the inlet fuel line has the correct fuel pressure.
2. Check your external fuel filter. Verify that the external fuel filter (if installed) is not blocked.
3. Check your inlet airflow, ventilation, and exhaust airflow. Verify that the inlet airflow and the exhaust airflow are not obstructed.
4. Check your ambient operating conditions and verify the expected power output due to temperature, altitude and other derating factors. Verify that ambient conditions are not outside the microturbine design envelope.

6.6.1.5 Unexpected Shut Down or Warning

When a warning incident occurs, no action is required by the user. When a fault incident occurs, the troubleshooting steps are as follows:

1. Attempt to restart. If unsuccessful, then verify the fuel, air, and electrical supply to the microturbine.
2. Attempt to restart. If unsuccessful, then enter the user password and reboot the system through the Display Panel.
3. Attempt to restart. If unsuccessful, then cycle the power by shutting off power to the system, waiting 30 seconds, and turning the power back on.
4. Attempt to restart. If unsuccessful, then note the event number listed on the Display Window, and then call your Capstone Authorized Service Provider for assistance.

When required, your Capstone Authorized Service Provider will determine whether the event noted requires a service call or if the user can perform fault correction on site. Generally, the Service Provider will initiate a service call for Internal Fault codes. In most other cases, the Service Provider will recommend a possible course of action to return the microturbine to operational status.

6.6.2. Troubleshooting Procedures for C30 Hazardous Location Model

Refer to the C30/C65 Offshore and Hazardous Location Application Guide (480010) for troubleshooting procedures that apply to the hazardous location microturbine.

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

Notes

Capstone reserves the right to change or modify, without notice, the design, specifications, and/or contents of this document without incurring any obligation either with respect to equipment previously sold or in the process of construction.

7. Product Support

Capstone Turbine Corporation is dedicated to the concept of quality to the owners and users of every microturbine. Your microturbine should operate without trouble. If you require maintenance support or other technical assistance, please contact your Capstone Authorized Service Provider.

Capstone Technical Support can assist you by providing contact data for your Capstone Authorized Service Provider.

Fill in this record with information about your Capstone Authorized Service Provider to allow easier access.

HVAC Guide Specifications
Heat Pump Air Cooled Liquid Chiller

Size Range:
5 Tons Nominal

Multiaqua Model Number:
MACH-060-1

Part 1 — General

1.01 SYSTEM DESCRIPTION

Multiaqua air cooled liquid heat pump chiller are designed using a scroll compressor, low sound condenser fans and a high efficiency pump.

1.02 QUALITY ASSURANCE

A. Unit shall be certified in accordance with U.L. Standard 95, latest revision (U.S.A)
B. Construction shall comply with ASHRAE 15 Safety Code, NEC and ASME applicable codes (U.S.A. codes)
C. Manufactured in a facility registered to ISO 9002, Manufacturing Quality Standard.
D. ETL Certified.
E. Fully load run tested at the factory.
F. Damage resistant packaging.

1.03 DELIVERY, STORAGE AND HANDLING

A. Packaged and readied for shipment from the factory.
B. Unit controls shall be capable of withstanding 150F storage temperatures in the control compartment.
C. Stored and handled per unit manufacturer's recommendations.

1.04 WARRANTY

A. Complete unit, first year parts only warranty against manufacturer's defects.
B. Compressor, years 2-5, parts only warranty against manufacturer's defects.

Part 2 — Products

2.01 EQUIPMENT

A. General:
   1. Factory-assembled, air cooled heat pump chiller.
   2. Shall be assembled on heavy gauge steel mounting/lifting rails.
   3. Contained within the unit cabinet shall be all factory wiring, piping controls, refrigerant charge (R-407c), and special requirements prior to field start-up.
   4. Brass body strainer with 20 mesh screen and blow down shall be supplied in cabinet as a field installable accessory.

B. Unit Cabinet:
   1. Cabinet shall be galvanized steel casing with a baked polyester powder finish.
   2. Cabinet shall be capable of withstanding 500-hour salt spray test in accordance with the ASTM (U.S.A) standard.

C. Condenser Fans:
   1. 4-blade, condenser fans shall be direct-driven, aluminum construction, and shall be statically and dynamically balanced with inherent corrosion protection.
   2. Air shall be discharged horizontally.
   3. Motors and fans shall be protected by coated steel wire safety guards.

D. Fan Motors:
   1. Condenser fan motors shall be single speed, direct drive.
   2. Totally enclosed.
   3. Permanently lubricated sleeve bearings and Class F insulation.
   4. Internal overload protection.

E. Compressors:
   1. Fully hermetic scroll type compressor.
   2. Direct Drive, 3500 rpm (50/60 Hz)
   3. Compressor shall be suction gas cooled.
   4. Internal motor protected.
   5. Protected by high pressure and loss of charge devices.
   6. External vibration isolation.

F. Pump:
1. Circulating pump shall be stainless steel with high efficiency enclosed motor.
2. Unit shall have chilled liquid solution piping to the exterior of the cabinet.
3. Shall be capable of a max liquid solution pressure of 60 psig.

G. Evaporator:
1. Evaporator shall have one independent refrigeration circuit and one liquid solution circuit.
2. Rated for a refrigerant side working pressure of 450 psig and shall be tested for a maximum fluid-side pressure of 150 psig.
2. Single pass, ANSI type 316 stainless steel, brazed plate construction.
4. Insulated with closed cell, elastometric foam (ASTM 518)

H. Condenser:
1. Shall be air cooled with integral sub-cooler.
2. One independent refrigeration circuit.
3. Constructed of rifled copper tubing mechanically bonded to aluminum fins.
3. Tubes shall be cleaned, dehydrated and sealed.
4. Assembled condenser coils shall be leak tested and pressure tested at 450 psig.

I. Refrigeration Components:
1. Refrigeration circuit components shall include sight glass, reversing valve, thermal expansion device, and complete operating charge of both refrigerant (R-407c) and compressor POE oil.

PART 3-Controls and Safties

3.01 Controls

A. Controls:

Unit control shall include the following minimum components.
1. Control transformer to serve all controllers, relays and control components.
2. Pump bypass timer
3. Compressor recycle timer.
4. Optional fan cycling control for low ambient operation.
5. Flow switch.
6. Defrost printed circuit board and thermostat.
7. Leaving water temperature thermostat with thermistors installed to measure cooler leaving water flow.
8. Manual heat/cool changeover switch.

B. Unit controls shall include the following functions.
1. Capacity control based on leaving chilled fluid temperature. Temperature setpoint accuracy of +/- 1.0F.
2. Liquid solution pump start/stop control.

3.02 Safeties:

A. Unit shall be equipped with thermistors and all necessary components in conjunction with the control system to provide the unit with the following protectants:
1. High refrigerant pressure.
2. Low liquid solution flow.
3. Thermal overload.
4. Short cycling.

PART 4 Operating Characteristics:

4.01 Temperatures

A. Unit shall be capable of starting and running in cooling mode at outdoor ambient temperatures from 55°F to 120°F.

B. Optional Low Ambient Kit shall allow starting and running at outdoor temperatures to – 20°F. A field supplied and installed crankcase heater must be used when operating at these temperatures.

C. Unit shall be capable of starting and running in heating mode at outdoor ambient temperatures from 70°F to 17°F.

D. Unit shall be capable of starting up in cooling with a maximum 80°F and a sustained 70°F entering liquid solution temperature to the evaporator.

E. Unit shall be capable of starting up in heating with a minimum 55°F liquid solution temperature.

F. Minimum 10% Propylene Glycol solution is required. For outdoor temperatures below 32°, reference MAC Glycol Solution Data Table.

4.02 Electrical Requirements

A. Primary electrical power supply shall enter the unit at a single point.
B. Electrical power supply shall be rated to withstand 120°F operating ambient temperature.
C. Unit shall be available in 208/230-01-50/60.
D. Control points shall be accessed through a terminal block.

		Supply Circuit Ampacity							

Multiaqua chillers are designed to operate exclusively with R407c refrigerant in a self-contained, pre-charged refrigerant system. Do not access the closed refrigerant circuit for any reason other than after-sale, after installation component replacement. Routine maintenance and service is to be performed by qualified personnel only.

These specifications are subject to change without notice.

Glycol Solution Data				
Propylene Glycol %	Water Flow	Capacity	Min. Ambient Temp	GPM Adjustment= 100% Capacity
10%	x 1.020	x 0.99	26°F	x 1.01
20%	x 1.028	x 0.98	18°F	x 1.03
30%	x 1.036	x 0.98	8°F	x 1.07
40%	x 1.048	x 0.97	-7°F	x 1.11
50%	x 1.057	x 0.96	-29°F	x 1.16

Example: 30% glycol solution.
Maximum Flow Rate = 12gpm x 1.036
System capacity x .98
Use Propylene Glycol Only

Important

If the outside temperature is expected to fall below freezing (32°F) in the area the Multiaqua chiller is to be installed; the installer must take the following precautions. Failure to do so will void the warranty.

To not engage in cold ambient mitigation will result in the failure of components such as the heat exchanger, piping, circulating pump, etc… and or property damage.

• Keep the liquid solution at a minimum of ten percent propylene glycol even in areas where there is no danger of freezing.
• The percentage amount of glycol recommended is dependent on the expected ambient temperatures and the solution makeup recommendation of the glycol manufacturer. Refer to the Glycol Solution Data table above.
• Ensure the system circulating pump is in a constant energized mode to keep a continuous circulation of liquid solution.

The Multiaqua chiller is a self-contained air-cooled condenser, coupled with an insulated brazed plate heat exchanger (evaporator). The system utilizes a scroll compressor to circulate refrigerant between the condenser and heat exchanger. The refrigerant is metered into the heat exchanger with a thermostatic expansion valve. Protecting the system are high and low pressure switches as well as a pump flow switch.

Liquid solution (water and propylene glycol; minimum 10 % is required) is circulated through the heat exchanger by an externally mounted pump. The liquid solution flows through the heat exchanger to the system supply piping and on to the air handlers.

Low ambient kits are available for operating ambient temperatures down to -20 degrees Fahrenheit. The low ambient kit consists of a pressure activated fan control.

Multiaqua Heat Pump Chiller Manual

The Multiaqua Chiller System is the only air conditioning/refrigeration system of its kind in the world today offering the degree of application flexibility described in the following manual.

The Multiaqua Chiller System is not only unique in its application flexibility; it is unique in superior quality, rated capacity and rugged durability. When installed in accordance with these instructions the system will deliver years of trouble free service.

Proper equipment sizing, piping design and installation are critical to the performance of the chiller. This manual is meant to be a "how to" introduction to piping and installing the Multiaqua Chiller System.

RECOGNIZE THIS SYMBOL AS AN INDICATION OF IMPORTANT SAFETY OR INSTALLATION RELATED INFORMATION.

Pressure loss information for a Composite Piping System has been used in preparing this manual. Web site information addresses are supplied throughout this manual for piping and accessory information. The plumbing industry also has pressure drop information on ferrous and copper piping systems, which will vary from the composite pipe system outlined in this manual. Composite pipe is the recommended pipe for Multiaqua Chiller System installations; however existing piping systems can be adapted to the system.

The following sections will describe each component, and how it functions within the system. Installation information is supplied where appropriate. The piping design section (page 26) will explain the design and layout out of the piping system from a "how to" perspective. Following the examples provided will enable the installer to determine the correct pipe and accessory sizing, as well as equipment location. It is important to know before installation if the proposed system will operate correctly, and doing a formal layout of a new application or review of an existing piping system will make that determination.

Throughout this manual the term **liquid solution** is used in place of water. The chiller circulates a solution of water and Propylene Glycol.

It is essential to operate the system with a minimum of 10% propylene glycol.

DO NOT OPERATE THIS SYSTEM USING WATER ALONE!

FOR PROPER LIQUID SOLUTIONS MIX RATIOS, REFER TO PAGE 6 OR THE GLYCOL MANUFACTURER'S RECOMMENDED MIX RATIOS.

System Description & Sequence of Operation

The Multiaqua MACH (Multiaqua Air Conditioning Heat Pump) is self-contained Reverse Cycle Chiller featuring dual condenser fans, direct expansion outdoor coil (air side) and a brazed plate liquid solution heat exchanger (liquid side). The outdoor coil acts as a condenser expelling heat from the refrigeration process in cooling and is an evaporator coil in the reverse cycle heat pump mode. The MACH utilizes a SporlanTM thermostatic expansion valve (TXV) for the outdoor coil and a piston type-metering device on the liquid solution heat exchanger. In the cooling mode the outdoor coil (condenser) expansion/check valve is bypassing liquid refrigerant to the liquid solution heat exchanger (evaporator) metering device. In the heating mode (reverse cycle) the outdoor coil (evaporator) expansion/check valve is receiving condensed liquid refrigerant from the liquid solution heat exchanger (condenser) metering device. Integral safety features are included on all models; including a low water flow control, a refrigerant high pressure switch and a five (5) minute delay on break timer.

The system, depending on which mode has been selected (HEAT or COOL) will provide either a chilled or heated liquid solution (water and Propylene Glycol mix). The solution temperature is controlled by the liquid solution temperature control (DTC) which is factory set at 115°/44° (F). The liquid solution is circulated through the heat exchanger by an internal stainless steel pump, which is protected with Silicon Carbide-Viton Seals, to the system supply piping and to the airside fan coil/s. Avoid switching over from heat to cool when the liquid solution temperature is above 80 degrees F. This could cause damage to chiller components.

⚠ **The Pump will not self-prime. A full column of liquid solution is necessary for operation. Do not attempt to operate the pump without a full charge of liquid solution or seal damage will occur.**

If the external load is a series of fan coils, each one must contain an individual zone valve to control the liquid flow. The zone valves are selected to provide the flow rate needed to achieve the proper capacity from the fan coil they control.

The temperature of the circulating liquid solution is controlled for either mode by a two (2) stage DTC (digital temperature control) with adjustable set points for precision control. A system sequence of operation, individual control description, troubleshooting information and a schematic are included in the controls section of this manual.

The liquid solution piping system suggested for new installations is a composite piping system. The composite system delivers easy on installation, low-pressure drops and will not rust or corrode. Existing and new copper or ferrous piping systems are adaptable to the Multiaqua system.

It must be recognized that ferrous pipe may cause accelerated deterioration of the brazed plate heat exchanger and could void the heat exchanger warranty.

**Also Included in this manual is a piping section that includes piping system design, installation and balancing.*

Equipment sizing for a Multiaqua solution system can utilize Load Diversity. Diversity is described as the actual amount of cooling or heating needed by various sections of a structure at a given time. Conventional central ducted air systems are designed for peak load conditions and must supply peak load capacity at all times to the conditioned space whether or not a demand exists for other zones. This introduces great system inefficiencies. A system sized to take advantage of diversity would determine the load by the time of day, building exposure, usage and adjust accordingly. To further define load diversity a structure utilizing a conventional central ducted air system would require six (6) tons of capacity at peak load. However, with the Multiaqua -MACH the specific load can be addressed and a smaller system utilized (potentially four (4) or (5) tons instead of the full capacity's 6 ton system. By taking advantage of load diversity, the system supplies the necessary amount of capacity to the spaces or zones on an as needed basis instead of producing a larger capacity 100% of the time.

To clarify this concept we will adapt the above information to a basic Multiaqua System. Utilizing diversity and a MACH-060 five (5) ton reverse cycle chiller we can supply chilled liquid solution to six (6) MHWW-12 (1) ton fan coils. Three (3) of which are located in rooms facing west and three (3) in rooms facing east. Diversity dictates that the high load zones (spaces) in a building need more cooling during different times of the day. A cooling load in the morning (AM) would be greatest for portions of a structure facing east. During midday spaces with skylights or upper floors or multi-floor structures impose more loads on the system. In the afternoon (PM) the load shifts to western facing spaces of the structure. The Multiaqua system will adjust to load by supplying chiller or heated liquid solution to where and when it's needed depending on the changing load of the structure. In this simple example, it would be possible for a five (5) ton system to handle what would normally be a six-ton load on a conventionally ducted system.
Load diversity can best be determined by referring to the ACCA (Air Conditioning Contractors of America) Manual "J", refer to Appendix A-2, Multi-Zone Systems. ACCA can be located at the following Internet address: www.acca.org.

ELECTRICAL AND PHYSICAL DATA

The information contained in this manual has been prepared to assist in the proper installation, operation and maintenance of the chiller. Improper installation, or installation not made in accordance with these instructions can result in unsatisfactory operation and/or dangerous conditions and can cause the warranty to become void. Read this manual and any instructions packaged with separate equipment required to make up the system prior to installation. Retain this manual for future reference.

 Separate and independent power supplies and disconnects must be provided. These chillers have separate and discreet power requirements within one cabinet.

 All power to the chiller must be turned off prior to opening cabinet and or servicing.

 Failure to properly ground chiller can result in death.

 Disconnect all power wiring to chiller before maintenance or service work. Failure to do so can cause electrical shock resulting in personal injury or death.

 All wiring must be done in accordance with the NEC (National Electric Code) as well as state and local codes, by qualified electricians.

 Product warranty does not cover any damages or defect to the chiller caused by the attachment or use of any components, accessories or devices (other than those authorized by the manufacturer) into, onto or in conjunction with the chiller. You should be aware that the use of unauthorized components, accessories or devices may adversely affect the operation of the chiller and may also endanger life and property. The manufacturer disclaims any responsibility for such loss or injury resulting from the use of such unauthorized components, accessories or devices.

 Upon receiving the chiller and components, inspect for any shipping damage. Claims for damage, either apparent or concealed should be filed immediately with the shipping company.

 No liquid other than the solution of water and Propylene Glycol ,mixed in accordance with Glycol Solution Data on page 6, shall be used in the piping system.

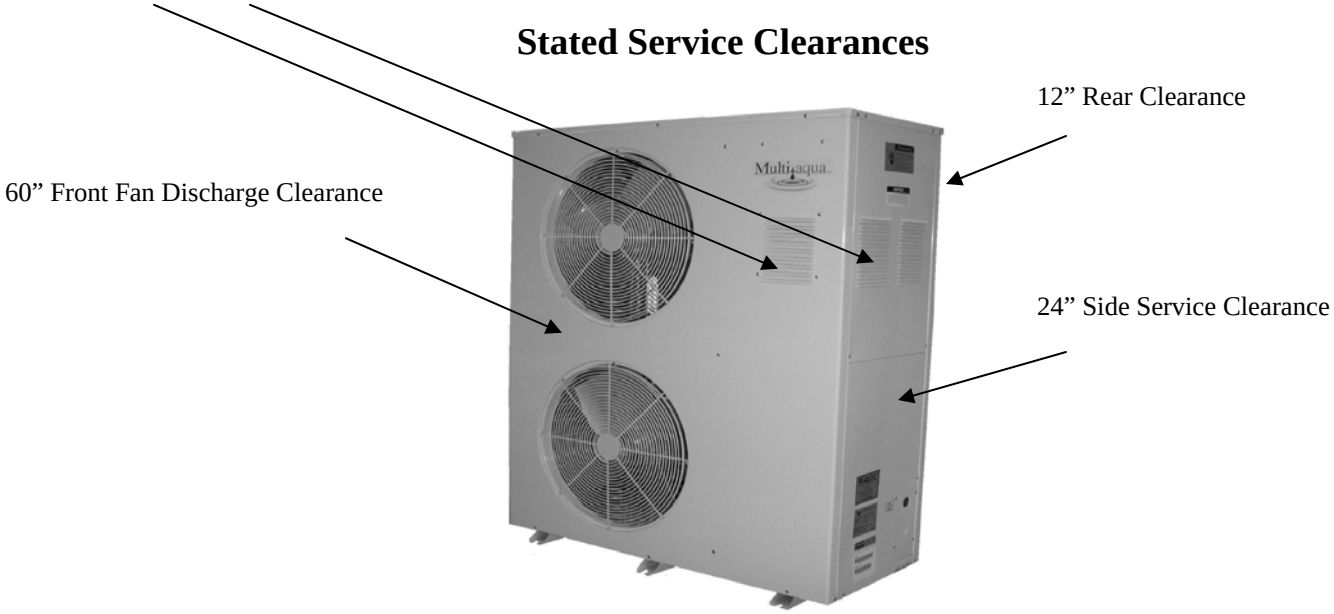
 Corrosive environments may subject metal parts of the chiller to rust and deteriorate. The oxidation could shorten the chiller's useful life. Corrosive elements include salt spray, fog or mist in sea coastal areas, sulfur or chlorine from lawn watering systems and various chemical contaminants from industries such as paper mills and petroleum refineries.

If the unit is to be installed in an area where contaminates are likely to be a problem, special attention should be given to the equipment location and exposure.

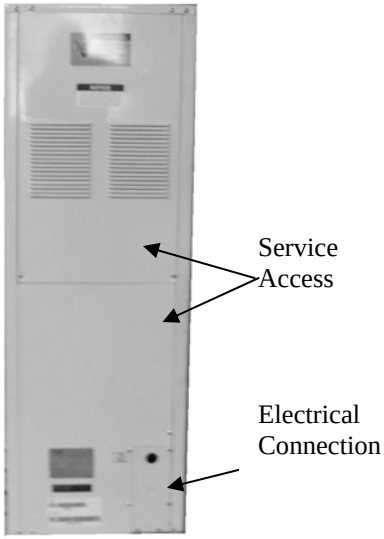
- Avoid having lawn sprinklers spray directly on the chiller cabinet.
- In coastal areas, locate the chiller on the side of the building away from the water front.
- Elevating the chiller off of its slab or base enough to allow air circulation will help avoid holding water in contact with the cabinet base.
- Regular maintenance will reduce the build-up of contaminants and help protect the cabinet finish.
- In severe locations having the chiller coated with an "epoxy" or other coating formulated for air conditioning systems located in coastal areas may be necessary.

Consult local building codes or ordinances for special installation requirements. When selecting a site to locate the chiller, consider the following:

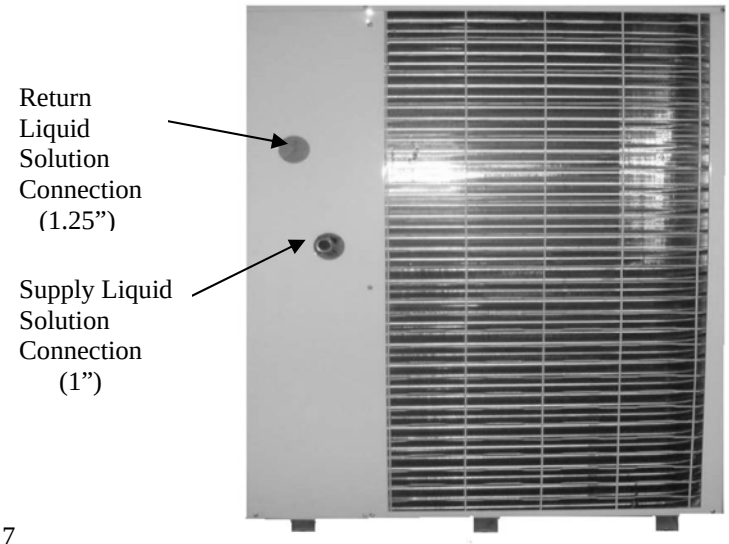
• A minimum clearance of 60” on the front fan discharge, 12” on the rear air inlet and a 24” clearance is required on the service side.



• The chiller can be located out or indoors. If installed indoors there must be 4500 cfm of outdoor air changes circulated through the mechanical room to sufficiently operate the chiller. No ductwork can be connected to the chiller’s condenser or condenser fans.

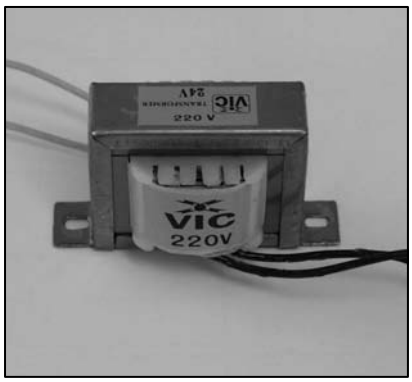


• If a concrete slab is used, do not connect the slab directly to any building’s foundation or structure to prevent sound transmission.

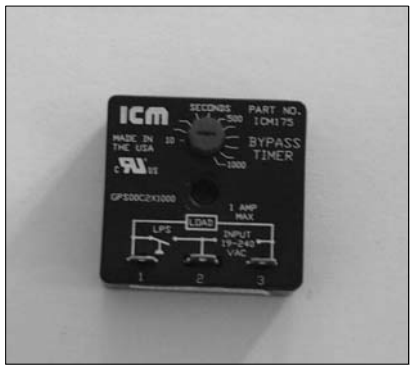


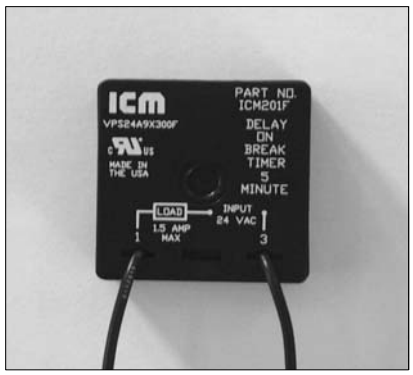
• Locate the slab on a level surface that is above grade to prevent ground water from entering the chiller cabinet.

Regular cleaning of the cabinet air filters will be necessary. The filters clean the air which cools the circulation pump.



Stated Service Clearances

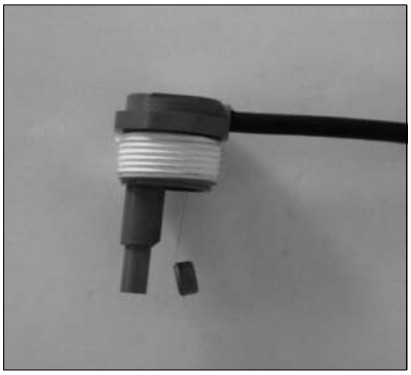




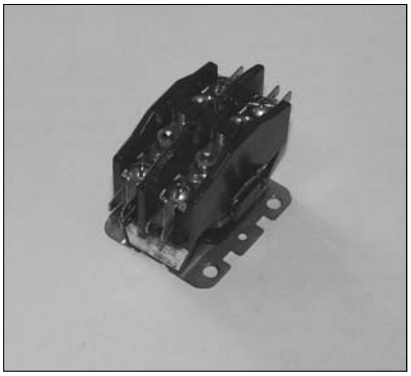
Description of Electrical Controls

Control Transformer: The control transformer is rated at 24 vac, 40 va (1.6 amps @ 24vac)

Pump Bypass Timer: The pump bypass timer is a 24 vac, 3-wire control. When energized the timer will bypass the flow switch for 10 seconds (by creating a circuit to the pump relay), energizing the pump relay, allowing the pump to operate long enough to close the flow switch. In a normally operating system the flow switch will stay closed powering the pump relay in series with the low and high- pressure switches. Should the flow switch open, the timer can only be reset by opening and closing the chiller's line voltage disconnect.



Refrigerant System Timer: The refrigerant timer is a 24 vac, 5-minute delay on break, 20wire timer. The normally closed contacts of the timer energize the compressor contactor through the chilled solution control. When the chilled solution control contacts open, the timer delays by opening its contact for 5-minutes before resetting to the closed position.



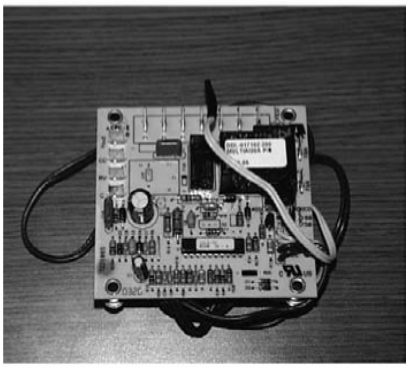
High Pressure Switch: The high-pressure switch is an automatic reset control that senses compressor discharge line pressure. It opens at 400 PSIG and closes at 300 PSIG.

Description of Electrical Controls (continued)

Flow Switch: The flow switch senses liquid solution flow. The paddle of the switch is inserted through a fitting into the pump discharge line. Liquid solution flow deflects the paddle closing the switch. The flow switch is position sensitive. The arrow ↑ on the switch must point in the direction of liquid solution flow.

Compressor Contactor The compressor contactor energizes the compressor through the two or three normally open contacts. The contactor coil operates (closes the contacts) when energized by 24 vac.

Pump Relay / Contactor: The pump relay energizes the pump through a normally open contact. The pump relay coil operates (closes the contact) when energized by 24 vac.



Liquid Solution Temperature Contro The liquid solution temperature control is an adjustable microprocessor based temperature control. This control receives temperature information from a thermistor located on the liquid solution supply line. A liquid crystal display continually indicates liquid solution temperature. The control is mounted inside the chiller cabinet.

Description of Electrical Controls (continued)

Mechanical Switch: The mechanical switch provided in the system allows the operator to choose between one (1) of three (3) modes, "HEAT", "COOL", or system "OFF". In the system "OFF" mode all heating or cooling functions will be suspended and only liquid circulation will continue.

Defrost_Control_Board: The Ranco DDL demand defrost control board sees to it that the coil is defrosted when it frosts over. Its a printed circuit board with on board relays to control the outdoor fan, and reversing valve. It uses the input of coil mounted, and outdoor air sensors to determine when defrost is needed.

Chiller Controls Sequence of Operation

**The paragraphs below will outline the common sequence of operation for the MACH then expand into the operation sequence for both the water heating and water chilling modes of operation. Following this information will be a section on system faults and problems solving.*

The pump will not self-prime. A full column of liquid solution is necessary for proper operation. Do not attempt to operate the pump without a full charge of liquid solution or seal damage will occur.

Common Sequence of Operation

When powered up the Multiaqua Heat Pump Chiller System energizes the control system transformer (208 - 240 volts), creating 24 - volt control voltage.

First the pump bypass timer is energized and temporarily bypasses the flow switch energizing the pump relay. The pump then starts to circulate move liquid solution through the piping system (**in a properly filled and air purged system**)**.** The circulation of liquid solution from the pump discharge keeps the flow switch closed. After a 10 second delay the pump timer contact opens, connecting the flow switch in series with the high and low-pressure switches. The pump will now run continuously unless power is interrupted or the flow switch opens.

**The only difference between heating and cooling modes is which coil is the evaporator and which coil is condenser. Energizing or de-energizing the reversing valve solenoid accomplishes switching coils. See reversing valve in Refrigerant Controls section.*

The mechanical (heat/cool/off) switch selects the mode of operation for the Multiaqua Heat Pump Chiller. If the switch is selected to the off position, only the liquid solution pump will continue to operate. Turning the switch to heat utilizes the same sequence described below but also energized the reversing valve and the Ranco™ DDL defrost control.

If the Digital Temperature Controller (DTC) is calling for cooling the control circuit is routed through the short cycle timer, the three safety switches (the flow, low and high pressure switches), and through the Ranco™ DDL defrost control to the compressor contractor. In heating the same sequence is followed with the exception, the 24-volt signal for compressor operation is passed to and through the defrost control board, for compressor operation. once energized, the contactor starts the compressor and condenser fan motors. The liquid solution controller (DTC) will open at the user programmed set point, causing the refrigerant short cycle timer to open its contact for 5 minutes as it delays before resetting to the closed position. This will de-energize the compressor and condenser fan motors. Power fluctuations will also initiate a 5-minute time delay. The 5-minute time delay allows the refrigerant system a period for pressure equalization, protecting the compressor from short cycling.

The chiller/heat pump temperature controller utilizes a thermistor to monitor the liquid solution temperature change. The temperature is then compared to the set point and differential temperatures, programmed into the control by the user. The set point of the liquid solution temperature, will cause the control to open or close. A cooling example would be control set point is programmed at 44° LWT (leaving water temperature) with a 10° differential, which opens the controller at 44° LWT, and closes it at 54°. A heating example would be the control programmed at 115° LWT with a 10° differential, which opens the control at 115° and closes it at 105°. The differential temperature is the number of degrees above or below set point the temperature programmed by the user into the controller. When liquid solution temperature falls or raises to the set point the controller cycles the compressor off.

• See wiring diagram on page 32

Chillers are shipped with the digital temperature controller set at 44° LWT and a 10° differential for cooling; heating is a 115° LWT and 10° differential.

The chiller/heat pump when operating in the heating mode utilizes the outdoor coil as an evaporator. The evaporator (outdoor coil) in heating must be 20° or more below the outdoor ambient temperature. This means that on a 30° day the coil temperature will be at a 10° or below operating temperature. Operating in this temperature range causes frost to form on the outdoor coil surfaces, which cut down on the heating efficiency and capacity (BTUH). To rid the outdoor coil of this frost build up and restore heating capacity and efficiency a Ranco DLD™ Demand Defrost Control is used.

Demand Defrost Control

The demand defrost control (Ranco DDL™) is a printed circuit board assembly consisting of solid-state control devices with electro-mechanical outputs. The demand defrost control monitors the outdoor ambient temperature, outdoor coil temperature, and compressor run-time to determine when a defrost cycle is required.

Defrost Initiation

A defrost will be initiated when the three conditions below are satisfied:
1) The outdoor coil temperature is below 35°F.
2) The compressor has operated for at least 3 minutes with the outdoor coil temperature below 35°F.
3) The measured difference between the ambient temperature and the outdoor coil temperature is greater than the calculated delta T (temperature difference).
Additionally, a defrost will be initiated if six hours of accumulated compressor run-time has elapsed without defrost, and the outdoor coil temperature below 35°F.

Defrost Termination
Once defrost is initiated, the defrost will continue until fourteen minutes has elapsed or the coil temperature has reached the terminate temperature. The terminate temperature is factory set at 70°F although the temperature can be changed to 50°F, 60°F, 70°, or 80° by relocating a jumper on the board (jumper and pin location center/right of board).

Temperature Sensors
The coil sensor is clipped to the midsection of the outdoor coil at a point fed by the distribution tubes from the TXV (Thermostatic Expansion Valve). The air sensor is located on the defrost control board, or on a separate wire whip similar to the coil sensor, and is left hanging to sense the outdoor air.

If the ambient sensor fails the defrost control will initiate defrost every 34 minutes with the coil temperature below 35°.

If the coil sensor fails the defrost control will not initiate defrost.

Test Mode
The test mode is initiated by shorting the TEST pins. In this mode of operation, the enable temperature (35°F coil) is ignored and all timers are sped up by a factor of 240. To initiate a manual defrost, short the TEST pins. Remove the short when the system switches to defrost mode. The defrost will terminate on time (14 minutes) or when the termination temperature has been achieved. Short TEST pins again to immediately terminate defrost.

SYSTEM FAULTS:

Flow Switch Opening: The flow switch is normally closed during pump operation. Should liquid solution flow be interrupted for any reason the control will open, shutting down and locking out system operation. The only exception to this is when power is first applied to the unit, and the pump bypass timer bypasses the flow switch for 10 seconds. If flow is less than 3 GPM flow switch will not close.

When the system is first filled with liquid solution and the pump started, expect the system to cycle off on the flow switch, until all of the air is removed from the piping system. The system will have to be reset by opening and then closing the disconnect switch or circuit breaker powering the system.

High Pressure Switch Opening: Should the compressor discharge pressure go high enough to open the high-pressure switch the compressor and outdoor fan motors will shut down. Check for a refrigerant leak, inoperative thermostatic expansion valve, low liquid solution setting, low ambient operation, low liquid solution flow, and in heating a frosted outdoor coil, indicating potential defrost or refrigerant problems. See the electrical Controls Sequence of Operation for a defrost board testing. Page 22.

Refrigeration System Operation

The refrigeration system is a closed loop consisting of a compressor, liquid solution side heat exchanger (evaporator in cooling & condenser in heating), airside outdoor coil (evaporator in heating and condenser on cooling), with combination Thermostatic Expansion Valve/Check Valve (TXV/Check Valve) assemblies on the systems air and liquid solution side. A reversing valve and accumulator are also in the refrigerant loop.

In cooling the hot gas is circulated from the compressor through the reversing valve to the outdoor coil (air side) where the hot gas is condensed into a liquid, then traveling through the outdoor coil mounted TXV/Check Valve, to the TXV/Check Valve on the (liquid solution) brazed plate heat exchanger, where the refrigerant pressure drops as the liquid refrigerant boils off and changes into a vapor (gas) as it picks up heat in the evaporator, then traveling to and through the reversing valve and suction line accumulator back to the compressor.

In heating the hot gas circulated from the compressor through reversing valve, traveling then to and through the TXV/Check Valve at the (liquid solution) brazed plate heat exchanger, where the hot gas is cooled by the lower temperature water circulating through the heat exchanger, condensing the refrigerant into a liquid. The now liquid refrigerant leaves the brazed plate heat exchanger traveling to the TXV/Check Valve where the refrigerant pressure drops as the liquid refrigerant boils off and changes into a vapor (gas) as it picks up heat in the evaporator, then traveling to and through the reversing valve and suction line accumulator and back to the compressor.

Description of Refrigerant Components

Scroll Compressor: Scroll technology ensures reliable high efficiency. All Multiaqua units feature Scroll performance at a low sound level over a wide range of operating conditions.

Caution must be used when near the top of the Scroll compressor. Operating temperatures can be high enough to cause serious Injury.

Brazed Plate Heat Exchanger: The "Heat Exchanger" or evaporator is of a

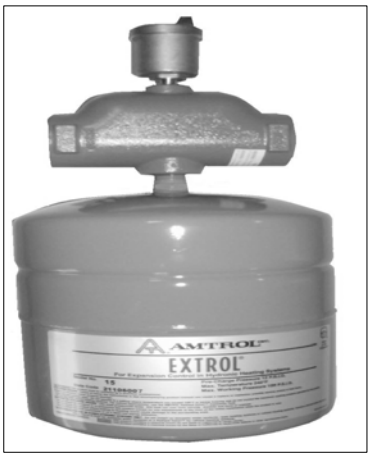
brazed copper and stainless steel design. Refrigerant and liquid solution is channeled through narrow openings between plates and flows in opposite directions. The counter flow design and fluid turbulence ensures maximum heat exchange at minimal pressure drop.

Bi-Directional Expansion/Check Valve: Multiaqua heat pump chillers are equipped with Thermostatic Expansion/Check Valve combination. The valves feature a liquid charged sensing bulb for constant superheat at various load conditions during the heat and cool mode of chiller operation. During the reverse cycle the internal check valve opens to allow refrigerant to flow through the valve with no pressure drop through the check valve.

Suction Accumulator: The suction accumulator is used to prevent excessive quantities of liquid refrigerant and oil from returning to the compressor during normal operation.

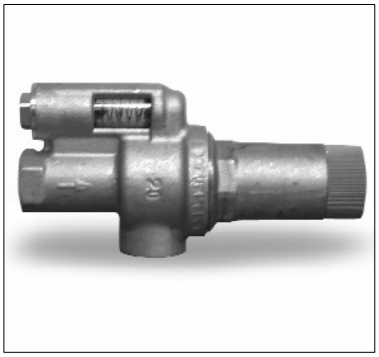
Reversing Valve: The four (4) way reversing valve when installed in the Multiaqua Heat Pump Chiller (MACH), reverses t h e direction of refrigerant flow through the heat exchanger and outdoor coil to provide heating and cooling from the system and to provide for defrosting of the outdoor coil during low ambient conditions.

Description Of Refrigerant Components (Continued)



Condenser coil: The air-cooled condenser coil is of copper tube with aluminum fin construction. The coil is protected by a painted metal condenser grille.

Piping System Components



Supply Storage Tank: The Supply Storage Tank must be used in systems with less than 25 gallons of liquid solution. The tank prevents rapid cycling of the compressor and acts as a reservoir for chilled liquid solution.

Part Number: WX202H (20 Gallon)
WX422H (42 Gallon)
Supply storage tank must be insulated in the field.

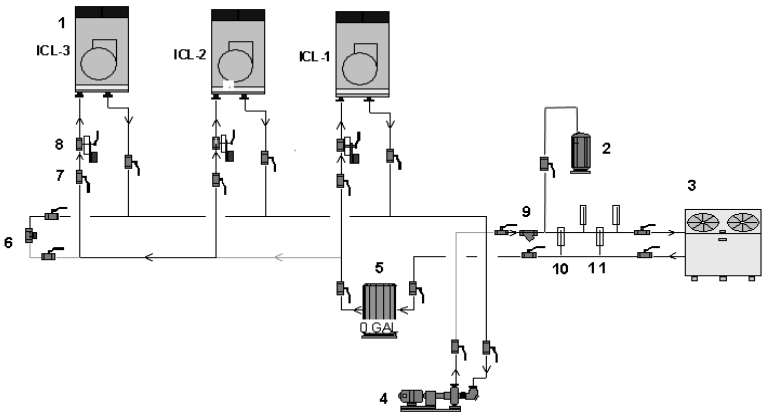
Expansion Tank and Air Scoop: The expansion tank and air scoop assembly is used to compensate for the expansion and contraction of liquid in the system. The air scoop eliminates air entrained in the liquid solution.

Part Number: 1500/1"

Liquid Solution Bypass Valve: The liquid solution bypass valve relieves system pressure from the supply loop to the return loop as the fan coil control valves are cycled off.

Part Number: D146M1032- 3/4"
D146M1040- 1 1/4"

Piping System Components (Continued)



2- Way Motorized Control Valve: The fan coil's motorized valve controls the flow of liquid solution to the system coil. Each fan coil in the system should have a motorized valve.

Part Number: MZV524E-T 1/2" 2-Way Zone Valve
MZV525E-T 3/4" 2-Way Zone Valve
MZV526E-T 1" 2-Way Zone Valve

Composite Piping Layout and Design: 2-Way Valves

Understanding the function and friction loss of each part of the piping system is important to the layout and successful installation of a chilled liquid solution system.

The circulation pump is the key performer in the piping system. The pump must circulate the liquid solution through the heat exchanger and piping system to the air handlers. Pumps are designed to deliver a flow rate measured in gallons per minute(GPM). The pump must be able to overcome the resistance to flow (pressure drop) imposed by the chiller components, piping system and air handlers while maintain the necessary flow rates in gallons per minute. Pump capacities in gallons per minute and pressure drop (feet of head) are listed on page 27 and 10.

Notes:
Installing Multiaqua chillers in parallel is recommended.

An adjustable valve must be used to throttle the discharge liquid solution flow rate to appropriate levels based on capacity and glycol mix percentages.

	MACH060
Compressor	Copeland Scroll
Refrigerant	R407c
Heat Exchanger	Brazed Plate
Max.Head Pressure	50 ft
Max Flow rate	14.4 gpm
Min Flow Rate	9.0 gpm
Supply Water Temp "C"	44° F
Return Water Temp "H"	130° F
Min Solution Content	25 gallons
Expansion Tank Size	2 Gallons
Pump	0.5 HP
Water Connections	1"Supply & 1.25" Return
Internal Pressure Loss	1.68 ft of head

Table 1

Piping resistance or pressure drop is measured in feet of head. A foot of head is the amount of pressure drop imposed in lifting liquid solution one foot. Pumps in the Multiaqua system are designed to move rated liquid solution flow in GPMs.

Installation Notes:

Piping such as PEX, steel, copper or PVC can be used with the Multiaqua system. Check local building codes for material conformation. Care must be taken when using PVC as the presence of propylene glycol may destroy plastics. Pressure drop data for the selected piping material is readily available and should be used. Should the Multiaqua chiller be installed using existing steel (ferrous metal) piping system, dielectric fittings must be used at the chiller and air handler. The factory supplied wye strainer will capture particles of rust and sediment inherent with steel piping and should be checked and cleaned after initial start up and opened during regular maintenance during the life of the system.

Any piping used to contain liquid solution must be insulated in accordance with local and national mechanical codes. Information on insulation installation and application can be obtained from Armaflex web site at www.armaflex.com and Owens-Corning site at www.owenscorning.com/mechanical/pipe/. For future servicing of the chiller and air handlers, it is suggested that shutoff valves be installed at the chiller and air handler(s). If ball valves are used, they can double as balancing valve (s) in the supply piping at each air handler. Chiller shut off valves should be attached at the chiller connections with unions.

The air handlers are to be controlled with electrically operated "slow-opening" solenoid valves, circulators or motorized zone valves as manufactured by Erie controls (www.eriecontrols.com/products/index.htm) A remote thermostat or air handler installed digital control operates the valves.

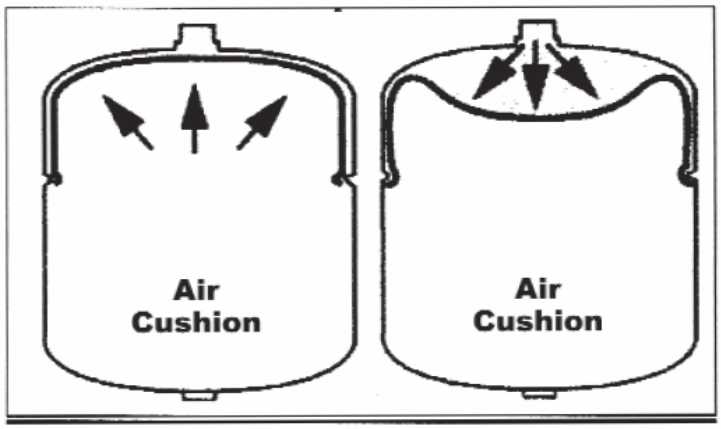
Bypass valves as shown in drawing on page 26, should be installed between the supply and the return chilled liquid solution pipes at a convenient location to the installation. The bypass valve operates to bypass liquid solution between the supply and return chilled liquid solution lines. In the event air handlers valves should shut down, the bypass valve is set to open up and bypass liquid solution between the supply and return lines, relieving pressure and eliminating the possibility of pump cavitations. To adjust the valve, run the system with one air handler solenoid actuated. De-energize the solenoid valve, (at this point no liquid solution will be flowing through the air handlers.) and adjust the bypass valve to relieve pressure between the supply and return piping.

Bleed ports will be factory installed on all Multiaqua air handlers. Bleed ports are opened to eliminate air trapped in the air handlers after filling the system with liquid solution and Propylene Glycol, and before operating the refrigerant compressor in the chiller.

The minimum liquid solution content in the chiller system, (piping, chiller, and air handlers), is 25 U.S. gallons Estimate the system liquid solution content. Should the system have less than 25 gallons of liquid solution content, a chilled liquid solution storage tank must be installed. The tank stores enough chilled liquid solution to prevent frequent chiller compressor cycles at light load and prevents chilled liquid temperature swings at higher load conditions when the chiller compressor is waiting to cycle on the time delay control.

Propylene Glycol must be added to the water used in the system. Propylene helps prevent freeze-ups due to low ambient temperature conditions and low chilled liquid solution temperatures. In comparison to water, Propylene Glycol slightly lessons the temperature exchange in the chiller heat exchanger. However, that is offset by the increased flow of liquid solution through the piping system enabled by the Propylene Glycol. To determine the Propylene Glycol content for various ambient temperatures refer to table 6 page 29.

In no instance should a Multiaqua chiller be installed with less than 10% Propylene Glycol content in the piping system. Using less than the recommended Propylene Glycol percentage content voids equipment warranty.



Installation Notes: (Continued)

Ethylene Glycol is environmentally hazardous and not recommended. Inhibited Propylene Glycol (typical automotive coolant) is not to be used in a Multiaqua Chiller under any circumstances. Dow Chemical's "Ambitrol" family of Glycol-based coolants of food grade Propylene Glycol is suggested. Information on Ambitrol is available from Dow at www.dow.com, search word "Ambitrol".

Table 6

% of Propylene Glycol to Water Content			
Minimum Ambient Temp. F.	Glycol %	Capacity	GPM Adjustment = 100 Capacity
26	10%	x .99	x 1.01
18	20%	x .98	x 1.03
8	30%	x .98	x 1.07
-7	40%	x .97	x 1.11
-29	50%	x .96	x 1.16

Expansion Tank

Liquid solution expansion and contraction within the closed system must be compensated for by utilizing an expansion tank. The expansion tank used with the Multiaqua system, is a steel tank with a rubber bladder attached to it internally. There is air pressure on one side of the rubber bladder that keeps the bladder pushed against the sides of the tank before the system is filled with liquid solution (illustration above). As the liquid solution heats up the bladder,will be pushed further away from the tank walls, allowing for expansion and contracting as the liquid solution temperature changes. By flexing, the bladder controls the system pressure adjusting to temperature variations of the chilled liquid solution system.

It is critical that the expansion tank's air bladder pressure be less than the system solution pressure. Air pressure can be measured with an automotive tire gauge at the bicycle valve port on the expansion tank. Bleeding air out of the bladder or increasing the pressure with a bicycle pump will adjust pressure.

System must use a liquid solution storage tank if system volume is less than 25 U.S. gallons.

Filling System with Liquid Solution and Coolant (Propylene Glycol)

Concentrations of Propylene Glycol in excess of 50% will destroy o-rings in fittings and pump. Water should be added to the system first or a liquid solution diluted Propylene Glycol mix.

Before filling system with Propylene Glycol and water, pressure test the piping system with compressed air. Testing should be done at a minimum of 50 psi but no greater than 60 psi.
The system should hold air pressure for a minimum of one hour with no leakage.

System that contains 50 or more U.S. gallons should have a tee fitting with a stopcock installed in the return line close to the chiller. The stopcock can be opened and attached to a hose with a female female hose fitting. In the open end of the hose section (1 -1.5 feet long) insert a funnel and pour into the system the diluted Propylene Glycol/liquid solution mixture or add water first and then the quantity of Propylene Glycol needed for minimum ambient protection (refer to page 29 table 6). After adding the Propylene Glycol /water mixture, or liquid solution and then coolant proceed to add enough water to the system to achieve a 15 psi gauge pressure. To measure system pressure shut off the stopcock, remove hose and attach a water pressure gauge. Open the stopcock to read system pressure.

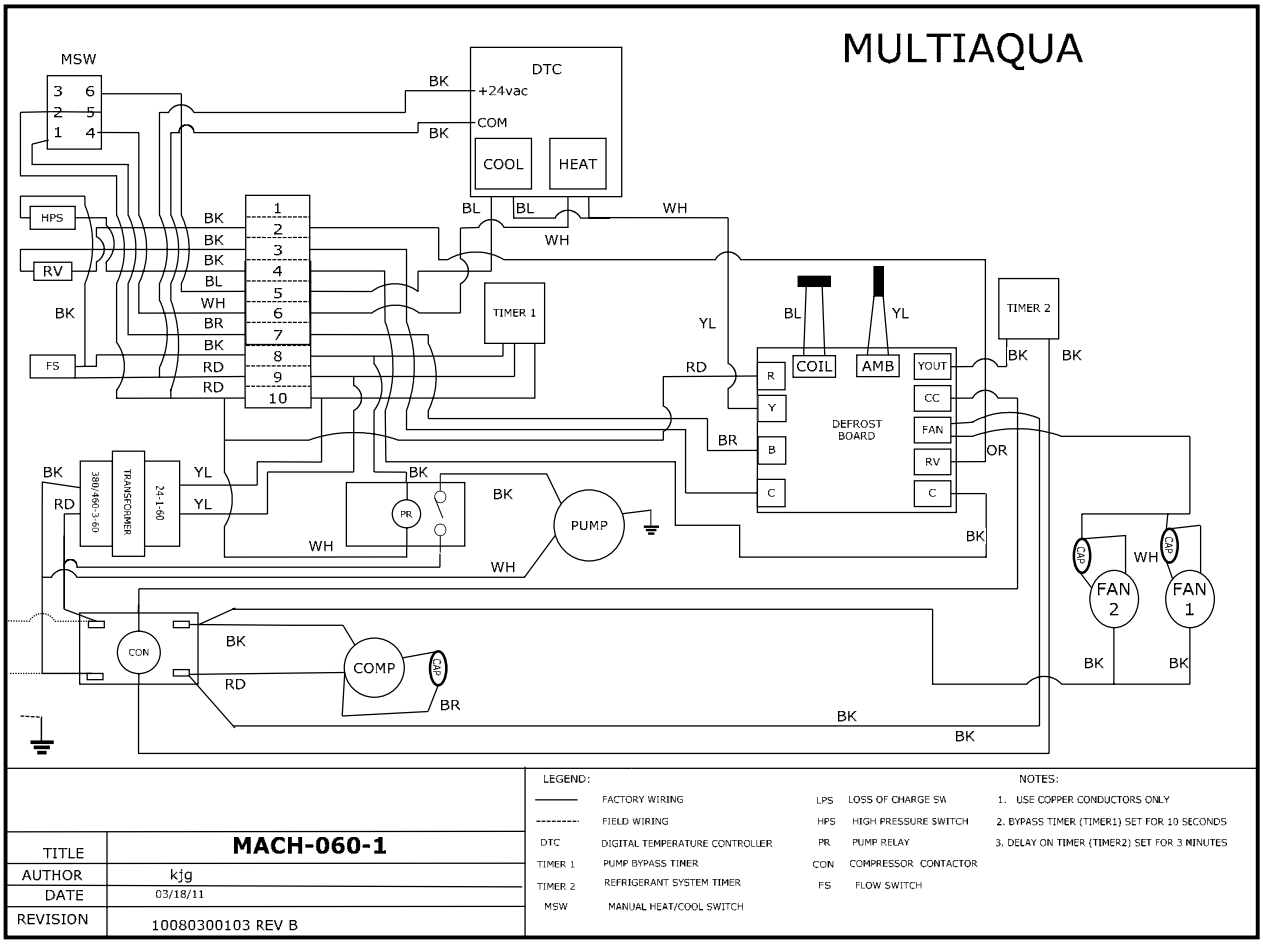
Systems that use the Chilled Liquid Solution Storage Tank should be filled at the tee/stopcock fitting in the outlet fitting of the storage tank. Fill the tanks with 10 gallons of water and with a funnel pour the calculated amount of Propylene Glycol into the tank. The amount of Propylene Glycol added should be calculated to achieve minimum ambient protection. (Refer to page 29 Table 6) After adding Propylene Glycol, fill the system with enough liquid solution to bring system pressure to approximately 15 psi gauge pressure. To measure system pressure shut off the stopcock and attach a water pressure gauge. Open the stopcock to read system pressure.

Air Elimination

Since we have the system filled we must eliminate the air left in the system. Briefly open each bleed valve at the air handlers and allow trapped air to escape. This will eliminate much of the air left in the system.
There is an air bleed located in the top of the discharge line of the chiller. Ensure it has been purged of air.
Next we will start the pump and continue bleeding air from the system. Be sure the chiller has line voltage available to it and set the chilled liquid solution control up to 100°F, which will ensure that only the pump runs at this point. The pump should now start and remain running. Should the pump stop at any time during this process it is an indication that the flow switch had air move across it allowing the circuit to be interrupted. Continue to bleed some air out of the system at the highest locations before resetting the pump bypass timer to get the pump running again. Open and close the power supply switch to the chiller to restart the pump. Continue bleeding air with the pump operating. You may have to start and re-start the pump a few times to complete air removal.

All piping systems should have a minimum of 10% Propylene Glycol in the system even in climates with non-freezing ambient temperatures.

Using less than the recommended Propylene Glycol percentage content voids equipment warranty.



Liquid solution control valves (solenoid or motorized valves) should be selected for low pressure drop. If a selected valve contributes to pushing your total head calculation to more than 50 feet of head, a larger valve may be needed to bring your total head below the maximum of 50 feet.

Liquid Solution Balancing:

Liquid solution balancing will require an accurate digital thermometer to measure return line liquid solution temperature at each air handler. Set the chilled liquid solution temperature control in the chiller at a normal operational temperature (44°F) and measure pump discharge temperature with the digital thermometer to check system solution temperature. After the chilled liquid solution temperature has lowered to the set point begin the balancing process. The system must be free of air and each air handler set at a temperature low enough to continue cooling operation (and liquid solution flow) during the balancing process. Begin by measuring the return line chilled liquid solution temperature of each air handler. Begin incrementally closing the supply line balance valve at the air handlers with the lowest return line chilled liquid solution temperature. Continue this process until each air handler has close to the same return line chilled liquid solution temperature

COP	Heating ❄1		2.84	—	2.69	—
Outdoor unit model			**MUZ-D30NA**	**MUY-D30NA**	**MUZ-D36NA**	**MUY-D36NA**
Power supply V , phase , Hz			208/230 , 1 , 60			
Max. fuse size (time delay)		A	25			
Min. circuit ampacity		A	21			
Fan motor		F.L.A	0.93			
Compressor	Model		TNB220FMCHT			
		R.L.A	16			
		L.R.A	20			
	Refrigeration oil	cc	870 (NEO22)			
Refrigerant control			Linear expansion valve			
Sound level ❄1	Cooling	dB(A)	55	55	56	56
	Heating		57	—	57	—
Defrost method			Reverse cycle	—	Reverse cycle	—
Dimensions	W	in.	33-1/16			
	D		13			
	H		33-7/16			
Weight		lb.	141	126	141	126
External finish			Munsell 3Y 7.8/1.1			
Remote controller			Wireless type			
Control voltage (by built-in transformer)			12 - 24 VDC			
Refrigerant piping			Not supplied			
Refrigerant pipe size (Min. wall thickness)	Liquid	in.	3/8 (0.0315)			
	Gas		5/8 (0.0394)			
Connection method	Indoor		Flared			
	Outdoor					
Between the indoor & outdoor units	Height difference	ft.	50			
	Piping length		100			
Refrigerant charge (R410A)			4 lb. 10 oz.	4 lb.	4 lb. 10 oz.	4 lb.

NOTE: Test conditions are based on ARI 210/240.

❄1: Rating conditions (Cooling) — Indoor: 80˚FDB, 67˚FWB, Outdoor: 95˚FDB, (75˚FWB) Rated frequency
(Heating) — Indoor: 70˚FDB, 60˚FWB, Outdoor: 47˚FDB, 43˚FWB Rated frequency

❄2: (Heating) — Indoor: 70˚FDB, 60˚FWB, Outdoor: 17˚FDB, 15˚FWB Maximum frequency

Test condition

⁂3,⁂4

ARI	Mode	Test	Indoor air condition (°F)		Outdoor air condition (°F)	
			Dry bulb	Wet bulb	Dry bulb	Wet bulb
	SEER (Cooling)	"A" Cooling Steady State at rated compressor Speed	80	67	95	(75)
		"B-2" Cooling Steady State at rated compressor Speed	80	67	82	(65)
		"B-1" Cooling Steady State at minimum compressor Speed	80	67	82	(65)
		Low ambient Cooling Steady State at minimum compressor Speed	80	67	67	(53.5)
		Intermediate Cooling Steady State at Intermediate compressor Speed ⁂5	80	67	87	(69)
	HSPF (Heating)	Standard Rating-Heating at rated compressor Speed	70	60	47	43
		Low temperature Heating at rated compressor Speed	70	60	17	15
		Max temperature Heating at minimum compressor Speed	70	60	62	56.5
		High temperature Heating at minimum compressor Speed	70	60	47	43
		Frost Accumulation at rated compressor Speed	70	60	35	33
		Frost Accumulation at Intermediate compressor Speed ⁂5	70	60	35	33

⁂5: At Intermediate compressor Speed
=("Cooling rated compressor speed" - "minimum compressor speed") / 3 + "minimum compressor speed".

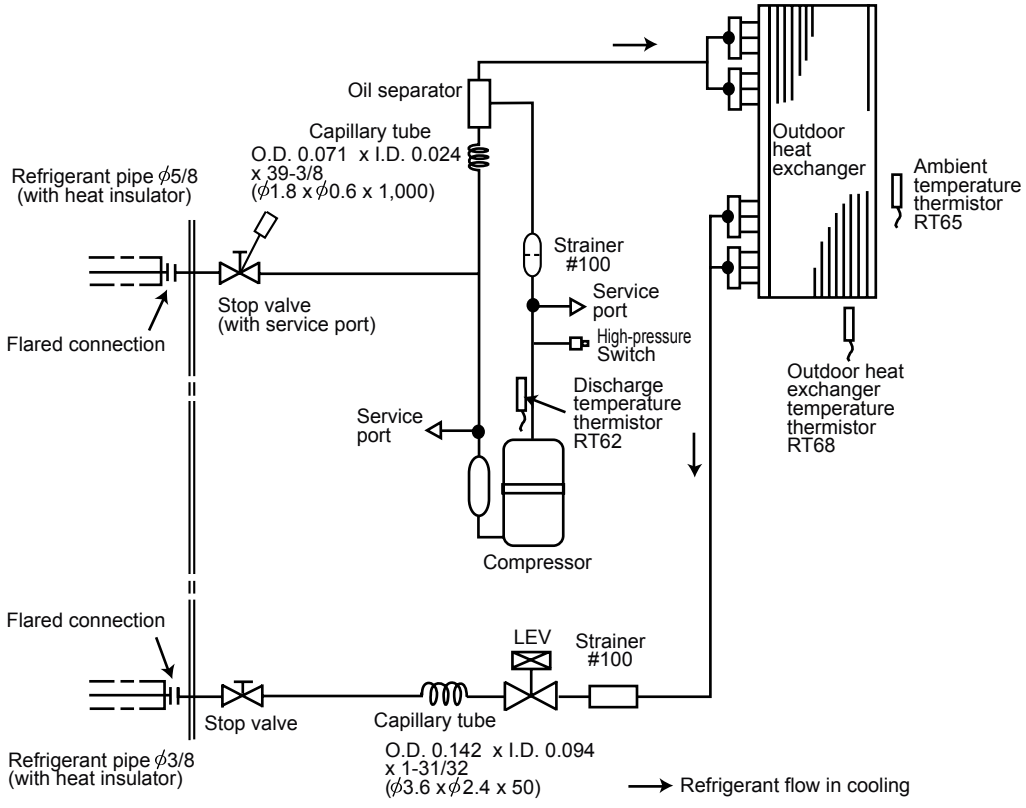
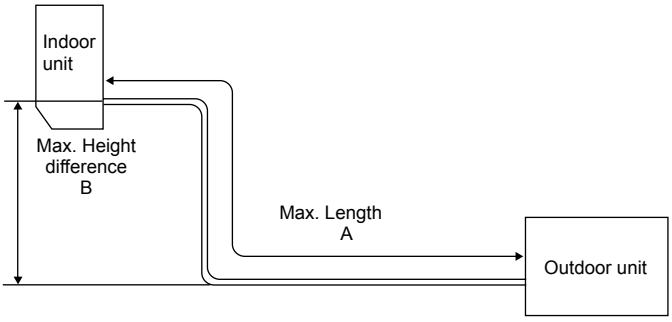
6 REFRIGERANT SYSTEM DIAGRAM



MUZ-D30NA MUZ-D36NA

Unit: inch



MUY-D30NA MUY-D36NA

Unit: inch

MAX. REFRIGERANT PIPING LENGTH and MAX. HEIGHT DIFFERENCE

Model	Refrigerant piping: ft.		Piping size O.D: in.	
	Max. Length A	Max. Height difference B	Gas	Liquid
MUZ-D30NA **MUZ-D36NA** **MUY-D30NA** **MUY-D36NA**	100	50	5/8	3/8

ADDITIONAL REFRIGERANT CHARGE (R410A: oz.)

Refrigerant piping exceeding 25 ft. requires additional refrigerant charge according to the calculation.

Model	Outdoor unit precharged	Refrigerant piping length (one way): ft.								
		25	30	40	50	60	70	80	90	100
MUZ-D30NA **MUZ-D36NA**	4 lb. 10 oz.	0	2.96	8.88	14.80	20.72	26.64	32.56	38.48	44.40

Calculation: X oz. = 2.96/5 oz. / ft. × (Refrigerant piping length (ft.) - 25)

Model	Outdoor unit precharged	Refrigerant piping length (one way): ft.								
		25	30	40	50	60	70	80	90	100
MUY-D30NA **MUY-D36NA**	4 lb.	0	1.08	3.24	5.40	7.56	9.72	11.88	14.04	16.20

Calculation: X oz. = 1.08/5 oz. / ft. × (Refrigerant piping length (ft.) - 25)

NOTE: Refrigerant piping exceeding 25 ft. requires additional refrigerant charge according to the calculation.

How to operate with fixed operational frequency of the compressor.

1. Press the EMERGENCY OPERATION switch on the front of the indoor unit, and select either EMERGENCY COOL mode or EMERGENCY HEAT mode before starting to operate the air conditioner.
2. The compressor starts with operational frequency.
3. The fan speed of the indoor unit is High.
4. This operation continues for 30 minutes.
5. In order to release this operation, press the EMERGENCY OPERATION switch twice or once, or press any button on the remote controller.

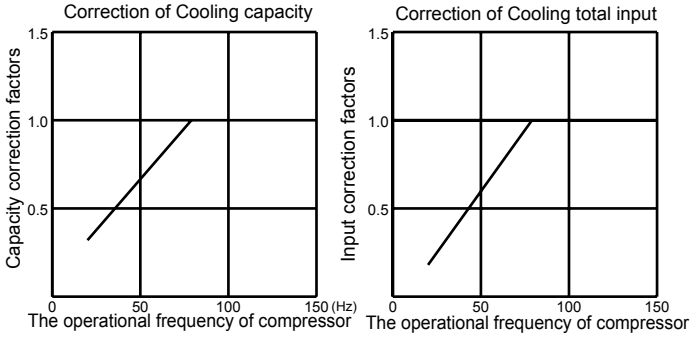
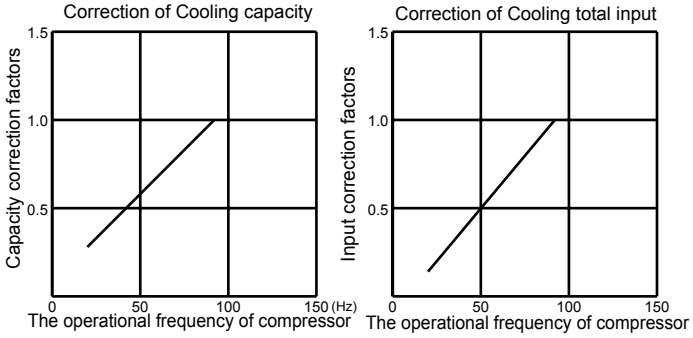
7-5. CAPACITY AND INPUT CORRECTION BY INVERTER OUTPUT FREQUENCY



MUZ-D30NA

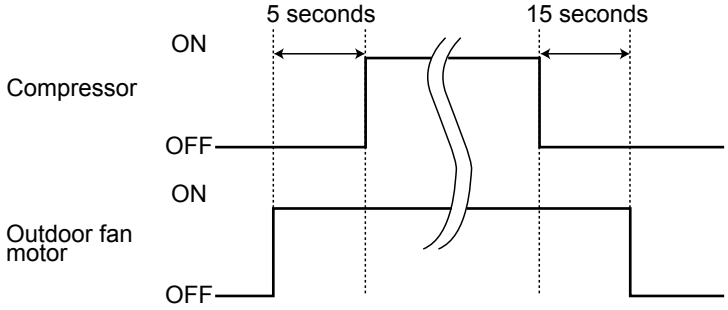


MUZ-D36NA

MUY-D30NA

MUY-D36NA

7-6. TEST RUN OPERATION (How to operate fixed-frequency operation)



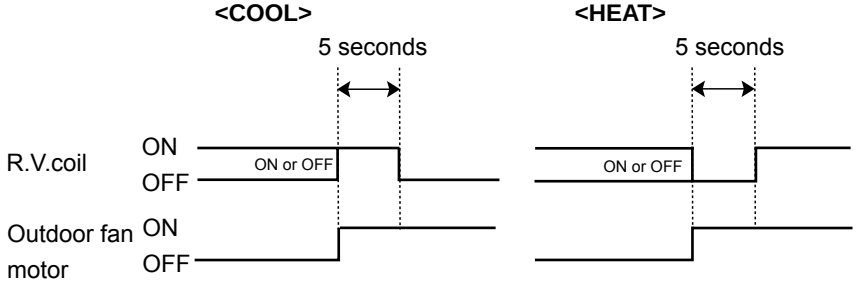
1. Press EMERGENCY OPERATION switch to COOL or HEAT mode (COOL: Press once, HEAT: Press twice).
2. Test run operation starts and continues to operate for 30 minutes.
3. Compressor operates at rated frequency in COOL mode or 58 Hz in HEAT mode.
4. Indoor fan operates at High speed.
5. After 30 minutes, test run operation finishes and EMERGENCY OPERATION starts (Operation frequency of compressor varies).
6. To cancel test run operation (EMERGENCY OPERATION), press EMERGENCY OPERATION switch or any button on remote controller.

8 ACTUATOR CONTROL

MUZ-D30NA MUZ-D36NA MUY-D30NA MUY-D36NA

8-1. OUTDOOR FAN MOTOR CONTROL

The fan motor turns ON/OFF, interlocking with the compressor.
[ON] The fan motor turns ON 5 seconds before the compressor starts up.
[OFF] The fan motor turns OFF 15 seconds after the compressor has stopped running.



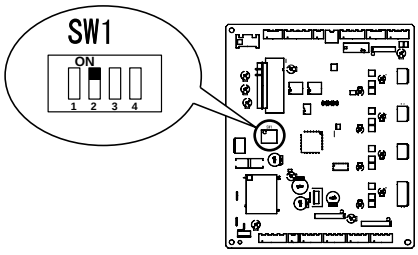
8-2. R.V. COIL CONTROL

<MUZ>

Heating · · · · · · · · · · · · · · · · · · ON
Cooling · · · · · · · · · · · · · · · · · · OFF
Dry · OFF

NOTE: The 4-way valve reverses for 5 seconds right before start-up of the compressor.

8-3. Relation between main sensor and actuator



Sensor	Purpose	Actuator				
		Compressor	LEV	Outdoor fan motor	R.V. coil	Indoor fan motor
Discharge temperature thermistor	Protection	○	○

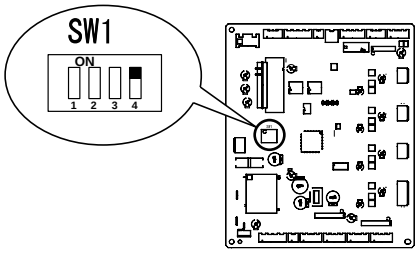
9 SERVICE FUNCTIONS

MUZ-D30NA MUZ-D36NA MUY-D30NA MUY-D36NA

9-1. PRE-HEAT CONTROL

If moisture gets into the refrigerant cycle, or when refrigerant is liquefied and collected in the compressor, it may interfere the start-up of the compressor.
To improve start-up condition, the compressor is energized even while it is not operating.
This is to generate heat at the winding.
The compressor uses about 50 W when pre-heat control is turned ON.
Pre-heat control is OFF at initial setting.



[How to activate pre-heat control]

1. Turn OFF the power supply for the air conditioner before making the setting.
2. Set the 2nd Dip Switch of SW1 on the outdoor electronic control P.C. board to ON to activate pre-heat control function.

9-2. CHANGE IN DEFROST SETTING

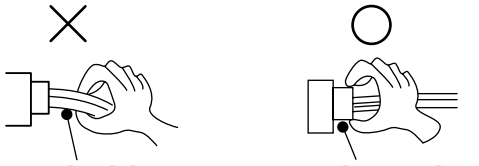
Changing defrost finish temperature

1. Turn OFF the power supply for the air conditioner before making the setting.
2. Set the 4th Dip Switch of SW1 on the outdoor electronic control P.C. board to ON to change the defrost finish temperature. (Refer to 10-6-1.)

4th Dip Switch of SW1	Defrost finish temperature
OFF (Initial setting)	49.5°F (9.7°C)
ON	64.9°F (18.3°C)

10 TROUBLESHOOTING

MUZ-D30NA MUZ-D36NA MUY-D30NA MUY-D36NA



10-1. CAUTIONS ON TROUBLESHOOTING

1. Before troubleshooting, check the following

1) Check the power supply voltage.
2) Check the indoor/outdoor connecting wire for miswiring.

2. Take care of the following during servicing

1) Before servicing the air conditioner, be sure to turn OFF the main unit first with the remote controller, then after confirming the horizontal vane is closed, turn off the breaker and/or disconnect the power plug.
2) Be sure to turn OFF the power supply before removing the front panel, the cabinet, the top panel, and the electronic control P.C. board.
3) When removing the electrical parts, be careful of the residual voltage of smoothing capacitor.
4) When removing the electronic control P.C. board, hold the edge of the board with care NOT to apply stress on the components.
5) When connecting or disconnecting the connectors, hold the housing of the connector. DO NOT pull the lead wires.

3. Troubleshooting procedure

1) First, check if the OPERATION INDICATOR lamp on the indoor unit is flashing on and off to indicate an abnormality. To make sure, check how many times the abnormality indication is flashing on and off before starting service work.
2) Before servicing check that the connector and terminal are connected properly.
3) When the electronic control P.C. board seems to be defective, check the copper foil pattern for disconnection and the components for bursting and discoloration.
4) Refer to 10-2. and 10-3.

10-2. FAILURE MODE RECALL FUNCTION

Outline of the function

This air conditioner can memorize the abnormal condition which has occurred once.

Even though LED indication listed on the troubleshooting check table (10-3.) disappears, the memorized failure details can be recalled.

1. Flow chart of failure mode recall function for the indoor/outdoor unit

Operational procedure

The cause of abnormality cannot be found because the abnormality does not recur.

Setting up the failure mode recall function

Turn ON the power supply.
<Preparation of the remote controller>
① While pressing both OPERATION SELECT button and TOO COOL button on the remote controller at the same time, press RESET button.
② First, release RESET button.
And release the other two buttons after all LCD in operation display section of the remote controller is displayed after 3 seconds.

Press OPERATE/STOP (ON/OFF) button of the remote controller (the set temperature is displayed) with the remote controller headed towards the indoor unit. ※1

Does the left lamp of OPERATION INDICATOR lamp on the indoor unit blink at the interval of 0.5 seconds?
Blinks: Either indoor or outdoor unit is abnormal. Beep is emitted at the same timing as the blinking of the left lamp of OPERATION INDICATOR lamp. ※2

No (OFF) → Indoor unit is normal.
But the outdoor unit might be abnormal because there are some abnormalities that cannot be recalled with this way.
Confirm if outdoor unit is abnormal according to the detailed outdoor unit failure mode recall function. (Refer to 10-2.2)

Yes (Blinks)

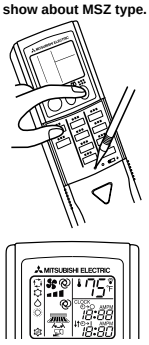
Judgment of indoor/outdoor abnormality

Before blinking, does the left lamp of OPERATION INDICATOR lamp stay ON for 3 seconds?
Stays ON for 3 seconds (without beep): The outdoor unit is abnormal.

Yes → The outdoor unit is abnormal.
Check the blinking pattern, and confirm the abnormal point with the outdoor unit failure mode table. (Refer to 10-2.3)
Make sure to check at least two consecutive blinking cycles. ※3

No → The indoor unit is abnormal.
Check the blinking pattern, and confirm the abnormal point with the indoor unit failure mode table. (Refer to indoor unit service manual.)
Make sure to check at least two consecutive blinking cycles. ※2

Releasing the failure mode recall function

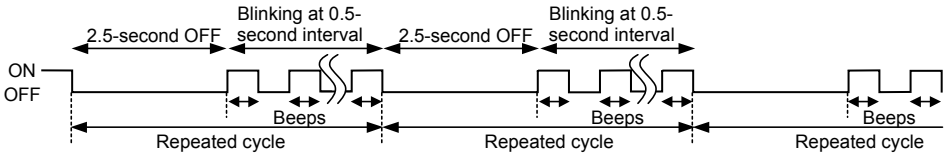


Release the failure mode recall function by the following procedures.
Turn OFF the power supply and turn it ON again.
Press RESET button of the remote controller.

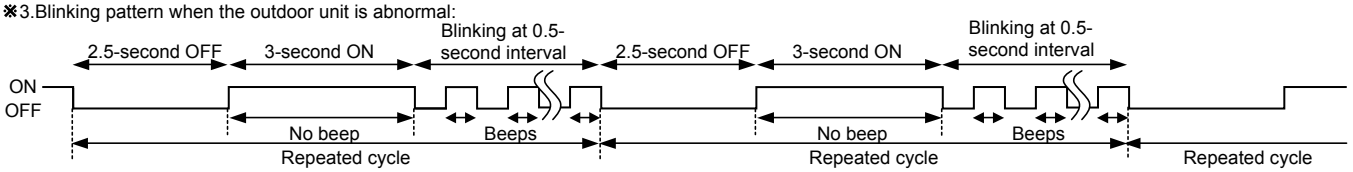
Repair the defective parts.

Deleting the memorized abnormal condition

① After repairing the unit, recall the failure mode again according to "Setting up the failure mode recall function" mentioned above.
② Press OPERATE/STOP (ON/OFF) button of the remote controller (the set temperature is displayed) with the remote controller headed towards the indoor unit.
③ Press EMERGENCY OPERATION switch so that the memorized abnormal condition is deleted.
④ Release the failure mode recall function according to "Releasing the failure mode recall function" mentioned above.



This figures show about MSZ type.



※1. Regardless of normal or abnormal condition, a short beep is emitted once the signal is received.

NOTE: 1. Make sure to release the failure mode recall function once it is set up, otherwise the unit cannot operate properly.
2. If the abnormal condition is not deleted from the memory, the last abnormal condition is kept memorized.

※2. Blinking pattern when the indoor unit is abnormal:

※3.Blinking pattern when the outdoor unit is abnormal:

2. Flow chart of the detailed outdoor unit failure mode recall function

Operational procedure

The outdoor unit might be abnormal.
Confirm if outdoor unit is abnormal according to the following procedures.

↓

Confirm that the remote controller is in the failure mode recall function.

↓

With the remote controller headed towards the indoor unit, press TOO COOL or TOO WARM button to adjust the set temperature to 77˚F (25˚C). ※1

※1. Regardless of normal or abnormal condition, 2 short beeps are emitted as the signal is received.

↓

Does left lamp of OPERATION INDICATOR lamp on the indoor unit blink at the interval of 0.5 seconds?
Blinks: The outdoor unit is abnormal. Beep is emitted at the same timing as the blinking of the left lamp of OPERATION INDICATOR lamp. ※2

No (OFF) → The outdoor unit is normal.

Yes (Blinks)

↓

The outdoor unit is abnormal.
Check the blinking pattern, and confirm the abnormal point with the outdoor unit failure mode table. (10-2.3.)
Make sure to check at least two consecutive blinking cycles. ※2

↓

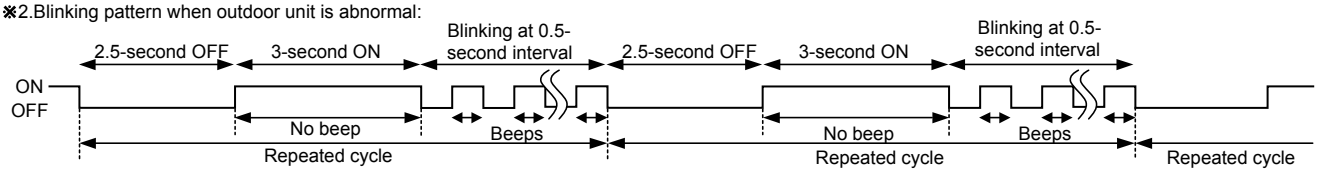
Releasing the failure mode recall function

Release the failure mode recall function by the following procedures.
Turn OFF the power supply and turn it ON again.
Press RESET button of the remote controller.

Release the failure mode recall function according to the left mentioned procedure.

↓

Repair the defective parts.



↓

Deleting the memorized abnormal condition

① After repairing the unit, recall the failure mode again according to "Setting up the failure mode recall function" (10-2.1.).
② Press OPERATE/STOP (ON/OFF) button of the remote controller (the set temperature is displayed) with the remote controller headed towards the indoor unit.
③ Press EMERGENCY OPERATION switch so that the memorized abnormal condition is deleted.
④ Release the failure mode recall function according to "Releasing the failure mode recall function" mentioned above.

NOTE: 1. Make sure to release the failure mode recall function once it is set up, otherwise the unit cannot operate properly.
2. If the abnormal condition is not deleted from the memory, the last abnormal condition is kept memorized.

※2.Blinking pattern when outdoor unit is abnormal:

3. Outdoor unit failure mode table

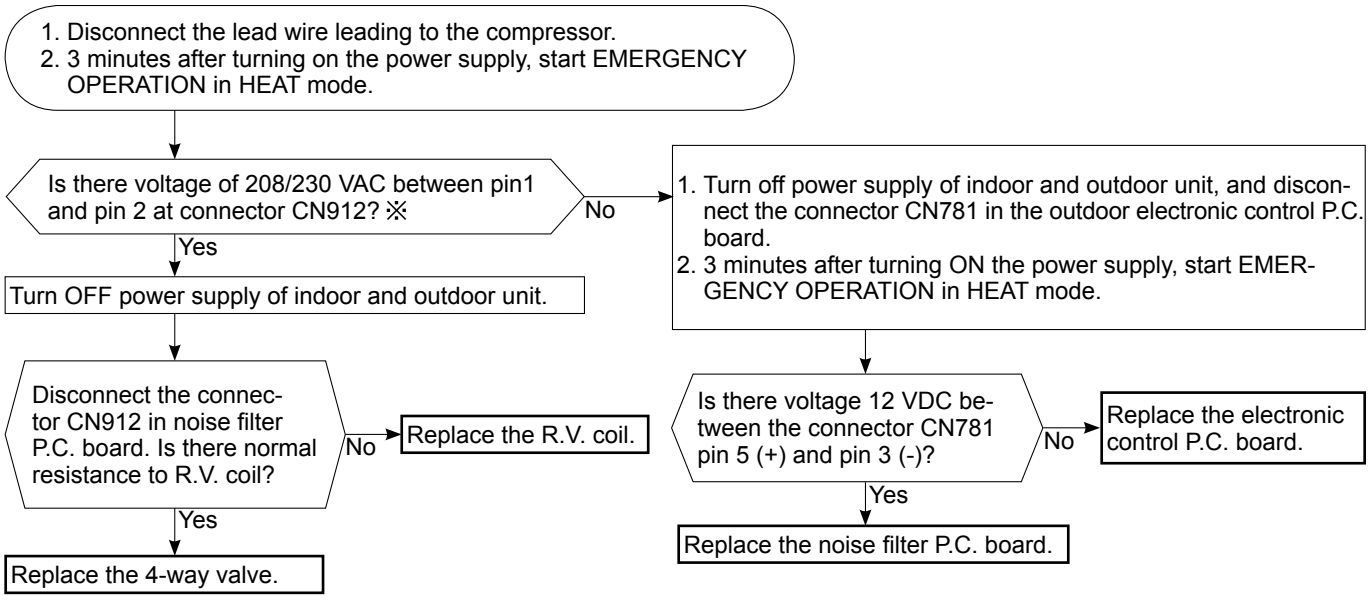
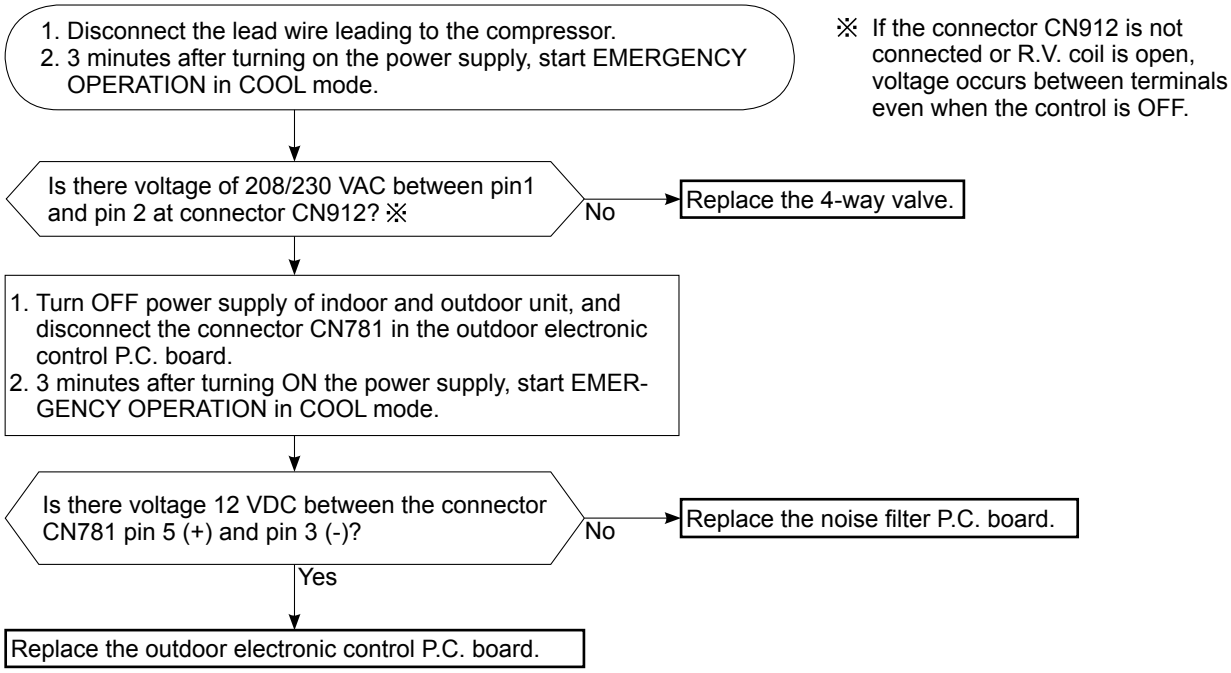
10-5. TROUBLESHOOTING FLOW

Ⓐ How to check inverter/compressor

Ⓑ Check of outdoor thermistors



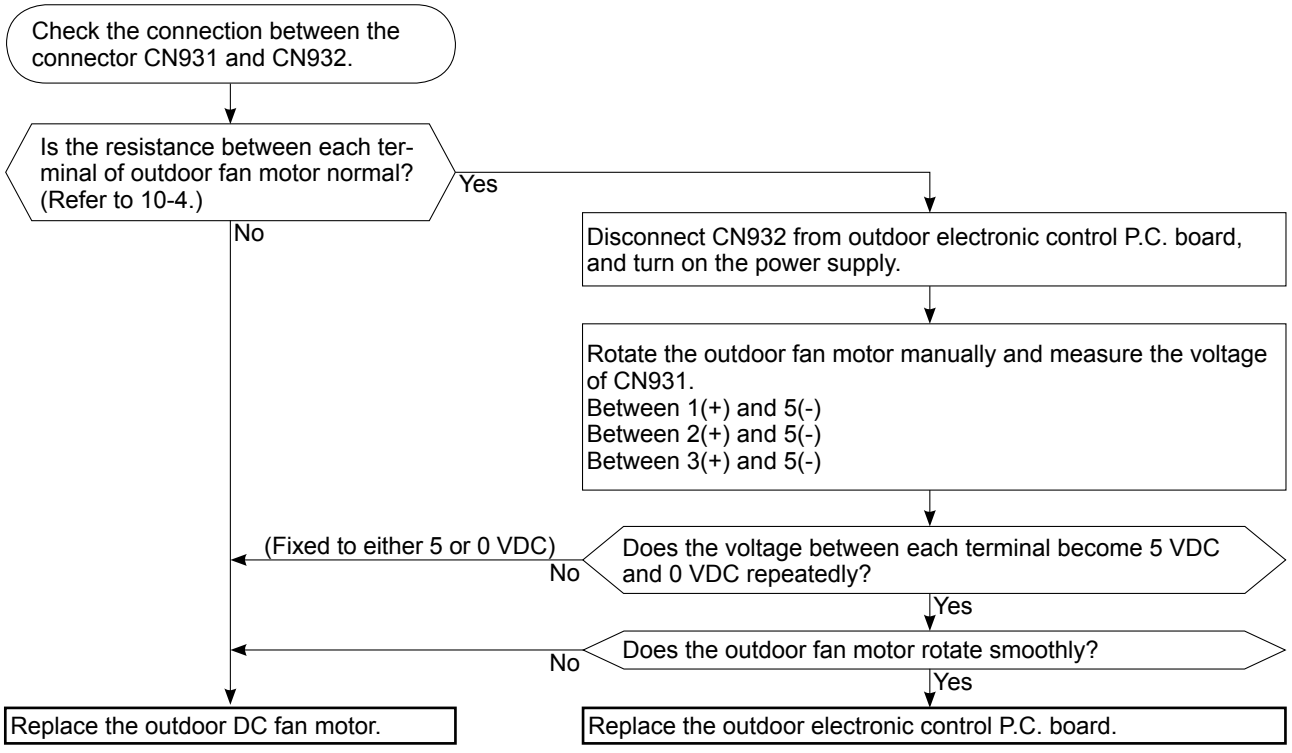
Thermistor	Symbol	Connector, Pin No.	Board
Defrost (**MUZ**)	RT61	Between CN661 pin1 and pin2	Outdoor electronic control P.C. board
Discharge temperature	RT62	Between CN661 pin3 and pin4	
Outdoor heat exchanger temperature	RT68	Between CN661 pin7 and pin8	
Ambient temperature	RT65	Between CN663 pin1 and pin2	
Fin temperature	RT64	Between CN3 pin1 and pin2	Outdoor power board



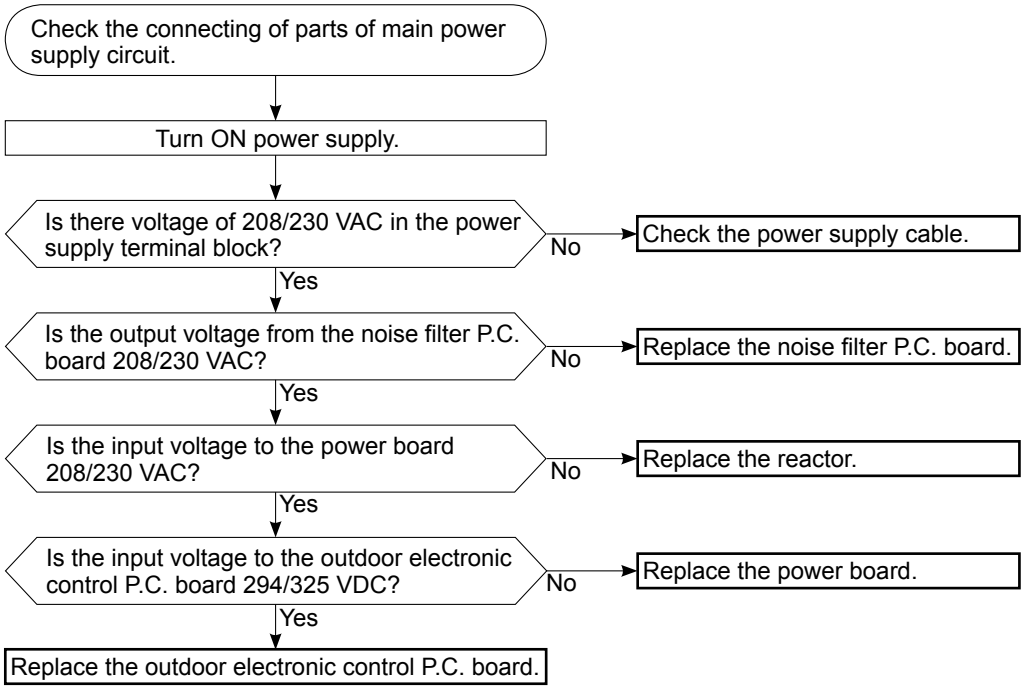
Ⓒ Check of R.V. coil

MUZ-D30/36

• Heating operation does not work.



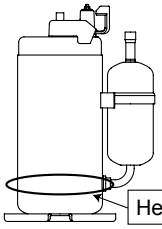
• Cooling operation does not work.



※ If the connector CN912 is not connected or R.V. coil is open, voltage occurs between terminals even when the control is OFF.

Ⓓ Check of outdoor fan motor

Ⓔ Check of power supply



Ⓕ Check of compressor start failure

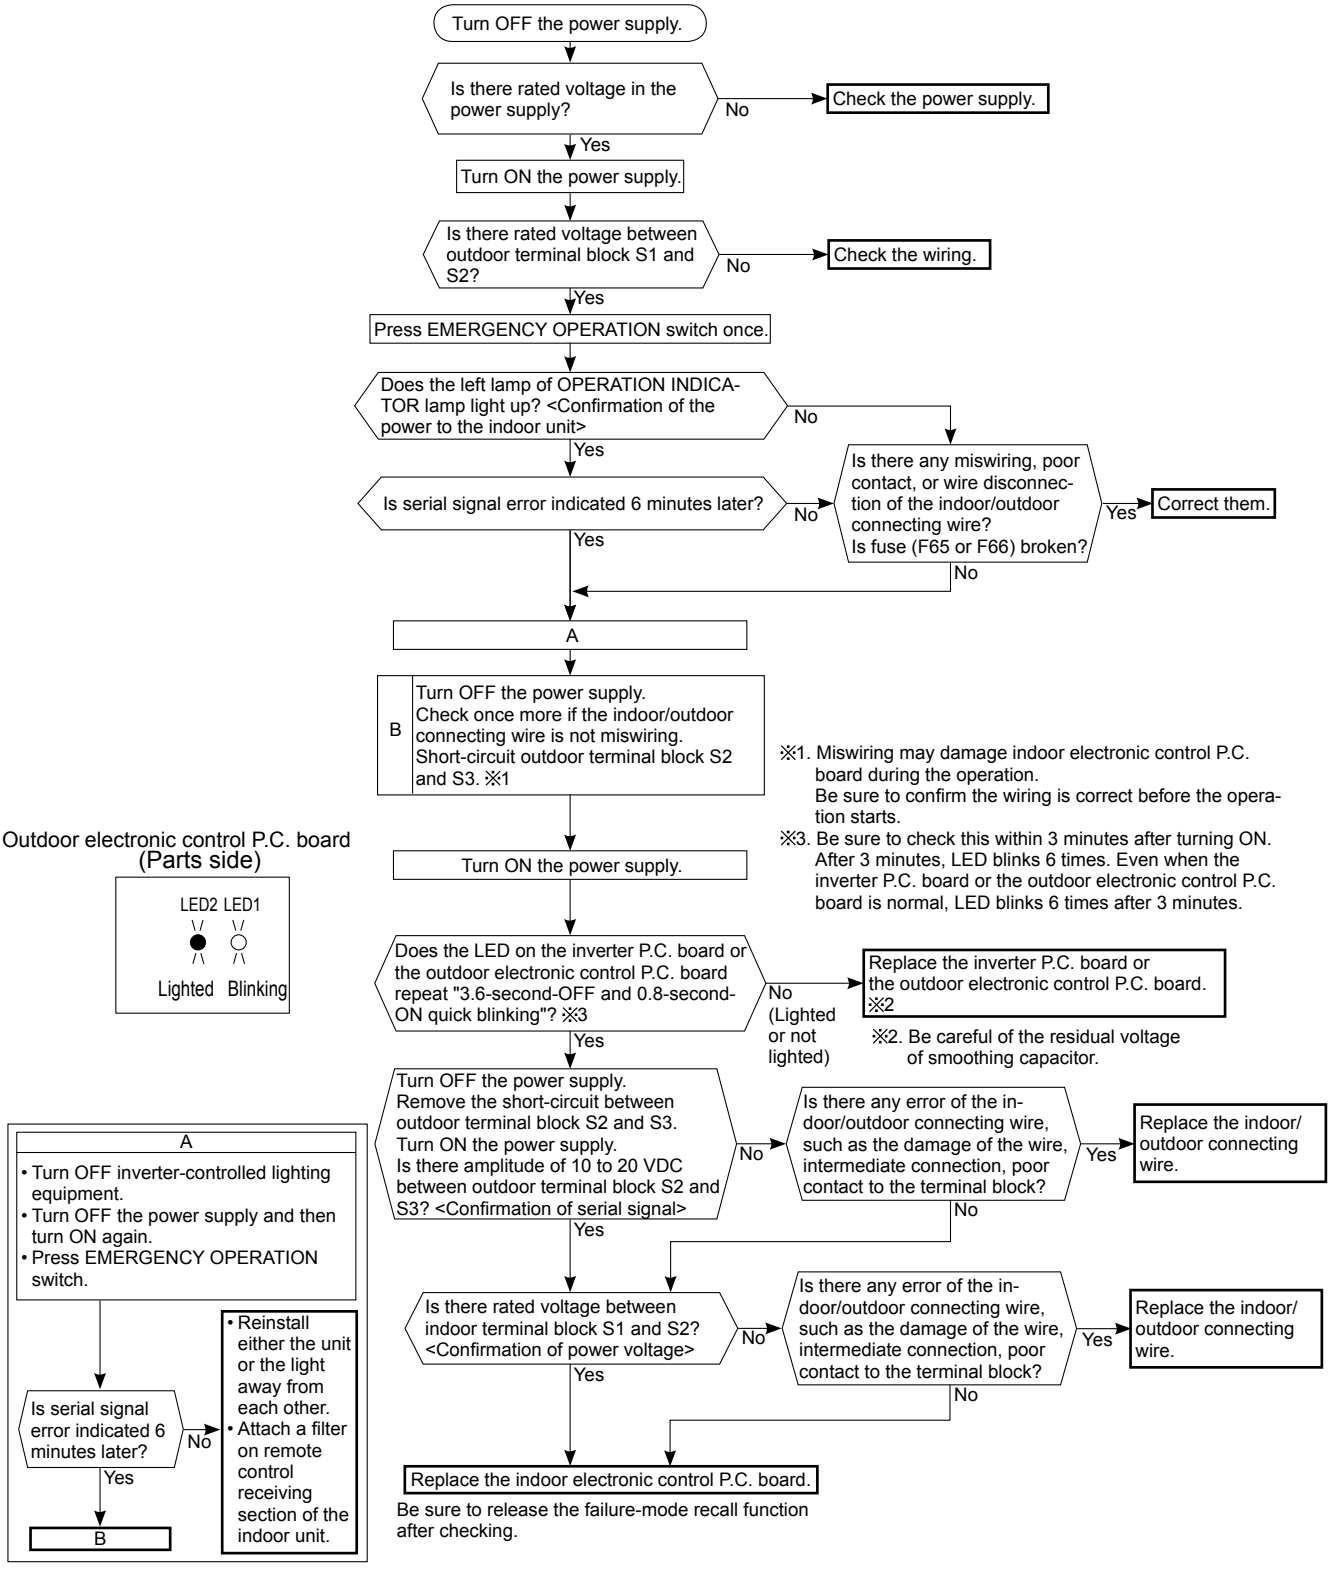
Confirm that 1~4 is normal.
•Electrical circuit check
1. Contact of lead wire leading to compressor
2. Output voltage of the outdoor electronic control P.C. board and balance of them (See 10-5.Ⓐ)
3. Direct current voltage to the outdoor electronic control P.C. board
4. Voltage between outdoor terminal block S1-S2

Does the compressor run for 10 seconds or more after it starts?
- Yes → Check the refrigerant circuit. Check the stop valve.
- No →

After the compressor is heated with a drier, does the compressor start? ※1
- No → Replace the compressor.
- Yes →

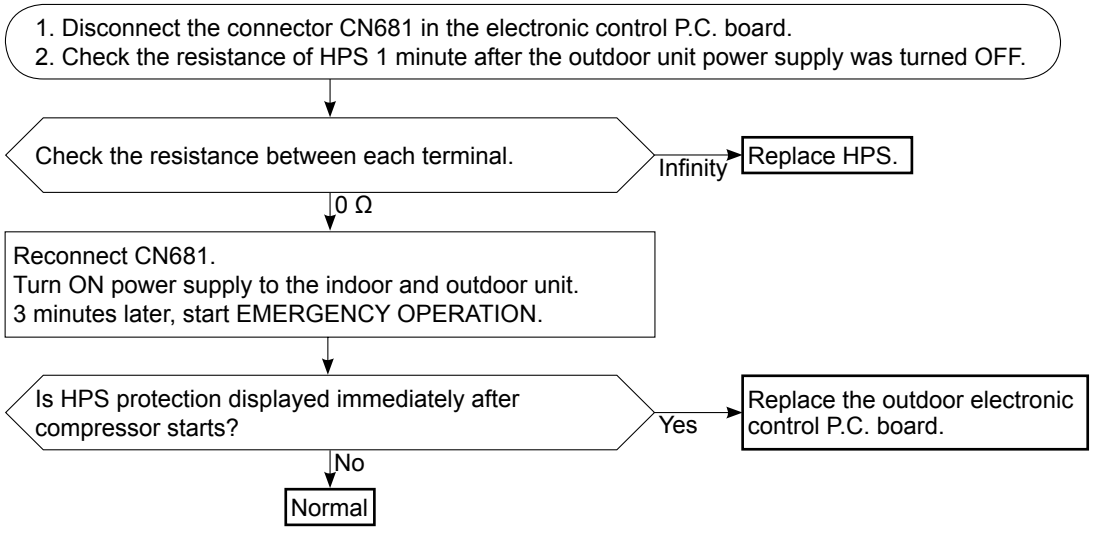
Compressor start failure. Activate pre-heat control. (Refer to 9-1. "PRE-HEAT CONTROL")

※1
Heat the compressor with a drier for about 20 minutes. Do not recover refrigerant gas while heating.



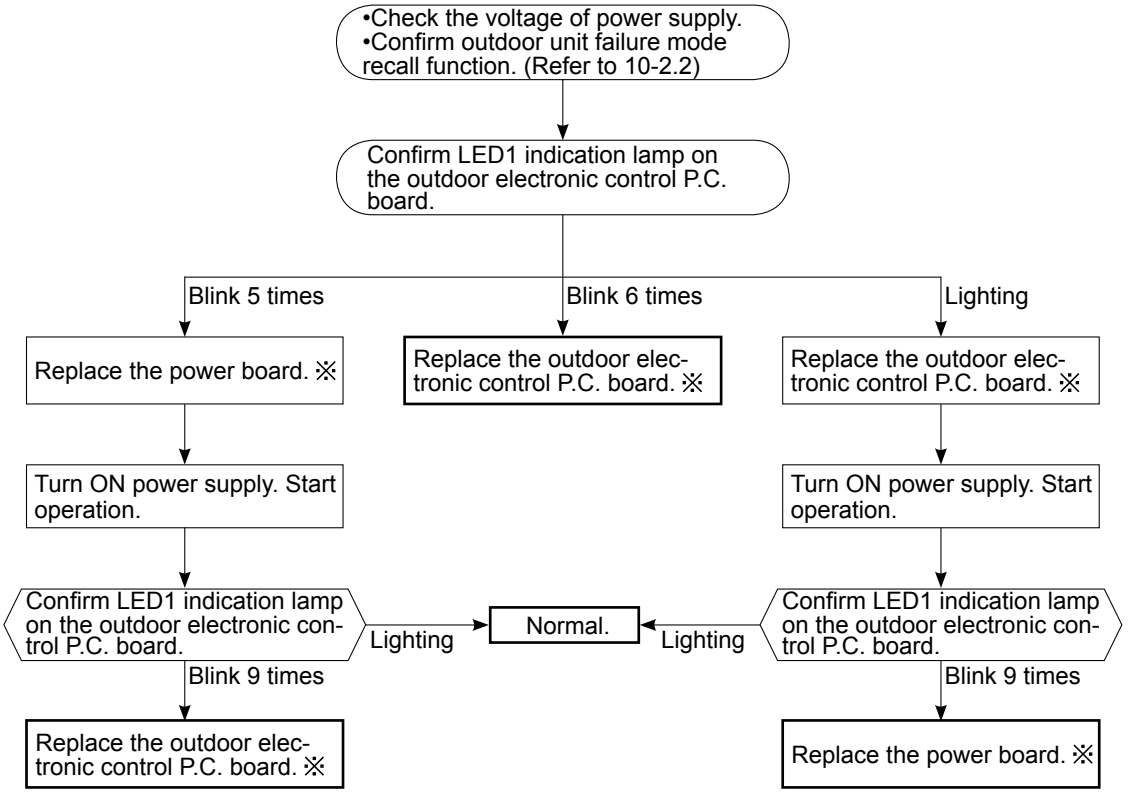
ⒼCheck of LEV

Turn ON power supply to the outdoor unit after checking LEV coil is mounted to the LEV body securely.



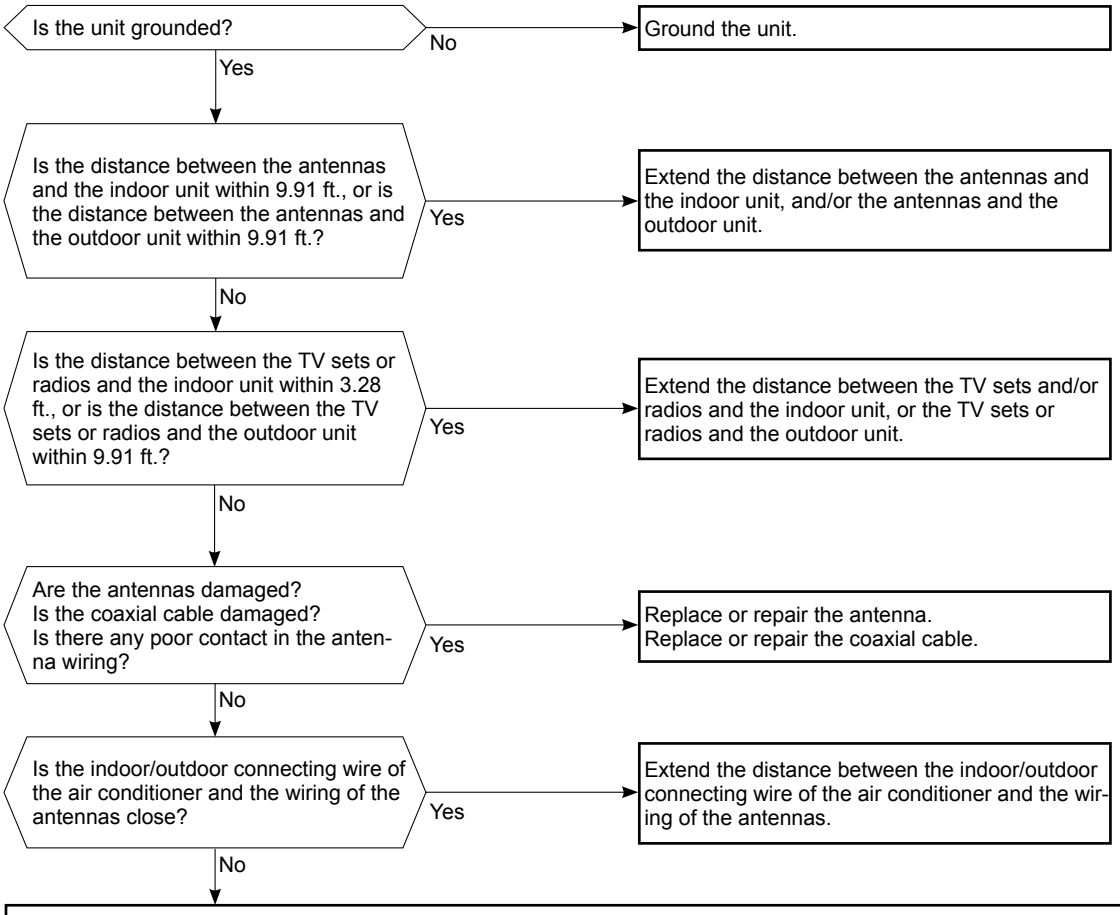
Is "click - click" sound heard? Or, do you feel vibration of the LEV coil with a hand?
- Yes → Normal
- No →

Disconnect the connector CN795. Is there normal resistance to LEV coil?
- Yes → Replace the outdoor electronic control P.C. board.
- No → Replace the LEV coil.



Ⓗ How to check miswiring and serial signal error

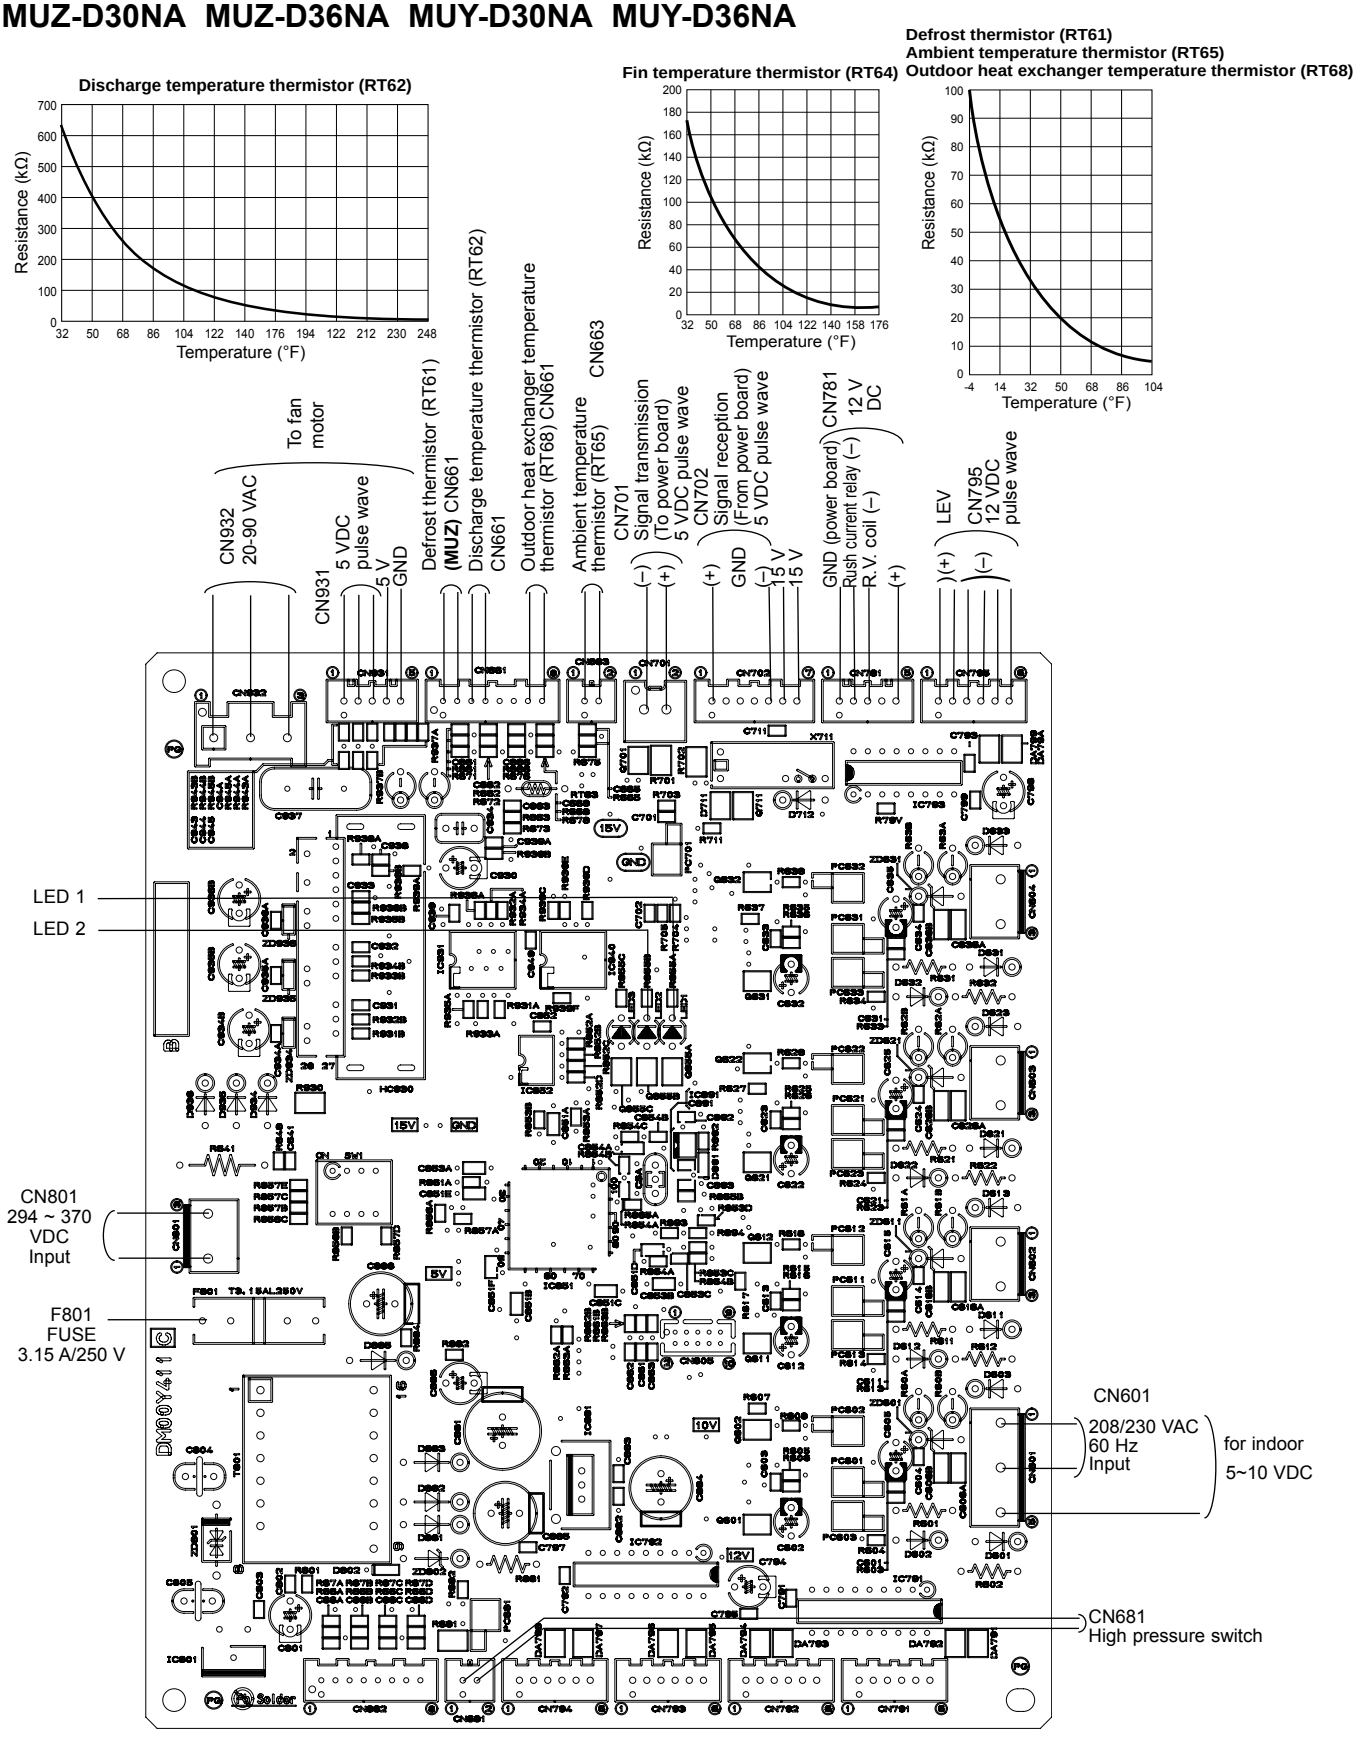
Ⓘ Check of HPS



Ⓙ Check of bus-bar voltage

※ Turn OFF power supply before removing P.C. board.

Ⓚ Electromagnetic noise enters into TV sets or radios



Even if all of the above conditions are fulfilled, the electromagnetic noise may enter, depending on the electric field strength or the installation condition (combination of specific conditions such as antennas or wiring).
Check the followings before asking for service.

1. Devices affected by the electromagnetic noise
   TV sets, radios (FM/AM broadcast, shortwave)
2. Channel, frequency, broadcast station affected by the electromagnetic noise
3. Channel, frequency, broadcast station unaffected by the electromagnetic noise
4. Layout of:
   indoor/outdoor unit of the air conditioner, indoor/outdoor wiring, grounding wire, antennas, wiring from antennas, receiver
5. Electric field intensity of the broadcast station affected by the electromagnetic noise
6. Presence or absence of amplifier such as booster
7. Operation condition of air conditioner when the electromagnetic noise enters in
   1) Turn OFF the power supply once, and then turn ON the power supply. In this situation, check for the electromagnetic noise.
   2) Within 3 minutes after turning ON the power supply, press OPERATE/STOP (ON/OFF) button on the remote controller for power ON, and check for the electromagnetic noise.
   3) After a short time (3 minutes later after turning ON), the outdoor unit starts running. During operation, check for the electromagnetic noise.
   4) Press OPERATE/STOP (ON/OFF) button on the remote controller for power OFF, when the outdoor unit stops but the indoor/outdoor communication still runs on. In this situation, check for the electromagnetic noise.

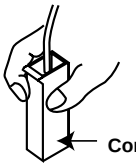
11 DISASSEMBLY INSTRUCTIONS

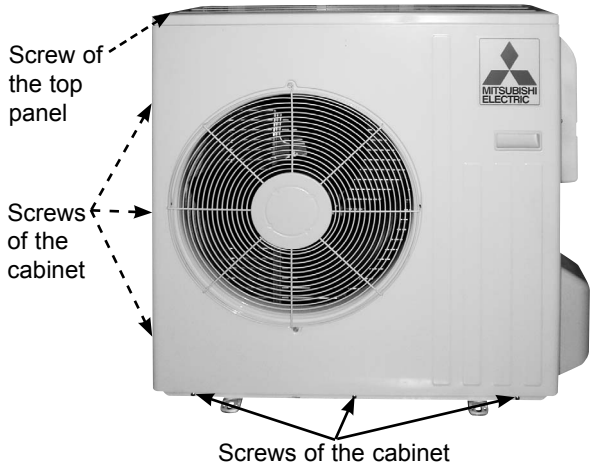
<"Terminal with locking mechanism" Detaching points>

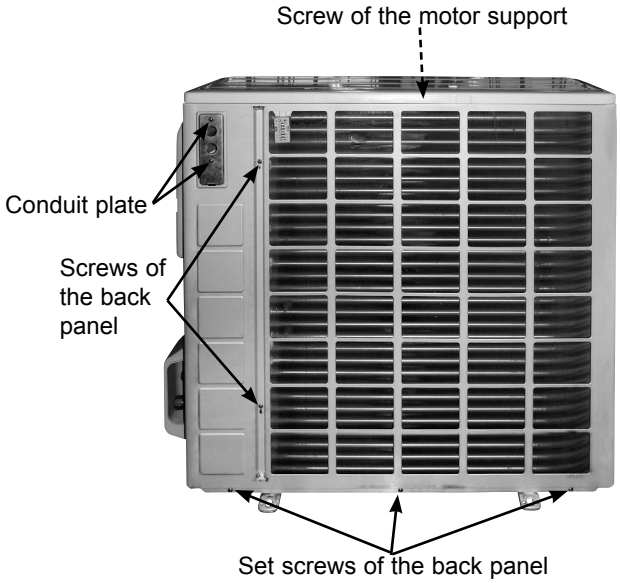


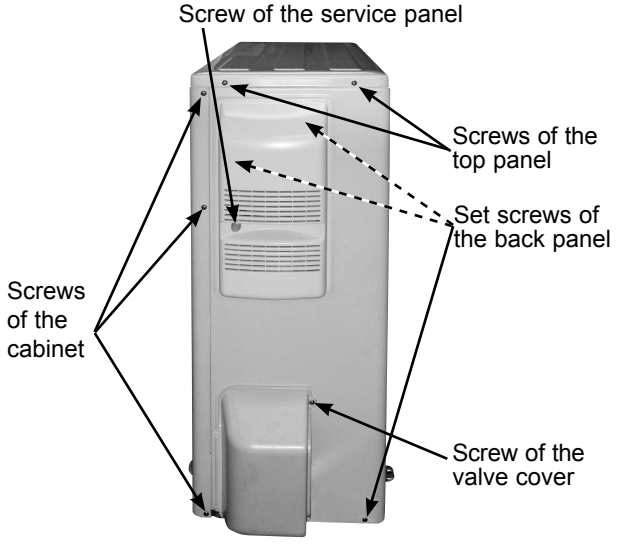
The terminal which has the locking mechanism can be detached as shown below.
There are two types (refer to (1) and (2)) of the terminal with locking mechanism.
The terminal without locking mechanism can be detached by pulling it out.
Check the shape of the terminal before detaching.

(1) Slide the sleeve and check if there is a locking lever or not.

① Slide the sleeve.
② Pull the terminal while pushing the locking lever.







(2) The terminal with this connector has the locking mechanism.

① Hold the sleeve, and pull out the terminal slowly.

MUZ-D30NA MUZ-D36NA MUY-D30NA MUY-D36NA

NOTE: Turn OFF power supply before disassembling.

OPERATING PROCEDURE

2. Removing the inverter assembly, P.C. board and power board

(1) Remove the top panel, cabinet, service panel and the back panel. (Refer to 1.)
(2) Disconnect the following connectors:
<Electronic control P.C. board>
CN931 and CN932 (Fan motor)
CN795 (LEV)
CN661 (Discharge temperature thermistor, defrost thermistor (MUZ) and outdoor heat exchanger temperature thermistor)
CN663 (Ambient temperature thermistor)
CN681 (High pressure switch) (MUZ)
<Noise filter P.C. board>
CN912 (4-way valve) (MUZ)
<Compressor>
<Reactor>
(4) Remove the screws fixing the relay panel.
(5) Remove the inverter assembly.
(6) Disconnect all connectors and lead wires on the electronic control P.C. board.
(7) Remove the electronic control P.C. board from the inverter assembly.
(8) Remove the screws fixing the power board assembly.
(9) Disconnect all connectors and lead wires on the power board.
(10) Remove the power board from the inverter assembly.
(11) Disconnect all connectors and lead wires on the noise filter P.C. board.
(12) Remove the noise filter P.C. board from the inverter assembly.

3. Removing R.V. coil (MUZ)

(1) Remove the top panel, cabinet, service panel and the back panel. (Refer to 1.)
(2) Disconnect the following connectors:
<Noise filter P.C. board>
CN912 (4-way valve)

SECTION 1

Introduction

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy at the PG&E Topock Compressor Station (TCS or Compressor Station). The Compressor Station is located adjacent to the Colorado River in eastern San Bernardino County, California, approximately 12 miles southeast of Needles, California, south of Interstate 40 (I-40), in the north end of the Chemehuevi Mountains (see Figure 1; figures are located at the end of this document).

The California Department of Toxic Substances Control (DTSC) is the state lead agency overseeing corrective actions at the Compressor Station in accordance with the Resource Conservation and Recovery Act (RCRA) Corrective Action. In February 1996, PG&E and DTSC entered into a Corrective Action Consent Agreement pursuant to Section 25187 of the California Health and Safety Code. The U.S. Department of the Interior (DOI) is the lead federal agency overseeing response actions for land under its jurisdiction, custody, or control near the Compressor Station pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). In July 2005, PG&E and the federal agencies (DOI, U.S. Bureau of Land Management [BLM], U.S. Fish and Wildlife Services (USFWS), and U.S. Bureau of Reclamation [BOR]) entered into an Administrative Consent Agreement (DOI 2005). In addition, PG&E and the United States executed a Remedial Design/Remedial Action Consent Decree (CD), on behalf of DOI, under CERCLA in 2012, which was approved by the U.S. District Court for the Central District of California in November 2013.

In a coordinated effort, DOI and DTSC selected the groundwater remedy to address chromium in groundwater at Solid Waste Management Unit (SWMU) 1/Area of Concern (AOC) 1 and AOC 10. The DOI decision is presented in the Record of Decision (ROD) (DOI 2010), and the DTSC decision is presented in a decision package that includes the certification of the Final Environmental Impact Report (EIR; DTSC 2011), the Final Statement of Basis (SOB), the Statement of Decision, and the Resolution of Approval, as well as a directive letter to PG&E on January 31, 2011. DOI and DTSC executed a Memorandum of Understanding (MOU) concerning the coordination in overseeing the implementation of groundwater response action at TCS on November 22, 2011 (DTSC and DOI 2011).

Although the groundwater remedy operation is not an activity that requires coverage under the California General Industrial Storm Water Permit, NPDES No. CAS000001, Order 2014-0057-DWQ (IGP),[1] the EIR mitigation measure HYDRO-1 and the Federal Action-Specific ARAR #34 (DOI 2010) require that an industrial Storm Water Pollution Prevention Plan (SWPPP) be prepared that covers the post-construction operation of the remedy.

This SWPPP has been developed to comply with the substantive requirements of the 2015 IGP. Pursuant to CERCLA Section 121(e), the onsite portions of CERCLA remedial actions are not required to obtain permits or comply with administrative requirements; therefore, only the substantive provisions of the IGP are addressed. The IGP is included in Appendices A and B of this SWPPP.

In accordance with the IGP, storm water pollution prevention has two major objectives:

- Identifying and evaluating sources of pollutants associated with industrial activities that may affect the quality of storm water discharges and authorized non-storm-water discharges (NSWDs) from the facility.
- Identifying and implementing site-specific best management practices (BMPs) to reduce or prevent pollutants from being released in storm water discharges and/or authorized NSWDs that may affect receiving water quality.

[1] The need for coverage under the IGP is triggered by being in one of the SIC codes or industrial activities identified in Attachment A to the IGP. The remedy does not fit into these categories.

This SWPPP covers all remedy facilities located outside of the Compressor Station, the Compressor Station evaporation ponds, and the long-term remedy support area at Moabi Regional Park.[2] The SWPPP identifies BMPs, establishes a monitoring implementation plan (MIP) (include visual observations), a sampling and analysis plan (SAP) (include annual evaluations), reporting, and training.

Conditions or circumstances which may require future revisions to be made to this SWPPP (as required by Section X.C.2 of the IGP) include:

- Changes in the design that materially affect the industrial activities subject under the SWPPP
- Additions of materials that are significant industrial materials or potential pollutants in the context of potential impact to storm water, e.g., use/store outside, readily dispersible in storm water, etc.
- Changes in locations of potential pollutants
- Leaks or releases to the environment

1.1 Roles and Responsibilities

The PG&E Topock Site Operations Manager (Curt Russell) is the contact person for onsite operation as it relates to the remedy and this SWPPP. His contact info is listed in Exhibit 1-1 (IGP X.A.1).

EXHIBIT 1-1
SWPPP Team
Groundwater Remedy Industrial Storm Water Pollution Prevention Plan
PG&E Topock Compressor Station, Needles, California

Name/SWPPP Title	Roles/Responsibilities
PG&E, Curt Russell PG&E Topock Site Operations Manager, SWPPP Lead Office: (760) 326-5582 Mobile: (760) 791-5884	Lead for overseeing compliance with this SWPPP and ensuring that proper BMPs are implemented and maintained. May delegate some responsibilities to appropriately-trained personnel (e.g., preparation of SWPPP and revisions, implementation of BMPs, training, inspections, sampling, annual reports). Certifies SWPPP and SWPPP amendments. Current SWPPP and subsequent amendments are kept onsite.
CH2M HILL, Andrew Redmond Initial SWPPP Preparer	Preparation of draft and final SWPPP.
SWPPP Onsite Trainer, TBD	Conduct/oversee training of personnel. May train additional personnel to conduct training sessions.
Remedy Lead Operator, SWPPP Inspector, TBD	Responsible for visual observations of storm water discharges, and NSWDs, annual compliance evaluation inspection.
SWPPP Field Sampling Technicians Trained technicians, TBD	Responsible for collecting storm water samples and submittal to analytical laboratory.

The PG&E Topock Site Operations Manager, or his designee, is responsible for maintaining and updating this SWPPP, implementing the measures described herein, and performing the monitoring and sampling activities described. Table 2-1 in Section 2 contains additional information on the SWPPP Team (tables are located at the end of each section). Alternate team members may be identified by the PG&E Topock Site Operations Manager when regularly assigned team members are unavailable (IGP X.D.1.c).

[2] Remedy facilities inside the Compressor Station and the Compressor Station evaporation ponds are covered under the Compressor Station's exemption for utilities and gas operations.

SECTION 2

Facility and System Description

The groundwater remedy includes:

- An in situ reactive zone (IRZ) along the National Trails Highway (NTH) using a line of wells that may be used as both injection and extraction wells to circulate groundwater and distribute an organic carbon source to promote reduction of hexavalent chromium (Cr[VI]) to trivalent chromium (Cr[III]).
- An Inner Recirculation Loop (IRL) comprised of:
  - Extraction wells near the Colorado River (referred to as the River Bank Extraction Wells) to provide hydraulic capture of the plume, cleanup of the floodplain downgradient of the IRZ, enhance the flow of contaminated groundwater through the IRZ line, and control migration of IRZ-generated by-products.
  - Injection wells to re-inject groundwater extracted from the River Bank Extraction Wells, which may be amended with an organic carbon source, and/or fresh water in the upgradient portion of the Cr(VI) plume to flush the plume through the IRZ.
- A TCS Recirculation Loop comprised of:
  - East Ravine Extraction Wells in the eastern (downgradient) end of the East Ravine to provide hydraulic capture of contaminated groundwater in bedrock; and Transwestern (TW) Bench Extraction Wells in the area northeast of the TCS to accelerate capture of Cr(VI)-impacted groundwater from the alluvial deposits located downgradient of the TCS.
  - TCS Injection Wells located upgradient of the TCS for the re-injection of groundwater extracted from the East Ravine Extraction Wells and TW Bench Extraction Wells, which will be amended with an organic carbon source, to promote reduction of the Cr(VI) to Cr(III) and remove elevated Cr(VI) groundwater concentrations from the alluvial aquifer in the vicinity of the TCS.
- Injection of fresh water to control and confine the plume migration to the west, to assist with flushing the chromium plume through the NTH IRZ, and to constrain westward spread of carbon-amended water and in situ byproducts from the Inner Recirculation Loop.
- A network of monitoring wells to monitor the effectiveness of the groundwater treatment system.

The groundwater remedy also includes supporting features that are needed to make the remedy effective and safe over its projected decades-long operation. The key supporting features include a Remedy-produced Water Conditioning System located inside the Compressor Station to manage wastewater produced from operations and maintenance (O&M) of the remedy (e.g., maintenance of wells and piping, sampling and monitoring of wells), improvements at the Compressor Station evaporation ponds to support long-term wastewater management, utilities (e.g., power supply for the remedy and distribution conduits, communication and data network, fire water), site safety and security (e.g., alarms, gates/fences, security cameras), access roads for installation and long-term O&M needs, an Operations building at the TW Bench to house site operation and field staff as well as essential O&M functions (e.g., remote control and monitoring equipment/telecom/ information technology, Supervisory Control and Data Acquisition [SCADA] system), and a long-term remedy support area at Moabi Regional Park that will house a laboratory, a document repository center, a training/ conference room, equipment storage, etc. as well as soil storage areas. Figures 2 and 3 show the overall remedy facilities layout.

This SWPPP covers the substantive requirements related to remedy facilities located outside of TCS and Compressor Station evaporation ponds including facilities located on the TW Bench, the MW-20 Bench, and at Moabi Regional Park.

Operation and maintenance activities associated with the groundwater remedy typically comprise of the following categories:

- Remedy facilities operation and maintenance
- Well maintenance and decommissioning
- Pipeline operation and maintenance
- Sampling and monitoring
- Access route and pathway maintenance
- Waste management
- Soil storage
- Contingency plan
- Emergency response

In general, the remedy is staffed during regular business hours (Section X.D.2.d of the IGP). The automated remediation system can operate 24 hours per day while unattended. Section 3 discusses the O&M activities in details.

2.1 List of Industrial Materials

Table 2-1 lists materials associated with remedy processes that could potentially contribute pollutants to storm water and non-storm water discharges. It includes the raw groundwater, chemicals used for well rehabilitation, chemicals used to treat remedy-produced water, lubricants, and maintenance chemicals. Also included are information related to storage, receiving and shipping, as well as handling locations, along with typical quantity and frequency. It is anticipated that information in this list will be completed and updated as remedy operations progress. The PG&E Topock Site Operations Manager or his designee will be responsible for maintaining an updated list at the site.

TABLE 2-1
List of Industrial Materials
Groundwater Remedy Industrial Storm Water Pollution Prevention Plan
PG&E Topock Compressor Station, Needles, California

Material/Physical Characteristic	Storage Location	Shipping/Receiving Location	Handling Location	Typical Quantity	Frequency
Untreated groundwater with total chromium or arsenic concentrations of 5 mg/L or more	Select IRZ wells, MW-20 Bench *(see Figure 2 for approximate locations of remediation wells, Figure 6 for carbon amendment building and storage tank on the MW-20 Bench)*	Produce at well-heads	Above ground at well heads	TBD	During remedy operations and well sampling
Carbon substrate (e.g., Ethanol) in liquid form	MW-20 Bench *(see Figure 6 for approximate location of carbon amendment building and carbon storage tank on the MW20 Bench)*	MW-20 Bench	MW-20 Bench, Aboveground at well heads	15,000-gallon storage tank at MW-20 Bench TBD at well heads	Intermittent
Well maintenance and rehabilitation reagents[a] (mostly in liquid form, carbon dioxide in gaseous form)	Brought onsite during well maintenance/rehabilitation activities, but will not be permanently stored on site *(see Figure 2 for approximate locations of remediation wells that may require maintenance and rehabilitation)*	In the vicinity of the well to be rehab, MW-20 Bench, TW Bench, Long-term remedy support area at Moabi Regional Park	In the vicinity of the well to be rehab	TBD	During well rehabilitation operations
Remedy-produced water with pH<2 (from well maintenance activities)	None	Produce at well-heads	At well-heads	TBD	During well rehabilitation operations
Remedy-produced water to be hauled off-site (if needed)	MW-20 Bench (*see Figure 6 for approximate location of truck loading/unloading station at the MW-20 Bench)*	MW-20 Bench	MW-20 Bench	TBD	Intermittent
Oil for pumps and equipment	Long-term remedy support area at Moabi Regional Park, TW Bench, MW-20 Bench *(see Figures 5-7 for approximate facility locations)*	Long-term remedy support area at Moabi Regional Park, TW Bench, MW-20 Bench	Long-term remedy support area at Moabi Regional Park, TW Bench, MW-20 Bench	TBD	Intermittent
Used oil hazardous waste	Long-term remedy support area at Moabi Regional Park, TW Bench, MW-20 Bench *(see Figures 5-7 for approximate facility locations)*	Long-term remedy support area at Moabi Regional Park, TW Bench, MW-20 Bench	Long-term remedy support area at Moabi Regional Park, TW Bench, MW-20 Bench	TBD	Intermittent
Solvents used for pumps and equipment	Long-term remedy support area at Moabi Regional Park, TW Bench, MW-20 Bench *(see Figures 5-7 for approximate facility locations)*	Long-term remedy support area at Moabi Regional Park, TW Bench, MW-20 Bench	Long-term remedy support area at Moabi Regional Park, TW Bench, MW-20 Bench	TBD	Intermittent
Used solvents hazardous waste	Long-term remedy support area at Moabi Regional Park, TW Bench, MW-20 Bench *(see Figures 5-7 for approximate facility locations)*	Long-term remedy support area at Moabi Regional Park, TW Bench, MW-20 Bench	Long-term remedy support area at Moabi Regional Park, TW Bench, MW-20 Bench	TBD	Intermittent
Laboratory reagents and associated waste (mostly in liquid form)	Onsite laboratory/sample processing at Moabi Regional Park *(see Figure 7 for approximate location of the long-term remedy support area where the onsite laboratory will be located)*	Onsite laboratory/sample processing at Moabi Regional Park	Onsite laboratory/sample processing at Moabi Regional Park	TBD	Intermittent
Compressed gas cylinders	Long-term remedy support area at Moabi Regional Park, TW Bench, MW-20 Bench *(see Figures 5-7 for approximate facility locations)*	Long-term remedy support area at Moabi Regional Park, TW Bench, MW-20 Bench	Long-term remedy support area at Moabi Regional Park, TW Bench, MW-20 Bench, Aboveground at well heads	TBD	Intermittent
Universal waste (batteries, electronic devices, lamps, aerosol cans, and mercury-containing equipment)	Long-term remedy support area at Moabi Regional Park, TW Bench, MW-20 Bench *(see Figures 5-7 for approximate facility locations)*	Long-term remedy support area at Moabi Regional Park, TW Bench, MW-20 Bench	Long-term remedy support area at Moabi Regional Park, TW Bench, MW-20 Bench	TBD	Intermittent
Acids, caustics, and/or dispersants[b] for use in the Clean-In-Place system and associated waste	MW-20 Bench *(see Figure 6 for location of the carbon amendment building in which the CIP system is located)*	MW-20 Bench	MW-20 Bench	330-gallon totes or smaller-volume drums	Intermittent
Soil stabilization agents (e.g., SoilTac[R], Gorilla Snout) (in liquid form)	Long-term remedy support area at Moabi Regional Park *(see Figure 7 for approximate facility location)*	Long-term remedy support area at Moabi Regional Park	Site locations where soil stabilization are needed	TBD	Intermittent
Water and sediments from pipeline maintenance	Along pipeline conveyance system *(see Figure 2 for general pipeline routes and locations)*	Vaults for maintenance along pipeline	TW Bench, MW-20 Bench, vaults for maintenance along pipeline	TBD	Intermittent
Sanitary waste	Septic tanks at TW Bench and Long-term remedy support area at Moabi Regional Park	TW Bench and Long-term remedy support area at Moabi Regional Park	TW Bench and Long-term remedy support area at Moabi Regional Park	Two 10,000-gallon buried plastic tanks at Moabi Regional Park One 10,000-gallon buried plastic tank at TW Bench	Intermittent

TABLE 2-1
List of Industrial Materials
Groundwater Remedy Industrial Storm Water Pollution Prevention Plan
PG&E Topock Compressor Station, Needles, California

Material/Physical Characteristic	Storage Location	Shipping/Receiving Location	Handling Location	Typical Quantity	Frequency
Empty drums, cans, unused chemicals, paints, etc.	Long-term remedy support area at Moabi Regional Park, TW Bench, MW-20 Bench *(see Figures 5-7 for approximate facility locations)*	Long-term remedy support area at Moabi Regional Park, TW Bench, MW-20 Bench	Long-term remedy support area at Moabi Regional Park, TW Bench, MW-20 Bench	TBD	Intermittent

Notes:

TBD – To Be Determined as O&M activities progress.

[a] Well Maintenance and rehabilitation reagents (e.g., hydrochloric acid, sulfamic acid, sulfuric acid, phosphoric acid, hydroxyacetic acid, acetic acid, citric acid, oxalic acid, ascorbic acid, hydrogen peroxide, sodium hypochlorite, sodium hydroxide, chlorine dioxide, potassium hydroxide, polyphosphate, Aqua Clear™ PFD, Rodine-103/Rodine 213, QC-21, CB4, NuWell 120, NuWell 130, nitrogen, and carbon dioxide). See also Exhibit 4.2-5 of the O&M Plan for a summary of available chemicals for well rehabilitation applications.

[b] Potential chemical reagents for use in the CIP system may include hydrochloric, glycolic (hydroxyacetic), and phosphoric acids, sodium hydroxide, and hydrogen peroxide. See also Exhibit 5.1-1 of the O&M Plan for a summary of available chemicals for Clean-In-Place system.

SECTION 3

Activities Assessment and Identification of Potential Pollutant Sources

This section assesses the activities associated with operation and maintenance of the groundwater remedy, and identifies potential pollutant sources (see Table 3-1).

TABLE 3-1
Summary of Activities Assessment and Identification of Potential Pollutant Sources
Groundwater Remedy Industrial Storm Water Pollution Prevention Plan
PG&E Topock Compressor Station, Needles, California

Remedy O&M Activities Category	Description of Activity* Relevant to this SWPPP (refer to Figures 2-7 for approximate locations of facilities)	Identification of Potential Pollutant Sources
Operation of Remedy and Support Facilities	Normal operation of the remedy facilities – remedy facilities include remediation wells and pipelines, carbon (ethanol) storage, carbon amendment facilities, conveyance piping, etc. Normal operation of support facilities – support facilities include power supply and distribution system, Operations building at TW Bench, truck loading/off-loading stations at the TW Bench/MW-20 Bench/Moabi Regional Park, onsite laboratory/sample processing at Moabi Regional Park, equipment maintenance facility at Moabi Regional Park, etc.	See Table 2-1.
Well Maintenance and Decommissioning*	Routine maintenance that can be conducted without intrusive modifications to the wellhead or well includes regular surging and pumping techniques. A more aggressive routine maintenance technique uses AquaGard that injects cryogenic liquid carbon dioxide (CO_2) into existing well access tubes and requires all or some of the following: a CO_2 injection trailer, CO_2 storage vessel, support truck, pump rig and/or crane (if a pump or pipe needs to be installed/removed), and a support truck. Nonroutine maintenance includes intrusive methods requiring removal of existing equipment from well and includes drop-pipe replacement; submersible pump repair/replacement; and well repair and well rehabilitation methods. Depending on the specific plan for well rehabilitation, some or all of the following equipment may be required: a pump rig and/or crane, support or pipe truck, generator(s), air compressor, chemical trailer (mixing tanks and pumps), neutralization trailer (mixing tanks and pumps), support truck, video van, vacuum or tanker truck, forklift, and 20,000-gallon frac tanks.	See Table 2-1.
Pipeline Maintenance*	A Clean-In-Place (CIP) system located at the MW-20 Bench will operate as a closed loop system to remove biological films and mineral scale deposits within remedy pipelines. Spent CIP solutions will be collected and managed as liquid wastes. Maintenance vaults are designed for removal of potential blockages and solids that may settled in the piping network. Water and sediments from the vaulta will be containerized and transported offsite or to the influent tanks of the frac tanks at the MW-20 Bench, or the TW Bench. Aboveground pipeline will need to be periodically repainted for upkeep and aesthetic reasons.	See Table 2-1.
Access Route and Pathway Maintenance*	Access routes and footpaths are expected to deteriorate over time, so maintenance activities will be required and will be tailored to the specific cause and repair need. For footpaths, pruning of overgrowth will be done using hand tools or mechanical-powered tools. Soil stabilization for disturbed areas may be accomplished by applying approved soil stabilizing agents (e.g., SoilTac), erosion control matting, silt fencing, etc.	See Table 2-1.
Waste Management	Management of different waste streams include wastes from the CIP system, used PPE, laboratory wastes, universal wastes, pipeline maintenance wastes, etc. Designated waste management areas are located at the TW Bench, MW-20 Bench, and Moabi Regional Park (Figure 4).	See Table 2-1.
Clean Soil Storage	Storage of clean soil (i.e., displaced soil that is nonhazardous and is suitable for final disposition onsite because contaminants are present below the interim screening level or the project-specific soil cleanup goals [once established]).	See Soil Management Plan (Volume 4 of the O&M Manual).
Sampling and Monitoring	The Sampling and Monitoring Plan (Volume 2 of the O&M Manual) describes the sampling and monitoring program for the remedy which includes groundwater and surface water sampling, and process sampling. The sample locations, analytes, and frequencies will be adapted in an ongoing manner to meet the needs of the remedy.	See Table 2-1.
Contingency Plan*	Contingency planning has been prepared for five key elements of the groundwater remedy: In-Situ Remediation System, Remedy-produced Water Management System, Freshwater Supply, Power Supply, and Remedy SCADA System. Contingency plan includes the Contingent Freshwater Pre-injection Treatment System and the Dissolved Metals Removal System. These systems would be located inside TCS if needed.	See O&M Contingency Plan (Volume 3 of the O&M Manual).
Emergency Response	The project-specific Health and Safety Plan and HMBPs identify the project emergency response procedures and equipment, including emergency response contacts and phone numbers.	See project-specific Hazardous Material Business Plans (HMBPs) (Appendix E of the O&M Plan) and Health and Safety Plan (Volume 5 of the O&M Manual)

Note:

*These activities will likely generate dust (IGP X.G.1.c).

SECTION 4

Best Management Practices

This section identifies site-specific best management practices (BMPs) to reduce or prevent pollutants from being released in storm water discharges and/or authorized NSWDs that may affect receiving water quality. Authorized NSWDs include potable water, fire hydrant testing, discharge of materials and release of hazardous materials/waste into secondary containment areas that is not released to the environment, etc.

4.1 Minimum BMPs

The following are the minimum BMPs consistent with Section X.H.1 of the 2015 IGP (see Appendix A), the BMPs applicability is discussed in Table 4-1:

Good Housekeeping, including:

- Observe all outdoor areas associated with industrial activity; including storm water discharge locations, drainage areas, conveyance systems, waste handling/disposal areas, and perimeter areas impacted by off-facility materials or storm water run-on to determine housekeeping needs. Clean and dispose of properly any identified debris, waste, spills, tracked materials, or leaked materials;
- Minimize or prevent material tracking;
- Minimize dust generated from industrial materials or activities;
- Ensure that all facility areas impacted by rinse/wash waters are cleaned as soon as possible;
- Cover all stored industrial materials that can be readily mobilized by contact with storm water;
- Contain all stored non-solid industrial materials or wastes that can be transported or dispersed via by the wind or contact with storm water;
- Prevent disposal of any rinse/wash waters or materials into the storm water conveyance system;
- Minimize storm water discharges from non-industrial areas (e.g., storm water flows from employee parking area) that contact industrial areas of the facility; and
- Minimize authorized NSWDs from non-industrial areas (e.g., potable water, fire hydrant testing, etc.) that contact industrial areas of the facility.

Preventive Maintenance, including:

- Identify all equipment and systems used outdoors that may spill or leak pollutants;
- Observe the identified equipment and systems to detect leaks, or identify conditions that may result in the development of leaks;
- Establish schedule for maintenance of identified equipment and systems; and
- Establish procedures for prompt maintenance and repair of equipment, and maintenance of systems when conditions exist that may result in the development of spills or leaks.

Material Handling and Waste Management, including:

- Prevent or minimize handling of industrial materials or wastes that can be readily mobilized by contact with storm water during a storm event;
- Contain all stored non-solid industrial materials or wastes that can be transported or dispersed by the wind, erosion or contact with storm water during handling;
- Cover industrial waste disposal containers and industrial material storage containers that contain industrial materials when not in use;

- Divert run-on and storm water generated from within the facility away from all stockpiled materials;
- Clean all spills of industrial materials and/or wastes that occur during handling; and
- Observe and clean as appropriate, any outdoor material/ or waste handling equipment or containers that can be contaminated by contact with industrial materials or wastes.

Erosion and Sediment Controls, including:

- Implement effective wind erosion controls;
- Provide effective stabilization for inactive areas, finished slopes, and other erodible areas prior to a forecasted storm event;
- Maintain effective perimeter controls and stabilize all site entrances and exits to sufficiently control discharges of erodible materials from discharging or being tracked off the site;
- Divert run-on and storm water generated from within the facility away from all erodible materials; and
- If sediment basins are implemented, ensure compliance with the design storm standards in Section X.H.6.

Employee Training Program, including:

- Ensure that all team members implementing the various compliance activities of the SWPPPP are properly trained to implement the requirements of the IGP, including but not limited to: BMP implementation, BMP effectiveness evaluations, visual observations, and monitoring activities. If the remedy enters Level 1 status, all appropriate team members shall be trained by a Qualified Industrial Stormwater Practitioner (QISP);
- Prepare or acquire appropriate training manuals or training materials;
- Identify which personnel need to be trained, their responsibilities, and the type of training they will receive;
- Provide a training schedule; and
- Maintain documentation of all completed training classes and the personnel that received training in the SWPPP.

Quality Assurance and Record Keeping, including:

- Develop and implement management procedures to ensure that appropriate staff implements all elements of the SWPPP, including the Monitoring Implementation Plan (MIP, see Section 5).
- Develop a method of tracking and recording the implementation of BMPs identified in the SWPPP.
- Maintain the BMP implementation records, training records, and records related to any spills and clean-up related response activities for a minimum of five years.

4.2 Advanced BMPs

The 2015 IGP requires that the site, to the extent feasible, implement and maintain any advanced BMPs necessary to reduce or prevent discharges of pollutants in its storm water discharge in a manner that reflects best industry practice considering technological availability and economic practicability and achievability. Advanced BMPs may include:

- Exposure Minimization BMPs (such as storm resistant shelters that prevent the contact of storm water with the industrial materials or areas of industrial activity)
- Storm Water Containment and Discharge Reduction BMPs that divert, infiltrate, reuse, contain, retain, or reduce the volume of storm water runoff
- Treatment Control BMPs (the implementation of one or more mechanical, chemical, biologic, or any other treatment technology)

Advanced BMPs for the groundwater remedy included in the 90% design are:

- Storm resistant shelters (i.e., buildings) for Operations at the TW Bench, Hazardous Materials storage at the TCS, and Carbon Amendment facilities at the MW-20 Bench
- Storm water drainage at the TW Bench to divert storm water run on and reduce the volume of storm water runoff.
- Drainage features in access roads to reduce erosion and divert storm water from remedy facilities such as wells and associated control equipment.

4.3 Temporary Suspension of Activities

If PG&E suspends industrial activities related to the remedy for ten or more consecutive calendar days during a reporting year, then the remedy may also suspend monitoring if it is infeasible to conduct monitoring while industrial activities are suspended. In the event of a temporary suspension of activities for more than 10 days during which it is infeasible to continue to perform monitoring, PG&E will prepare an addendum to the SWPPP specifying BMPs that will be implemented during the suspension to stabilize the site and will implement those BMPs prior to suspending monitoring activities.

TABLE 4-1
Summary of Site-Specific BMPs
Groundwater Remedy Industrial Storm Water Pollution Prevention Plan
PG&E Topock Compressor Station, Needles, California

Area	Activity	Potential Pollutant Source(s)	Potential Pollutant(s)	Best Management Practices
Site-wide	Operation and Maintenance	Examples: vehicle/equipment leaks and drips, or vandalism.	Motor oil, hydraulic oil, diesel fuel, gasoline, solvents	Training, inspections, annual evaluation, ensure vehicles/ equipment are in good working order and undergo regularly scheduled maintenance. Observe delivery and pickup vehicles that access the site. Park and refuel vehicles/equipment over portable drip containment pads. Cover all stored industrial materials that can be readily mobilized by contact with storm water. Prevent disposal of any rinse/wash waters or industrial materials into the storm water conveyance system. Maintain effective perimeter controls and stabilize site entrances and exits to sufficiently control discharges of erodible materials from discharging or being tracked off the site.
Site-wide	Vehicular Movement and Soil Erosion	Examples: incidental leakage from vehicles, dust and particulate generation from moving vehicles	Motor oil, diesel fuel, gasoline, radiator fluid	Good housekeeping, preventive maintenance, inspections, training, and following posted speed limit. Control track-out. Particulate matter generated during vehicular movement to be mitigated by utilizing water buffalo or water truck to suppress any particulates from crossing property boundaries.
Conveyance pipeline	Groundwater Extraction, Conveyance, and Injection	Examples: break in pipe, tanks, leaking valve, well vaults	Groundwater with Cr(VI) concentrations greater than 5.0 mg/L	Well vaults and piping air release valves have sealed containment.
Wells	Well Maintenance	Examples: incidental leakage from vehicles, dust and particulate generation from moving vehicles, release form hoses or containers during back-flushing and/or acid solution rehabilitation	Acids (some with dispersants), oxidizing agents (hydrogen peroxide, chlorine); biocides, and chelating agents	Training, inspections, good housekeeping. Conduct observation during back-flushing and/or acid solution rehabilitation events. Place portable containment pads under temporary equipment (e.g., generators, containers, vacuum trucks).

TABLE 4-1
Summary of Site-Specific BMPs
Groundwater Remedy Industrial Storm Water Pollution Prevention Plan
PG&E Topock Compressor Station, Needles, California

Area	Activity	Potential Pollutant Source(s)	Potential Pollutant(s)	Best Management Practices
TW Bench/MW-20 Bench/Long-term Remedy Support Area	Loading and unloading activities	Examples: incidental leaks of oil, hydraulic fluid, lubricant, etc. from 3rd party delivery/service trucks and forklift during loading/ unloading	Ethanol, Well Maintenance and rehabilitation reagents	Good housekeeping, preventive maintenance, inspections, training in unloading/loading and forklift procedures, inspections. Observation of unloading and loading activities to detect spills or improper handling. Proper use of secondary containment. Material shipping and receiving is performed with two personnel at all times. Example: Operator and spotter directing via hand signals or other. Cover all stored industrial materials that can be readily mobilized by contact with storm water.
TW Bench, MW-20 Bench	Carbon amendment operations	Examples: leaks associated with carbon amendment storage and deliveries	Carbon	Good housekeeping, preventive maintenance, inspections, training, and observing removal of sump contents for possible spills/leaks. Carbon amendment building is covered and enclosed.
Clean Soil Storage Area at Moabi Regional Park	Soil storage, loading and unloading activities	Examples: incidental leakage from vehicles, dust and particulate generation from moving vehicles and soil	Soil/Total Suspended Solid (TSS) in runoff	Training, inspections, good housekeeping. No uncovered equipment storage other than the soil/aggregate separator. Place straw wattles around soil and aggregate storage piles to prevent storm water run-on and run-off. Use wooden stakes to keep wattles in place. Cover piles or spray with cohesive agent prior to rain events. Prevent disposal of any rinse/wash waters or industrial materials into the storm water conveyance system. Utilize watering (i.e., with water buffalo) for dust mitigation during intrusive soil disturbance.
Remediation Wells	Ethanol application	Ethanol application	Ethanol	Good housekeeping, preventive maintenance, inspections, and training
Access Roads and Pathways	Vehicle movement, road maintenance	Example: Storm water run on/off gathering TSS	Erosion, TSS	Drainage features in access roads to reduce erosion and divert storm water from remedy facilities such as wells and associated control equipment
NSWDs	Allowable NSWDs	Example: air conditioning condensate, potable water, fire hydrant testing	Machine oil in air conditioner	Good housekeeping, preventive maintenance, inspections, and training

SECTION 5

Monitoring Implementation Plan

The Monitoring Implementation Plan (MIP) describes the visual observations, frequency, locations, and documentation as required by the IGP. The SWPPP team will evaluate results recorded from the visual observations and determine if adjustments to the BMPs and/or SWPPP amendments, if any, are needed (IGP Section I).

Monthly Visual Observations

At least once per calendar month, visually observe each drainage area (see Table 5-1 for a list of potential discharge locations) for the following:

- The presence or indications of prior, current, or potential unauthorized NSWDs and their sources.
- Authorized NSWDs, sources, and associated BMPs.
- Outdoor industrial equipment and storage areas, outdoor industrial activities areas, BMPs, and all other potential source of industrial pollutants.
- The monthly visual observations will be conducted during daylight hours of scheduled facility operating hours and on days without precipitation.

Sampling Event Visual Observations

- Sampling event visual observations will be conducted at the same time sampling occurs at a discharge location. At each discharge location where a sample is obtained, onsite sampling technician will observe the discharge of storm water associated with industrial activity.
- Ensure that visual observations of discharge from contained storm water, and corresponding documentation, discharged from containment sources (e.g. secondary containment or storage ponds) are conducted at the time that the discharge is sampled.
- Visually observe and record the presence or absence of floating and suspended materials, oil and grease, discolorations, turbidity, odors, trash/debris, and source(s) of any discharged pollutants.
- In the event that a discharge location is not visually observed during the sampling event, record which discharge locations were not observed.

TABLE 5-1
Potential Discharge Locations
Groundwater Remedy Industrial Storm Water Pollution Prevention Plan
PG&E Topock Compressor Station, Needles, California

ID	Location	Comments
TW-SW1	TW Bench (Figure 5)	On-site sampling technician to observe surface water flow to determine precise sampling location
MW20-SW1	MW-20 Bench (Figure 6)	On-site sampling technician to observe surface water flow to determine precise sampling location
PM-SW1, SW2	Clean Soil Storage/Long-term Remedy Support Area at Moabi Regional Park (Figure 7)	On-site sampling technician to observe surface water flow to determine precise sampling location

Notes:
The TCS is exempt from SWPPP requirements, therefore, no storm water samples will be collected within the TCS boundary.

SECTION 6

Sampling and Analysis Plan

The sampling and analysis plan (SAP) describes the sampling and analysis of storm water samples from qualified storm events (QSEs), and comparison to applicable Numeric Action Levels. The SAP also includes an Annual Evaluation as required by the IGP.

- Collect and analyze storm water samples from two QSEs within the first half of each reporting year (July 1 to December 31), and two QSEs within the second half of each reporting year (January 1 to June 30). A QSE is defined as a precipitation event that produces a discharge for at least one drainage area and is preceded by 48 hours with no discharge from any drainage area. A potential list of discharge locations is presented in Table 5-1.
- Samples from each discharge location will be collected within 4 hours of the start of the discharge, or the start of facility operations if the QSE occurs within the previous 12-hour period (e.g., for storms with discharges that begin during the night for facilities with daytime operating hours). Sample collection is required during scheduled facility operating hours and when sampling conditions are safe.
- Samples will be analyzed for the following parameters (this may be modified as needed by the PG&E Site Manager to achieve the objectives of the SWPPP while maintaining compliance with the IGP):
  - Total suspended solids (TSS)
  - Oil and grease (O&G)
  - pH

6.1 Comparison to Applicable Numeric Action Levels and Exceedance Response Actions

The IGP contains annual and instantaneous maximum NALs. The applicable NALs for the groundwater remedy are listed in Table 6-1.

The Colorado River is the receiving water at Topock, specifically the Colorado River and Associated Lakes and Reservoirs (California-Nevada border to Lake Havasu). A listing of impaired water bodies in California is provided online at the SWRCB: http://www.waterboards.ca.gov/water_issues/programs/tmdl/integrated2010.shtml. This section of the Colorado River is not listed on the Impaired Water Bodies 303(d) list for any parameters.

At the beginning of IGP coverage, the groundwater remedy has baseline status for all parameters. The Baseline status for any given parameter will change to Level 1 status if sampling results indicate an NAL exceedance for that parameter in any subsequent reporting year (July 1 to June 30). Level 1 status for any parameter will change to Level 2 status if sampling results indicate an NAL exceedance in any subsequent reporting year for the same parameter while the Discharger is in Level 1. Level 2 status will commence on July 1 following the reporting year during which the NAL exceedance(s) occurred. See Section XII of the 2015 IGP for NAL exceedance response actions (ERAs) required under Level 1 and Level 2 status as well as actions and sampling results that would return the facility to baseline status.

TABLE 6-1
Applicable Numeric Action Levels (NALs)
Groundwater Remedy Industrial Storm Water Pollution Prevention Plan
PG&E Topock Compressor Station, Needles, California

Parameter	Test Method	Reporting Units	Annual NAL	Instantaneous Maximum NAL
pH	See Topock Program Quality Assurance Project Plan (QAPP[1])	pH units	N/A	Less than 6.0, greater than 9.0
TSS	See QAPP[1]	mg/L	100	400
O&G, Total	See QAPP[1]	mg/L	15	25

Notes:

[1] The QAPP is included Appendix B of the Sampling and Monitoring Plan (Volume 2 of the O&M Manual).

For annual NALs, an exceedance occurs when the average of all analytical results from all samples taken during a reporting year for a given parameter exceeds an annual NAL value. For the instantaneous maximum NALs, an exceedance occurs when two or more analytical results from samples taken for any parameter within a reporting year exceed the instantaneous maximum NAL value (for TSS and O&G), or are outside of the instantaneous maximum NAL range (for pH).

6.2 Annual Evaluation

The 2015 IGP requires that one Annual Evaluation will be conducted for each reporting year (July 1 to June 30). The Annual Evaluation will be conducted no fewer than 8 months and no more than 16 months following the previous Annual Evaluation. The Annual Evaluation will consist of:

- A review of all sampling, visual observation, and inspection and monitoring records and sampling and analysis results conducted during the previous reporting year
- A visual inspection of all areas of industrial activity and associated potential pollutant sources for evidence of, or the potential for, pollutants entering the storm water conveyance system
- A visual inspection of all drainage areas previously identified as having no exposure to the groundwater remedy industrial activities and materials
- A visual inspection of equipment needed to implement the BMPs
- A visual inspection of any BMPs
- A review and effectiveness assessment of all BMPs for each area of industrial activity and associated potential pollutant sources to determine if the BMPs are properly designed, implemented, and are effective in reducing and preventing pollutants in industrial storm water discharges and authorized NSWDs
- An assessment of any other factors needed to comply with the requirements in IGP Section XVI.B.

PG&E will revise the SWPPP as appropriate and implement revisions within 90 days of the Annual Evaluation.

SECTION 7

Reporting

Annual reports include a summary and evaluation of all sampling and analysis results, original laboratory reports, and chain of custody forms, a summary of all corrective actions taken during the compliance year, and identification of any compliance activities or corrective actions that were not implemented.

Annual reporting is a requirement of permitted SWPPP documents and reports are submitted electronically through SMARTs. Because this is not a permitted SWPPP, the annual reports will not be submitted through SMARTs. The annual reports will be submitted to DTSC (as required by HYDRO-1) and DOI.

SECTION 8

Training

8.1 Training Requirements

Individuals with roles related to this SWPPP will be trained commensurate with their responsibilities. This includes personnel:

- Responsible for overseeing compliance with the conditions of the IGP and the components of this SWPPP
- Responsible for preparing, revising, and amending this SWPPP
- Responsible for preparing and submitting reports required under the General Permit
- Responsible for installation, inspection, maintenance, and repair of BMPs
- Responsible for collection and management of storm water samples and performing visual observations under the MIP
- Responsible for managing hazardous materials at the site (e.g., unloading of treatment chemicals, operation of the treatment system)

Initial and annual refresher training will be provided. The PG&E Topock Site Operations Manager (Curt Russell) and Site Compliance Lead (Chris Smith) will be responsible for track training and maintain copies of training materials, required training for each staff member with SWPPP responsibilities, records of completed training classes, and personnel receiving training.

8.2 Training Documentation

All SWPPP training sessions will be documented. An example training documentation form is shown in Exhibit 8-1. The example training form can be adjusted for use onsite by the PG&E Topock Site Operations Manager.

Appendix A
California Industrial Storm Water General Permit

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES)

GENERAL PERMIT FOR
STORM WATER DISCHARGES
ASSOCIATED WITH INDUSTRIAL ACTIVITIES

ORDER
NPDES NO. CAS000001

This Order was adopted by the State Water Resources Control Board on:	**<Adoption Date>**
This Order shall become effective on:	~~January~~July **1, 2015**
This Order shall expire on:	~~December 31, 2019~~June 30, 2020

IT IS HEREBY ORDERED that as of ~~January~~July 1, 2015 this Order supersedes Order 97-03-DWQ except for Order 97-03-DWQ's requirement to submit annual reports by ~~January 1, 2015~~July 1, 2015 and except for enforcement purposes. As of ~~January~~July 1, 2015, a Discharger shall comply with the requirements in this Order to meet the provisions contained in Division 7 of the California Water Code (commencing with section 13000) and regulations adopted thereunder, and the provisions of the federal Clean Water Act and regulations and guidelines adopted thereunder.

I, Jeanine Townsend, Clerk to the Board, do hereby certify that this Order, including its fact sheet, attachments, and appendices is a full, true, and correct copy of an Order adopted by the State Water Resources Control Board, on **<Adoption Date>**.

I. FINDINGS

A. General Findings

The State Water Resources Control Board (State Water Board) finds that:

1. The Federal Clean Water Act (Clean Water Act) prohibits certain discharges of storm water containing pollutants except in compliance with a National Pollutant Discharge Elimination System (NPDES) permit. (33 U.S.C. §§ 1311, 1342 (also referred to as Clean Water Act §§ 301, 402).) The United States Environmental Protection Agency (U.S. EPA) promulgates federal regulations to implement the Clean Water Act's mandate to control pollutants in storm water discharges. (40 C.F.R. § 122, et seq.) The NPDES permit must require implementation of Best Available Technology Economically Achievable (BAT) and Best Conventional Pollutant Control Technology (BCT) to reduce or ~~eliminate~~prevent pollutants in storm water discharges and authorized non-storm water discharges (NSWDs). The NPDES permit must also include additional requirements necessary to implement applicable water quality objectives or water quality standards (~~collectively,~~ water quality standards,~~WQS~~ collectively).

2. On November 16, 1990, U.S. EPA promulgated Phase I storm water regulations in compliance with section 402(p) of the Clean Water Act. (55 Fed. Reg. 47990, codified at 40 C.F.R. § 122.26.) These regulations require operators of facilities subject to storm water permitting (Dischargers), that discharge storm water associated with industrial activity (industrial storm water discharges), to obtain an NPDES permit. Section 402(p)(3)(A) of the Clean Water Act also requires that permits for discharges associated with industrial activity include requirements necessary to meet water quality standards~~WQS~~.

3. Phase II storm water regulations[1] require permitting for storm water discharges from facilities owned and operated by a municipality with a population of less than 100,000. The previous exemption from the Phase I permitting requirements under section 1068 of the Intermodal Surface Transportation Efficiency Act of 1991 was eliminated.

4. This Order (General Permit) is an NPDES General Permit issued in compliance with section 402 of the Clean Water Act and shall take effect on ~~January~~July 1, 2015, provided that the Regional Administrator of U.S. ~~-~~EPA has no objection. If the U.S. EPA Regional Administrator has an objection, this General Permit will not become effective until the objection is withdrawn.

5. This action to adopt an NPDES General Permit is exempt from the provisions of the California Environmental Quality Act (Pub. Resources Code, § 21000, et seq.) in accordance with section 13389 of the Water Code. (See *County of*

[1] U.S. EPA. Final NPDES Phase II Rule. <http://cfpub.epa.gov/npdes/stormwater/swfinal.cfm>. [as of February~~July 3~~4, 201~~3~~4]

Los Angeles v. California State Water Resources Control Bd. (2006) 143 Cal.App.4th 985.)

6. State Water Board Order 97-03-DWQ is rescinded as of the ~~Effective Date~~effective date of this General Permit (~~January~~July 1, 2015) except for Order 97-03-DWQ's requirement that annual reports be submitted by ~~January 1~~July1, 2015 and except for enforcement purposes.

7. Effective ~~January~~July 1, 2015, the State Water Board and the Regional Water Quality Control Boards (Regional Water Boards) (~~collectively,~~ Water Boards, collectively) will enforce the provisions herein.

8. This General Permit authorizes discharges of industrial storm water to waters of the United States, so long as those discharges comply with all requirements, provisions, limitations, and prohibitions in this General Permit.

9. Industrial activities covered under this General Permit are described in Attachment A.

10. The Fact Sheet for this Order is incorporated as findings of this General Permit.

11. Acronyms are defined in Attachment B and terms used in this General Permit are defined in Attachment C.

12. This General Permit regulates industrial storm water discharges and authorized NSWDs from specific categories of industrial facilities identified in Attachment A hereto, and industrial storm water discharges and authorized NSWDs from facilities designated by the Regional Water Boards to obtain coverage under this General Permit. This General Permit does not apply to industrial storm water discharges and NSWDs that are regulated by other individual or general NPDES permits

13. This General Permit does not preempt or supersede the authority of municipal agencies to prohibit, restrict, or control industrial storm water discharges and authorized NSWDs that may discharge to storm water conveyance systems or other watercourses within their jurisdictions as allowed by state and federal law.

14. All terms defined in the Clean Water Act, U.S. EPA regulations, and the Porter-Cologne Water Quality Control Act (Wat. Code, § 13000, et seq.) will have the same definition in this General Permit unless otherwise stated.

15. Pursuant to 40 Code of Federal Regulations section 131.12 and State Water Board Resolution 68-16, which incorporates the requirements of 40 Code of Federal Regulations section 131.12 where applicable, the State Water Board finds that discharges in compliance with this General Permit will not result in the lowering of water quality to a level that does not achieve water quality objectives and protect beneficial uses. Any degradation of water quality from existing high quality water to a level that achieves water quality objectives and

DRAFT

protects beneficial uses is appropriate to support economic development. This General Permit's requirements constitute best practicable treatment or control for discharges of industrial storm water and authorized non-storm water discharges, and are therefore consistent with those provisions.

16. Compliance with any specific limits or requirements contained in this General Permit does not constitute compliance with any other applicable permits.

17. This General Permit requires that the Discharger certify and submit all Permit Registration Documents (PRDs) for Notice of Intent (NOI) and No Exposure Certification (NEC) coverage via the State Water Board's Storm Water Multi-Application and Report Tracking System (SMARTS) website. ~~An~~(See Attachment D for an example of the information required to be submitted in the PRDs via SMARTS~~ can be found in Attachment D.~~) All other documents required by this General Permit to be electronically certified and submitted via SMARTS can be submitted by the Discharger or by a designated Duly Authorized Representative on behalf of the Discharger. Electronic reporting is required to reduce the state's reliance on paper, to improve efficiency, and to make such General Permit documents more easily accessible to the public and the Water Boards.

18. ~~Any~~All information provided to the Water Boards shall comply with the Homeland Security Act and ~~any~~all other federal law that concerns security in the United States, as applicable.

B. Industrial Activities Not Covered Under this General Permit

19. Discharges of storm water from areas on tribal lands are not covered under this General Permit. ~~Industrial~~Storm water discharges from industrial facilities on tribal lands are regulated by ~~an~~a separate NPDES permit issued by U.S. EPA.

20. Discharges of storm water regulated under another individual or general NPDES permit adopted by the State Water Board or Regional Water Board are not covered under this General Permit, including the ~~current~~State Water Board NPDES General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities.

21. Storm water discharges to combined sewer systems are not covered under this General Permit. These discharges must be covered by an individual permit. (40 C.F.R. § 122.26(a)(7)~~6)(i)~~.)

22. Conveyances that discharge storm water runoff combined with municipal sewage are not covered under this General Permit.

23. Discharges of storm water identified in Clean Water Act section 402(l) (33 U.S.C. § 1342(l)) are not covered under this General Permit.

24. Facilities otherwise subject to this General Permit but for which a valid Notice of Non-Applicability (NONA) has been certified and submitted via SMARTS.

by the Entity are not covered under this General Permit. Entities (See Section XX.C.1 of this General Permit) who are claiming "No Discharge" through the NONA shall meet the eligibility requirements and provide a No Discharge Technical Report in accordance with Section XX.C.

25. This General Permit does not authorize discharges of dredged or fill material regulated by the US Army Corps of Engineers under section 404 of the Clean Water Act and does not constitute a water quality certification under section 401 of the Clean Water Act.

C. Discharge Prohibitions

26. Pursuant to section 13243 of the Water Code, the State Water Board may specify certain conditions or areas where the discharge of waste, or certain types of waste, is prohibited.

27. With the exception of certain authorized NSWDs as defined in Section IV, this General Permit prohibits NSWDs. The State Water Board recognizes that certain NSWDs should be authorized because they are not generated by industrial activity, are not significant sources of pollutants when managed appropriately, and are generally unavoidable because they are related to safety or would occur regardless of industrial activity. Prohibited NSWDs may be authorized under other individual or general NPDES permits, or waste discharge requirements issued by the Water Boards.

28. Prohibited NSWDs are referred to as unauthorized NSWDs in this General Permit. Unauthorized NSWDs shall be either eliminated or permitted by a separate NPDES permit. Unauthorized NSWDs may contribute significant pollutant loads to receiving waters. Measures to control sources of unauthorized NSWDs such as spills, leakage, and dumping, must be addressed through the implementation of Best Management Practices (BMPs).

29. This General Permit incorporates discharge prohibitions contained in water quality control plans, as implemented by the Water Boards.

30. Direct discharges of waste, including industrial storm water discharges, to Areas of Special Biological Significance (ASBS) are prohibited unless the Discharger has applied for and the State Water Board has granted an exception to the State Water Board's 2009 Water Quality Control Plan for Ocean Waters of California as amended by State Water Board Resolution 2012-0056 (California Ocean Plan)[2] allowing the discharge.

[2] State Water Resources Control Board. Ocean Standards Web Page. <http://www.waterboards.ca.gov/water_issues/programs/ocean/>. [as of February ~~July~~ ~~34~~, 201~~34~~]. State Water Resources Control Board. Water Quality Control Plan for Ocean Waters Of California 2009. <http://www.waterboards.ca.gov/water_issues/programs/ocean/docs/2009_cop_adoptedeffective_usepa.pdf>. [as of February ~~July~~ ~~34~~, 201~~34~~].

D. Effluent Limitations

31. Section 301(b) of the Clean Water Act and 40 Code of Federal Regulations section ~~122.44~~ require NPDES permits to include technology-based requirements at a minimum, and any more stringent effluent limitations necessary for receiving waters to meet applicable water quality standards~~WQS~~. Clean Water Act section 402(p)(3)(A) requires that discharges of storm water runoff from industrial facilities comply with Clean Water Act section 301.

32. This General Permit requires control of pollutant discharges using BAT and BCT to reduce and prevent ~~and reduce~~ discharges of pollutants, and any more stringent effluent limitations necessary for receiving waters to meet applicable water quality standards~~WQS~~.

33. It is not feasible for the State Water Board to establish numeric technology based effluent limitations for discharges ~~covered~~authorized by this General Permit at this time. The rationale for this determination is discussed in detail in the Fact Sheet of this General Permit. Therefore, this General Permit requires Dischargers to implement minimum BMPs and ~~any~~ applicable advanced BMPs as defined in Section X.H (collectively, BMPs) to comply with the requirements of this General Permit. This approach is consistent with U.S. EPA's 2008 Multi-Sector General Permit for Stormwater Discharges Associated with Industrial Activity (2008 MSGP).

34. 40 Code of Federal Regulations section 122.44(d) ~~also~~ requires that NPDES permits include Water Quality Based Effluent Limitations (WQBELs) to attain and maintain applicable numeric and narrative ~~WQS~~ water quality standards for receiving waters.

35. Where numeric water quality criteria have not been established, 40 Code of Federal Regulations section 122.44(d)(1)(vi) provides that WQBELs may be established using U.S. EPA criteria guidance under section 304(a) of the Clean Water Act, a proposed state criteria or policy interpreting narrative criteria supplemented with other relevant information, and/or an indicator parameter.

36. This General Permit requires Dischargers to implement BMPs when~~where~~ necessary, in order to support attainment of ~~WQS~~water quality standards. The use of BMPs to control or abate the discharge of pollutants is authorized by 40 Code of Federal Regulations section 122.44(k)(3) because numeric effluent limitations are infeasible and implementation of BMPs ~~are~~is reasonably necessary to achieve effluent limitations and water quality standards ~~or~~, and to carry out the purposes and intent of the Clean Water Act. (40 C.F.R. § 122.44(k)(4).)

State Water Resources Control Board. Resolution 2012-0056. <http://www.swrcb.ca.gov/board_decisions/adopted_orders/resolutions/2012/rs2012_0056.pdf>. [as of February~~July 3~~4, 201~~3~~4].

E. Receiving Water Limitations

37. This General Permit requires compliance with receiving water limitations based on water quality standards. The primary receiving water limitation requires that industrial storm water discharges and authorized NSWDs not cause or contribute to an exceedance of applicable water quality standards. ~~This General Permit requires all Dischargers to comply with all applicable WQS for waters of the United States that may be affected by their industrial storm water discharges and authorized NSWDs.~~ Water quality standards~~WQS~~ apply to the quality of the receiving water, not the quality of the industrial storm water discharge. Therefore, compliance with the receiving water limitations ~~can~~ generally ~~not~~cannot be determined solely by the effluent water quality characteristics. If any Discharger's storm water discharge causes or contributes to an exceedance of a water quality standard, that Discharger must implement additional BMPs or other control measures in order to attain compliance with the receiving water limitation. Compliance with ~~WQS~~ water quality standards may, in some cases, require Dischargers to implement controls that are more protective than ~~the~~ controls ~~that are necessary~~implemented solely to ~~meet~~comply with the technology-based requirements in this General Permit.

F. Total Maximum Daily Loads (TMDLs)

38. TMDLs relate to the maximum amount of a pollutant that a water body can receive and still attain water quality standards~~WQS~~. A TMDL is defined as the sum of the allowable loads of a single pollutant from all contributing point sources (the waste load allocations~~, or WLAs~~) and non-point sources (load allocations~~, or LAs~~), plus the contribution from background sources. (40 C.F.R. § 130.2(i).) Discharges addressed by this General Permit are considered to be point source discharges, and therefore must comply with effluent limitations that are "consistent with the assumptions and requirements of any available waste load allocation for the discharge prepared by the state and approved by U.S. EPA pursuant to 40 Code of Federal Regulations section 130.7. (40 C.F.R. § 122.44 (d)(1)(vii).) In addition, Water Code section 13263, subdivision (a), requires that waste discharge requirements implement any relevant water quality control plans. Many TMDLs contained in water quality control plans include implementation requirements in addition to waste load allocations. Attachment E of this General Permit lists the watersheds with U.S. EPA-approved and U.S. EPA-established TMDLs that include requirements, including waste load allocation~~WLA~~s, for Dischargers covered by this General Permit.

39. The State Water Board recognizes that it is appropriate to develop TMDL-specific permit requirements derived from each TMDL's waste load allocation~~WLA~~ and implementation requirements, in order to provide clarity to Dischargers regarding their responsibilities for compliance with applicable TMDLs. The development of TMDL-specific permit requirements is subject to public noticing requirements and a corresponding public comment period. ~~Given~~Due to the number and variety of Dischargers subject to a wide range of

DRAFT

TMDLs, development of TMDL-specific permit requirements for each TMDL listed in Attachment E will severely delay the reissuance of this General Permit. Because most of the TMDLs were established by the Regional Water Boards, and because some of the waste load allocation~~WLA~~s and/or implementation requirements may be shared by multiple Dischargers, the development of TMDL-specific permit requirements is best coordinated at the Regional Water Board level.

40. State and Regional Water Board staff~~, with the assistance of State Water Board staff,~~ will develop proposed TMDL-specific permit requirements (including monitoring and reporting requirements) for each of the TMDLs listed in Attachment E ~~by July 1, 2015~~. After conducting a 30-day public comment period, the Regional Water Boards will submit to the State Water Board proposed TMDL-specific permit requirements for adoption by the State Water Board into this General Permit~~.~~ by July 1, 2016. The Regional Water Boards may also include proposed TMDL-specific monitoring requirements for inclusion in this General Permit, or may issue Regional Water Board orders pursuant to Water Code section 13383 requiring TMDL-specific monitoring. The proposed TMDL-specific permit requirements shall have no force or effect until adopted, with or without modification, by the State Water Board. Consistent with the 2008 MSGP, Dischargers are not required to take any additional actions to comply with the TMDLs listed in Attachment E until the State Water Board reopens this General Permit and includes TMDL-specific permit requirements, unless notified otherwise by a Regional Water Board.

41. The Regional Water Boards shall submit to the State Water Board the following information for each of the TMDLs listed in Attachment E:

    a. Proposed TMDL-specific permit ~~and~~, monitoring and reporting requirements applicable to industrial storm water discharges and NSWDs authorized under this General Permit, including ~~any timelines~~compliance schedules and deliverables consistent with the TMDLs. TMDL-specific permit requirements are not limited by the BAT/BCT technology-based standards;

    b. An explanation of how the proposed TMDL-specific permit requirements, ~~timelines~~compliance schedules, and deliverables are consistent with the assumptions and requirements of any applicable waste load allocation~~WLA~~ and implement each TMDL; and,

    c. Where a BMP-based approach is proposed, an explanation of how the proposed BMPs will be sufficient to implement applicable waste load allocation~~WLA~~s.

42. Upon receipt of the information described in Finding 40, and no later than July 1, 2016, the State Water Board will issue a public notice and conduct a public comment period for the reopening of this General Permit to amend Attachment E, the Fact Sheet, and other provisions as necessary for

incorporation of TMDL-specific permit requirements into this General Permit. Attachment E may also be subsequently reopened during the term of this General Permit to incorporate additional TMDL-specific permit requirements.

G. Discharges Subject to the California Ocean Plan

43. On October 16, 2012 the State Water Board amended the California Ocean Plan ~~(California Ocean Plan).~~. The amended California Ocean Plan requires industrial storm water dischargers with outfalls discharging to ocean waters to comply with the California Ocean Plan's model monitoring provisions. These provisions require Dischargers to: (a) monitor runoff for specific parameters at all outfalls from two storm events per year, and collect at least one representative receiving water sample per year, (b) conduct specified toxicity monitoring at certain types of outfalls at a minimum of once per year, and (c) conduct marine sediment monitoring for toxicity under specific circumstances. The California Ocean Plan provides conditions under which some of the above monitoring provisions may be waived by the Water Boards.

44. This General Permit requires Dischargers with outfalls discharging to ocean waters that are subject to the model monitoring provisions of the California Ocean Plan to develop and implement a monitoring plan in compliance with those provisions and any additional monitoring requirements established pursuant to Water Code section 13383. Dischargers that have not developed and implemented a monitoring program in compliance with the California Ocean Plan's model monitoring provisions by ~~January~~July 1, 2015 (the effective date of this General Permit~~,~~), or seven (7) days prior to commencing operations, whichever is later, are ineligible to obtain coverage under this General Permit.

45. The California Ocean Plan prohibits the direct discharge of waste to ASBS. ASBS are defined in California Ocean Plan as "those areas designated by the State Water Board as ocean areas requiring protection of species or biological communities to the extent that alteration of natural water quality is undesirable."

46. The California Ocean Plan authorizes the State Water Board to grant an exception to Ocean Plan provisions where the board determines that the exception will not compromise protection of ocean waters for beneficial uses and the public interest will be served.

47. On March 20, 2012, the State Water Board adopted Resolution 2012-0012 which contains exceptions to the California Ocean Plan for specific discharges of storm water and non-point sources. This resolution also contains the special protections that are to be implemented for those discharges to ASBS.

48. This General Permit requires Dischargers who have been granted an exception to the Ocean Plan authorizing the discharges to ASBS by the State

Water Board to comply with the requirements contained in Section VIII.B of this General Permit.

H. Training

49. To improve compliance and maintain consistent implementation of this General Permit, Dischargers are required to designate a Qualified Industrial Storm Water Practitioner (QISP) for each facility the Discharger operates that has entered Level 1 status in the Exceedance Response Action (ERA) process as described in Section XII of this General Permit. A QISP may be assigned to more than one facility. In order to qualify as a QISP, a State Water Board-sponsored or approved training course must be completed. A competency exam may be required by the State Water Board to demonstrate sufficient knowledge of the QISP course material.

50. A QISP ~~is responsible for~~must assist the Discharger in completing the Level 1 status and Level 2 status ERA requirements as specified in Section XII of this General Permit.

51. A Compliance Group Leader, as defined in Section XIV of this General Order must ~~be a QISP~~complete a State Water Board sponsored or approved training program for Compliance Group Leaders.

52. All engineering work subject to the Professional Engineers Act (Bus. & Prof. Code § 6700, et seq.) and required by this General Permit shall be performed by a California licensed professional engineer ~~in accordance with the Professional Engineers Act (Bus. .& Prof. Code § 6700, et seq.).~~

53. California licensed professional civil, industrial, chemical, and mechanical engineers and geologists have licenses that have professional overlap with the topics of this General Permit. The California Department of Consumer Affairs, Board for Professional Engineers, Land Surveyors and Geologists (CBPELSG) provides the licensure and regulation of professional civil, industrial, chemical, and mechanical engineers and professional geologists in California. The State Water Board is developing a specialized self-guided State Water Board-sponsored registration and training program specifically for these CPBELSG licensed engineers and geologists in good standing with CBPELSG.

I. Storm Water Pollution Prevention Plan (SWPPP) Requirements

54. This General Permit requires the development of a site-specific SWPPP in accordance with Section X of this General Permit. The SWPPP must include the information needed to demonstrate compliance with the requirements of this General Permit. The SWPPP must be submitted electronically via SMARTS, and a copy be kept at the facility. SWPPP revisions shall be completed in accordance with Section X.B of this General Permit

DRAFT

J. Sampling, Visual Observations, Reporting and Record Keeping

55. This General Permit complies with 40 Code of Federal Regulations section 122.44(i), which establishes monitoring requirements that must be included in storm water permits. Under this General Permit, Dischargers are required to: (a) conduct an Annual Comprehensive Facility Compliance Evaluation (Annual Evaluation) to identify areas of the facility contributing pollutants to industrial storm water discharges, (b) evaluate whether measures to reduce or prevent ~~or reduce~~ industrial pollutant loads identified in the Discharger's SWPPP are adequate and properly implemented in accordance with the terms of this General Permit, and (c) determine whether additional control measures are needed.

~~56.~~ This General Permit contains monitoring requirements that are necessary to determine whether pollutants are being discharged, and whether response actions are necessary. Data and information resulting from the monitoring will assist in Dischargers' evaluations of BMP effectiveness and compliance with this General Permit. Visual observations are one form of monitoring. This General Permit requires Dischargers to perform a variety of visual observations designed to identify pollutants in industrial storm water discharges and their sources. To comply with this General Permit Dischargers shall: (1) electronically self-report any violations via SMARTS,

~~57.~~56. (2) comply with the Level 1 status and Level 2 status ERA requirements, when applicable, and (3) adequately address and respond to any Regional Water Board comments on the Discharger's compliance reports.

~~58.~~57. Dischargers that meet the requirements of the No Exposure Certification (NEC) Conditional Exclusion set forth in Section XVII of this General Permit are exempt from the SWPPP requirements, sampling requirements, and visual observation requirements in this General Permit.

K. Facilities Subject to Federal Storm Water Effluent Limitation Guidelines (ELGs)

~~59.~~58. U.S. EPA regulations at 40 Code of Federal Regulations Chapter I Subchapter N (Subchapter N) establish technology-based Effluent Limitation Guidelines and New Source Performance Standards (ELGs) for industrial storm water discharges from facilities in specific industrial categories. For these facilities, compliance with the BAT/BCT and ELG requirements constitutes compliance with technology-based requirements of this General Permit.

~~60.~~59. 40 Code of Federal Regulations section 122.44(i)(3) and (4) require storm water permits to require at least one Annual Evaluation and any monitoring requirements for applicable ELGs in Subchapter N. This General Permit requires Dischargers to comply with all applicable ELG requirements found in Subchapter N.

L. Sampling and Analysis Reduction

~~61.~~60. This General Permit reduces the number of qualifying sampling events required to be sampled each year when the Discharger demonstrates: (1) consistent compliance with this General Permit,(2) consistent effluent water quality sampling, and (3) analysis results that do not exceed numerical action levels.

M. Role of Numeric Action Levels (NALs) and Exceedance Response Actions (ERAs)

~~62.~~61. This General Permit incorporates a multiple objective performance measurement system that includes NALs, new comprehensive training requirements, Level 1 ERA Reports, Level 2 ERA Technical Reports, and Level 2 ERA Action Plans. Two objectives of the performance measurement system are to inform Dischargers, the public and the Water Boards on: (1) the overall pollutant control performance at any given facility, and (2) the overall performance of the industrial statewide storm water program. Additionally, the State Water Board expects that this information and assessment process will provide information necessary to determine the feasibility of numeric effluent limitations for industrial dischargers in the next reissuance of this General Permit, consistent with the State Water Board Storm Water ~~Panel's~~Panel of Experts' June 2006 Recommendations.[3]

~~63.~~62. This General Permit contains annual and instantaneous maximum NALs. The annual NALs are established as the 2008 MSGP benchmark values, and are applicable for all parameters listed in Table 2. The instantaneous maximum NALs are calculated from a Water Board dataset, and are only applicable for Total Suspended Solids (TSS), Oil and Grease (O&G), and pH. An NAL exceedance is determined as follows:

a. For annual NALs, an exceedance occurs when the average of all analytical results from all samples taken at a facility during a reporting year for a given parameter exceeds an annual NAL value listed in Table 2 of this General Permit; ~~and~~or,

b. For the instantaneous maximum NALs, an exceedance occurs when two or more analytical results from samples taken ~~from~~for any parameter within a reporting year exceed the instantaneous maximum NAL value (for ~~TSS~~Total Suspended Solids, and ~~O&G~~Oil and Grease), or are outside of the instantaneous maximum NAL range (for pH) listed in Table 2 of this General Permit. For the purposes of this General Permit, the reporting year is July 1 through June 30.

[3] State Water Board Storm Water Panel of Experts, The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities (June 19, 2006) <http://www.swrcb.ca.gov/water_issues/programs/stormwater/docs/numeric/swpanel_final_report.pdf> [as of February ~~July 34~~, 201~~3~~4].

~~64.~~63. The NALs are not intended to serve as technology-based or water quality-based numeric effluent limitations. The NALs are not derived directly from either BAT/BCT requirements or receiving water objectives. NAL exceedances defined in this General Permit are not, in and of themselves, violations of this General Permit. A Discharger that does not fully comply with the Level 1 status and/or Level 2 status ERA requirements, when required by the terms of this General Permit, is in violation of this General Permit.

~~65.~~64. ERAs are designed to assist Dischargers in complying with this General Permit. Dischargers subject to ERAs must evaluate the effectiveness of their BMPs being implemented to ensure they are adequate to achieve compliance with this General Permit.

~~66.~~65. U.S. EPA regulations at Subchapter N establish ELGs for storm water discharges from facilities in 11 industrial categories. Dischargers subject to these ELGs are required to comply with the applicable requirements.

~~67.~~66. Exceedances of the NALs that are attributable solely to pollutants originating from non-industrial pollutant sources (such as run-on from adjacent facilities, non-industrial portions of the Discharger's property, or aerial deposition) are not a violation of this General Permit because the NALs are designed to provide feedback on industrial sources of pollutants. Dischargers may submit a Non-Industrial Source Pollutant Demonstration as part of their Level 2 ERA Technical Report to demonstrate that the presence of a pollutant causing an NAL exceedance is attributable solely to pollutants originating from non-industrial pollutant sources.

~~68.~~67. A Discharger who has designed, installed, and implemented BMPs to reduce or prevent pollutants in industrial storm water discharges in compliance with this General Permit may submit an Industrial Activity BMPs Demonstration, as part of their Level 2 ERA Technical Report.

~~69.~~68. This General Permit establishes design storm standards for all treatment control BMPs. These design standards are directly based on the standards in State Water Board Order 2000-0011 regarding Standard Urban Storm Water Mitigation Plans (SUSMPs). These design standards are generally expected to be consistent with BAT/BCT, to be protective of water quality, and to be effective for most pollutants. The standards are intended to eliminate the need for most Dischargers to further treat/control industrial storm water discharges that are unlikely to contain pollutant loadings that exceed the NALs set forth in this General Permit.

N. Compliance Groups

~~70.~~69. Compliance Groups are groups of Dischargers (Compliance Group Participants) that share common types of pollutant sources and industrial activity characteristics. Compliance Groups provide an opportunity for the Compliance Group Participants to ~~pool~~combine resources and develop ~~Consolidated~~consolidated Level 1 ERA Reports for Level 1 NAL exceedances

and appropriate BMPs for implementation in response to Level 2 status ERA requirements that are representative of the entire Compliance Group. Compliance Groups also provide the Water Boards and the public with valuable information as to how industrial storm water discharges are affected by non-industrial background pollutant sources (including natural background) and geographic locations. When developing the next reissuance of this General Permit, the State Water Board expects to have a better understanding of the feasibility and benefits of sector-specific and watershed-based permitting ~~approaches~~alternatives, which may include technology- or water quality-based numeric effluent limitations ~~(NELs)~~. The ~~State Water Board intends that the~~ effluent data, BMP performance data and other information provided from Compliance Groups' consolidated reporting will further assist the State Water Board in addressing ~~these issues~~sector-specific and watershed-based permitting alternatives.

O. Conditional Exclusion – No Exposure Certification (NEC)

~~71.~~70. Pursuant to U.S. EPA Phase II regulations, all Dischargers subject to this General Permit may qualify for a conditional exclusion from specific requirements if they submit a NEC demonstrating that their facilities have no exposure of industrial activities and materials to storm water discharges.

~~72.~~71. This General Permit requires Dischargers who seek the NEC conditional exclusion to obtain coverage in accordance with Section XVII of this General Permit. Dischargers that meet the requirements of the NEC are exempt from the SWPPP, sampling requirements, and monitoring requirements in this General Permit.

~~73.~~72. Dischargers seeking NEC coverage are required to ~~file~~certify and submit the applicable permit registration documents. Annual inspections, re-certifications, and fees are required in subsequent years. Light industry facility Dischargers ~~that were previously~~ excluded from coverage under the previous permit (Order 97-03-DWQ) must obtain the appropriate coverage under this General Permit. Failure to comply with the Conditional Exclusion conditions listed in this General Permit may lead to enforcement for discharging without a permit pursuant to sections 13385 or 13399.25, et seq., of the Water Code. A Discharger with NEC coverage that anticipates a change (or changes) in circumstances that would lead to exposure should register for permit coverage prior to the anticipated changes.

P. Special Requirements for Facilities Handling Plastic Materials

~~74.~~73. Section 13367 of the Water Code requires facilities handling preproduction plastic to implement specific BMPs aimed at minimizing discharges of such materials. The definition of Plastic Materials for the purposes of this General Permit includes the following types of sources of Plastic Materials: virgin and recycled plastic resin pellets, powders, flakes, powdered additives, regrind, ~~scrap,~~ dust, and ~~industrial process waste or recycling that has~~other types of preproduction plastics with the potential to discharge or migrate ~~and~~

discharge off-site. Such Plastic Materials are considered storm water gross pollutants.

Q. Regional Water Board Authorities

75.74. Regional Water Boards are primarily responsible for enforcement of this General Permit. This General Permit recognizes that Regional Water Boards have the authority to protect the beneficial uses of receiving waters and prevent degradation of water quality in their region. As such, Regional Water Boards may modify monitoring requirements and review, comment, approve or disapprove certain Discharger submittals required under this General Permit.

DRAFT

IT IS HEREBY ORDERED that all Dischargers subject to this General Permit shall comply with the following conditions and requirements.

II. RECEIVING GENERAL PERMIT COVERAGE

A. Certification

1. For Storm Water Multi-Application Reporting and Tracking System (SMARTS) electronic account management and security reasons, as well as enforceability of this General Permit, the Discharger's Legally Responsible Person (LRP) of an industrial facility seeking coverage under this General Permit shall certify and submit all Permit Registration Documents (PRDs) for Notice of Intent (NOI) or No Exposure Certification (NEC) coverage. All other documents shall be certified and submitted via SMARTS by the Discharger's (LRP) or by their Duly Authorized Representative in accordance with the Electronic Signature and Certification Requirements in Section XXI.K. All documents required by this General Permit that are certified and submitted via SMARTS shall be in accordance with Section XXI.K.

2. Hereinafter references to certifications and submittals by the Discharger refer to the Discharger's LRP and their Duly Authorized Representative.

B. Coverages

This General Permit includes requirements for two (2) types of permit coverage, NOI coverage and NEC coverage. State Water Board Order 97-03-DWQ (previous permit) remains in effect until ~~January~~July 1, 2015. When PRDs are certified and submitted and the annual fee is received, the State Water Board will assign the Discharger a Waste Discharger Identification (WDID) number.

1. General Permit Coverage (NOI Coverage)

   a. Dischargers that discharge storm water associated with industrial activity to waters of the United States are required to meet all applicable requirements of this General Permit.

   b. The Discharger shall register for coverage under this General Permit by certifying and submitting PRDs via SMARTS (http://smarts.waterboards.ca.gov), which consist of:

      i. A completed NOI and signed certification statement;

      ii. A copy of a current Site Map from the Storm Water Pollution Prevention Plan (SWPPP) in Section X.E;

      iii. A SWPPP (see Section X); and,

c. ~~The Discharger shall pay appropriate Annual Fee in accordance with California Code of Regulations, title 23, section 2200 et seq.~~[4] The Discharger shall pay the appropriate Annual Fee in accordance with California Code of Regulations, title 23, section 2200 et seq.[5]

2. General Permit Coverage (NEC Coverage)

a. Dischargers that certify their facility has no exposure of industrial activities or materials to storm water in accordance with Section XVII qualify for NEC coverage and are not required to comply with the SWPPP or monitoring requirements of this General Permit.

b. Dischargers who qualify for NEC coverage shall conduct one Annual Facility Comprehensive Compliance Evaluation (Annual Evaluation) as described in Section XV, pay an annual fee, and ~~annually~~ certify annually that their facilities continue to meet the NEC requirements.

c. The Discharger shall submit the following PRDs on or before October 1, 2015 for NEC coverage via SMARTS:

i. A completed NEC Form (Section XVII.F.1) and signed certification statement (Section XVII.H);

ii. A completed NEC Checklist (Section XVII.F.2); and

iii. A current Site Map consistent with requirements in Section X.E~~; and,~~.;

d. ~~The Discharger shall pay the appropriate Annual Fee in accordance with California Code of Regulations, title 23, section 2200 et seq.~~[6] The Discharger shall pay the appropriate annual fee in accordance with California Code of Regulations, title 23, section 2200 et seq.[7]

3. General PRD Requirements

a. Site Maps

Dischargers registering for NOI or NEC coverage shall prepare a site map(s) as part of their PRDs in accordance with Section X.E. A separate copy of the site map(s) is required to be in the SWPPP. If there is a significant change in the facility layout (e.g., new building, change in

[4] ~~Until the State Board adopts an electronic fee payment system, annual fees must be mailed.~~
[5] See footnote 4. Annual fees must be mailed or sent electronically using the State Water Boards' Electronic Funds Transfer (EFT) system in SMARTS.
[6] ~~See footnote 4. Annual fees must be mailed or sent electronically using the State Water Boards' Electronic Funds Transfer (EFT) system in SMARTS.~~
[7] See footnote 4.

storage locations, boundary change, etc.) a revision to the site map is required and shall be certified and submitted via SMARTS.

b. A Discharger shall submit a single set of PRDs for coverage under this General Permit for multiple industrial activities occurring at the same facility.

c. Any information provided to the Water Boards by the Discharger shall comply with the Homeland Security Act and other federal law that addresses security in the United States; any information that does not comply should not be submitted in the PRDs. The Discharger must provide justification to the Regional Water Board regarding redacted information within any submittal.

d. Dischargers may redact trade secrets from ~~required submittals~~information that is submitted via SMARTS. Dischargers who certify and submit redacted information via SMARTS must include a general description of ~~any~~the redacted information and the basis for the redaction in the ~~submittal~~version that ~~includes the information.~~is submitted via SMARTS. Dischargers must submit complete and un-redacted ~~paper copies~~ versions of the information that are clearly labeled "CONFIDENTIAL" to the Regional Water Board within 30 days of the submittal of the redacted information. All information ~~submittal per this Section~~labeled "CONFIDENTIAL" will be maintained by the Water Boards in a separate, confidential file.

4. Schedule for Submitting PRDs - Existing Dischargers Under the Previous Permit.

a. Existing Dischargers[8] with coverage under the previous permit shall continue coverage under the previous permit until ~~January~~July 1, 2015. All waste discharge requirements and conditions of the previous permit are in effect until ~~January~~July 1, 2015.

b. Existing Dischargers with coverage under the previous permit shall ~~have until January 1, 2015 to~~ register for NOI coverage by July 1, 2015 or for NEC coverage~~.~~ by October 1, 2015. Existing Dischargers ~~that were~~ previously listed in Category 10 (Light Industry) of the previous permit, and continue to have no exposure to industrial activities and materials, have until ~~January~~October 1, 2015 to register for NEC coverage.

c. Existing Dischargers with coverage under the previous permit, that do not register for NOI ~~or NEC~~ coverage by ~~January~~July 1, 2015, may have their permit coverage administratively terminated as soon as ~~January~~July 1, 2015.

[8] Existing Dischargers are Dischargers with an active Notice of Intent (permit coverage) under the previous permit (97-03-DWQ) prior to the effective date of this General Permit.

d. Existing Dischargers with coverage under the previous permit that are eligible for NEC coverage but do not register for NEC coverage by October 1, 2015 may have their permit coverage administratively terminated as soon as ~~July~~October 1, 2015.

~~d.~~e. Existing Dischargers shall continue to comply with the SWPPP requirements in State Water Board Order 97-03-DWQ up to, but no later than, ~~December 31, 2014~~June 30, 2015.

~~e.~~f. Existing Dischargers shall implement an updated SWPPP in accordance with Section X by ~~January~~July 1, 2015.

~~f.~~g. Existing Dischargers that submit a Notice of Termination (NOT) under the previous permit prior to ~~January~~July 1, 2015 and that receive NOT approval from the Regional Water Board are not subject to this General Permit unless they subsequently submitted new PRDs.

5. Schedule for Submitting PRDs - New Dischargers Obtaining Coverage On or After ~~January~~July 1, 2015

   New Dischargers registering for NOI coverage on or after ~~January~~July 1, 2015 shall certify and submit PRDs via SMARTS at least seven (7) days prior to commencement of industrial activities or on ~~January~~July 1, 2015, whichever comes later.

   a. New Dischargers registering for NEC coverage shall electronically certify and submit PRDs via SMARTS by ~~January~~October 1, 2015, or at least seven (7) days prior to commencement of industrial activities, whichever ~~comes~~is later.

C. Termination and Changes to General Permit Coverage

1. Dischargers with NOI or NEC coverage shall request termination of coverage under this General Permit when either (a) operation of the facility has been transferred to another entity, (b) the facility has ceased operations, completed closure activities, and removed all industrial related pollutants, or (c) the facility's operations have changed and are no longer subject to the General Permit. Dischargers shall certify and submit a Notice of Termination ~~(NOT)~~ via SMARTS. Until a valid NOT is received, the Discharger remains responsible for compliance with this General Permit and payment of accrued annual fees.

2. Whenever there is a change to the facility location, the Discharger shall certify and submit new PRDs via SMARTS. When ownership changes, the prior Discharger (seller) must inform the new Discharger (buyer) of the General Permit applications and regulatory coverage requirements. The new Discharger must certify and submit new PRDs via SMARTS to obtain coverage under this General Permit.

DRAFT

3. Dischargers with NOI coverage where the facility qualifies for NEC coverage in accordance with Section XVII of this General Permit, may register for NEC coverage via SMARTS. Such Dischargers are not required to submit an NOT to cancel NOI coverage.

4. Dischargers with NEC coverage, where changes in the facility and/or facility operations occur, which result in NOI coverage instead of NEC coverage, shall register for NOI coverage via SMARTS. Such Dischargers are not required to submit an NOT to cancel NEC coverage.

5. Dischargers shall provide additional information supporting an NOT, or revise their PRDs via SMARTS, upon request by the Regional Water Board.

6. Dischargers that are denied approval of a submitted NOT or registration for NEC coverage by the Regional Water Board, shall continue compliance with this General Permit under their existing NOI coverage.

7. New Dischargers (Dischargers with no previous NOI or NEC coverage) shall register for NOI coverage if the Regional Water Board denies NEC coverage.

~~8. Dischargers that change coverage from NOI coverage to NEC coverage are not required to pay the annual fees associated with NEC coverage until the following billing cycle. Dischargers changing coverage from NEC coverage to NOI coverage shall pay the full NOI coverage annual fee. The NOI coverage fee shall not be pro-rated.~~

D. Preparation Requirements

1. The following documents shall be certified and submitted by the Discharger via SMARTS:

   a. Annual Reports (Section XVI) and SWPPPs (Section X);

   b. NOTs;

   c. Sampling Frequency Reduction ~~(SFR)~~ Certification (Section XI.C.7);

   d. Level 1 ERA Reports (Section XII.C) prepared by a QISP; ~~and~~

   e. Level 2 ERA Technical Reports and Level 2 ERA Action Plans (Sections XII.D.1-2) prepared by a QISP; and,

   f. SWPPPs for inactive mining operations as described in Section XIII, signed (wet signature and license number) ~~prepared~~ by a California licensed professional engineer.

2. The following documents shall be ~~prepared, stamped and~~ signed (wet signature and license number) by a California licensed professional engineer:

a. Calculations for Dischargers subject to Subchapter N in accordance with Section XI.D;

b. Notice of Non-Applicability (NONA) Technical Reports described in Section XX.C for facilities that are engineered and constructed to have contained the maximum historic precipitation event (or series of events) using the precipitation data collected from the National Oceanic and Atmospheric Agency's website;

c. NONA Technical Reports described in Section XX.C for facilities located in basins or other physical locations that are not tributaries or hydrologically connected to waters of the United States; and,

d. SWPPPs for inactive mines described in Section XIII.

III. DISCHARGE PROHIBITIONS

A. All discharges of storm water to waters of the United States are prohibited except as specifically authorized by this General Permit or another NPDES permit.

B. Except for non-storm water discharges (NSWDs) authorized in Section IV, discharges of liquids or materials other than storm water, either directly or indirectly to waters of the United States, are prohibited~~. These unauthorized~~ unless authorized by another NPDES permit. Unauthorized NSWDs must be either eliminated or authorized by a separate NPDES permit.

C. Industrial storm water discharges and authorized NSWDs ~~shall not~~that contain pollutants that cause or threaten to cause pollution, contamination, or nuisance as defined in section 13050 of the Water Code, are prohibited.

D. ~~Dischargers shall not~~Discharges that violate any discharge prohibitions contained in applicable Regional Water Board Water Quality Control Plans (Basin Plans), or statewide water quality control plans and policies~~.~~ are prohibited.

~~D.~~**E.** Discharges to ASBS are prohibited in accordance with the California Ocean Plan, unless granted an exception by the State Water Board and in compliance with the Special Protections contained in Resolution 2012-0012.

~~E.~~**F.** Industrial storm water discharges and NSWDs authorized ~~NSWDs regulated~~ by this General Permit ~~shall not~~that contain hazardous substances equal to or in excess of a reportable quantity listed in 40 Code of~~.~~ Federal ~~.~~Regulations~~.~~ sections 110.6, 117.21, or 302.6~~.~~ are prohibited.

IV. AUTHORIZED NON-STORM WATER DISCHARGES (NSWDs)

A. The following NSWDs are authorized provided they meet the conditions of Section IV.B:

1. Fire-hydrant~~,~~ and fire prevention or response system flushing;

2. Potable water sources including potable water related to the operation, maintenance, or testing of potable water systems;

3. Drinking fountain water and atmospheric condensate including refrigeration, air conditioning, and compressor condensate;

4. Irrigation drainage and landscape watering provided all pesticides, herbicides and fertilizers have been applied in accordance with the manufacturer's label;

5. Uncontaminated natural springs, groundwater, foundation drainage, footing drainage;

6. Seawater infiltration where the seawater is discharged back into the source: and,

7. Incidental windblown mist from cooling towers that collects on rooftops or adjacent portions of your facility, but not intentional discharges from the cooling tower (e.g., "piped" cooling tower blowdown or drains).

B. The NSWDs identified in Section IV.A are authorized by this General Permit if the ~~Discharger satisfies the~~ following conditions are met:

1. The authorized NSWDs are not in violation of any Regional Water Board Water Quality Control Plans (Basin Plans) or other requirements, or statewide water quality control plans or policies requirement;

2. The authorized NSWDs are not in violation of any municipal agency ordinance or requirements;

3. BMPs ~~have been~~are included in the SWPPP and implemented to:

   a. ~~Prevent~~Reduce or ~~reduce~~prevent the contact of authorized NSWDs with materials or equipment that are potential sources of pollutants;

   b. ~~Minimize~~Reduce, to the extent practicable, the flow or volume of authorized NSWDs;

   c. Ensure that authorized NSWDs do not contain quantities of pollutants that cause or contribute to an exceedance of a water quality standards~~WQS~~; and,

   d. ~~Prevent~~Reduce or ~~reduce~~prevent discharges of pollutants in authorized NSWDs in a manner that reflects best industry practice considering technological availability and economic practicability and achievability.

4. ~~Conduct~~The Discharger ~~C~~conducts monthly visual observations (Section XI.A.1) of NSWDs and sources to ensure adequate BMP implementation and effectiveness; and,

5. ~~Report~~The Discharger reports and ~~describe~~describes all authorized NSWDs in the Annual Report.

C. Firefighting related discharges are not subject to this General Permit and are not subject to the conditions of Section IV.B. These discharges, however, may be subject to Regional Water Board enforcement actions under other sections of the Water Code. Firefighting related discharges that are contained and are later discharged may be subject to municipal agency ordinances and/or Regional Water Board requirements.

V. EFFLUENT LIMITATIONS

A. Dischargers shall implement BMPs that comply with the BAT/BCT requirements of this General Permit to reduce or prevent discharges of pollutants in their storm water discharge in a manner that reflects best industry practice considering technological availability and economic practicability and achievability.

B. Industrial storm water discharges from facilities subject to storm water ELGs in Subchapter N shall not exceed those ~~effluent limitations.~~storm water ELGs. The ELGs for industrial storm water discharges subject to Subchapter N are ~~found~~ in Attachment F of this General Permit.

C. Dischargers located within a watershed for which a Total Maximum Daily Load (TMDL) has been approved by U.S. EPA, shall comply with any applicable TMDL-specific permit requirements that have been incorporated into this General Permit in accordance with Section VII.A. Attachment E contains a reference list of potential TMDLs that may apply to Dischargers subject to this General Permit.

VI. RECEIVING WATER LIMITATIONS

A. Dischargers shall ensure that industrial storm water discharges and authorized NSWDs do not cause or contribute to an exceedance of any applicable water quality standards~~WQS~~ in any affected receiving water.

B. Dischargers shall ensure that industrial storm water discharges and authorized NSWDs do not adversely affect human health or the environment.

C. Dischargers shall ensure that industrial storm water discharges and authorized NSWDs do not contain pollutants in quantities that threaten to cause pollution or a public nuisance.

VII. TOTAL MAXIMUM DAILY LOADS (TMDLs)

A. Implementation

1. The State Water Board shall reopen and amend this General Permit, including Attachment E, the Fact Sheet and other applicable Permit provisions as necessary, in order to incorporate TMDL-specific permit

requirements, as described in Findings 3~~8~~7 through 4~~2~~21. Once this General Permit is amended, Dischargers shall comply with the incorporated TMDL-specific permit requirements in accordance with any specified compliance schedule(s). TMDL-specific compliance dates that exceed the term of this General Permit may be included for reference, and are enforceable in the event that this General Permit is administratively extended or reissued.

2. The State Water Board may, at its discretion, reopen this General Permit to add TMDL-specific permit requirements to Attachment E, or to incorporate new TMDLs adopted during the term of this General Permit that include requirements applicable to Dischargers covered by this General Permit.

B. New Dischargers applying for NOI coverage under this General Permit that will be discharging to ~~an impaired~~a water body with a 303(d) listed impairment are ineligible for coverage unless the Discharger submits data and/or information demonstrating that:

1. ~~Demonstrates that the discharger~~The Discharger has eliminated all exposure to storm water of the pollutant(s) for which the water body is impaired, ~~and documents~~has documented the procedures taken to prevent exposure onsite, and ~~retains~~has retained such documentation with the SWPPP at the facility;

2. ~~Demonstrates the~~The pollutant for which the water body is impaired is not present at the ~~site~~Discharger's facility, and ~~retains~~the Discharger has retained documentation of this finding with the SWPPP at the facility; or,

3. ~~Demonstrates the~~The discharge of any listed pollutant ~~discharge~~ will not cause or contribute to an exceedance of a ~~WQS~~water quality standard. This is demonstrated if: (1) the discharge complies with water quality standard~~WQS~~ at the point of discharge, or (2) if there are sufficient remaining waste load allocation~~WLA~~s in an approved TMDL and the discharge is controlled at least as stringently as similar discharges subject to that TMDL.

VIII. DISCHARGES SUBJECT TO THE CALIFORNIA OCEAN PLAN

A. Discharges to Ocean Waters

1. Dischargers with outfalls discharging to ocean waters that are subject to the model monitoring provisions of the California Ocean Plan shall develop and implement a monitoring plan in compliance with those provisions and any additional monitoring requirements established pursuant to Water Code section 13383. Dischargers who have not developed and implemented a monitoring program in compliance with the California Ocean Plan's model monitoring provisions by ~~January~~July 1, 2015, or seven (7) days prior to commencing of operations, whichever is later, are ineligible to obtain coverage under this General Permit.

2. Dischargers are ineligible for the methods and exceptions provided in Section XI.C of this General permit for any of the outfalls discharging to ocean waters subject to the model monitoring provisions of the California Ocean Plan.

B. Discharge Granted an Exceptions for Areas of Special Biological Significance (ASBS)

Dischargers who were granted an exception to the California Ocean Plan prohibition against direct discharges of waste to an ASBS pursuant to Resolution 2012-0012[9] amended by Resolution 2012-0031[10] shall comply with the conditions and requirements set forth in Attachment G of this General Permit. Any Discharger that applies for and is granted an exception to the California Ocean Plan prohibition after July 1, 2013 shall comply with the conditions and requirements set forth in the granted exception.

IX. TRAINING QUALIFICATIONS

A. General

1. A Qualified Industrial Storm Water Practitioner (QISP) is a person (either the Discharger or a person designated by the Discharger) who has completed a State Water Board-sponsored or approved QISP training course[11], and has registered as a QISP via SMARTS. Upon completed registration the State Water Board will issue a QISP identification number.

2. The Executive Director of the State Water Board or an Executive Officer of a Regional Water Board may rescind any QISP's registration if it is found that the QISP has repeatedly demonstrated an inadequate level of performance in completing the QISP requirements in this General Permit. An individual whose QISP registration has been rescinded may ~~file a written appeal to~~request that the State Water Board review the rescission. Any ~~appeal~~ request for review must be received by the State Water Board no later than 30 days of the date that the individual received written notice of the rescission.

3. Dischargers with Level 1 status shall:

   a. Designate a person to be the facility's QISP and ensure that this person has attended and satisfactorily completed the State Water Board-sponsored or approved QISP training course.

[9] State Water Resources Control Board. Resolution 2012-0012. <http://www.waterboards.ca.gov/board_decisions/adopted_orders/resolutions/2012/rs2012_0012.pdf>. [as of February ~~July 34~~, 2014~~3~~].

[10] State Water Resources Control Board. Resolution 2012-0031. <http://www.swrcb.ca.gov/board_decisions/adopted_orders/resolutions/2012/rs2012_0031.pdf>. [as of February ~~July 34~~, 2014~~34~~].

[11] A specialized self-guided State Water Board-sponsored registration and training program will be available as an option for CPBELSG licensed professional civil, mechanical, industrial, and chemical engineers and professional geologists by the effective date of this General Permit.

b. Ensure that the facility's designated QISP provides sufficient training to ~~all facility staff~~the appropriate team members assigned to perform activities required by this General Permit.

X. Storm Water Pollution Prevention Plan (SWPPP)

A. SWPPP Elements

Dischargers shall develop and implement a site-specific SWPPP for each industrial facility covered by this General Permit that shall contain the following elements, as described further in this Section[12]:

1. Facility Name and Contact Information;
2. Site Map;
3. List of ~~Significant~~ Industrial Materials;
4. Description of Potential Pollution Sources;
5. Assessment of Potential Pollutant Sources;
6. Minimum BMPs;
7. Advanced BMPs, if applicable;
8. Monitoring Implementation Plan ~~(MIP)~~;
9. Annual Comprehensive Facility Compliance Evaluation (Annual Evaluation); and,
10. Date that SWPPP was Initially Prepared and the Date of Each SWPPP Amendment, if Applicable.

B. SWPPP Implementation and Revisions

All Dischargers are required to implement their SWPPP by ~~January~~July 1, 2015 or upon commencement of industrial activity. The Discharger shall:

1. Revise their on-site SWPPP whenever necessary;
2. Certify and submit via SMARTS their SWPPP within 30 days whenever the SWPPP contains significant revision(s); and,
3. ~~Not be~~With the exception of significant revisions, the Discharger is not required to certify and submit via SMARTS their SWPPP revisions more than once every three (3) months in the reporting year.

[12] Appendix 1 (SWPPP Checklist) of this General Permit is ~~included for reference by~~provided to assist the Discharger ~~on~~in including information required ~~to be included~~ in the SWPPP. This checklist is not required to be used.

C. SWPPP Performance Standards

1. The Discharger shall ensure a SWPPP is prepared to:

   a. Identify and evaluate all sources of pollutants that may affect the quality of industrial storm water discharges and authorized NSWDs;

   b. Identify and describe the minimum BMPs (Section X.H.1) and any advanced BMPs (Section X.H.2) implemented to reduce or prevent pollutants in industrial storm water discharges and authorized NSWDs. BMPs shall be selected to achieve compliance with this General Permit; and,

   c. Identify and describe conditions or circumstances which may require future revisions to be made to the SWPPP.

2. The Discharger shall prepare a SWPPP in accordance with all applicable SWPPP requirements of this Section. A copy of the SWPPP shall be maintained at the facility.

D. Planning and Organization

1. Pollution Prevention Team

   Each facility must have a Pollution Prevention Team established and responsible for assisting with the implementation of the requirements in this General Permit. The Discharger shall include in the SWPPP detailed information about its Pollution Prevention Team including:

   a. The positions within the facility organization (collectively, team members) who assist in implementing the SWPPP and conducting all monitoring requirements in this General Permit;

   b. The responsibilities, duties, and activities of each of the team members; and,

   c. The procedures ~~that shall be implemented~~ to identify alternate team members to implement the SWPPP and conduct required monitoring ~~requirements~~ when the regularly assigned team members are temporarily unavailable (due to vacation, illness, out of town business, ~~etc.).~~ or other absences).

2. Other Requirements and Existing Facility Plans

   a. The Discharger shall ensure its SWPPP is developed, implemented, and revised as necessary to be consistent with any applicable municipal, state, and federal requirements that pertain to the requirements in this General Permit.

b. The Discharger may include in their SWPPP the specific elements of existing plans, procedures, or regulatory compliance documents that contain storm water-related BMPs or otherwise relate to the requirements of this General Permit.

c. The Discharger shall properly reference the original sources for any elements of existing plans, procedures, or regulatory compliance documents included as part of their SWPPP and shall maintain a copy of the documents at the facility as part of the SWPPP.

d. The Discharger shall document in their SWPPP the facility's scheduled ~~facility~~ operating hours as defined in Attachment C. Scheduled facility operating hours that would be considered irregular (temporary, intermittent, seasonal, weather dependent, etc.) shall also be documented in the SWPPP.

E. Site Map

1. The Discharger shall prepare a site map that includes notes, legends, a north arrow, and other data as appropriate to ensure the map is clear, legible and understandable.

2. The Discharger may provide the required information on multiple site maps.

3. The Discharger shall include the following information on the site map:

   a. The facility boundary, storm water drainage areas within the facility boundary, and portions of any drainage area impacted by discharges from surrounding areas. Include the flow direction of each drainage area, on-facility surface water bodies, areas of soil erosion, and location(s) of nearby water bodies (such as rivers, lakes, wetlands, etc.) or municipal storm drain inlets that may receive the facility's industrial storm water discharges and authorized NSWDs;

   b. Locations of storm water collection and conveyance systems, associated ~~points of~~ discharge locations, and direction of flow. Include any sample locations if different than the identified discharge locations;

   ~~b.~~c. Locations and descriptions of structural control measures[13] that affect industrial storm water discharges, authorized NSWDs, and/or run-on;

[13] Examples of structural control measures are catch basins, berms, detention ponds, secondary containment, oil/water separators, diversion barriers, etc.

~~c.~~d. Identification of all impervious areas of the facility, including paved areas, buildings, covered storage areas, or other roofed structures;

~~d.~~e. Locations where materials are directly exposed to precipitation and the locations where identified significant spills or leaks (Section X.G.1.d) have occurred; and~~,~~

~~e.~~f. Areas of industrial activity subject to this General Permit. Identify all industrial storage areas and storage tanks, shipping and receiving areas, fueling areas, vehicle and equipment storage/maintenance areas, material handling and processing areas, waste treatment and disposal areas, dust or particulate generating areas, cleaning and material reuse areas, and other areas of industrial activity that may have potential pollutant sources.

F. List of ~~Significant~~ Industrial Materials

The Discharger shall ensure the SWPPP includes a list of ~~significant~~ industrial materials handled at the facility, and the locations where each material is stored, received, shipped, and handled, as well as the typical quantities and handling frequency. ~~Dischargers shall list materials that include raw materials, intermediate products, final or finished products, recycled materials, and waste or disposed materials in the SWPPP.~~

G. Potential Pollutant Sources

1. Description of Potential Pollutant Sources

   a. Industrial Processes

      The Discharger shall ensure the SWPPP describes each industrial process including: manufacturing, cleaning, maintenance, recycling, disposal, and any other activities related to the process. The type, characteristics, and approximate quantity of ~~significant~~ industrial materials used in or resulting from the process shall be included. Areas protected by containment structures and the corresponding containment capacity shall be identified and described.

   b. Material Handling and Storage Areas

      The Discharger shall ensure the SWPPP describes each material handling and storage area, including: the type, characteristics, and quantity of ~~significant~~ industrial materials handled or stored; the shipping, receiving, and loading procedures; the spill or leak prevention and response procedures; and the areas protected by containment structures and the corresponding containment capacity.

   c. Dust and Particulate Generating Activities

The Discharger shall ensure the SWPPP describes all industrial activities that generate a significant amount of dust or particulate that may be deposited within the facility boundaries. The SWPPP shall describe such industrial activities, including the discharge locations, the source type, and the characteristics of the dust or particulate pollutant.

d. Significant Spills and Leaks

The Discharger shall:

i. Evaluate the facility for areas where spills and leaks can likely occur;

ii. Ensure the SWPPP includes ~~a~~:

a) A list of any industrial materials~~, including unauthorized NSWDs~~ that have spilled or leaked in significant quantities and have discharged from the facility's storm water conveyance system within the previous five-year period;

b) ~~Ensure the SWPPP includes a~~A list of any toxic chemicals identified in 40 Code of Federal Regulations section 302 that have been discharged from the facilities' storm water conveyance system as reported on U.S. EPA Form R, as well as oil and hazardous substances in excess of reportable quantities (40 C.F.R. §§ 110, 117, and 302) that have discharged from the facility's storm water conveyance system within the previous five-year period;

c) ~~Ensure the SWPPP includes a~~A list of any industrial materials that have spilled or leaked in significant quantities and had the potential to be discharged from the facility's storm water conveyance system within the previous five-year period; and,

~~ii.~~iii. Ensure that for each discharge or potential discharge listed above the SWPPP includes the location, characteristics, and approximate quantity of the materials spilled or leaked; approximate quantity of the materials discharged from the facility's storm water conveyance system; the cleanup or remedial actions that have occurred or are planned; the approximate remaining quantity of materials that have the potential to be discharged; and the preventive measures taken to ensure spills or leaks of the material do not reoccur.

e. NSWDs

The Discharger shall:

i. Ensure the SWPPP includes an evaluation of the facility that identifies all NSWDs, sources, and drainage areas;

DRAFT

ii. Ensure the SWPPP includes an evaluation of all drains (inlets and outlets) that identifies connections to the storm water conveyance system;

iii. Ensure the SWPPP includes a description of how all unauthorized NSWDs have been eliminated; and,

iv. Ensure all NSWDs are described in the SWPPP. This description shall include the source, quantity, frequency, and characteristics of the NSWDs, associated drainage area, and whether it is an authorized or unauthorized NSWD in accordance with Section IV.

f. Erodible Surfaces

The Discharger shall ensure the SWPPP includes a description of the facility locations where soil erosion may be caused by industrial activity, contact with storm water, authorized and unauthorized NSWDs, or run-on from areas surrounding the facility.

2. Assessment of Potential Pollutant Sources

a. The Discharger shall ensure that the SWPPP includes a narrative assessment of all areas of industrial activity with potential industrial pollutant sources. At a minimum, the assessment shall include:

i. The areas of the facility with likely sources of pollutants in industrial storm water discharges and authorized NSWDs;

ii. The pollutants likely to be present in industrial storm water discharges and authorized NSWDs;

iii. The approximate quantity, physical characteristics (e.g., liquid, powder, solid, etc.), and locations of each ~~significant~~ industrial material handled, produced, stored, recycled, or disposed;

iv. The degree to which the pollutants associated with those materials may be exposed to, and mobilized by contact with, storm water;

v. The direct and indirect pathways by which pollutants may be exposed to storm water or authorized NSWDs;

vi. All sampling, visual ~~monitoring~~observation, and inspection records;

vii. The effectiveness of existing BMPs to reduce or prevent pollutants in industrial storm water discharges and authorized NSWDs; ~~and,~~

viii. The ~~predicted~~estimated effectiveness of implementing, to the extent feasible, minimum BMPs to reduce or prevent pollutants in industrial storm water discharges and authorized NSWDs; and.~~.~~

ix. The identification of the industrial pollutants related to the receiving waters with 303(d) listed impairments identified in Appendix 3 or approved TMDLs that may be causing or contributing to an exceedance of a water quality standard~~WQS~~ in the receiving waters.

b. Based upon the assessment above, Dischargers shall identify in the SWPPP any areas of the facility where the minimum BMPs described in subsection H.1 below will not adequately reduce or prevent ~~or reduce~~ pollutants in storm water discharges in compliance with Section V.A. Dischargers shall identify any advanced BMPs, as described in subsection H.2 below, for those areas.

c. Based upon the assessment above, Dischargers shall identify any drainage areas with no exposure to industrial activities and materials in accordance with the definitions in Section XVII.

d. Based upon the assessment above, Dischargers shall identify any additional parameters, beyond the required parameters in Section XI.B.6 that indicate the presence of pollutants in industrial storm water discharges.

H. Best Management Practices (BMPs)

1. Minimum BMPs

The Discharger shall, to the extent feasible, implement and maintain all of the following minimum BMPs to reduce or prevent pollutants in industrial storm water discharges.[14]

a. Good Housekeeping

The Discharger shall:

i. Observe all outdoor areas associated with industrial activity; including storm water discharge locations, drainage areas, conveyance systems, waste handling/disposal areas, and perimeter areas impacted by off-facility materials or storm water run-on to determine housekeeping needs. Any identified debris, waste, spills, tracked materials, or leaked materials shall be cleaned and disposed of properly;

ii. Minimize or prevent material tracking;

iii. Minimize dust generated from industrial materials or activities;

[14] For the purposes of this General Permit, the requirement to implement BMPs "to the extent feasible" requires Dischargers to select, design, install and implement BMPs that reduce or prevent discharges of pollutants in their storm water discharge in a manner that reflects best industry practice considering technological availability and economic practicability and achievability.

iv. Ensure that all facility areas impacted by rinse/wash waters are cleaned as soon as possible;

v. Cover all stored industrial materials that can be readily mobilized by contact with storm water;

vi. Contain all stored non-solid industrial materials or wastes (e.g., particulates, powders, shredded paper, etc.)~~liquid, powder, etc.)~~ that can be transported or dispersed ~~via~~ by the wind or contact with storm water;

vii. Prevent disposal of any rinse/wash waters or industrial materials into the storm water conveyance system;

viii. Minimize storm water discharges from non-industrial areas (e.g., storm water flows from employee parking area) that contact industrial areas of the facility; and,

ix. Minimize authorized NSWDs from non-industrial areas (e.g., potable water, fire hydrant testing, etc.) that contact industrial areas of the facility.

b. Preventive Maintenance

The Discharger shall:

i. Identify all equipment and systems used outdoors that may spill or leak pollutants;

ii. Observe the identified equipment and systems to detect leaks, or identify conditions that may result in the development of leaks;

iii. Establish an appropriate schedule for maintenance of identified equipment and systems; and,

iv. Establish procedures for prompt maintenance and repair of equipment, and maintenance of systems when conditions exist that may result in the development of spills or leaks.

c. Spill and Leak Prevention and Response

The Discharger shall:

i. Establish procedures and/or controls to minimize spills and leaks;

ii. Develop and implement spill and leak response procedures to prevent industrial materials from discharging through the storm water conveyance system. Spilled or leaked industrial materials shall be cleaned promptly and disposed of properly;

iii. Identify and describe all necessary and appropriate spill and leak response equipment, location(s) of spill and leak response

DRAFT

equipment, and spill or leak response equipment maintenance procedures; and,

iv. Identify and train appropriate spill and leak response personnel.

d. Material Handling and Waste Management

The Discharger shall:

i. Prevent or minimize handling of industrial materials or wastes that can be readily mobilized by contact with storm water during a storm event;

ii. Contain all stored non-solid industrial materials or wastes (e.g., particulates, powders, shredded paper, etc.) that can be transported or dispersed ~~via~~by the wind ~~erosion~~ or contact with storm water ~~during handling~~;

iii. Cover industrial waste disposal containers and industrial material storage containers that contain industrial materials when not in use;

iv. Divert run-on and storm water generated from within the facility away from all stockpiled materials;

v. Clean all spills of industrial materials~~/~~ or wastes that occur during handling in accordance with the spill response procedures (Section X.H.1.c~~e~~); and,

vi. Observe and clean as appropriate, any outdoor material~~/~~ or waste handling equipment or containers that can be contaminated by contact with industrial materials or wastes.

e. Erosion and Sediment Controls

For each erodible surface facility location identified in the SWPPP (Section X.G.1.f), the Discharger shall:

i. Implement effective wind erosion controls;

ii. Provide effective stabilization for inactive areas, finished slopes, and other erodible areas prior to a forecasted storm event;

iii. Maintain effective perimeter controls and stabilize all site entrances and exits to sufficiently control discharges of erodible materials from discharging or being tracked off the site;

iv. Divert run-on and storm water generated from within the facility away from all erodible materials; and,

v. If sediment basins are implemented, ensure compliance with the design storm standards in Section X.H.6.

f. Employee Training Program

The Discharger shall:

i. Ensure that all team members implementing the various compliance activities of this General Permit are ~~adequately~~properly trained to implement the requirements of this General Permit, including but not limited to: BMP implementation, BMP effectiveness evaluations, ~~V~~visual observations, and ~~M~~monitoring activities. If a Discharger enters Level 1 status, ~~all personnel~~appropriate team members shall be trained by a QISP;

ii. Prepare or acquire appropriate training manuals or training materials;

iii. Identify which personnel need to be trained, their responsibilities, and the type of training they shall receive;

iv. Provide a training schedule; and,

v. Maintain documentation of all completed training classes and the personnel that received training in the SWPPP.

g. Quality Assurance and Record Keeping

The Discharger shall:

i. Develop and implement management procedures to ensure that appropriate staff implements all elements of the SWPPP, including the Monitoring Implementation Plan;

ii. Develop a method of tracking and recording the implementation of BMPs identified in the SWPPP; and~~,~~

iii. Maintain the BMP implementation records, training records, and records related to any spills and clean-up related response activities for a minimum of five (5) years (Section XXI.J.4).

2. Advanced BMPs

a. In addition to the minimum BMPs described in Section X.H.1, the Discharger shall, to the extent feasible, implement and maintain any advanced BMPs identified in Section X.G.2.b, necessary to reduce or prevent discharges of pollutants in its storm water discharge in a manner that reflects best industry practice considering technological availability and economic practicability and achievability.

b. Advanced BMPs may include one or more of the following BMPs:

i. Exposure Minimization BMPs

These include storm resistant shelters (either permanent or temporary) that prevent the contact of storm water with the identified industrial materials or area(s) of industrial activity.

ii. Storm Water Containment and Discharge Reduction BMPs

These include BMPs that divert, infiltrate, reuse, contain, retain, or reduce the volume of storm water runoff. Dischargers are encouraged to utilize BMPs that infiltrate or reuse storm water where feasible.

iii. Treatment Control BMPs

This is the implementation of one or more mechanical, chemical, biologic, or any other treatment technology that will meet the treatment design standard.

iv. Other Advanced BMPs

Any additional BMPs not described in subsections b.i through iii above that are necessary to meet the effluent limitations of this General Permit.

3. Temporary Suspension of Industrial Activities

For facilities that plan to temporarily suspend industrial activities for ten (10) or more consecutive calendar days during a reporting year, the Discharger may also suspend monitoring if it is infeasible to conduct monitoring while industrial activities are suspended (e.g., the facility is not staffed, or the facility is remote or inaccessible) and the facility has been stabilized. The Discharger shall include in the SWPPP the BMPs necessary to achieve compliance with this General Permit during the temporary suspension of the industrial activity. Once all necessary BMPs have been implemented to stabilize the facility, the Discharger is not required to:

a. Perform monthly visual observations (Section XI.A.1.a.); or,

b. Perform sampling and analysis (Section XI.B.) if it is infeasible to do so (e.g. facility is remotely located).

The Discharger shall upload via SMARTS (7) seven calendar days prior to the planned temporary suspension of industrial activities:

i. SWPPP revisions specifically addressing the facility stabilization BMPs;

ii. The justification for why monitoring is infeasible at the facility during the period of temporary suspension of industrial activities;

iii. The date the facility is fully stabilized for temporary suspension of industrial activities; and,

iv. The projected date that industrial activities will resume at the facility.

c. Upon resumption of industrial activities at the facility, the Discharger shall, via SMARTS, confirm and/or update the date the facility's industrial activities have resumed. At this time, the Discharger is required to resume all compliance activities under this General Permit.

d. The Regional Water Boards may review the submitted information pertaining to the temporary suspension of industrial activities. Upon review, the Regional Water Board may request revisions or reject the Discharger's request to temporarily suspend monitoring.

4. BMP Descriptions

a. The Discharger shall ensure that the SWPPP identifies each BMP being implemented at the facility, including:

i. The pollutant(s) that the BMP is designed to reduce or prevent in industrial storm water discharges;

ii. The frequency, time(s) of day, or conditions when the BMP is scheduled for implementation;

iii. The locations within each area of industrial activity or industrial pollutant source where the BMP shall be implemented;

iv. The individual and/or position responsible for implementing the BMP;

v. The procedures, including maintenance procedures, and/or instructions to implement the BMP effectively;

vi. The equipment and tools necessary to implement the BMP effectively; and,

vii. The BMPs that may require more frequent visual observations beyond the monthly visual observations as described in Section XI.A.1.

b. The Discharger shall ensure that the SWPPP identifies and justifies each minimum BMP or applicable advanced BMP not being implemented at the facility because they do not reflect best industry practice considering technological availability and economic practicability and achievability.

DRAFT

c. The Discharger shall identify any BMPs described in subsection a above that are implemented in lieu of any of the minimum or applicable advanced BMPs.

5. BMP Summary Table

The Discharger shall prepare a table summarizing each identified area of industrial activity, the associated industrial pollutant sources, the industrial pollutants, and the BMPs being implemented.

6. Design Storm Standards for Treatment Control BMPs

All new treatment control BMPs employed by the Discharger shall be designed to comply with design storm standards in this Section~~.~~, except as provided in an Industrial Activity BMP Demonstration (Section XII.D.2.a). A Factor of Safety shall be incorporated into the design of all treatment control BMPs to ensure that storm water is sufficiently treated throughout the life of the treatment control BMPs. The design storm standards for treatment control BMPs are as follows:

a. Volume-based BMPs: The Discharger, at a minimum, shall calculate[15] the volume to be treated using one of the following methods:

i. The volume of runoff produced from an 85th percentile 24-hour storm event~~;~~, as determined from local, historical rainfall records;

ii. The volume of runoff produced by the 85th percentile 24-hour storm event, determined as the maximized capture runoff volume for the facility, from the formula recommended in the Water Environment Federation's Manual of Practice;[16] or,

iii. The volume of annual runoff ~~based on unit basin storage volume,~~required to achieve ~~90~~80% or more ~~volume~~ treatment ~~by~~, determined in accordance with the ~~method recommended~~methodology set forth in the latest edition of California Stormwater Best Management Practices Handbook~~.~~ [17][18], using local, historical rainfall records.

b. Flow-based BMPs: The Discharger shall calculate the flow needed to be treated using one of the following methods:

[15] All hydrologic calculations shall be certified by a California licensed professional engineer in accordance with the Professional Engineers Act (Bus. & Prof. Code § 6700, et seq).

[16] Water Environment Federation (WEF). Manual of Practice No. 23/ ASCE Manual of Practice No. 87, cited in chapter 5 (1998 Edition) and Cited in Chapter 3 (2012 Edition) .

[17] ~~California Stormwater Quality Association. Stormwater Best Management Practice New Development and Redevelopment Handbook. < http://www.casqa.org/ >. [as of July 3, 2013].~~

[18] California Stormwater Quality Association. Stormwater Best Management Practice New Development and Redevelopment Handbook. < http://www.casqa.org/ >. [as of July 3, 2013].

i. The maximum flow rate of runoff produced from a rainfall intensity of at least 0.2 ~~inch/hr~~inches per hour for each hour of a storm event;

ii. The maximum flow rate of runoff produced by the 85th percentile hourly rainfall intensity, as determined from local historical rainfall records, multiplied by a factor of two; or,

iii. The maximum flow rate of runoff, as determined using local historical rainfall records, that achieves approximately the same reduction in total pollutant loads ~~and flows~~ as would be achieved by ~~mitigation~~ treatment of the 85th percentile hourly rainfall intensity multiplied by a factor of two.

I. MONITORING IMPLEMENTATION PLAN ~~(MIP)~~

The Discharger shall prepare a Monitoring Implementation Plan in accordance with the requirements of this General Permit. The Monitoring Implementation Plan shall be included in the SWPPP and ~~. The MIP~~ shall include the following items:

1. An identification of team members assigned to conduct the monitoring requirements;

2. A description of the following in accordance with Attachment H~~, to include~~:

   a. Discharge locations;

   b. Visual observation procedures; and,

   c. Visual observation response procedures related to monthly visual observations and sampling event visual observations~~; and,~~.

3. Justifications for any of the following that are applicable to the facility:

   a. Alternative discharge locations in accordance with Section XI.C.3;

   b. Representative Sampling Reduction ~~(RSR)~~ in accordance with Section XI.C.4; or,

   c. Qualified Combined Samples ~~(QCS)~~ in accordance with Section XI.C.5.

4. Procedures for field instrument calibration instructions, including calibration intervals specified by the manufacturer; and,~~.~~

5. An example Chain of Custody form used when handling and shipping water quality samples to the lab.

DRAFT

XI. MONITORING

A. Visual Observations

1. Monthly Visual Observations

   a. At least once per calendar month, the Discharger shall visually observe each drainage area for the following:

      i. The presence or indications of prior, current, or potential unauthorized NSWDs and their sources;

      ii. Authorized NSWDs, sources, and associated BMPs to ensure compliance with Section IV.B.3; and,

      iii. Outdoor industrial equipment and storage areas, outdoor industrial activities areas, BMPs, and ~~any~~all other potential source of industrial pollutants.

   b. The monthly visual observations shall be conducted during daylight hours of scheduled facility operating hours and on days without precipitation.

   c. The Discharger shall provide an explanation in the Annual Report for uncompleted monthly visual observations.

2. Sampling Event Visual Observations

   Sampling event visual observations shall be conducted at the same time sampling occurs at a discharge location. At each discharge location where a sample is obtained, the Discharger shall observe the discharge of storm water associated with industrial activity.

   a. The Discharger shall ensure that visual observations of ~~discharge from contained~~ storm water~~, and corresponding documentation,~~ discharged from containment sources (e.g. secondary containment or storage ponds) are conducted at the time that the discharge is sampled.

   ~~a.~~b. The Discharger shall ensure that visual observations and sampling of storm water discharges from volume-based or flow-based treatment BMPs and any bypass that occurs are conducted at the same time.

   ~~b.~~c. The Discharger shall visually observe and record the presence or absence of floating and suspended materials, oil and grease, discolorations, turbidity, odors, trash/debris, and source(s) of any discharged pollutants.

   ~~c.~~d. In the event that a discharge location is not visually observed during the sampling event, the Discharger shall record which discharge

DRAFT

locations were not observed during sampling or that there was no discharge from the discharge location.

~~d.~~e. The Discharger shall provide an explanation in the Annual Report for uncompleted sampling event visual observations.

3. Visual Observation Records

   The Discharger shall maintain records of all visual observations. Records shall include the date, approximate time, locations observed, presence and probable source of any observed pollutants, name of person(s) that conducted the observations, and any response actions and/or additional SWPPP revisions necessary in response to the visual observations.

4. ~~Dischargers~~The Discharger shall revise BMPs as necessary when the visual observations indicate pollutant sources have not been adequately addressed in the SWPPP.

B. Sampling and Analysis

1. A Qualifying Storm Event (QSE) is a precipitation event that:

   a. Produces a discharge for at least one drainage area; and,

   b. Is ~~P~~preceded by 48 hours with no discharge from any drainage area.

2. The Discharger shall collect and analyze storm water samples from two (2) QSEs within the first half of each reporting year (July 1 to December 31), and two (2) QSEs within the second half of each reporting year (January 1 to June 30).

3. Compliance Group Participants are only required to collect and analyze storm water samples from one (1) QSE within the first half of each reporting year (July 1 to December 31)~~,~~ and one (1) QSE within the second half of the reporting year (January 1 to June 30).

4. Except as provided in Section XI.C.4 (Representative Sampling Reduction), samples shall be collected from each drainage area at all discharge locations. The samples must be:

   a. Representative of storm water associated with industrial activities and any commingled authorized NSWDs; or,

   b. Associated with the discharge of contained storm water.

5. Samples from each discharge location shall be collected within four (4) hours of:

   a. The start of the discharge; or,

DRAFT

b. The start of facility operations if the QSE occurs within the previous 12-- hour period (e.g., for storms with discharges that begin during the night for facilities with day-time operating hours). Sample collection is required during scheduled facility operating hours and when sampling conditions are safe in accordance with Section XI.C.6.a.ii.

6. The Discharger shall analyze all collected samples -for the following parameters:

   a. Total suspended solids (TSS) and oil ~~&~~and grease (O&G);

   b. pH (see Section XI.C.2);

   c. Additional parameters identified by the Discharger on a facility-specific basis that serve as indicators of the presence of all industrial pollutants identified in the pollutant source assessment (Section X.G.2). These additional parameters may be modified (added or removed) in accordance with any updated SWPPP pollutant source assessment;

   d. Additional applicable parameters listed in Table 1 below. These parameters are dependent on the facility Standard Industrial Classification (SIC) code(s);

   e. Additional applicable industrial parameters related to receiving waters with 303(d) listed impairments or approved TMDLs based on the assessment in Section X.G.2.~~xi~~a.ix. Test methods with lower detection limits may be necessary when discharging to receiving waters with 303(d) listed impairments or TMDLs;

   f. Additional parameters required by the Regional Water Board. The Discharger shall contact its Regional Water Board to determine appropriate analytical test methods for parameters not listed in Table 2 below. These analytical test methods will be added to SMARTS; and~~,~~

   g. For discharges subject to Subchapter N, ~~any~~ additional parameters specifically required by Subchapter N. If the discharge is subject to ELGs, the Dischargers shall contact the Regional Water Board to determine appropriate analytical methods for parameters not listed in Table 2 below.

7. The Discharger shall select corresponding NALs, analytical test methods, ~~detection limits~~, and reporting units from the list provided in Table 2 below. SMARTS will be updated over time to add additional acceptable analytical test methods. Dischargers may propose an analytical test method for any parameter or pollutant that does not have an analytical test method specified in Table 2 or in SMARTS. Dischargers may also propose analytical test methods with substantially similar or more stringent method

detection limits than existing approved analytical test methods. Upon approval, the analytical test method will be added to SMARTS.

8. The Discharger shall ensure that the collection, preservation and handling of all storm water samples are in accordance with Attachment H, Storm Water Sample Collection and Handling Instructions.

9. Samples from different discharge locations shall not be combined or composited ~~prior to field measurements or laboratory analysis.~~except as allowed in Section XI.C.5 (Qualified Combined Samples).

10. The Discharger shall ensure that all laboratory analyses are conducted according to test procedures under 40 Code of Federal Regulations part 136, including the observation of holding times, unless other test procedures have been specified in this General Permit or by the Regional Water Board.

11. Sampling Analysis Reporting

    a. The Discharger shall submit all sampling and analytical results for all individual or ~~q~~Qualified ~~c~~Combined ~~s~~Samples ~~(QCS)~~ via SMARTS within 30 days of obtaining all results for each sampling event.

    b. The Discharger shall provide the method detection limit when an analytical result from samples taken is reported by the laboratory as a "non-detect" or less than the method detection limit. A value of zero shall not be reported.

    c. The Discharger shall provide the analytical result from samples taken that is reported by the laboratory as below the minimum level (often referred to as the reporting limit) but above the method detection limit.

    Reported analytical results will be averaged automatically by SMARTS. For any calculations required by this General Permit, ~~all effluent sampling analytical results that are reported by the laboratory as "non-detect" or less than the Method Detection Limit (MDL), a value of zero shall be used. Any results reported by the laboratory as "Detected Not Quantifiable" or less than the Minimum Level (ML) but above the MDL, a value of the MDL plus ½ the difference between the MDL and the ML shall be used.~~SMARTS will assign a value of zero (0) for all results less than the minimum level as reported by the laboratory.

**The NAL is the highest value used by U.S. EPA based on their hardness table in the 2008 MSGP.
~~***More stringent test methods with lower detection limits may be used.~~

DRAFT

C. Methods and Exceptions

1. The Discharger shall comply with the monitoring methods in this General Permit and Attachment H.

2. pH Methods

   a. Dischargers that are not subject to Subchapter N ELGs mandating pH analysis related to acidic or alkaline sources and have never entered Level 1 status for pH, are eligible to screen for pH using wide range litmus pH paper or other equivalent pH test kits. The pH screen shall be performed as soon as practicable, but no later than 15 minutes after the sample is collected.

   b. Dischargers subject to Subchapter N ELGs ~~or have~~ shall either analyze samples for pH using methods in accordance with 40 Code of Federal Regulations 136 for testing storm water or use a calibrated portable instrument for pH.

   c. Dischargers that enter Level 1 status (see Section XII.C) for pH shall, in the subsequent reporting years, analyze for pH using ~~-~~methods in accordance with 40 Code of Federal Regulations 136 or use a calibrated portable instrument for pH.

   d. Dischargers using a calibrated portable instrument for pH shall ensure that all field measurements are conducted in accordance with the accompanying manufacturer's instructions.

3. Alternative Discharge Locations

   The Discharger is required to identify, when practicable, alternative discharge locations for any discharge locations identified in accordance with Section XI.B.4 if the facility's discharge locations are:

   a. Affected by storm water run-on from surrounding areas that cannot be controlled; and/or,

   b. Difficult to observe or sample (e.g. submerged discharge outlets, dangerous discharge location accessibility).

4. Representative Sampling Reduction ~~(RSR)~~

   a. The Discharger may reduce the number of locations to be sampled in each drainage area (e.g., roofs with multiple downspouts, loading/unloading areas with multiple storm drains) if the industrial activities and physical characteristics (grade, surface materials, etc.) of the drainage area for each location to be sampled are substantially similar to one another. To qualify for the Representative Sampling Reduction, ~~RSR,~~ the Discharger shall provide a Representative Sampling

Reduction ~~RSR~~ justification in the Monitoring Implementation Plan~~MIP~~ section of the SWPPP.

b. The Representative Sampling Reduction ~~RSR~~ justification shall include:

i. Identification and description of each drainage area and corresponding discharge location(s);

ii. A description of the industrial activities that occur throughout the drainage area;

iii. A description of the physical characteristics of the drainage area;

iv. A rationale that demonstrates that the industrial activities and physical characteristics of the drainage area(s) are substantially similar; and,

v. An identification of the discharge location(s) selected for representative sampling, and rationale demonstrating that the selected location(s) to be sampled ~~-~~are representative of the discharge from the entire drainage area.

c. A Discharger that satisfies the conditions of subsection 4.b.i through v above shall submit and certify via SMARTS the revisions to the Monitoring Implementation Plan~~MIP~~ that includes the Representative Sampling Reduction ~~RSR~~ justification.

d. Upon submittal of the Representative Sampling Reduction ~~RSR~~ justification, the Discharger may reduce the number of locations to be sampled in accordance with the Representative Sampling Reduction ~~RSR~~ justification. The Regional Water Board may reject the Representative Sampling Reduction ~~RSR~~ justification and/or request additional supporting documentation. In such instances, the Discharger is ineligible for the Representative Sampling Reduction ~~RSR~~ until the Regional Water Board approves the Representative Sampling Reduction ~~RSR~~ justification.

5. Qualified Combined Samples ~~(QCS)~~

a. The Discharger may authorize ~~the lab~~an analytical laboratory to combine samples of equal volume from as many as four (4) discharge locations if the industrial activities and physical characteristics (grade, surface materials, etc.) within each of the drainage areas are substantially similar to one another.

b. The Qualified Combined Samples ~~QCS~~ justification shall include:

i. Identification and description of each drainage area and corresponding discharge locations;

ii. A description of the industrial activities that occur throughout the drainage area;

iii. A description of the physical characteristics of the drainage area; and,

iv. A rationale that demonstrates that the industrial activities and physical characteristics of the drainage area(s) are substantially similar.

c. A Discharger that satisfies the conditions of subsection 5.b.i through iv above shall submit and certify via SMARTS the revisions to the Monitoring Implementation Plan~~MIP~~ that includes the Qualified Combined Samples ~~QCS~~ justification.

d. Upon submittal of the Qualified Combined Samples ~~QCS~~ justification revisions in the Monitoring Implementation Plan~~MIP~~, the Discharger may authorize the lab to combine samples of equal volume from as many as four (4) drainage areas. The Regional Water Board may reject the Qualified Combined Samples ~~QCS~~ justification and/or request additional supporting documentation. In such instances, the Discharger is ineligible for the Qualified Combined Samples ~~QCS~~ justification until the Regional Water Board approves the Qualified Combined Samples ~~QCS~~ justification.

e. Regional Water Board approval is necessary to combine samples from more than four (4) discharge locations.

6. Sample Collection and Visual Observation Exceptions

a. Sample collection and visual observations are not required under the following conditions:

i. During dangerous weather conditions such as flooding or electrical storms; or~~,~~

ii. Outside of scheduled facility operating hours. The Discharger is not precluded from collecting samples or conducting visual observations outside of scheduled facility operating hours.

b. In the event that samples are not collected, or visual observations are not conducted in accordance with Section XI.B.5 due to these exceptions, an explanation shall be included in the Annual Report.

c. Sample collection is not required for drainage areas with no exposure to industrial activities and materials in accordance with the definitions in Section XVII.

7. Sampling Frequency Reduction ~~(SFR)~~ Certification
   a. Dischargers are eligible to reduce the number of QSEs sampled each reporting year in accordance with the following requirements:

      i. Results from four (4) consecutive QSEs that were sampled (QSEs ~~can~~may be from different reporting years) did not exceed any NALs as defined in Section XII.A; and

      ii. The Discharger is in full compliance with the requirements of this General Permit and has updated, certified and submitted via SMARTS all documents, data, and reports required by this General Permit during the time period in which samples were collected.

   b. The Regional Water Board may notify a Discharger that it may not reduce the number of QSEs sampled each reporting year if the Discharger is subject to an enforcement action.

   c. An eligible Discharger shall certify via SMARTS that it meets the conditions in subsection 7.a above.

   d. Upon Sampling Frequency Reduction ~~SFR~~ certification, the Discharger shall collect and analyze samples from one (1) QSE within the first half of each reporting year (July 1 to December 31), and one (1) QSE within the second half of each reporting year (January 1 to June 30). All other monitoring, sampling, and reporting requirements remain in effect.

   e. Dischargers who participate in a Compliance Group and certify a Sampling Frequency Reduction ~~SFR~~ are only required to collect and analyze storm water samples from one (1) QSE within each reporting year.

   ~~Regional Water Boards~~

   f. A Discharger may ~~reject a~~reduce sampling per the Sampling Frequency Reduction ~~SFR~~ certification ~~and/~~unless notified by the Regional Water Board that: (1) the Sampling Frequency Reduction certification has been rejected or ~~request~~(2) additional supporting documentation must be submitted. In such instances, a Discharger is ineligible for the Sampling Frequency Reduction ~~SFR~~ until the Regional Water Board provides Sampling Frequency Reduction ~~SFR~~ certification approval. Revised Sampling Frequency Reduction ~~SFR~~ certifications shall be certified and submitted via SMARTS by the Discharger.

   g. A Discharger loses its Sampling Frequency Reduction ~~SFR~~certification if an NAL exceedance occurs (Section XII.A).

D. Facilities Subject to Federal Storm Water Effluent Limitation Guidelines (ELGs)

1. In addition to the other requirements in this General Permit, Dischargers with facilities subject to storm water ELGs in Subchapter N shall:

   a. Collect and analyze samples from QSEs for each regulated pollutant specified in the appropriate category in Subchapter N as specified in Section XI.B;

   b. For Dischargers with facilities subject to 40 Code of Federal Regulations parts 419[20] and 443[21], estimate or calculate the volume of industrial storm water discharges from each drainage area subject to the ELGs and the mass of each regulated pollutant as defined in parts 419 and 443; and.

   c. Ensure that the volume/mass estimates or calculations required in subsection b are completed by a California licensed professional engineer.

2. Dischargers subject to Subchapter N shall submit the information in Section XI.D.1.a through c in their Annual Report.

3. Dischargers with facilities subject to storm water ELGs in Subchapter N are ineligible for the Representative Sampling Reduction RSR in Section XI.C.4.

XII. EXCEEDANCE RESPONSE ACTIONS (ERAs)

A. NALs and NAL Exceedances

The Discharger shall perform sampling, analysis and reporting in accordance with the requirements of this General Permit and shall compare the results to the two types of NAL values found in Table 2 to determine whether either type of NAL has been exceeded for each applicable parameter. The two types of potential NAL exceedances are as follows:

1. Annual NAL exceedance: The Discharger shall determine the average concentration for each parameter using the results of all the sampling and analytical results for the entire facility for the reporting year (i.e., all "effluent" data). The Discharger shall compare the average concentration for each parameter to the corresponding annual NAL values in Table 2. For Dischargers using composite sampling or flow-weighted measurements in accordance with standard practices, the average concentrations shall be calculated in accordance with the U.S. EPA's NPDES Storm Water

[20] Part 419 - Petroleum refining point source category
[21] Part 443 - Effluent limitations guidelines for existing sources and standards of performance and pretreatment standards for new sources for the paving and roofing materials (tars and asphalt) point source category

Sampling Guidance Document.[22] An annual NAL exceedance occurs when the average of all the analytical results for a parameter from samples taken within a reporting year exceeds the annual NAL value for that parameter listed in Table 2; and,

2. Instantaneous maximum NAL exceedance: The Discharger shall compare all sampling and analytical results from each distinct sample (individual or combined as authorized by XI.C.5) to the corresponding instantaneous maximum NAL values in Table 2. An instantaneous maximum NAL exceedance occurs when two (2) or more analytical results from samples taken for any single parameter within a reporting year exceed the instantaneous maximum NAL value (for TSS and O&G) or are outside of the instantaneous maximum NAL range for pH.

B. Baseline Status

At the beginning of a Discharger's NOI Coverage, all Dischargers have Baseline status for all parameters.

C. Level 1 Status

A Discharger's Baseline status for any given parameter shall change to Level 1 status if sampling results indicate an NAL exceedance for that parameter in any subsequent reporting year. Level 1 status will commence on July 1 following the reporting year during which the exceedance(s) occurred.[23]

1. Level 1 ERA Evaluation

a. ~~Within 60 days~~By October 1 following commencement of ~~entering~~ Level 1 status~~,~~ for any parameter with sampling results indicating an NAL exceedance, the Discharger shall ~~complete~~:

b. Complete an evaluation, with the assistance of a QISP, of the industrial pollutant sources at the facility that are or may be related to the NAL exceedance(s); and,

~~a.~~c. Identify in the evaluation the corresponding BMPs ~~and implementation measures~~ in the SWPPP~~. The evaluation shall identify~~ and any additional BMPs and SWPPP revisions necessary to prevent ~~or reduce~~ future NAL exceedances and to comply with the requirements of this General Permit. Although the evaluation may focus on the drainage areas where the NAL exceedance(s) occurred, all drainage areas shall be evaluated.

[22] U.S. EPA. NPDES Storm Water Sampling Guidance Document. <http://www.epa.gov/npdes/pubs/owm0093.pdf >. [as of February~~July 3~~4, 201~~3~~4]

[23] For all sampling results reported before June 30th of the preceding reporting year. If sample results indicating an NAL exceedance are submitted after June 30th, the Discharger will change status once those results have been reported.

2. Level 1 ERA Report

a. Based upon the above evaluation, the Discharger shall, as soon as practicable but no later than January 1 following commencement of Level 1 status ~~subsequent reporting year~~:

i. Revise the SWPPP as necessary and implement any additional BMPs identified in the evaluation;

ii. Certify and submit via SMARTS a Level 1 ERA Report prepared by a QISP that includes the following:

1) A summary of the Level 1 ERA ~~e~~Evaluation required in subsection C.1 above; and,~~.~~

2) ~~An implementation schedule and~~ A detailed description ~~for~~of the SWPPP revisions and any additional BMPs ~~and SWPPP revisions~~ for each parameter that exceeded an NAL.

iii. Certify and submit via SMARTS the QISP's identification number, name, and contact information (telephone number, e-mail address).

~~a.~~b. A Discharger's Level 1 status for a parameter will return to Baseline status once a Level 1 ERA report has been completed, all identified additional BMPs have been implemented, and results from four (4) ~~subsequent and~~ consecutive QSEs that were sampled subsequent to BMP implementation indicate no additional NAL exceedances for that parameter.

3. NAL Exceedances Prior to Implementation of Level 1 Status BMPs.

Prior to the implementation of an additional BMP identified in the Level 1 ERA Evaluation or October 1, whichever comes first, sampling results for any parameter(s) being addressed by that additional BMP will not be included in the calculations of annual average or instantaneous NAL exceedances in SMARTS.

D. Level 2 Status

A Discharger's Level 1 status for any parameter shall change to Level 2 status if sampling results indicate an NAL exceedance in any subsequent reporting year for the same parameter~~.~~ while the Discharger is in Level 1. Level 2 status

will commence on July 1 following the reporting year during which the NAL exceedance(s) occurred.[24]

1. Level 2 ERA Action Plan

   a. Dischargers with Level 2 status shall ~~prepare~~certify and submit via SMARTS a Level 2 ERA Action Plan prepared by a QISP that addresses each new Level 2 NAL exceedance by January 1 following the reporting year during which the NAL exceedance(s) occurred. For each new Level 2 NAL exceedance, the Level 2 Action Plan will identify which of the demonstrations in subsection D.2.a through c the Discharger has selected to perform. A new Level 2 NAL exceedance is any Level 2 NAL exceedance for 1) a new parameter in any drainage area, or 2) the same parameter that is being addressed in an existing Level 2 ERA Action Plan in a different drainage area.

   b. The Discharger shall certify and submit via SMARTS the QISP's identification number, name, and contact information (telephone number, e-mail address) if this information has changed since previous certifications.

   ~~b.~~c. The Level 2 ERA Action Plan shall at a minimum address the drainage areas with corresponding Level 2 NAL exceedances.

   ~~c.~~d. All elements of the Level 2 ERA Action Plan shall be implemented as soon as practicable and completed no later than 1 year after submitting the Level 2 ERA Action Plan.

   ~~d.~~e. The Level 2 ERA Action Plan shall include a schedule and a detailed description of the tasks required to complete the Discharger's selected demonstration(s) as described below in Section D.2.a through c.

2. Level 2 ERA Technical Report

   On January 1 of the reporting year following the submittal of the Level 2 ERA Action Plan, a Discharger~~s~~ with Level 2 status shall certify and submit a Level 2 ERA Technical Report prepared by a QISP that includes one or more of the following demonstrations:

[24] For all sampling results reported before June 30th of the preceding reporting year. If sample results indicating an NAL exceedance are submitted after June 30th, the Discharger will change status ~~once~~upon the date those results have been reported into SMARTS.

a. Industrial Activity BMPs Demonstration

This shall include the following requirements, as applicable:

i. Shall include a description of the industrial pollutant sources and corresponding industrial pollutants that are or may be related to the NAL exceedance(s);

ii. Shall include ~~A~~an evaluation of all pollutant source~~(~~s~~)~~ associated with industrial activity that are or may be related to the NAL exceedance(s);

iii. Where all of the Discharger's implemented BMPs, including additional BMPs identified in the Level 2 ERA Action Plan, achieve compliance with the effluent limitations of this General Permit and are expected to eliminate future NAL exceedance(s), the Discharger shall provide a description and analysis of all implemented BMPs;~~.~~

iv. In cases where all of the Discharger's implemented BMPs, including additional BMPs identified in the Level 2 ERA Action Plan, achieve compliance with the effluent limitations of this General Permit but are not expected to eliminate future NAL exceedance(s), the Discharger shall provide, in addition to a description and analysis of all implemented BMPs:

1) An evaluation of any additional BMPs that would reduce or prevent NAL exceedances;

2) ~~An e~~Estimated costs of the additional BMPs evaluated; and,

3) An analysis describing the basis for the selection of BMPs implemented in lieu of the additional BMPs evaluated but not implemented.

v. The description and analysis of BMPs required in subsection a.iii above shall specifically address the drainage areas where the NAL exceedance(s) responsible for the Discharger's Level 2 status occurred, although any additional Level 2 ERA Action Plan BMPs may be implemented for all drainage areas; and,

vi. ~~An analysis describing the basis for the selection of~~If an alternative design storm standard for treatment control BMPs ~~that have or will be implemented (~~in lieu of the design storm standard for treatment control BMPs in Section X.H.6 in this General Permit~~.~~) will achieve compliance with the effluent limitations of this General Permit, the Discharger shall provide an analysis describing the basis for the selection of the alternative design storm standard.

b. Non-Industrial Pollutant Source Demonstration

This shall include:

i. A statement that the Discharger has determined that the exceedance of the NAL is attributable solely to the presence of non-industrial pollutant sources. (The pollutant may also be present due to industrial activities, in which case the Discharger must demonstrate that the pollutant contribution from the industrial activities by itself does not result in an NAL exceedance.) The sources shall be identified as either run-on from adjacent properties, aerial deposition from man-made sources, or as generated by on-site non-industrial sources;

ii. A statement that the Discharger has identified and evaluated all potential pollutant sources that may have commingled with storm water associated with the Discharger's industrial activity and ~~could~~may be contributing to the NAL exceedance; ~~and,~~

~~ii.~~iii. A description of any on-site industrial pollutant sources and corresponding industrial pollutants that are contributing to the NAL exceedance~~that are or may be discharged;~~;

~~iii.~~iv. An assessment of the relative contributions of the pollutant from (1) storm water run-on to the facility from adjacent properties or non-industrial portions of the Discharger's property or from aerial deposition and (2) the storm water associated with the Discharger's industrial activity;

~~iv.~~v. A summary of all existing BMPs for that parameter; and,

~~v.~~vi. An evaluation of all on-site/off-site analytical monitoring data demonstrating that the NAL exceedances are caused by pollutants in storm water run-on to the facility from adjacent properties or non-industrial portions of the Discharger's property or from aerial deposition.

c. Natural Background Pollutant Source Demonstration

This shall include:

i. A statement that the Discharger has determined that the NAL exceedance ~~of the NAL~~ is attributable solely to the presence of the pollutant in the natural background~~;~~ that has not been disturbed by industrial activities. (The pollutant may also be present due to industrial activities, in which case the Discharger must demonstrate that the pollutant contribution from the industrial activities by itself does not result in an NAL exceedance);

DRAFT

ii. A summary of all data previously collected by the Discharger, or other identified data collectors, that describes the levels of natural background pollutants in the storm water discharge;

iii. A summary of any research and published literature that relates the pollutants evaluated at the facility as part of the Natural Background Source Demonstration;

iv. Map showing the reference site location in relation to facility along with available land cover information;

v. Reference site and test site elevation;

vi. Available geology and soil information for reference and test sites;

vii. Photographs showing site vegetation;

viii. Site reconnaissance survey data regarding presence of roads, outfalls, or other human-made structures; and,

ix. Records from relevant state or federal agencies indicating no known mining, forestry, or other human activities upstream of the proposed reference site.

3. Level 2 ERA Technical Report Submittal

a. The Discharger shall certify and submit via SMARTS the Level 2 ERA Technical Report described in Section D.2 above.

b. The State Water Board and Regional Boards (Water Boards) may review the submitted Level 2 ERA Technical Reports. Upon review of a Level 2 ERA Technical Report, the Water Boards may reject the Level 2 ERA Technical Report and direct the Discharger to take further action(s) to comply with this General Permit.

c. Dischargers with Level 2 status who have submitted the Level 2 ERA Technical Report are only required to annually update the Level 2 ERA Technical Report based upon additional NAL exceedances of the same parameter and same drainage area, facility operational changes, pollutant source(s) changes, and/or information that becomes available via compliance activities (monthly ~~inspections~~visual observations, sampling results, annual evaluation, etc.). The Level 2 ERA Technical Report shall be prepared by a QISP and be certified and submitted via SMARTS by the Discharger with each Annual Report.

d. Dischargers are not precluded from submitting a Level 2 ERA Action Plan or ERA Technical Report prior to entering Level 2 status if information is available to adequately prepare the report and perform the demonstrations described above. A Discharger who chooses to submit a Level 2 ERA Action Plan or ERA Technical Report prior to entering Level 2 status will automatically be placed in Level 2 in accordance to the Level 2 ERA schedule.

4. Eligibility for Returning to Baseline Status

a. Dischargers with Level 2 status who submit an Industrial Activity BMPs Demonstration in accordance with subsection 2.a.i through iii above and have implemented BMPs to prevent future NAL exceedance(s) for the Level 2 parameter(s) shall return to baseline status for that parameter, if results from four (4) subsequent consecutive QSEs sampled indicate no additional NAL exceedance(s) for that parameter(s). If future NAL exceedances occur for the same parameter(s), the Discharger's Baseline status will return to Level 2 status on July 1 in the subsequent reporting year during which the NAL exceedance(s) occurred. These Dischargers shall update the Level 2 ERA Technical Report as required above in Section D.3.c.

b. Dischargers are ineligible to return to baseline status if they submit any of the following:

i. A industrial activity BMP demonstration in accordance with subsection 2.a.iv above;

ii. An non-industrial pollutant source demonstration; or,

iii. A natural background pollutant source demonstration.

5. Level 2 ERA Implementation Extension

a. Dischargers that need additional time to submit the Level 2 ERA Technical Report shall be automatically granted a single time extension for up to six (6) months upon submitting the following items into SMARTS, as applicable:

i. Reasons for the time extension;

ii. A revised Level 2 ERA Action Plan including a schedule and a detailed description of the necessary tasks still to be performed to complete the Level 2 ERA Technical Report; and~~,~~

iii. A description of any additional temporary BMPs that will be implemented while permanent BMPs are being constructed.

b. The Regional Water Boards will review Level 2 ERA Implementation Extensions for completeness and adequacy. Requests for extensions that total more than six (6) months are not granted unless approved in writing by the Water Boards. The Water Boards may (1) reject or revise the time allowed to complete Level 2 ERA Implementation Extensions, (2) identify additional tasks necessary to complete the Level 2 ERA Technical Report, and/or (3) require the Discharger to implement additional temporary BMPs.

XIII. INACTIVE MINING OPERATION CERTIFICATION

A. Inactive mining operations are defined in Part 3 of Attachment A of this General Permit. The Discharger may, in lieu of complying with the General Permit requirements described in subsection B below, certify and submit via SMARTS that their inactive mining operation meets the following conditions:

1. The Discharger has determined and justified in the SWPPP that it is impracticable to implement the monitoring requirements in this General Permit for the inactive mining operation;

2. A SWPPP has been ~~prepared~~ signed (wet signature and license number) by a California licensed professional engineer and is being implemented in accordance with the requirements of this General Permit; and,

3. The facility is in compliance with this General Permit, except as provided in subsection B below.

B. The Discharger who has certified and submitted that they meet the conditions in subsection A above, are not subject to the following General Permit requirements:

1. Monitoring Implementation Plan ~~(MIP)~~ in Section X.I;

2. Monitoring Requirements in Section XI;

3. Exceedance Response Actions (ERAs) in Section XII; and,

4. Annual Report Requirements in Section XVI.

C. Inactive Mining Operation Certification Submittal Schedule

1. The Discharger shall certify and submit via SMARTS NOI coverage PRDs listed in Section II.B.1 and meet the conditions in subsection A above.

2. The Discharger shall annually inspect the inactive mining site and certify via SMARTS no later than July 15th of each reporting year, that their inactive

mining operation ~~still~~continues to meet the conditions in subsection A above~~; and,~~.

3. The Discharger shall have a California licensed professional engineer review and update the SWPPP if there are changes to their inactive mining operation or additional BMPs are needed to comply with this General Permit. Any significant updates to the SWPPP shall be signed (wet signature and license number) by a California license professional engineer.

4. The Discharger shall certify and submit via SMARTS any significantly revised SWPPP within 30 days of the revision(s).

XIV. COMPLIANCE GROUPS AND COMPLIANCE GROUP LEADERS

A. Compliance Group Qualification Requirements

1. Any group of Dischargers of the same industry type or any QISP representing Dischargers of the same industry type may form a Compliance Group. A Compliance Group shall consist of Dischargers that operate facilities with similar types of industrial activities, pollutant sources, and pollutant characteristics (e.g., scrap metals recyclers would join a different group than paper recyclers, truck vehicle maintenance facilities would join a different group than airplane vehicle maintenance facilities, etc.). A Discharger participating in a Compliance Group is termed a Compliance Group Participant. Participation in a Compliance Group is not required. Compliance Groups may be formed at any time.

2. Each Compliance Group shall have a Compliance Group Leader.

3. To establish a Compliance Group, the Compliance Group Leader shall register as a Compliance Group Leader via SMARTS. The registration shall include documentation demonstrating compliance with the Compliance Group qualification requirements above and a list of the Compliance Group Participants.

4. Each Compliance Group Participant shall register as a member of an established Compliance Group via SMARTS.

5. The Executive Director of the State Water Board may review Compliance Group registrations and/or activities for compliance with the requirements of this General Permit. The Executive Director may reject the Compliance Group, the Compliance Group Leader, or individual Compliance Group Participants within the Compliance Group.

DRAFT

B. Compliance Group Leader Responsibilities

1. A Compliance Group Leader must ~~be a QISP.~~complete a State Water Board sponsored or approved training program for Compliance Group Leaders.

2. The Compliance Group Leader shall assist Compliance Group Participants with all compliance activities required by this General Permit.

3. A Compliance Group Leader shall prepare a Consolidated Level 1 ERA Report for all Compliance Group Participants with Level 1 status for the same parameter. Compliance Group Participants who certify and submit these Consolidated Level 1 ERA Reports are subject to the same provisions as individual Dischargers with Level 1 status, as described in Section XII.C. A Consolidated Level 1 ERA Report is equivalent to a Level 1 ERA Report.

4. The Compliance Group Leader shall update the Consolidated Level 1 ERA Report as needed to address additional Compliance Group Participants with ERA Level 1 status.

5. A Compliance Group Leader shall prepare a Level 2 ERA Action Plan specific to each Compliance Group Participant with Level 2 status. Compliance Group Participants who certify and submit these Level 2 ERA Action Plans are subject to the same provisions as individual Dischargers with Level 2 status, as described in Section XII.D.

6. A Compliance Group Leader shall prepare a Level 2 ERA Technical Report specific to each Compliance Group Participant with Level 2 status. Compliance Group Participants who certify and submit these Level 2 ERA Technical Reports are subject to the same provisions as individual Dischargers with Level 2 status, as described in Section XII.D.

7. The Compliance Group Leader shall inspect all the facilities of the Compliance Group Participants that have entered Level 2 status prior to preparing the individual Level 2 ERA Technical Report.

8. The Compliance Group Leader shall revise the Consolidated Level 1 ERA Report, individual Level 2 ERA Action Plans, or individual Level 2 Technical Reports in accordance with any comments received from the Water Boards.

9. The Compliance Group Leader shall inspect all the facilities of the Compliance Group Participants at a minimum of once per reporting year (July 1 to June 30).

C. Compliance Group Participant Responsibilities

1. Each Compliance Group Participant is responsible for permit compliance for the Compliance Group Participant's facility and for ensuring that the Compliance Group Leader's activities related to the Compliance Group Participant's facility comply with this General Permit.

2. Compliance Group Participants with Level 1 status shall certify and submit via SMARTS the Consolidated Level 1 ERA Report. The Compliance Group Participants shall certify that they have reviewed the Consolidated Level 1 ERA Report and have implemented any required additional BMPs. Alternatively, the Compliance Group Participant may submit an individual Level 1 ERA Report in accordance with the provisions in Section XII.C.2.

3. Compliance Group Participants with Level 2 status shall certify and submit via SMARTS their individual Level 2 ERA Action Plan and Technical Report prepared by their Compliance Group Leader. ~~The~~Each Compliance Group Participant shall certify that they have reviewed the Level 2 ERA Action Plan and Technical Report and will implement any required additional BMPs.

4. Compliance Group Participants can at any time discontinue their participation in their associated Compliance Group via SMARTS. Upon discontinuation, the former Compliance Group Participant is immediately subject to the sampling and analysis requirements described in Section XI.B.2.

XV. ANNUAL COMPREHENSIVE FACILITY COMPLIANCE EVALUATION (ANNUAL EVALUATION)

The Discharger shall conduct one Annual Evaluation for each reporting year (July 1 to June 30). If the Discharger conducts an Annual Evaluation fewer than eight (8) months, or more than sixteen (16) months, after it conducts the previous Annual Evaluation, it shall document the ~~reasons~~justification for doing so. The Discharger shall revise the SWPPP, as appropriate, and implement the revisions within 90 days of the Annual Evaluation. At a minimum, Annual Evaluations shall consist of:

A. A review of all sampling, visual observation, and inspection ~~and monitoring~~ records ~~and sampling and analysis results~~ conducted during the previous reporting year;

B. An ~~visual~~ inspection of all areas of industrial activity and associated potential pollutant sources for evidence of, or the potential for, pollutants entering the storm water conveyance system;

C. An ~~visual~~ inspection of all drainage areas previously identified as having no exposure to industrial activities and materials in accordance with the definitions in Section XVII;

D. An ~~visual~~ inspection of equipment needed to implement the BMPs;

E. An ~~visual~~ inspection of any BMPs;

F. A review and effectiveness assessment of all BMPs for each area of industrial activity and associated potential pollutant sources to determine if the BMPs are

properly designed, implemented, and are effective in reducing and preventing pollutants in industrial storm water discharges and authorized NSWDs; and,

G. An assessment of any other factors needed to comply with the requirements in Section XVI.B.

XVI. ANNUAL REPORT

A. The Discharger shall certify and submit via SMARTS an Annual Report no later than July 15th ~~of~~ following each reporting year using the standardized format and checklists in SMARTS.

B. The Discharger shall include in the Annual Report:

1. A Compliance Checklist that indicates whether a Discharger complies with, and has addressed all applicable requirements of this General Permit;

2. An explanation for any non-compliance of requirements within the reporting year, as indicated in the Compliance Checklist;

3. An identification, including page numbers and/or sections, of all revisions made to the SWPPP within the reporting year; and,

4. The date(s) of the Annual Evaluation.

XVII. CONDITIONAL EXCLUSION - NO EXPOSURE CERTIFICATION (NEC)

A. Discharges composed entirely of storm water ~~which have~~that has not been exposed to industrial activity are not industrial storm water discharges. Dischargers are conditionally excluded from complying with the SWPPP and monitoring requirements of this General Permit if all of the following conditions are met:

1. There is no exposure of Industrial Materials and Activities to rain, snow, snowmelt, and/or runoff;

2. All unauthorized NSWDs have been eliminated and all authorized NSWDs meet the conditions of Section IV;

3. The Discharger has certified and submitted via SMARTS PRDs for NEC coverage pursuant to the instructions in Section II.B.2 ~~and guidance in Attachment D~~; and,

4. The Discharger has satisfied all other requirements of this Section ~~and Appendix 2~~.

B. NEC Specific Definitions

1. No Exposure - all Industrial Materials and Activities are protected by a Storm-Resistant Shelter to prevent all exposure to rain, snow, snowmelt, and/or runoff.

DRAFT

2. Industrial Materials and Activities - includes, but is not limited to, industrial material handling activities or equipment, ~~industrial~~ machinery, raw materials, intermediate products, by-products, final products, and waste products.

3. Material Handling Activities - includes the storage, loading and unloading, transportation, or conveyance of any industrial raw material, intermediate product, final product, or waste product.

4. Sealed - banded or otherwise secured, and without operational taps or valves.

5. Storm-Resistant Shelters - includes completely roofed and walled buildings or structures. Also includes structures with only a top cover supported by permanent supports but with no side coverings, provided material within the structure is not subject to wind dispersion (sawdust, powders, etc.), or track-out, and there is no storm water discharged from within the structure that comes into contact with any materials.

C. NEC Qualifications

To qualify for an NEC, a Discharger shall:

1. Except as provided in subsection D below, provide a Storm-Resistant Shelter to protect Industrial Materials and Activities from exposure to rain, snow, snowmelt, run-on, and runoff;

2. Inspect and evaluate the facility annually to determine that storm water exposed to industrial materials or equipment has not and will not be discharged to waters of the United States. Evaluation records shall be maintained for five (5) years in accordance with Section XXI.J.4;

3. Register for NEC coverage by certifying that there are no discharges of storm water contaminated by exposure to Industrial Materials and Activities from areas of the facility subject to this General Permit, and certify that all unauthorized NSWDs have been eliminated and all authorized NSWDs meet the conditions of Section IV (Authorized NSWDs). NEC coverage and annual renewal requires payment of an annual fee in accordance with California Code of Regulations, title 23, section 2200 et seq.; and,

4. Submit PRDs for NEC coverage shall be prepared and submitted in accordance with the:

   a. Certification requirements in Section XXI.K;~~,~~ and,

   b. Submittal schedule in accordance with Section II.B.2~~, and~~.

   ~~c. Instructions and guidance provided in Appendix 2.~~

D. NEC Industrial Materials and Activities - Storm-Resistant Shelter Not Required

To qualify for NEC coverage, a Storm-Resistant Shelter is not required for the following:

1. Drums, barrels, tanks, and similar containers that are tightly Sealed, provided those containers are not deteriorated, do not contain residual industrial materials on the outside surfaces, and do not leak;

2. Adequately maintained vehicles used in material handling;

3. Final products, other than products that would be mobilized in storm water discharge (e.g., rock salt);

4. Any Industrial Materials and Activities that are protected by a temporary shelter for a period of no more than ninety (90) days due to facility construction or remodeling; and,

5. Any Industrial Materials and Activities that are protected within a secondary containment structure that will not discharge storm water to waters of the United States.

E. NEC Limitations

1. NEC coverage is available on a facility-wide basis only, not for individual outfalls. If a facility has industrial storm water discharges from one or more drainage areas that require NOI coverage, Dischargers shall register for NOI coverage for the entire facility through SMARTS in accordance with Section II.B.2. Any drainage areas on that facility that would otherwise qualify for NEC coverage may be specially addressed in the facility SWPPP by including an NEC Checklist and a certification statement demonstrating that those drainage areas of the facility have been evaluated; and that none of the Industrial Materials or Activities listed in subsection C above are, or will be in the foreseeable future, exposed to precipitation.

2. If circumstances change and Industrial Materials and Activities become exposed to rain, snow, snowmelt, and/or runoff, the conditions for this exclusion shall no longer apply. In such cases, the Discharger may be subject to enforcement for discharging without a permit. A Discharger with NEC coverage that anticipates changes in circumstances should register for NOI coverage at least seven (7) days before anticipated exposure.

3. The Regional Water Board may deny NEC coverage and require NOI coverage upon determining that:

   a. Storm water is exposed to Industrial Materials and Activities; and/or

   b. The discharge has a reasonable potential to cause or contribute to an exceedance of an applicable water quality standards~~WQS~~.

F. NEC Permit Registration Documents Required for Initial NEC Coverage

A Discharger shall submit via SMARTS the following PRDs for NEC coverage to document the applicability of the conditional exclusion:

1. The NEC form, which includes:

   a. The legal name, postal address, telephone number, and e-mail address of the Discharger;

   b. The facility business name and physical mailing address, the county name, and a description of the facility location if the facility does not have a physical mailing address; and,

   c. Certification by the Discharger that all PRDs submitted are correct and true and ~~that~~ the conditions of no exposure have been met.

2. An NEC Checklist prepared by the Discharger demonstrating that the facility has been evaluated; and that none of the following industrial materials or activities are, or will be in the foreseeable future, exposed to precipitation:

   a. Using, storing or cleaning industrial machinery or equipment, and areas where residuals from using, storing or cleaning industrial machinery or equipment remain and are exposed;

   b. Materials or residuals on the ground or in storm water inlets from spills/leaks;

   c. Materials or products from past industrial activity;

   d. Material handling equipment (except adequately maintained vehicles);

   e. Materials or products during loading/unloading or transporting activities;

   f. Materials or products stored outdoors (except final products intended for outside use, e.g., new cars, where exposure to storm water does not result in the discharge of pollutants);

   g. Materials contained in open, deteriorated or leaking storage drums, barrels, tanks, and similar containers;

   h. Materials or products handled/stored on roads or railways owned or maintained by the Discharger;

   i. Waste material (except waste in covered, non-leaking containers, e.g., dumpsters);

   j. Application or disposal of processed wastewater (unless already covered by an NPDES permit); and,

k. Particulate matter or visible deposits of residuals from roof stacks/vents evident in the storm water outflow.

3. Site Map (see Section X.E).

G. Requirements for Annual NEC Coverage Recertification

By ~~July~~October 1 of each reporting year beginning in 2015, any Discharger who has previously registered for NEC coverage shall either submit and certify an NEC demonstrating that the facility has been evaluated, and that none of the Industrial Materials or Activities listed above are, or will be in the foreseeable future, exposed to precipitation, or apply for NOI coverage.

H. NEC Certification Statement

All NEC certifications and re-certifications shall include the following certification statement:

I certify under penalty of law that I have read and understand the eligibility requirements for claiming a condition of 'no exposure' and obtaining an exclusion from NPDES storm water permitting; and that there are no discharges of storm water contaminated by exposure to industrial activities or materials from the industrial facility identified in this document (except as allowed in subsection C above). I understand that I am obligated to submit a no exposure certification form annually to the State Water Board and, if requested, to the operator of the local Municipal Separate Storm Sewer System (MS4) into which this facility discharges (where applicable). I understand that I must allow the Water Board staff, or MS4 operator where the discharge is into the local MS4, to perform inspections to confirm the condition of no exposure and to make such inspection reports publicly available upon request. I understand that I must obtain coverage under an NPDES permit prior to any point source discharge of storm water from the facility. I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based upon my inquiry of the person or persons who manage the system, or those persons directly involved in gathering the information, the information submitted is to the best of my knowledge and belief true, accurate and complete. I am aware there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

XVIII. SPECIAL REQUIREMENTS - PLASTIC MATERIALS

A. Facilities covered under this General Permit that handle Plastic Materials are required to implement BMPs to eliminate discharges of plastic in storm water in addition to the other requirements of this General Permit that are applicable to all other Industrial Materials and Activities. Plastic Materials~~, including~~ are virgin and recycled plastic resin pellets, powders, flakes, powdered additives,

regrind, ~~scrap,~~ dust, and ~~industrial process waste or recycling~~other similar types of preproduction plastics with the potential to discharge or migrate off-site ~~are considered storm water gross pollutants.~~. Any Discharger~~s~~' facility handling ~~these types of P~~plastic~~s~~ Materials will be referred to as Plastics Facilities in this General Permit. Any Plastics Facility covered under this General Permit that manufactures, transports, stores, or consumes these materials shall submit information to the State Water Board in their PRDs, including the type and form of plastics, and which BMPs are implemented at the facility to prevent illicit discharges. Pursuant to Water Code section 13367, Plastics Facilities are subject to mandatory, minimum BMPs.

1. At a minimum, Plastics Facilities shall implement and include in the SWPPP:

   a. Containment systems at each on-site storm drain discharge location down gradient of areas containing plastic material. The containment system shall be designed to trap all particles retained by a 1mm mesh screen, with a treatment capacity of no less than the peak flow rate from a one-year, one-hour storm.

   b. When a containment system is infeasible, or poses the potential to cause an illicit discharge, the facility may propose a technically feasible alternative BMP or suite of BMPs. The alternative BMPs shall be designed to achieve the same or better performance standard as a 1mm mesh screen with a treatment capacity of the peak flow rate from a one-year, one-hour storm. Alternative BMPs shall be submitted to the Regional Water Board for approval.

   ~~c.~~ Plastics Facilities shall use durable~~,~~ sealed containers designed not to rupture under typical loading and unloading activities at all points of plastic transfer and storage.

   ~~d. Plastics Facilities shall use durable, sealed containers designed not to rupture under typical loading and unloading activities at all points of plastic storage.~~

   c.

   ~~e.~~d. Plastics Facilities shall use capture devices as a form of secondary containment during transfers, loading, or unloading Plastic Materials. Examples of capture devices for secondary containment include, but are not limited to~~,~~ catch pans, tarps, berms or any other device that collects errant material.

   ~~f.~~e. Plastics Facilities shall have a vacuum or vacuum-type system for quick cleanup of fugitive plastic material available for employees.

   ~~g.~~f. Pursuant to Water Code section 13367(e)(1), Plastics Facilities that handle Plastic Materials smaller than 1mm in size shall develop a containment system designed to trap the smallest plastic material

handled at the facility with a treatment capacity of at least the peak flow rate from a one-year, one-hour storm, or develop a feasible alternative BMP or suite of BMPs that are designed to achieve a similar or better performance standard that shall be submitted to the Regional Water Board for approval.

2. Plastics Facilities are exempt from the Water Code requirement to install a containment system under section 13367 of the Water Code if they meet one of the following requirements that are determined to be equal to, or exceed the performance requirements of a containment system:

   a. The Discharger has certified and submitted via SMARTS a valid No Exposure Certification (NEC) in accordance with Section XVII; or

   b. Plastics Facilities are exempt from installing a containment system, if the following suite of eight (8) BMPs is implemented. This combination of BMPs is considered to reduce or prevent ~~or reduce~~ the discharge of plastics at a performance level equivalent to or better than the 1mm mesh and flow standard in Water Code section 13367(e)(1).

      i. Plastics Facilities shall annually train employees handling Plastic Materials. Training shall include environmental hazards of plastic discharges, employee responsibility for corrective actions to prevent errant Plastic Materials, and standard procedures for containing, cleaning, and disposing of errant Plastic Materials.

      ii. Plastics Facilities shall immediately fix any Plastic Materials containers that are punctured or leaking and shall clean up any errant material in a timely manner.

      iii. Plastics Facilities shall manage outdoor waste disposal of Plastic Materials in a manner that prevents the materials from leaking from waste disposal containers or during waste hauling.

      iv. Plastics Facilities that operate outdoor conveyance systems for Plastic Materials shall maintain the system in good operating condition. The system shall be sealed or filtered in such a way as to prevent the escape of materials when in operation. When not in operation, all connection points shall be sealed, capped, or filtered so as to not allow material to escape. Employees operating the conveyance system shall be trained how to operate in a manner that prevents the loss of materials such as secondary containment, immediate spill response, and checks to ensure the system is empty during connection changes.

      v. Plastics Facilities that maintain outdoor storage of Plastic Materials shall do so in a durable, permanent structure that prevents exposure to weather that could cause the material to migrate or discharge in storm water.

vi. Plastics Facilities shall maintain a schedule for regular housekeeping and routine inspection for errant Plastic Materials. The Plastics Facility shall ensure that their employees follow the schedule.

vii. PRDs shall include the housekeeping and routine inspection schedule, spill response and prevention procedures, and employee training materials regarding plastic material handling.

viii. Plastics Facilities shall correct any deficiencies in the employment of the above BMPs that result in errant Plastic Materials that may discharge or migrate off-site in a timely manner. Any Plastic Materials that are discharged or that migrate off-site constitute an illicit discharge in violation of this General Permit.

XIX. REGIONAL WATER BOARD AUTHORITIES

A. The Regional Water Boards may review a Discharger's PRDs for NOI or NEC coverage and administratively reject General Permit coverage if the PRDs are deemed incomplete. The Regional Water Boards may take actions that include rescinding General Permit coverage, requiring a Discharger to revise and re-submit their PRDs (certified and submitted by the Discharger) within a specified time period, requiring the Discharger to apply for different General Permit coverage or a different individual or general permit, or taking no action.

B. The Regional Water Boards have the authority to enforce the provisions and requirements of this General Permit. This includes, but is not limited to, reviewing SWPPPs, Monitoring Implementation Plan~~MIP~~s, ERA Reports, and Annual Reports, conducting compliance inspections, and taking enforcement actions.

C. As appropriate, the Regional Water Boards may issue NPDES storm water general or individual permits to a Discharger, categories of Dischargers, or Dischargers within a watershed or geographic area. Upon issuance of such NPDES permits, this General Permit shall no longer regulate the affected Discharger(s).

D. The Regional Water Boards may require a Discharger to revise its SWPPP, ERA Reports, or monitoring programs to achieve compliance with this General Permit. In this case, the Discharger shall implement these revisions in accordance with a schedule provided by the Regional Water Board.

E. The Regional Water Boards may approve requests from a Discharger to include co-located, but discontiguous, industrial activities within the same facility under a single NOI or NEC coverage.

F. Consistent with 40 Code of Federal Regulations section 122.26(a)(9)(i)(D), the Regional Water Boards may require any discharge that is not regulated by this General Permit, that is determined to contributes to a violation of a water quality standard~~WQS~~ or is a significant contributor of pollutants to waters of the United States, to be covered under this General Permit ~~is~~as appropriate. Upon

designation, the Discharger responsible for the discharge shall obtain coverage under this General Permit.

G. The Regional Water Boards may review a Discharger's Inactive Mining Operation Certification and reject it at any time if the Regional Water Board determines that access to the facility for monitoring purposes is practicable or that the facility is not in compliance with the applicable requirements of this General Permit.

H. All Regional Water Board actions that modify a Discharger's obligations under this General Permit must be in writing and should also be submitted in SMARTS.

XX. SPECIAL CONDITIONS

A. Reopener Clause

This General Permit may be reopened and amended to incorporate TMDL-related provisions. This General Permit may also be modified, revoked and reissued, or terminated for cause due to promulgation of amended regulations, water quality control plans or water quality control policies, receipt of U.S. EPA guidance concerning regulated activities, judicial decision, or in accordance with 40 Code of Federal Regulations sections 122.62, 122.63, 122.64, and 124.5.

B. Water Quality Based Corrective Actions

1. Upon determination by the Discharger or written notification by the Regional Water Board that industrial storm water discharges and/or authorized NSWDs contain pollutants that are in violation of Receiving Water Limitations (Section VI), the Discharger shall:

   a. Conduct a facility evaluation to identify pollutant source(s) within the facility that are associated with industrial activity and whether the BMPs described in the SWPPP have been properly implemented;

   b. Assess the facility's SWPPP and its implementation to determine whether additional BMPs or SWPPP implementation measures are necessary to reduce or prevent ~~or reduce~~ pollutants in industrial storm water discharges to meet the Receiving Water Limitations (Section VI); and,

   c. Certify and submit via SMARTS documentation based upon the above facility evaluation and assessment that:

      i. Additional BMPs and/or SWPPP implementation measures have been identified and included in the SWPPP to meet the Receiving Water Limitations (Section VI); or

ii. No additional BMPs or SWPPP implementation measures are required to reduce or prevent pollutants in industrial storm water discharges to meet the Receiving Water Limitations (Section VI).

2. The Regional Water Board may reject the Dischargers water quality based corrective actions and/or request additional supporting documentation.

C. Requirements for Dischargers Claiming "No Discharge" through the Notice of Non-Applicability (NONA)

1. For the purpose of the NONA, the Entity (Entities) is referring to the person(s) defined in section 13399.30 of the Water Code.

2. Entities who are claiming "No Discharge" through the NONA shall meet the following eligibility requirements:

   a. The facility ~~shall~~ is ~~either be (1)~~ engineered and constructed to have contained the maximum historic precipitation event (or series of events) using the precipitation data collected from the National Oceanic and Atmospheric Agency's website (or other nearby precipitation data available from other government agencies)~~; or~~ so that there will be no discharge of industrial storm water to waters of the United States, including no discharge to groundwater that has a direct hydrologic connection to waters of the United States; or,

   b. The facility is ~~L~~located in basins or other physical locations that are not hydrologically connected to waters of the United States.

3. When claiming the "No Discharge" option, Entities shall submit and certify via SMARTS both the NONA and a No Discharge Technical Report. The No Discharge Technical Report shall demonstrate the facility meets the eligibility requirements described above.

4. The No Discharge Technical Report shall be ~~prepared~~ signed (wet signature and license number) by a California licensed professional engineer.

XXI. STANDARD CONDITIONS

A. Duty to Comply

Dischargers shall comply with all standard conditions in this General Permit. Permit noncompliance constitutes a violation of the Clean Water Act and the Water Code and is grounds for enforcement action and/or removal from General Permit coverage.

Dischargers shall comply with effluent standards or prohibitions established under section 307(a) of the Clean Water Act for toxic pollutants within the time provided in the regulations that establish these standards or prohibitions.

B. Duty to Reapply

Dischargers that wish to continue an activity regulated under this General Permit after the expiration date of this General Permit shall apply for and obtain authorization from the Water Boards as required by the new general permit once it is issued.

C. General Permit Actions

1. This General Permit may be modified, revoked and reissued, or terminated for cause. Submittal of a request by the Discharger for General Permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not annul any General Permit condition.

2. If a toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is promulgated under section 307(a) of the Clean Water Act for a toxic pollutant which is present in the discharge, and that standard or prohibition is more stringent than any limitation on the pollutant in this General Permit, this General Permit shall be modified or revoked and reissued to conform to the toxic effluent standard or prohibition.

D. Need to Halt or Reduce Activity Not a Defense

In an enforcement action, it shall not be a defense for a Discharger that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this General Permit.

E. Duty to Mitigate

Dischargers shall take all responsible steps to ~~minimize~~reduce or prevent any discharge ~~which~~that has a reasonable likelihood of adversely affecting human health or the environment.

F. Proper Operation and Maintenance

Dischargers shall at all times properly operate and maintain any facilities and systems of treatment and control (and related equipment and apparatuses) which are installed or used by the Discharger to achieve compliance with the conditions of this General Permit. Proper operation and maintenance also include adequate laboratory controls and appropriate quality assurance procedures. Proper operation and maintenance may require the operation of backup or auxiliary facilities or similar systems installed by a Discharger when necessary to achieve compliance with the conditions of this General Permit.

G. Property Rights

This General Permit does not convey any property rights of any sort or any exclusive privileges. It also does not authorize any injury to private property or

any invasion of personal rights, nor does it authorize any infringement of federal, state, or local laws and regulations.

H. Duty to Provide Information

Upon request by the relevant agency, Dischargers shall provide information to determine compliance with this General Permit to the Water Boards, U.S. EPA, or local Municipal Separate Storm Sewer System (MS4) within a reasonable time. Dischargers shall also furnish, upon request by the relevant agency, copies of records that are required to be kept by this General Permit.

I. Inspection and Entry

Dischargers shall allow the Water Boards, U.S. EPA, and local MS4 (including any authorized contractor acting as their representative), to:

1. Enter upon the premises at reasonable times where a regulated industrial activity is being conducted or where records are kept under the conditions of this General Permit;

2. Access and copy at reasonable times any records that must be kept under the conditions of this General Permit;

3. Inspect the facility at reasonable times; and,

4. Sample or monitor at reasonable times for the purpose of ensuring General Permit compliance.

J. Monitoring and Records

1. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.

2. If Dischargers monitor any pollutant more frequently than required, the results of such monitoring shall be included in the calculation and reporting of the data submitted.

3. Records of monitoring information shall include:

   a. The date, exact location, and time of sampling or measurement;

   b. The date(s) analyses were performed;

   c. The individual(s) that performed the analyses;

   d. The analytical techniques or methods used; and,

   e. The results of such analyses.

4. Dischargers shall retain, for a period of at least five (5) years, either a paper or electronic copy of all storm water monitoring information, records, data,

and reports required by this General Permit. Copies shall be available for review by the Water Board's staff at the facility during scheduled facility operating hours.

5. Upon written request by U.S. EPA or the local MS4, Dischargers shall provide paper or electronic copies of Annual Reports or other requested records to the Water Boards, U.S. EPA, or local MS4 within ten (10) ~~working~~ days from receipt of the request.

K. Electronic Signature and Certification Requirements

1. All Permit Registration Documents (PRDs) for NOI and NEC coverage shall be certified and submitted via SMARTS by the Discharger's Legally Responsible Person (LRP). All other documents may be certified and submitted via SMARTS by the LRP or by their designated Duly Authorized Representative.

2. When a new LRP or Duly Authorized Representative is designated, the Discharger shall ensure that the appropriate revisions are made via SMARTS. In unexpected or emergency situations, it may be necessary for the Discharger to directly contact the State Water Board's Storm Water Section to register for SMARTS account access in order to designate a new LRP.

3. Documents certified and submitted via SMARTS by an unauthorized or ineligible LRP or Duly Authorized Representative are invalid.

4. LRP eligibility is as follows:

   a. For a corporation: by an authorized corporate officer. For the purposes of this section, an authorized corporate officer means: (a) a president, secretary, treasurer, vice-president, or other officer of the corporation with authority to execute documents on behalf of the corporation pursuant to corporate bylaws or board resolution; or (b) the manager of the facility, if authority to sign documents has been assigned or delegated to the manager in accordance with corporate bylaws and by corporate resolution;

   b. For a partnership or sole proprietorship: by a general partner or the proprietor, respectively, that is authorized to execute legally binding documents on behalf of the partnership or sole proprietorship (as the case may be) in accordance with the entity's governing documents; or,

   c. For a municipality, state, federal, or other public agency: by either a principal executive officer or ranking elected official that possesses signatory authority of the governmental agency at issue. The principal executive officer of a federal agency includes the chief executive officer of the agency or the senior executive officer having responsibility for the

overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of U.S. EPA).

5. Duly Authorized Representative eligibility is as follows:

   a. The Discharger must authorize via SMARTS any person designated as a Duly Authorized Representative;

   b. The authorization shall specify that a person designated as a Duly Authorized Representative has responsibility for the overall operation of the regulated facility or activity, such as a person that is a manager, operator, superintendent, or another position of equivalent responsibility, or is an individual who has overall responsibility for environmental matters for the company; and,

   c. The authorization must be current (it has been updated to reflect a different individual or position) prior to any report submittals, certifications, or records certified by the Duly Authorized Representative.

L. Certification

Any person signing, certifying, and submitting documents under Section XXI.K above shall make the following certification:

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons that manage the system or those persons directly responsible for gathering the information, to the best of my knowledge and belief, the information submitted is, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

M. Anticipated Noncompliance

Dischargers shall give advance notice to the Regional Water Board and local MS4 of any planned changes in the industrial activity that may result in noncompliance with this General Permit.

N. Penalties for Falsification of Reports

Clean Water Act section 309(c)(4) provides that any person that knowingly makes any false material statement, representation, or certification in any record or other document submitted or required to be maintained under this General Permit, including reports of compliance or noncompliance shall upon conviction, be punished by a fine of not more than $10,000 or by imprisonment for not more than two years or by both.

DRAFT

O. Oil and Hazardous Substance Liability

Nothing in this General Permit shall be construed to preclude the initiation of any legal action or relieve the Discharger from any responsibilities, liabilities, or penalties to which the Discharger is or may be subject to under section 311 of the Clean Water Act.

P. Severability

The provisions of this General Permit are severable; if any provision of this General Permit or the application of any provision of this General Permit to any circumstance is held invalid, the application of such provision to other circumstances and the remainder of this General Permit shall not be affected thereby.

Q. Penalties for Violations of Permit Conditions

1. Clean Water Act section 309 provides significant penalties for any person that violates a permit condition implementing sections 301, 302, 306, 307, 308, 318, or 405 of the Clean Water Act or any permit condition or limitation implementing any such section in a permit issued under section 402. Any person that violates any permit condition of this General Permit is subject to a civil penalty not to exceed $37,500[25] per calendar day of such violation, as well as any other appropriate sanction provided by section 309 of the Clean Water Act.

2. The Porter-Cologne Water Quality Control Act also provides for civil and criminal penalties, which ~~in some cases~~ may be greater than ~~those~~penalties under the Clean Water Act.

R. Transfers

Coverage under this General Permit is non-transferrable. When operation of the facility has been transferred to another entity, or a facility is relocated, new PRDs for NOI and NEC coverage must be certified and submitted via SMARTS prior to the transfer, or at least seven (7) days prior to the first day of operations for a relocated facility.

S. Continuation of Expired General Permit

If this General Permit is not reissued or replaced prior to the expiration date, it will be administratively continued in accordance with 40 Code of Federal Regulations 122.6 and remain in full force and effect.

[25] May be further adjusted in accordance with the Federal Civil Penalties Inflation Adjustment Act.

DRAFT

I. BACKGROUND

A. Purpose

The purpose of this Fact Sheet is to explain the legal requirements and technical rationale that serve as the basis for the requirements of this Order <Insert Order No.> (General Permit), adopted by the State Water Resources Control Board (State Water Board) on <Insert Date>. This General Permit regulates operators of facilities subject to storm water permitting (Dischargers), that discharge storm water associated with industrial activity (industrial storm water discharges). This General Permit replaces Water Quality Order 97-03-DWQ**.** This Fact Sheet does not contain any independently-enforceable requirements; the General Permit contains all of the actual requirements applicable to Dischargers. In case of any conflict between the Fact Sheet and the General Permit, the terms of the General Permit govern.

B. History

The Federal Clean Water Act (CWA)[1] prohibits discharges from point sources to waters of the United States, unless the discharges are in compliance with a National Pollutant Discharge Elimination System (NPDES) permit. (CWA § 301(a).) In 1987, the CWA was amended to establish a framework for regulating municipal storm water discharges and discharges of storm water associated with industrial activity (industrial storm water discharges) under the NPDES program. (CWA § 402(p).) In 1990, the United States Environmental Protection Agency (U.S. EPA) promulgated regulations, commonly known as Phase I, establishing application requirements for storm water permits for specified categories of industries. (40 C.F.R. § 122.26.) In 1992, U.S. EPA revised the monitoring requirements for industrial storm water discharges. (40 C.F.R. § 122.44(i)(2), (4), (5).) In 1999, U.S. EPA adopted additional storm water regulations, known as Phase II. (64 Fed. Reg. 68722.) The Phase II regulations provide for, among other things, a conditional exclusion from NPDES permitting requirements for industrial activities that have no exposure to storm water.

Industrial storm water discharges are regulated pursuant to CWA section 402(p)(3)(A). This provision requires NPDES permits for industrial storm water discharges to implement CWA section 301, which includes requirements for Dischargers to comply with technology-based effluent limitations, and any more stringent water quality-based limitations necessary to meet water quality standards. Technology-based effluent limitations applicable to industrial activities are based on best conventional pollutant control technology (BCT) for conventional pollutants, and best available technology economically achievable (BAT) for toxic and non-conventional pollutants. (CWA § 301(b)(1)(A) and (2)(A).) To ensure compliance with water quality standards, NPDES permits may also require a Discharger to implement best management practices (BMPs). 40 Code of Federal Regulations section 122.44(k)(4) requires the use of BMPs to control or abate the discharge of pollutants when numeric effluent limitations (NELs) are infeasible. The State Water Board has concluded that it is infeasible to establish

[1] Federal Water Pollution Control Act of 1970 (also referred to as the Clean Water Act or CWA), 33 U.S.C. § 1201 et seq. All further statutory references herein are to the CWA unless otherwise indicated.

NELs for storm water discharges associated with industrial activity due to insufficient information at the time of adoption of this General Permit.

On April 17, 1997, the State Water Board issued NPDES General Permit for Industrial Storm Water Discharges, Excluding Construction Activities, Water Quality Order 97-03-DWQ (previous permit). This General Permit, Order <Insert Order>, rescinds the previous permit and serves as the statewide general permit for industrial storm water discharges. The State Water Board concludes that significant revisions to the previous permit requirements are necessary for implementation, consistency and objective enforcement. As discussed in this Fact Sheet, this General Permit requires Dischargers to:

- Eliminate unauthorized non-storm water discharges (NSWDs);
- Develop and implement storm water pollution prevention plans (SWPPPs) that include best management practices (BMPs);
- Implement minimum BMPs, and advanced BMPs as necessary, to achieve compliance with the effluent and receiving water limitations of this General Permit;
- Conduct monitoring, including visual observations and analytical storm water monitoring for indicator parameters;
- Compare monitoring results for monitored parameters to applicable numeric action levels (NALs) derived from the U.S. EPA 2008 Multi-Sector General Permit for Storm Water Discharges Associated with Industrial Activity (2008 MSGP) and other industrial storm water discharge monitoring data collected in California;
- Perform the appropriate Exceedance Response Actions (ERAs) when there are exceedances of the NALs; and,
- Certify and submit all permit-related compliance documents via the Storm Water Multi Application Reporting and Tracking System (SMARTS). Dischargers shall certify and submit these documents which include, but are not limited to, Permit Registration Documents (PRDs) including Notices of Intent (NOIs), No Exposure Certifications (NECs), and Storm Water Pollution Prevention Plans (SWPPPs), as well as Annual Reports, Notices of Termination (NOTs), Level 1 ERA Reports, and Level 2 ERA Technical Reports.

C. Blue Ribbon Panel of Experts (Panel)

In 2005 and 2006, the State Water Board convened a Blue Ribbon Panel of Experts (Panel) to address the feasibility of NELs in California's storm water permits. Specifically, the Panel was charged with answering the following questions:

> Is it technically feasible to establish numeric effluent limitations, or some other quantifiable limit, for inclusion in storm water permits?

How would such limitations or criteria be established, and what information and data would be required? [2]

The Panel was directed to answer these questions for industrial storm water discharge general permits, construction storm water discharge general permits, and area-wide municipal storm water discharge permits. The Panel was also directed to address both technology-based and water quality based limitations and criteria.

In evaluating the establishment of numeric limitations and criteria, the Panel was directed to consider all of the following:

- The ability of the State Water Board to establish appropriate objective limitations or criteria;
- How compliance is to be determined;
- The ability of Dischargers and inspectors to monitor for compliance; and
- The technical and financial ability of Dischargers to comply with the limitations or criteria.

Following an opportunity for public comment, the Panel identified several water quality concerns, public process and program effectiveness issues. A summary of the Panel's recommendations regarding industrial storm water discharges follows:[3]

- Current data are inadequate; accordingly, the State Water Board should improve monitoring requirements to collect useful data for establishing NALs and NELs.
- Required parameters for further monitoring should be consistent with the type of industrial activity (i.e., monitor for heavy metals when there is a reasonable expectation that the industrial activity will contribute to increased heavy metals concentrations in storm water).
- Insofar as possible, the use of California data (or national data applicable to California) is preferred when setting NELs and NALs.
- Industrial facilities that do not discharge to Municipal Separate Storm Sewer Systems (MS4s) should implement BMPs for their non-industrial exposure (e.g., parking lots, roof runoff) similar to BMPs implemented by commercial facilities in MS4 jurisdictions.

[2] State Water Board Storm Water Panel of Experts, The Feasibility of Numeric Effluent Limits Applicable to Discharges of Storm Water Associated with Municipal, Industrial and Construction Activities (June 19, 2006). <http://www.waterboards.ca.gov/water_issues/programs/stormwater/docs/numeric/swpanel_final_report.pdf>. [as of February 4, 2014].

[3] See footnote 2.

- In all cases, Dischargers should implement a suite of minimum BMPs, including, but not limited to, good housekeeping practices, employee training, and preventing exposure of materials to rain.

- Standard Industrial Classification (SIC) code categories are not a satisfactory way of identifying industrial activities at any given site. The State Water Board should develop an improved method of characterizing industrial activities that will improve water quality in storm water.

- Recognizing that implementing the Panel's suggested changes is a large task, the State Water Board should set priorities for implementation of the Panel's suggested approach in order to achieve the greatest reduction of pollutants statewide.

- Recognizing that an increasing number of industries have moved industrial activities indoors to prevent storm water pollution, such facilities should be granted regulatory relief from NALs and/or NELs , but should still be required to comply with any applicable MS4 permit requirements.

- Recognizing the need for improved monitoring and reduction of pollutants in industrial storm water discharges, the State Water Board should consider the total economic impact of its requirements to not economically penalize California industries when compared to industries outside of California.

With regard to the industrial activities component of its charge, the Panel limited its focus to the question of whether sampling data can be used to derive technology-based NELs. The Panel did not address other factors or approaches that may relate to the task of determining technology- and water quality-based NELs consistent with the regulations and law. Examples of these other factors are discussed in more detail in this Fact Sheet. Additionally, in its final report the Panel did not clearly differentiate between the role of numeric and non-numeric effluent limitations, nor did it consider U.S. EPA procedures used to promulgate effluent limitation guidelines (ELGs) in 40 Code of Federal Regulations, Chapter I, Subchapter N (Subchapter N).

D. Summary of Significant Changes in this General Permit

The previous permit issued by the State Water Board on April 17, 1997, had been administratively extended since 2002 until the adoption of this General Permit. Significant revisions to the previous permit were necessary to update permit requirements consistent with recent regulatory changes pertaining to industrial storm water under the CWA. This General Permit differs from the previous permit in the following areas:

1. Minimum Best Management Practices (BMPs)

   This General Permit requires Dischargers to implement a set of minimum BMPs. Implementation of the minimum BMPs, in combination with any advanced BMPs (BMPs, collectively,) necessary to reduce or prevent pollutants in industrial storm water discharges, serve as the basis for compliance with this General Permit's

technology-based effluent limitations and water quality based receiving water limitations. Although there is great variation in industrial activities and pollutant sources between industrial sectors and, in some cases between operations within the same industrial sector, the minimum BMPs specified in this General Permit represent common practices that can be implemented by most facilities.

The previous permit did not require a minimum set of BMPs but rather allowed Dischargers to consider which non-structural BMPs should be implemented and which structural BMPs should be considered for implementation when non-structural BMPs are ineffective.

This General Permit requires Dischargers to implement minimum BMPs (which are mostly non-structural BMPs), and advanced BMPs (which are mostly structural BMPs) when implementation of the minimum BMPs do not meet the requirements of the General Permit. Advanced BMPs consists of treatment control BMPs, exposure reduction BMPs, and storm water containment and discharge reduction BMPs. BMPs that exceed the performance expectation of minimum BMPs are considered advanced BMPs. Dischargers are encouraged to utilize advanced BMPs that infiltrate or reuse storm water where feasible.

The minimum and advanced BMPs required in this General Permit are consistent with U.S. EPA's 2008 Multi-Sector General Permit for Stormwater Discharges Associated with Industrial Activity (2008 MSGP), guidance developed by the California Stormwater Quality Association, and recommendations by Regional Water Quality Control Board (Regional Water Board) inspectors. Dischargers are required to evaluate BMPs being implemented and determine an appropriate interval for the implementation and inspection of these BMPs.

2. Conditional Exclusion - No Exposure Certification (NEC)

   This General Permit applies U.S. EPA Phase II regulations regarding a conditional exclusion for facilities that have no exposure of industrial activities and materials to storm water. (40 C.F.R. § 122.26(g).) (The previous permit required light industries to obtain coverage only if their activities were exposed to storm water.) This General Permit implements current U.S. EPA rules allowing any type of industry to claim a conditional exclusion. The NEC requires enrollment for coverage prior to conditionally excluding a Discharger from a majority of this General Permit's requirements.

3. Electronic Reporting Requirements

   This General Permit requires Dischargers to submit and certify all reports electronically via SMARTS. The previous permit used a paper reporting process with electronic reporting as an option.

4. Training Expectations and Roles

   This General Permit requires that Dischargers arrange to have appropriately trained personnel implementing this General Permit's requirements at each facility. In

addition, if a Discharger's facility enters Level 1 status, the Level 1 ERA Report must be prepared by a Qualified Industrial Storm Water Practitioner (QISP). All Action Plans and Technical Reports required in Level 2 status must also be prepared by a QISP.

Dischargers may appoint a staff person to complete the QISP training or may contract with an outside QISP. QISP training is tailored to persons with a high degree of technical knowledge and environmental experience. Although QISPs do not need to be California licensed professional engineers, it may be necessary to involve a California licensed professional engineer to perform certain aspects of the Technical Reports.

5. Numeric Action Levels (NALs) and NAL Exceedances

   This General Permit contains two types of NAL exceedances. An annual NAL exceedance occurs when the average of all sampling results within a reporting year for a single parameter (except pH) exceeds the applicable annual NAL. The annual NALs are derived from, and function similarly to, the benchmark values provided in the 2008 MSGP. Instantaneous maximum NALs target hot spots or episodic discharges of pollutants. An instantaneous maximum NAL exceedance occurs when two or more analytical results from samples taken for any parameter within a reporting year exceed the applicable instantaneous maximum NAL value. Instantaneous maximum NALs for Total Suspended Solids (TSS) and Oil and Grease (O&G) are based on previously gathered California industrial storm water discharge monitoring data. The instantaneous maximum NAL for pH is derived from the benchmark value provided in the 2008 MSGP.

6. Exceedance Response Actions (ERA)

   This General Permit requires Dischargers to develop and implement ERAs, when an annual NAL or instantaneous maximum NAL exceedance occurs during a reporting year. The first time an annual NAL or instantaneous maximum NAL exceedance occurs for any one parameter, a Discharger's status is changed from Baseline to Level 1 status, and the Discharger is required to evaluate and revise, as necessary, its BMPs (with the assistance of a QISP) and submit a report prepared by a QISP. The second time an annual NAL or instantaneous maximum NAL exceedance occurs for the same parameter in a subsequent reporting year, the Discharger's status is changed from Level 1 to Level 2 status, and Dischargers are required to submit a Level 2 ERA Action Plan and a Level 2 ERA Technical Report. Unless the demonstration is not accepted by the State Water Board or a Regional Water Board, the Discharger is not required to perform additional ERA requirements for the parameter(s) involved if the Discharger demonstrates that:

   a. Additional BMPs required to eliminate NAL exceedances are not technologically available or economically practicable and achievable; or,

   b. NAL exceedances are solely caused by non-industrial pollutant sources; or,

c. NAL exceedances are solely attributable to pollutants from natural background sources.

Information supporting the above demonstrations must be included in QISP-prepared Level 2 ERA Technical Reports.

7. CWA section 303(d) Impairment

This General Permit requires a Discharger to monitor additional parameters if the discharge(s) from its facility contributes pollutants to receiving waters that are listed as impaired for those pollutants (CWA section 303(d) listings). This General Permit lists the receiving waters that are 303(d) listed as impaired for pollutants that are likely to be associated with industrial storm water in Appendix 3. For example, if a Discharger discharges to a water body that is listed as impaired for copper, and the discharge(s) from its facility has the potential sources of copper, the Discharger must add copper to the list of parameters to monitor in its storm water discharge.

8. Design Storm Standards for Treatment Control BMPs

This General Permit includes design storm standards for Dischargers implementing treatment control BMPs. The design storm standards include both volume- and flow-based criteria. Dischargers are not required to retrofit existing treatment control BMPs unless required to meet the technology-based effluent limitations and receiving water limitations in this General Permit.

9. Qualifying Storm Event (QSE)

This General Permit defines a QSE as a precipitation event that:

a. Produces a discharge for at least one drainage area; and,

b. Is preceded by 48 hours with no discharge from any drainage area.

The definition above differs from the definition in the previous permit, resulting in an increase number of QSEs eligible for sample collection. Therefore, most Dischargers will be able to collect the required number of samples, regardless of their facility location.

10. Sampling Protocols

This General Permit requires Dischargers to collect samples during scheduled facility operating hours from each drainage location within four hours of: (1) the start of the discharge from a QSE occurring during scheduled facility operating hours, or (2) the start of scheduled facility operating hours if the QSE occurred in the previous twelve (12) hours. The benefits of this sampling protocol: (a) allows a more reasonable amount of time to collect samples, (b) increases the likelihood for samples collected at discharge locations to be representative of the drainage area discharge characteristics, (c) increases the number of QSEs eligible for sample collection, and, (d) reduces the likelihood of Dischargers collecting samples with short-term concentration spikes.

The previous permit required that Dischargers collect grab samples during the first hour of discharge that commenced during scheduled facility operating hours. These sample collection requirements were widely considered to be too rigid and out of step with other states' sample collection requirements. Since many storm events begin in the evening or early morning hours, numerous opportunities to collect samples were lost because Dischargers could not obtain samples during the first hour of discharge. Dischargers with facilities that have multiple discharge locations had difficulties collecting samples within such a short timeframe therefore affecting data quality.

11. Sampling Frequency

This General Permit increases the sampling frequency by requiring the Discharger to collect and analyze storm water samples from each discharge location for two (2) QSEs within the first half of each reporting year (July 1 to December 31), and two (2) QSEs within the second half of each reporting year (January 1 to June 30). The increased sampling, compared to the previous permit's two samples during the wet season, is consistent with the 2008 MSGP and other states' permit requirements and will improve compliance determination with this General Permit. The State Water Board expects that the elimination of the wet season sampling requirements will increase the number of possible QSEs eligible for monitoring.

12. Compliance Groups

To allow industrial facilities to efficiently share knowledge, skills and resources towards achieving General Permit compliance, this General Permit allows the formation of Compliance Groups and Compliance Group Leaders . Dischargers participating in a Compliance Group (Compliance Group Participants) are collectively required to sample twice a year. Compliance Group Leaders are required to be approved through the State Water Board-approved training program process, inspect each facility once within each reporting year, and prepare Level 1 and Level 2 ERA reports as necessary. The Compliance Group option is described in more detail in General Permit section XIV and in this Fact Sheet in the Section titled "Compliance Groups."

13. Discharges to Ocean Waters

This General Permit requires Dischargers with ocean-discharging outfalls subject to model monitoring provisions of the California Ocean Plan to develop and implement a monitoring plan in compliance with those provisions and any additional monitoring requirements established pursuant to Water Code section 13383. Dischargers who have not developed and implemented a monitoring program in compliance with the California Ocean Plan model monitoring provisions by January 1, 2015 or seven (7) days prior to commencing operations, whichever is later, are ineligible to obtain coverage under this General Permit.

DRAFT

II. TECHNICAL RATIONALE FOR REQUIREMENTS IN THIS GENERAL PERMIT

A. Receiving General Permit Coverage

1. This General Permit provides regulatory coverage for new and existing industrial storm water discharges and authorized NSWDs from:

   a. Facilities required by federal regulations to obtain an NPDES permit;

   b. Facilities designated by the Regional Water Boards to obtain an NPDES permit; and,

   c. Facilities directed by the Regional Water Boards to obtain coverage specifically under this General Permit. The Regional Water Board typically directs a Discharger to change General Permit coverage under two circumstances:

      (1) switch from an individual NPDES permit to this General Permit, or

      (2) switch from the NPDES General Permit for Storm Water Discharges Associated with Construction And Land Disturbance Activities, (Order 2009-0009-DWQ, NPDES No CAS000002 (to this General Permit for long-term construction related activities that are similar to industrial activities (e.g. concrete batch plants).

40 Code of Federal Regulations section 122.26(b)(14) defines "storm water discharge associated with industrial activity" and describes the types of facilities subject to permitting (primarily by Standard Industrial Classification (SIC) code). This General Permit provides regulatory coverage for all facilities with industrial activities described in Attachment A where the covered industrial activity is the Discharger's primary industrial activity. In some instances, a Discharger may have more than one primary industrial activity occurring at a facility.

The 1987 SIC manual uses the term "establishment" to determine the primary economic activity of a facility. The manual instructs that where distinct and separate economic activities are performed at a single location, each activity should be treated as a separate establishment (and, therefore, separate primary activity). For example, the United States Navy (primary SIC code 9711) may conduct industrial activities subject to permitting under this General Permit, such as landfill operations (SIC code 4953), ship and boat building and repair (SIC code 3731, and flying field operations (SIC code 4581).

The SIC manual also discusses "auxiliary" functions of establishments. Auxiliary functions provide management or support services to the establishment. Examples of auxiliary functions are warehouses and storage facilities for the establishment's own materials, maintenance and repair shops of the establishment's own machinery, automotive repair shops or storage garages of the establishment's own vehicles, administrative offices, research, development, field engineering support, and testing conducted for the establishment. When auxiliary functions are performed at physically separate facilities from the establishment they serve, they generally are not subject to General Permit coverage. If

auxiliary functions are performed at the same physical location as the establishment, then they are subject to General Permit coverage if they are associated with industrial activities.

This clarification does not change the scope of which facilities are subject to permitting relative to the 1997 IGP. The 1997 IGP Fact Sheet had used the term "auxiliary" to describe a facility's separate primary activities, which has caused confusion.

In 1997, the North American Industrial Classification System (NAICS) was published, replacing the SIC code system. The U.S. EPA has indicated that it intends to incorporate the NAICS codes into the federal storm water regulations but has not done so yet. The State Water Board recognizes that many Dischargers in newer industries were not included in the 1987 SIC code manual and may have difficulty determining their SIC code information. To address this transition, SMARTS has been modified to accept both SIC codes and NAICS codes, and NAICS codes are automatically translated into SIC codes. There may be instances of conflict between SIC and NAICS codes. The use of NAICS codes shall not expand or reduce the types of industries subject to this General Permit as compared to the SIC codes listed in the General Permit. State Water Board staff will work closely with the applicant to resolve these conflicts in SMARTS as they are identified. Dischargers should be aware that the use of an NAICS code which results in failure to submit any of the required PRDs under this General Permit remains a violation of the terms of this General Permit.

The facilities included in category one of Attachment A (facilities subject to Subchapter N) are subject to storm water ELGs that are incorporated into the requirements of this General Permit. Dischargers whose facilities are included in this category must examine the appropriate federal ELGs to determine the applicability of those guidelines. This General Permit contains additional requirements (Section XI.D) that apply only to facilities with storm water ELGs.

2. Types of Discharges Not Covered by this General Permit

   a. Discharges from construction and land disturbance activities that are subject to the General Permit for Discharges of Storm Water Associated with Construction Activity (Construction General Permit).

   b. Discharges covered by an individual or general storm water NPDES permit. Some industrial storm water discharges may be regulated by other individual or general NPDES permits issued by the State Water Board or the Regional Water Boards (Water Boards, collectively,). This General Permit shall not regulate these discharges. When the individual or general NPDES permits for such discharges expire, the Water Boards may authorize coverage under this General Permit or another general NPDES permit, or may issue a new individual NPDES permit consistent with the federal and state storm water regulations. Interested parties may request that the State Water Board or appropriate Regional Water Board issue individual or general NPDES permits for specific discharges that, in their view are not properly regulated through this General Permit. General permits may be issued for a particular industrial group or watershed area which

would supersede this General Permit. To date, two Regional Water Board have issued such permits:

i. The Lahontan Regional Water Board has adopted an NPDES permit and general Waste Discharge Requirements to regulate discharges from marinas and maintenance dredging (Regional Water Board Order R6T-2005-0015 - NPDES Permit No. CAG616003) in the Lake Tahoe Hydrologic Unit.

ii. The Santa Ana Regional Water Board adopted the Sector Specific General Permit for Stormwater Runoff Associated with Industrial Activities from Scrap Metal Recycling Facilities within the Santa Ana Region, Order R8-2012-0012, NPDES Permit No. CAG 618001 (Scrap Metal Recycling Permit). The Scrap Metal Recycling Permit is applicable to facilities within the Santa Ana Region that are listed under Standard Industrial Classification (SIC) Code 5093 and engaged in the following types of activities: (1) automotive wrecking for scrap-wholesale (this category does not include facilities engaged in automobile dismantling for the primary purpose of selling second hard parts); (2) iron and steel scrap - wholesale; (3) junk and scrap metal - wholesale; (4) metal waste and scrap - wholesale; and (5) non-ferrous metals scrap - wholesale. Other types of facilities listed under SIC Code 5093 and engaged in waste recycling are not required to get coverage under the Scrap Metal Recycling Permit. A list of covered facilities as of February 8, 2011 was included in Attachment A of the Scrap Metal Recycling Permit.

c. Discharges that the Regional Water Boards determine to be ineligible for coverage under this General Permit. In such cases, a Regional Water Board will require the discharges be covered by another individual or general NPDES permit. The applicability of this General Permit to such discharges is terminated when the discharge is subject to another individual or general NPDES permit.

d. Discharges that do not enter waters of the United States. These include:

i. Discharges to municipal separate sanitary sewer systems;

ii. Discharges to evaporation ponds, discharges to percolation ponds, and/or any other methods used to retain and prevent industrial storm water discharges from entering waters of the United States;

iii. Discharges to combined sewer systems. In California, the only major combined sewer systems are located in San Francisco and downtown Sacramento. Dischargers who believe they discharge into a combined sewer system should contact the local Regional Water Board to verify discharge location; and,

iv. Dischargers Claiming the “No Discharge” Option in the Notice of Non-Applicability (NONA) (Fact Sheet Section II.S).

e. Discharges from mining operations or oil and gas facilities composed entirely of flows that are from conveyances or systems of conveyances used for collecting and conveying precipitation runoff and do not come into contact with any overburden, raw materials, intermediate products, finished products, by-products, or waste products located at the facility. (33 U.S.C. § 1342(l)(2).)

f. Discharges from facilities on Tribal Lands regulated by U.S. EPA.

3. Obtaining General Permit Coverage (Section II of this General Permit)

   The State Water Board has developed the SMARTS online database system to handle registration and reporting under this General Permit. More information regarding SMARTS and access to the database is available online at https://smarts.waterboards.ca.gov. The State Water Board has determined that all documents related to general storm water enrollment and compliance must be certified and submitted via SMARTS by Dischargers.

   This General Permit requires all Dischargers to electronically certify and submit PRDs via SMARTS to obtain: (1) regulatory coverage, or (2) to certify that there are no industrial activities exposed to storm water at the facility and obtain regulatory coverage under the NEC provision of this General Permit. Facilities that were eligible to self-certify no exposure under the previous permit (see category 10 in Attachment 1 of the previous permit) are required to certify and submit via SMARTS PRDs for NOI coverage under this General Permit by July 1, 2015 or for NEC coverage by October 1, 2015. The Water Board is estimating that 10,000 – 30,000 Dischargers may be registering for NOI or NEC coverage under this General Permit. Separate registration deadlines, one for NOI coverage and one for NEC coverage, provides Dischargers better assistance from Storm Water Helpdesk and staff.

   Dischargers shall electronically certify and submit the PRDs via SMARTS for each individual facility. This requirement is intended to establish a clear accounting of the name, address, and contact information for each Discharger, as well as a description of each Discharger's facility.

   The Water Boards recognize that certain information pertaining to an industrial facility may be confidential. Many Stakeholders were asking for clarification on the process the Water Boards would use to manage confidential information or the process Dischargers could use to redact such information. Dischargers may redact trade secrets information from required submittals (Section II.B.3.d). Dischargers are required to include a general description of the redacted information and the basis for the redaction. Dischargers are still required to submit complete and un-redacted versions of the information to the Water Boards within 30 days, however these versions should be clearly labeled "CONFIDENTIAL" so that the confidentiality of these documents is clear to Regional Water Board staff, even when there is a change in staff. This General Permit requires that all information provided to the Water Boards by the Discharger comply with the Homeland Security Act and other federal law that addresses security in the United States.

   All Dischargers who certify and submit PRDs via SMARTS for NOI coverage on or after July 1, 2015 or for NEC coverage on or after October 1, 2015, shall immediately comply with the provisions in this General Permit.

4. General Permit Coverage for Landfills

   This General Permit covers storm water discharges from landfills, land application sites, and open dumps that receive or have received industrial waste from any

facility covered by this General Permit. Industrial storm water discharges from these facilities must be covered by this General Permit unless (1) they are already covered by another NPDES permit, or (2) the Regional Water Board has determined that an NPDES permit is not required because the site has been stabilized or required closure activities have been completed.

In most cases, it is appropriate for new landfill construction or final closure to be covered by the Construction General Permit, rather than this General Permit. Questions have arisen as to what constitutes new landfill construction at an existing landfill versus the normal planned expansion of a landfill. Similarly, questions have arisen about the type of closure activities that may be subject to the Construction General Permit versus the normal closure of "cells" that occurs during continued landfill operations and are not subject to the Construction General Permit. Other questions such as whether temporary or permanent newly graded/paved roads disturbing greater than one acre at a landfill are subject to the Construction General Permit. Landfill Dischargers have asked for clarity regarding these questions. The previous permit required Dischargers to contact the Regional Water Boards to determine permit appropriateness. Site specific circumstances continue to require Dischargers to contact Regional Water Boards for final determinations.

Based upon the State Water Board's storm water program history, there are only a handful of instances where an operating landfill has been simultaneously subject to both the construction and industrial permitting requirements. Typically a landfill is subject to the construction permitting requirements during the time the landfill is initially constructed and prior to operation. A landfill is subject to the industrial permitting requirements during landfill operations, and subject to the construction permitting requirements during final landfill closure activities.

Once a landfill begins operations, continued expansion or closure of incremental landfill cells is authorized under the industrial permitting requirements since these are normal aspects of landfill operations. These expansion/closure activities occur within a limited timeframe (often taking less than 90 days from beginning to end) and are not separately subject to additional local approval (e.g., a new building permit). Any construction or demolition of temporary non-impervious roads directly related to landfill operations are subject to the industrial permitting requirements.

Construction or closure of a separate section of the landfill that is either subject to additional permitting by the local authorities and/or lasts more than 90 days requires coverage under the Construction General Permit. Construction of permanent facility structures such as buildings and impervious parking lots or roads that disturb greater than one acre are also subject to the Construction General Permit. (Permanent facility structures are defined as any structural improvements designed to remain until the landfill is closed.)

Site specific circumstances such as proximity to nearby waterways, extent of activities, pollutants of concern, and other considerations can impact any decision as to whether a particular activity is to be regulated under this General Permit or the Construction General Permit. Regional Water Boards will continue to exercise their discretion as necessary to protect the beneficial uses of the receiving water(s).

5. General Permit Coverage for Small Municipal Separate Storm Sewer Systems (MS4s)

   Section 1068 of the Intermodal Surface Transportation Efficiency Act of 1991 exempted municipal agencies serving populations of less than 100,000 from Phase I permit requirements other than sanitary landfills, power plants, and airports facilities. U.S. EPA's Phase II regulations eliminated the above exemption as of March 10, 2003. All facilities in Attachment A of this General Permit that are operated by a small municipal agency are subject to NPDES storm water permitting requirements and this General Permit.

6. Changes to General Permit Coverage

   Dischargers who no longer operate a facility required to be covered under this General Permit (either NOI or NEC coverage) are required to electronically certify and submit via SMARTS a Notice of Termination (NOT). An NOT is required when there is a change in ownership of the industrial activities subject to permitting or when industrial activities subject to permitting are permanently discontinued by the Discharger at the site. When terminating NOI coverage, Dischargers may only submit an NOT once all exposure of industrial materials and equipment have been eliminated. Dischargers may not submit NOTs for temporary or seasonal facility closures. The General Permit requires Dischargers to implement appropriate BMPs to reduce or prevent pollutants in storm water discharges during the temporary facility closure.

   This General Permit allows Dischargers to change General Permit coverage, as appropriate, from NOI coverage to NEC coverage or from NEC coverage to NOI coverage.

B. Discharge Prohibitions

This General Permit covers industrial storm water discharges and authorized NSWDs from industrial facilities and prohibits any discharge of materials other than storm water and authorized NSWDs (Section III and Section IV of this General Permit). It is a violation of this General Permit to discharge hazardous substances in storm water in excess of the reportable quantities established in 40 Code of Federal Regulations sections 117.3 and 302.4.

The State Water Board is authorized, under Water Code section 13377, to issue NPDES permits which apply and ensure compliance with all applicable provisions of the CWA, and any more stringent limitations necessary to implement water quality control plans, protect beneficial uses, and prevent nuisance.

C. Non-Storm Water Discharges (NSWDs)

Unauthorized NSWDs can be generated from various pollutant sources. Depending upon their quantity and location where generated, unauthorized NSWDs can discharge to the storm drain system during dry weather as well as during a storm event (comingled with storm water discharge). These NSWDs can consist of, but are not limited to; (1) waters generated by the rinsing or washing of vehicles, equipment,

buildings, or pavement, or (2) fluid, particulate or solid materials that have spilled, leaked, or been disposed of improperly.

Some NSWDs are not directly related to industrial activities and normally discharge minimal pollutants when properly managed. Section IV of this General Permit provides a limited list of NSWDs that are authorized if Dischargers implement BMPs to prevent contact with industrial materials prior to discharge. The list in Section IV is similar to the list provided in the 2008 MSGP but does not include pavement and external building surfaces washing without detergents. These two items are not included because the Discharger is responsible to reduce or prevent pollutants in storm water discharges from paved areas and buildings associated with industrial activities. Since industrial materials and non-industrial material likely co-exist, the washing of paved areas and external building surfaces may result in discharges of pollutants associated with industrial activities. In addition, washing activities generally occur during dry-weather periods when receiving water flows are lower than wet-weather periods. Wash waters are likely to discharge in higher concentrations than would occur if these pollutants were naturally discharged during a storm event. The discharge of high concentration wash water during a time of dry-weather flows is inconsistent with the goal of protecting receiving waters. These discharges are, therefore, considered unauthorized NSWDs. Similar to the 2008 MSGP, firefighting related discharges are not subject to this General Permit.

A major required element of the SWPPP is the identification and measures for elimination of unauthorized NSWDs. Unauthorized NSWDs can contribute a significant pollutant load to receiving waters. Measures to control spills, leakage, and dumping can often be addressed through BMPs. This General Permit's BMP requirements for NSWDs remain essentially unchanged from the previous permit other than the increased frequency of required visual observations from quarterly to monthly. See Section XI.A.1 of this General Permit.

D. Effluent Limitations

1. Technology-Based and Water Quality-Based Effluent Limitations

   CWA Section 301(b)(1)(C) requires that discharges from existing facilities must, at a minimum, comply with technology-based effluent limitations based on the technological capability of Dischargers to control pollutants in their discharges. Discharges must also comply with any more stringent water quality-based limitations necessary to meet water quality standards in accordance with CWA Section 301(b)(1)(C). Water quality-based limitations are discussed in Section E of this Fact Sheet titled "Receiving Water Limitations." Both technology-based effluent limitations and water quality-based limitations are implemented through NPDES permits. (CWA sections 301(a) and (b).)

2. Types of Technology-Based Effluent Limitations

   All NPDES permits are required to contain technology-based effluent limitations (TBELs). (40 C.F.R. §§122.44(a)(1) and 125.3.) TBELs may consist of effluent limitations guidelines (ELGs) established by U.S. EPA through regulation, or may be developed using best professional judgment on a case-by-case basis.

The CWA sets forth standards for TBELs based on the type of pollutant or the type of facility/source involved. The CWA establishes two levels of pollution control for existing sources. For the first level, existing sources that discharge pollutants directly to receiving waters were initially subject to effluent limitations based on the "best practicable control technology currently available" (BPT). (33 U.S.C. § 1314(b)(1)(B).) BPT applies to all pollutants. For the second level, existing sources that discharge conventional pollutants are subject to effluent limitations based on the "best conventional pollutant control technology" (BCT). (33 U.S.C. §1314(b)(4)(A); see also 40 C.F.R. §401.16 (list of conventional pollutants).) Also for the second level, other existing sources that discharge toxic pollutants or "nonconventional" pollutants ("nonconventional" pollutants are pollutants that are neither "toxic" nor "conventional") are subject to effluent limitations based on "best available technology economically achievable" (BAT). (33 U.S.C. §1311(b)(2)(A); see also 40 C.F.R. §401.15 (list of toxic pollutants).) The factors to be considered in establishing the levels of these control technologies are specified in section 304(b) of the CWA and in U.S. EPA's regulations at 40 C.F.R. §125.3.

When establishing ELGs for an industrial category, U.S. EPA evaluates a wide variety of technical factors to determine BPT, BCT, and BAT. U.S. EPA considers the specific factors of an industry such as pollutant sources, industrial processes, and the size and scale of operations. U.S. EPA evaluates the specific treatment, structural, and operational source control BMPs available to reduce or prevent pollutants in the discharges. The costs of implementing BMPs to address these factors are weighed against their effectiveness and ability to protect water quality. Factors such as industry economic viability, economies of scale, and retrofit costs are also considered.

To date, U.S. EPA has: (1) not promulgated storm water ELGs for most industrial categories, (2) not established NELs within all ELGs that have been promulgated, and (3) exempted certain types of facilities within an industrial category from complying with established ELGs. The feedlot category (40 Code of Federal Regulations part 412) provides an example of several of these points. In that instance, U.S. EPA did not establish numeric effluent limitations but instead: (1) established a narrative effluent limitation requiring retention of all feedlot-related runoff from a 25-year, 24-hour storm, and (2) limited application of the ELG to feedlots with a minimum number of animals. U.S. EPA also recently promulgated ELGs for the "Construction and Development (C&D)" industry, which included, among many other limitations, conditional numeric effluent limitations. Though the NELs in these ELGs were later stayed by U.S. EPA, the ELGs exempted construction sites of less than 30 acres from complying with the established numeric effluent limitations.

40 Code of Federal Regulations, Chapter I, Subchapter N ("Subchapter N"), includes over 40 separate industrial categories where the U.S. EPA has established ELGs for new and existing industrial wastewater discharges to surface waters, discharges to publicly owned treatment works (pre-treatment standards), and storm water discharges to surface waters. Generally, U.S. EPA has focused its efforts on the development of ELGs for larger industries and those industries with the greatest

potential to pollute. In total, the 40 categories for which ELGs have been established (not including construction) represent less than 10 percent of the types of facilities subject to this General Permit. Additionally, most ELGs focus on industrial process wastewater discharges and pre-treatment standards, and only 11 of the 40 categories establish numeric or narrative ELGs for industrial storm water discharges. Those that do include ELGs for industrial storm water discharges generally address storm water discharges that are generated from direct contact with primary pollutant sources at the subject facilities, and not the totality of the industrial storm water discharge from the facility, as the term "storm water discharge associated with industrial activity" for this General Order is defined in the CWA. (40 C.F.R. § 122.26(b)(14).) Where U.S. EPA has not issued effluent limitation guidelines for an industry, the State Water Board is required to establish effluent limitations for NPDES permits on a case-by-case basis based on best professional judgment (BPJ). (33 U.S.C. § 1342(a)(1); 40 C.F.R. § 125.3(c)(2).) In this General Permit, most of the TBELs are based on BPJ decision-making because no ELG applies.

The TBELs in this General Permit represent the BPT (for conventional, toxic, and non-conventional pollutants), BCT (for conventional pollutants), and BAT (for toxic pollutants and non-conventional pollutants) levels of control for the applicable pollutants. If U.S. EPA has not promulgated ELGs for an industry, or if a Discharger is discharging a pollutant not covered by the otherwise applicable ELG, the State Water Board is required to establish effluent limitations in NPDES permit limitations based on best professional judgment . (33 U.S.C. § 1342(a)(1); 40 C.F.R. 125.3(c).) This General Permit includes TBELS established on best professional judgment and limitations based on storm water-specific ELGs listed in Attachment F of this General Permit, where applicable.

3. Authority to Include Non-Numeric Technology-Based Limits in NPDES Permits

TBELs in this General Permit are based on best professional judgment and are non-numeric ("narrative") technology-based effluent limitations expressed as requirements for implementation of effective BMPs. Federal regulations provide that permits must include BMPs to control or abate the discharge of pollutants when where "[n]umeric effluent limitations are infeasible." 40 C.F.R. 122.44(k)(3).

Since 1977, courts have recognized that there are circumstances when numeric effluent limitations are infeasible and have held that EPA may issue permits with conditions (e.g., BMPs) designed to reduce the level of effluent discharges to acceptable levels. Natural Res. Def. Council, Inc. v. Costle, 568 F.2d 1369 (D.C.Cir.1977).

U.S. EPA has also interpreted the CWA to allow BMPs to take the place of numeric effluent limitations under certain circumstances. 40 C.F.R. §122.44(k), titled "Establishing limitations, standards, and other permit conditions (applicable to State NPDES programs ...)," provides that permits may include BMPs to control or abate the discharge of pollutants when: (1) "[a]uthorized under section 402(p) of the CWA for the control of stormwater discharges"; or (2) "[n]umeric effluent limitations are infeasible." 40 C.F.R. § 122.44(k).

In 2006, The U.S. Court of Appeals for the Sixth Circuit held that the CWA does not require U.S. EPA to set numeric limits where such limits are infeasible. (Citizens Coal Council v. United States Environmental Protection Agency, 447 F.3d 879, 895-96 (6th Cir. 2006)). The Citizens Coal court cited to the statement in Waterkeeper Alliance, Inc. v. EPA, 399 F.3d 486, 502 (2d Cir. 2005) that "site-specific BMPs are effluent limitations under the CWA" in concluding that "the EPA's inclusion of numeric and non-numeric limitations in the guideline for the coal remining subcategory was a reasonable exercise of its authority under the CWA." (447 F.3d at 896.) Additionally, the Citizen's Coal court cited to Natural Res. Def. Council, Inc. v. EPA, 673 F.2d 400, 403 (D.C.Cir.1982) noting that "section 502(11) [of the CWA] defines 'effluent limitation' as 'any restriction' on the amounts of pollutants discharged, not just a numerical restriction." NPDES permit writers have substantial discretion to impose non-quantitative permit requirements pursuant to section 402(a)(1)), especially when the use of numeric limits is infeasible. (NRDC v. EPA, 822 F.2d 104, 122-24 (D.C. Cir. 1987); 40 C.F.R. 122.44(k)(3).)

4. Decision to Include Non-Numeric Technology-Based Effluent Limits in This General Permit

   It is infeasible for the State Water Board to develop numeric effluent limitations using the best professional judgment approach due to lack of sufficient information. Previous versions of this General Permit required Dischargers to sample their industrial storm water discharges and report the results to the Regional Water Boards. Dischargers were not required to submit this data online into a statewide database; as a result, much of this data is not available for analysis. Moreover, much of the data that are available for analysis are not of sufficient quality to make conclusions or perform basic statistical tests.

   The Blue Ribbon Panel of Experts, State Water Board staff, and many stakeholders evaluated the available storm water data set and concluded that the information provides limited value due to the limited pool of industrial facilities submitting data, poor overall data quality, and extreme variance within the dataset, as described below.

   The poor quality of the existing data set is attributable a number of factors. For example, the previous permits have required Dischargers to sample during the first hour of discharge from two storm events a year. This sampling schedule was designed to catch what was considered to represent the higher end of storm water discharge concentrations for most parameters. The results from this type of sampling were thought to be an indicator of whether or not additional BMPs would be necessary. The sampling schedule was not designed, however, to estimate pollutant discharge loading, or to characterize the impact of the discharge on the receiving water. Doing so would normally require the use of more advanced sampling protocols such as flow meters, continuous automatic sampling devices, certified/trained sampling personnel, and other facility-specific considerations.

   Furthermore, there is currently no data which details the relationship between the BMPs implemented at each facility and the facility's sampling results. The SWPPPs

required by the previous permits were not submitted to the Water Boards, but were kept onsite by Dischargers. Due to the limited availability of quality sampling data and "level of effort" information contained in SWPPPs, the State Water Board is unable to exercise best professional judgment to make the connection between effluent quality (sampling results) and the level of effort, costs, and performance of the various technologies that is needed in order to express the TBELs in this General Permit numerically, as NELs.

Some stakeholders have suggested that separating the data sets by industry type would lead to more reliable data with which to develop NELs. Advocates of this approach suggest that the variability of the data may be caused in part by the mixing of data from different industrial categories. The State Water Board believes that the variation is primarily due to storm intensity, duration, time of year, soil saturation or some other factors. It is necessary to collect information related to those factors and BMPs implemented in order to evaluate the variability attributable to those factors. There is currently too large of an information gap to begin the process of developing NELs for all industrial sectors not currently subject to ELGs.

The State Water Board has proposed NELs in past drafts of this General Permit. In comments, many stakeholders have highlighted the difficulty of developing statewide NELs that are applicable to all industry sectors, or even NELs that cover any specific industry sectors. For example, stakeholders have commented that:

a. Background/ambient conditions in some hydrogeologic zones may contribute pollutant loadings that would significantly contribute to, if not exceed, the NEL values;

b. Some advanced treatment technologies have flow/volume limitations as well as economy of scale issues for smaller facilities;

c. Treatment technologies that require that sheet flows be captured and conveyed via discrete channels or basins may not only result in significant retrofit costs, but may conflict with local ordinances that prohibit such practices, as they can cause damage or erosion to down gradient property owners, or cause other environmental problems;

d. There is insufficient regulatory guidance and procedures to allow permit writers to properly specify monitoring frequency and sampling protocols (e.g., instantaneous maximum, 1-day average, 3-day average, etc.), and for Dischargers to obtain representative samples to compare to NELs for the purpose of strict compliance; and,

e. NELs must be developed with consideration of what is economically achievable for each industrial sector. These stakeholders point out that the U.S. EPA goes to great lengths evaluating the various BMP technologies available for a particular pollutant, the costs and efficiency of each BMP, and the applicability of the BMPs to the industry as a whole or to a limited number of industrial sites based upon the size of the facility, the quantity of material, and other considerations.

The State Water Board does not have the information (including monitoring data, industry specific information, BMP performance analyses, water quality information, monitoring guidelines, and information on costs and overall effectiveness of control technologies) necessary to promulgate NELs at the time of adoption of this General Permit. Therefore, it is infeasible to include NELs in this statewide General Permit.

Many of the new requirements in this General Permit have been designed to address the shortcomings of previous permits and the existing storm water data set. Under this General Permit, sampling results must be certified and submitted into SMARTS by Dischargers, along with SWPPPs which outline the technologies and BMPs used to control pollutants at each facility. The ERA process will also collect information on costs and the engineering aspects of the various control technologies employed by each facility. Previous permit versions did not have a mechanism for receiving this site specific information electronically, and only a small percentage of Dischargers submitted their Annual Reports via SMARTS. This General Permit will make this information more accessible, allowing the Water Boards to evaluate the relationship between BMPs and the ability of facilities to meet the NALs set forth in this General Permit. Finally, the new Qualified Industrial Storm Water Practitioner (QISP) training requirements of this General Permit have been designed in part to improve the quality of the data submitted.

5. Narrative Technology-Based Effluent Limitations (TBELs) and Best Management Practices (BMPs)

   The primary TBEL in this General Permit requires Dischargers to "implement BMPs that comply with the BAT/BCT requirements of this General Permit to reduce or prevent discharges of pollutants in their storm water discharge in a manner that reflects best industry practice considering technological availability and economic practicability and achievability." (Section V.A of this General Permit). This TBEL is a restatement of the BAT/BCT standard, as articulated by U.S. EPA in the 2008 MSGP and accompanying Fact Sheet. In order to comply with this TBEL, Dischargers must implement BMPs that meet or exceed the BAT/BCT technology-based standard. The requirement to "reduce or prevent" is equivalent to the requirement in the federal regulations that BMPs be used in lieu of NELs to "control or abate" the discharge of pollutants. (40 C.F.R. § 122.44(k).)

   BMPs are defined as the "scheduling of activities, prohibitions of practices, maintenance procedures, and other management practices to reduce or prevent the discharge of pollutants… includ[ing] treatment requirements, operating procedures, and practices to control site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage." (40 C.F.R. § 122.2.)

   This General Permit (Sections X.H.1 and X.H.2) requires all Dischargers to implement minimum BMPs, as well as any advanced BMPs that are necessary to adequately reduce or prevent pollutants in discharges consistent with the TBELs. The minimum BMPs specified in this General Permit represent common practices that can be implemented by most facilities. This General Permit generally does not mandate the specific mode of design, installation or implementation for the minimum

BMPs at a Discharger's facility. It is up to the Discharger, in the first instance, to determine what must be done to meet the applicable effluent limits. For example, Section X.H.1.a.vi of this General Permit requires Dischargers to contain all stored non-solid industrial materials that can be transported or dispersed via wind or contact with storm water. How this is achieved will vary by facility: for some facilities, all activities may be moved indoors, while for others this will not be feasible. However, even for the latter, many activities may be moved indoors, others may be contained using tarps or a containment system, while still other activities may be limited to times when exposure to precipitation is not likely. Each of these control measures is acceptable and appropriate depending upon the facility-specific circumstances.

BMPs can be actions (including processes, procedures, schedules of activities, prohibitions on practices and other management practices), or structural or installed devices to reduce or prevent water pollution. (40 C.F.R. § 122.2.) They can be just about anything that is effective at preventing pollutants from entering the environment, and for meeting applicable limits of this General Permit. In this General Permit, Dischargers are required to select, design, install, and implement facility-specific control measures to meet these limits. Many industrial facilities already have such control measures in place for product loss prevention, accident and fire prevention, worker health and safety or to comply with other environmental regulations. Dischargers must tailor the BMPs detailed in this General Permit to their facilities, as well as improve upon them as necessary to meet permit limits. The examples detailed in this Fact Sheet emphasize prevention over treatment. However, sometimes more traditional end-of-pipe treatment may be necessary, particularly where a facility might otherwise cause or contribute to an exceedance of water quality standards.

This General Permit requires Dischargers to implement BMPs "to the extent feasible." Consistent with the control level requirements of the CWA, for the purposes of this General Permit, the requirement to implement BMPs "to the extent feasible" means to reduce and/or prevent discharges of pollutants using BMPs that represent BAT and BPT in light of best industry practice.[4] In other words, Dischargers are required to select, design, install and implement BMPs that reduce or prevent discharges of pollutants in their storm water discharge in a manner that reflects best industry practice considering their technological availability and economic practicability and achievability.

To determine technological availability and economic practicability and achievability, Dischargers need to consider what control measures are considered "best" for their industry, and then select and design control measures for their site that are viable in terms of cost and technology. The State Water Board believes that for many facilities minimization of pollutants in storm water discharges can be achieved without using highly engineered, complex treatment systems. The BMPs included in

[4] Because toxic and nonconventional pollutants are controlled in the first step by BPT and in the second step by BAT, and the second level of control is "increasingly stringent" (EPA v. National Crushed Stone, 449 U.S. 64, 69 (1980), for simplicity of discussion, the rest of this discussion will focus on BAT. Similarly, because the BAT levels of control in this General Permit are expressed as BMPs and pollution prevention measures, they will also control conventional pollutants. Therefore this discussion will focus on BAT rather than BCT or BPT for conventional pollutants.

this General Permit emphasize effective “low-tech” controls, such as regular cleaning of outdoor areas where industrial activities may take place, proper maintenance of equipment, diversion of storm water around areas where pollutants may be picked up, and effective advanced planning and training (e.g., for spill prevention and response).

E. Receiving Water Limitations and Water Quality Standards

Pursuant to CWA section 301(b)(1)(C) and Water Code section 13377, this General Permit requires compliance with receiving water limitations based on water quality standards. The primary receiving water limitation requires that industrial storm water discharges not cause or contribute to an exceedance of applicable water quality standards. Implementation of the BMPs as required by the technology-based effluent limitation in Section V of this General Permit will typically result in compliance with the receiving water limitations. The discussion of BMPs in this General Permit generally focuses on requiring implementation of BMPs to the extent necessary to achieve compliance with the technology-based effluent limitations, because the technology-based limitations apply similarly to all facilities. In addition, however, this General Permit also makes it clear that, if any individual facility's storm water discharge causes or contributes to an exceedance of a water quality standard, that Discharger must implement additional BMPs or other control measures that are tailored to that facility in order to attain compliance with the receiving water limitation. A Discharger that is notified by a Regional Water Board or who determines the discharge is causing or contributing to an exceedance of a water quality standard must comply with the Water Quality Based Corrective Actions found in Section XX.B of this General Permit.

Water Quality Based Corrective Actions are different from the Level 1 and Level 2 ERAs that result from effluent-based monitoring. It is possible for a Discharger to be engaged in Level 1 or Level 2 ERAs for one or more pollutants and simultaneously be required to perform Water Quality Based Corrective Actions for one or more other pollutants.

Failure to comply with these additional Water Quality Based Corrective Action requirements is a violation of this General Permit. If additional operational source control measures do not adequately reduce the pollutants, Dischargers must implement additional measures such as the construction of treatment systems and/or overhead coverage. Overhead coverage is any structure or temporary shelter that prevents the vertical contact of precipitation with industrial materials or activities. If the Regional Water Board determines that the Discharger’s selected BMPs are inadequate, the Regional Water Board may require implementation of additional BMPs and/or may take enforcement against Dischargers for failure to comply with this General Permit.

F. Total Maximum Daily Loads (TMDLs)

TMDLs are regulatory tools that provide the maximum amount of a pollutant from potential source in the watershed that a water body can receive while attaining water quality standards. A TMDL is defined as the sum of the allowable loads of a single pollutant from all contributing point sources (the waste load allocations) and non-point sources (load allocations), plus the contribution from background sources. (40 C.F.R. § 130.2, subd. (i).) Discharges covered by this General Permit are considered to be point

source discharges, and therefore must comply with effluent limitations that are "consistent with the assumptions and requirements of any available waste load allocation for the discharge prepared by the State and approved by EPA pursuant to 40 Code of Federal Regulations section 130.7." (40 C.F.R. § 122.44, subd. (d)(1)(vii).) In addition, Water Code section 13263, subdivision (a), requires that waste discharge requirements implement relevant water quality control plans. Many TMDLs in existing water quality control plans include both waste load allocations and implementation requirements. Attachment E of this General Permit lists the watersheds with U.S. EPA-approved and U.S. EPA-established TMDLs that include TMDL requirements for Dischargers covered by this General Permit.

NPDES-regulated storm water discharges (which include industrial storm water) must be addressed by waste load allocations in TMDLs. (40 C.F.R. § 130.2(h).) NPDES permits must contain effluent limits and conditions consistent with the requirements and assumptions of the waste load allocations in TMDLs. (40 C.F.R. § 122.44(d)(1)(vii)(B).) To date, the relevant waste load allocations assigned to industrial storm water discharges are not directly translatable to effluent limitations. Many of the TMDLs lack sufficient facility specific information, discharge characterization data, implementation requirements, and compliance monitoring requirements. Accordingly, an analysis of each TMDL applicable to industrial storm water discharges must to be performed to determine if it is appropriate to translate the waste load allocation into a numeric effluent limit, or if the effluent limit is to be expressed narratively using a BMP approach. U.S. EPA recognizes that because storm water discharges are highly variable in frequency and duration and are not easily characterized, it is often not feasible or appropriate to establish numeric limits. Variability and the lack of data available make it difficult to determine with precision or certainty actual and projected loadings for individual Dischargers or groups of Dischargers.

Regardless of whether the effluent limit is to be numeric or narrative, the existing waste load allocations must be carefully analyzed, and in many cases translated, to determine the appropriate effluent limitations. Issues of interpretation exist with all of the waste load allocations applicable to Dischargers, and these issues vary based on the TMDL. Below is an example of one of the simpler issues:

FIGURE 1: Example Waste Load Allocations Proposed Translation: Ballona Creek Estuary – Toxic Pollutants

Metals per Acre Waste Load Allocations for Individual General Construction or Industrial Storm Water Permittees (grams/year/acre)				
Cadmium	Copper	Lead	Silver	Zinc
0.1	3	4	0.1	13
Metals per Acre Waste Load Allocations for Individual General Construction or Industrial Storm Water Permittees (milligrams/year/acre)				
Chlordane	DDTs	Total Polychlorinated biphenyl (PCBs)	Total Polycyclic aromatic hydrocarbons (PAHs)	
0.04	0.14	2	350	

In order for the above waste load allocations to effectively be implemented as effluent limits under the General Permit, the Water Boards must (1) identify which discharges the waste load allocations apply to, (2) identify the acreages of the individual facilities, (3) convert the waste load allocations from grams/year/acre (or milligrams/year/acre) to grams/year (or milligrams/year) based on the acreage at each identified facility, (4) assign the effluent limits to the identified Dischargers, (5) determine appropriate monitoring to assess compliance with the effluent limits, and (6) develop a tracking mechanism for each identified facility and their individual effluent limits. A similar stepwise process is necessary for each TMDL with waste load allocations assigned to industrial storm water discharges. For TMDLs where effluent limits will be expressed as BMPs, analysis must to be performed to determine the appropriate BMPs and the corresponding effectiveness to comply with the assigned waste load allocations.

Some waste load allocations are already expressed as concentration based numbers. It may appear simple to incorporate these values into this General Permit as effluent limits, but the questions still remain regarding how to determine compliance. The monitoring requirements in this General Permit are not designed to measure compliance with a numeric effluent limit or to measure the effect of a discharge on a receiving water body. (See the discussion on monitoring requirements in Fact Sheet Section II.J.) This General Permit requires sampling of four (4) storm events a year, with certain limitations as to when a discharge may be sampled. This method of monitoring may not appropriately serve as TMDL compliance sampling since grab samples are only representative of the particular moment in time when the sample was taken. Since storm water is highly variable, four grab samples per year may not provide sufficient confidence that the effluent limit is being met. An alternative monitoring scheme may be necessary to determine the facility's impact on the receiving water and to determine compliance with any assigned effluent limits. Questions concerning whether sampling results should be grab samples, composite samples, flow-weighted averaged over all drainage areas, etc. cannot be determined for each concentration-based TMDL without a more thorough analysis.

Additionally, monitoring and assessment requirements must be developed for all of the TMDLs to determine compliance with or progress towards meeting TMDL requirements. The proposed monitoring requirements in this General Permit are not designed to assess pollutant loading or determine compliance with TMDL-specific effluent limits.

Due to the large number and variety of discharges subject to a wide range of TMDLs statewide, to prevent a severe delay in the adoption of this General Permit, TMDL-specific permit requirements for the TMDLs listed in Attachment E will be proposed by the Regional Water Boards. Since the waste load allocations and/or implementation requirements apply to multiple discharges in the region(s) the TMDL were developed, the development of TMDL-specific permit requirements is best coordinated at the Regional Water Board level. The development of TMDL-specific permit requirements is subject to notice and a public comment period prior to incorporation into this General Permit.

Regional Water Board staff, with the assistance of State Water Board staff, will develop and submit the proposed TMDL-specific permit requirements for each of the TMDLs

listed in Attachment E by July 1, 2016.[5] After conducting a 30-day public comment period, the Regional Water Boards will propose TMDL-specific permit requirements to the State Water Board for adoption into this General Permit. The Regional Water Boards may also include TMDL-specific monitoring requirements for inclusion in this General Permit, or may issue Regional Water Board orders pursuant to Water Code section 13383 requiring TMDL-specific monitoring. The Regional Water Boards or their Executive Officers may complete these tasks, and the proposed TMDL-specific permit requirements shall have no force or effect until adopted, with or without modification, by the State Water Board. Unless directed to do so by the Regional Water Board, Dischargers are not required to take any additional actions to comply with the TMDLs listed in Attachment E until the State Water Board reopens this General Permit and includes TMDL-specific permit requirements. This approach is consistent with the 2008 MSGP. TMDL-specific permit requirements are not limited by the BAT/BCT technology-based standards.

The Regional Water Boards will submit to the State Water Board the following information for each of the TMDLs listed in Attachment E:

- Proposed TMDL-specific permit requirements, including any applicable effluent limitations, implementation timelines, additional monitoring requirements, reporting requirements, an explanation of how an exceedance of an effluent limitation or a violation of the TMDL will be determined, and required deliverables consistent with the TMDL(s);
- An explanation of how the proposed TMDL-specific permit requirements, timelines, and deliverables are consistent with the assumptions and requirements of applicable waste load allocation(s) to implement the TMDL(s);
- Where a BMP-based approach is proposed, an explanation of how the proposed BMPs will be sufficient to implement applicable waste load allocations; and
- Where concentration-based monitoring is required, an explanation of how the required monitoring, reporting and calculation methodology for an exceedance of an effluent limitation or a violation of the TMDL(s) will be sufficient to demonstrate compliance with the TMDL(s).

Upon receipt of the information described above, the State Water Board will conduct a public comment period and reopen this General Permit to populate Attachment E, the Fact Sheet, and other provisions as necessary in order to incorporate these TMDL-specific permit requirements into this General Permit. Attachment E may also be reopened during the term of this General Permit to add additional TMDLs and corresponding implementation requirements.

This General Permit (Section X.G.2.a.ix) requires a Discharger to identify any additional industrial parameters that may be discharged to a waterbody with a 303(d) impairment identified in Appendix 3 as likely to be associated with industrial storm water. Dischargers may need to implement additional monitoring for any applicable parameters (Section XI.B.6.e). Appendix 3 of this General Permit includes the water bodies with 303(d) impairments or TMDLs for pollutants that are likely to be associated with

[5] Due to the workload associated with the implementation of this General Permit (e.g., training program development, NEC outreach, electronic enrollment and reporting via SMARTS) it is believed that two years in necessary for Staff to complete a comprehensive analysis and stakeholder process for TMDLS applicable to Dischargers under this General Permit.

industrial storm water in black font, and those that are not likely to be associated with industrial storm water in red font. This determination is based on the pollutant or pollutants that are causing each impairment, and the State Water Board's general experience regarding the types of pollutants that are typically found in industrial storm water discharges. The list of waterbodies is from the State Water Boards statewide 2010 Integrated CWA Section 303(d) List / Section 305(b) Report.

Some of the water bodies with 303(d) impairments or TMDLs listed in Appendix 3 of this General Permit are not applicable to Dischargers covered under this General Permit. Appendix 3 indicates these water bodies Dischargers are not required to include in their pollutant source assessment (unless directed to do so by the Regional Water Board).

G. Discharges Subject to the California Ocean Plan

1. Discharges to Ocean Waters

   On October 16, 2012 the State Water Board amended the California Ocean Plan (California Ocean Plan) to require industrial storm water Dischargers with outfalls discharging to ocean waters to comply with the California Ocean Plan's model monitoring provisions. The amended California Ocean Plan requires industrial storm water dischargers with outfalls discharging to ocean waters to comply with the California Ocean Plan's model monitoring provisions. These provisions require Dischargers to: (a) monitor runoff for specific parameters at all outfalls from two storm events per year, and collect at least one representative receiving water sample per year, (b) conduct specified toxicity monitoring at certain types of outfalls at a minimum of once per year, and (c) conduct marine sediment monitoring for toxicity under specific circumstances (California Ocean Plan, Appendix III). The California Ocean Plan provides conditions under which some of the above monitoring provisions may be waived by the Water Boards.

   This General Permit requires dischargers with outfalls that discharge to ocean waters to comply with the California Ocean Plan's model monitoring provisions and any additional monitoring requirements established pursuant to Water Code section 13383. Dischargers who have not developed and implemented a monitoring program in compliance with the California Ocean Plan's model monitoring provisions by January 1, 2015 or seven (7) days prior to commencing operations, whichever is later, are ineligible to obtain coverage under this General Permit.

2. Areas of Special Biological Significance (ASBS) Exception

   The State Water Board adopted the California Ocean Plan (California Ocean Plan) in 1972, and has subsequently amended the Plan. The California Ocean Plan prohibits the discharge of waste to designated ASBS. ASBS are ocean areas designated by the State Water Board as requiring special protection through the maintenance of natural water quality. The California Ocean Plan states that the State Water Board may grant an exception to California Ocean Plan provisions where the State Water Board determines that the exception will not compromise protection of ocean waters for beneficial uses and the public interest will be served.

On March 20, 2012, the State Water Board adopted Resolution 2012-0012 (ASBS Exception), which grants an exception to the California Ocean Plan prohibition on discharges to ASBS for a limited number of industrial storm water Discharger applicants. The ASBS Exception contains "Special Protections" to maintain natural water quality and protect the beneficial uses of the ASBS. In order to legally discharge into an ASBS, these Dischargers must comply with the terms of the ASBS Exception and obtain coverage under this General Permit. This General Permit incorporates the terms of the ASBS Exception and includes the applicable monitoring requirements for all Dischargers discharging to an ASBS under the ASBS Exception.

H. Training Qualifications

This General Permit and the previous permit both require Dischargers to ensure that personnel responsible for permit compliance have an acceptable level of knowledge. Stakeholders have observed that the previous permit did not adequately specify how to comply with various elements of the permit, such as selecting discharge locations representative of the facility storm water discharge and evaluating potential pollutant sources, nor did it provide a clearly outlined Discharger training program. Guidance that is available from outside sources can be complicated to understand or costly to obtain, which can result in many Dischargers developing and implementing deficient SWPPPs and conducting inadequate monitoring activities. Some Dischargers under the previous permit had the resources to hire professional environmental staff or environmental consultants to assist in compliance. Even in those cases, however, there was little certainty that Dischargers received training regarding implementation of the various BMPs being implemented and required monitoring activities under the previous permit. Through this General Permit, the State Water Board seeks to improve compliance and monitoring data quality, and expand each Discharger's understanding of this General Permit's requirements.

This General Permit establishes the Qualified Industrial Storm Water Practitioner (QISP) role. A QISP is someone who has completed a State Water Board sponsored or approved QISP training course and has registered in SMARTS. A QISP is required to implement certain General Permit requirements at the facility once it has entered Level 1 status in the ERA process as described in Section XII of this General Permit. In some instances it may be advisable for a facility employee to take the training, or for a facility to hire a QISP prior to entering Level 1 status as the training will contain information on the new permit requirements and how to perform certain tasks such as selecting discharge locations representative of the facility storm water discharge, evaluating potential pollutant sources, and identifying inadequate SWPPP elements.

Some industry stakeholders have claimed that their staff is already adequately trained. These employees may continue to perform the basic permit functions (e.g. prepare SWPPPs, perform monitoring requirements, and prepare Annual Reports) without receiving any additional training if the facility's sampling and analysis results do not exceed the NALs. This requirement is structured in a manner to reduce the costs of compliance for facilities that may not negatively impact receiving water quality.

California licensed professional civil, industrial, chemical, and mechanical engineers and geologists have licenses that have professional overlap with the topics of this General Permit. The California Department of Consumer Affairs, Board for Professional Engineers, Land Surveyors and Geologists (CBPELSG) provides the licensure and regulation of professional civil, industrial, chemical, and mechanical engineers and professional geologists in California. The State Water Board is developing a specialized self-guided State Water Board-sponsored registration and training program specifically for these CPBELSG licensed engineers and geologists in good standing with CBPELSG. The CBPELSG has staff and resources dedicated to investigate and take appropriate enforcement actions in instances where a licensed professional engineer or geologist is alleged to be noncompliant with CBPELSG's laws and regulations. Actions that result in noncompliance with this General Permit may constitute a potential violation of the CBPELSG requirements and may subject a licensee to investigation by the CBPELSG.

A QISP may represent one or more facilities but must be able to perform the functions required by this General Permit at all times. It is advisable that this individual be limited to a specific geographic region due to the difficulty of performing the needed tasks before, during, and after qualifying storm events may be difficult or impossible if extensive travel is required. Dischargers are required to ensure that the designated QISP has completed the appropriate QISP training course.

This General Permit contains a mechanism that allows for the Water Boards' Executive Director or Executive Officer to rescind the registration of any QISPs who are found to be inadequately performing their duties as a QISP will no longer be able to do so. A QISP may ask the State Water Board to review any decision to revoke his or her QISP registration. Table 1 of this Fact Sheet below describes the different roles that the QISP and California licensed professional engineers have in this General Permit.

TABLE 1: Role-Specific Permit Requirements

Qualifications	Task
QISP	Level 1 ERA Evaluation and report, Level 2 ERA Action Plan, and Technical Report, and the Level 2 ERA extension
California licensed professional engineer	Inactive Mining Operation Certification, SWPPPs for inactive mining, and annual re-certification of Inactive Mining Operation Certification, NONA Technical Reports, and Subchapter N calculations

I. Storm Water Pollution Prevention Plan (SWPPP)

1. General

   This General Permit requires that all Dischargers develop, implement, and retain onsite a site-specific SWPPP. The SWPPP requirements generally follow U.S. EPA's five-phase approach to developing SWPPPs, which has been adapted to reflect the requirements of this General Permit in Figure 2 of this Fact Sheet. This approach provides the flexibility necessary to

establish appropriate BMPs for different industrial activities and pollutant sources. This General Permit requires a Discharger to include in its SWPPP (Section X of this General Permit) a site map, authorized NSWDs at the facility, and an identification and assessment of potential pollutants sources resulting from exposure of industrial activities to storm water.

This General Permit requires that Dischargers clearly describe the BMPs that are being implemented in the SWPPP. In addition to providing descriptions, Dischargers must also describe who is responsible for the BMPs, where the BMPs will be installed, how often and when the BMPs will be implemented, and identify any pollutants of concern. Table 2 of this Fact Sheet provides an example of how a Discharger could assess potential pollution sources and provide a corresponding BMPs summary.

This General Permit requires that Dischargers select an appropriate facility inspection frequency beyond the required monthly inspections if necessary, and to determine if SWPPP revisions are necessary to address any physical or operational changes at the facility or make changes to the existing BMPs (Section X.H.4.a.vii and Section XI.A.4 of this General Permit). Facilities that are subject to multi-phased physical expansion or significant seasonal operational changes may require more frequent SWPPP updates and facility inspections. Facilities with very stable operations may require fewer SWPPP updates and facility inspections.

Failure to develop or implement an adequate SWPPP, or update or revise an existing SWPPP as required, is a violation of this General Permit. Failure to maintain the SWPPP on-site and have it available for inspection is also a violation of this General Permit.

Dischargers are also required to submit their SWPPPs and any SWPPP revisions via SMARTS; accordingly, BMP revisions made in response to observed compliance problems will be included in the revised SWPPP electronically submitted via SMARTS.

DRAFT

FIGURE 2: Five Phases for Developing and Implementing an Industrial Storm Water Pollution Prevention Plan (SWPPP)

PLANNING AND ORGANIZATION

*Form Pollution Prevention Team
*Review other facility plans

ASSESSMENT

*Develop a site map
*Identify potential pollutant sources
*Inventory of materials and chemicals
*List significant spills and leaks
*Identify Non-Storm Water Discharges
*Assess pollutant risk

Best Management Practice (BMP) IDENTIFICATION

*Identify minimum required BMPs
*Identify any advanced BMPs

IMPLEMENTATION

*Train employees for the Pollution Prevention Team
*Implement BMPs
*Collect and review records

EVALUATION / MONITORING

*Conduct annual facility evaluation (Annual Evaluation)
*Review monitoring information
*Evaluate BMPs
*Review and revise SWPPP

DRAFT

TABLE 2: Example - Assessment of Potential Industrial Pollution Sources and Corresponding BMPs Summary

Area	Activity	Pollutant Source	Industrial Pollutant	BMPs
Vehicle and Equipment Fueling	Fueling	Spills and leaks during delivery	Fuel oil	-Use spill and overflow protection
		Spills caused by topping off fuel tanks	Fuel oil	-Train employees on proper fueling, cleanup, and spill response techniques
		Hosing or washing down fuel area	Fuel oil	-Use dry cleanup methods rather than hosing down area -Implement proper spill prevention control program
		Leaking storage tanks	Fuel oil	-Inspect fueling areas regularly to detect problems
		Rainfall running off fueling area, and rainfall running onto and off fueling area	Fuel oil	-Minimize run-on of storm water into the fueling area, cover fueling area

2. Minimum and Advanced BMPs

Section V of this General Permit requires the Discharger to comply with technology-based effluent limitations (TBELs). In this General Permit, TBELs rely on implementation of BMPs for Dischargers to reduce and prevent pollutants in their discharge. The BMP effluent limitations have been integrated into the Section X.H of this General Permit and are divided into two categories – minimum BMPs which are generally non-structural BMPs that all Dischargers must implement to the extent feasible, and advanced BMPs which are generally structural BMPs that must be implemented if the minimum BMPs are inadequate to achieve compliance with the TBELs. Section X of this General Permit includes both substantive control requirements in the form of the BMPs listed in Section X.H, as well as various reporting and recordkeeping requirements. The requirement to implement BMPs "to the extent feasible" allows Dischargers flexibility when implementing BMPs, by not requiring the implementation of BMPs that are not technologically available and economically practicable and achievable in light of best industry practices.

DRAFT

The 2008 MSGP requires Dischargers to comply with 12 non-numeric technology-based effluent limits in Section 2.1.2 of the permit through the implementation of "control measures." This requirement is an expansion of the general considerations outlined in the MSGP adopted in 2000. The control measures specified by the U.S. EPA in the 2008 MSGP are as follows (in order as listed in the 2008 MSGP):

1. Minimize Exposure
2. Good Housekeeping
3. Maintenance
4. Spill Prevention and Response Procedures
5. Erosion and Sediment Controls
6. Management of Runoff
7. Salt Storage Piles or Piles Containing Salt
8. Sector Specific Non-Numeric Effluent Limits
9. Employee Training
10. Non-Storm Water Discharges (NSWDs)
11. Waste, Garbage and Floatable Debris
12. Dust Generation and Vehicle Tracking of Industrial Materials

This General Permit addresses eleven of the above twelve control measures from the 2008 MSGP Section 2.1.2 Non-Numeric Technology-Based Effluent Limits (BPT/BAT/BCT). Eleven of the control measures are addressed as minimum BMPs that the State Water Board has determined to be most applicable to California's Dischargers. Two of those eleven control measures (1- Minimize Exposure, 6 – Management of Runoff) are also identified as advanced BMPs (Section X.H.2 of this General Permit). This General Permit is not a sector-specific permit and therefore does not contain limitations to address control measure number 8 (Sector Specific Non-Numeric Effluent Limits).

The non-structural elements of the control measure to minimize exposure are addressed in the minimum BMP Section X.H.1 of this General Permit while structural control elements are addressed in the advanced BMP Section X.H.2 of this General Permit. The on-site diversion elements of the control measure to minimize exposure are addressed as minimum BMPs.

The runoff reduction elements of the control measure to minimize exposure are included as advanced BMPs. Advanced BMPs that are required to be implemented when a Discharger has implemented the minimum BMPs to the extent feasible and they are not adequate to comply with the TBELs. The advanced BMP categories are: (1) exposure minimization BMPs, (2) storm water containment and discharge reduction BMPs, (3) treatment control BMPs, and (4) additional advanced BMPs needed to meet the effluent limitations of this General Permit. Advanced BMPs are generally structural control measures and can include any BMPs that exceed the minimum BMPs. The control measure for Non-Storm Water Discharges (NSWDs) is addressed in both the discharge prohibitions (Section III) and authorized non-storm water discharges (Section IV) of this General Permit and essentially represents a minimum BMP.

DRAFT

This General Permit encourages Dischargers to utilize BMPs that infiltrate or reuse storm water where feasible. The State Water Board expects that these types of BMPs will not be appropriate for all industrial facilities, but recognizes the many possible benefits (e.g. increased aquifer recharge, reduces flooding, improvements to water quality) associated with the infiltration and reuse of storm water. Encouraging the use of storm water infiltration and reuse BMPs is consistent with the statewide approach to managing storm water with lower impact methods.

The BMPs in this General Permit that coincide with the control measures in the 2008 MSGP are as follows (in order as listed in the 2008 MSGP):

a. Minimization of Exposure to Storm Water

Section 2.1.2.1 of the 2008 MSGP requires Dischargers to minimize the exposure of industrial materials and areas of industrial activity to rain, snow, snowmelt, and runoff. The 2008 MSGP mixes both structural and nonstructural BMPs and specifies particular BMPs to consider when minimizing exposure such as grading/berming areas to minimize runoff, locating materials indoors, spill clean up, contain vehicle fluid leaks or drain fluids before storing vehicles on-site, secondary containment of materials, conduct cleaning activities undercover, indoors or in bermed areas, and drain all wash water to a proper collection system.

This General Permit requires the evaluation of BMPs in the potential pollutant source assessment in the SWPPP (Section X.G.2). When the minimum BMPs are not adequate to comply with the TBELs, Dischargers are required to implement advanced BMPs (Section X.H.2.a). These advanced BMPs may include additional exposure minimization BMPs (Section X.H.2.b.1).

b. Good Housekeeping

Section 2.1.2.2 of the 2008 MSGP requires that Dischargers keep all exposed areas that may be a potential source of pollutants clean and orderly. This General Permit (Section X.H.1.a) seeks to define “clean and orderly” by specifying a required set of nine (9) minimum good housekeeping BMPs, which include: observations of outdoor/exposed areas, BMPs for controlling material tracking, BMPs for dust generated from industrial materials or activities, BMPs for rinse/wash water activities, covering stored industrial materials/waste, containing all stored non-solid industrial materials, preventing discharge of rinse/wash waters/industrial materials, prevent non-industrial area discharges from contact with industrial areas of the facility, and prevent authorized NSWDs from non-industrial areas from contact with industrial areas of the facility.

c. Preventative Maintenance

Section 2.1.2.3 of the 2008 MSGP requires that Dischargers regularly inspect, test, maintain, and repair all industrial equipment to prevent leaks, spills and releases of pollutants that may be exposed to storm water discharged to receiving waters. This General Permit (Section X.H.1.b) incorporates this

concept by requiring four (4) nonstructural BMPs which include: identification and inspection of equipment, observations of potential leaks in identified equipment, an equipment maintenance schedule, and equipment maintenance procedures.

d. Spill and Leak Prevention and Response

Section 2.1.2.4 of the 2008 MSGP requires that Dischargers minimize the potential for leaks, spills and other releases that may be exposed to storm water. Dischargers are also required to develop a spill response plan which includes procedures such as labeling of containers that are susceptible to a spill or a leakage, establishing containment measures for such industrial materials, procedures for stopping leaks/spills, and provisions for notification of the appropriate personnel about any occurrence. This General Permit (Section X.H.1.c) requires implementation of four (4) BMPs to address spills. These BMPs include: developing a set of spill response procedures to minimize spills/leaks, develop procedures to minimize the discharge of industrial materials generated through spill/leaks, identifying/describing the equipment needed and where it will be located at the facility, and identify/training appropriate spill response personnel.

e. Erosion and Sediment Controls

Section 2.1.2.5 of the 2008 MSGP requires the use of structural and/or non-structural control measures to stabilize exposed areas and contain runoff. Also required is the use of a flow velocity dissipation device(s) in outfall channels where necessary to reduce erosion and/or settle out pollutants. This General Permit (Section X.H.1.e) requires the implementation of (5) BMPs to prevent erosion and sediment discharges. The erosion and sediment control BMPs include: implementing effective wind erosion controls, providing for effective stabilization of erodible areas prior to a forecasted storm event, site entrance stabilization/prevent material tracking offsite and implement perimeter controls, diversion of run-on and storm water generated from within the facility away from all erodible materials, and ensuring compliance with the design storm standards in Section X.H.6. U.S. EPA has developed online resources for erosion and sediment controls.[6]

f. Management of Runoff

Section 2.1.2.6 of the 2008 MSGP requires the diversion, infiltration, reuse, containment, or otherwise reduction of storm water runoff, to minimize pollutants in discharges. This General Permit (Sections X.H.1.a.viii, X.H.1.d.iv., and X.H.1.e.iv) requires Dischargers to divert run-on from non-industrial sources and

[6] U.S. EPA. 2008 MSGP. <http://cfpub.epa.gov/npdes/stormwater/msgp.cfm> [as of February 4, 2014].
U.S. EPA. National Menu of BMPs. <http://cfpub.epa.gov/npdes/stormwater/menuofbmps/index.cfm>. [as of February 4, 2014].
U.S. EPA. National Management Measures to Control Nonpoint Source Pollution from Urban Areas <http://water.epa.gov/polwaste/nps/urban/index.cfm>. [as of February 4, 2014].

manage storm water generated within the facility away from industrial materials and erodible surfaces. Runoff reduction is required as an advanced BMP when minimum BMPs are not adequate to comply with the TBELs. The 2008 MSGP encouraged Dischargers to consult with EPA's internet-based resources relating to runoff management.[7]

g. Salt Storage Piles or Piles Containing Salt

Section 2.1.2.7 of the 2008 MSGP requires salt storage piles/piles containing salt that may be discharged to be enclosed or covered and to use BMPs when the salt is being used. This General Permit does not have a minimum BMP specifically for salt storage, however it does require all stockpiled/stored industrial materials be managed in a way to reduce or prevent industrial storm water discharges of the stored/stockpiled pollutants. The good housekeeping (Section X.H.1.a) and material handling and waste management (Section X.H.1.d) minimum BMPs in this General Permit require that all materials readily mobilized by storm water be covered, the minimization of handling of industrial materials or wastes that can be readily mobilized by contact with storm water during a storm event, and the diversion of run-on from stock piled materials.

h. Sector Specific Non-Numeric Effluent Limits

Section 2.1.2.8 of the 2008 MSGP requires Dischargers to achieve any additional non-numeric limits stipulated in the relevant sector-specific section(s) of Part 8 of the 2008 MSGP. This General Permit is not a sector-specific permit and does not contain sector-specific non-numeric effluent limitations like the 2008 MSGP. While this General Permit does not specify sector-specific BMPs, Dischargers are required to select and implement BMPs for their specific facility to reduce or prevent industrial storm water discharges of pollutants to comply with the technology-based effluent limitations. In addition, sectors with applicable ELGs must comply with those ELGs.

i. Employee Training Program

Section 2.1.2.9 of the 2008 MSGP requires all employees engaged in industrial activities or the handling of industrial materials that may affect storm water to obtain training covering implementation of this General Permit. This General Permit (Section X.D.1 and X.H.1.f) requires a facility to establish a Pollution Prevention Team (team members, collectively) responsible for implementing permit requirements such as the SWPPP, monitoring requirements, or BMPs.

The five (5) minimum training BMPs include: ensuring that all team members are properly trained, preparing the proper training materials and manuals, identifying

[7] U.S. EPA. Sector-Specific Industrial Stormwater Fact Sheet Series <www.epa.gov/npdes/stormwater/msgp>. [as of February 4, 2014].
U.S. EPA. National Menu of Stormwater BMPs <www.epa.gov/npdes/stormwater/menuofbmps> [as of February 4, 2014].
U.S. EPA. National Management Measures to Control Nonpoint Source Pollution from Urban Areas (and any similar State or Tribal publications) <www.epa.gov/owow/nps/urbanmm/index.html>. [as of February 4, 2014].

which individuals needs to be trained, providing a training schedule, and maintaining documentation on the training courses and which individuals received the training.

This General Permit also requires a QISP to be assigned to each facility that reaches Level 1 status. One purpose of a QISP is to have an individual available who can provide compliance assistance with these training requirements. The QISP is responsible for training the appropriate team members. Appropriate team members are any team members involved in implementing this General Permit for drainage areas causing NAL exceedances, and any other team members identified by the QISP that need additional training to implement this General Permit.

j. NSWDs

Section 2.1.2.10 of the 2008 MSGP requires that unauthorized NSWDs are eliminated (Part 1.2.3 of the 2008 MSGP lists the NSWDs authorized by the 2008 MSGP). The good housekeeping minimum BMP (Section X.H.1.a.ix of this General Permit) requires that contact between authorized NSWDs and industrial areas of the facility be minimized. This General Permit (Section IV) also includes separate requirements for authorized NSWDs and (Section III) prohibits unauthorized NSWDs.

k. Material Handling and Waste Management

Section 2.1.2.11 of the 2008 MSGP requires that Dischargers ensure waste, garbage, and floatable debris are not discharged into receiving waters. The 2008 MSGP identifies keeping areas clean and intercepting such materials as ways to minimize such discharges. This General Permit (Section X.H.1.d) requires Dischargers to implement six (6) general BMPs that address material handling and waste management. These BMPs include: preventing or minimizing handling of waste or materials during a storm event that could potentially result in a discharge, containing industrial materials susceptible to being dispersed by the wind, covering industrial waste disposal containers when not in use to contain industrial materials, diversion of run-on and storm water generated from within the facility away from all stock piled materials, cleaning and managing spills of such wastes or materials (in accordance with Section X.H.1.e of this General Permit), and conducting observations of outdoor areas and equipment that may come into contact with such materials or waste and become contaminated.

l. Waste, Garbage and Floatable Debris

Section 2.1.2.11 of the 2008 MSGP requires that waste, garbage, and floatable debris are not discharged to receiving waters by keeping exposed areas free of such materials or by intercepting them before they are discharged. Material handling and waste management BMPs are included in Section X.H.1.d of this General Permit. Dischargers are required to: prevent handling of waste materials during a storm event that could result in a discharge, contain waste disposal containers when not in use, clean and manage spills from waste, and observe

outdoor areas and equipment that may come into contact with waste and become contaminated.

m. Dust Generation and Vehicle Tracking of Industrial Materials

Section 2.1.2.12 of the 2008 MSGP requires that generation of dust and off-site tracking of raw, final, or waste materials is minimized. This General Permit does not require minimization of dust generation and vehicle tracking of industrial materials as a minimum BMP directly. Dust generation and vehicle tracking of industrial materials BMPs are included in Section X.H.1.a ("good housekeeping") of this General Permit where Dischargers must prevent dust generation from industrial materials or activities and contain all stored non-solid industrial materials that can be transported or dispersed via wind or come in contact with storm water, and Section X.H.1.d. ("material handling and waste management") of this General Permit, which requires Dischargers to contain non-solid industrial materials or wastes that can be dispersed via wind erosion or come into contact with storm water during handling.

n. Quality Assurance and Record Keeping

Section 2.1.2 of the 2008 MSGP does not directly designate record keeping as a control measure. This General Permit (Section X.H.1.g) includes quality assurance and record keeping as a minimum BMP and requires Dischargers to implement three (3) general BMPs. These BMPs include: developing and implementing procedures to ensure that all elements of the SWPPP are implemented, develop a method of tracking and recording the implementation of all BMPs identified in the SWPPP, and a requirement to keep and maintain those records. This ensures that management procedures are designed and permit requirements are implemented by appropriate staff.

o. Implementation of BMPs in the SWPPP

Like the previous permit, this General Permit does not assign Dischargers a schedule to implement BMPs. Instead, this General Permit requires Dischargers to select the appropriate schedule to implement the minimum BMPs. In addition, this General Permit requires Dischargers to identify, as necessary, any BMPs that should be implemented prior to precipitation events. Although Dischargers are required to maintain internal procedures to ensure the BMPs are implemented according to schedule or prior to precipitation events, Dischargers are only required to certify in the Annual Report whether they complied with the BMP implementation requirements.

Dischargers are required to implement an effective suite of BMPs that meet the technology and water-quality based limitations of this General Permit. Based upon Regional Water Board staff inspections, there is significant variation between Dischargers' interpretations of what BMPs were necessary to comply with the previous permit. This General Permit establishes a new requirement that Dischargers must implement, to the extent feasible, specific minimum BMPs to reduce or prevent the presence of pollutants in their industrial storm water

discharge. In addition, due to the wide variety of facilities conducting numerous and differing industrial activities throughout the state, this General Permit retains the requirement from the previous permit that Dischargers establish and implement additional BMPs beyond the minimum. Implementation of this General Permit's minimum BMPs, together with any necessary advanced BMPs, will result in compliance with the effluent limitations of this General Permit (Section V.A). All Dischargers must evaluate their facilities and determine the best practices within their industry considering technological availability and economic practicability and achievability to implement these minimum BMPs and any advanced BMPs.

The State Water Board has selected minimum BMPs that are generally applicable at all facilities. The minimum BMPs are consistent with the types of BMPs normally found in properly developed SWPPPs and, in most cases, should represent a significant portion of the effort required for a Discharger to achieve compliance. Due to the diverse industries covered by this General Permit, the development of a more comprehensive list of minimum BMPs is not currently feasible. The selection, applicability, and effectiveness of a given BMP is often related to industrial activity type and to facility-specific facts and circumstances. Advanced BMPs must be selected and implemented by Dischargers, based on the type of industry and facility-specific conditions, to the extent necessary to comply with the technology-based effluent limitation requirements of this General Permit.

Failure to implement all of the minimum BMPs to the extent feasible is a violation of this General Permit. (Section X.H.1.) Dischargers must justify any determination that it is infeasible to implement a minimum BMP in the SWPPP (Section X.H.4.b). Failure to implement advanced BMPs necessary to achieve compliance with either the technology or water quality standards requirements in this General Permit is a violation of this General Permit.

p. Temporary Suspension of Industrial Activities

The exception for inactive and unstaffed sites in section 6.2.1.3 of the 2008 MSGP does not require a Discharger with a facility that is inactive and unstaffed with no industrial materials or activities exposed to storm water (in accordance with the substantive requirements in 40 Code of Federal Regulations section 122.26(g)) to complete benchmark monitoring. The Discharger is required to sign and certify a statement in the SWPPP verifying that the site is inactive and unstaffed. If circumstances change and industrial materials or activities become exposed to storm water or the facility becomes active and/or staffed, this exception no longer applies and the Discharger is required to begin complying immediately with the applicable benchmark monitoring requirements under part 6.2 of the 2008 MSGP.

This General Permit allows Dischargers to temporarily suspend monitoring at facilities where industrial activities have been suspended in accordance with Section X.H.3. This is only intended for Dischargers with facilities where it is infeasible to comply with this General Permit's monitoring while activities are

suspended (e.g. remote, unstaffed, or inaccessible facilities during the time of such a suspension). Dischargers are required to update the facility's SWPPP with the BMPs being used to stabilize the site and submit the suspension dates and a justification for the suspension of monitoring via SMARTS.

3. Design Storm Standards for Treatment Control BMPs

It is the State Water Board's intent to minimize the regulatory uncertainty and costs concerning treatment control BMPs in order to encourage the implementation of treatment control BMPs when appropriate. Section X.H.6 of this General Permit specifies a design storm standard for use when treatment controls BMPs are installed. There is both a volume-based and flow-based design storm standard in this General Permit. Both are based on the 85th percentile 24-hour storm event. Without a design storm standard, Dischargers have installed treatment controls using a wide variety of designs that were sometimes either unnecessarily stringent/expensive, or deficient in complying with the requirements of the relevant permit. Some Dischargers have been hesitant to consider treatment options because of the uncertainty concerning acceptable treatment design. The design storm standards are generally expected to:

- Be consistent with the effluent limitations of this General Permit;
- Be protective of water quality;
- Be achievable for most pollutants and their associated treatment technologies; and,
- Reduce the costs associated with treating industrial storm water discharges beyond the levels necessary to achieve compliance with this General Permit.

In lieu of complying with the design storm standards for treatment control BMPs, Dischargers may certify and submit a Level 2 ERA Technical Report, including an Industrial Activity BMPs Demonstration (Section XII.D.2.a of this General Permit). The Level 2 ERA Technical Report requirement is based upon NAL exceedances. . Under this option, a Discharger with Level 2 status must either implement BMPs to eliminate future NAL exceedances, or justify what BMPs must be implemented to comply with this General Permit even if the BMPs will not eliminate future exceedances of NALs. Dischargers who implement treatment control BMPs that vary from the design storm standards in Section X.H.6 must include an analysis showing that their treatment control BMPs comply with this General Permit's effluent limitations in the Industrial Activity BMP Demonstration.

This General Permit does not require Dischargers to retrofit existing treatment controls that do not meet the design storm standard, unless the Discharger determines that the existing treatment controls are not adequate to comply with this General Permit. In addition, once TMDL-specific implementation requirements are added to this General Permit, those Dischargers subject to TMDLs may need to add new or retrofitted treatment control BMPs to meet the TMDL implementation requirements.

To arrive at these design storm standards, the State Water Board has relied heavily on previous Water Board decisions concerning treatment efficacy for municipalities, published documents, stakeholder comments, and reasonableness. In 2000, the State Water Board issued State Water Board Order WQ 2000-11, which upheld Los Angeles Regional Water Board's permit requirements which mandated that all new development and redevelopment exceeding certain size criteria design treatment BMPs based on a specific storm volume: the 85th percentile 24-hour storm event. This design storm standard was based on research demonstrating that the standard represents the maximized treatment volume cut-off at the point of diminishing returns for rainfall/runoff frequency.[8] On the basis of this equation, the maximized runoff volume for 85 percent treatment of annual runoff volumes in California can range from 0.08 to 0.86 inch depending on the imperviousness of the watershed area and the mean amount of rainfall. This design storm standard is referred to as the Standard Urban Storm Water Mitigation Plan's volumetric criterion and there are multiple acceptable methods of calculating this volume. For more information, see the California Stormwater Best Management Practices Handbook.[9]

The San Diego Regional Water Board first established both volumetric and flow-based design storm criteria for NPDES MS4 permits. It is generally accepted by civil engineers doing hydrology work to use twice the peak hourly flow of a specific storm event to use as the basis for flow-based design of BMPs. This General Permit therefore establishes the flow-based design storm standard to be twice the peak hourly flow of the 85th percentile 24-hour storm event.

The primary objective of specifying a design storm standard is to properly size BMPs to, at a minimum, effectively treat the first flush of run-off from all storm events. The economic impacts of treating all storm water from a facility versus the minimal environmental benefit of complete treatment justify the design storm approach. It is unrealistic to require each facility to do a cost benefit analysis of their treatment structures. To simplify the requirements for design, the State Water Board reviewed research from the City of Portland[10] and the City of San Jose[11] to determine the volume of each rain event compared to the amount of events that occur for that volume. The results of their findings show an inflection point that is typically found at approximately the 80 to 85 percentile of recorded storm events.

Dischargers who install any type of volume-based treatment device are encouraged to consider the BMPs in the California Department of Public Health's guidance manual published July 2012, "Best Management Practices for Mosquito Control in California" at http://www.cdph.ca.gov/HealthInfo/discond/Documents/BMPforMosquitoControl07-12.pdf.

4. Monitoring Implementation Plan

Dischargers are required to prepare and implement a Monitoring Implementation Plan (Section X.I of this General Permit). The Monitoring Implementation Plan requirements are designed to assist the Discharger in developing a comprehensive plan for the monitoring requirements in this General Permit and to assess their monitoring program. The Monitoring Implementation Plan includes a description of visual observation procedures and locations, as well as sampling procedures, locations, and methods. The Monitoring Implementation Plan shall be included in the SWPPP.

J. Monitoring and Reporting Requirements

1. General Monitoring Provisions

This General Permit requires Dischargers to develop and implement a facility-specific monitoring program. Monitoring is defined as visual observations, sampling and analysis. The monitoring data will be used to determine:

a. Whether BMPs addressing pollutants in industrial storm water discharges and authorized NSWDs are effective for compliance with the effluent and receiving water limitations of this General Permit,

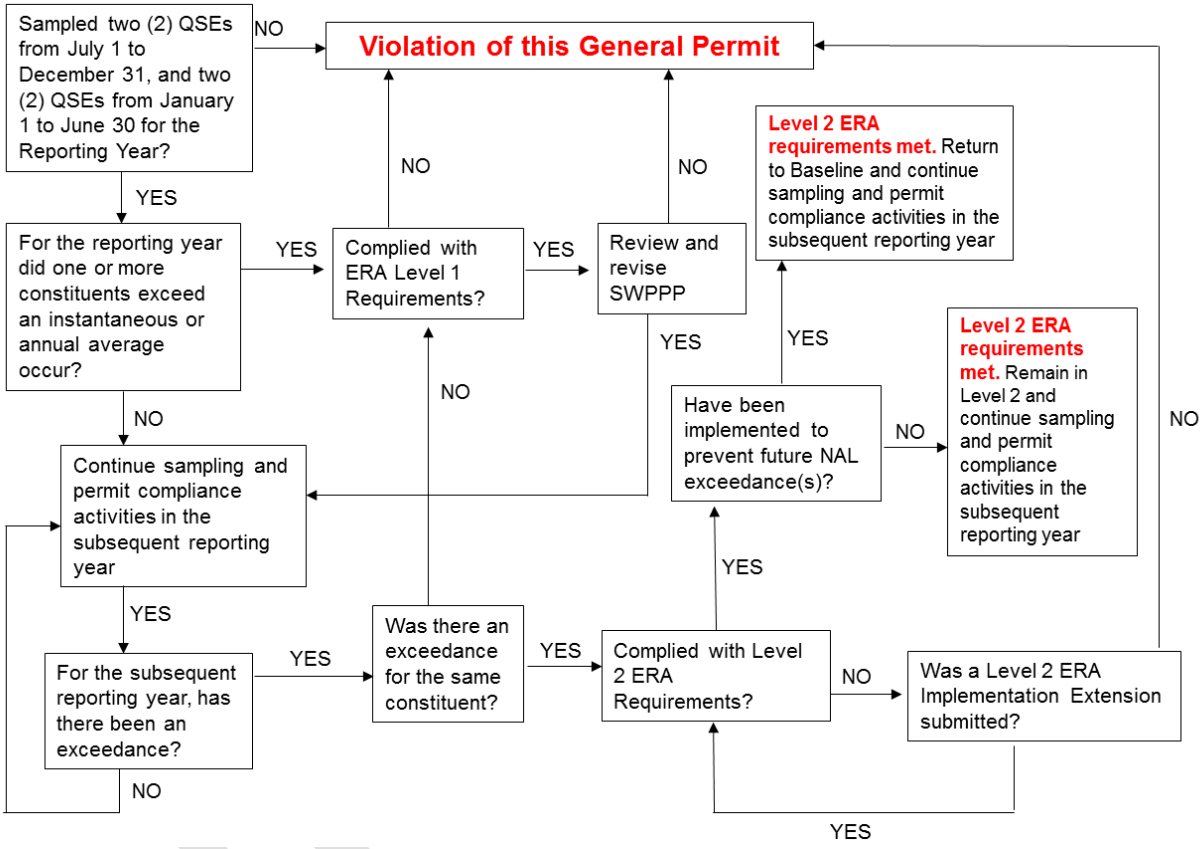
b. The presence of pollutants in industrial storm water discharges and authorized NSWDs (and their sources) that may trigger the implementation of additional BMPs and/or SWPPP revisions; and,

c. The effectiveness of BMPs in reducing or preventing pollutants in industrial storm water discharges and authorized NSWDs.

Effluent sampling and analysis information may be useful to Dischargers when evaluating the need for improved BMPs. The monitoring requirements in this General Permit recognize the 2008 MSGP approach to visual observations as an effective monitoring method for evaluating the effectiveness of BMPs at most facilities. Section 6.2 of the 2008 MSGP limits its monitoring sampling requirements to certain industrial categories. Similar to the previous permit, this General Permit requires all Dischargers to sample unless they have obtained NEC coverage or have an inactive mining operation(s) certified as allowed under this General Permit Section XIII.

This General Permit defines a Qualifying Storm Event (QSE) to provide clarity to Dischargers of when sampling is required. The previous permit (Section B.5.a) specified that sampling was required within the first hour of discharge, however, this General Permit requires Dischargers to sample within four hours of the start of Discharge. Many Dischargers were not able to get samples of their discharge locations within one (1) hour under the previous permit so this general permit has expanded the timeframe allowed to provide enough time to sample all discharge locations. The previous permit required three working dry days before sampling and this General Permit defines this period as 48 hours, this timeframe was decreased to provide more opportunities for Dischargers to obtain samples. This General Permit does not specify a volume for sampling due to the complexity of using rain gauges and the limited access of rain gauge station data.

Dischargers are only required to obtain samples required during scheduled facility operating hours and when sampling conditions are safe in accordance with Section XI.C.6.a.ii of this General Permit. If a storm event occurs during unscheduled facility operating hours (e.g. during the weekend or night) and during the 12 hours preceding the scheduled facility operating hours, the Dischargers is still responsible for obtaining samples at discharge locations that are still producing a discharge at the start of facility operations. Under the previous permit, many Dischargers were unable to obtain samples due to rainfall beginning at night.



The State Water Board recognizes that it may not be feasible for all facilities to obtain four QSEs in a reporting year because there may not be enough qualifying storm events to do so. Therefore, a Discharger that is unable to collect and analyze storm water samples from two QSEs in each half of a reporting year due to a lack of QSEs is not in violation of Section XI.B.2. Dischargers that miss four QSEs during a reporting year due to the fact that four QSEs did not occur are not required to make up these sampling events in subsequent reporting years.

The State Water Board recognizes that each facility has unique physical characteristics, industrial activities, and/or variations in BMP implementation and performance which warrants the requirement that each facility demonstrate its compliance. Figure 3 of this Fact Sheet provides a summary of all the monitoring-related requirements of this General Permit. This General Permit's monitoring requirements include sampling and analysis requirements for specific indicator parameters that indicate the presence of pollutants in industrial storm water discharges. The "indicator parameters" are oil and grease (for petroleum hydrocarbons), total suspended solids (for sediment and sediment bound pollutants) and pH (for acidic and alkaline pollutants). Additionally, Dischargers are required to evaluate their facilities and analyze samples for additional facility-specific parameters. These monitoring program requirements are designed to provide useful, cost-effective, timely, and easily obtained information to assist Dischargers as they identify their facility's pollutant sources and implement corrective actions and revise BMPs as necessary (Section XI.A.4 of this General Permit).

This General Permit requires a combination of visual observations and analytical monitoring. Visual observations provide Dischargers with immediate information

indicating the presence of many pollutants and their sources. Dischargers must implement timely actions and revise BMPs as necessary (Section XI.A.4) when the visual observations indicate pollutant sources have not been adequately addressed in the SWPPP. Analytical monitoring provides an additional indication of the presence and concentrations of pollutants in storm water discharge. Dischargers are required to evaluate potential pollutant sources and corresponding BMPs and revise the SWPPP appropriately when specific types of NAL exceedances occur as described below.

FIGURE 3: Compliance Determination Flowchart

2. Visual Observations

There are two major changes to the visual observation requirements in this General Permit compared to the previous permit, which include:

a. Monthly Visual Observations

The previous permit required separate quarterly visual observations for unauthorized and authorized non-storm water discharges. It did not require periodic visual observations of the facility to determine whether all potential pollutant sources were being adequately controlled with BMPs. Prior drafts of this General Permit proposed the addition of pre-storm inspections. This was met with great resistance by Dischargers because of the complexity and burden of determining when a QSE would occur. Many of these Dischargers

recommended that monthly BMP and non-storm water discharge visual observations should replace the proposed pre-storm inspections. This General Permit merges all visual observations into a single monthly visual observation.

b. Sampling Event Visual Observations

The previous permit required monthly storm water visual observations. This required Dischargers to conduct visual observations for QSEs that were not being sampled since only two QSEs were required to be sampled in the previous permit. As discussed below, the sampling requirement has been increased to four QSEs within each reporting year with two QSEs required in each half of the reporting year. We expect that this will result in more samples being collected and analyzed, since most of California experiences, on average, at least two QSEs per half year. This General Permit streamlines the storm water visual observation requirement by linking the visual observations to the time of sampling.

3. Sampling and Analysis

a. General

As part of the process for developing previous drafts of this General Permit, the State Water Board considered comments from numerous stakeholders concerning sampling and analysis. Sampling and analysis issues were the most dominant of all issues raised in the comments.

The State Water Board received stakeholder comments that fall into three primary categories concerning this General Permit's sampling and analysis approach:

i. Comments supporting an intensive water quality sampling and analysis approach (with the goal of producing more accurate discharge-characterizing and pollutant concentration data) as the primary method of determining compliance with effluent limitations and receiving water limitations. Since this approach requires large amounts of high quality data to accurately quantify the characteristics of the discharges, it is referred to as the quantitative monitoring approach. Stakeholders supporting the quantitative approach generally also support the use of stringent NELs to evaluate compliance with this General Permit;

ii. Comments supporting only visual observations as the primary method of determining compliance: These stakeholders generally assert that storm water sampling is an incomplete and not very cost effective means of determining water quality impacts on the receiving waters; and,

iii. Comments supporting a combination of visual observations and cost-effective water quality sampling and analysis approach (sampling and analysis that would produce data indicating the presence of pollutants) to determine compliance (similar to the previous permit's approach). Since this approach

uses more qualitative information to describe the quality and characteristics of the discharges, it is referred to as the qualitative monitoring approach.

Within each of the three categories, there are various recommendations and rationales as to the exact monitoring frequencies, procedures and methods, required to implement the approach. Stakeholders in favor of the quantitative monitoring approach commented that it is the only reliable and meaningful method of assuring that: (1) BMPs are effective in reducing or preventing pollutants in storm water discharge in compliance with BAT/BCT, and (2) the discharge is not causing or contributing to an exceedance of a water quality standards. The stakeholders state that visual observations are not effective in measuring pollutant concentrations nor is it effective in determining the presence of colorless and/or odorless pollutants. The stakeholders state that qualitative monitoring (and the use of indicator parameters) will not provide results useful for calculating pollutant loading nor will it accurately characterize the discharge.

Stakeholders in favor of requiring only visual observations state that sampling and analysis is unnecessary because (1) the previous permit did not include NELs so the usefulness of sampling and analysis data is limited, (2) a significant majority of Dischargers should be able to develop appropriate BMPs without sampling and analysis data, (3) most pollutant sources and pollutants can be detected and mitigated through visual observations, (4) the costs associated with quantitative monitoring are excessive and disproportionate to any benefits, (5) U.S. EPA's storm water regulations do not require sampling, (6) The 2008 MSGP relies heavily on visual observations and requires only a limited number of specific industries to conduct sampling and analysis, and (7) the majority of Dischargers are small businesses and do not have sufficient training or understanding to perform accurate sampling and analysis.

Stakeholders in favor of requiring both visual observations and a cost-effective qualitative monitoring program state that (1) both are within the means and understanding of most Dischargers, and (2) monitoring results are useful for evaluating a Discharger's compliance without unnecessarily increasing the burden on the Discharger and without subjecting Dischargers to non-technical enforcement actions.

The State Water Board finds that it is feasible for the majority of Dischargers to develop appropriate BMPs without having to perform large amounts of quantitative monitoring, which can be very costly. In the absence of implementing NELs, the State Water Board has determined that the infeasibility and costs associated with developing quantitative monitoring programs at each of thousands industrial facilities currently permitted would outweigh the limited benefits. The primary difficulty associated with requiring intensive quantitative monitoring lies with the cost and the difficulty of accurately sampling industrial storm water discharges.

Stakeholders that support quantitative monitoring believe the data is necessary to determine pollutant loading, concentration, or contribution to water quality violations. In order to derive data necessary to support those goals, however,

the data must be of high quality, meaning it must be accurate, precise and have an intact chain of custody. Many industrial facilities do not have well-defined storm water conveyance systems for sample collection. Storm water frequently discharges from multiple locations through sheet flow into nearby streets and adjoining properties. Sample collection from a portion of the sheet flow is an inexact measurement since not all of the flow is sampled. Requiring every Discharger to construct well-defined storm water conveyances may cost anywhere from thousands to hundreds of thousands of dollars per facility depending on the size and nature of each industrial facility. At many facilities, the construction of such conveyances may also violate local building codes, create safety hazards, cause flooding, or increase erosion. In addition, eliminating sheet flow at some facilities could result in increased pollutant concentrations.

The State Water Board has considered the complexity and costs associated with quantitative monitoring. Unlike continuous point source discharges (e.g., publicly owned treatment works), storm water discharges are variable in intensity and duration. The concentration of pollutants discharged at any one time is dependent on many complex variables. The largest concentration of pollutants would be expected to discharge earlier in the storm event and taper off as discharges continue. Therefore, effective quantitative monitoring of storm water discharges would require that storm water discharges be collected and sampled until most or all of the pollutants have been discharged. Multiple samples would need to be collected over many hours. To determine the pollutant mass loading, the storm water discharge flow must also be measured each time a sample is collected.

For a quantitative monitoring approach to yield useful pollutant loading information, the installation of automatic sampling devices and flow meters at each discharge location would usually be necessary. In addition, qualified individuals would be needed to conduct the monitoring procedures, and to handle and maintain flow meters and automatic samplers are needed. A significant majority of storm water Dischargers under this General Permit do not possess the skills to manage such an effort. Dischargers will bear the cost of employing and/or training on-site staff to do this work, or the cost of contracting with environmental consultants and acquiring the required flow meters and automatic samplers. The cost to Dischargers to conduct quantitative monitoring varies depending on the number of outfalls, the number of storms, the length of each storm, the amount of staff training, and other variables.

To address these concerns, this General Permit includes a number of new items that bridge the gap between the previous permit's qualitative monitoring and the quantitative approach recommended by many commenters. This General Permit includes a requirement for all Dischargers to designate a QISP when they enter Level 1 status due to NAL exceedances. The QISP is required to be trained to: (1) more accurately identify discharge locations representative of the facility storm water discharge (2) select and implement appropriate sampling procedures (3) evaluate and develop additional BMPs to reduce or prevent pollutants in the industrial storm water discharges.

Dischargers that fail to develop and implement an adequate Monitoring Implementation Plan that includes both visual observations and sampling and analysis, are in violation of this General Permit. Dischargers that fail to comply with Level 1 status and Level 2 status ERA requirements, triggered by NAL exceedances, are in violation of this General Permit.

Water Code section 13383.5 requires that the State Water Board include (1) standardized methods for collection of storm water samples, (2) standardized methods for analysis of storm water samples, (3) a requirement that every sample analysis be completed by a State certified laboratory or in the field in accordance with Quality Assurance and Quality Control (QA/QC) protocols, (4) a standardized reporting format, (5) standardized sampling and analysis programs for QA/QC, and (6) minimum detection limits. The monitoring requirements in this General Permit (Section XI), as supplemented by SMARTS, address these requirements.

Under the previous permit, many Dischargers did not developed adequate sample collection and handling procedures, decreasing the quality of analytical results. In addition, Dischargers often selected inappropriate test methods, method detection limits, or reporting units. This General Permit requires all Dischargers to identify discharge locations that are representative of industrial storm water discharges and develop and implement reasonable sampling procedures to ensure that samples are not mishandled or contaminated.

It is infeasible for the State Water Board to provide a single comprehensive set of sample collection and handling procedures/instructions due to the wide variation in storm water conveyance and collection systems in use at facilities around the state. As an alternative, Attachment H of this General Permit provides minimum storm water sample collection and handling instructions that pertain to all facilities. Dischargers are required to develop facility-specific sample collection and handling procedures based upon these minimum requirements. Table 2 in this General Permit provides the minimum test methods that shall be used for a variety of common pollutants. Dischargers must be aware that use of more sensitive test methods (e.g., U.S. EPA Method 1631 for Mercury) may be necessary if they discharge to an impaired water body or are otherwise required to do so by the Regional Water Board. This General Permit allows Dischargers to propose an analytical test method for any parameter or pollutant that does not have an analytical test method specified in Table 2 or in SMARTS. Dischargers may also propose analytical test methods with substantially similar or more stringent method detection limits than existing approved analytical test methods. Upon approval, SMARTS will be updated over time to add additional acceptable analytical test methods.

The previous permit allowed Dischargers to reduce sampling analysis requirements for substantially similar drainage areas by either (1) combining samples for an unspecified maximum number of substantially similar drainage areas, or (2) sampling a reduced number of substantially similar drainage areas. The State Water Board provided this procedure to reduce analytical costs. The complexity associated with determining substantially similar drainage areas has

led Dischargers to produce various, and sometimes questionable, analytical schemes. In addition, the previous permit did not establish a maximum number of samples that could be combined.

To standardize sample collection and analysis as required by Water Code section 13383.5, while continuing to offer a reduced analytic cost option, these requirements have been revised. Section XI.B.4 of this General Permit requires Dischargers to collect samples from all discharge locations regardless of whether the discharges are substantially similar or not. Dischargers may analyze each sample collected, or may analyze a combined sample consisting of equal volumes, collected from as many as four (4) substantially similar discharge locations. A minimum of one combined sample shall be analyzed for every one (1) to four (4) discharge locations, and the samples shall be combined in the lab in accordance with Section XI.C.5 of this General Permit.

Representative sampling is only allowed for sheet flow discharges or discharges from drainage areas with multiple discharge locations. Dischargers shall select the appropriate location(s) to be sampled and intervals necessary to obtain samples representative of storm water associated with industrial activities generated within the corresponding drainage area. Dischargers are not required to sample discharge locations that have no exposure of industrial activities or materials as defined in Section XVII of this General Permit within the corresponding drainage area. However, Dischargers are required to conduct the monthly visual observations regardless of the selected locations to be sampled.

This General Permit defines a QSE as a precipitation event that produces a discharge from any drainage area that is preceded by 48 consecutive hours without a discharge from any drainage area. The previous permit did not include a QSE definition; instead, it utilized a different approach to defining the storm events that were required to be sampled. Under the previous permit, eligible storm events were storm events that occurred after three consecutive working days of dry weather. The three consecutive working days of dry weather definition in the previous permit led Dischargers to miss many opportunities to sample. Some Dischargers were unable to collect samples from two storm events in certain years under the previous definition. To resolve this difficulty, this General Permit increases the sampling requirements to four (4) QSEs per year, while decreasing the number of days without a discharge, resulting in additional opportunities for Dischargers to sample. Additionally, by eliminating the previous permit's reference to "dry weather," this General Permit allows some precipitation to occur between QSEs so long as there is no discharge from any drainage area. This change will result in more QSE sampling opportunities.

To improve clarity and consistency, the definitions contained in other storm water permits were considered with the goal of developing a standard definition for 'dry weather' for this General Permit. The 2008 MSGP sets a "measurable storm event" as one that produces at least 0.1 inches of precipitation and results in an actual discharge after 72 hours (three days) of dry weather. The State of Washington defines a "qualifying storm event" as a storm with at least 0.1 inches of precipitation preceded by at least 24 hours of no measurable precipitation,

mirroring the definition found in the previous MSGP (2000 version). The State of Oregon requires that samples be taken in the first 12 hours of discharge and no less than 14 days apart. Review of other permits concludes that there is not a single commonly used approach to triggering sampling in industrial general permits. Therefore an enforceable sampling trigger is included in this General permit that requires Dischargers to sample four storm events within each reporting year.

b. Effluent Water Quality Sampling and Analysis Parameters

Dischargers are required to sample and analyze their effluent for certain parameters. "Parameter" is a term used in laboratory analysis circles to represent a distinct, reportable measure of a particular type. For example, ammonia, hexavalent chromium, total nitrogen and chemical oxygen demand are all parameters that a laboratory can analyze storm water effluent for and report a quantity back. A parameter is also an indicator of pollution. In this General Permit, pH, total suspended solids and chemical oxygen demand are examples of indicator parameters. They are not direct measures of a water quality problem or condition of pollution but can be used to indicate a problem or condition of pollution. Indicator parameters can also be used to indicate practices and/or the presence of materials at a facility to bring forth information for compliance evaluation processes, like annual report review and inspection. For example, chemical oxygen demand concentrations can indicate the presence of dissolved organic compounds, like residual food from collected recycling materials.

Minimum parameter-specific monitoring is required for Dischargers, regardless of whether additional facility-specific parameters are selected. This General Permit requires some parameters to be analyzed and reported for the duration of permit coverage to develop comparable sampling data over time and over many storm events and to demonstrate compliance. The Regional Water Boards may use such data to evaluate individual facility compliance and assess the differences between various industries. Accordingly, the parameters selected correspond to a broad range of industrial facilities, are inexpensive to sample and analyze, and have sampling and analysis methods which are easy to understand and implement. Some analytical methods for field measurements of some parameters, such as pH, may be performed using relatively inexpensive field instruments and provides an immediate alert to possible pollutant sources.

The following three selected minimum parameters are considered indicator parameters, regardless of facility type. These parameters typically provide indication and/or the correlation of whether other pollutants are present in storm water discharge. These parameters were selected for the following reasons:

i. pH is a numeric measurement of the hydrogen-ion concentration. Many industrial facilities handle materials that can affect pH. A sample is considered to have a neutral pH if it has a value of 7. At values less than 7, water is considered acidic; above 7 it is considered alkaline or basic. Pure rain water in California typically has a pH value of approximately 7.

ii. Total Suspended Solids (TSS) is an indicator of the un-dissolved solids that are present in storm water discharge. Sources of TSS include sediment from erosion, and dirt from impervious (i.e., paved) areas. Many pollutants adhere to sediment particles; therefore, reducing sediment will reduce the amount of these pollutants in storm water discharge.

iii. Oil and Grease (O&G) is a measure of the amount of O&G present in storm water discharge. At very low concentrations, O&G can cause sheen on the surface of water. O&G can adversely affect aquatic life, create unsightly floating material, and make water undrinkable. Sources of O&G include, but are not limited to, maintenance shops, vehicles, machines and roadways.

The previous permit allowed Dischargers to analyze samples for either O&G or Total Organic Carbon (TOC). This General Permit requires all Dischargers analyze samples for O&G since almost all Dischargers with outdoor activities operate equipment and vehicles can potentially generate insoluble oils and greases. Dischargers with water soluble-based organic oils may be required to also test for TOC. The TOC and O&G tests are not synonymous, duplicative or interchangeable.

This General Permit removes the requirement to analyze for specific conductance as part of the minimum analytic parameters. Specific conductance is not required by U.S. EPA for any industry type. Additionally, stakeholder comments indicate that there are many non-industrial sources that may cause high specific conductance and interfere with the efficacy of the test. For example, salty air deposition that occurs at facilities in coastal areas may raise the specific conductance in water over 500 micro-ohms per centimeter (µhos/cm). Dischargers are not prevented from performing a specific conductance test as a screening tool if it is useful to detect a particular pollutant of concern as required (e.g. salinity).
This General Permit requires Dischargers subject to Subchapter N ELGs for pH to analyze for pH using approved test methods in accordance with 40 Code of Federal Regulations part 136. These federal regulations specify that analysis of pH must take place within 15 minutes of sample collection. All other Dischargers may screen for pH using wide range litmus pH paper or other equivalent pH test kits within 15 minutes of sample collection. If in any reporting year a Discharger has two or more pH results outside of the range of 6.0 – 9.0 pH units, that Discharger is required to comply with the approved test methods in 40 Code of Federal Regulations part 136 in subsequent reporting years.

For almost all Dischargers, obtaining laboratory analysis within 15 minutes is logistically impossible. For many Dischargers, maintaining a calibrated pH meter is difficult, labor intensive, and error prone. Screening for pH will limit the number of additional Dischargers required to comply with 40 Code of Federal Regulations part 136 methods to those that have pH measures outside the range of 6.0-9.0 pH units. The use of wide range litmus pH paper or other equivalent pH test kits is not as accurate as a calibrated pH meter, however litmus paper is allowed in the 2008 MSGP, and when used properly it can provide an accurate screening

measure to determine if further more-accurate pH sampling is necessary to determine compliance.

Review of available monitoring data shows that storm water discharges from most types of industrial facilities comply with the pH range of 6.0 to 9.0 pH units. There are specific types of industries, like cement or concrete manufacturers that have shown a trend of higher pH values very close to 9.0 pH units. Rather than require all industries as a whole to monitor with the more costly 40 Code of Federal Regulations part 136 methods, this General Permit establishes a triggering mechanism for these more advanced pH test methods. The Regional Water Boards retain their authority to require more accurate test methods. Once a Discharger triggers the requirement to use the more accurate testing methods in 40 Code of Federal Regulations part 136, the Discharger may not revert back to screening for pH for the duration of coverage under this General Permit.

In the early 1990s, U.S. EPA, through its group application program, evaluated nationwide monitoring data and developed the listed parameters and SIC associations shown in Table 1 of this General Permit. The 2008 MSGP requires that Dischargers analyze storm water effluent for the listed parameters under certain conditions. In addition to the parameters in Table 1 of this General Permit, Dischargers are required to select additional facility-specific analytical parameters to be monitored, based upon the types of materials that are both exposed to and mobilized by contact with storm water. Dischargers must, at a minimum, understand how to identify industrial materials that are handled outdoors and which of those materials can easily dissolve or be otherwise transported via storm water.

The Regional Water Boards have the authority to revise the monitoring requirements for an individual facility or group of facilities based on site-specific factors including geographic location, industry type, and potential to pollute. For example, the Los Angeles Regional Water Board required all dismantlers (SIC Code 5015) within their jurisdiction to monitor for copper and zinc instead of aluminum and iron during the term of the previous permit. SMARTS will be programmed to incorporate any monitoring revisions required by the Regional Water Boards. Dischargers will receive email notification of the monitoring requirement revision and their SMARTS analytical reporting input screen will display the corresponding revisions. Dischargers may add, but not otherwise modify, the sampling parameters on their SMARTS input screen.

Dischargers are also required to identify pollutants that may cause or contribute to an existing exceedance of any applicable water quality standards for the receiving water. This General Permit requires Dischargers to control its discharge as necessary to meet the receiving water limitations, and to select additional monitoring parameters that are representative of industrial materials handled at the facility (regardless of the degree of storm water contact or relative mobility) that may be related to pollutants causing a water body to be impaired.

DRAFT

4. Methods and Exceptions

   a. Storm Water Discharge Locations

      Dischargers are required to visually observe and collect samples of industrial storm water discharges from each drainage area at all discharge locations. These samples must be representative of the storm water discharge leaving each drainage area. This is a change from the previous permit which allowed a Discharger to reduce the number of discharge locations sampled if two or more discharge locations were substantially similar.

      Dischargers are required to identify, when practicable, alternate discharge locations if: (1) the facility's industrial drainage areas are affected by storm water run-on from surrounding areas that cannot be controlled, or (2) discharge locations are difficult to observe or sample (e.g. submerged discharge outlets, dangerous discharge location accessibility).

   b. Representative Sampling Reduction

      Some stakeholders have indicated that there are unique circumstances where sampling a subset of representative discharge locations fully characterizes the full set of storm water discharges. Stakeholders provided examples related to drainage areas with multiple discharge locations where sampling only a subset of these discharge locations produces results that are representative of the drainage areas' storm water discharges. In such situations, this General Permit allows Dischargers to reduce the number of discharge locations. For each drainage area with multiple discharge locations (e.g. roofs with multiple downspouts, loading/unloading areas with multiple storm drain inlets), the Discharger may reduce the number of discharge locations to be sampled if the conditions in Section XI.C.4 of this General Permit are met.

   c. Qualified Combined Samples

      Dischargers may combine samples from up to four (4) discharge locations if the industrial activities within each drainage area and each drainage area's physical characteristics (i.e. grade, surface materials) are substantially similar.

      Dischargers are required to provide documentation in the Monitoring Implementation Plan supporting that the above conditions have been evaluated and fulfilled. A Discharger may combine samples from more than four (4) discharge locations only with approval from the appropriate Regional Water Board.

   d. Sample Collection and Visual Observation Exceptions

      Dischargers are not required to collect samples or conduct visual observations during dangerous weather conditions such as flooding or electrical storms, or outside of scheduled facility operating hours. A Discharger is not precluded from conducting sample collection activities or visual observations outside of scheduled facility operating hours.

In the event that a Discharger is unable to collect the required samples or conduct visual observations due to the above exceptions, the Discharger must include an explanation of the conditions obstructing safe monitoring in its Annual Report. If access to a discharge location is dangerous on a routine basis, a Discharger must choose an alternative discharge location in accordance with General Permit Section XI.C.3.

e. Sampling Frequency Reduction

Facilities that do not have NAL exceedances for four (4) consecutive QSEs are unlikely to pose a significant threat to water quality. If the storm water from these facilities is also in full compliance with this General Permit, the Discharger is eligible for a reduction in sampling frequency. The Sampling Frequency Reduction allows a Discharger to decrease its monitoring from four (4) samples within each reporting year to one (1) QSE within the first half of each reporting year (July 1 to December 31) and one (1) QSE within the second half of each reporting year (January 1 to June 30). If a Discharger has a subsequent NAL exceedance after the Sampling Frequency Reduction, it must comply with the original sampling requirements of this General Permit. Only Dischargers that have baseline status or that have satisfied the Level 1 requirements are eligible for this sampling and analysis reduction.

A Discharger requesting to reduce its sampling frequency shall certify and submit a Sampling Frequency Reduction certification via SMARTS. The Sampling Frequency Reduction certification shall include documentation that the General Permit conditions for the Sampling Frequency Reduction have been satisfied.

Dischargers participating in a Compliance Group and certifying a Sampling Frequency Reduction are only required to collect and analyze storm water samples from one (1) QSE within each reporting year. These Dischargers must receive year-round compliance assistance from their Compliance Group Leader and must comply with all requirements of this General Permit.

5. Facilities Subject to Federal Storm Water Effluent Limitation Guidelines (ELGs)

Federal regulations at Subchapter N establish ELGs for industrial storm water discharges from facilities in eleven industrial sectors. For these facilities, compliance with the ELGs constitutes compliance with the technology standard of BPT, BAT, BCT, or New Source Performance Standards provided in the ELG for the specified pollutants, and compliance with the technology-based requirements in this General Permit for the specified pollutant.

K. Exceedance Response Actions (ERAs)

1. General

The previous permit did not incorporate the benchmarks from any of the MSGPs or NALs for Dischargers to evaluate sampling results. Unlike the requirements for industrial storm water discharges that cause or contribute to an exceedance of a

water quality standards, the previous permit did not provide definitions, procedures or guidelines to assess sampling results. Many Regional Water Boards have formally or informally notified Dischargers that exceedances of the MSGP benchmarks should be used to determine whether additional BMPs are necessary. However, there was considerable confusion as to the extent to which a Discharger would be expected to implement actions in response to exceedances of these values, and the timelines that had to be met to prevent an enforcement action. The lack of specificity with regards to what constituted an exceedance, and what actions are required in response to an exceedance, have been identified as a problem by the Water Boards, industry and environmental stakeholders.

This General Permit contains two (2) types of NALs. Annual NALs function similarly to, and are based upon, the values provided in the 2008 MSGP. Instantaneous maximum NALs target hot spots or episodic discharges of pollutants and are established based on California industrial storm water discharge monitoring data. When a Discharger exceeds an NAL it is required to perform ERAs. The ERAs are divided into two levels of responses and can generally be differentiated by the number of years in which a facility's discharge exceeds an NAL trigger. These two levels are explained further in Section XII of this General Permit. This ERA process provides Dischargers with an adaptive management-based process to develop and implement cost-effective BMPs that are protective of water quality and compliant with this General Permit. This process is also designed to provide Dischargers with a more defined pathway towards full compliance.

The ERA requirements in this General Permit were developed using best professional judgment and Water Board experience with the shortcomings of the previous permit's compliance procedures. Public comments received during State Water Board hearings on the 2002, 2005, 2011, 2012 and 2013 draft permits, and NPDES industrial storm water discharge permits from other states with well-defined ERA requirements were also considered by the State Water Board.

The State Water Board presumes that one single NAL exceedance for a particular parameter is not a clear indicator that a facility's discharge is out of compliance with the technology-based effluent limitations or receiving water limitations. This presumption recognizes the highly variable nature of storm water discharge and the limited value of a single quarterly grab sample to represent the quality of a facility's storm water discharge for an entire storm event and all other non-sampled storm events. With this presumption, the State Water Board is addressing costly monitoring requirements that do not bring forth valuable compliance and/or water quality information.

2. NALs and NAL Exceedances

   a. This General Permit contains two types of NAL exceedances as follows:

      Annual NAL exceedance - the Discharger is required to calculate the average annual concentration for each parameter using the results of all sampling and analytical results for the entire facility for the reporting year (i.e., all "effluent" data), and compare the annual average concentration to the corresponding Annual NAL values in Table 2 of this General Permit. An

annual NAL exceedance occurs when the annual average of all the sampling results for a parameter taken within a reporting year exceeds the annual NAL value for that parameter listed in Table 2 of this General Permit.

For the purposes of calculating the annual average concentration for each parameter, this General Permit considers any sampling result that are a "non-detect" or less than the method detection limit as a zero (0) value. The reason to use zero (0) values instead of the detected but not quantifiable value (minimum level or reporting limit) is that these values are very low and are unlikely to contribute to an NAL exceedance. There are statistical methods to include low values when calculations are for numeric criteria and limitations, however, the NALs in this General Permit are approximate values used to provide feedback to the Discharger on site performance, and are not numeric criteria or limitations. Therefore, it is not necessary to include these insignificant values in the calculations for the NALs. For Dischargers using composite sampling or flow measurement in accordance with standard practices, the average concentrations shall be calculated in accordance with the U.S. EPA Guidance Manual for the Monitoring and Reporting Requirements of the NPDES Multi-Sector Storm Water General Permit.[12]

i. Instantaneous maximum NAL exceedance - the Discharger is required to compare all sampling and analytical results from each distinct sample (individual or combined) to the corresponding instantaneous maximum NAL values in Table 2 of this General Permit. An instantaneous maximum NAL exceedance occurs when two or more analytical results from samples taken for any parameter within a reporting year exceed the instantaneous maximum NAL value (for TSS and O&G), or are outside of the instantaneous maximum NAL range (for pH).

b. Instantaneous maximum NAL analysis

In its June 19, 2006 report, the Blue Ribbon Panel of Experts (Panel) made several specific recommendations for how to set numeric limitations in future industrial storm water general permit(s). For sites not subject to TMDLs, the Panel suggested that the numeric values be based upon industry types or categories, with the recognition that each industry has its own specific water quality issues and financial viability. Furthermore, the Panel concluded:

> To establish Numeric Limits for industrial sites requires a reliable database, describing current emissions by industry types or categories, and performance of existing BMPs. The current industrial permit has not produced such a database for most industrial categories because of inconsistencies in monitoring or compliance with monitoring requirements. The Board needs to reexamine the existing data sources, collect new data as required and for additional water quality parameters (the current permit requires only pH, conductivity, total suspended solids,

[12] U.S. EPA. NPDES Storm Water Sampling Guidance Document. Web. July 1992. <http://www.epa.gov/npdes/pubs/owm0093.pdf>. [as of February 4, 2014].

> and either total organic carbon or oil and grease) to establish practical and achievable Numeric Limits.

The Panel suggested an alternative method that would allow the use of the existing Water Board dataset to establish action levels, referred to as the "ranked percentile" method. The Panel recommended:

> The ranked percentile approach (also a statistical approach) relies on the average cumulative distribution of water quality data for each constituent developed from many water quality samples taken for many events at many locations. The Action Level would then be defined as those concentrations that consistently exceed some percentage of all water quality events (i.e. the 90th percentile). In this case, action would be required at those locations that were consistently in the outer limit (i.e. uppermost 10th percentile) of the distribution of observed effluent qualities from urban runoff.

After performing various data analysis exercises with the Water Board dataset, State Water Board staff concluded that the Water Board dataset is not adequate to calculate instantaneous NAL values using the Panel's recommended method for all of parameters that have annual NAL values based on the U.S. EPA benchmarks. Additionally, public comments on the January 2011 draft of this General Permit suggest that it is problematic to calculate NAL values based on the existing data. Therefore, the Water Board dataset was not used to calculate instantaneous NAL values for all parameters.

However, since all Dischargers regulated under the previous permit were required to sample for TSS and O&G/TOC , State Water Board staff found that the existing dataset for these parameters is of sufficient quality to calculate instantaneous NAL values. State Water Board staff also found that this data was less prone to what appear to be data input errors. The final dataset used to calculate the instantaneous NALs in this General Permit had outlier values that were eliminated from the dataset by using approved test method detection limits ranges. The methods and corresponding method detection limit ranges used to screen outliers are as follows:

- O&G - EPA 413.1 Applicable Range: 5-1,000 mg/L
- O&G - EPA 1664 Applicable Range: 5-1,000 mg/L
- TSS - EPA 160.2 Applicable Range: 4-20,000 mg/L

The intent of the instantaneous maximum NAL is to identify specific drainage areas of concern or episodic sources of pollution in industrial storm water that may indicate inadequate storm water controls and/or water quality impacts. In the effort to add instantaneous NAL exceedances to the ERA process, the State Water Board explored different options for the development of an appropriate value (i.e. percentile approach, benchmarks times a multiplier, confidence intervals). The California Stormwater Quality Association's comments on the previous draft permit included a proposed method for calculating NAL values

using a percentile approach. The State Water Board researched and evaluated this methodology and determined it is the most appropriate way to directly compare available electronic sampling data from Dischargers regulated under the previous permit. This percentile approach was used to establish the instantaneous maximum NALs in this General Permit, for discharges to directly compare with sampling results and identify drainage areas of water quality concern.

The percentile approach is a non-parametric approach identified in many statistical textbooks for determining highly suspect values. Highly suspect values are defined as values that exceed the limits of the outer fences of a box plot. Upper limits of the outer fence are calculated by adding three times the inter-quartile range (25th to 75th percentiles) to the upper-end of the inter-quartile range (the 75th percentile). The California Stormwater Quality Association calculated an NAL value of 401 mg/L for TSS using the percentile approach using the Water Board dataset. The State Water Board performed the same analysis with the same Water Board dataset and calculated a slightly different value of 396 mg/L; therefore, the instantaneous maximum NAL value for TSS of 400 mg/L was established. Appling the percentile approach to the existing O&G data results in the instantaneous maximum NAL value for O&G of 25 mg/L.

The State Water Board compared existing sampling data to the instantaneous maximum NAL values and concluded that seven (7) percent of the total samples exceeded the highly suspected value for TSS and 7.8 percent of the total samples exceeded the highly suspected value for O&G. These results suggest that the instantaneous maximum NAL values are adequate to identify drainage areas of concern statewide since they are not regularly exceeded. Using best professional judgment, the State Water Board concludes that an exceedance of these values twice within a reporting year is unlikely to be the result of storm event variability or random BMP implementation problems, and the use of the percentile approach is therefore appropriate.

Due to issues with the ranges of concentrations and the logarithmic nature of pH, statistical methods cannot be applied to pH in the same ways as other parameters. Review of storm water sampling data by the State Water Board and other stakeholders has shown that pH is not typically a parameter of concern for most industrial facilities. Accordingly, a range of pH limits established in Regional Water Board Basin Plans is implemented in this General Permit for the instantaneous maximum NAL values. Most Basin Plans set a water quality objective of 6.0 - 9.0 pH units for water bodies, an exceedance outside the range of 6.0 - 9.0 pH units is consistent with the water quality concerns for pH among Regional Water Boards. An industrial facility with proper BMP implementation is expected to have industrial storm water discharges within the range of 6.0 - 9.0 pH units.

High concentrations of TSS and O&G, or pH values outside the range of 6.0 – 9.0 pH units, in a discharge may be an indicator of potential BMP implementation or receiving water quality concerns with other pollutants with parameters that do not have an instantaneous maximum NAL value. The State Water Board may

consider instantaneous maximum NAL values for other parameters in a subsequent reissuance of this General Permit, based on data collected during this General Permit term.

The percentile approach is considered by many stakeholders to be the best method to evaluate BMP performance and general effluent quality in a community or population where the vast majority of the industrial facilities are implementing sufficient pollutant control measures. The Water Board's current dataset does not provide a way of evaluating actual BMP implementation at each facility when analyzing the data; therefore the monitoring information reported during the previous permit term cannot be linked to compliance with technology-based standards. The State Water Board intends to use data collected during this General Permit term to evaluate the percentile approach, improve the quality of collected data for other parameters, and further develop an understanding of how reported data relates to implemented BMP-control technologies.

Under this General Permit, a Discharger enters Level 1 status and must fulfill the Level 1 status ERA requirements following its first occurrence of any NAL exceedance. Level 2 status ERA requirements follow the second occurrence of an NAL exceedance for the same parameter in a subsequent reporting year. This ERA process provides Dischargers with an adaptive management-based process to develop and implement cost-effective BMPs that are protective of water quality and compliant with this General Permit. This General Permit's ERA process is designed to have a well-defined compliance end-point. It is not a violation of this General Permit to exceed the NAL values; it is a violation of the permit, however, to fail to comply with the Level 1 status and Level 2 status ERA requirements in the event of NAL exceedances.

The State Water Board acknowledges that storm water discharge concentrations are often highly variable and dependent upon numerous circumstances such as storm size, the time elapsed since the last storm, seasonal activities, and the time of sample collection. Since there are potential enforcement consequences for failure to comply with this General Permit's ERA process, the State Water Board's intention is to use NAL exceedances to solely require Dischargers with recurring annual NAL exceedances or drainage areas that produce recurring instantaneous maximum NAL exceedances to be subject to the follow-up ERA requirements.

If NALs exceedances do not occur, the State Water Board generally expects that the Discharger has implemented sufficient BMPs to control storm water pollution. When NAL exceedances do occur, however, the potential that the Discharger may not have implemented appropriate and/or sufficient BMPs increases, and the Discharger is required to implement escalating levels of ERAs. If NAL exceedances occur, this General Permit requires Dischargers to evaluate and potentially install additional BMPs, or re-evaluate and improve existing BMPs to be in compliance with this General Permit.

3. Baseline Status

At the beginning of a Discharger's NOI coverage under this General Permit, the Discharger has Baseline status. A Discharger demonstrating compliance with all NALs will remain at Baseline status and is not required to complete Level 1 status and Level 2 status ERA requirements.

If a Discharger has returned to Baseline status (from Level 2 status) and additional NAL exceedances occur, the Discharger goes into Level 1 status, then potentially Level 2 status. Dischargers do not go directly into Level 2 status from Baseline status.

4. Level 1 Status

Regardless of when an NAL exceedance occurs during Baseline status, a Discharger's status changes from Baseline status to Level 1 status on July 1 of the subsequent reporting year. By October 1 following the commencement of Level 1 status, the Discharger is required to appoint a QISP to assist with the completion of the Level 1 Evaluation. The Level 1 Evaluation must include a review of the facility's SWPPP for compliance with the effluent and receiving water limitations of this General Permit, an evaluation of the industrial pollutant sources at the facility that are or may be related to the NAL exceedance(s), and identification of any additional BMPs that will eliminate future exceedances. When conducting the Level 1 Evaluation, a Discharger must ensure that all potential pollutant sources that could be causing or contributing to the NAL exceedance(s) are fully characterized, that the current BMPs are adequately described, that employees responsible for implementing BMPs are appropriately trained, and that internal procedures are in place to track that BMPs are being implemented as designed in the SWPPP. A Discharger is additionally required to evaluate the need for additional BMPs. Level 1 ERAs are designed to provide the Discharger the opportunity to improve existing BMPs or add additional BMPs to comply with the requirements of this General Permit.

By January 1 following commencement of Level 1 status, a Discharger is required to certify and submit via SMARTS a Level 1 ERA Report prepared by a QISP. The Level 1 ERA Report must contain a summary of the Level 1 Evaluation, all new or revised BMPs added to the SWPPP.

In most cases, the State Water Board believes that Level 1 status BMPs will be operationally related rather than structural and, therefore can be implemented without delay. Recognizing that a Discharger should not be penalized for sampling results obtained before implementing BMPs, sampling results for parameters and their corresponding drainage areas that caused the NAL exceedance up to October 1 or the date the BMPs were implemented, whichever is sooner, will not be used for calculating NAL exceedances. Although this General Permit allows up to January 1 to implement Level 1 status BMPs, the State Board has chosen an interim date of October 1 to encourage more timely Level 1 BMP implementation. Dischargers who implement Level 1 BMPs after October 1 may risk obtaining subsequent sampling results that may cause them to go into Level 2 status.

5. Level 2 Status

Level 2 ERAs are required during any subsequent reporting year in which the same parameter(s) has an NAL exceedance (annual average or instantaneous maximum), if this occurs, a Discharger's status changes from Level 1 status to Level 2 status on July 1 of the subsequent reporting year. Dischargers with Level 2 status must further evaluate BMP options for their facility. Dischargers may have to implement additional BMPs, which may include physical, structural, or mechanical devices that are intended to prevent pollutants from contacting storm water. Examples of such controls include, but are not limited to:

- Enclosing and/or covering outdoor pollutant sources within a building or under a roofed or tarped outdoor area.

- Physically separating the pollutant sources from contact with run-on of uncontaminated storm water.

- Devices that direct contaminated storm water to appropriate treatment BMPs (e.g., discharge to sanitary sewer as allowed by local sewer authority).

- Treatment BMPs including, but not limited to, detention ponds, oil/water separators, sand filters, sediment removal controls, and constructed wetlands.

Dischargers may select the most cost-effective BMPs to control the discharge of pollutants in industrial storm water discharges. Where appropriate, BMPs can be designed and targeted for various pollutant sources (e.g., providing overhead coverage for one potential pollutant while discharging to a detention basin for another source may be the most cost-effective solution).

a. Level 2 ERA Action Plans

The State Water Board acknowledges that there may be circumstances that make it difficult, if not impossible, for a Discharger to immediately implement additional BMPs. For example, it may take time to get a contract for construction in place, obtain necessary building permits, and design and construct the BMPs. Dischargers may also suspect that pollutants are from a non-industrial or natural background source and need time to study their site. A Discharger is required to certify and submit an Action Plan prepared by a QISP via SMARTS by January 1 following the reporting year in which the NAL exceedance that resulted in the Discharger entering Level 2 occurred. The Level 2 ERA Action Plan requires a Discharger to propose actions necessary to complete the Level 2 ERA Technical Report, the demonstrations the Discharger has selected, and propose a time frame for implementation.

If a Discharger changes the QISP assisting with the Level 2 ERA requirements this General Permit requires the Discharger to update the QISP information via SMARTS. Current information on individuals assisting Dischargers with compliance of this General Permit provides the Water Boards with the necessary contact information if there are questions on the submitted documents, and for possible verification of a QISP's certification.

Dischargers are required to address each Level 2 NAL exceedance in an Action Plan. The State Water Board recognizes that Dischargers with Level 2 status may have multiple parameters or facility areas that have Level 2 NAL exceedances and the timing of the exceedances may make it very difficult to address all Level 2 NAL exceedances in one Action Plan. When Level 2 ERA exceedances occur in subsequent reporting years, after an Action Plan is certified and submitted, a Discharger will need to develop an Action Plan for this new Level 2 NAL exceedance. This General Permit defines new Level 2 NAL exceedances as an exceedance for a new parameter in any drainage area at the facility, or an exceedance for the same parameter being addressed in an existing Action Plan, but where the exceedance occurred in a different drainage area than identified in the existing Action Plan.

b. Level 2 ERA Technical Reports

The Level 2 ERA Technical Report contains three different options that require a Discharger to submit demonstrations showing the cause of the NAL exceedance(s). This General Permit requires a Discharger to appoint a QISP to prepare the Level 2 ERA Technical Reports. The State Water Board acknowledges that there may be cases where a combination of the demonstrations may be appropriate; therefore a Discharger may combine any of the following three demonstration options in their Level 2 ERA Technical Report when appropriate. A Discharger is only required to annually update its Level 2 ERA Technical Report when necessary and is not required to annually re-certify and re-submit the entire Level 2 ERA Technical Report.

i. Industrial Activity BMPs Demonstration

The Industrial Activity BMPs Demonstration is for the following:

- Dischargers who decided to implement additional BMPs that are expected to eliminate future NAL exceedance(s) and that have been implemented in order to achieve compliance with the technology-based effluent limitations of this General Permit, and

- Dischargers who decided to implement additional BMPs that may not eliminate future NAL exceedance(s) and that have been implemented in order to achieve compliance with the technology-based effluent limitations of this General Permit.

When preparing the Industrial Activity BMPs Demonstration, the QISP shall identify and evaluate all individual pollutant source(s) associated with industrial activity that are or may be related to an NAL exceedance and all designed, information on the drainage areas associated with the Level 2 NAL exceedances, and installed BMPs that are implemented to reduce or prevent pollutants in industrial storm water discharges in compliance with this General Permit.

If an Industrial Activity BMPs Demonstration is submitted as the Level 2 ERA Technical Report and the Discharger is able to show reductions in pollutant concentrations below the NALs for four (4) subsequent consecutive QSEs, the Discharger returns to Baseline Status. A Discharger that submits an Industrial Activity BMPs Demonstration but has not installed additional BMPs that are expected to eliminate future NAL exceedance(s) will remain with Level 2 status but is not subject to additional ERAs unless directed by the Regional Water Board.

ii. Non-Industrial Pollutant Source Demonstration

A Non-Industrial Pollutant Source Demonstration is for a Discharger to demonstrate that the pollutants causing the NAL exceedances are not related to industrial activities conducted at the facility, and additional BMPs at the facility will not contribute to the reduction of pollutant concentrations.

Dischargers including the Non-Industrial Pollutant Demonstration in their Level 2 ERA Technical Report shall have a QISP determine that the sources of non-industrial pollutants in storm water discharges are not from industrial activity or natural background sources within the facility.

Sources of non-industrial pollutants that are discharged separately and are not comingled with storm water associated with industrial activity are not considered subject to this General Permit's requirements. When pollutants from non-industrial sources are comingled with storm water associated with industrial activity, the Discharger is responsible for all the pollutants in the combined discharge unless the technical report clearly demonstrates that the NAL exceedances due to the combined discharge are solely attributable to the non-industrial sources. The pollutant may also be present due to industrial activities, in which case the Discharger must demonstrate that the pollutant contribution from the industrial activities by itself does not result in an NAL exceedance. In most cases, the Non-Industrial Pollutant Source Demonstration will contain sampling data and analysis distinguishing the pollutants from non-industrial sources from the pollutants generated by industrial activity.

Once the Level 2 ERA Technical Report, including this demonstration is certified and submitted via SMARTS, the Discharger has satisfied all the requirements necessary for that pollutant for ERA purposes. A Discharger that submits a Non-Industrial Pollutant Demonstration remains with Level 2 status but is not subject to additional ERAs unless directed by the Regional Water Board.

iii. Natural Background Pollutant Source Demonstration

The benchmark monitoring schedule in section 6.2.1.2 of the 2008 MSGP allows a Discharger to determine that the exceedance of the benchmark is attributable solely to the presence of that pollutant in the natural background. A Discharger making this determination is not required to perform corrective

action or additional benchmark monitoring providing that the other 2008 MSGP requirements are met. The 2008 MSGP Fact Sheet requires Dischargers to include in the following in the SWPPP: 1) map(s) showing the reference site location, facility, available land cover information, reference site and test site elevation, available geology and soil information for reference and test sites, photographs showing site vegetation, site reconnaissance survey data and records. This General Permit requires this information to be included in the Natural Background Pollutant Source Demonstration in Section XII.D.2.c.

The Natural Background Pollutant Source Demonstration in this General Permit is for a Discharger that can demonstrate that pollutants causing the NAL exceedances are not related to industrial activities conducted at the facility, and are solely attributable to the presence of those pollutants in natural background. The pollutant may also be present due to industrial activities, in which case the Discharger must demonstrate that the pollutant contribution from the industrial activities by itself does not result in an NAL exceedance. Natural background pollutants include those substances that are naturally occurring in soils or groundwater that have not been disturbed by industrial activities. Natural background pollutants do not include legacy pollutants from earlier activity on a site, or pollutants in run-on from neighboring sources which are not naturally occurring. Dischargers are not required to reduce concentrations for pollutants in the effluent caused by natural background sources if these pollutants concentrations are not increased by industrial activity.

The 2008 MSGP Fact Sheet states that the background concentration of a pollutant in runoff from a non-human impacted reference site in the same watershed must be determined by evaluation of ambient monitoring data or by using information from a peer-reviewed publication or a local, state, or federal government publication specific to runoff or storm water in the immediate region. Studies that are in other geographic areas, or are clearly based on different topographies or soils, are not sufficient to meet this requirement. When such data is not available, and there are no known sources of the pollutant, the background concentration should be assumed to be zero.
In cases where historic monitoring data from a site are used for generating a natural background concentration, and the site is no longer accessible or able to meet reference site acceptability criteria, the Discharger must submit documentation (e.g., historic land use maps) indicating the site did meet reference site criteria (such as indicating the absence of human activity) during the time data collection occurred.

Once the Level 2 ERA Technical Report, including a Natural Background Demonstration meeting the conditions in Section XII.D.2.c of this General Permit is certified and submitted via SMARTS, the Discharger is no longer responsible for the identified background parameters(s) in the corresponding drainage area(s). A Discharger that submits this type of demonstration will

remain with Level 2 status but is not subject to additional ERAs unless directed by the Regional Water Board.

c. Level 2 ERA Implementation Extension

The State Water Board recognizes that there may be circumstances that make implementation of all necessary actions required in the Level 2 ERAs by the permitted due dates infeasible. In such circumstances a Discharger may request additional time by submitting a Level 2 ERA Implementation Extension. The Level 2 ERA Implementation Extension will automatically allow Dischargers up to an additional six (6) months to complete the tasks identified in the Level 2 ERA Action Plans while remaining in compliance with this General Permit. The Level 2 ERA Implementation Extension is subject to Regional Water Board review. If additional time is needed beyond the initial six (6) month extension, a second Level 2 ERA Implementation Extension may be submitted but is not effective unless it is approved by the Water Board.

L. Inactive Mining Operations

Inactive mining sites may need coverage under this General Permit. Inactive mining operations are mining sites, or portions of sites, where mineral mining and/or dressing occurred in the past with an identifiable Discharger (owner or operator), but are no longer actively operating. Inactive mining sites do not include sites where mining claims are being maintained prior to disturbances associated with the extraction, beneficiation, or processing of mined materials. A Discharger has the option to certify and submit via SMARTS that its inactive mining operations meet the conditions for an Inactive Mining Operation Certification in Section XIII of this General Permit. The Discharger must have a SWPPP for an inactive mine signed (wet signature with license number) by a California licensed professional engineer. The Inactive Mining Operation Certification in this General Permit is in lieu of performing certain identified permit requirements. This General Permit requires an annual inspection of an inactive mining site and an annual re-certification of the SWPPP. Any significant updates to the SWPPP shall be signed (wet signature and license number) by a California license professional engineer. The Discharger must certify and submit via SMARTS any significantly revised SWPPP within 30 days of the revision(s)

M. Compliance Groups and Compliance Group Leaders

Group Monitoring, as defined in the previous permit, has been eliminated in this General Permit and replaced with a new compliance option called Compliance Groups. The Compliance Group option differs from Group Monitoring as it requires (1) all Dischargers participating in a Compliance Group (Compliance Group Participants) sample two QSEs each year, (2) the Compliance Group Leader to inspect each Participant's facility within each reporting year, (3) the Compliance Group Leader must complete a State Water Board sponsored or approved training program for Compliance Group Leaders, and (4) the Compliance Group Leader to prepare Consolidated Level 1 ERA Reports, and individual Level 2 ERA Action Plans and Technical Reports. The Compliance Group option is similar to Group Monitoring as it retains a mechanism that

allows Dischargers of the same industry type to comply with this General Permit through shared resources in a cost saving manner.

This General Permit emphasizes sampling and analysis as a means to evaluate BMP performance and overall compliance, and the significantly reduced sampling requirements previously afforded to Group Monitoring Participants (two samples within a five-year period) does not provide the necessary information to achieve these goals. However, a moderate reduction in sampling requirements is included as an incentive for Compliance Group Participants while concurrently requiring sufficient individual facility sampling data to determine compliance. A Compliance Group Leader is required to provide the necessary sampling training and guidance to the Compliance Group Participants. This additional training requirement will increase sampling data quality that will offset the reduced sampling frequency for Compliance Groups.

Participation in Compliance Groups will provide additional cost savings for Dischargers in the preparation of the Consolidated Level 1 ERA Reports, and for Compliance Group Leader assistance in preparing the Level 2 ERA Action Plans and the individual Level 2 ERA Technical Reports. It is likely that many of the pollutant sources causing NAL exceedances, and the corresponding BMP cost evaluation and selection, when appropriate, will overlap for groups of facilities in a similar industry type. When these overlaps occur, a Compliance Group Leader should be able to more efficiently evaluate the pollutant sources and BMP options, and prepare the necessary reports.

The State Water Board believes that it is necessary for Compliance Group Leaders to have a higher level of industrial storm water compliance and training experience than the expectations of a QSIP. Many stakeholder comments on this General Permit suggested various certifications to provide this higher level of experience; however, the State Water Board believes a process similar to the Trainer of Record process for the Construction General Permit training program will develop Compliance Group Leaders with the appropriate level of experience to fulfill the necessary qualifications.

The intent of the Compliance Groups is to have only one or a small number of Compliance Groups per industrial sector. The process for becoming a QISP trainer and/or a Compliance Group Leader is purposely similar to the Construction General Permit trainer of record process for consistency within storm water regulatory leaders. The formal process to qualify to conduct trainings for QISPs and/or to be a Compliance Group Leader will include the submittal of a statement of qualifications for review, a review fee, completion of an exam and training specific to this role. For more information see the Construction General Permit trainer of record process: http://www.casqa.org/TrainingandEducation/ConstructionGeneralPermitTrainingQSDQSPToR/tabid/205/Default.aspx

After the initial Compliance Group registration, Compliance Group Leaders are required to submit and maintain their list of Compliance Group Participants via SMARTS. There are no additional administrative documents required. The previous permit required group leaders to provide annual group evaluation reports and a letter of intent to continue group monitoring. The State Water Board found these items to be resource intensive and placed an unnecessary administrative burden on group leaders. The

Compliance Group requirements in this General Permit reduces the administrative burden on both the Compliance Group Leaders and Water Board staff.

The State Water Board's intent for the effluent data, BMP selection, cost, and performance information, and other industry specific information provided in Compliance Group reports is for evaluation of sector-specific permitting approaches and the use of NALs in the next reissuance of this General Permit.

N. Annual Evaluation

Federal regulations require NPDES industrial storm water Dischargers to evaluate their facility and SWPPP annually. Typically this requires an inspection of the facility to ensure: (1) the SWPPP site map is up to date, (2) control of all potential pollutant sources is included in the SWPPP, and (3) sampling data and visual observation records are used to evaluate if the proper BMPs are being implemented. As Dischargers are required to conduct monthly visual observation that partially overlap with the actions required by the annual evaluation requirements, Dischargers may perform the annual evaluation inspection concurrent with a monthly visual observation.

O. Annual Report

All Dischargers shall certify and submit via SMARTS an Annual Report no later than July 15 following each reporting year. The reporting requirements for this General Permit's Annual Report are streamlined in comparison to the previous permit. The Annual Report now consists of two primary parts: (1) a compliance checklist indicating which permit requirements were completed and which were not (e.g., a Discharger who completes the required sampling of four QSEs during the reporting year, versus a Discharger who is only able to sample two QSEs during the reporting year), and (2) an explanation for items on the compliance checklist that were determined incomplete by the Discharger. Unlike the previous permit, the Annual Report does not require Dischargers to provide the details of each visual observation (such as name of observer, time of observation, observation summary, corrective actions, etc.) or provide the details of the Annual Comprehensive Site Evaluation. Dischargers, however, continue to be required to retain those records and have them available upon request. The Annual Report is further simplified through the immediate electronic reporting via SMARTS of sampling data and copies of the original laboratory reports instead of such information being included in the Annual Report.

P. Conditional Exclusion - No Exposure Certification (NEC) Requirements

This General Permit's conditional exclusion requirements are similar to the requirements provided in 40 C.F.R. section 122.26(g)(3). Clarifications were added in this General Permit, however, to the types of "storm resistant shelters" and the periods when "temporary shelters" may be used in order to avert regulatory confusion. California does not have operating coal power plants, which are a major contributor to acid rain elsewhere in the United States. California does have nonpoint sources or atmospheric deposition that may locally impact the pH of the rain water, however this is not categorized as acid rain as referred to by the U.S. EPA for the NEC coverage

DRAFT

requirements. The No Exposure Guidance Document[13] developed by the U.S. EPA mentions acid rain as a potential source of contaminants to consider for NEC coverage. The acid rain leachate language was not included in this General Permit's Appendix 2 to clarify that Dischargers may qualify for NEC coverage, even if the facility has metal buildings or structures.

The Discharger shall certify and submit complete PRDs for NEC coverage via SMARTS. Based upon the State Water Board's experience with reissuing and implementing the 2009 Construction General Permit, the transition for existing Dischargers to register under this new General Permit is staff resource intensive. The State Water Board staff is available to assist Dischargers requiring assistance with enrolling under this General Permit, both for NOI coverage and NEC coverage. The State Water Board has also experienced that more time is needed for its staff to assist Dischargers registering for NEC coverage. To provide better customer service to all Dischargers, three months have been added to the NEC coverage PRD submittal schedule for new and existing Dischargers (Section II.B.4 of this General Permit, extending the NEC coverage registration date to October 1, 2015.

Dischargers must annually inspect their facility to ensure continued compliance with NEC requirements, and annually re-certify and submit an NEC via SMARTS. Based on its regulatory experience, the State Water Board has determined that a five-year NEC re-certification period is inadequate. A significant percentage of facilities may revise, expand, or relocate their operations in any given year. Furthermore, a significant percentage of facilities experience turnover of staff knowledgeable of the NEC requirements and limitations. Accordingly, the State Water Board believes that annual NEC evaluation and re-certification requirements are appropriate to continually assure adequate program compliance.

Q. Special Requirements - Plastic Materials

Water Code section 13367 requires the Water Boards to implement measures that control discharges of preproduction plastic from point and nonpoint sources. The State Water Board intends to use this General Permit to regulate discharges of preproduction plastics from areas of facilities that are subject to this General Permit. A Regional Water Board may designate facilities, or areas of facilities, that are not otherwise subject to this General Permit, pursuant to Section XIX.F. For example, a Regional Water Board may designate Plastic Materials handling areas of a transportation facility that are not associated with vehicle maintenance as requiring coverage under this General Permit.

Preproduction plastics used by the plastic manufacturing industry are small in size and have the potential to mobilize in storm water. Preproduction plastic washed into storm water drains can move to waters of the United States where it contributes to the growing problem of plastic debris in inland and coastal waters. Water Code section 13367 outlines five mandatory BMPs that are required for all facilities that handle preproduction plastic. These mandatory BMPs are included in this General Permit.

[13] U.S. EPA. Guidance Manual for Conditional Exclusion from Storm Water Permitting Based On "No Exposure" of Industrial Activities to Storm Water. Web. June 2000. < http://www.epa.gov/npdes/pubs/noxguide.pdf>. [as of January 31, 2014].

The State Water Board has received comments regarding the Water Code requirements for Plastics Facilities to install a containment system for on-site storm drain locations that meet 1mm capture and 1-year 1-hour storm flow requirement standards. As a result, this General Permit includes the option under Water Code section 13367 that allows a plastics facility to propose an alternative BMP or suite of BMPs that can meet the same performance and flow requirements as a 1mm capture and 1-year 1-hour storm flow containment system standards. These alternative BMPs are to be submitted to the Regional Water Board for approval. This alternative is intended to allow the facility to develop BMPs that focus on pollution prevention measures that can perform as well as, or better than, the containment system otherwise required by the statute.

The State Water Board also includes two additional containment system alternatives in this General Permit that are considered to be equivalent to, or better than, the 1mm capture and 1-year 1-hour storm flow requirements:

- An alternative allowing plastic facilities to implement a suite of eight BMPs addressing the majority of potential sources of plastic discharges. This suite of BMPs is based on industry and U.S. EPA recommendations and Water Board experience with storm water inspections, violations, and enforcement cases throughout California.

- An alternative allowing a facility to operate in a manner such that all preproduction plastic materials are used indoors and pose no potential threat for discharge off-site. The facility is required to notify the Regional Water Board of the intent to seek this exemption and of any changes to the facility or operations that may disqualify the facility for the exemption. The exemption may be revoked by the Regional Water Board at any time.

Plastics facilities may use preproduction plastic materials that are less than 1mm in size, or produce materials, byproducts, or waste that is smaller than 1mm in size. These small size materials will pass through the 1mm capture containment system required by Water Code section 13367. Plastics facilities with sub-1mm materials must design a containment system to capture the smallest size material onsite with a 1-year 1-hour storm flow requirement, or propose alternative BMPs for Regional Water Board approval that meet the same requirements.

The remaining BMPs required by Water Code section 13367 are consistent with recommendations for handling and clean-up of preproduction plastics in the American Chemistry Council publication, *Operation Clean Sweep* and U.S. EPA's publication *Plastic Pellets in the Aquatic Environment: Sources and Recommendations*. The State Water Board believes that the entire approach in this General Permit for plastic materials is consistent with Water Code section 13367.

R. Regional Water Board Authorities

The Regional Water Boards retain discretionary authority over many issues that may arise from industrial discharges within their respective regions. This General Permit emphasizes the authority of the Regional Water Boards over specific requirements of this General Permit that do not meet region-specific water quality protection regulatory needs.

S. Special Conditions: Requirements for Dischargers Claiming the "No Discharge" Option in the Notice of Non-Applicability

1. General

Entities that operate facilities generating storm water associated with industrial activities that is not discharged to waters of the United States are not required to obtain General Permit coverage. Entities that have contacted the Water Boards to inquire what is necessary to avoid permit coverage have received inconsistent guidance. This has resulted in regulatory inconsistency and uncertainty as to whether they are in compliance if their industry operates without General Permit coverage. Depending upon how each Regional Water Board handles "No Discharge" claims, some facilities with advanced containment design may be required to obtain General Permit coverage while other facilities with less advanced containment design may be allowed to operate without General Permit coverage. Some stakeholders have complained that this type of regulatory inconsistency puts some facilities at an economically-competitive disadvantage given the costs associated with permit compliance.

U.S. EPA regulations do not provide a design standard, definition, or guidance as to what constitutes "No Discharge." Unlike Conditional Exclusion requirements, U.S. EPA regulations do not require an entity to submit technical justification or certification that a facility does not discharge to waters of the United States (U.S.). Therefore entities have previously been allowed to self-determine that their facility does not discharge to water of the U.S. when using any containment design standard. The State Water Board does not have available information showing that most entities have adequately performed hydraulic calculations to determine the frequency of discharge corresponding to their containment controls or have had these hydraulic calculations reviewed or completed by a California licensed professional engineer. Although U.S. EPA makes clear that an unpermitted discharge to waters of the U.S. is a violation of the CWA, this leaves regulatory agencies with the very difficult task of knowing when any given facility discharges in order to carry-out enforcement actions.

In 1998, the Water Code was amended to require entities who are requested by the Water Boards to obtain General Permit coverage, but that have a valid reason to not obtain General Permit coverage, to submit a Notice of Non-Applicability (NONA). (Wat. Code, § 13399.30, subd. (a)(2)). The NONA covers multiple reasons why an entity is not required to be permitted including (1) facility closure, (2) not the legal owner, (3) incorrect SIC code, (4) eligibility for the Conditional Exclusion (No Exposure Certification), and (5) the facility not discharging to water of the U.S. ("No Discharge"). The previous permit contained definitions, requirements, and guidance that entities may reference to determine whether they are eligible to select any of the first four NONA reasons for not obtaining General Permit coverage. However, neither the previous permit nor the Water Code provide definitions, requirements, and guidance for entities to determine whether they are eligible to indicate "No Discharge" on the NONA as a reason for not obtaining General Permit coverage.

This General Permit addresses and resolves the issues discussed above by establishing consistent, statewide eligibility requirements in Section XX.C for entities submitting NONAs indicating "No Discharge." When requested by the Water Boards to obtain General Permit coverage, entities must meet these "No Discharge" eligibility requirements or obtain General Permit coverage. The Water Boards retain enforcement authority if a facility subsequently discharges.

2. "No Discharge" Eligibility Requirements

   The entity must certify submit in SMARTS a NONA Technical Report signed (wet signature and license number) by a California licensed professional engineer that contains the analysis and details of the containment design supporting the "No Discharge" eligibility determination. Because containment design will require hydraulic calculations, soil permeability analysis, soil stability calculations, appropriate safety factor consideration, and the application of other general engineering principles, state law requires the technical report to be signed (wet signature and license number) by a California licensed professional engineer.

   The State Water Board has selected a containment design target that, as properly applied will result in few, if any, discharges. The facility must either be:

   a. Engineered and constructed to contain all storm water associated with industrial activities from discharging to waters of the United States, including no discharge to groundwater that has a direct hydrologic connection to waters of the United States. Dischargers must base this information upon maximum historic precipitation event data (or series of events) from the nearest rain gauges as provided by the National Oceanic and Atmospheric Administration's (NOAA) website, or other nearby precipitation data available from other government agencies. At a minimum, Dischargers must ensure that the containment design addresses maximum 1-hour, 24-hour, weekly, monthly, and annual precipitation data for the duration of the exclusion.

      Design storm events are generally specified as a one-time expected hydraulic failure over a reoccurrence of years for a specified storm event. For example, if a design storm standard is a 100 year 24-hour event, then a facility's containment system designed to contain the maximum volume of water would be expected to fall in 24 hours once every 100 years. Design standards vary dependent upon the regulatory program and the level of protection needed. Since California has considerable variations in climate/topography/soil conditions across the state, the "No Discharge" NONA eligibility requirements have been created so that each facility's containment design can incorporate unique site specific circumstances to meet the requirement that discharges will not occur based upon past historical precipitation data. Facilities that are not designed to not meet the "No Discharge" eligibility requirements must obtain General Permit coverage.

   b. Located in basins or other physical locations that are not hydrologically connected to waters of the United States.

The State Water Board considered allowing Entities to review United States Army Corp of Engineer maps to determine, without a California licensed professional engineer, whether their facility location is within a basin and/or other physical location that is not hydrologically connected to waters of the United States. The State Water Board believes that this determination can be difficult in some cases, or is likely to be performed incorrectly. In addition, there may be areas of the state that are not hydrologically connected to waters of the United States, but are not on United States Army Corps of Engineer maps. Therefore, all "No Discharge" Technical Reports must be signed (wet signature and license number) by a California licensed professional engineer.

3. Additional Considerations

The "No Discharge" determination does not cover storm water containment systems that transfer industrial pollutants to groundwater. Entities must determine whether designs that incorporate infiltration may discharge to and contaminate groundwater. If there is a threat to groundwater, Entities must contact the Regional Water Boards prior to construction of infiltration design elements.

Entities that have not eliminated all discharges that are subject to General Permit coverage (NOI Coverage or NEC Coverage) are ineligible to submit NONAs indicating "No Discharge."

DRAFT

ATTACHMENT A

FACILITIES COVERED BY NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) GENERAL PERMIT FOR STORM WATER DISCHARGES ASSOCIATED WITH INDUSTRIAL ACTIVITIES (GENERAL PERMIT)

1. Facilities Subject To Storm Water Effluent Limitations Guidelines, New Source Performance Standards, or Toxic Pollutant Effluent Standards Found in 40 Code of Federal Regulations, Chapter I, Subchapter N (Subchapter N):

   Cement Manufacturing (40 C.F.R. Part 411); Feedlots (40 C.F.R. Part 412); Fertilizer Manufacturing (40 C.F.R. Part 418); Petroleum Refining (40 C.F.R. Part 419), Phosphate Manufacturing (40 C.F.R. Part 422), Steam Electric (40 C.F.R. Part 423), Coal Mining (40 C.F.R. Part 434), Mineral Mining and Processing (40 C.F.R. Part 436), Ore Mining and Dressing (40 C.F.R. Part 440), Asphalt Emulsion (40 C.F.R. Part 443), Landfills (40 C.F.R. Part 445), and Airport Deicing (40 C.F.R. Part 449).

   .

2. Manufacturing Facilities:

   Facilities with Standard Industrial Classifications (SICs) 20XX through 39XX, 4221 through 4225. (This category combines categories 2 and 10 of the previous general permit.)

3. Oil and Gas/Mining Facilities:

   Facilities classified as SICs 10XX through 14XX, including active or inactive mining operations (except for areas of coal mining operations no longer meeting the definition of a reclamation area under 40 Code of Federal Regulations. 434.11(1) because the performance bond issued to the facility by the appropriate Surface Mining Control and Reclamation Acts authority has been released, or except for areas of non-coal mining operations which have been released from applicable State or Federal reclamation requirements after December 17, 1990) and oil and gas exploration, production, processing, or treatment operations, or transmission facilities that discharge storm water contaminated by contact with or that has come into contact with any overburden, raw material, intermediate products, finished products, by-products, or waste products located on the site of such operations. Inactive mining operations are mining sites that are not being actively mined, but which have an identifiable owner/operator. Inactive mining sites do not include sites where mining claims are being maintained prior to disturbances associated with the extraction, beneficiation, or processing of mined material; or sites where minimal activities are undertaken for the sole purpose of maintaining a mining claim.

4. Hazardous Waste Treatment, Storage, or Disposal Facilities:

   Hazardous waste treatment, storage, or disposal facilities, including any facility operating under interim status or a general permit under Subtitle C of the Federal Resource, Conservation, and Recovery Act.

5. Landfills, Land Application Sites, and Open Dumps:

   Landfills, land application sites, and open dumps that receive or have received industrial waste from any facility within any other category of this Attachment; including facilities subject to regulation under Subtitle D of the Federal Resource, Conservation, and Recovery Act, and facilities that have accepted wastes from construction activities (construction activities include any clearing, grading, or excavation that results in disturbance).

6. Recycling Facilities:

   Facilities involved in the recycling of materials, including metal scrapyards, battery reclaimers, salvage yards, and automobile junkyards, including but limited to those classified as Standard Industrial Classification 5015 and 5093.

7. Steam Electric Power Generating Facilities:

   Any facility that generates steam for electric power through the combustion of coal, oil, wood, etc.

8. Transportation Facilities:

   Facilities with SICs 40XX through 45XX (except 4221-25) and 5171 with vehicle maintenance shops, equipment cleaning operations, or airport deicing operations. Only those portions of the facility involved in vehicle maintenance (including vehicle rehabilitation, mechanical repairs, painting, fueling, and lubrication) or other operations identified under this Permit as associated with industrial activity.

9. Sewage or Wastewater Treatment Works:

   Facilities used in the storage, treatment, recycling, and reclamation of municipal or domestic sewage, including land dedicated to the disposal of sewage sludge, that are located within the confines of the facility, with a design flow of one million gallons per day or more, or required to have an approved pretreatment program under 40 Code of Federal Regulations part 403. Not included are farm lands, domestic gardens, or lands used for sludge management where sludge is beneficially reused and are not physically located in the confines of the facility, or areas that are in compliance with Section 405 of the Clean Water Act.

ATTACHMENT C

GLOSSARY

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES)
GENERAL PERMIT FOR STORM WATER DISCHARGES
ASSOCIATED WITH INDUSTRIAL ACTIVITIES
(GENERAL PERMIT)

Adoption Date [Insert Adoption Date Here]

Aerial Deposition
Total suspended particulate matter found in the atmosphere as solid particles or liquid droplets. Chemical composition of particulates varies widely, depending on location and time of year. Sources of airborne particulates include but are not limited to: dust, emissions from industrial processes, combustion products from the burning of wood and coal, combustion products associated with motor vehicle or non-road engine exhausts, and reactions to gases in the atmosphere. Deposition is the act of these materials being added to a landform.

Beneficial Uses
As defined in the California Water Code, beneficial uses of the waters of the state that may be protected against quality degradation, include but are not limited to, domestic, municipal, agricultural and industrial supply; power generation; recreation; aesthetic enjoyment; navigation; and preservation and enhancement of fish, wildlife, and other aquatic resources or preserves.

Best Available Technology Economically Achievable (BAT)
As defined by United States Environmental Protection Agency (U.S. EPA), BAT is a technology-based standard established by the Clean Water Act (CWA) as the most appropriate means available on a national basis for controlling the direct discharge of toxic and nonconventional pollutants to navigable waters. The BAT effluent limitations guidelines, in general, represent the best existing performance of treatment technologies that are economically achievable within an industrial point source category or subcategory.

Best Conventional Pollutant Control Technology (BCT)
As defined by U.S. EPA, BCT is a technology-based standard for the discharge from existing industrial point sources of conventional pollutants including biochemical oxygen demand (BOD), total suspended sediment (TSS), fecal coliform, pH, oil and grease.

Best Professional Judgment (BPJ)
The method used by permit writers to develop technology-based NPDES permits conditions on a case-by-case basis using all reasonably available and relevant data.

GLOSSARY

Best Management Practices (BMPs)
Scheduling of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the discharge of pollutants. BMPs also include treatment requirements, operating procedures, and practices to control site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

Chain of Custody
Form used to track sample handling as samples progress from sample collection to the laboratory. The chain of custody is also used to track the resulting analytical data from the laboratory to the client. Chain of custody forms can be obtained from an analytical laboratory upon request.

Debris
Litter, rubble, discarded refuse, and remains of destroyed inorganic anthropogenic waste.

Detected Not Quantifiable ~~(DNQ)~~
A s~~S~~ample result that is between the Method Detection Limit (MDL) and the Minimum Level (ML).

Discharger
A person, company, agency, or other entity that is the operator of the industrial facility covered by this General Permit.

Drainage Area
The area of land that drains water, sediment, pollutants, and dissolved materials to a common discharge location.

Effective Date
The date, set by the State Water Resources Control Board (State Water Board), when at least one or more of the ~~new~~ General Permit~~'s~~ requirements take effect and the previous permit expires. ~~The Effective Date contained in t~~This General Permit ~~draft has~~requires most of the requirements (such as SMARTs submittals, minimum BMPs, sampling and analysis requirements) to take~~ing~~ effect on July~~anuary~~ 15, 2015.

Effluent
Any discharge of water either to the receiving water or beyond the property boundary controlled by the Discharger.

Effluent Limitation
Any numeric or narrative restriction imposed on quantities, discharge rates, and concentrations of pollutants that are discharged from point sources into waters of the United States, waters of the contiguous zone, or the ocean.

DRAFT

GLOSSARY

Erosion
The process by which soil particles are detached and transported by the actions of wind, water~~,~~ or gravity.

Erosion Control BMPs
Vegetation, such as grasses and wildflowers, and other materials, such as straw, fiber, stabilizing emulsion, protective blankets, etc., placed to stabilize areas of disturbed soils, reduce loss of soil due to the action of water or wind, and prevent water pollution.

Facility
A collection of industrial processes discharging storm water associated with industrial activity within the property boundary or operational unit.

Field Measurements
Testing procedures performed in the field with portable field-testing kits or meters.

Good Housekeeping BMPs
BMPs designed to reduce or eliminate the addition of pollutants through analysis of pollutant sources, implementation of proper handling/disposal practices, employee education, and other actions.

Industrial Materials
Includes, but is not limited to: raw materials, recyclable materials, intermediate products, final products, by product, waste products, fuels, materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; raw materials used in food processing or production; hazardous substances designated under Section 101(14) of Comprehensive Environmental Response, Compensation, and Liability Act (CERLCA); any chemical the facility is required to report pursuant to Section 313 of Title III of Superfund Amendments and Reauthorization Act (SARA); fertilizers; pesticides; and waste products such as ashes, slag, and sludge and that are used, handled, stored, or disposed in relation to a facility's industrial activity.

Method Detection Limit ~~(MDL)~~
The minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero.

Minimum Level ~~(ML)~~
The lowest level at which the entire analytical system must give a recognizable signal and acceptable calibration point for the analyte. It is equivalent to the concentration of the lowest calibration standard, assuming that all method-specified sample weights, volumes, and cleanup procedures have been employed.

Monitoring Implementation Plan ~~(MIP)~~
Planning document included in the Storm Water Pollution Prevention Plan (SWPPP). Dischargers are required to record information on the implementation of the monitoring requirements in this General Permit. The MIP should include relevant information on:

the Monthly Visual Observation schedule, Sampling Parameters, Representative Sampling Reduction ~~(RSR)~~, Sample Frequency Reduction ~~(SFR)~~, and Qualified Combined Samples ~~(QCS)~~.

Monitoring Requirements
Includes sampling and analysis activities as well as visual observations.

Natural Background
Pollutants including substances that are naturally occurring in soils or groundwater. Natural background pollutants do not include legacy pollutants from previous activity at a facility~~on your site~~, or pollutants in run-on from neighboring sources which are not naturally occurring.

New Discharge(r)
A facility from which there is a discharge, that did not commence the discharge at a particular site prior to August 13, 1979, which is not a new source as defined in 40 Code of Federal Regulations 122.29, and which has never received a finally effective NPDES permit for discharges at that site. See 40 Code of Federal Regulations 122.2.

Numeric Action Level (NAL) Exceedance
Annual NAL exceedance - the Discharger shall determine the average concentration for each parameter using the results of all the sampling and analytical results for the entire facility for the reporting year (i.e., all "effluent" data) and compare this to the corresponding Annual NAL values in Table 2. For Dischargers using composite sampling or flow measurement in accordance with standard practices, the average concentrations shall be calculated in accordance with the U.S. EPA Guidance Manual for the Monitoring and Reporting Requirements of the NPDES Multi-Sector Storm Water General Permit.[1] An annual NAL exceedance occurs when the average of all the analytical results for a parameter from samples taken within a reporting year exceeds an annual NAL value for that parameter listed in Table 2 (or is outside the NAL pH range);

Instantaneous maximum NAL exceedance - the Discharger shall compare all sampling and analytical results from each distinct sample (individual or composite) to the corresponding Instantaneous maximum NAL values in Table 2. An instantaneous maximum NAL exceedance occurs when two or more analytical results from samples taken for any parameter within a reporting year exceed the instantaneous maximum NAL value (for TSS and O&G), or are outside of the instantaneous maximum NAL range (for pH).

~~**Non-Visible Pollutants**~~
~~Pollutants associated with a specific site or activity that can have a negative impact on water quality, but cannot be seen though observation (ex: chlorine). Such pollutants being discharged are not authorized.~~

[1] U.S. EPA. NPDES Storm Water Sampling Guidance Document. <http://www.epa.gov/npdes/pubs/owm0093.pdf >. [as of July 3, 2013]

Non Detect ~~(ND)~~
Sample result is less than Method Detection Limit ~~(MDL)~~; Analyte being tested cannot be detected by the equipment or method.

Non-Storm Water Discharges (NSWDs)
Discharges that do not originate from precipitation events. Including~~,~~ but not limited to, discharges of process water, air conditioner condensate, non-contact cooling water, vehicle wash water, sanitary wastes, concrete washout water, paint wash water, irrigation water, or pipe testing water.

Numeric Action Level (NAL)
Pollutant concentration levels used to evaluate if best management practices are effective and if additional measures are necessary to control pollutants. NALs are not effluent limits. The exceedance of an NAL is not a permit violation.

Operator
In the context of storm water associated with industrial activity, any party associated with an industrial facility that meets either of the following two criteria:

a. The party has operational control over the industrial SWPPP and SWPPP specifications, including the ability to make modifications to those plans and specifications

b. The party has day-to-day operational control of activities at the facility which are necessary to ensure compliance with a SWPPP for the facility or other permit conditions (e.g., authorized to direct workers at a site to carry out activities required by the SWPPP or comply with other permit conditions).

pH
Unit universally used to express the intensity of the acid or alkaline condition of a water sample. The pH of natural waters tends to range between 6.0 and 9.0, with neutral being 7.0. ~~Extremes of pH can have deleterious effects on aquatic systems.~~

Plastic Materials
~~Plastic resin pellets, powders, flakes, additives, regrind, scrap, dust, and industrial process waste or recycling that has the potential to discharge or migrate and discharge off-site.~~ Plastic Materials are virgin and recycled plastic resin pellets, powders, flakes, powdered additives, regrind, dust, and other similar types of preproduction plastics with the potential to discharge or migrate off-site.

Qualified Industrial Storm Water Practitioner (QISP)
Only required once a Discharger reaches Level 1 status, a QISP is the individual assigned to ensure compliance with this General Permit. This includes implementing the SWPPP, performing the Annual Comprehensive Facility Compliance Evaluation (Annual Evaluation), assisting in the preparation of Annual Reports, performing ERAs,

and training appropriate ~~p~~Pollution ~~p~~Prevention ~~t~~Team members. The individual must take the appropriate state approved or sponsored training to be qualified. Dischargers shall ensure that the designated QISP is geographically located in an area where they will be able to adequately perform the permit requirements at all of the facilities they represent.

Qualifying Storm Event (QSE)
A precipitation event that:

a. Produces a discharge for at least one drainage area; and

b. Is preceded by 48 hours with no discharge from any drainage area.

Regional Water Board
Includes the Executive Officer and delegated Regional Water Board staff.

Runoff Control BMPs
Measures used to divert run-on from offsite and runoff within the site.

Run-on
Discharges that originate offsite and flow onto the property of a separate facility or property or, discharges that originate onsite from areas not related to industrial activities and flow onto areas on the property with industrial activity.

Scheduled Facility Operating Hours
The time periods when the facility is staffed to conduct any function related to industrial activity, but excluding time periods where only routine maintenance, emergency response, security, and/or janitorial services are performed.

Sediment
Solid particulate matter, both mineral and organic, that is in suspension, is being transported, or has been moved from its origin by air, water, gravity, or ice and has come to rest on the earth's surface either above or below sea level.

Sedimentation
Process of deposition of suspended matter carried by water, wastewater, or other liquids that flow by gravity. Control of sedimentation is accomplished by reducing the velocity of the liquid below the point at which it can transport the suspended material.

Sediment Control BMPs
Practices that trap soil particles after they have been eroded by rain, flowing water, or wind. Includes those practices that intercept and slow or detain the flow of storm water to allow sediment to settle and be trapped (i.e~~.g~~., silt fence, sediment basin, fiber rolls, etc.).

Sheet Flow

Flow of water that occurs overland in areas where there are no defined channels and where the water spreads out over a large area at a uniform depth.

~~**Significant Materials**~~
~~Includes, but is not limited to: raw materials; fuels; materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; raw materials used in food processing or production; hazardous substances designated under Section 101(14) of Comprehensive Environmental Response, Compensation, and Liability Act (CERLCA); any chemical the facility is required to report pursuant to Section 313 of Title III of Superfund Amendments and Reauthorization Act (SARA); fertilizers; pesticides; and waste products such as ashes, slag, and sludge that have the potential to be released with industrial storm water discharges~~

Source
Any facility or building, property, road, or area that causes or contributes to pollutants in storm water.

Storm Water
Storm water runoff, snowmelt runoff, and storm water surface runoff and drainage.

Storm Water Discharge Associated With Industrial Activity
The discharge from any conveyance which is used for collecting and conveying storm water and which is directly related to manufacturing, processing, or raw materials storage areas at an industrial plant as identified in Attachment A of this General Permit. The term does not include discharges from facilities or activities excluded from the NPDES program. The term includes, but is not limited to, storm water discharges from industrial plant yards; immediate access roads and rail lines used or traveled by carriers of raw materials; manufactured products, waste material, or by-products used or created by the facility; material handling sites; refuse sites; sites used for the application or disposal of process wastewaters (as defined at 40 C.F.R. section 401); sites used for the storage and maintenance of material handling equipment; sites used for residual treatment, storage, or disposal; shipping and receiving areas; manufacturing buildings; storage areas (including tank farms) for raw materials, and intermediate and finished products; and areas where industrial activity has taken place in the past and significant materials remain and are exposed to storm water. The term does not include discharges from facilities or activities excluded from the NPDES program under 40 C.F.R. section 122.

Material handling activities include the: storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, finished product, by-product, or waste product. The term excludes areas located on plant lands separate from the plant's industrial activities, such as office buildings and accompanying parking lots as long as the drainage from the excluded areas is not mixed with storm water drained from the above described areas. Industrial facilities (including industrial facilities that are federally, State, or municipally owned or operated that meet the description of the

facilities listed in this paragraph) include those facilities designated under 40 C.F.R. section122.26(a)(1)(v).

Structural Controls
Any structural facility designed and constructed to mitigate the adverse impacts of storm water and urban runoff pollution.

Total Suspended Solids (TSS)
The measure of the suspended solids in a water sample including inorganic substances such as soil particles, organic substances such as algae, aquatic plant/animal waste, and particles related to industrial/sewage waste, etc. The TSS test measures the concentration of suspended solids in water by measuring the dry weight of a solid material contained in a known volume of a sub-sample of a collected water sample. Results are reported in mg/L.

Toxicity
The adverse response(s) of organisms to chemicals or physical agents ranging from mortality to physiological responses, such as impaired reproduction or growth anomalies.

Trade Secret
Information, including a formula, pattern, compilation, program, device, method, technique, or process, that: (1) derives independent economic value, actual or potential, from not being generally known to the public or to other persons who can obtain economic value from its disclosure or use; and (2) is the subject of efforts that are reasonable under the circumstances to maintain its secrecy.

Turbidity
The cloudiness of water quantified by the degree to which light traveling through a water column is scattered by the suspended organic and inorganic particles it contains. The turbidity test is reported in Nephelometric Turbidity Units (NTU) or Jackson Turbidity Units (JTU).

Waters of the United States
Generally refers to surface waters, as defined for the purposes of the federal Clean Water Act.

Water Quality Objectives
Defined in the California Water Code as limits or levels of water quality constituents or characteristics which are established for the reasonable protection of beneficial uses of water or the prevention of nuisance within a specific area.

Water Quality Standards
Consists of beneficial uses, water quality objectives to protect those uses, an antidegradation policy, and policies for implementation. Water quality standards are established in Regional Water Quality Control Plans (Basin Plans) and statewide Water

Quality Control Plans. U.S. EPA has also adopted water quality criteria (the same as objectives) for California in the National Toxics Rule and California Toxics Rule.

DRAFT

ATTACHMENT D

PERMIT REGISTRATION DOCUMENTS (PRDs)

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES)
GENERAL PERMIT FOR STORM WATER DISCHARGES
ASSOCIATED WITH INDUSTRIAL ACTIVITIES
(GENERAL PERMIT)

This Attachment provides an example of the information Dischargers are required to submit in the PRDs via the Storm Water Multi-Application Reporting Tracking System (SMARTS). The actual PRD requirements are in Section II of this General Permit.

A. Who Must Submit PRDs

All Dischargers that operate facilities as described in Attachment A of this General Permit are subject to either Notice of Intent (NOI) or No Exposure Certification (NEC) Coverage and shall comply with the PRD requirements in this General Permit~~Attachment~~.

B. Who Is Not Required to Submit PRDs

Dischargers that operate facilities described below are not required to submit PRDs:

1. Facilities that are not described in Attachment A~~,~~; ~~or~~
2. Facilities that are described in Attachment A but do not have discharges of storm water associated with industrial activity to waters of the United States~~,~~; or,
3. Facilities that are already covered by an NPDES permit for discharges of storm water associated with industrial activity.

C. Annual Fees for NOI and NEC Coverage

Annual Fees for NOI and NEC coverage are established through regulations adopted by the State Water Board and are subject to change (see California Code of Regulations, title 23, section 2200 et seq.).

~~1. The Annual Fee for NOI Coverage as of the Adoption Date of this General Permit is $1359.~~

~~2. The Annual Fee for NEC Coverage as of the Adoption Date of this General Permit is $242.~~

D. When and How to Apply

Dischargers proposing to conduct industrial activities subject to this General Permit must electronically certify and submit PRDs via the Storm Water Multiple Application Reporting and Tracking System (SMARTS)[1] no less than seven (7) days prior to the commencement of industrial activity. Existing Dischargers must submit PRDs by January 1, 2015.

E. PRD Requirements for NOI Coverage

1. Notice of Intent (NOI) and Signed Electronic Authorization Form.
2. Site Map (Section X.E of this General Permit).
3. Storm Water Pollution Prevention Plan (see Section X of this General Permit).

F. Description of PRDs for NOI Coverage

1. The Notice of Intent (NOI) requires the following information:

   a. Operator/Owner Information

      Operator/Owner Company or Organization Name
      Contact First Name
      Contact Last Name
      Title
      Street Address
      Address Line 2
      City/State/Zip
      Phone ~~Ex~~ (e.g. 999-999-9999)
      E-mail (e.g. abc@xyz.com)
      Federal Tax ID

   b. Facility Information

      Facility Name
      WDID Number (if applicable)
      Contact First Name
      Contact Last Name

[1] The State Water Board has developed the SMARTS online database system to handle registration and reporting under this General Permit. More information regarding SMARTS and access to the database is available online at <https://smarts.waterboards.ca.gov>. [as of June 26, 2013].

d. Receiving Water Information

Does your facility's storm water flow directly or indirectly into waters of the US such as river, lake, ocean, etc. (check box for directly or indirectly)

i. Indirectly to waters of the US

ii. Storm drain system - Enter owner's name:

iii. Directly to waters of the US (e.g., river, lake, creek, stream, bay, ocean, etc.)

DRAFT

iv. Name of the receiving water: _____

2. The Site Map(s) shall include the following Information:

a. The facility boundary;

b. Storm water drainage areas within the facility boundary;

c. Portions of any drainage area impacted by discharges from surrounding areas and flow direction of each drainage area;

d. On-facility surface water bodies;

e. Areas of soil erosion;

f. Location(s) of nearby water bodies (such as rivers, lakes, wetlands, etc.);

g. Location(s) of municipal storm drain inlets that may receive the facility's industrial storm water discharges and authorized Non-Storm Water Discharges (NSWDs);

h. Locations of storm water collection and conveyance systems and associated points of discharge, and direction of flow;

i. Any structural control measures (that affect industrial storm water discharges, authorized NSWDs, and run-on)~~-~~;

j. All impervious areas of the facility, including paved areas, buildings, covered storage areas, or other roofed structures;

k. Locations where materials are directly exposed to precipitation;

l. ~~and the l~~Locations where significant spills or leaks identified (Section X.G.1.d of this General Permit) have occurred;

m. Areas of industrial activity subject to this General Permit;

n. All storage areas and storage tanks;

o. Shipping and receiving areas;

p. Fueling areas;

q. Vehicle and equipment storage/maintenance areas;

r. Material handling and processing areas;

s. Waste treatment and disposal areas;

t. Dust or particulate generating areas;

u. Cleaning and material reuse areas; and,

v. Any other areas of industrial activity which may have potential pollutant sources.

3. The Storm Water Pollution Prevention Plan (SWPPP) must be prepared in accordance with Section X of this General Permit.

4. A NOI Certification by the Discharger that all PRDs submitted are correct and true.

5. SMARTS Electronic Authorization Form (Signed by any user authorized to certify and submit data electronically).

G. PRD Requirements for NEC Coverage

1. No Exposure Certification and Signed Electronic Authorization Form.

2. No Exposure Certification Checklist Consistent with Requirements in Section XVII.F.2 of this General Permit.

3. Current Site Map Consistent with Requirements in Section X.E of this General Permit.

DRAFT

H. Description of PRDs for NEC Coverage

1. The No Exposure Certification requires the following information:

   a. Operator/Owner Information

      Operator/Owner Name
      Contact First Name
      Contact Last Name
      Title
      Street Address
      Address Line 2
      City/State/Zip

d. SMARTS Electronic Authorization Form - Signed by any user authorized to certify and submit data electronically.

e. Certification by the Discharger that all PRDs submitted are correct and true and that the conditions of no-exposure have been met.

2. The NEC Checklist (Section XVII.~~E~~F.2 of this General Permit) must be prepared to demonstrate that, based upon a facility inspection and evaluation, none of the following industrial materials or activities are, or will be in the foreseeable future, exposed to precipitation~~.~~:

a. Activities such as using, storing, or cleaning industrial machinery or equipment, and areas with materials or residuals from these activities;

b. Materials or residuals on the ground or in storm water inlets from spills/leaks;

c. Materials or products from past industrial activity;

d. Material handling equipment (except adequately maintained vehicles);

e. Materials or products during loading/unloading or transporting activities;

f. Materials or products stored outdoors (except final products intended for outside use, e.g., new cars, where exposure to storm water does not result in the discharge of pollutants);

g. Materials contained in open, deteriorated or leaking storage drums, barrels, tanks, and similar containers;

h. Materials or products handled/stored on roads or railways owned or maintained by the Discharger;

i. Waste material (except waste in covered, non-leaking containers, e.g., dumpsters). Application or disposal of processed wastewater (unless already covered by an NPDES permit); and,

j. Particulate matter or visible deposits of residuals from roof stacks/vents evident in the storm water outflow.

3. The Site Map(s) shall include the following information (see Section X.E of this General Permit):

   a. The facility boundary;

   b. Storm water drainage areas within the facility boundary;

   c. Portions of any drainage area impacted by discharges from surrounding areas and flow direction of each drainage area;

   d. On-facility surface water bodies;

   e. Areas of soil erosion;

   f. Location(s) of nearby water bodies (such as rivers, lakes, wetlands, etc.);

   g. Location(s) of municipal storm drain inlets that may receive the facility's industrial storm water discharges and authorized NSWDs;

   h. Locations of storm water collection and conveyance systems and associated points of discharge, and direction of flow;

   i. Any structural control measures (that affect industrial storm water discharges, authorized NSWDs, and run-on)~~.~~;

   j. All impervious areas of the facility, including paved areas, buildings, covered storage areas, or other roofed structures;

   k. Locations where materials are directly exposed to precipitation and the locations where significant spills or leaks identified (Section X.G.1.d of this General Permit) have occurred;

   l. Areas of industrial activity subject to this General Permit;

   m. All storage areas and storage tanks;

   n. Shipping and receiving areas;

   o. Fueling areas;

   p. Vehicle and equipment storage/maintenance areas;

   q. Material handling and processing areas;

DRAFT

r. Waste treatment and disposal areas;

s. Dust or particulate generating areas;

t. Cleaning and material reuse areas; and,

u. Any other areas of industrial activity which may have potential pollutant sources.

I. Obtaining Coverage

To obtain coverage under this General Permit PRDs must be included and completed. If any of the required items are missing, the PRD submittal is considered incomplete and will be rejected. Upon receipt of a complete PRD submittal, the State Water Board will process the application package in the order received and assign a (WDID) number.

J. Additional Information

The Water Board may require the submittal of additional information in SMARTS if required to determine the appropriate fee for the facility as specified by the fee regulations.

K. Questions

If you have any questions on completing the PRDs or about SMARTS, please email stormwater@waterboards.ca.gov or call (866) 563-3107.

LIST OF TOTAL MAXIMUM DAILY LOADS (TMDLS) APPLICABLE TO INDUSTRIAL STORM WATER DISCHARGERS

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES)
GENERAL PERMIT FOR STORM WATER DISCHARGES
ASSOCIATED WITH INDUSTRIAL ACTIVITIES
(GENERAL PERMIT)

The following table contains a list of Regional Water Board adopted and/or US EPA established/approved TMDLs, as of the adoption date of this General Permit, that are applicable to industrial storm water Dischargers. TMDLs adopted/established after the effective date of the General Permit may, at the Water Boards discretion, be included in this General Permit. This General Permit may be reopened to amend TMDL-specific permit requirements in this Attachment E, or to incorporate new TMDLs adopted during the term of this General Permit that include requirements applicable to Dischargers covered by this General Permit.

Water Body	Pollutant
San Francisco Bay Regional Water Quality Control Board	
Napa River	Sediment
Sonoma Creek	Sediment
Los Angeles Regional Water Quality Control Board	
Santa Clara River Reach 3	Chloride
Santa Clara River	Nutrients
Los Angeles River	Metals
Los Angeles River	Nutrients
San Gabriel River	Metals and Selenium
Santa Monica Bay	Nearshore Debris
Machado Lake	Nutrient
Harbor Beaches of Ventura	Bacteria
Ballona Creek	Metals
Ballona Creek Estuary	Toxic Pollutants
Los Angeles Harbor	Bacteria
Marina del Rey Back Basins	Bacteria
Santa Clara River	Bacteria
Walker Creek,	Mercury
Oxnard Drain No. 3	Pesticides, PCBs[1] and Sediment Toxicity
Long Beach City Beaches and Los Angeles River Estuary	Indicator Bacteria
Los Angeles and Long Beach Harbors	Toxic and Metals

[1] Polychlorinated biphenyls

LIST OF TOTAL MAXIMUM DAILY LOADS (TMDLS) APPLICABLE TO INDUSTRIAL STORM WATER DISCHARGERS

Los Angeles Area Lakes	Nitrogen, Phosphorus, Mercury, Trash, Organochlorine Pesticides and PCBs
Santa Monica Bay	DDTs and PCBs
Machado Lake	Toxics
Colorado Lagoon	Pesticides, Polycyclic aromatic hydrocarbons, PCBs, and Metals
Calleguas Creek Watershed	Salts
Calleguas Creek Watershed	Metals and Selenium
Ballona Creek, Ballona Estuary, and Sepulveda Channel	Bacteria
Marina Del Rey Harbor-Back Basins	Copper, Lead, Zinc, and Chlordane, and Total PCBs
Los Cerritos Channel	Metals
Santa Ana Regional Water Quality Control Board	
San Diego Creek and Newport Bay	Toxic Pollutants
San Diego Regional Water Quality Control Board	
Chollas Creek	Diazinon
Chollas Creek	Copper, Lead, and Zinc
Los Peñasquitos Lagoon	Sediment
Rainbow Creek	Total Nitrogen and Total Phosphorus

EFFLUENT LIMITATION GUIDELINES (ELGs)

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES)
GENERAL PERMIT FOR STORM WATER DISCHARGES
ASSOCIATED WITH INDUSTRIAL ACTIVITIES
(GENERAL PERMIT)

The following Parts of federal regulations at 40 Code of Federal Regulations Chapter I Subchapter N (Subchapter N) contain ELGs approved by US EPA for specific categories of industrial storm water discharges:

Point Source Category	ELGs[1]
Part 411 - Cement Manufacturing	 411.pdf
Part 418 - Fertilizer Manufacturing	 418.pdf
Part 419 - Petroleum Refining	 419.pdf
Part 422 - Phosphate Manufacturing	 422.pdf
Part 423 - Steam Electric Power Generating	 423.pdf

DRAFT

[1] Double-click on the pdf object to view applicable ELGs. If you are having trouble viewing the pdf file, open your pdf reader in a separate window and double-click on the object again.

Point Source Category	ELGs[2]
Part 429 - Wetting of logs at wet deck storage areas	429.pdf
Part 434 - Coal Mining	434.pdf
Part 436 - Mineral Mining And Processing	436.pdf
Part 440 - Ore Mining And Dressing	440.pdf
Part 443 - Paving And Roofing Materials (Tars And Asphalt)	443.pdf
Part 445 - Landfills	445.pdf
Part 449 - Airport Deicing	449.pdf

DRAFT

[2] Double-click on the pdf object to view applicable ELGs. If you are having trouble viewing the pdf file, open your pdf reader in a separate window and double-click on the object again.

New Source Performance Standards

New source performance standards (NSPS) represent the best available demonstrated control technology standards. US EPA has established NSPS guidelines for the industries found in the Table below. The intent of NSPS guidelines is to set effluent limitations that represent state-of-the-art treatment technology for new sources.[3]

Table 1 - Storm Water Specific NSPS Effluent Limitation Guidelines

Regulated Discharge	40 CFR Section	Multi Sector General Permit Sector	NSPS	Date New Source Data Established
Discharge resulting from spray down or intentional wetting of logs as wet deck storage areas	Part 429, Subpart I	A	Yes	1/26/81
Runoff from phosphate fertilizer manufacturing facilities that comes into contact with any raw materials, finished products, by-products or waste products (SIC 2874)	Part 418, Subpart A	C	Yes	4/8/74
Runoff from asphalt emulsion facilities	Part 443, Subpart A	D	Yes	7/28/75
Runoff from materials storage piles at cement manufacturing facilities	Part 411, Subpart C	E	Yes	2/20/74
Mine dewatering discharges at crushed stone, construction sand and gravel, or industrial sand mining facilities	Part 436, Subparts B, C, D	J	No	N/A
Runoff from hazardous waste and non-hazardous waste landfills	Part 445, Subparts A and B	K, L	Yes	2/2/00
Runoff from coal storage piles at steam electric generating facilities	Part 423	O	Yes	11/19/82 & 10/8/74
Discharges from primary airports with over 1,000 annual jet departures that conduct deicing operations.	Part 449, Subpart A	S	Yes	NA

DRAFT

[3] New source means any building, structure, facility, or installation from which there is or may be a "discharge of pollutants," the construction of which commenced: (1) After promulgation of standards of performance under section 306 of CWA which are applicable to such source, or (2) After proposal of standards of performance in accordance with section 306 of CWA which are applicable to such source, but only if the standards are promulgated in accordance with section 306 within 120 days of their proposal as defined in 40 C.F.R section 122.26.

ATTACHMENT G

REQUIREMENTS FOR DISCHARGERS WHO HAVE BEEN GRANTED AN OCEAN PLAN EXCEPTION FOR DISCHARGES TO ASBS

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES)
GENERAL PERMIT FOR STORM WATER DISCHARGES ASSOCIATED
WITH INDUSTRIAL ACTIVITIES
(GENERAL PERMIT)

A. Areas of Special Biological Significance (ASBS)

1. ASBS are defined in the California Ocean Plan as "those areas designated by the State Water Board as ocean areas requiring protection of species or biological communities to the extent that alteration of natural water quality is undesirable."

2. The California Ocean Plan prohibits the discharge of waste to ASBS.

3. The California Ocean Plan authorizes the State Water Board to grant an exception to Ocean Plan provisions where the board determines that the exception will not compromise protection of ocean waters for beneficial uses and the public interest will be served.

4. On March 20, 2012, the State Water Board adopted Resolution 2012-0012 (amended by Resolution 2012-0031 on June 19, 2012) which contained a general exception to the California Ocean Plan for discharges of storm water and non-point sources (ASBS Exception). This resolution also contains the Special Protections that are to be implemented for direct discharges to ASBS. Resolution 2012-0012 is hereby incorporated by reference and its requirements must be complied with by industrial storm water Dischargers discharging directly to ASBS.

5. This General Permit requires Dischargers who have been granted an Ocean Plan exception for discharges to ASBS to comply with the requirements contained in the Special Protections. These requirements are contained below.

B. ASBS Non-Storm Water Discharges

1. The term "ASBS Non-Storm Water Discharges" means any waste discharges from a municipal separate storm sewer system (MS4) or other NPDES permitted storm drain system to an ASBS that are not comprised entirely of storm water.

2. Only the following ASBS Non-Storm Water Discharges are allowed, provided that the discharges are essential for emergency response purposes, structural stability, slope stability or occur naturally:

a. Discharges associated with emergency fire fighting operations.

b. Foundation and footing drains.

c. Water from crawl space or basement pumps.

d. Hillside dewatering.

e. Naturally occurring groundwater seepage via a storm drain.

f. Non-anthropogenic flows from a naturally occurring stream via a culvert or storm drain, as long as there are no contributions of anthropogenic runoff.

3. Authorized ASBS Non- Storm Water Discharges shall not cause or contribute to a violation of the water quality objectives in Chapter II of the Ocean Plan nor alter natural ocean water quality in an ASBS.

4. At the San Clemente Island ASBS, discharges incidental to military training and research, development, test, and evaluation operations are allowed. Discharges incidental to underwater demolition and other in-water explosions are not allowed in the two military closure areas in the vicinity of Wilson Cove and Castle Rock. Discharges must not result in a violation of the water quality objectives, including the protection of the marine aquatic life beneficial use, anywhere in the ASBS.

5. At the San Nicolas Island and Begg Rock ASBS, discharges incidental to military research, development, testing, and evaluation of, and training with, guided missile and other weapons systems, fleet training exercises, small-scale amphibious warfare training, and special warfare training are allowed. Discharges incidental to underwater demolition and other in-water explosions are not allowed. Discharges must not result in a violation of the water quality objectives, including the protection of the marine aquatic life beneficial use, anywhere in the ASBS.

C. ASBS Compliance Plan

1. State Water Board Resolution 2012-0012 grants an exception to the Ocean Plan's prohibition on discharges to ASBS (ASBS Exception) to applicants who were identified as Dischargers of industrial storm water to ASBS (ASBS Dischargers). Each ASBS Discharger shall specifically address the prohibition of ASBS Non-Storm Water Discharges and the requirement to maintain natural water quality for industrial storm water discharges to an ASBS in an ASBS Compliance Plan to be included in the ASBS Discharger's SWPPP. The ASBS Compliance Plan is subject to approval by the Executive Director of the State Water Board. The ASBS Compliance Plan shall include:

a. A map of surface drainage of storm water runoff, showing areas of sheet runoff and priority discharges, and a description of any structural Best Management Practices (BMPs) already employed and/or BMPs to be employed in the future. Priority discharges are those that pose the greatest water quality threat and which are identified as requiring installation of structural BMPs. The map shall also show the storm water conveyances in relation to other features such as service areas, sewage conveyances and treatment facilities, landslides, areas prone to erosion, and waste and hazardous material storage areas, if applicable. The SWPPP shall also include a procedure for updating the map and plan when changes are made to the storm water conveyance facilities.

b. A description of the measures by which all unauthorized ASBS Non-Storm Water Discharges (e.g., dry weather flows) has been eliminated, how these measures will be maintained over time, and how these measures are monitored and documented.

c. A description of how pollutant reductions in storm water runoff, that are necessary to comply with these special conditions, will be achieved through BMPs. Structural BMPs need not be installed if the Discharger can document to the satisfaction of the Executive Director that such installation would pose a threat to health or safety. BMPs to control storm water runoff discharges (at the end-of-pipe) during a design storm shall be designed to achieve on average the following target levels:

   1) Table B Instantaneous Maximum Water Quality Objectives in Chapter II of the Ocean Plan; or

   2) A 90% reduction in pollutant loading during storm events, for the applicant's total discharges.

      The baseline date for the reduction is March 20, 2012 (the effective date of the ASBS Exception), except for those structural BMPs installed between January 1, 2005 and the adoption of these special protections. The reductions must be achieved and documented by March 20, 2018.

d. A description of how the ASBS Discharger will address erosion and the prevention of anthropogenic sedimentation in the ASBS. The natural habitat conditions in the ASBS shall not be altered as a result of anthropogenic sedimentation.

e. A description of the non-structural BMPs currently employed and planned in the future (including those for construction activities), and include an implementation schedule. The ASBS Compliance Plan shall also describe the structural BMPs, including any low impact development (LID) measures, currently employed and planned for higher threat discharges and include an

implementation schedule. To control storm water runoff discharges (at the end-of-pipe) during a design storm, ASBS Dischargers must first consider using LID practices to infiltrate, use, or evapotranspiration storm water runoff on-site. The BMPs and implementation schedule shall be designed to ensure that natural water quality conditions in the receiving water are achieved and maintained by either reducing flows from impervious surfaces or reducing pollutant loading, or some combination thereof.

D. Reporting

If the results of the receiving water monitoring described in Section F. below (Sampling and Analysis Requirements) indicate that the storm water runoff is causing or contributing to an alteration of natural ocean water quality in the ASBS, the ASBS Discharger shall submit a report to the State Water Board within 30 days of receiving the results.

1. The report shall identify the constituents in storm water runoff that alter natural ocean water quality and the sources of these constituents.

2. The report shall describe BMPs that are currently being implemented, BMPs that are identified in the SWPPP for future implementation, and any additional BMPs that may be added to the SWPPP to address the alteration of natural water quality. The report shall include a new or modified implementation schedule for the BMPs.

3. Within 30 days of the approval of the report by the Executive Director, the ASBS Discharger shall revise its ASBS Compliance Plan to incorporate any new or modified BMPs that have been or will be implemented, the implementation schedule, and any additional monitoring required.

4. As long as the ASBS Discharger has complied with the procedures described above and is implementing the revised SWPPP, the Discharger does not have to repeat the same procedure for continuing or recurring exceedances of natural ocean water quality conditions due to the same constituent.

5. Compliance with this section does not excuse violations of any term, prohibition, or special condition contained in the Special Protections of the ASBS Exception.

E. Compliance Schedule

1. As of March 20, 2012, all unauthorized ASBS Non-Storm Water Discharges (e.g., dry weather flow) were effectively prohibited.

2. By September 20, 2013, the Discharger shall submit a draft written ASBS Compliance Plan to the Executive Director that describes its strategy to comply with these special conditions, including the requirement to maintain natural water

quality in the affected ASBS. The ASBS Compliance Plan shall include a description of appropriate non-structural controls and a time schedule to implement structural controls (implementation schedule) to comply with these special conditions for inclusion in the Discharger's SWPPP.

3. By September 20, 2014, the Discharger shall submit the final ASBS Compliance Plan, including a description and final schedule for structural controls based on the results of runoff and receiving water monitoring.

4. By September 20, 2013, any non-structural controls that are necessary to comply with these special conditions shall be implemented.

5. By March 20, 2018, any structural controls identified in the ASBS Compliance Plan that are necessary to comply with these special conditions shall be operational.

6. By March 20, 2018, all Dischargers must comply with the requirement that their discharges into the affected ASBS maintain natural ocean water quality. If the initial results of post-storm receiving water quality testing indicate levels higher than the 85th percentile threshold of reference water quality data and the pre-storm receiving water levels, then the Discharger must re-sample the receiving water, pre- and post-storm. If after re-sampling the post-storm levels are still higher than the 85th percentile threshold of reference water quality data, and the pre-storm receiving water levels, for any constituent, then natural ocean water quality is exceeded. See Flowchart at the end of this Attachment.

7. The Executive Director may only authorize additional time to comply with the special conditions 5 and 6, above if good cause exists to do so. Good cause means a physical impossibility or lack of funding

   If a Discharger claims physical impossibility, it shall notify the Board in writing within thirty (30) days of the date that the Discharger first knew of the event or circumstance that caused or would cause it to fail to meet the deadline in 5. or 6. The notice shall describe the reason for the noncompliance or anticipated noncompliance and specifically refer to this Section of these requirements. It shall describe the anticipated length of time the delay in compliance may persist, the cause or causes of the delay as well as measures to minimize the impact of the delay on water quality, the measures taken or to be taken by the Discharger to prevent or minimize the delay, the schedule by which the measures will be implemented, and the anticipated date of compliance. The Discharger shall adopt all reasonable measures to avoid and minimize such delays and their impact on water quality.

   The Discharger may request an extension of time for compliance based on lack of funding. The request for an extension shall require:

a. for municipalities, a demonstration of significant hardship to Discharger ratepayers, by showing the relationship of storm water fees to annual household income for residents within the Discharger's jurisdictional area, and the Discharger has made timely and complete applications for all available bond and grant funding, and either no bond or grant funding is available, or bond and/or grant funding is inadequate; or

b. for other governmental agencies, a demonstration and documentation of a good faith effort to acquire funding through that agency's budgetary process, and a demonstration that funding was unavailable or inadequate.

F. Additional Requirements – Waterfront and Marine Operations

In addition to the above provisions, a Discharger with waterfront and marine operations shall comply with the following:

1. For discharges related to waterfront and marine operations, the Discharger shall develop a Waterfront and Marine Operations Management Plan (Waterfront Plan). This plan shall contain appropriate Management Measures/Practices to address nonpoint source pollutant discharges to the affected ASBS.

   a. The Waterfront Plan shall contain appropriate Management Measures/Practices for any waste discharges associated with the operation and maintenance of vessels, moorings, piers, launch ramps, and cleaning stations in order to ensure that beneficial uses are protected and natural water quality is maintained in the affected ASBS.

   b. For discharges from marinas and recreational boating activities, the Waterfront Plan shall include appropriate Management Measures, described in The Plan for California's Nonpoint Source Pollution Control Program, for marinas and recreational boating, or equivalent practices, to ensure that nonpoint source pollutant discharges do not alter natural water quality in the affected ASBS.

   c. The Waterfront Plan shall include Management Practices to address public education and outreach to ensure that the public is adequately informed that waste discharges to the affected ASBS are prohibited or limited by special conditions in these Special Protections. The management practices shall include appropriate signage, or similar measures, to inform the public of the ASBS restrictions and to identify the ASBS boundaries.

   d. The Waterfront Plan shall include Management Practices to address the prohibition against trash discharges to ASBS. The Management Practices shall include the provision of adequate trash receptacles for marine recreation areas, including parking areas, launch ramps, and docks. The plan shall also include appropriate Management Practices to ensure that the receptacles are

adequately maintained and secured in order to prevent trash discharges into the ASBS. Appropriate Management Practices include covering the trash receptacles to prevent trash from being windblown, staking or securing the trash receptacles so they don't tip over, and periodically emptying the receptacles to prevent overflow.

e. The Discharger shall submit its Waterfront Plan to the State Water Board Executive Director by September 20, 2012. The Waterfront Plan is subject to approval by the State Water Board Executive Director. The plan must be fully implemented within by September 20, 2013.

2. The discharge of chlorine, soaps, petroleum, other chemical contaminants, trash, fish offal, or human sewage to ASBS is prohibited. Sinks and fish cleaning stations are point source discharges of wastes and are prohibited from discharging into ASBS. Anthropogenic accumulations of discarded fouling organisms on the sea floor must be minimized.

3. Limited-term activities, such as the repair, renovation, or maintenance of waterfront facilities, including, but not limited to, piers, docks, moorings, and breakwaters, are authorized only in accordance with Chapter III.E.2 of the Ocean Plan.

4. If the Discharger anticipates that the Discharger will fail to fully implement the approved Waterfront Plan within the 18 month deadline, the Discharger shall submit a technical report as soon as practicable to the Executive Director. The technical report shall contain reasons for failing to meet the deadline and propose a revised schedule to fully implement the plan.

5. The State Water Board may, for good cause, authorize additional time to comply with the Waterfront Plan. Good cause means a physical impossibility or lack of funding.

   If a Discharger claims physical impossibility, it shall notify the Board in writing within thirty (30) days of the date that the Discharger first knew of the event or circumstance that caused or would cause it to fail to meet the deadline in Section F.1.e above. The notice shall describe the reason for the noncompliance or anticipated noncompliance and specifically refer to this Section of this Attachment. It shall describe the anticipated length of time the delay in compliance may persist, the cause or causes of the delay as well as measures to minimize the impact of the delay on water quality, the measures taken or to be taken by the Discharger to prevent or minimize the delay, the schedule by which the measures will be implemented, and the anticipated date of compliance. The Discharger shall adopt all reasonable measures to avoid and minimize such delays and their impact on water quality. The Discharger may request an extension of time for compliance based on lack of funding. The request for an extension shall require:

a. a demonstration of significant hardship by showing that the Discharger has made timely and complete applications for all available bond and grant funding, and either no bond or grant funding is available, or bond and/or grant funding is inadequate.

b. for governmental agencies, a demonstration and documentation of a good faith effort to acquire funding through that agency's budgetary process, and a demonstration that funding was unavailable or inadequate.

G. Sampling and Analysis Requirements

1. Monitoring is mandatory for all ASBS Dischargers to assure compliance with the Ocean Plan. Monitoring requirements include both: (1) Core Discharge Monitoring and (2) Ocean Receiving Water Monitoring (see Sections H. and I. below). The State and Regional Water Boards must approve sampling site locations and any adjustments to the monitoring programs. All ocean receiving water and reference area monitoring must be comparable with the Water Boards' Surface Water Ambient Monitoring Program (SWAMP).

2. Safety concerns: Sample locations and sampling periods must be determined considering safety issues. Sampling may be postponed upon notifying the Executive Director that hazardous conditions prevail.

3. Analytical Chemistry Methods: All constituents must be analyzed using the lowest minimum detection limits comparable to the Ocean Plan water quality objectives. For metal analysis, all samples, including storm water effluent, reference samples, and ocean receiving water samples, must be analyzed by the approved analytical method with the lowest minimum detection limits (currently Inductively Coupled Plasma/Mass Spectrometry) described in the Ocean Plan.

H. Core Discharge Monitoring Program

1. General sampling requirements for timing and storm size:

   Runoff must be collected during a storm event that is greater than 0.1 inch and generates runoff, and at least 72 hours from the previously measurable storm event. Runoff samples shall be collected during the same storm and at approximately the same time when post-storm receiving water is sampled, and analyzed for the same constituents as receiving water and reference site samples as described in Section I. below.

2. Runoff flow measurements

   a. For industrial storm water outfalls in existence as of December 31, 2007, 18 inches (457mm) or greater in diameter/width (including multiple outfall pipes in combination having a width of 18 inches, runoff flows must be

measured or calculated, using a method acceptable to and approved by the Executive Director.

b. This will be reported annually for each precipitation season to the Executive Director.

3. Runoff samples – storm events

a. For outfalls equal to or greater than 18 inches (0.46m) in diameter or width: 1) samples of storm water runoff shall be collected during the same storm as receiving water samples and analyzed for oil and grease, total suspended solids, and, if within the range of the southern sea otter, indicator bacteria or some other measure of fecal contamination; and 2) samples of storm water runoff shall be collected and analyzed for critical life stage chronic toxicity (one invertebrate or algal species) at least once during each storm season when receiving water is sampled in the ASBS.

b. For outfalls equal to or greater than 36 inches (0.91m) in diameter or width:

1) samples of storm water runoff shall be collected during the same storm as receiving water samples and analyzed for oil and grease, total suspended solids, and, if within the range of the southern sea otter, indicator bacteria or some other measure of fecal contamination; and

2) samples of storm water runoff shall be further collected during the same storm as receiving water samples and analyzed for Ocean Plan Table B metals (provided at the end of this Attachment) for protection of marine life, Ocean Plan polynuclear aromatic hydrocarbons (PAHs), current use pesticides (pyrethroids and OP pesticides), and nutrients (ammonia, nitrate and phosphates); and

3) samples of storm water runoff shall be collected and analyzed for critical life stage chronic toxicity (one invertebrate or algal species) at least once during each storm season when receiving water is sampled in the ASBS.

4) if an ASBS Discharger has no outfall greater than 36 inches, then storm water runoff from the applicant's largest outfall shall be further collected during the same storm as receiving water samples and analyzed for Ocean Plan Table B metals (provided at the end of this Attachment) for protection of marine life, Ocean Plan polynuclear aromatic hydrocarbons (PAHs), current use pesticides (pyrethroids and OP pesticides), and nutrients (ammonia, nitrate and phosphates).

c. For an applicant not participating in a regional integrated monitoring program [see below in Section I.3.] in addition to the sampling requirements in Section H.3.a. and b. above, a minimum of the two largest outfalls or 20 percent of the

larger outfalls, whichever is greater, shall be sampled (flow weighted composite samples) at least three times annually during wet weather (storm event) and analyzed for all Ocean Plan Table A constituents, Table B constituents (Table A and B constituents are provided at the end of this Attachment) for marine aquatic life protection (except for toxicity, only chronic toxicity for three species shall be required), DDT, PCBs, Ocean Plan PAHs, OP pesticides, pyrethroids, nitrates, phosphates, and Ocean Plan indicator bacteria. For parties discharging to ASBS in more than one Regional Water Board region, at a minimum, one (the largest) such discharge shall be sampled annually in each Region.

d. The Executive Director may reduce or suspend core monitoring once the storm runoff is fully characterized. This determination may be made at any point after the discharge is fully characterized, but is best made after the monitoring results from the first permit cycle are assessed.

I. Ocean Receiving Water and Reference Area Monitoring Program

1. In addition to performing the Core Discharge Monitoring Program in Section H. above, all ASBS Dischargers must perform ocean receiving water monitoring. In order to fulfill the requirements for monitoring the physical, chemical, and biological characteristics of the ocean receiving waters within their ASBS, ASBS Dischargers may choose either (1) an individual monitoring program, or (2) participation in a regional integrated monitoring program.

2. Individual Monitoring Program: The requirements listed below are for those ASBS Dischargers who elect to perform an individual monitoring program to fulfill the requirements for monitoring the physical, chemical, and biological characteristics of the ocean receiving waters within the affected ASBS. In addition to Core Discharge Monitoring, the following additional monitoring requirements shall be met:

   a. Three times annually, during wet weather (storm events), the receiving water at the point of discharge from the outfalls described in Section H.3. above shall be sampled and analyzed for Ocean Plan Table A constituents, Table B constituents (Table A and B constituents are provided at the end if this Attachment) for marine aquatic life, DDT, PCBs, Ocean Plan PAHs, OP pesticides, pyrethroids, nitrates, phosphates, salinity, chronic toxicity (three species), and Ocean Plan indicator bacteria.

      The sample location for the ocean receiving water shall be in the surf zone at the point of discharges; this must be at the same location where storm water runoff is sampled. Receiving water shall be sampled prior to (pre-storm), and during (or immediately after) the same storm (post-storm). Post-storm sampling shall be during the same storm and at approximately the same time as when the runoff is sampled. Reference water quality shall also be

sampled three times annually and analyzed for the same constituents pre-storm and post-storm, during the same storm seasons when receiving water is sampled. Reference stations will be determined by the State Water Board's Division of Water Quality and the applicable Regional Water Board(s).

b. Sediment sampling shall occur at least three times during every five (5) year period. The subtidal sediment (sand or finer, if present) at the discharge shall be sampled and analyzed for Ocean Plan Table B constituents (provided at the end of this Attachment) for marine aquatic life, DDT, PCBs, PAHs, pyrethroids, and OP pesticides. For sediment toxicity testing, only an acute toxicity test using the amphipod Eohaustorius estuarius must be performed.

c. A quantitative survey of intertidal benthic marine life shall be performed at the discharge and at a reference site. The survey shall be performed at least once every five (5) year period. The survey design is subject to approval by the Regional Water Board and the State Water Board's Division of Water Quality. The results of the survey shall be completed and submitted to the State Water Board and Regional Water Board at least six months prior to the end of the permit cycle.

d. Once during each five (5) year period, a bioaccumulation study shall be conducted to determine the concentrations of metals and synthetic organic pollutants at representative discharge sites and at representative reference sites. The study design is subject to approval by the Regional Water Board and the State Water Board's Division of Water Quality. The bioaccumulation study may include California mussels (Mytilus californianus) and/or sand crabs (Emerita analoga or Blepharipoda occidentalis). Based on the study results, the Regional Water Board and the State Water Board's Division of Water Quality, may adjust the study design in subsequent permits, or add or modify additional test organisms (such as shore crabs or fish), or modify the study design appropriate for the area and best available sensitive measures of contaminant exposure.

e. Marine Debris: Representative quantitative observations for trash by type and source shall be performed along the coast of the ASBS within the influence of the ASBS Discharger's outfalls. The design, including locations and frequency, of the marine debris observations is subject to approval by the Regional Water Board and State Water Board's Division of Water Quality.

f. The monitoring requirements of the Individual Monitoring Program in this Section are minimum requirements. After a minimum of one (1) year of continuous water quality monitoring of the discharges and ocean receiving waters, the Executive Director of the State Water Board may require additional monitoring, or adjust, reduce or suspend receiving water and reference station monitoring. This determination may be made at any point

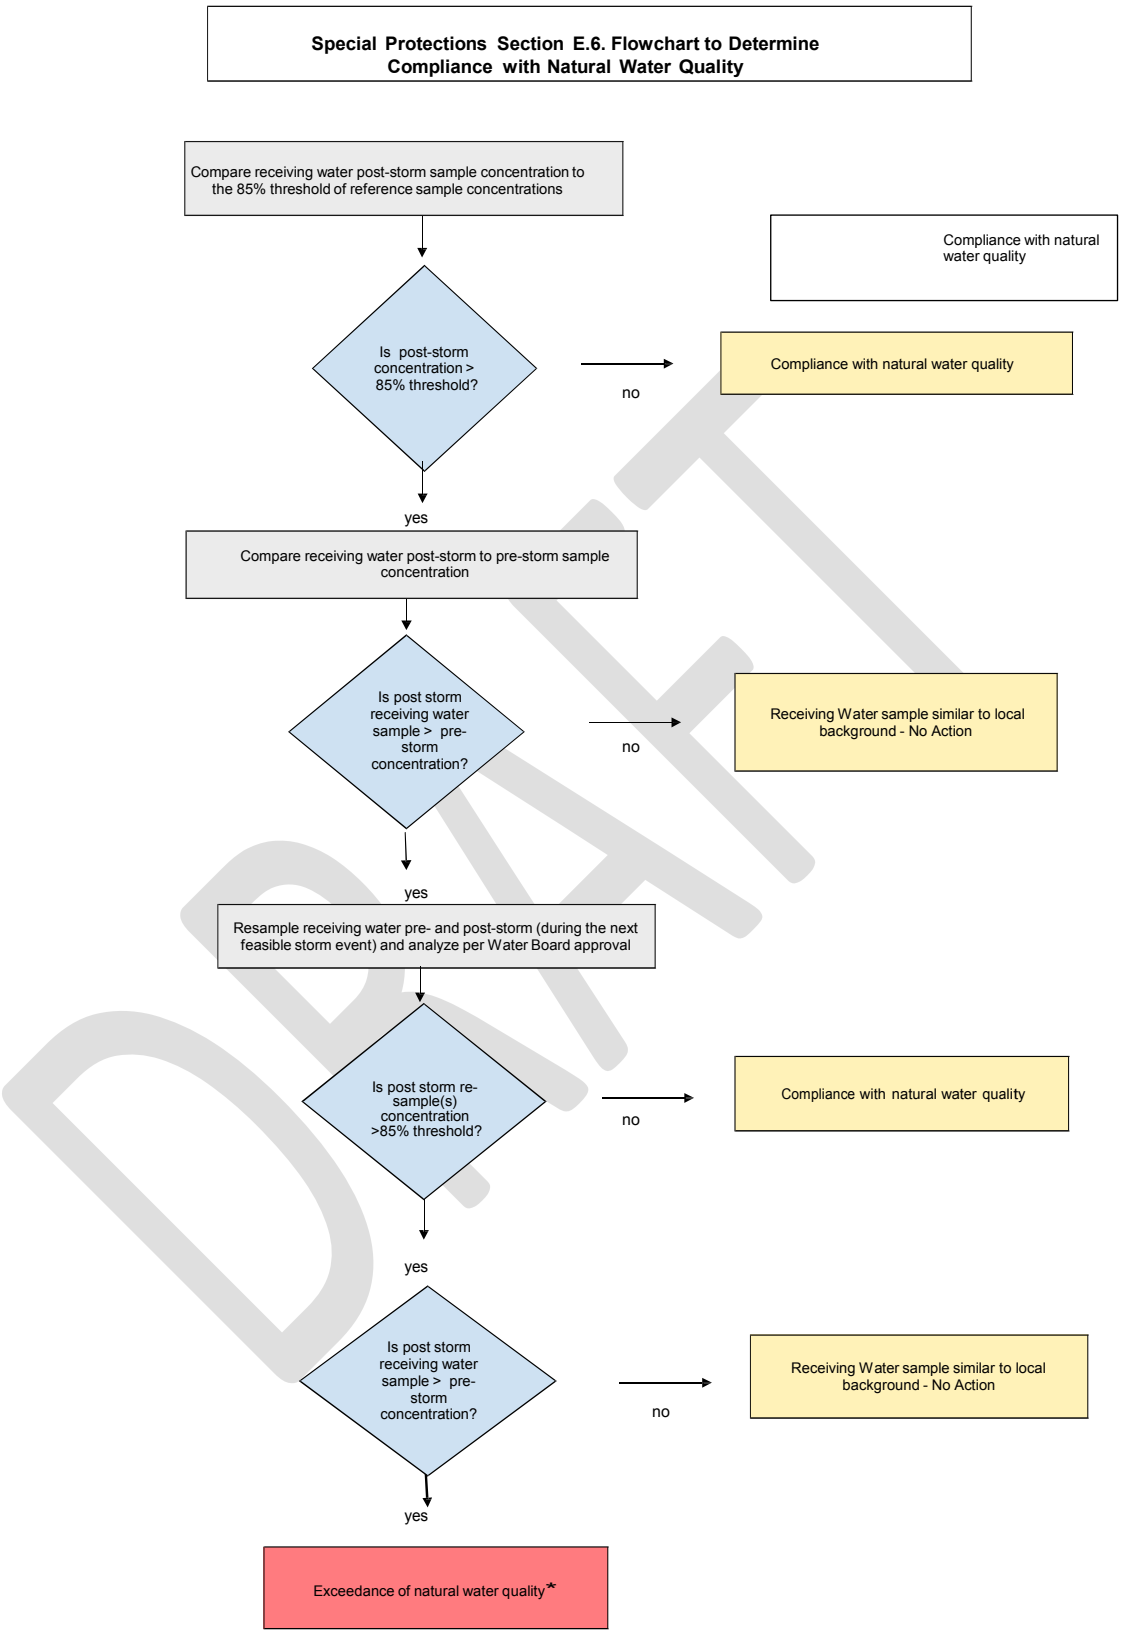
DRAFT

after the discharge and receiving water is fully characterized, but is best made after the monitoring results from the first permit cycle are assessed.

3. Regional Integrated Monitoring Program: ASBS Dischargers may elect to participate in a regional integrated monitoring program, in lieu of an individual monitoring program, to fulfill the requirements for monitoring the physical, chemical, and biological characteristics of the ocean receiving waters within their ASBS. This regional approach shall characterize natural water quality, pre- and post-storm, in ocean reference areas near the mouths of identified open space watersheds and the effects of the discharges on natural water quality (physical, chemical, and toxicity) in the ASBS receiving waters, and should include benthic marine aquatic life and bioaccumulation components. The design of the ASBS stratum of a regional integrated monitoring program may deviate from the otherwise prescribed individual monitoring approach (in Section I.2.) if approved by the State Water Board's Division of Water Quality and the Regional Water Boards.

   a. Ocean reference areas shall be located at the drainages of flowing watersheds with minimal development (in no instance more than 10% development), and shall not be located in CWA Section 303(d) listed waterbodies or have tributaries that are 303(d) listed. Reference areas shall be free of wastewater discharges and anthropogenic non-storm water runoff. A minimum of low threat storm runoff discharges (e.g. stream highway overpasses and campgrounds) may be allowed on a case-by-case basis. Reference areas shall be located in the same region as the ASBS receiving water monitoring occurs. The reference areas for each Region are subject to approval by the participants in the regional integrated monitoring program, the State Water Board's Division of Water Quality and the applicable Regional Water Board(s). A minimum of three ocean reference water samples must be collected from each station, each from a separate storm during the same storm season that receiving water is sampled. A minimum of one reference location shall be sampled for each ASBS receiving water site sampled per responsible party. For parties discharging to ASBS in more than one Regional Water Board region, at a minimum, one reference station and one receiving water station shall be sampled in each region.

   b. ASBS ocean receiving water must be sampled in the surf zone at the location where the runoff makes contact with ocean water (i.e. at "point zero"). Ocean receiving water stations must be representative of worst-case discharge conditions (i.e. co-located at a large drain greater than 36 inches, or if drains greater than 36 inches are not present in the ASBS then the largest drain greater than18 inches.) Ocean receiving water stations are subject to approval by the participants in the regional monitoring program and the State Water Board's Division of Water Quality and the applicable Regional Water Board(s). A minimum of three ocean receiving water samples must be collected during each storm season from each station, each from a separate



storm. A minimum of one receiving water location shall be sampled in each ASBS per responsible party in that ASBS. For parties discharging to ASBS in more than one Regional Water Board region, at a minimum, one reference station and one receiving water station shall be sampled in each region.

c. Reference and receiving water sampling shall commence during the first full storm season following the adoption of these special conditions, and post-storm samples shall be collected during the same storm event when storm water runoff is sampled. Sampling shall occur in a minimum of two storm seasons. For those ASBS Dischargers that have already participated in the Southern California Bight 2008 ASBS regional monitoring effort, sampling may be limited to only one storm season.

d. Receiving water and reference samples shall be analyzed for the same constituents as storm water runoff samples. At a minimum, constituents to be sampled and analyzed in reference and discharge receiving waters must include oil and grease, total suspended solids, Ocean Plan Table B metals (provided at the end of this Attachment) for protection of marine life, Ocean Plan PAHs, pyrethroids, OP pesticides, ammonia, nitrate, phosphates, and critical life stage chronic toxicity for three species. In addition, within the range of the southern sea otter, indicator bacteria or some other measure of fecal contamination shall be analyzed.

DRAFT

REQUIREMENTS FOR DISCHARGERS WHO HAVE BEEN GRANTED AN OCEAN PLAN EXCEPTION FOR DISCHARGES TO ASBS

* When an exceedance of natural water quality occurs, the Discharger must comply with Section D. Note, when sampling data is available, end-of-pipe effluent concentrations will be considered by the Water Boards in making this determination.

ASBS Monitoring

TABLE A
Monitoring Constituent List
(excerpted from California Ocean Plan dated 2009)

Constituent	Units
Grease and Oil	mg/L
Suspended Solids	Mg/L
Settleable Solids	mL/L
Turbidity	NTU
PH	

TABLE B
Monitoring Constituent List
(Excerpted from California Ocean Plan dated 2009)

Constituent	Units
Arsenic	µg/L
Cadmium	µg/L
Chromium	µg/L
Copper	µg/L
Lead	µg/L
Mercury	µg/L
Nickel	µg/L
Selenium	µg/L
Silver	µg/L
Zinc	µg/L
Cyanide	µg/L
Total Chlorine Residual	µg/L
Ammonia (as N)	µg/L
Acute Toxicity	TUa
Chronic Toxicity	TUc
Phenolic Compounds (non-chlorinated)	µg/L
Chlorinated Phenolics	µg/L
Endosulfan	µg/L
Endrin	µg/L
HCH	µg/L

Analytical Chemistry Methods: All constituents shall be analyzed using the lowest minimum detection limits comparable to the Ocean Plan water quality objectives. For metal analysis, all samples, including storm water effluent, reference samples, and ocean receiving water samples, shall be analyzed by the approved analytical method with the lowest minimum detection limits (currently Inductively Coupled Plasma/Mass Spectrometry) described in the Ocean Plan.

ATTACHMENT H

SAMPLE COLLECTION AND HANDLING INSTRUCTIONS

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES)
GENERAL PERMIT FOR STORM WATER DISCHARGES
ASSOCIATED WITH INDUSTRIAL ACTIVITIES
(GENERAL PERMIT)

For more detailed guidance, Dischargers should refer to the U.S. EPA's "Industrial Stormwater Monitoring and Sampling Guide," dated March 2009, available at: http://www.epa.gov/npdes/pubs/msgp_monitoring_guide.pdf and the "NPDES Storm Water Sampling Guidance Document," dated July 1992, available at: http://www.epa.gov/npdes/pubs/owm0093.pdf .

1. Identify the sampling parameters required to be tested and the number of storm water discharge points that will be sampled. Request the analytical testing laboratory to provide the appropriate number and type of sample containers, sample container labels, blank chain of custody forms, and sample preservation instructions.

2. Determine how samples will be transported to the laboratory. The testing laboratory should receive samples within 48 hours of the physical sampling (unless otherwise required by the laboratory). The Discharger may either deliver the samples to the laboratory, arrange for the laboratory to pick up the samples, or overnight ship the samples to the laboratory. All sample analysis shall be done in accordance with 40 Code of Federal Regulations part 136. Samples for pH have a holding time of 15 minutes.[1]

3. Qualified Combined Samples ~~(QCS)~~ shall be combined by the laboratory and not by the Discharger. Sample bottles must be appropriately labeled to instruct the laboratory on which samples to combine.

4. Unless the Discharger can provide flow weighted information, all combined samples shall be volume weighted.

5. For grab samples, ~~U~~use only the sample containers provided by the laboratory to collect and store samples. Use of any other type of containers may contaminate samples.

6. For automatic samplers that are not compatible with bottles provided by the laboratory, the Discharger is required to send the sample container included with the automatic sampler to the laboratory for analysis.

[1] 40 C.F.R. section 136.3, Table II - Required Containers, Preservation Techniques, and Holding Times.

7. The Discharger can only use automatic sampling device to sample parameters that the device is designed to. For pH, Dischargers can only use automatic sampling devices with the ability to read pH within 5 minutes of sample collection.

8. The Discharger is prohibited from using an automatic sampling device for Oil and Grease, unless the automatic sampling device is specifically designed to sample for Oil and Grease.

9. To prevent contamination, do not touch inside of sample container or cap or put anything into the sample containers before collecting storm water samples.

10. Do not overfill sample containers. Overfilling can change the analytical results.

11. Tightly screw on the cap of each sample container without stripping the threads of the cap.

12. Complete and attach a label for each sample container. The label shall identify the date and time of sample collection, the person taking the sample, and the sample collection location or discharge point. The label should also identify any sample containers that have been preserved.

13. Carefully pack sample containers into an ice chest or refrigerator to prevent breakage and maintain temperature during shipment. Remember to place frozen ice packs into shipping containers. Samples should be kept as close to 4 degrees Celsius (39 degrees Fahrenheit) as possible until arriving to the laboratory. Do not freeze samples.

14. Complete a Chain of Custody form for each set of samples. The Chain of Custody form shall include the Discharger's name, address, and phone number, identification of each sample container and sample collection point, person collecting the samples, the date and time each sample container was filled, and the analysis that is required for each sample container.

15. Upon shipping/delivering the sample containers, obtain both the signatures of the persons relinquishing and receiving the sample containers.

16. Dischargers shall designate and train personnel to collect, maintain, and ship samples in accordance with the sample protocols and laboratory practices.

17. Refer to Table 1 in the General Permit for test methods, detection limits, and reporting units.

18. All sampling and sample preservation shall be in accordance with 40 Code of Federal Regulations part 136 and the current edition of "Standard Methods for the Examination of Water and Wastewater" (American Public Health

Association). All monitoring instruments and equipment (including Discharger field instruments for measuring pH or specific conductance if identified as an additional sampling parameter) shall be calibrated and maintained in accordance with manufacturers' specifications to ensure accurate measurements. All laboratory analyses shall be conducted according to approved test procedures under 40 Code of Federal Regulations part 136, unless other test procedures have been specified by the Regional Water Quality Control Board. All metals shall be reported as total metals. Dischargers may conduct their own field analysis of pH (or specific conductance if identified as an additional sampling parameter) if the Discharger has sufficient capability (qualified and trained employees, properly calibrated and maintained field instruments, etc.) to adequately perform the field analysis. With the exception of field analysis conducted by Dischargers for pH (or specific conductance if identified as an additional sampling parameter), all analyses shall be sent to and conducted at a laboratory certified for such analyses by the California Department of Public Health. Dischargers are required to report to the Water Board any sampling data collected more frequently than required in this General Permit (Section XXI.J.2)

APPENDIX 2

INSTRUCTIONS FOR NO EXPOSURE CERTIFICATION (NEC)

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES)
GENERAL PERMIT FOR STORM WATER DISCHARGES ASSOCIATED WITH INDUSTRIAL ACTIVITIES
(GENERAL PERMIT)

This Attachment provides general guidance instructions and guidance for obtaining NEC coverage. The actual NEC requirements are primarily contained in Section XVII of this General Permit.

A. INSTRUCTIONS:

Who May File for NEC Coverage

Sections 301 and 402(p) of the Clean Water Act (CWA), and Sections 1311 and 1342(p) of 33 United~~.~~ States~~.~~ Code~~.~~ prohibit the discharge of storm water associated with industrial activity to waters of the United States without a National Pollutant Discharge Elimination System (NPDES) permit. However, NPDES permit coverage is "conditionally excluded" for discharges of storm water associated with industrial activities (industrial storm water discharges) if the Discharger can certify that a condition of "No Exposure" exists at the industrial facility. A condition of "No Exposure" means that a Discharger's industrial activities and materials are not exposed to storm water. Industrial storm water discharges from construction and land disturbance activities are ineligible for the NEC coverage. Dischargers who file valid NECs in accordance with these instructions are not required to implement ~~BAT~~ Best Available Technology Economically Achievable /~~BCT~~Best Conventional Pollutant Control Technology and comply with the Storm Water Pollution Prevention Plan (SWPPP) and monitoring requirements of this General Permit.

Obtaining and Maintaining NEC Coverage

A Discharger~~s~~ ~~shall~~ must electronically certify and submit NEC Permit Registration Documents (PRDs) via State Water Resources Control Board's (State Water Board's) Storm Water Multi-Application and Report Tracking System (SMARTS) to obtain NEC coverage. This conditional exclusion does not become effective until the PRDs are submitted and the annual fee is paid. Upon receipt of the annual fee, the Discharger will electronically receive an NEC acceptance notification via SMARTS, which will include a Waste Discharge~~r~~ Identification (WDID) number. A Discharger~~s~~ ~~shall~~ must maintain a condition of "No Exposure" at the facility ~~in order~~ for the conditional exclusion to remain applicable. The Discharger ~~shall~~ must annually electronically re-certify the NEC via SMARTS to confirm that the conditions of "no exposure" are being maintained. If conditions change resulting in the exposure of materials and activities to storm water, the Discharger must electronically certify and submit PRDs via SMARTS for Notice of Intent (NOI) coverage under the General Permit for Storm Water Discharges Associated with Industrial Activities (General Permit).

Fees

First time NEC coverage PRDs and the annual re-certification require a ~~fee~~ fee~~that is currently $242~~. ~~This~~ ~~f~~Fees may be changed by ~~State Water Resources Control Board (~~State Water Board~~)~~ regulation, independent of this General Permit ~~adoption~~.

How to Prepare and Submit PRDs for ~~the~~ NEC Coverage

A Discharger~~s~~ ~~shall~~ must electronically certify and submit PRDs for NEC coverage in accordance with the instructions provided at the State Water Board web site for SMARTS:

https://smarts.waterboards.ca.gov/smarts/faces/SwSmartsLogin.jsp

A Discharger~~s~~ with multiple facilities that satisfy the conditions of "No Exposure" ~~shall~~ must certify and submit PRDs for each facility. The Discharger is~~s are~~ required to inspect and evaluate each individual facility to determine the condition of No-Exposure. The Discharger must~~s shall~~ retain an electronic or paper copy of the NEC coverage acceptance notification for their records.

The following information is required in the PRDs:

Discharger Information

1. The legal business name of the business entity, public organization, or any other entity that operates the facility described in the certification. The name of the operator may or may not be the same as the name of the facility. The operator is the legal entity that controls the facility operations, not the plant or site manager.

2. The mailing address of the facility operator, including the city, state, and zip code.

3. The facility operator contact person, telephone number and e-mail address.

INSTRUCTIONS FOR NO EXPOSURE CERTIFICATION (NEC)

Facility Information

4. The legal business name of the facility.

5. The total acreage of the facility associated with industrial activity. (Facility size in acres is calculated by taking the square feet and dividing by 43,560.)

6. The complete physical street address (e.g. the street address used for express deliveries), including the city, State, and zip code. Do not use a P.O. Box number. If ~~no~~ a physical street address does not exist~~s~~, describe the location or provide the latitude and longitude of a point within the facility boundary. Latitude and longitude are available from United States Geological Survey quadrangle or topographic maps, or may be found using a mapping site on the internet.

7. The facility contact person, telephone number, and e-mail address.

8. The 4-digit Standard Industrial Classification (SIC) code that represents the facility primary industrial activity. Provide a brief description of the primary industrial activity. If applicable, enter other significant SIC codes and descriptions. To obtain these codes, see the 1987 SIC Manual or the Occupational Health and Safety Administration's site:

   http://www.osha.gov/pls/imis/sicsearch.html

9. If the facility is currently covered under the General Permit, include the WDID number. The WDID number will be used at a later date to terminate the facility's coverage under the General Permit as necessary.

Facility Mailing or Billing Address

Completion~~g~~ of this item is ~~only~~ required ~~if there is a different~~ the facility mailing address or billing address ~~than~~ differs from the physical facility address provided above. The Discharger ~~shall~~ must indicate ~~to~~ which address the annual fee invoice ~~should~~ must be sent to if the State Water Board is unable to transmit the invoice electronically.

Site Map~~s~~

Site maps ~~are to~~must be prepared and submitted ~~consistent~~ in accordance with the requirements in Section X.E of this General Permit.

NEC~~Exposure~~ Checklist

The Discharger must ~~At the end of this Appendix, there is a list of~~ evaluate the eleven major areas ~~for which~~that storm water exposure may occur, ~~must be evaluated by the Discharger~~per the listing at the end of this appendix. The Discharger must be able to certify that none of these major areas have potential for exposure. If the Discharger cannot certify that every one of the eleven major areas do not have exposure, a potential for exposure exists at the facility and the facility is not eligible for NEC coverage. The Discharger must obtain (or continue) NOI coverage under this General Permit if the facility is not eligible for NEC coverage. After obtaining NOI coverage, the Discharger ~~can institute~~may implement facility modifications to eliminate the potential for a discharge of storm water exposed to industrial activity, and then change their NOI coverage to NEC coverage by certifying ~~they meet~~ the conditions of "No Exposure~~.~~" are met.

Certification

Federal and state statutes provide for severe penalties for Dischargers ~~who~~ that submit false information on the PRDs. Dischargers shall certify and submit PRDs via SMARTS for NEC coverage in accordance with Electronic Signature and Certification Requirements in Section XXI.K of this General Permit.~~Federal regulations require the PRDs to be certified by an Operator as follows:.~~

~~For a corporation: an Operator is a responsible corporate officer, which meansas follows:~~

~~The president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision making functions for the corporation, or~~

~~The manager of one or more manufacturing, production, or operating facilities, provided the manager is authorized to make management decisions which govern the operation of the regulated facility, including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long-term environmental compliance with environmental laws and regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements, and has the authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures;~~

~~For a partnership or sole proprietorship, an Operator is a general partner or the proprietor; or~~

DRAFT

INSTRUCTIONS FOR NO EXPOSURE CERTIFICATION (NEC)

~~For a municipal, state, federal, or other public facility, an Operator is either a principal executive or ranking elected official.~~

B. GUIDANCE:

~~Please c~~Contact your local Regional Water Quality Control Board (Regional Water Board) office with questions regarding this guidance.

1. Who is Eligible to Qualify for the No Exposure Certification (NEC) - Conditional Exclusion?

All industrial categories listed in Attachment A of this General Permit (excluding construction) are eligible to apply for the NEC coverage.

2. Limitations on Eligibility for ~~the~~ NEC coverage

In addition to construction projects not being eligible, the following situations limit the applicability of NEC coverage:

a. NEC coverage is available on a facility~~-~~-wide basis only, not for individual drainage areas or discharge locations. Generally, if any exposed industrial materials or activities exist, or have a potential to exist, anywhere at a facility, NEC coverage is not applicable to the facility. If the Regional Water Board determines that a facility does have exposure or the facility's storm water discharges have a reasonable potential to cause or contribute to an exceedance of applicable water quality objectives/standards, the Regional Water Board can deny NEC coverage.

b. If changes at a facility result in potential exposure of industrial activities or materials, the facility is no longer eligible for NEC coverage. Dischargers shall register for NOI coverage under this General Permit prior to a planned facility change that will cause exposure, or within seven (7) calendar days after unplanned exposure occurs. If an unplanned exposure occurs due to an emergency response or one-time event that is unlikely to re-occur, a Discharger may contact the Regional Water Board to discuss whether the requirement to obtain NOI coverage can be waived. Unless the Discharger receives a written waiver from the Regional Water Board, the Discharger shall electronically certify and submit PRDs to obtain NOI coverage.

c. Current contamination resulting from historic industrial practices at the facility (e.g., soil contamination, groundwater contamination, etc.) represents a condition of exposure to waters of the United S~~s~~tate; therefore a facility with historic contamination is not eligible for NEC coverage.

3. What is the Definition of No Exposure?

a. No Exposure means all industrial materials and activities are protected by a storm-resistant shelter to prevent exposure to rain, snow, snowmelt and/or runoff.

b. Industrial materials and activities include, but are not limited to, material-handling equipment or activities; industrial machinery; raw materials, intermediate products, by-products, and final products; or waste products.

c. Material handling activities include storage, loading and unloading, transport, or conveyance of any raw material, intermediate product, by-product, final product, or waste product.

d. Final products ~~which are meant~~intended to be used outdoors (e.g., automobiles) typically pose little risk of polluting storm water ~~because they are~~since not typically contaminated with pollutants that become mobilized by contact with storm water. Final products are exempt from the requirement for protection by a storm-resistant shelter to qualify for no exposure. Similarly, containers, racks, and other transport platforms (e.g., wooden pallets) used for the storage or conveyance of final products may also be stored outside if pollutant-free or pollutants do not mobilize via contact with storm water.

e. Storm-resistant shelters include: (1) completely roofed and walled buildings or structures, (2) structures with only a top cover (no side coverings) supported by permanent supports, provided material within the structure is not subject to wind dispersion (sawdust, powders, etc.) or being tracked out of the facility, and is not a source of pollutants in the ~~-~~industrial storm water discharges.

4. Industrial Materials/Activities ~~that Do~~ Not Requiring a Storm-Resistant Shelter

~~While t~~The intent of the "No Exposure" exclusion is to ~~promote~~ maintain a condition of permanent "No Exposure~~,~~". ~~a~~ A storm-resistant shelter is not required for the following industrial materials and activities:

a. Drums, Barrels, Tanks, and Similar Containers that are sealed ("sealed" means banded or otherwise secured and without operational taps or valves), are not exposed provided those containers are not deteriorated, do not contain residual materials on

the outside surfaces, and do not leak. Drums, barrels, etc., that are not opened while outdoors, or are not deteriorated or leaking, ~~are unlikely to~~and that do not pose ~~constitute~~ a risk of contaminating storm water runoff. Consider the following when making ~~your~~ a "No Exposure" determination:

i. ~~-~~Materials shall not be added or withdrawn to/from containers while outdoors

ii. Simply moving containers while outside does not create exposure unless exposure occurs when pollutants are "tracked out" by the container handling equipment or vehicles.

iii. All outdoor containers shall be inspected to ensure they are not open, deteriorated, or leaking. When an outdoor container is observed as opened, deteriorated, or leaking, the container must immediately be closed, replaced, or sheltered. Frequent detection of open, deteriorated, or leaking containers, or failure to immediately close, replace, or shelter opened, deteriorated or leaking containers will cause a condition of exposure.

iv. Containers, racks, and other transport platforms (e.g., wooden pallets) used with ~~the~~ drums, barrels, etc., can be stored outside providing they are contaminant-free and in good repair.

b. Above Ground Storage Tanks (ASTs)~~.~~ In addition to generally being considered as not exposed, ASTs may also be exempt from the prohibition against adding or withdrawing material to/from external containers. ASTs typically use transfer valves to dispense materials ~~which~~ that support facility operations (e.g., heating oil, propane, butane, chemical feedstock) or fuel for delivery vehicles (gasoline, diesel, compressed natural gas). For operational ASTs to qualify for "No Exposure", the following must be satisfied:

i. The tank(s) shall be physically separated from and not associated with vehicle maintenance operations.

ii. There shall be no leaks from piping, pumps, or other equipment that has the potential to come in contact with storm water.

iii. Wherever feasible, the tank(s) shall ~~-~~have secondary containment (e.g., an impervious dike, berm or concrete retaining structure) to prevent runoff in the event of a structural failure or leaking transfer valve. Note: any resulting unpermitted discharge ~~would~~ is in violation ~~of~~ the CWA.

c. Lidded Dumpsters. Lidded dumpsters containing waste materials, providing the containers are completely covered and nothing can drain out holes in the bottom, spilled when loaded into the dumpster, or spilled in loading into a garbage truck. Industrial waste materials and trash that is stored uncovered is considered exposed.

d. Adequately maintained vehicles, such as trucks, automobiles, forklifts, trailers or other general-purpose vehicles found onsite - but not industrial machinery ~~- which~~that are not leaking, are in good repair or are not otherwise a potential source of contaminants:

i. Vehicles passing between buildings ~~will likely~~may be exposed to storm water, however if the vehicles are adequately maintained, a condition of exposure ~~will~~ may not exist. Similarly, non-leaking vehicles awaiting maintenance at vehicle maintenance facilities are not considered as potential exposure. However, vehicles that have been washed or rinsed that are not completely dry prior to outside exposure have the potential to cause a condition of exposure. Vehicles that track materials out of the facility are considered to be mobilizing pollutants. Vehicles that exit maintenance bays are also considered to cause exposure.

ii. The mere conveyance between buildings of materials / products that ~~would~~ are otherwise not ~~be~~ allowed to be stored outdoors, does not create a condition of exposure, provided the materials/products are ~~not~~ adequately protected from storm water and ~~could~~ do not have the potential to be released as a result of a leak or spill.

e. Final products built and intended for use outdoors (e.g., new cars), provided the final products have not deteriorated, are not contaminated, or are not otherwise potential sources of contaminants.

Types of final products not qualifying for a certification of "No Exposure":

i. Products that ~~would~~ may be mobilized in storm water discharges (e.g., rock salt).

ii. Products, which may, when exposed, oxidize, deteriorate, leak, or otherwise be a potential source of contaminants (e.g., junk cars, stockpiled train rails).

iii. "Final" products that are, in actuality, "intermediate" products. Intermediate products

DRAFT

are those used in the composition of yet another product (i.e.g., sheet metal, tubing, and paint used in making tractors).

iv. Even if the intermediate product is "final" for a manufacturer and destined for incorporation in a "final product intended for use outdoors," thesce product is are not allowed to be exposed because they may be chemically treated or are insufficiently impervious to weathering.

f. Special Conditions for Construction Activities
Permanent, uninterrupted sheltering of industrial activities or materials may not always be possible during facility renovation or construction. When such circumstances exist, the Discharger is not required to obtain coverage under an NPDES permit as long as the following conditions are met:

i. Materials and activities are protected with temporary covers or shelters (i.e.g. tarpaulins);

ii. The temporary covers or shelters shall adequately prevent the contact of storm water to materials and activities;

iii. Materials that are subject to wind dispersion are not eligible forstored under temporary sheltering;

iv. Temporary shelters shall are only be used when necessary during facility renovation or construction and until permanent storm-resistant shelters as described above are available; and,

v. Temporary shelters shall are only be used for a single period of ninety days or less. (Facilities with construction and renovation projects that will need the use of temporary shelters beyond 90 days, or that will require multiple periods of ninety days or less, are required to be covered by an NPDES permit.)

5. Other Potential Sources of Contaminants

a. Particulate Emissions from Roof Stacks and/or Vents: Deposits of particles or residuals from roof stacks/vents which couldthat have the potential to be mobilized by storm water runoff are considered exposed.

b. Acid Rain Leachate: Industrial facilities are also responsible for storm water discharges that contain pollutants resulting from the leaching effect of acidic storm water on metal building structures. Therefore, operators must be aware when certifying a condition of "no exposure" of the existence of structural elements that could be soluble as a result of contact with acidic precipitation (e.g., uncoated copper roofs). If the dissolved metals or other contaminants could cause or contribute to a water quality violation, a condition of "no exposure" cannot be certified.

c.b. Pollutants Potentially Mobilized by Wind. Windblown materials cause a condition of exposure. Materials sheltered from precipitation can stillare be deemed exposed if the materials can has a potential to be mobilized by wind.

6. Certifying a Condition of "No Exposure"

To obtain the NEC coverage, the Discharger must electronically certify and submit PRDs via SMARTS that the facility meets the definition of "No Exposure" and pay an annual fee. The Discharger must **submit PRDs for NEC coverage even if the Discharger was not previously required to file for NEC coverage under the previous General Permit**. These PRDs include a checklist requiring the Discharger to evaluate eleven major areas to determine whether there is exposure of industrial activities and materials at the facility. To qualify for NEC coverage the Discharger must satisfy all the NEC coverage conditions in this General Permit and certify that there is "No Exposure". The checklist: 1) aids the Discharger in determining if its facility is eligible for NEC coverage, and 2) furnishes the necessary documentation supporting relief from the General Permit's requirement of NOI coverage. Additionally, Ddischargers with NEC coverage are not required to develop and implement SWPPPs or comply with ete the monitoring requirements.

If a Discharger cannot certify that there is "No Exposure" at the facility, the Discharger must make appropriate changes at the facility to eliminate exposure prior to registering for future NEC coverage. These Facility changes must remove all potential for pollutant exposure to storm water.

An annual inspection and evaluation, re-certification and fee are required thereafter.

7. Other NEC coverage Facts:

a. NEC coverage is only valid if the condition of "No Exposure" exists and is reasonably expected to continue to exist. Dischargers shall electronically certify and submit PRDs for NOI coverage when the condition of "No Exposure" is no longer s expected to exist.

b. Dischargers must file PRDs for NEC coverage for each qualifying facility.

DRAFT

c. An NEC must be submitted for each separate facility qualifying for the "Nno Eexposure" conditional exclusion.

d. An NEC is non-transferable. If a new operator takes over facility operations, the new operator shall electronically certify and submit PRDs and applicable fees for new NEC coverage via SMARTS prior to the operations transfer. NEC coverage cannot be transferred from one physical location to another regardless of ownership.

8. Operators May Be Required to Obtain NOI Coverage Based on the Protection Of Water Quality?

Operators who certified that their facilities qualify for NEC coverage may, nonetheless, be required by the Regional Water Board to obtain NOI coverage if the Regional Water Board determines that the facility's discharge has the potential to cause or contribute to an exceedance of applicable water quality objectives/standards or determines that exposure exists at the facility. The Regional Water Board may request information and/or inspect the facility to assess potential water quality impacts and to determine if NOI coverage is required. The Discharger shall take appropriate actions to ensure that water quality standards are achievedcompliance with the General Permit.

9. Steps to Obtain NEC coverage

(This section will walk you through the process of obtaining NEC coverage.

Step 1: Determine if your facility is subject to this General Permit (refer to Attachment A of this General Permit). If yes, proceed to Step 2. If not, stop here.

If your facility is included in Attachment A and conducts industrial activities, you are required to **either** register for NOI coverage or NEC coverage.

Step 2: Determine if your regulated industrial activity meets the definition of "No Exposure" and qualifies for the exclusion from permitting. If it doesyes, proceed to Step 3. If not, stop here and obtain NOI coverage. An evaluation ofg the facility must be conducted by, facility personnel familiar with the facility and its operations should be used. Inspect all facility areas and potential pollutant sources to determine whether the facility satisfies the "No Exposure" conditions.

Step 3: Electronically certify and submit the PRDs for NEC coverage via SMARTS and mail the annual fee to the State Water Board at the following address:

SWRCB
Surfacetorm Water Permitting Section
PO Box 1977
Sacramento, CA 95812-1977

To maintain NEC coverage, the NEC must re-certify and pay a fee annually. This may only be done if the condition of "No Exposure" continues to exist at the facility.

Step 4: If requested, you must allow staff from the Regional Water Boards, local Municipal Separate Storm Sewer System (MS4), or United States Environmental Protection Agency must be allowed to inspect your facility. All inspection reports will be made publicly available.

Step 5: Maintain a condition of "Nno Eexposure".

- NEC coverage is not a blanket exemption. Therefore, if facility physical or operational changes occur which cause exposure of industrial activities or materials to storm water, the Discharger must then immediately comply with all the requirements of this General Permit, including obtaining NOI coverage as applicable.

- To maintain the condition of "No Exposure", the Discharger shall annually evaluate the facility to assure that the conditions of "No Exposure" still exist. More frequent evaluations may be necessary in circumstances when facility operations are rapidly changing.

- Failure to maintain the condition of "No Exposure" or otherwise obtain NOI coverage can may lead to the unauthorized discharge of storm water associated with industrial activity to waters of the United States, resulting in penalties under the CWA and Water Code.

C. Frequently Asked Questions:

Q1. Who is eligible for NEC Coverage?

A. Any Discharger operating a facility described in Attachment A may register for NEC coverage if their facility has a condition of "No Exposure".

Q2. How does an eligible Discharger file for NEC coverage and where is the annual fee sent?

A. The PRDs for NEC coverage shall be electronically certified and submitted in accordance with the instructions provided in SMARTS at the State Water Board website at: https://smarts.waterboards.ca.gov/smarts/faces/SwSmartsLogin.jsp. The fee is currently $242, but may be changed by regulation. Once NEC coverage is

DRAFT

accepted, an invoice will be electronically sent to the Discharger. The annual fee and invoice shall be sent to:

State Water Resources Control Board
Division of Water Quality
Attention: Industrial Storm Water Unit
P.O. Box 1977
Sacramento, CA 95812-1977

Q3. If my facility's storm water discharges are covered by an individual permit, can I file for NEC coverage?

A. Yes. Storm water discharges covered by an individual permit are eligible for NEC coverage if the conditions at the facility satisfy the definition of "No Exposure" and you obtain approval to terminate individual permit coverage from the local Regional Water Board prior to PRD submittal. Approval from the Regional Water Board is mandatory. Many individual permits, for example, contain numeric storm water effluent limitations ("antibacksliding" provisions may prevent these facilities from qualifying for the "No Exposure" conditional exclusion).

Q4. My facility was originally excluded from the Phase I regulations because it was classified as a "light industrial facility". The facility has never had any exposure to storm water runoff. Do I now need to certify that the facility meets the No Exposure Exclusion from NPDES Storm Water Permitting?

A. Yes. See answer provided to question number 9, "What is the exclusion "conditional" upon?"

Q5. Do I have to file a Notice of Termination (NOT) and a register for NEC coverage if my facility has NOI coverage and qualifies for NEC coverage?

A. No. You are only required to register for NEC coverage. You must provide the WDID# in your NEC coverage PRDs in order for the State Water Board to change permit coverage status.

Q6. When and how often is a NEC coverage re-certification required?

A. Re-certification of NEC coverage is required annually (assuming the facility maintains its "No Exposure" status). The State Water Board will electronically transmit an NEC re-certification and annual fee notification to each facility operator who has filed for NEC coverage.

New Dischargers must register for NEC coverage before the commencement of facility operations. Dischargers that fail to file for NEC coverage or apply for NOI coverage before the commencement of facility operations will be out of compliance and subject to enforcement.

Existing Dischargers have two options for submitting NECs:

1. Facility operators of "light industrial" facilities who have been operating under their original, no-certification-required permitting exemption must submit the NEC at any time prior to October ~~July~~ 1, 2015. ~~Such~~ Dischargers who have not submitted an NEC or applied for permit coverage by this due date will be considered out of compliance and subject to Water Board enforcement.

2. Dischargers who have NOI coverage may register for NEC coverage at any time following completion of facility changes that result in the condition of "No Exposure".

Q7. What happens if I know of changes that may cause exposure?

A. If exposure has the potential to occur in the near future due to some anticipated change at the facility, ~~you must~~the Discharger must obtain NOI coverage to avoid potential enforcement for violations of this General Permit.

Q8. Is the NEC coverage transferable to a new Discharger?

A. No. If a new operator takes over your facility, the new operator must register for new NEC coverage prior to the transfer. A new application fee is required.

Q9. What is the exclusion "conditional" upon?

A. The exclusion from permit coverage requirements is "conditional" upon the certification of the Discharger that the facility does not have exposure of materials or activities to storm water. PRDs for NEC coverage shall be electronically submitted to the State Water Board and will not be accepted if incomplete. The Regional Water Board may review the information, contact and/or inspect the facility, and invalidate the NEC and require the Discharger to obtain NOI coverage. PRDs are public documents and will be available for public review via SMARTS.

Q10. Can secondary containment around an outdoor exposed area qualify for a condition of "No Exposure"?

A. ~~In general, i~~If secondary containment is engineered to always prevent a discharge of collected rainfall (based on the historical rainfall record) and a simultaneous spill

of any other industrial materials or liquids, the "No Exposure" condition ~~can~~ may be claimed. Note ~~that: there~~that there must be proper disposal of any water or liquids collected from the containment (i.e~~.g~~., discharged in compliance with another NPDES permit, treated and discharged to the sanitary sewer, or trucked offsite to an appropriate disposal/treatment facility).

D. NEC Checklist

An NEC Checklist must be prepared by the Discharger demonstrating that: (1) the facility has been evaluated,~~;~~ ~~and that~~ (2) none of the following materials or activities are, or will be in the foreseeable future, exposed to precipitation, and ~~that~~ (3) all unauthorized NSWDs have been eliminated:

1. Using, storing or cleaning industrial machinery or equipment, and areas where residuals from using, storing or cleaning industrial machinery or equipment remain and are exposed;

2. Materials or residuals on the ground or in storm water inlets from spills/leaks;

3. Materials or products from past industrial activity;

4. Material handling equipment (except adequately maintained vehicles);

5. Materials or products during loading/unloading or transporting activities;

6. Materials or products stored outdoors (except final products intended for outside use, i.e~~.g~~., new cars, where exposure to storm water does not result in the discharge of pollutants);

7. Materials contained in open, deteriorated or leaking storage drums, barrels, tanks, and similar containers;

8. Materials or products handled/stored on roads or railways owned or maintained by the Discharger;

9. Waste material (except waste in covered, non-leaking containers, i.e~~.g~~., dumpsters);

10. Application or disposal of processed wastewater (unless already covered by an NPDES permit); and

11. Particulate matter or visible deposits of residuals from roof stacks/vents evident in the storm water outflow.

DRAFT

APPENDIX 3

WATERBODIES WITH CLEAN WATER ACT SECTION 303(D) LISTED IMPAIRMENTS

NATIONAL POLLUTION DISCHARGE ELIMINTATION SYSTEM (NPDES)
GENERAL PERMIT FOR STORM WATER DISCHARGES
ASSOCIATED WITH INDUSTRIAL ACTIVITIES
(GENERAL PERMIT)

The 303(d) impairments below are sourced from the 2010 Integrated Report. The rows in red are impairments for which industrial storm water Dischargers subject to this General Permit are not required to analyze for additional parameters unless directed by the Regional Water Board, because these parameters are typically not associated with industrial storm water. Test methods with substantially similar or more stringent method detection limits may be used if approved by the staff of the State Water Board prior to sampling and analysis and upon approval , will be added into SMARTS. The rows that are not in red are impairments for which Dischargers in the 303(d) impaired watershed are required to analyze for additional parameters, if applicable, because these parameters are more likely to be associated with industrial storm water. See General Permit Section XI.B.6.e. In the event that any of the impairments in this appendix are subsequently delisted, the Dischargers in that watershed are no longer required to analyze for the additional parameters for those impairments, and the provisions for new Dischargers in 303(d) impaired watersheds contained in Section VII.B of this General Permit no longer apply for those impairments.

Field Code Changed

Appendix B
California Industrial Storm Water General Permit – Change Sheet

Change Sheet # 1 for the National Pollutant Discharge Elimination System (NPDES) General Permit for Storm Water Discharges Associated With Industrial Activities (Industrial General Permit)

Changes in ~~**double redline strike out**~~ are **NEW deletions** since the Comment period that closed March 4, 2014.

Changes in **double red underline** are the **NEW additions** since the Comment period that closed March 4, 2014.

Changes in ~~**redline strike out**~~ are **previous deletions** made in response to Comments made on the 2013 draft Industrial General Permit and already identified in the February 19, 2014 version of the Industrial General Permit.

Changes in **red underline** are **previous additions** made in response to Comments made on the 2013 draft Industrial General Permit and already identified in the February 19, 2014 version of the Industrial General Permit.

Changes 1-8 are on the Fact Sheet for the Industrial General Permit

Change 1: On page 2 Section I.B of the Draft Fact Sheet, change the seventh bullet point as follows:

- Certify and submit all permit-related compliance documents via the Storm Water Multiple Application Reporting and Tracking System (SMARTS). Dischargers shall certify and submit these documents which include, but are not limited to, Permit Registration Documents (PRDs) including Notices of Intent (NOIs), No Exposure Certifications (NECs), and Storm Water Pollution Prevention Plans (SWPPPs), as well as Annual Reports, Notices of Termination (NOTs), Level 1 ERA Reports, and Level 2 ERA Technical Reports.

Change 2: On page 26 Section II.F of the Draft Fact Sheet, addition of a third paragraph as follows:

New Dischargers (as defined in Attachment C) applying for NOI coverage under this General Permit that will be discharging to an impaired water body with a 303(d) listed impairment are ineligible for coverage unless the Discharger submits data and/or information, prepared by a QISP, demonstrating that the facility will not cause or contribute to the impairment. Section VII.B of this General Permit describes the three different options New Dischargers have for making this determination. This General Permit requires a QISP to assist the New Discharger with this determination because individuals making this determination will need expertise in industrial storm water pollutant sources, BMPs and a thorough understanding of complying with U.S. EPAs storm water regulations and this General Permit's requirements. Not requiring New Dischargers to have a QISP assist in this demonstration would possibly lead to costly retrofits or closure of a new facility that has not demonstrated that the facility will not cause or contribute to the impairment.

Change 3: On page 28 Table 1 of the Draft Fact Sheet, addition of language as follows:

TABLE 1: Role-Specific Permit Requirements

Qualifications	Task
QISP	Assist New Dischargers determine coverage eligibility for Discharges to an impaired water body. Level 1 ERA Evaluation and report, Level 2 ERA Action Plan, and Technical Report, and the Level 2 ERA extension
California licensed professional engineer	Inactive Mining Operation Certification, SWPPPs for inactive mining, and annual re-certification of Inactive Mining Operation Certification, NONA Technical Reports, and Subchapter N calculations

Change 4: On page 29 Section II.I.1 of the Draft Fact Sheet, additional language added to the second paragraph as follows:

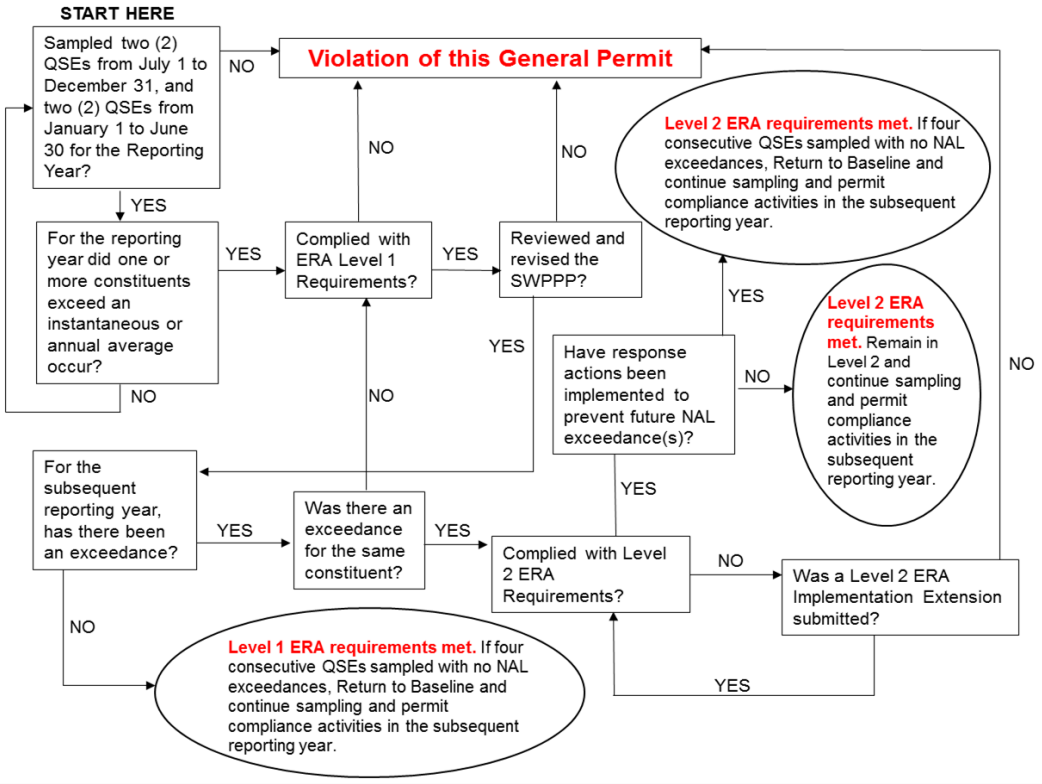
Failure to develop or implement an adequate SWPPP, or update or revise an existing SWPPP as required, is a violation of this General Permit. Failure to maintain the SWPPP on-site and have it available for inspection is also a violation of this General Permit.

Dischargers are also required to submit their SWPPPs and any SWPPP revisions via SMARTS; accordingly, BMP revisions made in response to observed compliance problems will be included in the revised SWPPP electronically submitted via SMARTS. Dischargers are also required to submit their SWPPPs and any significant SWPPP revisions via SMARTS; accordingly, BMP revisions made in response to observed compliance problems will be included in the revised SWPPP electronically submitted via SMARTS. Not all SWPPP revisions are significant and it is up to the Dischargers to distinguish between revisions that are significant and those that are not significant. If no changes are made at all to the SWPPP, the Discharger is not required to resubmit the SWPPP on any specific frequency.

- Significant SWPPP Revisions: Dischargers are required to certify and submit via SMARTS their SWPPP within 30 days of the significant revision(s). While it is not easy to draw a line generally between revisions that are significant and those that are not significant, Dischargers are not required to certify and submit via SMARTS any SWPPP revisions that are comprised of only typographical fixes or minor clarifications.

- All Other SWPPP Revisions: Dischargers are required to submit revisions to the SWPPP that are determined to not be significant every three (3) months in the reporting year.

Change 5: On page 41 Section II.I.3 of the Draft Fact Sheet, new first paragraph added as follows (this also includes the addition of footnote 12 and 13):



Dischargers should be aware of the potential unintended public health concerns associated with treatment control BMPs. Extensive monitoring studies conducted by the California Department of Public Health (CDPH) have documented that mosquitoes opportunistically breed in structural BMPs, particularly those that hold standing water for over 96 hours. BMPs that produce mosquitoes create potential public health concerns and increase the burden on local vector control agencies that are mandated to inspect for and abate mosquitoes and other vectors within their jurisdictional boundaries. These unintended consequences can be lessened when BMPs incorporate design, construction, and maintenance principles developed specifically to minimize standing water available to mosquitoes[12] while having negligible effects on the capacity of the structures to provide water quality improvements. The California Health and Safety Code prohibits landowners from knowingly providing habitat for or allowing the production of mosquitoes and other vectors, and gives local vector control agencies broad inspection and abatement powers[13].

New Footnote 12: [12] California Department of Public Health. (2012). Best Management Practices for Mosquito Control in California. < http://www.westnile.ca.gov/resources.php>. [as of February 4, 2014]

New Footnote 13: [13] California Health & Safety Code, Division 3, Section 2060 and following.

Change 6: On page 43 Figure 3 of the Draft Fact Sheet has been updated and replaced with the following:

FIGURE 1: Compliance Determination Flowchart

Change 7: On page 61 Section II.K.5.b of the Draft Fact Sheet, change made as follows:

b. The Level 2 ERA Technical Report contains three different options that require a Discharger to submit demonstrations showing the cause of the NAL exceedance(s). This General Permit requires a Discharger to appoint a QISP to prepare the Level 2 ERA Technical Reports. The State Water Board acknowledges that there may be cases where a combination of the demonstrations may be appropriate; therefore a Discharger may combine any of the following three demonstration options in their Level 2 ERA Technical Report when appropriate. A Discharger is only required to annually update its Level 2 ERA Technical Report when necessary as defined in Section XII.D.3.c of this General Permit and is not required to annually re-certify and re-submit the entire Level 2 ERA Technical Report. If there are no changes prompting an update of the Level 2 ERA Technical Report, as specified in Section XII.D.3.c of this General Permit, the Discharger will provide this certification in the Annual Report that there have been no changes warranting re-submittal of the Level 2 ERA Technical Report.

Change 8: On page 65 Section II.M of the Draft Fact Sheet, change made to the fourth paragraph as follows:

The State Water Board believes that it is necessary for Compliance Group Leaders to have a higher level of industrial storm water compliance and training experience than the expectations of a ~~QSIP~~QISP. Many stakeholder comments on this General Permit suggested various certifications to provide this higher level of experience; however, the State Water Board believes a process similar to the Trainer of Record process for the Construction General Permit training program will develop Compliance Group Leaders with the appropriate level of experience to fulfill the necessary qualifications.

Change 9: On page 70 Section II.S.2.a of the Draft Fact Sheet, language added as follows:

a. Engineered and constructed to contain all storm water associated with industrial activities from discharging to waters of the United States, including no discharge to groundwater that has a direct hydrologic connection to waters of the United States. The General Permit covers only dischargers who are required to obtain an NPDES permit under the CWA. Determining whether a discharge to groundwater has a direct hydrological connection to the waters of the United States will require a fact-specific inquiry including, but not limited to, the time and distance connecting the discharge to the surface waters, geology, and slope. (See e.g., Greater Yellowstone Coalition v. Larson (D.Idaho 2009) 641 F.Supp.2d 1120.).

Changes 10-23 are on the Order for the Industrial General Permit

Change 10: On page 3 Section I.A Finding 17 of the Draft Order, language added as follows:

17. This General Permit requires that the Discharger certify and submit all Permit Registration Documents (PRDs) for Notice of Intent (NOI) and No Exposure Certification (NEC) coverage via the State Water Board's Storm Water Multi-~~ple~~ Application and Report Tracking System (SMARTS) website. ~~An~~(See Attachment D

for an example of the information required to be submitted in the PRDs via SMARTS ~~can be found in Attachment D.~~.) All other documents required by this General Permit to be electronically certified and submitted via SMARTS can be submitted by the Discharger or by a designated Duly Authorized Representative on behalf of the Discharger. Electronic reporting is required to reduce the state's reliance on paper, to improve efficiency, and to make such General Permit documents more easily accessible to the public and the Water Boards.

Change 11: On page 9 Section I.H Finding 50 of the Draft Order, language added as follows:

50. A QISP ~~is responsible for~~must assist the Discharger in completing the Level 1 status and Level 2 status ERA requirements as specified in Section XII of this General Permit. A QISP is also responsible for assisting New Dischargers that will be discharging to an impaired water body with a 303(d) listed impairment, demonstrate eligibility for coverage though preparing the data and/or information required in Section VII.B.

Change 12: On page 23 Section VII.B of the Draft Order, language added as follows:

B. New Dischargers applying for NOI coverage under this General Permit that will be discharging to ~~an impaired~~a water body with a 303(d) listed impairment are ineligible for coverage unless the Discharger submits data and/or information, prepared by a QISP, demonstrating that:

Change 13: On page 37 Section X.H.6 of the Draft Order, language added as follows:

6. Design Storm Standards for Treatment Control BMPs

   All new treatment control BMPs employed by the Discharger to comply with Section X.H.2 Advanced BMPs and new sediment basins installed after the effective date of this order shall be designed to comply with design storm standards in this Section~~.~~, except as provided in an Industrial Activity BMP Demonstration (Section XII.D.2.a). A Factor of Safety shall be incorporated into the design of all treatment control BMPs to ensure that storm water is sufficiently treated throughout the life of the treatment control BMPs. The design storm standards for treatment control BMPs are as follows:

Change 14: On page 39 Section XI.A.2.b of the Draft Order, language modified as follows:

b. Any Discharger ~~shall ensure that visual observations and sampling of storm water discharges from~~employing volume-based or flow-based treatment BMPs ~~and~~ shall sample any bypass that occurs while the visual observations and sampling of storm water discharges are conducted ~~at the same time~~.

Change 15: On page 46 Section XI.C.4.a of the Draft Order, language added as follows:

a. The Discharger may reduce the number of locations to be sampled in each drainage area (e.g., roofs with multiple downspouts, loading/unloading areas with multiple storm drains) if the industrial activities, BMPs, and physical

characteristics (grade, surface materials, etc.) of the drainage area for each location to be sampled are substantially similar to one another. To qualify for the Representative Sampling Reduction, ~~RSR,~~ the Discharger shall provide a Representative Sampling Reduction ~~RSR~~ justification in the Monitoring Implementation Plan ~~MIP~~ section of the SWPPP.

Change 16: On page 47 Section XI.C.4.b.iii of the Draft Order, language added as follows:

i. A description of the BMPs implemented in the drainage area;

Change 17: On page 47 Section XI.C.5.a of the Draft Order, language added as follows:

a. The Discharger may authorize ~~the lab~~an analytical laboratory to combine samples of equal volume from as many as four (4) discharge locations if the industrial activities, BMPs, and physical characteristics (grade, surface materials, etc.) within each of the drainage areas are substantially similar to one another.

Change 18: On page 48 Section XI.C.5.b of the Draft Order, language added as follows:

ii. A description of the BMPs implemented in the drainage area;

Change 19: On page 51 Section XII.C of the Draft Order, language added as follows:

C. Level 1 Status

A Discharger's Baseline status for any given parameter shall change to Level 1 status if sampling results indicate an NAL exceedance for that same parameter ~~in any subsequent reporting year~~. Level 1 status will commence on July 1 following the reporting year during which the exceedance(s) occurred.[1]

Change 20: On page 52 Section XII.D of the Draft Order, language added as follows:

D. Level 2 Status

A Discharger's Level 1 status for any given parameter shall change to Level 2 status if sampling results indicate an NAL exceedance ~~in any subsequent reporting~~ year for that ~~e~~same parameter~~.~~ while the Discharger is in Level 1. Level 2 status will commence on July 1 following the reporting year during which the NAL exceedance(s) occurred.[2]

[1] For all sampling results reported before June 30th of the preceding reporting year. If sample results indicating an NAL exceedance are submitted after June 30th, the Discharger will change status once those results have been reported.

[2] For all sampling results reported before June 30th of the preceding reporting year. If sample results indicating an NAL exceedance are submitted after June 30th, the Discharger will change status ~~once~~upon the date those results have been reported into SMARTS.

Change 21: On page 56 Section XII.D.3.c of the Draft Order, language added as follows:

c. Dischargers with Level 2 status who have submitted the Level 2 ERA Technical Report are only required to annually update the Level 2 ERA Technical Report based upon additional NAL exceedances of the same parameter and same drainage area (if the original Level 2 ERA Technical Report contained an Industrial Activity BMP Demonstration and the implemented BMPs were expected to eliminate future NAL exceedances in accordance with Section XII.D.2.a.ii), facility operational changes, pollutant source(s) changes, and/or information that becomes available via compliance activities (monthly ~~inspections~~visual observations, sampling results, annual evaluation, etc.). The Level 2 ERA Technical Report shall be prepared by a QISP and be certified and submitted via SMARTS by the Discharger with each Annual Report. If there are no changes prompting an update of the Level 2 ERA Technical Report, as specified above, the Discharger will provide this certification in the Annual Report that there have been no changes warranting re-submittal of the Level 2 ERA Technical Report.

Change 22: On page 71 Section XX.C.2.a of the Draft Order, footnote 25 added as follows:

a. The facility ~~shall~~ is ~~either be (1)~~ engineered and constructed to have contained the maximum historic precipitation event (or series of events) using the precipitation data collected from the National Oceanic and Atmospheric Agency's website (or other nearby precipitation data available from other government agencies)~~; or~~ so that there will be no discharge of industrial storm water to waters of the United States, including no discharge to groundwater that has a direct hydrologic connection to waters of the United States[25]; or,

New Footnote 25: [25]No discharge to groundwater that has a direct hydrological connection to waters of the United States shall mean that the discharger is not required to obtain an NPDES permit because there is no discharge to the waters of the United States, as defined by regulations and case law interpreting the scope of the Clean Water Act. (See, e.g., Greater Yellowstone Coalition v. Larson (D.Idaho 2009) 641 F.Supp.2d 1120.)

Change 23: On page 74-75 Section XXI.K.4 of the Draft Order changes are as follows:

C. Electronic Signature and Certification Requirements

1. LRP eligibility is as follows:

a. For a corporation: by ~~an authorized~~ a responsible corporate officer. ~~-~~For the purpose~~s~~ of this section, a~~n authorized~~ responsible corporate officer means:

i. ~~(a) a~~A president, secretary, treasurer, or vice-president~~, or other officer~~ of the corporation ~~with authority to execute documents on behalf~~in charge ~~of the corporation pursuant to corporate bylaws~~a principal business function; or ~~board resolution~~; or

ii.~~(b) t~~The manager of one or more manufacturing, production, or operating facilities, provided, the manager is authorized to make management decisions which govern the operation of the regulated facility~~, if~~ including having the

explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate ~~bylaws and by corporate resolution~~; procedures.

b. For a partnership or sole proprietorship: by a general partner or the proprietor, respectively, ~~that is authorized to execute legally binding documents on behalf of the partnership or sole proprietorship (as the case may be) in accordance with the entity's governing documents; or,~~

c. For a municipality, state, federal, or other public agency: by either a principal executive officer or ranking elected official ~~that possesses signatory authority of the governmental agency at issue~~. This includes ~~principal executive officer of a federal agency includes~~ the chief executive officer of the agency or the senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of U.S. EPA).

Changes 24-27 are on the Attachments and Appendices for the Industrial General Permit

Change 24: On page 1 Attachment D is as follows:

This Attachment provides an example of the information Dischargers are required to submit in the PRDs via the Storm Water Multi~~-~~ple Application Reporting Tracking System (SMARTS). The actual PRD requirements are in Section II of this General Permit.

Change 25: On page 2 Attachment E (List Of Total Maximum Daily Loads (TMDLs) Applicable To Industrial Storm Water Dischargers) is as follows:

San Diego Regional Water Quality Control Board	
Chollas Creek	Diazinon
Chollas Creek	Copper, Lead, and Zinc
Los Peñasquitos Lagoon	Sediment
Rainbow Creek	Total Nitrogen and Total Phosphorus
Shelter Island Yacht Basin	Dissolved Copper
Baby Beach in Dana Point Harbor and Shelter Island Shoreline Park in SD Bay	Indicator Bacteria
Twenty Beaches and Creeks	Indicator Bacteria

Change 26: On page 2 Attachment H Item 7(Sample Collection and Handling Instructions) changes are as follows:

The Discharger can only use automatic sampling device to sample parameters that the device is designed to. For pH, Dischargers can only use automatic sampling devices with the ability to read pH within 15 minutes of sample collection.

Change 27: On page 1 Appendix 3 (Waterbodies With Clean Water Act Section 303(D) Listed Impairments) changes are as follows:

The 303(d) impairments below are sourced from the 2010 Integrated Report. The rows in red are impairments for which industrial storm water Dischargers subject to this General Permit are not required to analyze for additional parameters unless directed by the Regional Water Board, because these parameters are typically not associated with industrial storm water. Test methods with substantially similar or more stringent method detection limits may be used if approved by the staff of the State Water Board prior to sampling and analysis and upon approval , will be added into SMARTS. The rows that are not in red are impairments for which Dischargers in the 303(d) impaired watershed are required to analyze for additional parameters, if applicable, because these parameters are more likely to be associated with industrial storm water. See General Permit Section XI.B.6.e. In the event that any of the impairments in this appendix are subsequently delisted, the Dischargers with discharges ~~in~~to that watershed are no longer required to analyze for the additional parameters for those impairments, and the provisions for new Dischargers with discharges ~~in~~to 303(d) impaired water bodies contained in Section VII.B of this General Permit no longer apply for those impairments.

Appendix E
Project-Specific Hazardous Materials Business Plans (HMBPs)

(Provided on CD-ROM Only)

APPENDIX E

Project-Specific HMBPs

In compliance with the EIR mitigation measure HAZ-1a-c and California Action-Specific ARAR #90, the Hazardous Materials Business Plans (HMBPs) for the Topock Compressor Station and the IM-3 Treatment Plant will be updated to include the hazardous materials used for the groundwater remedy. Hazardous materials to be stored and handled at the Remedy-produced Water Conditioning Plant, the Hazardous Materials Storage Building inside the Compressor Station, and the Transwestern Bench will be incorporated into the existing HMBP for the Compressor Station. All hazardous materials to be stored and handled at remedy facilities located outside of the Compressor Station and the Transwestern Bench will be incorporated into the existing HMBP for the IM-3 Treatment Plant. These HMBPs will be updated for submittal to the County when required by HMBP guidance (i.e., after new hazardous materials are on site or qualifying facility modifications require HMBP updates).

Below is a list of potential hazardous materials and wastes that could be used and stored at the following remedy facilities:

- Potential chemicals to be used and stored in the Remedy-produced Water Conditioning Building (located inside the Compressor Station) include the following:
  - Caustic (e.g., sodium hydroxide), to be stored in a 550-gallon tank
  - Acid (e.g., hydrochloric acid), to be stored in a 550-gallon tank
  - A coagulant (e.g., Nalco Ultrion 8187 [aluminum chloride hydroxide])
  - A flocculent addition (e.g., Nalco® 7878 Flocculant [anionic type])
  - Laboratory reagents and related waste
  - Compressed gas cylinders
- Potential chemicals to be used and stored in the carbon amendment facilities (at the MW-20 Bench) include:
  - Carbon substrate (95 percent ethanol) - 15,000-nominal gallon tank at MW-20 Bench
  - Acids, caustics, and/or dispersants for use in the Clean-In-Place system at the MW-20 Bench (330-gallon totes or smaller-volume drums). Potential chemical reagents for use in this system may include hydrochloric, glycolic (hydroxyacetic), and phosphoric acids, sodium hydroxide, and hydrogen peroxide
  - Compressed gas cylinders
- Potential hazardous materials/wastes related to the groundwater remedy and stored in the Hazardous Materials Storage Building (located inside the Compressor Station) include:
  - Chemicals, hazardous materials, and wastes listed above with the exception of ethanol.
  - Universal waste
  - Compressed gas cylinders
- Potential hazardous materials/wastes to be used in remedy processes and stored at the main construction headquarter and the long-term remedy support area at Moabi Regional Park include:
  - Laboratory reagents and related waste
  - Cleaning solutions including solvents used for pumps and equipment
  - Oil used for pumps and equipment
  - Used oil hazardous waste
  - Used solvents hazardous waste
  - Universal waste
  - Compressed gas cylinders

Record Keeping

The following San Bernardino County Certified Unified Program Agency (CUPA) HMBP guidelines for record keeping will be adopted for the project:

- A copy of the HMBPs will be kept on site.
- The Cover Sheet, Business Activities Form, Business Owner/Operator Identification Form, and any other information that has changed is required to be updated by March 1 of every year.
- The entire HMBPs will be reviewed and re-certified every 3 years.
- The HMBPs will be revised within 30 days of change of: owner, business address, business name, emergency contact information, inventory, or other site conditions which may significantly impact emergency response (such as additional hazardous materials, increased quantities exceeding 50 percent of previously reported maximum quantity, and/or increased container sizes). PG&E will provide the revised Plan to the Agencies.

In addition, in compliance with Section XXV of the CD (DOI 2013), PG&E will maintain records for 10 years following receipt of certification of completion. At the conclusion of the record retention period, PG&E will notify DOI and DTSC in writing at least 90 days prior to the destruction of any records and will provide DOI and DTSC with the opportunity to take possession of any records.

BUSINESS EMERGENCY/CONTINGENCY PLAN COVER SHEET

I. IDENTIFICATION

For Dept Use Only – Log In/Date Stamp

FACILITY ID #	F	A	0	0	0	9	1	5	0

BUSINESS NAME (Same as FACILITY NAME or DBA)

PG&E – Topock Groundwater Extraction Site

BUSINESS SITE ADDRESS	CITY	ZIPCODE
145453 National Trails Highway	Needles	92363

II. SUBMISSION CHECKLIST

(Complete this Section if submitting an entire Business Emergency/Contingency Plan whether new or revised)

Submission Checklist ☒

- ☒ Business Activities Form
- ☒ Business Owner/Operator Identification Form
- ☒ Supplemental Emergency Contact Page
- ☒ Emergency Response Plans and Procedures
- ☐ Hazardous Materials Inventory Summary Form for the facility listing materials (including wastes) by item number
- ☐ One Hazardous Materials Inventory Form for each hazardous material (including wastes) which meet reporting criteria
- ☐ Material Safety Data Sheets attached to the inventory form of each material not listed in Appendix I
- ☒ Facility map (using grid form provided) consisting of all required features including the location of each inventoried item
- ☐ Site map (using grid form provided) consisting of all required features including surrounding facilities and areas.
- ☒ Area map - photocopied city map with location of site indicated
- ☒ Owner/Operator has signed and dated the plan and all required individual pages of the plan
- ☒ Submit the original and 1 copy to the Hazardous Materials Division. One is for distribution to the local fire jurisdiction
- ☒ ***Retain one copy of the business emergency/contingency plan at the facility***.

III. UPDATE/CERTIFICATION

(Complete this Section if submitting a partial update or re-certifying an existing Plan)

Check the appropriate boxes below and sign the certification statement. Submit 2 copies of all update information.

- ☐ Please incorporate the following into my Business Emergency/Contingency Plan
  - ☐ New Business Owner/Operator Identification Form
  - ☐ New Inventory Forms and new Inventory Summary Form (and maps, if affected)
  - ☐ New Supplemental Emergency Contact Page
- ☐ Other: _____

Brief explanation of changes: _____

- ☐ There have been no changes to the inventory. In place of submitting the annual inventory, I hereby attest to all of the following:
  - The information contained in the inventory most recently submitted to the CUPA is complete, accurate and up to date.
  - There has been no change in the quantity, storage, or handling of hazardous materials (including waste) reported in the most recently submitted inventory.
  - No hazardous materials (including waste) subject to inventory requirements are being handled that are not listed on the most recently submitted inventory.
  - This certification is not being made to meet annual inventory submission requirements of EPCRA. (EPCRA requires complete annual submission)

IV. SIGNATURE

(Complete this Section for all submissions)

Certification - Based on my inquiry of those individuals responsible for obtaining the information, I certify under penalty of law that I have personally examined and am familiar with the information submitted on this document and believe the information is true, accurate and complete.

Hazardous Materials

Does your facility have on site (for any purpose) at any one time, hazardous materials at or above 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet for compressed gases (include liquids in ASTs and USTs); or is regulated under more restrictive inventory local reporting requirements (shown below if present); or the applicable Federal threshold quantity for an extremely hazardous substance specified in 40 CFR Part 355, Appendix A or B; or handle radiological materials in quantities for which an emergency plan is required pursuant to 10 CFR Parts 30, 40 or 70?	**Yes**

Underground Storage Tank(s) (UST)

Does your facility own or operate underground storage tanks?	**No**

Hazardous Waste

Is your facility a Hazardous Waste Generator?	**Yes**
Does your facility treat hazardous waste on-site?	**Yes**
Is your facility's treatment subject to financial assurance requirements (for Permit by Rule and Conditional Authorization)?	**Yes**
Does your facility consolidate hazardous waste generated at a remote site?	**No**
Does your facility need to report the closure/removal of a tank that was classified as hazardous waste and cleaned on-site?	**No**
Does your facility generate in any single calendar month 1,000 kilograms (kg) (2,200 pounds) or more of federal RCRA hazardous waste, or generate in any single calendar month, or accumulate at any time, 1 kg (2.2 pounds) of RCRA acute hazardous waste; or generate or accumulate at any time more than 100 kg (220 pounds) of spill cleanup materials contaminated with RCRA acute hazardous waste.	**No**
Is your facility a Household Hazardous Waste (HHW) Collection site?	**No**

Excluded and/or Exempted Materials

Does your facility recycle more than 100 kg/month of excluded or exempted recyclable materials (per HSC 25143.2)?	**Yes**
Does your facility own or operate ASTs above these thresholds? Store greater than 1,320 gallons of petroleum products (new or used) in aboveground tanks or containers.	**No**
Does your facility have Regulated Substances stored onsite in quantities greater than the threshold quantities established by the California Accidental Release prevention Program (CalARP)?	**No**

Additional Information

No additional comments provided.

EMERGENCY CONTACTS

BUSINESS NAME (Same as FACILITY NAME or DBA)
PG&E – Topock Groundwater Extraction Site

A business shall appoint an Emergency Coordinator and Alternate Emergency Coordinator. These persons shall be knowledgeable in all aspects of the business operation. In the event of a release or threatened release of hazardous materials, the Emergency Coordinators shall be responsible for initiating response actions by the business. The Emergency Coordinators shall have full access to the facility, site familiarity and authority to make decisions for the business and to commit business resources. Hazardous waste generators must provide the information required in Title 22 of the California Code of Regulations and must list all emergency coordinators in the order that they will assume responsibility.

ONLY Emergency Contacts listed on this separate page will be held as confidential.

EMERGENCY RESPONSE PLANS & PROCEDURES – AGENCY NOTIFICATION

BUSINESS NAME (Same as FACILITY NAME or DBA) 3

Pacific Gas and Electric Company – Topock Groundwater Extraction Site

POST BY TELEPHONE

Agency Notification: **If a situation is an emergency, call 911 first.** Additionally, a handler of hazardous materials is required to immediately report any release or threatened release of a hazardous material to San Bernardino County Fire Department, Hazardous Materials Division and the Governor's Office of Emergency Services. Spills exceeding Federal reportable quantities require additional notification to the National Response Center. However, California statute does not limit the requirement to report to any specific quantity. **Also note that calling 911 does not meet the requirement for the handler to report a release and that the local fire department cannot make required notifications on behalf of the handler.** This CUPA requires a written report within 15 days after any reportable release or threatened release. Contact the CUPA for further guidance.

Agency (* Indicates mandatory notification)	**Phone Number**
1. ***Local Emergency Response Agency (if an emergency)	**911**
2. ***San Bernardino County Fire Department Hazardous Materials Division	**(800) 33-TOXIC** or **(909) 386-8425**

*Note: (800) 33-TOXIC does not work nationwide; non-local callers must use (909) 386-8425 to report **any** release or threatened release.*

3. * State of California, Governor's Office of Emergency Services (CalOES) **(800) 852-7550** or **(916) 845-8911**

EMERGENCY INFORMATION REQUIRED: BE PREPARED TO PROVIDE THE FOLLOWING INFORMATION

- Name & phone number of person reporting
- Name and street address of the business
- Location of the incident or threatened release
- Type of incident or threatened release
- Hazardous materials involved & physical state
- Hazards to human health and/or environment
- Actions taken or planned
- Contractor or cleanup company name
- Estimate of the quantity released
- Media (soil, water, air) into which release occurred
  - Precautions to take (if known)
- Time and duration of the release
  - Is the chemical an extremely hazardous substance?
  - Extent of injuries, if any
- Is any assistance required?

Release reporting citations (California Health and Safety Code):

§ 25501. Definitions:

(r) "Release" means any spilling, leaking, pumping, pouring, emitting, emptying, discharging, injecting, escaping, leaching, dumping, or disposing into the environment, unless permitted or authorized by a regulatory agency.

(u) "Threatened release," means a condition creating a substantial probability of harm, when the probability and potential extent of harm make it reasonably necessary to take immediate action to prevent, reduce, or mitigate damages to persons, property, or the environment.

§ 25507(a) … the handler or any employee, authorized representative, agent, or designee of a handler shall, upon discovery, immediately report any release or threatened release of a hazardous material to the administering agency, and to the office, in accordance with the regulations adopted pursuant to Section 25503. Each handler and any employee, authorized representative, agent, or designee of a handler shall provide all state, city, or county fire or public health or safety personnel and emergency rescue personnel with access to the handler's facilities.

See Appendix G for further citations and explanation.

EMERGENCY RESPONSE PLANS AND PROCEDURES

BUSINESS NAME (Same as FACILITY NAME or DBA)

Pacific Gas and Electric Company – Topock Groundwater Extraction Site

State Law requires your business to complete all sections of the Emergency Response Procedure listed below:
For each of the following, **briefly** describe your business's standard operating procedures relating to the release or threatened release of hazardous materials located at your facility. You may attach additional pages if necessary, but do not include copies of facility manuals unless requested to do so by this Department. You may reference manuals that are used by your facility for these procedures, but you must still give a brief description here.

EVACUATION/NOTIFICATION: Indicate location(s) where employees, customers, visitors or others on site are to evacuate in an emergency. Describe how your business will immediately notify people and evacuate the facility in the event of a release or threatened release of hazardous materials. Include the route and meeting place.

Evacuation of the facility will occur as a response to an incident with known or unknown hazards that could pose a threat to the health and/or safety of facility personnel. All facility personnel have been trained in the evacuation routes for their work stations and other areas of the facility. An assembly point is designated inside the main entrance to the facility. The decision to evacuate is the responsibility of the Facility Emergency Coordinator or the Shift Supervisor. He/she will determine the extent of the evacuation. Evacuation signals are provided by either radio or given verbally.

PREVENTION/MITIGATION/ABATEMENT: Describe what policies and procedures your business will follow to prevent, reduce and/or remove the hazard to persons, property or the environment caused by a release or threatened release of hazardous materials and/or hazardous wastes. (√ Check those items that apply and write additional information in the space provided).

☒ Reduction of containers on site if not used or needed
☒ Containers are properly labeled and closed when not in use
☐ Compressed gas cylinders are properly secured
☒ Use of monitoring system Type: **Automated Systems Fail-Safe Alarms – high level shutdown alarms in tanks**
☒ Other:

Secondary containment for tanks (tanks and associated piping)
Drip pads placed to collect incidental spills during loading operations
Operator observation of loading of groundwater into tanker trucks
Daily inspection of tank systems in accordance with 22 CCR
Initial and refresher training of personnel managing hazardous materials and groundwater treatment
This information can be found in Attachment 5.

Date: 02-01-2014

EMERGENCY RESPONSE PLANS AND PROCEDURES

BUSINESS NAME (Same as FACILITY NAME or DBA)

Pacific Gas and Electric Company – Topock Groundwater Extraction Site

FACILITY TRAINING PLAN: Describe employee and operator training including local emergency response coordination, use of facility emergency equipment, and provisions for initial and refresher training. In addition, describe training for hazardous materials/waste handling as required by OSHA. (√ Check those items that apply and write additional information in the space provided)

- ☒ New employee training
- ☒ Annual training & periodic refresher courses
- ☒ Familiarization with the Emergency Response Plans and Procedures of this Business Plan
- ☒ Spill control equipment
- ☒ Monitoring system
- ☒ Personal Protective Equipment
- ☐ On the job training (Described below)
- ☒ Other:

In addition to training in emergency response measures, personnel will be trained in responsibilities related to:

- Operating treatment system
- Loading of trucks
- Sampling and field analysis of round water samples
- Conducting general site and tank system inspections
- Tracking of manifests
- Operating portable generator
- System operators are 40-hour HAZWOPER trained

EMERGENCY PROCEDURES: Describe duties of the Emergency Coordinator and how implementation of Facility Emergency Response will be accomplished. (e.g. Notification, evacuation, emergency coordination) (√ Check those items that apply and write additional information in the space provided)

Emergency Coordinator will:

- ☒ Identify potential hazards and determine whether a release has occurred
- ☒ Activate local emergency systems (e.g. manual shutoff devices) and take appropriate immediate actions based on level of training and the ability to act safely
- ☒ Coordinate the notification and evacuation of employees, customers, and other visitors from the facility
- ☒ Make required agency notifications and request needed assistance
- ☒ Assist responding agencies by providing access to the facility and information about the facility
- ☐ Other:

Pacific Gas and Electric Company – Topock Groundwater Extraction Site

FACILITY EMERGENCY EQUIPMENT: List facility emergency equipment on site (e.g. fire extinguisher, fire alarms, spill control equipment, SCBA, first aid kits, etc.). Include test/maintenance plan. (√ Check those items that apply and write additional information in the space provided)

	Equipment	Quantity/Type	Maintenance Schedule/Frequency
☒	Fire extinguisher(s)	**12 (ABC) Dry Chemical; 4 (BC) Carbon dioxide**	**Monthly Inspections**
☒	First aid kit(s)	**2**	**Monthly Inspections**
☒	Fire alarm(s)	**2**	**Monthly Inspections**
☒	Spill control equipment		**At Topock Compressor Station**
	Shovels		**See Emergency Equipment Table**
	Spill Kits		
	Pump		
☒	Monitoring system	**Multiple equipment with various alarm systems**	**Monthly Inspections**
☒	Personal Protective Equipment		**Monthly Inspections**
☒	Gloves		**Monthly Inspections**
☒	Safety Glasses		**Monthly Inspections**

FACILITY EARTHQUAKE RESPONSE: Identify areas of the facility as well as mechanical or other systems that require immediate inspection due to their vulnerability to earthquake related ground motion. (e.g. Hazardous materials or waste storage locations, vessels, piping, pipe and tank supports, valves, gauges, etc.) (√ Check those items that apply and write additional information in the space provided)

- ☒ Chemical Storage Locations – Product and Waste
- ☒ Process vessels
- ☒ Aboveground storage tanks
- ☐ Emergency shut-off systems
- ☒ Piping and pipe supports
- ☐ Utility connections
- ☒ Groundwater Well Heads
- ☒ Auxiliary fuel supply for generator

This information can be found in Attachment 6.

ARRANGEMENTS/AGREEMENTS: Describe any arrangements or agreements that you have with private emergency response teams, waste haulers, disposal companies, recyclers, local hospitals, police and/or fire. If you have no arrangements or agreements, state that fact in the space provided. (√ Check those items that apply and write additional information in the space provided)

- ☒ Hazardous waste hauler **PSC Industrial Outsourcing Inc., (800) 321-1030**
- ☒ Emergency response team **Sheriff and Fire Departments**
- ☒ Local hospitals **Colorado River Medical Center**
- ☒ Other: **See Attachment 4**
- ☐ No arrangements or agreements at this time

Date: 02-01-2014

Emergency Equipment

22 CCR §66265.52(e) [as referenced by 22 CCR §66262.34(a)(4)] requires that emergency equipment at the facility be listed. Completion of the following Emergency Equipment Inventory Table meets this requirement.

Emergency Equipment Inventory Table

1. Equipment Category	2. Equipment Type	3. Locations*	4. Description**
Personal Protective Equipment, Safety Equipment, and First Aid Equipment	☒ Cartridge Respirators	Topock Groundwater Extraction Site	Personal Protection
	☐ Chemical Monitoring Equipment *(describe)*		
	☒ Chemical Protective Aprons/Coats	Topock Groundwater Extraction Site	Personal Protection
	☒ Chemical Protective Boots	Topock Groundwater Extraction Site	Personal Protection
	☒ Chemical Protective Gloves	Topock Groundwater Extraction Site	Personal Protection
	☒ Chemical Protective Suits: *Coveralls*	Topock Groundwater Extraction Site	Personal Protection
	☒ Face Shields	Topock Groundwater Extraction Site	Personal Protection
	☒ First Aid Kits/Stations *(describe)*	See Facility Layout Map	Personal Protection
	☒ Hard Hats	Vehicles and on-site	Company Issued
	☒ Plumbed Eye Wash Stations	See Facility Layout Map	Personal Protection
	☐ Portable Eye Wash Kits *(i.e., bottle type)*		
	☒ Respirator Cartridges *(describe)*	Topock Groundwater Extraction Site	Personal Protection
	☒ Safety Glasses/Splash Goggles	Topock Groundwater Extraction Site	Personal Protection
	☒ Safety Showers	Topock Groundwater Extraction Site	Personal Protection
	☐ Self-Contained Breathing Apparatuses (SCBA)		
	☐ Other *(describe)*		
Fire Extinguishing Systems	☐ Automatic Fire Sprinkler Systems		
	☒ Fire Alarm Boxes/Stations	See Facility Layout Map	
	☐ Fire Extinguisher Systems *(describe)*		
	☒ Fire Extinguishers *(describe)*	See Facility Layout Map	
	☐ Other *(describe)*		
Spill Control Equipment and Decontamination Equipment	☒ Absorbents *(describe)*	See Facility Layout Map	Spill Cleanup
	☒ Berms/Dikes *(describe)*	See Facility Layout Map	Spill Cleanup
	☒ Decontamination Equipment *(describe)*	See Facility Layout Map	Spill Cleanup
	☐ Emergency Tanks *(describe)*		
	☐ Exhaust Hoods		
	☐ Gas Cylinder Leak Repair Kits *(describe)*		
	☒ Neutralizers *(describe)*	See Facility Layout Map	Spill Cleanup
	☒ Overpack Drums	See Facility Layout Map	5, 55 and 95-gallon drums
	☐ Sumps *(describe)*		
	☐ Other *(describe)*		
Communications and Alarm Systems	☐ Chemical Alarms *(describe)*		
	☐ Intercoms/ PA Systems		
	☒ Portable Radios	Vehicles	Communication
	☒ Telephones	Operations Building	Communication
	☐ Tank Leak Detection Systems		
	☒ Other: *Cell phones*	Vehicles	Communication
Additional Equipment *(Use Additional Pages if Needed.)*	☐		
	☐		
	☐		
	☐		
	☐		

* **Note:** Small barrels containing absorbent compound, spill control pillows or absorbent socks, gloves etc, in small quantity can also be found at the facility.

** Describe the equipment and its capabilities. If applicable, specify any testing/maintenance procedures/intervals. Attach additional pages, numbered appropriately, if needed.

Record Keeping

Emergency Response/Contingency Plan (Hazardous Materials Business Plan Module)

All facilities that handle hazardous materials must maintain records associated with their management. A summary of your record keeping procedures is a required module of the Unidocs Hazardous Materials Business Plan (HMBP). A blank summary has been provided below for you to complete and submit if you do not already have such a document. **If you already have a brief written description of your hazardous materials record keeping systems that addresses all subjects covered below, you are not required to complete this page, but you must include a copy of your existing document as part of your HMBP.**

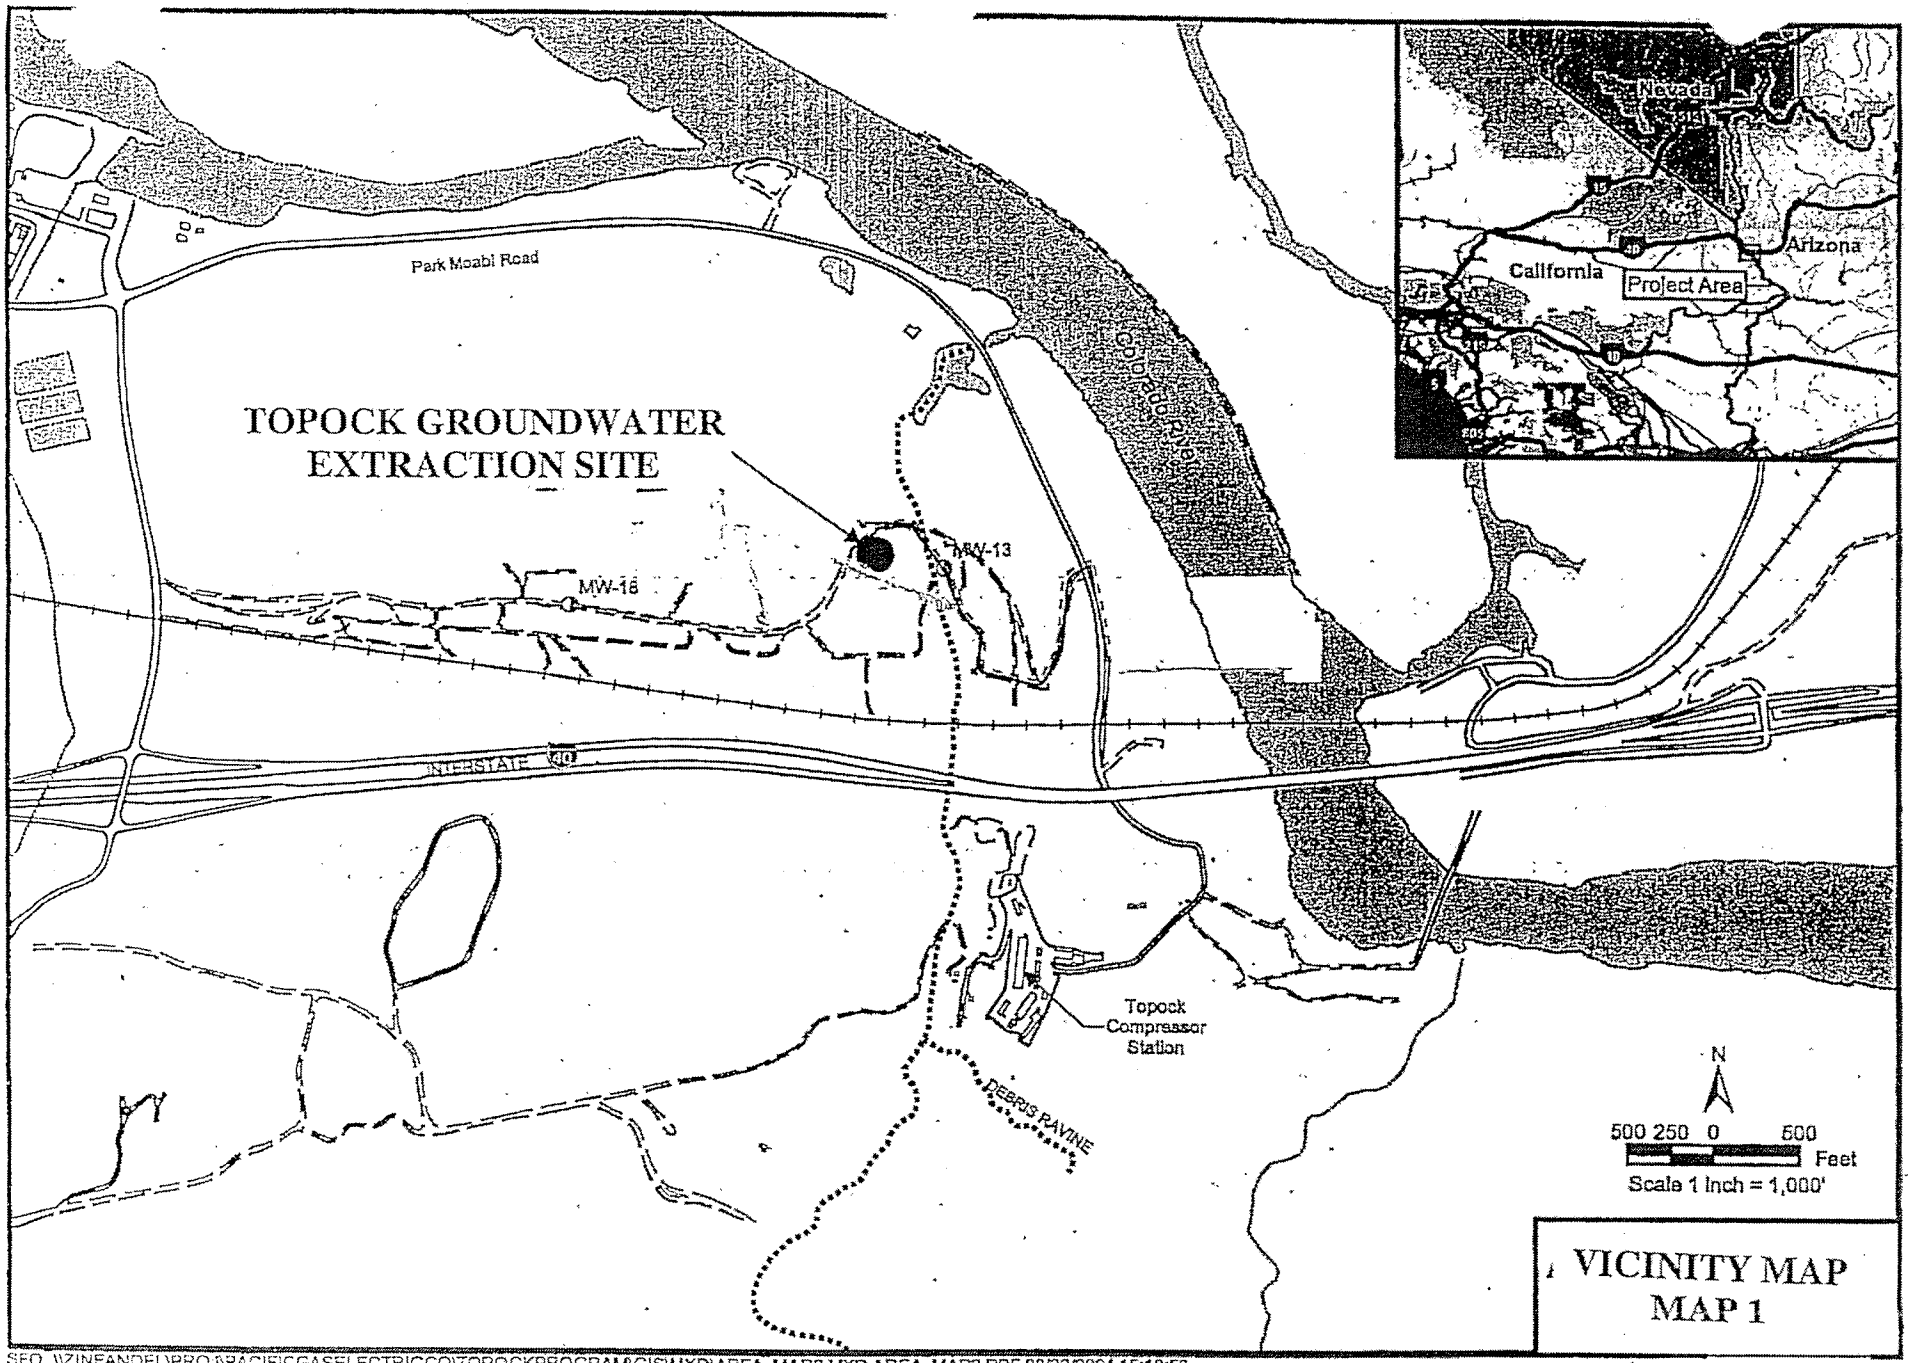
Check all boxes that apply. The following records are maintained at the facility.
Note: Items marked with an asterisk (*) are required.

☒	Current employees' training records *(to be retained until closure of the facility)* *
☒	Former employees' training records *(to be retained at least three years after termination of employment)* *
☒	Training Program(s) *(i.e., written description of introductory and continuing training)* *
☒	Current copy of this Emergency Response/Contingency Plan *
☒	Record of recordable/reportable hazardous material/waste releases *
☒	Record of hazardous material/waste storage area inspections *
☒	Record of hazardous waste tank daily inspections *
☐	Description and documentation of facility emergency response drills

Note: The above list of records does not necessarily identify every type of record required to be maintained by the facility.

Note: The following section applies where local agencies require facility owners/operators to perform and document routine facility self-inspections,

A copy of the Inspection Check Sheet(s) or Log(s) used in conjunction with required routine self-inspections of your facility must be submitted with your HMBP. *[Exception: Unidocs provides a Hazardous Materials/Waste Storage Area Inspection Form that you may use if you do not already have your own form. If you use the Unidocs form (available at* **www.unidocs.org***), you do not need to attach a copy.]*



Check the appropriate box:

☐	We will use the Unidocs "Hazardous Materials/Waste Storage Area Inspection Form" to document inspections.
☒	We will use our own documents to record inspections. ***(A blank copy of each document used must be attached to this HMBP.)***

Agreements with Emergency Response Agencies

The following firm can be utilized and will be called, if needed, to assist with cleanup and disposal operations.

SPILL CLEANUP, RESPONSE, AND TRANSPORTATION		ARRANGEMENTS
Name Address City Telephone	PSC Industrial Outsourcing Inc. 1802 Shelton Drive Hollister, CA 95023 (800) 321-1030	Oil Spill Response and Hazardous Waste and PCBs - Cleanup and Transportation

TITLE 22 (CCR) HAZARDOUS WASTE CONTINGENCY PLAN
AGREEMENT BETWEEN PG&E AND
LOCAL EMERGENCY RESPONSE ORGANIZATION

PG&E and Colorado River Medical Center hereby agree to the following arrangements with regards to Pacific Gas and Electric Company's (PG&E's) Topock Groundwater Extraction Site located near Needles, California.

1. PG&E will familiarize the above-named local organization with the layout of the facility, the properties and associated hazards of the hazardous waste handled at the facility, places where facility personnel would normally be working, entrances to and roads inside the facility and possible evacuation routes.
2. The above-named organization will provide customary and appropriate emergency assistance to the facility in the event of a hazardous waste emergency which requires the service of the Colorado River Medical Center.

AGREEMENT BETWEEN PG&E AND
LOCAL EMERGENCY RESPONSE ORGANIZATION

PG&E and San Bernardino County Sheriff's Department, Colorado River Station hereby agree to the following arrangements with regards to Pacific Gas and Electric Company's (PG&E's) Topock Groundwater Extraction Site located near Needles, California.

1. PG&E will familiarize the above-named local organization with the layout of the facility, the properties and associated hazards of the hazardous waste handled at the facility, places where facility personnel would normally be working, entrances to and roads inside the facility and possible evacuation routes.
2. The above-named organization will provide customary and appropriate emergency assistance to the facility in the event of a hazardous waste emergency which requires the service of the San Bernardino County Sheriff's Department, Colorado River Station.

Attachment 5
Emergency Response Procedure: Hazard Mitigation/Prevention/Abatement [19 CCR §2731(e)]

Briefly describe your business standard operating procedures in the event of a release or threatened release of hazardous materials:

1. Evaluate hazards.
2. If safe, take care of injured.
3. Call 911 or specific emergency responder if the situation appears to be beyond your ability to resolve immediately.
4. Don't attempt any action that is beyond the scope of your knowledge, training or experience.
5. If necessary to evacuate the facility, follow evacuation routes and procedures.
6. Notify internal emergency coordinator (site emergency contact) and/or the assigned Environmental Field Specialist.
7. If necessary, arrange for hazardous materials/emergency response contractor to respond and/or clean up spill.
8. Assure that appropriate agency notifications are made (after situation is stabilized and it is safe to do so).

1. **PREVENTION** (prevent the hazard) – Describe what is done to prevent a release or threatened release of hazardous materials (e.g. discussion of safety and storage procedures).

   a. Complete required routine inspections of facility equipment, piping, tanks, shut-off valves and emergency response equipment.
   b. Perform required maintenance of systems identified in routine inspections.
   c. Provide secondary containment where required to prevent leakage or spills.
   d. Maintain secondary containment (make sure water is removed, leaks and cracks are repaired).
   e. Check packaging and lids of hazardous materials containers during routine inspections.
   f. Promptly clean up small spills and properly dispose of clean up materials.
   g. Segregate incompatible materials.
   h. Keep hazardous materials stored in appropriate locations (designated lockers, sheds, etc.).
   i. Assure that security fencing, locks and gates are in good repair and being used properly.
   j. Keep evacuation map and emergency response procedures prominently posted.

2. **MITIGATION** (reduce the hazard) – What is your immediate response to a leak, spill, fire, explosion, or airborne release (e.g. absorbent on spills, use of fire extinguisher, closing of valves, etc.).

   a. Evaluate hazards.
   b. If safe, take care of injured.
   c. Call 911 or specific emergency responder if the situation appears to be beyond your ability to resolve immediately.
   d. If safe, attempt to put out a fire using appropriate fire extinguisher.
   e. If safe, take steps to prevent leak from worsening or moving towards a waterway or storm drain (close valves, place sand bags or containment booms).
   f. If necessary to evacuate the facility, follow evacuation routes and procedures.
   g. If there is potential for the leak or spill to affect people or the environment near the facility, work with incident commander to notify/evacuate people/animals from the area as appropriate.
   h. Notify internal emergency coordinator (site emergency contact) and/or the assigned Environmental Field Specialist.
   i. If necessary, arrange for hazardous materials/emergency response contractor to respond and/or clean up spill.
   j. Assure that appropriate agency notifications are made (after situation is stabilized and it is safe to do so).

3. **ABATEMENT** (remove the hazard) – Describe what you would do to remove any released material (e.g. clean up company, absorb spill and containerize).

   a. Small leaks and spills should be cleaned up using appropriate absorbent material.
   b. Remove/repair any leaking pipes, tanks, containment or packaging.
   c. Contaminated materials from clean up efforts must be disposed of properly (containerized as hazardous waste and/or removed by qualified hazardous waste contractor).
   d. For large spills (over one gallon, could enter the storm drain or contaminate a wetland, stream, lake or other water body), immediately call a qualified hazardous materials spill response contractor (work with EFS to access PG&E's list of qualified hazardous materials spill response contractors).

Attachment 6
Emergency Response Procedure: Earthquake Vulnerability [19 CCR §2731(c)]

Identify areas of the facility where releases could occur or would require immediate inspection or isolation because of the vulnerability to earthquake related ground motion. *(check all which apply)*:

☐ NOT APPLICABLE

☒ Hazardous Waste/ Hazardous Materials Storage Areas	☐ Production Floor	☐ Process Lines
☐ Bench/ Lab	☐ Waste Treatment	☒ Oil-Filled Transformers

BUSINESS EMERGENCY/CONTINGENCY PLAN COVER SHEET

I. IDENTIFICATION

For Dept Use Only – Log In/Date Stamp

FACILITY ID # F A 0 0 0 6 7 2 3

BUSINESS NAME (Same as FACILITY NAME or DBA) 3

PG&E – Topock Compressor Station

BUSINESS SITE ADDRESS	CITY	ZIPCODE
Interstate 40 and Park Moabi Road 14 Miles East of Needles	Needles	92363

II. SUBMISSION CHECKLIST

(Complete this Section if submitting an entire Business Emergency/Contingency Plan whether new or revised)

Submission Checklist ☒

- ☒ Business Activities Form
- ☒ Business Owner/Operator Identification Form
- ☒ Supplemental Emergency Contact Page
- ☒ Emergency Response Plans and Procedures
- ☐ Hazardous Materials Inventory Summary Form for the facility listing materials (including wastes) by item number
- ☐ One Hazardous Materials Inventory Form for each hazardous material (including wastes) which meet reporting criteria
- ☐ Material Safety Data Sheets attached to the inventory form of each material not listed in Appendix I
- ☒ Facility map (using grid form provided) consisting of all required features including the location of each inventoried item
- ☐ Site map (using grid form provided) consisting of all required features including surrounding facilities and areas.
- ☒ Area map - photocopied city map with location of site indicated
- ☒ Owner/Operator has signed and dated the plan and all required individual pages of the plan
- ☒ Submit the original and 1 copy to the Hazardous Materials Division. One is for distribution to the local fire jurisdiction
- ☒ ***Retain one copy of the business emergency/contingency plan at the facility***.

III. UPDATE/CERTIFICATION

(Complete this Section if submitting a partial update or re-certifying an existing Plan)

Check the appropriate boxes below and sign the certification statement. Submit 2 copies of all update information.

- ☐ Please incorporate the following into my Business Emergency/Contingency Plan
  - ☐ New Business Owner/Operator Identification Form
  - ☐ New Inventory Forms and new Inventory Summary Form (and maps, if affected)
  - ☐ New Supplemental Emergency Contact Page
- ☐ Other: _____

Brief explanation of changes: _____

☐ There have been no changes to the inventory. In place of submitting the annual inventory, I hereby attest to all of the following:

- The information contained in the inventory most recently submitted to the CUPA is complete, accurate and up to date.
- There has been no change in the quantity, storage, or handling of hazardous materials (including waste) reported in the most recently submitted inventory.
- No hazardous materials (including waste) subject to inventory requirements are being handled that are not listed on the most recently submitted inventory.
- This certification is not being made to meet annual inventory submission requirements of EPCRA. (EPCRA requires complete annual submission)

IV. SIGNATURE

(Complete this Section for all submissions)

Certification - Based on my inquiry of those individuals responsible for obtaining the information, I certify under penalty of law that I have personally examined and am familiar with the information submitted on this document and believe the information is true, accurate and complete.

Hazardous Materials

Does your facility have on site (for any purpose) at any one time, hazardous materials at or above 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet for compressed gases (include liquids in ASTs and USTs); or is regulated under more restrictive inventory local reporting requirements (shown below if present); or the applicable Federal threshold quantity for an extremely hazardous substance specified in 40 CFR Part 355, Appendix A or B; or handle radiological materials in quantities for which an emergency plan is required pursuant to 10 CFR Parts 30, 40 or 70?	Yes

Underground Storage Tank(s) (UST)

Does your facility own or operate underground storage tanks?	Yes

Hazardous Waste

Is your facility a Hazardous Waste Generator?	Yes
Does your facility treat hazardous waste on-site?	No
Is your facility's treatment subject to financial assurance requirements (for Permit by Rule and Conditional Authorization)?	No
Does your facility consolidate hazardous waste generated at a remote site?	Yes
Does your facility need to report the closure/removal of a tank that was classified as hazardous waste and cleaned on-site?	No
Does your facility generate in any single calendar month 1,000 kilograms (kg) (2,200 pounds) or more of federal RCRA hazardous waste, or generate in any single calendar month, or accumulate at any time, 1 kg (2.2 pounds) of RCRA acute hazardous waste; or generate or accumulate at any time more than 100 kg (220 pounds) of spill cleanup materials contaminated with RCRA acute hazardous waste.	Yes
Is your facility a Household Hazardous Waste (HHW) Collection site?	No

Excluded and/or Exempted Materials

Does your facility recycle more than 100 kg/month of excluded or exempted recyclable materials (per HSC 25143.2)?	No
Does your facility own or operate ASTs above these thresholds? Store greater than 1,320 gallons of petroleum products (new or used) in aboveground tanks or containers.	Yes
Does your facility have Regulated Substances stored onsite in quantities greater than the threshold quantities established by the California Accidental Release prevention Program (CalARP)?	No

Additional Information

No additional comments provided.

EMERGENCY CONTACTS

BUSINESS NAME (Same as FACILITY NAME or DBA)
PG&E – Topock Compressor Station

A business shall appoint an Emergency Coordinator and Alternate Emergency Coordinator. These persons shall be knowledgeable in all aspects of the business operation. In the event of a release or threatened release of hazardous materials, the Emergency Coordinators shall be responsible for initiating response actions by the business. The Emergency Coordinators shall have full access to the facility, site familiarity and authority to make decisions for the business and to commit business resources. Hazardous waste generators must provide the information required in Title 22 of the California Code of Regulations and must list all emergency coordinators in the order that they will assume responsibility.

ONLY Emergency Contacts listed on this separate page will be held as confidential.

EMERGENCY RESPONSE PLANS & PROCEDURES – AGENCY NOTIFICATION

BUSINESS NAME (Same as FACILITY NAME or DBA) 3

Pacific Gas and Electric Company – Topock Compressor Station

POST BY TELEPHONE

Agency Notification: **If a situation is an emergency, call 911 first.** Additionally, a handler of hazardous materials is required to immediately report any release or threatened release of a hazardous material to San Bernardino County Fire Department, Hazardous Materials Division and the Governor's Office of Emergency Services. Spills exceeding Federal reportable quantities require additional notification to the National Response Center. However, California statute does not limit the requirement to report to any specific quantity. **Also note that calling 911 does not meet the requirement for the handler to report a release and that the local fire department cannot make required notifications on behalf of the handler.** This CUPA requires a written report within 15 days after any reportable release or threatened release. Contact the CUPA for further guidance.

Agency (* Indicates mandatory notification)	**Phone Number**
1. ***Local Emergency Response Agency (if an emergency)	**911**
2. ***San Bernardino County Fire Department Hazardous Materials Division	**(800) 33-TOXIC** or **(909) 386-8425**

*Note: (800) 33-TOXIC does not work nationwide; non-local callers must use (909) 386-8425 to report **any** release or threatened release.*

3. ***** State of California, Governor's Office of Emergency Services (CalOES) **(800) 852-7550** or **(916) 845-8911**
4. National Response Center (**800) 424-8802**
5. Other Agencies *(Cal OSHA, Regional Board, Air Quality, as applicable)*

Agency Name	*Phone Number*
Mojave Desert Air Quality Management District	(760) 245-1661
San Bernardino County Fire Department Needles Fire Station 13, Needles	(909) 387-5974 (760) 326-2833
San Bernardino County Sheriff's Department, Colorado River Station	(760) 326-9200
Colorado River Medical Center	(760) 326-4531

EMERGENCY INFORMATION REQUIRED: BE PREPARED TO PROVIDE THE FOLLOWING INFORMATION

- ♦ Name & phone number of person reporting
- ♦ Name and street address of the business
- ♦ Location of the incident or threatened release
- ♦ Type of incident or threatened release
- ♦ Hazardous materials involved & physical state
- ♦ Hazards to human health and/or environment
- ♦ Actions taken or planned
- ♦ Contractor or cleanup company name
- ♦ Estimate of the quantity released
- ♦ Media (soil, water, air) into which release occurred
- ♦ Precautions to take (if known)
- ♦ Time and duration of the release
- ♦ Is the chemical an extremely hazardous substance?
- ♦ Extent of injuries, if any
- ♦ Is any assistance required?

Release reporting citations (California Health and Safety Code):

§ 25501. Definitions:

(r) "Release" means any spilling, leaking, pumping, pouring, emitting, emptying, discharging, injecting, escaping, leaching, dumping, or disposing into the environment, unless permitted or authorized by a regulatory agency.

(u) "Threatened release," means a condition creating a substantial probability of harm, when the probability and potential extent of harm make it reasonably necessary to take immediate action to prevent, reduce, or mitigate damages to persons, property, or the environment.

§ 25507(a) … the handler or any employee, authorized representative, agent, or designee of a handler shall, upon discovery, immediately report any release or threatened release of a hazardous material to the administering agency, and to the office, in accordance with the regulations adopted pursuant to Section 25503. Each handler and any employee, authorized representative, agent, or designee of a handler shall provide all state, city, or county fire or public health or safety personnel and emergency rescue personnel with access to the handler's facilities.

EMERGENCY RESPONSE PLANS AND PROCEDURES

BUSINESS NAME (Same as FACILITY NAME or DBA)

Pacific Gas and Electric Company – Topock Compressor Station

State Law requires your business to complete all sections of the Emergency Response Procedure listed below: For each of the following, **briefly** describe your business's standard operating procedures relating to the release or threatened release of hazardous materials located at your facility. You may attach additional pages if necessary, but do not include copies of facility manuals unless requested to do so by this Department. You may reference manuals that are used by your facility for these procedures, but you must still give a brief description here.

EVACUATION/NOTIFICATION: Indicate location(s) where employees, customers, visitors or others on site are to evacuate in an emergency. Describe how your business will immediately notify people and evacuate the facility in the event of a release or threatened release of hazardous materials. Include the route and meeting place.

Evacuation of the facility will occur as a response to an incident with known or unknown hazards that could pose a threat to the health and/or safety of facility personnel. All facility personnel have been trained in the evacuation routes for their work stations and the other areas of the facility. An assembly point is designated outside the main entrance to the facility. The decision to evacuate is the responsibility of the Facility Emergency Coordinator or the Shift Supervisor. He/she will determine the extent of evacuation. Evacuation signals are provided by either audible alarms or given verbally.

PREVENTION/MITIGATION/ABATEMENT: Describe what policies and procedures your business will follow to prevent, reduce and/or remove the hazard to persons, property or the environment caused by a release or threatened release of hazardous materials and/or hazardous wastes. (√ Check those items that apply and write additional information in the space provided).

☒ Reduction of containers on site if not used or needed

☒ Containers are properly labeled and closed when not in use

☒ Compressed gas cylinders are properly secured

☐ Use of monitoring system Type: _____

☒ Other:

Areas containing significant quantities of hazardous materials and identified storage vessels are periodically inspected, as appropriate, for visible leaks, accumulations in secondary containment; compatibility or materials; proper labeling and signage; safety, personal protective and fire fighting equipment, spill response equipment and supplies; operability of emergency eyewash and shower stations.

PG&E has detailed spill response and mitigation procedures which are an integral part of the hazardous materials business plan. The Primary Facility Emergency Coordinator is the individual who is responsible for coordinating all emergency response measures at the facility. The primary Emergency Coordinator is familiar with all aspects of the facility's contingency plan, all operations and activities at the facility, the characteristics of materials and wastes handled, the location(s) of all applicable emergency response records for the facility, and the facility layout. This person has the authority to commit the resources needed to carry out the contingency plan and the responsibility to respond to emergencies. This information can be found in Attachment 5.

Date: 02-01-2014

EMERGENCY RESPONSE PLANS AND PROCEDURES

BUSINESS NAME (Same as FACILITY NAME or DBA)

Pacific Gas and Electric Company – Topock Compressor Station

FACILITY TRAINING PLAN: Describe employee and operator training including local emergency response coordination, use of facility emergency equipment, and provisions for initial and refresher training. In addition, describe training for hazardous materials/waste handling as required by OSHA. (√ Check those items that apply and write additional information in the space provided)

- ☒ New employee training
- ☒ Annual training & periodic refresher courses
- ☒ Familiarization with the Emergency Response Plans and Procedures of this Business Plan
- ☒ Spill control equipment
- ☐ Monitoring system
- ☒ Personal Protective Equipment
- ☒ On the job training (Described below)
- ☒ Other:

PG&E has complimentary training programs that address the proper handling of hazardous materials and wastes at Company facilities. The training program meets the employee training requirements at both federal and state regulations as they apply to hazardous waste contingency plans and emergency response plans. In accordance with Federal and State regulations (40 CFR, Titles 19 and 27 of the California Code of Regulations, and California Health and Safety Code), employees in each department or facility receive "Right to Know" or "Hazard Communication Training on specific topics such as safe methods for storage and handling of hazardous materials, proper fitting and use of personal protective equipment, and knowledge of the specific hazards of the chemicals to which the employees are exposed. "Right to Know" instruction is given by the supervisor or other qualified person. The supervisor documents the training by maintaining a signed training roster.

United States Department of Transportation (U.S.DOT) Hazardous Material Transportation training as required in 49CFR 17.2702, 172.704 and 177.816 is provided to any employee who packages, labels, marks, loads or offers a hazardous material for transport, or who transports a hazardous material. All employees are required to be trained within six months of starting a job assignment that involves hazardous waste management duties.

Employees receive appropriate on-the-job training which includes procedures for spill prevention and spill cleanup and the handling of hazardous materials and hazardous wastes. Spill prevention procedures and cleanup procedures are documented in PG&E California Gas Transmission (CGT) Environmental Compliance Manual Volume #2.

EMERGENCY PROCEDURES: Describe duties of the Emergency Coordinator and how implementation of Facility Emergency Response will be accomplished. (e.g. Notification, evacuation, emergency coordination) (√ Check those items that apply and write additional information in the space provided)

Emergency Coordinator will:

- ☒ Identify potential hazards and determine whether a release has occurred
- ☒ Activate local emergency systems (e.g. manual shutoff devices) and take appropriate immediate actions based on level of training and the ability to act safely
- ☒ Coordinate the notification and evacuation of employees, customers, and other visitors from the facility
- ☒ Make required agency notifications and request needed assistance
- ☒ Assist responding agencies by providing access to the facility and information about the facility
- ☒ Other:

The Facility Emergency Coordinator is the individual who is responsible for coordinating all emergency response measures at the facility. The Facility Emergency Coordinator is familiar with all aspects of the facility's contingency plan, all operations and activities at the facility, the characteristics of materials and wastes handled, the location(s) of all applicable emergency response records for the facility, and the facility layout. The person has the authority to commit to resources needed to carry out the contingency plan and the responsibility to respond to emergencies.

Date: 02-01-2014

EMERGENCY RESPONSE PLANS AND PROCEDURES

BUSINESS NAME (Same as FACILITY NAME or DBA)
3
Pacific Gas and Electric Company – Topock Compressor Station

FACILITY EMERGENCY EQUIPMENT: List facility emergency equipment on site (e.g. fire extinguisher, fire alarms, spill control equipment, SCBA, first aid kits, etc.). Include test/maintenance plan. (√ Check those items that apply and write additional information in the space provided)

	Equipment	Quantity/Type	Maintenance Schedule/Frequency
☒	Fire extinguisher(s)	**See Emergency Equipment Table**	
☒	First aid kit(s)	**See Emergency Equipment Table**	
☐	Fire alarm(s)		
☒	Spill control equipment	**See Emergency Equipment Table**	
☐	Monitoring system		
☒	Personal Protective Equipment	**See Emergency Equipment Table**	
☐			
☐			
☐			
☐			

FACILITY EARTHQUAKE RESPONSE: Identify areas of the facility as well as mechanical or other systems that require immediate inspection due to their vulnerability to earthquake related ground motion. (e.g. Hazardous materials or waste storage locations, vessels, piping, pipe and tank supports, valves, gauges, etc.) (√ Check those items that apply and write additional information in the space provided)

- ☒ Chemical Storage Locations – Product and Waste
- ☐ Process vessels
- ☒ Aboveground storage tanks
- ☒ Emergency shut-off systems
- ☒ Piping and pipe supports
- ☐ Utility connections
- ☒ Other

Following a moderate to severe earthquake, the natural gas pipelines leading to and from the facility, and other major natural gas containing equipment or piping are inspected for damage and leaks. Following the natural gas conveyance equipment inspections, aboveground storage tanks and hazardous materials storage areas are inspected for damage**.** This information can be found in Attachment 6.

ARRANGEMENTS/AGREEMENTS: Describe any arrangements or agreements that you have with private emergency response teams, waste haulers, disposal companies, recyclers, local hospitals, police and/or fire. If you have no arrangements or agreements, state that fact in the space provided. (√ Check those items that apply and write additional information in the space provided)

- ☒ Hazardous waste hauler **PSC Industrial Outsourcing Inc., (800) 321-1030**
- ☐ Emergency response team
- ☒ Local hospitals **Colorado River Medical Center, (760) 326-4531**
- ☒ Other: **See Attachment 4**
- ☐ No arrangements or agreements at this time

Date: 02-01-2014

Emergency Equipment

22 CCR §66265.52(e) [as referenced by 22 CCR §66262.34(a)(4)] requires that emergency equipment at the facility be listed. Completion of the following Emergency Equipment Inventory Table meets this requirement.

Emergency Equipment Inventory Table			
1. Equipment Category	**2. Equipment Type**	**3. Locations***	**4. Description****
Personal Protective Equipment, Safety Equipment, and First Aid Equipment	☒ Cartridge Respirators	See Facility Layout Map	Personal Protection
	☐ Chemical Monitoring Equipment *(describe)*		
	☐ Chemical Protective Aprons/Coats		
	☒ Chemical Protective Boots	See Facility Layout Map	Personal Protection
	☒ Chemical Protective Gloves	See Facility Layout Map	Personal Protection
	☒ Chemical Protective Suits: *Coveralls*	See Facility Layout Map	Personal Protection
	☒ Face Shields	See Facility Layout Map	Personal Protection
	☒ First Aid Kits/Stations *(describe)*	See Facility Layout Map	Personal Protection
	☒ Hard Hats	Vehicles	Company Issued
	☒ Plumbed Eye Wash Stations	See Facility Layout Map	Personal Protection
	☐ Portable Eye Wash Kits *(i.e., bottle type)*		
	☒ Respirator Cartridges *(describe)*	See Facility Layout Map	Personal Protection
	☒ Safety Glasses/Splash Goggles	See Facility Layout Map	Personal Protection
	☒ Safety Showers	See Facility Layout Map	Personal Protection
	☐ Self-Contained Breathing Apparatuses (SCBA)		
	☐ Other *(describe)*		
Fire Extinguishing Systems	☐ Automatic Fire Sprinkler Systems		
	☒ Fire Alarm Boxes/Stations	See Facility Layout Map	
	☐ Fire Extinguisher Systems *(describe)*		
	☒ Fire Extinguishers *(describe)*	See Facility Layout Map	
	☒ Other *(Hose Station)*	See Facility Layout Map	
Spill Control Equipment and Decontamination Equipment	☒ Absorbents *(describe)*	See Facility Layout Map	Spill Cleanup
	☒ Berms/Dikes *(Curb)*	See Facility Layout Map	Spill Containment
	☐ Decontamination Equipment *(describe)*		
	☐ Emergency Tanks *(describe)*		
	☐ Exhaust Hoods		
	☐ Gas Cylinder Leak Repair Kits *(describe)*		
	☒ Neutralizers *(for Odorant)*	See Facility Layout Map	Spill Cleanup
	☒ Overpack Drums	See Facility Layout Map	5, 55 and 95-gallon drums
	☐ Sumps *(describe)*		
	☐ Other *(describe)*		
Communications and Alarm Systems	☐ Chemical Alarms *(describe)*		
	☐ Intercoms/ PA Systems		
	☒ Portable Radios	Vehicles	Communication
	☒ Telephones	Throughout Site	Communication
	☐ Tank Leak Detection Systems		
	☒ Other: *Cell phones*	Vehicles	Communication
Additional Equipment *(Use Additional Pages if Needed.)*	☐		
	☐		
	☐		
	☐		
	☐		

* See Facility Layout Map for equipment locations.

** Describe the equipment and its capabilities. If applicable, specify any testing/maintenance procedures/intervals. Attach additional pages, numbered appropriately, if needed.

Record Keeping

Emergency Response/Contingency Plan (Hazardous Materials Business Plan Module)

All facilities that handle hazardous materials must maintain records associated with their management. A summary of your record keeping procedures is a required module of the Unidocs Hazardous Materials Business Plan (HMBP). A blank summary has been provided below for you to complete and submit if you do not already have such a document. **If you already have a brief written description of your hazardous materials record keeping systems that addresses all subjects covered below, you are not required to complete this page, but you must include a copy of your existing document as part of your HMBP.**

Check all boxes that apply. The following records are maintained at the facility.
Note: Items marked with an asterisk (*) are required.

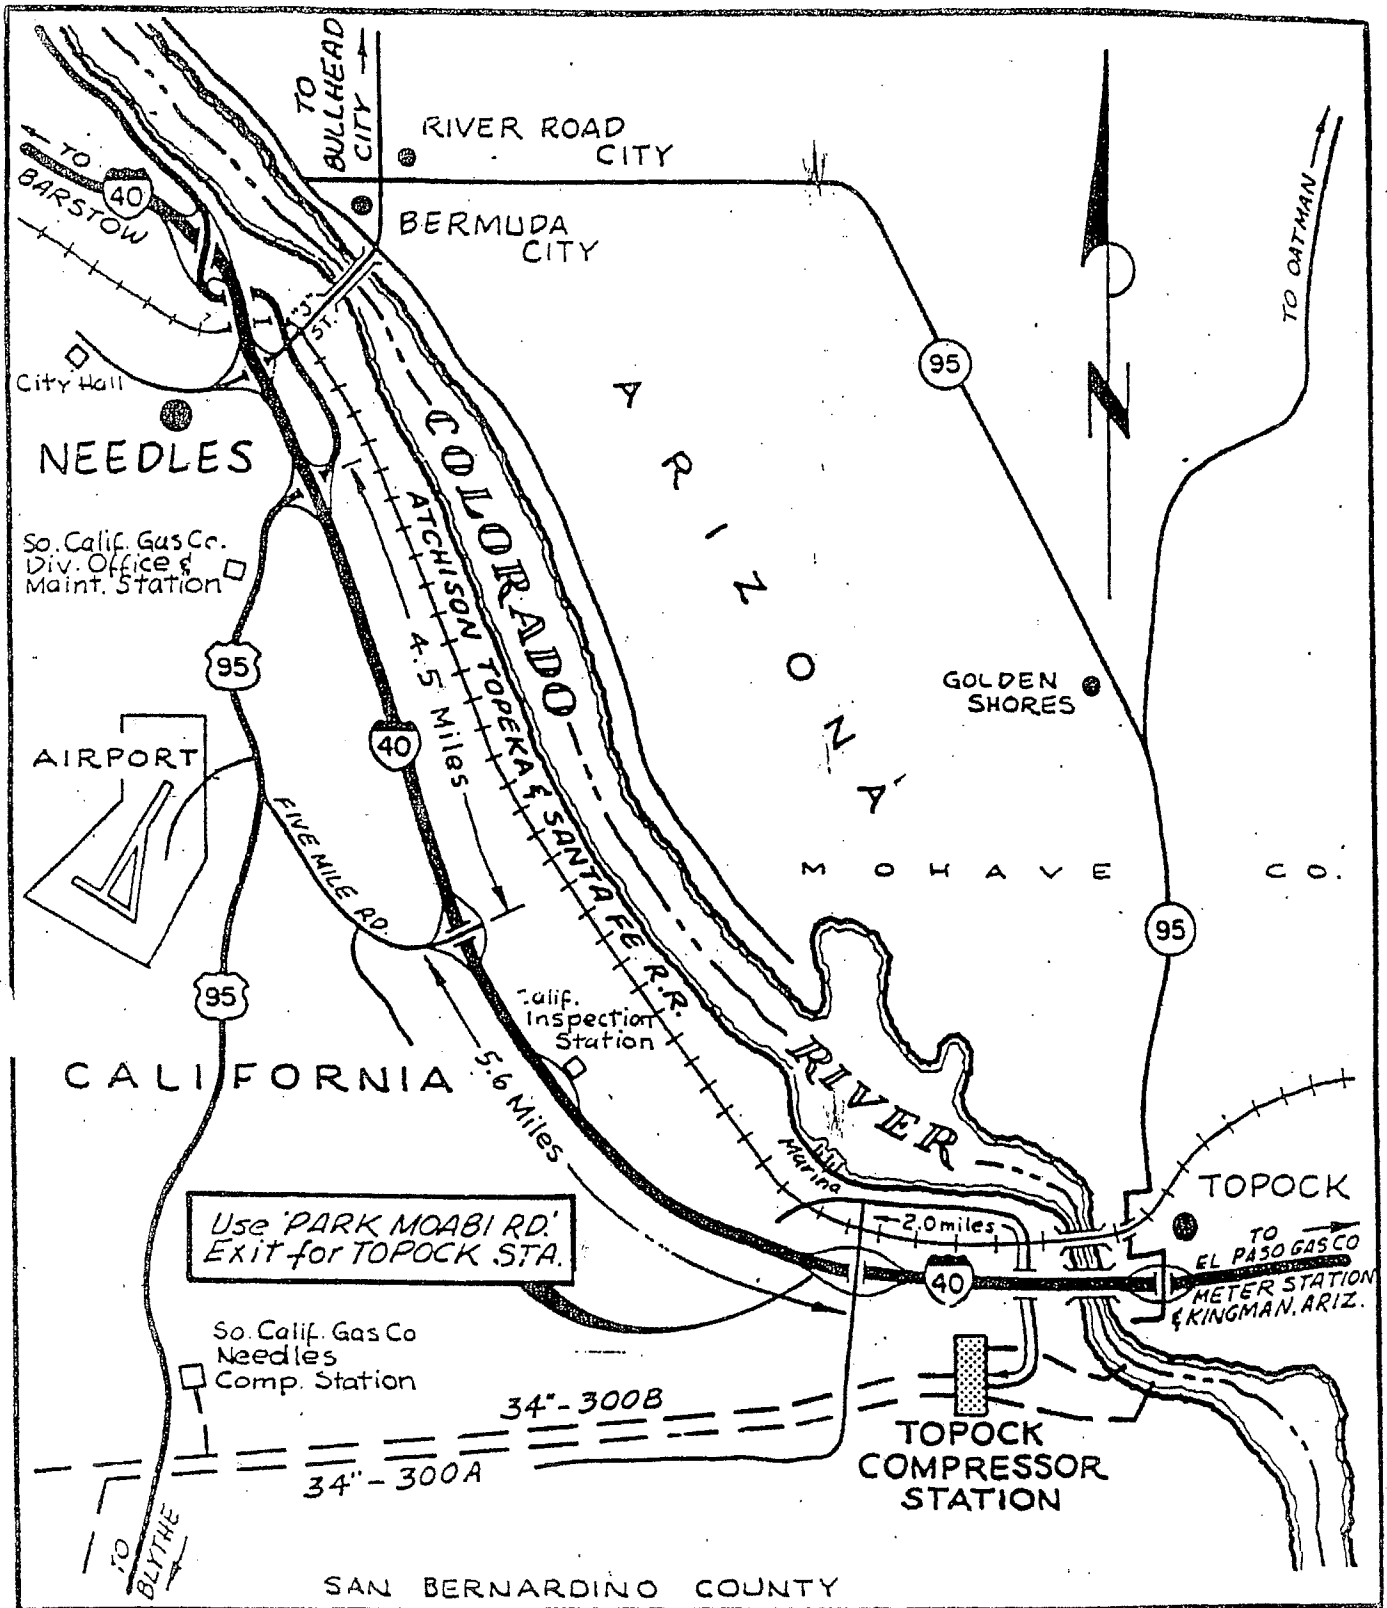
☒	Current employees' training records *(to be retained until closure of the facility)* *.
☒	Former employees' training records *(to be retained at least three years after termination of employment)* *
☒	Training Program(s) *(i.e., written description of introductory and continuing training)* *
☒	Current copy of this Emergency Response/Contingency Plan *
☒	Record of recordable/reportable hazardous material/waste releases *
☒	Record of hazardous material/waste storage area inspections *
☒	Record of hazardous waste tank daily inspections *
☐	Description and documentation of facility emergency response drills

Note: The above list of records does not necessarily identify every type of record required to be maintained by the facility.

Note: The following section applies where local agencies require facility owners/operators to perform and document routine facility self-inspections,

A copy of the Inspection Check Sheet(s) or Log(s) used in conjunction with required routine self-inspections of your facility must be submitted with your HMBP. *[Exception: Unidocs provides a Hazardous Materials/Waste Storage Area Inspection Form that you may use if you do not already have your own form. If you use the Unidocs form (available at* **www.unidocs.org***), you do not need to attach a copy.]*

Check the appropriate box:



☐	We will use the Unidocs "Hazardous Materials/Waste Storage Area Inspection Form" to document inspections.
☒	We will use our own documents to record inspections. ***(A blank copy of each document used must be attached to this HMBP.)***

San Bernadino County Fire Department
385 North Arrowhead Avenue
San Bernadino, CA 92415
Attention: Chief Brierty

April 3, 1997

Dear Chief Brierty,

As a generator of hazardous waste, the Pacific Gas and Electric Company is required to obtain letters of agreement with appropriate law enforcement, fire services and medical care providers. The intent of this agreement is to provide reasonable and customary care in the unlikely event of a hazardous waste emergency at the following PG&E facilities located within your vicinity or jurisdiction:

- Topock Compressor Station
- Hinkley Compressor Station

In support of this agreement, PG&E offers to familiarize the San Bernadino County Fire Department with the layout of the facility, the properties and hazards posed by the wastes generated at the facility, places where facility personnel would normally be working, access and egress routes and possible evacuation routes. Much of the technical information may be found in the facilities' Hazardous Materials Business Plan (HMBP) which is included for your reference. A tour of each facility covered by this agreement is available upon request.

To facilitate this process, an agreement form has been included along with a self-addressed stamped envelope. Your assistance in this matter is greatly appreciated. If you have any questions regarding this request, please feel free to call Taha Nassar at (510) 974-4072 or Phil Steiner at (510)974-4075.

Sincerely,

Philip A Steiner
Senior Environmental Consultant

GARY PENROD, SHERIFF

April 7, 1997

Pacific Gas and Electric Company
375 North Wiget Lane, Suite 200
Walnut Creek, CA 94598

Attention: Philip A. Steiner

Dear Mr. Steiner,

Attached is the Letter of Agreement Form you sent to our office.

I wanted to bring to your attention that the phone number listed in the manual for our office is incorrect. The correct number is (760) 326-9200.

Also, for future reference, John Trumbull is now the Captain of the Colorado River Station and all correspondence should be directed to him.

Sincerely,

GARY PENROD, SHERIFF
San Bernardino County

John Trumbull, Captain
Colorado River Station

Attachment 5
Emergency Response Procedure: Hazard Mitigation/Prevention/Abatement [19 CCR §2731(e)]

Briefly describe your business standard operating procedures in the event of a release or threatened release of hazardous materials:

1. Evaluate hazards.
2. If safe, take care of injured.
3. Call 911 or specific emergency responder if the situation appears to be beyond your ability to resolve immediately.
4. Don't attempt any action that is beyond the scope of your knowledge, training or experience.
5. If necessary to evacuate the facility, follow evacuation routes and procedures.
6. Notify internal emergency coordinator (site emergency contact) and/or the assigned Environmental Field Specialist.
7. If necessary, arrange for hazardous materials/emergency response contractor to respond and/or clean up spill.
8. Assure that appropriate agency notifications are made (after situation is stabilized and it is safe to do so).

1. **PREVENTION** (prevent the hazard) – Describe what is done to prevent a release or threatened release of hazardous materials (e.g. discussion of safety and storage procedures).

   a. Complete required routine inspections of facility equipment, piping, tanks, shut-off valves and emergency response equipment.
   b. Perform required maintenance of systems identified in routine inspections.
   c. Provide secondary containment where required to prevent leakage or spills.
   d. Maintain secondary containment (make sure water is removed, leaks and cracks are repaired).
   e. Check packaging and lids of hazardous materials containers during routine inspections.
   f. Promptly clean up small spills and properly dispose of clean up materials.
   g. Segregate incompatible materials.
   h. Keep hazardous materials stored in appropriate locations (designated lockers, sheds, etc.).
   i. Assure that security fencing, locks and gates are in good repair and being used properly.
   j. Keep evacuation map and emergency response procedures prominently posted.

2. **MITIGATION** (reduce the hazard) – What is your immediate response to a leak, spill, fire, explosion, or airborne release (e.g. absorbent on spills, use of fire extinguisher, closing of valves, etc.).

   a. Evaluate hazards.
   b. If safe, take care of injured.
   c. Call 911 or specific emergency responder if the situation appears to be beyond your ability to resolve immediately.
   d. If safe, attempt to put out a fire using appropriate fire extinguisher.
   e. If safe, take steps to prevent leak from worsening or moving towards a waterway or storm drain (close valves, place sand bags or containment booms).
   f. If necessary to evacuate the facility, follow evacuation routes and procedures.
   g. If there is potential for the leak or spill to affect people or the environment near the facility, work with incident commander to notify/evacuate people/animals from the area as appropriate.
   h. Notify internal emergency coordinator (site emergency contact) and/or the assigned Environmental Field Specialist.
   i. If necessary, arrange for hazardous materials/emergency response contractor to respond and/or clean up spill.
   j. Assure that appropriate agency notifications are made (after situation is stabilized and it is safe to do so).

3. **ABATEMENT** (remove the hazard) – Describe what you would do to remove any released material (e.g. clean up company, absorb spill and containerize).

   a. Small leaks and spills should be cleaned up using appropriate absorbent material.
   b. Remove/repair any leaking pipes, tanks, containment or packaging.
   c. Contaminated materials from clean up efforts must be disposed of properly (containerized as hazardous waste and/or removed by qualified hazardous waste contractor).
   d. For large spills (over one gallon, could enter the storm drain or contaminate a wetland, stream, lake or other water body), immediately call a qualified hazardous materials spill response contractor (work with EFS to access PG&E's list of qualified hazardous materials spill response contractors).

Attachment 6
Emergency Response Procedure: Earthquake Vulnerability [19 CCR §2731(c)]

Identify areas of the facility where releases could occur or would require immediate inspection or isolation because of the vulnerability to earthquake related ground motion. *(check all which apply)*:

☐ NOT APPLICABLE

☒ Hazardous Waste/ Hazardous Materials Storage Areas ☐ Production Floor ☐ Process Lines

☐ Bench/ Lab ☐ Waste Treatment ☐ Oil-Filled Transformers

☐ Other (describe):

Identify mechanical systems where releases could occur or would require immediate inspection or isolation because of the vulnerability to earthquake related ground motion. *(check all which apply)*:

10148423
EPA ID Number
CAT080011729

Submittal Status

Submitted on 1/31/2014 by *Megan Silva* of PG&E (San Ramon, CA)

Consolidation Site Information

Interstate 40 and Park Moabi Road, 14 Miles East of Needles
Needles 92363

Description of Remote Location(s)

The types of remote locations include: unstaffed substations and unstaffed customer support facilities. Sources from which the non-RCRA Hazardous waste is collected can come from numerous types of equipment distributed throughout its service territory. Installation and maintenance of this equipment can generate wastes. Examples of electric support equipment are utility poles, street lights, transformers, switches, capacitor banks, service shops, and meters.

Description of Waste(s) Collected

The following types may include the following Non-RCRA Hazardous Waste liquids: antifreeeze-glycol/water, oily water, non-PCB Oils, insulating oil 5-49ppm PCB and Insulating oil greater than or equal to 50ppm PCB. Non-RCRA Hazardous Waste Solids may include: antifreeze-glycol contaminated debris, clean up debris, latex paint, asbestos related waste, mercaptan contaminated debris, empty containers like adhesives, empty containers like consumer products, oily dibris and rags.

On-Site Hazardous Waste Treatment	Estimated Monthly Volume Consolidated
No	11251 Pounds

Basis For Not Needing a Federal Permit

Yes **The hazardous waste being consolidated is not hazardous waste under federal law although the waste is regulated as hazardous waste under California state law.**

The hazardous waste is hazardous waste under federal law, but transportation to and accumulation of the consolidation site of the waste is not submited to permitting requirements under federal law for the following other reason(s):

RCRA does not subject these wastes to permitting requirements

Address:	

Instructions: Place a check mark (√) in each box if no problem is found. Mark **N/A** if question on checklist is not applicable.
Mark with an "X" any box if a problem is found and record the problem in the **Exhibit 10 Equipment Maintenance Log**.

	WEEK OF MONTH:	WEEK 1	WEEK 2	WEEK 3	WEEK 4
DISPENSER EQUIPMENT	**DATE OF INSPECTION** (MM/DD):				
1. Retractor wheel functioning w/hose at bend 10" off ground? (if applicable)					
2. Hoses are free of kinks, cracks and flat spots? (bend tightly to observe).					
3. Does nozzle hold-open latch operate properly (minimizes vapor to user)?					
4. Does nozzle automatic shut off device operate properly (prevent spill)?					
5. Are the bellows free of holes, cracks, slits, tears?					
6. For UST or stand alone\dispenser: Are the insides of the fuel dispensers free from water, fuel leakage and debris?					
TANK EQUIPMENT					
7. Are the UST's manhole cover, fill tube cap, & gaskets in good condition?					
8. Are UST spill containers beneath the manhole covers clean and dry?					
9. Is the drain valve in the spill container operable with chain?					
10. For gasoline tanks w/vapor recovery only: Does the dry break (poppet valve) spring open and return to closed?					
11. For gasoline tanks: Are the fill and vapor adapter tight on the riser?					
12. For ASTs **without** 24-hour leak detection equipment: is secondary containment (annular or berm) free from liquids?					
OTHER					
13. Is tank system operated in accordance with CARB Executive Orders and Permits to Operate (CUPA and/or Air District) and local regulations?					
14. The Permit to Operate is posted at the fuel island kiosk or nearby building?					
15. Is monitoring equipment functioning properly? (e.g. Veeder-Root TLS, gages etc.)					
16. Inspection checklist is maintained onsite for 3 years or permit requirement.					
	Inspectors Initials or LAN ID:				

NOTE: If deficiencies are noted, you must make the correction immediately or **tag the dispenser Out-Of-Order** and contract your local Environmental Field Specialist for assistance. All alarms and deficiencies **shall be** recorded in Exhibit 10-Equipment Maintenance Log.

Comments: _____

Required Follow-Up Actions: _____

INSTRUCTIONS

1. The monthly UST system inspection must be conducted by a Designated UST Operator who possesses a current "California UST System Operator" exam issued by the International Code Council (ICC).
2. The Designated UST Operator must alert the UST Owner or Operator of any condition discovered during the monthly visual inspection that may require follow-up actions.
3. A copy of this monthly inspection report must be provided to the UST Owner or Operator.
4 The UST Owner or Operator must maintain a copy of each monthly inspection report and all attachments for the most recent 12 months. The records shall be maintained on-site or, if approved by the local agency, off-site at a readily available location.

Appendix F
Fuel SOP

- Remedy-SOP-02: Safe Fueling and Fuel Handling Policy

(Provided on CD-ROM Only)

Standard Operating Procedure
PG&E Topock Groundwater Remedy
Operations and Maintenance Plan

Title: Safe Fueling and Fuel Handling Policy

Number: Remedy-SOP-02_Rev0

Created Date: 7/15/2013

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS). The objective of this Standard Operating Procedure is to describe the policy required to refuel vehicles, fuel tanks, and equipment/portable containers safely during work on and off the project site.

2 Approvals

Each vendor/contractor must obtain approval from PG&E Topock Site Operations Manager, and or Sr. Environmental Inspector of a) the planned fueling and re-fueling methods for the contracted activities to be performed at the site, and b) the commercial fuel supplier prior to first use for contracted activities.

3 Safety Guidelines During Fueling Operations

PG&E requires all vendors/contractors to follow appropriate procedures during fueling/refueling activities in order to avoid spills and incidents. The following general guidelines will be followed unless pre-approved otherwise:

Preparation, Pre-Fueling and Fueling Guidelines

- Turn off all equipment or engines before refueling.
- When fueling at a pump, remain attentive to the fuel nozzle.
- When not fueling at a fixed pump, stage splash pad containment as needed.
- Identify and locate fire extinguisher prior to fueling.
- Do not become distracted while fueling by electronic devices, reading materials, or conversations with bystanders.
- Use only UL-approved containers for portable gasoline storage cans.
- When filling a portable container, always place the container on level ground and keep the pump nozzle in contact with the container when refueling to avoid a static electricity ignition of fuel vapors. Fill slowly to avoid spillage and skin/clothing contact and use a funnel if needed.
- When fueling from a portable container, stage splash containment as needed.
- Only store fuel in locations approved by PG&E, and never near any ignition sources.

- In the event of a fire, make use of fire extinguisher that is available. If fire cannot be contained, relocate yourself to a safe location and call 911.

General Remote Fueling Considerations

- Position the fuel supply source as close to the equipment to be fueled as is practicable and safe.
- Inspect fuel conveyance hose/equipment and all connections and fittings for signs of wear or defects prior to the initiation of fuel pumping or pouring. If pouring fuel from a portable container, a funnel constructed of suitable material must be used to avoid splashing.
- Stage splash containment and fire extinguisher as needed.
- Ensure the area is free from ignition sources (i.e., hot equipment/work, sources of spark or static electricity).
- Once fueling is complete, deactivate the fuel supply pump prior to removing the fill nozzle from the equipment, and ensure that residual fuel has been emptied from the conveyance hose (as appropriate based on design of the equipment used).
- Inspect work area for any signs of spills, and remove spill pad(s), as appropriate.

3 Communication and Contingency Action

If a spill occurs the appropriate clean-up actions should commence as efficiently and safely as possible. Use a natural fiber push broom and/or a spark resistant shovel or scoop.

In addition, the reason for the spill will be investigated, and the team will modify the fueling procedure or conduct equipment repairs as determined appropriate to minimize the potential for future spills. Further, PG&E Site Operations Manager/Sr. Environmental Inspector must be notified immediately.

4 Waste Management

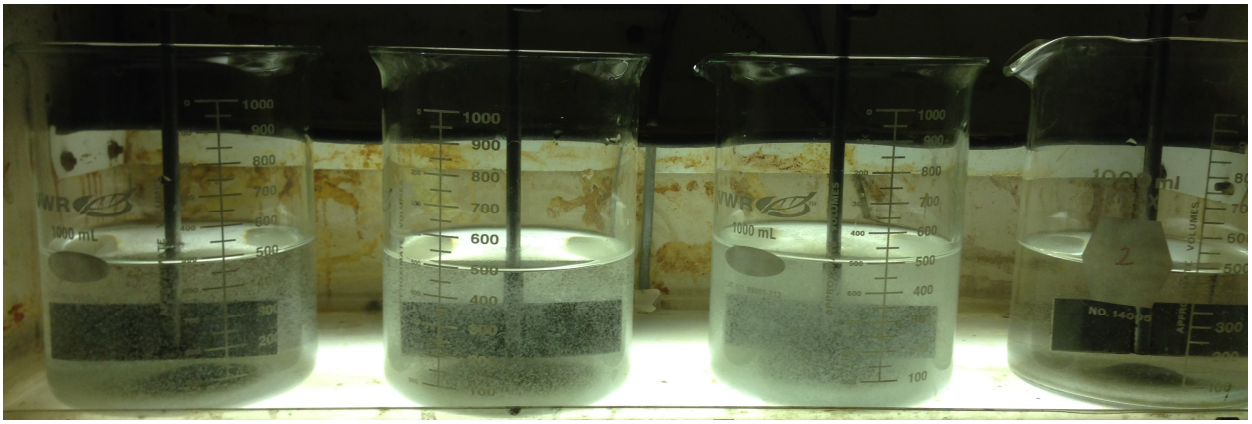
All waste generated during refueling, such as oily absorbent pads, must be transported and disposed of as directed by PG&E immediately following generation. Do not dispose of any oil/fuel contaminated pads or rags in the soil roll-off bins or waste dumpsters.

Appendix G
PG&E Topock Coagulant Screening Report

(Provided on CD-ROM Only)

February 5, 2014

Mr. John Porcella
CH2M Hill



Nalco Company
2111 E. Dominguez Street
Long Beach, CA 90810
(310) 605-5101
www.nalco.com

SUBJECT: Coagulant Screening

Dear Mr. Porcella:

This report contains findings and recommendations from the jar testing conducted on February 5, 2014 at your request. A wide selection of coagulants and flocculents were screened for their effectiveness on a well backwash sample provided from the backwash of the SA-RW-19 well. Nalco 8187 coagulant and Nalco 7878 flocculent proved very effective in settling a stable solid at a low dose.

The picture shows samples of the well water with 20, 40, 60 and 10 ppm of Nalco 8187 coagulant. The solids flocked well in approximately 5-7 minutes creating a settable particle before the addition of any flocculent. This reaction time should be taken into account in the design of any equipment in the full size plant as 5-7 minutes of reaction time will require the coagulant to be fed well upstream of any clarification device. You will note that the increased chemical dose actually reduced its effectiveness.

Based on a 10 ppm dose of Nalco 8187, the use rate in the final treatment plant will be quite small. Calculating roughly, it will take 10 gallons of Nalco 8187 to treat 1 million gallons of backwash water. The estimate I was given today was ~20,000 gallons of backwash water per day meaning a 55 gallon drum will last 250 days.

Due to the nature of flocculents requiring a makedown system, the very low expected usage for a flocculent, and the good settling with coagulant alone I would hope that we could get adequate clarification without a flocculent. If a flocculent is required, the dose is in the 1 ppm range meaning a 5 gallon pail will last 250 days. There was some mention of high chloride concentrations in some of the Topock wells. Flocculents are usually susceptible to degradation by high salt concentrations, but the Nalco 7878 is used in similar applications elsewhere and holds up well to high salt concentration waters.

If you have any questions or comments about this report, please contact me at (702) 506-6696 or aggodfrey@nalco.com.

Sincerely,

Andrew Godfrey

SAFETY DATA SHEET

PRODUCT

ULTRION® 8187

EMERGENCY TELEPHONE NUMBER(S)

(800) 424-9300 (24 Hours) CHEMTREC

1. CHEMICAL PRODUCT AND COMPANY IDENTIFICATION

PRODUCT NAME : **ULTRION® 8187**

APPLICATION : WATER CLARIFICATION AID

COMPANY IDENTIFICATION : Nalco Company
1601 W. Diehl Road
Naperville, Illinois
60563-1198

EMERGENCY TELEPHONE NUMBER(S) : (800) 424-9300 (24 Hours) CHEMTREC

NFPA 704M/HMIS RATING
HEALTH : 2 / 2 FLAMMABILITY : 0 / 0 INSTABILITY : 0 / 0 OTHER :
0 = Insignificant 1 = Slight 2 = Moderate 3 = High 4 = Extreme * = Chronic Health Hazard

2. COMPOSITION/INFORMATION ON INGREDIENTS

Our hazard evaluation has identified the following chemical substance(s) as hazardous. Consult Section 15 for the nature of the hazard(s).

Hazardous Substance(s)	CAS NO	% (w/w)
Aluminum Chloride Hydroxide	12042-91-0	30.0 - 60.0

3. HAZARDS IDENTIFICATION

****EMERGENCY OVERVIEW****

WARNING
Irritating to eyes.
Do not get in eyes, on skin or on clothing. Do not take internally. Use with adequate ventilation. In case of contact with eyes, rinse immediately with plenty of water and seek medical advice. After contact with skin, wash immediately with plenty of water. Use a mild soap if available.
Wear suitable protective clothing. Wear chemical splash goggles.
Not flammable or combustible. May evolve HCl under fire conditions.

PRIMARY ROUTES OF EXPOSURE :
Eye, Skin, Inhalation

HUMAN HEALTH HAZARDS - ACUTE :

EYE CONTACT :
Can cause moderate irritation.

SKIN CONTACT :
May cause irritation with prolonged contact.

INGESTION :
Not a likely route of exposure. There may be irritation to the gastro-intestinal tract with nausea and vomiting.

INHALATION :
Not a likely route of exposure. Repeated or prolonged exposure may irritate the respiratory tract.

AGGRAVATION OF EXISTING CONDITIONS :
A review of available data does not identify any worsening of existing conditions.

HUMAN HEALTH HAZARDS - CHRONIC :
No adverse effects expected other than those mentioned above.

4. FIRST AID MEASURES

EYE CONTACT :
Immediately flush eye with water for at least 15 minutes while holding eyelids open. Get medical attention.

SKIN CONTACT :
Flush with large amounts of water. Use soap if available. If symptoms develop, seek medical advice.

INGESTION :
Do not induce vomiting without medical advice. If conscious, washout mouth and give water to drink. Get medical attention.

INHALATION :
Remove to fresh air, treat symptomatically. If symptoms develop, seek medical advice.

NOTE TO PHYSICIAN :
Based on the individual reactions of the patient, the physician's judgement should be used to control symptoms and clinical condition.

5. FIRE FIGHTING MEASURES

FLASH POINT : None

EXTINGUISHING MEDIA :
Not expected to burn. Use extinguishing media appropriate for surrounding fire. Keep containers cool by spraying with water.

FIRE AND EXPLOSION HAZARD :
Not flammable or combustible. May evolve HCl under fire conditions.

SPECIAL PROTECTIVE EQUIPMENT FOR FIRE FIGHTING :
In case of fire, wear a full face positive-pressure self contained breathing apparatus and protective suit.

6. ACCIDENTAL RELEASE MEASURES

PERSONAL PRECAUTIONS :
Restrict access to area as appropriate until clean-up operations are complete. Use personal protective equipment recommended in Section 8 (Exposure Controls/Personal Protection). Stop or reduce any leaks if it is safe to do so. Keep people away from and upwind of spill/leak. Ventilate spill area if possible. Ensure clean-up is conducted by trained personnel only. Do not touch spilled material. Have emergency equipment (for fires, spills, leaks, etc.) readily available. Notify appropriate government, occupational health and safety and environmental authorities.

METHODS FOR CLEANING UP :
SMALL SPILLS: Soak up spill with absorbent material. Place residues in a suitable, covered, properly labeled container. Wash affected area. LARGE SPILLS: Contain liquid using absorbent material, by digging trenches or by diking. Reclaim into recovery or salvage drums or tank truck for proper disposal. Clean contaminated surfaces with water or aqueous cleaning agents. Contact an approved waste hauler for disposal of contaminated recovered material. Dispose of material in compliance with regulations indicated in Section 13 (Disposal Considerations).

ENVIRONMENTAL PRECAUTIONS :
Do not contaminate surface water.

7. HANDLING AND STORAGE

HANDLING :
Do not get in eyes, on skin, on clothing. Do not take internally. Use with adequate ventilation. Do not breathe vapors/gases/dust. Keep the containers closed when not in use. Have emergency equipment (for fires, spills, leaks, etc.) readily available. Ensure all containers are labeled.

STORAGE CONDITIONS :
Store in suitable labeled containers. Store the containers tightly closed. Store separately from bases.

SUITABLE CONSTRUCTION MATERIAL :
PVC, Buna-N, Polyurethane, Polypropylene, Polyethylene, Viton, HDPE (high density polyethylene), 100% phenolic resin liner Compatibility with Plastic Materials can vary; we therefore recommend that compatibility is tested prior to use.

UNSUITABLE CONSTRUCTION MATERIAL :
Brass, Hypalon, Stainless Steel 304, EPDM, Mild steel, Stainless Steel 316L, Neoprene, Epoxy phenolic resin

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

OCCUPATIONAL EXPOSURE LIMITS :
This product does not contain any substance that has an established exposure limit.

ENGINEERING MEASURES :
General ventilation is recommended.

RESPIRATORY PROTECTION :
Where concentrations in air may exceed the limits given in this section or when significant mists, vapors, aerosols, or dusts are generated, an approved air purifying respirator equipped with suitable filter cartridges is recommended. Consult the respirator / cartridge manufacturer data to verify the suitability of specific devices. In event of emergency or planned entry into unknown concentrations a positive pressure, full-facepiece SCBA should be used. If respiratory protection is required, institute a complete respiratory protection program including selection, fit testing, training, maintenance and inspection.

HAND PROTECTION :
When handling this product, the use of chemical gloves is recommended. The choice of work glove depends on work conditions and what chemicals are handled. Please contact the PPE manufacturer for advice on what type of glove material may be suitable. Gloves should be replaced immediately if signs of degradation are observed.

SKIN PROTECTION :
Wear standard protective clothing.

EYE PROTECTION :
Wear chemical splash goggles.

HYGIENE RECOMMENDATIONS :
Use good work and personal hygiene practices to avoid exposure. Keep an eye wash fountain available. Keep a safety shower available. If clothing is contaminated, remove clothing and thoroughly wash the affected area. Launder contaminated clothing before reuse. Always wash thoroughly after handling chemicals. When handling this product never eat, drink or smoke.

HUMAN EXPOSURE CHARACTERIZATION :
Based on our recommended product application and personal protective equipment, the potential human exposure is:
Low

9. PHYSICAL AND CHEMICAL PROPERTIES

PHYSICAL STATE	Liquid
APPEARANCE	Colorless
ODOR	None

SPECIFIC GRAVITY	1.34 @ 77 °F / 25 °C
DENSITY	11.1 lb/gal
SOLUBILITY IN WATER	Complete
pH (100 %)	3.5
FREEZING POINT	32 °F / 0 °C
BOILING POINT	219.2 °F / 104 °C

VAPOR PRESSURE	Same as water
VOC CONTENT	0.00 % EPA Method 24

Note: These physical properties are typical values for this product and are subject to change.

10. STABILITY AND REACTIVITY

STABILITY :
Stable under normal conditions.

HAZARDOUS POLYMERIZATION :
Hazardous polymerization will not occur.

CONDITIONS TO AVOID :
Avoid extremes of temperature.

MATERIALS TO AVOID :
Strong Bases

HAZARDOUS DECOMPOSITION PRODUCTS :
Under fire conditions: HCl

11. TOXICOLOGICAL INFORMATION

No toxicity studies have been conducted on this product.

SENSITIZATION :
This product is not expected to be a sensitizer.

CARCINOGENICITY :
None of the substances in this product are listed as carcinogens by the International Agency for Research on Cancer (IARC), the National Toxicology Program (NTP) or the American Conference of Governmental Industrial Hygienists (ACGIH).

HUMAN HAZARD CHARACTERIZATION :
Based on our hazard characterization, the potential human hazard is: Low

12. ECOLOGICAL INFORMATION

ECOTOXICOLOGICAL EFFECTS :

The following results are for the product.

Acute Fish Results :

Species	Exposure	Test Type	Value	Test Descriptor
Inland Silverside	96 hrs	LC50	> 5,000 mg/l	Product

Rainbow Trout	96 hrs	LC50	590 mg/l	Product
Fathead Minnow	96 hrs	LC50	1,094 mg/l	Product

ACUTE INVERTEBRATE RESULTS :

Species	Exposure	Test Type	Value	Test Descriptor
Daphnia magna	48 hrs	LC50	> 5,000 mg/l	Product
Mysid Shrimp (Mysidopsis bahia)	96 hrs	LC50	4,773 mg/l	Product
Ceriodaphnia dubia	48 hrs	LC50	> 5,000 mg/l	Product

Chronic Invertebrate Results :

Species	Exposure	Test Type	Value	End Point	Test Descriptor
Ceriodaphnia dubia	7 Days	NOEC	15 mg/l	Survival	Product
Ceriodaphnia dubia	7 Days	LOEC	30 mg/l	Survival	Product
Ceriodaphnia dubia	7 Days	EC25 / IC25	7.2 mg/l	Reproduction	Product
Ceriodaphnia dubia	7 Days	IC50	10.3 mg/l	Reproduction	Product

PERSISTENCY AND DEGRADATION :

Total Organic Carbon (TOC) : 99 mg/l

Chemical Oxygen Demand (COD) : 490 mg/l

Biological Oxygen Demand (BOD) :

Incubation Period	Value	Test Descriptor
5 d	< 14 mg/l	Product

Greater than 95% of this product consists of inorganic substances for which a biodegradation value is not applicable.

MOBILITY :
The environmental fate was estimated using a level III fugacity model embedded in the EPI (estimation program interface) Suite TM, provided by the US EPA. The model assumes a steady state condition between the total input and output. The level III model does not require equilibrium between the defined media. The information provided is intended to give the user a general estimate of the environmental fate of this product under the defined conditions of the models.
If released into the environment this material is expected to distribute to the air, water and soil/sediment in the approximate respective percentages;

Air	Water	Soil/Sediment
<5%	30 - 50%	50 - 70%

The portion in water is expected to be soluble or dispersible.

BIOACCUMULATION POTENTIAL
This preparation or material is not expected to bioaccumulate.

ENVIRONMENTAL HAZARD AND EXPOSURE CHARACTERIZATION
Based on our hazard characterization, the potential environmental hazard is: Low
Based on our recommended product application and the product's characteristics, the potential environmental exposure is: Low

If released into the environment, see CERCLA/SUPERFUND in Section 15.

13. DISPOSAL CONSIDERATIONS

If this product becomes a waste, it is not a hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA) 40 CFR 261, since it does not have the characteristics of Subpart C, nor is it listed under Subpart D.

As a non-hazardous waste, it is not subject to federal regulation. Consult state or local regulation for any additional handling, treatment or disposal requirements. For disposal, contact a properly licensed waste treatment, storage, disposal or recycling facility.

14. TRANSPORT INFORMATION

The information in this section is for reference only and should not take the place of a shipping paper (bill of lading) specific to an order. Please note that the proper Shipping Name / Hazard Class may vary by packaging, properties, and mode of transportation. Typical Proper Shipping Names for this product are as follows.

LAND TRANSPORT :

Proper Shipping Name :	PRODUCT IS NOT REGULATED DURING TRANSPORTATION

AIR TRANSPORT (ICAO/IATA) :

Proper Shipping Name :	PRODUCT IS NOT REGULATED DURING TRANSPORTATION

MARINE TRANSPORT (IMDG/IMO) :

Proper Shipping Name :	PRODUCT IS NOT REGULATED DURING TRANSPORTATION

15. REGULATORY INFORMATION

This section contains additional information that may have relevance to regulatory compliance. The information in this section is for reference only. It is not exhaustive, and should not be relied upon to take the place of an individualized compliance or hazard assessment. Nalco accepts no liability for the use of this information.

NATIONAL REGULATIONS, USA :

OSHA HAZARD COMMUNICATION RULE, 29 CFR 1910.1200 :
Based on our hazard evaluation, the following substance(s) in this product is/are hazardous and the reason(s) is/are shown below.

Aluminum Chloride Hydroxide : Eye irritant

CERCLA/SUPERFUND, 40 CFR 302 :
Notification of spills of this product is not required.

SARA/SUPERFUND AMENDMENTS AND REAUTHORIZATION ACT OF 1986 (TITLE III) - SECTIONS 302, 311, 312, AND 313 :

SECTION 302 - EXTREMELY HAZARDOUS SUBSTANCES (40 CFR 355) :
This product does not contain substances listed in Appendix A and B as an Extremely Hazardous Substance.

SECTIONS 311 AND 312 - MATERIAL SAFETY DATA SHEET REQUIREMENTS (40 CFR 370) :
Our hazard evaluation has found this product to be hazardous. The product should be reported under the following indicated EPA hazard categories:

X	Immediate (Acute) Health Hazard
-	Delayed (Chronic) Health Hazard
-	Fire Hazard
-	Sudden Release of Pressure Hazard
-	Reactive Hazard

Under SARA 311 and 312, the EPA has established threshold quantities for the reporting of hazardous chemicals. The current thresholds are: 500 pounds or the threshold planning quantity (TPQ), whichever is lower, for extremely hazardous substances and 10,000 pounds for all other hazardous chemicals.

SECTION 313 - LIST OF TOXIC CHEMICALS (40 CFR 372) :
This product does not contain substances on the List of Toxic Chemicals.

TOXIC SUBSTANCES CONTROL ACT (TSCA) :
The substances in this preparation are included on or exempted from the TSCA 8(b) Inventory (40 CFR 710)

FOOD AND DRUG ADMINISTRATION (FDA) Federal Food, Drug and Cosmetic Act :
When use situations necessitate compliance with FDA regulations, this product is acceptable under : 21 CFR 176.170 Components of paper and paperboard in contact with aqueous and fatty foods and 21 CFR 176.180 Components of paper and paperboard in contact with dry foods.

Product must be used at a pH above 5.5 to retain its FDA status. Limitations: no more than required to produce intended technical effect.

This product has been certified as KOSHER/PAREVE for year-round use INCLUDING THE PASSOVER SEASON by the CHICAGO RABBINICAL COUNCIL.

NSF INTERNATIONAL :
This product has received NSF/International certification under NSF/ANSI Standard 60 in the coagulation and flocculation category. The official name is "Polyaluminum Chloride." Maximum product application dosage is : 180 mg/l.

FEDERAL WATER POLLUTION CONTROL ACT, CLEAN WATER ACT, 40 CFR 401.15 / formerly Sec. 307, 40 CFR 116.4 / formerly Sec. 311 :
Substances listed under this regulation are not intentionally added or expected to be present in this product. Listed components may be present at trace levels.

CLEAN AIR ACT, Sec. 112 (Hazardous Air Pollutants, as amended by 40 CFR 63), Sec. 602 (40 CFR 82, Class I and II Ozone Depleting Substances) :
Substances listed under this regulation are not intentionally added or expected to be present in this product. Listed components may be present at trace levels.

CALIFORNIA PROPOSITION 65 :
Substances listed under California Proposition 65 are not intentionally added or expected to be present in this product.

MICHIGAN CRITICAL MATERIALS :
Substances listed under this regulation are not intentionally added or expected to be present in this product. Listed components may be present at trace levels.

STATE RIGHT TO KNOW LAWS :
Substances listed under this regulation are not intentionally added or expected to be present in this product. Listed components may be present at trace levels.

INTERNATIONAL CHEMICAL CONTROL LAWS :

CANADIAN ENVIRONMENTAL PROTECTION ACT (CEPA) :
The substance(s) in this preparation are included in or exempted from the Domestic Substance List (DSL).

AUSTRALIA
All substances in this product comply with the National Industrial Chemicals Notification & Assessment Scheme (NICNAS).

CHINA
All substances in this product comply with the Provisions on the Environmental Administration of New Chemical Substances and are listed on or exempt from the Inventory of Existing Chemical Substances China (IECSC).

EUROPE
The substances in this preparation have been reviewed for compliance with the EINECS or ELINCS inventories.

JAPAN
All substances in this product comply with the Law Regulating the Manufacture and Importation Of Chemical Substances and are listed on the Existing and New Chemical Substances list (ENCS).

KOREA
All substances in this product comply with the Toxic Chemical Control Law (TCCL) and are listed on the Existing Chemicals List (ECL)

NEW ZEALAND
All substances in this product comply with the Hazardous Substances and New Organisms (HSNO) Act 1996,and are listed on or are exempt from the New Zealand Inventory of Chemicals.

PHILIPPINES
All substances in this product comply with the Republic Act 6969 (RA 6969) and are listed on the Philippines Inventory of Chemicals & Chemical Substances (PICCS).

16. OTHER INFORMATION

Due to our commitment to Product Stewardship, we have evaluated the human and environmental hazards and exposures of this product. Based on our recommended use of this product, we have characterized the product's general risk. This information should provide assistance for your own risk management practices. We have evaluated our product's risk as follows:

* The human risk is: Low

* The environmental risk is: Low

Any use inconsistent with our recommendations may affect the risk characterization. Our sales representative will assist you to determine if your product application is consistent with our recommendations. Together we can implement an appropriate risk management process.

This product material safety data sheet provides health and safety information. The product is to be used in applications consistent with our product literature. Individuals handling this product should be informed of the recommended safety precautions and should have access to this information. For any other uses, exposures should be evaluated so that appropriate handling practices and training programs can be established to insure safe workplace operations. Please consult your local sales representative for any further information.

2. COMPOSITION/INFORMATION ON INGREDIENTS

Our hazard evaluation has identified the following chemical substance(s) as hazardous. Consult Section 15 for the nature of the hazard(s).

Hazardous Substance(s)	CAS NO	% (w/w)
Hydrotreated Light Distillate	64742-47-8	20.0 - 40.0
Oxyalkylated alcohol	Proprietary	1.0 - 5.0

3. HAZARDS IDENTIFICATION

****EMERGENCY OVERVIEW****

CAUTION
May cause irritation with prolonged contact. Toxic to aquatic organisms.
Do not get in eyes, on skin, on clothing. Do not take internally. Wear suitable protective clothing. Keep container tightly closed. Water in contact with the product will cause slippery floor conditions. In case of contact with eyes, rinse immediately with plenty of water and seek medical advice. After contact with skin, wash immediately with plenty of soap and water. Protect product from freezing.
May evolve oxides of carbon (COx) under fire conditions.

PRIMARY ROUTES OF EXPOSURE :
Eye, Skin

HUMAN HEALTH HAZARDS - ACUTE :

EYE CONTACT :
May cause irritation with prolonged contact.

SKIN CONTACT :
May cause irritation with prolonged contact.

INGESTION :
Not a likely route of exposure. No adverse effects expected.

INHALATION :
Not a likely route of exposure. Repeated or prolonged exposure may irritate the respiratory tract.

SYMPTOMS OF EXPOSURE :
Acute :
A review of available data does not identify any symptoms from exposure not previously mentioned.
Chronic :
Frequent or prolonged contact with product may defat and dry the skin, leading to discomfort and dermatitis.

AGGRAVATION OF EXISTING CONDITIONS :
A review of available data does not identify any worsening of existing conditions.

4. FIRST AID MEASURES

EYE CONTACT :
Flush affected area with water. If symptoms develop, seek medical advice.

SKIN CONTACT :
Remove contaminated clothing. Wash off affected area immediately with soap and plenty of water. If symptoms develop, seek medical advice.

INGESTION :
Do not induce vomiting without medical advice. If conscious, washout mouth and give water to drink. If symptoms develop, seek medical advice.

INHALATION :
Remove to fresh air, treat symptomatically. If symptoms develop, seek medical advice.

NOTE TO PHYSICIAN :
Based on the individual reactions of the patient, the physician's judgement should be used to control symptoms and clinical condition.

5. FIRE FIGHTING MEASURES

FLASH POINT : Minimum 200 °F / 93.3 °C (PMCC)

EXTINGUISHING MEDIA :
Foam, Dry powder, Carbon dioxide, Other extinguishing agent suitable for Class B fires

UNSUITABLE EXTINGUISHING MEDIA :
Do not use water unless flooding amounts are available.

FIRE AND EXPLOSION HAZARD :
May evolve oxides of carbon (COx) under fire conditions.

SPECIAL PROTECTIVE EQUIPMENT FOR FIRE FIGHTING :
In case of fire, wear a full face positive-pressure self contained breathing apparatus and protective suit.

6. ACCIDENTAL RELEASE MEASURES

PERSONAL PRECAUTIONS :
Notify appropriate government, occupational health and safety and environmental authorities. Do not touch spilled material. Stop or reduce any leaks if it is safe to do so. Use personal protective equipment recommended in Section 8 (Exposure Controls/Personal Protection).

METHODS FOR CLEANING UP :
SMALL SPILLS: Soak up spill with absorbent material. Place residues in a suitable, covered, properly labeled container. Wash affected area. LARGE SPILLS: Contain liquid using absorbent material, by digging trenches or by diking. Reclaim into recovery or salvage drums or tank truck for proper disposal. Contact an approved waste hauler for disposal of contaminated recovered material. Dispose of material in compliance with regulations indicated in Section 13 (Disposal Considerations).

ENVIRONMENTAL PRECAUTIONS :
This product is toxic to fish. It should not be directly discharged into lakes, ponds, streams, waterways or public water supplies.

7. HANDLING AND STORAGE

HANDLING :
Do not take internally. Have emergency equipment (for fires, spills, leaks, etc.) readily available. Ensure all containers are labeled. Avoid eye and skin contact.

STORAGE CONDITIONS :
Store separately from oxidizers. Store the containers tightly closed.

8. EXPOSURE CONTROLS/PERSONAL PROTECTION

OCCUPATIONAL EXPOSURE LIMITS :
This product does not contain any substance that has an established exposure limit.

ENGINEERING MEASURES :
General ventilation is recommended.

RESPIRATORY PROTECTION :
Due to its low volatility and toxicity, the hazard potential associated with this material is relatively low. Respiratory protection is not normally needed.

HAND PROTECTION :
Nitrile gloves PVC gloves

SKIN PROTECTION :
Wear standard protective clothing.

EYE PROTECTION :
Wear chemical splash goggles.

HYGIENE RECOMMENDATIONS :
Keep an eye wash fountain available. Keep a safety shower available.

HUMAN EXPOSURE CHARACTERIZATION :
Based on our recommended product application and personal protective equipment, the potential human exposure is:
Low

9. PHYSICAL AND CHEMICAL PROPERTIES

PHYSICAL STATE	Liquid
APPEARANCE	Off-white
ODOR	Hydrocarbon

SPECIFIC GRAVITY	1.1 @ 72 °F / 22 °C
DENSITY	9.2 lb/gal
SOLUBILITY IN WATER	Emulsifiable
pH (100 %)	7.6
BOILING POINT	210 °F / 98.88 °C
VOC CONTENT	27.04 % EPA Method 24

Note: These physical properties are typical values for this product and are subject to change.

10. STABILITY AND REACTIVITY

STABILITY :
Stable under normal conditions.

HAZARDOUS POLYMERIZATION :
Hazardous polymerization will not occur.

CONDITIONS TO AVOID :
Freezing temperatures.

MATERIALS TO AVOID :
Addition of water results in gelling. Contact with strong oxidizers (e.g. chlorine, peroxides, chromates, nitric acid, perchlorate, concentrated oxygen, permanganate) may generate heat, fires, explosions and/or toxic vapors.

HAZARDOUS DECOMPOSITION PRODUCTS :
Under fire conditions: Oxides of carbon

11. TOXICOLOGICAL INFORMATION

No toxicity studies have been conducted on this product.

SENSITIZATION :
This product is not expected to be a sensitizer.

CARCINOGENICITY :
None of the substances in this product are listed as carcinogens by the International Agency for Research on Cancer (IARC), the National Toxicology Program (NTP) or the American Conference of Governmental Industrial Hygienists (ACGIH).

HUMAN HAZARD CHARACTERIZATION :
Based on our hazard characterization, the potential human hazard is: Low

12. ECOLOGICAL INFORMATION

ECOTOXICOLOGICAL EFFECTS :

No toxicity studies have been conducted on this product.

MOBILITY :
The environmental fate was estimated using a level III fugacity model embedded in the EPI (estimation program interface) Suite TM, provided by the US EPA. The model assumes a steady state condition between the total input and output. The level III model does not require equilibrium between the defined media. The information provided is intended to give the user a general estimate of the environmental fate of this product under the defined conditions of the models.
If released into the environment this material is expected to distribute to the air, water and soil/sediment in the approximate respective percentages;

Air	Water	Soil/Sediment
<5%	10 - 30%	70 - 90%

The portion in water is expected to be soluble or dispersible.

BIOACCUMULATION POTENTIAL
This preparation or material is not expected to bioaccumulate.

ENVIRONMENTAL HAZARD AND EXPOSURE CHARACTERIZATION
Based on our hazard characterization, the potential environmental hazard is: Moderate
Based on our recommended product application and the product's characteristics, the potential environmental exposure is: Moderate

If released into the environment, see CERCLA/SUPERFUND in Section 15.

13. DISPOSAL CONSIDERATIONS

If this product becomes a waste, it is not a hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA) 40 CFR 261, since it does not have the characteristics of Subpart C, nor is it listed under Subpart D.

As a non-hazardous waste, it is not subject to federal regulation. Consult state or local regulation for any additional handling, treatment or disposal requirements. For disposal, contact a properly licensed waste treatment, storage, disposal or recycling facility.

14. TRANSPORT INFORMATION

The information in this section is for reference only and should not take the place of a shipping paper (bill of lading) specific to an order. Please note that the proper Shipping Name / Hazard Class may vary by packaging, properties, and mode of transportation. Typical Proper Shipping Names for this product are as follows.

LAND TRANSPORT :

Proper Shipping Name : PRODUCT IS NOT REGULATED DURING TRANSPORTATION

AIR TRANSPORT (ICAO/IATA) :

Proper Shipping Name : PRODUCT IS NOT REGULATED DURING TRANSPORTATION

MARINE TRANSPORT (IMDG/IMO) :

Proper Shipping Name : PRODUCT IS NOT REGULATED DURING TRANSPORTATION

15. REGULATORY INFORMATION

This section contains additional information that may have relevance to regulatory compliance. The information in this section is for reference only. It is not exhaustive, and should not be relied upon to take the place of an individualized compliance or hazard assessment. Nalco accepts no liability for the use of this information.

NATIONAL REGULATIONS, USA :

OSHA HAZARD COMMUNICATION RULE, 29 CFR 1910.1200 :
Based on our hazard evaluation, the following substance(s) in this product is/are hazardous and the reason(s) is/are shown below.

Hydrotreated Light Distillate : Exposure Limit
Oxyalkylated alcohol : Eye irritant

CERCLA/SUPERFUND, 40 CFR 117, 302 :
Notification of spills of this product is not required.

SARA/SUPERFUND AMENDMENTS AND REAUTHORIZATION ACT OF 1986 (TITLE III) - SECTIONS 302, 311, 312, AND 313 :

SECTION 302 - EXTREMELY HAZARDOUS SUBSTANCES (40 CFR 355) :
This product does not contain substances listed in Appendix A and B as an Extremely Hazardous Substance.

SECTIONS 311 AND 312 - MATERIAL SAFETY DATA SHEET REQUIREMENTS (40 CFR 370) :
Our hazard evaluation has found this product to be hazardous. The product should be reported under the following indicated EPA hazard categories:

X	Immediate (Acute) Health Hazard
	Delayed (Chronic) Health Hazard
	Fire Hazard
	Sudden Release of Pressure Hazard
	Reactive Hazard

Under SARA 311 and 312, the EPA has established threshold quantities for the reporting of hazardous chemicals. The current thresholds are: 500 pounds or the threshold planning quantity (TPQ), whichever is lower, for extremely hazardous substances and 10,000 pounds for all other hazardous chemicals.

SECTION 313 - LIST OF TOXIC CHEMICALS (40 CFR 372) :
This product does not contain substances on the List of Toxic Chemicals.

TOXIC SUBSTANCES CONTROL ACT (TSCA) :
The substances in this preparation are included on or exempted from the TSCA 8(b) Inventory (40 CFR 710)

FOOD AND DRUG ADMINISTRATION (FDA) Federal Food, Drug and Cosmetic Act :
When use situations necessitate compliance with FDA regulations, this product is acceptable under : 21 CFR 176.180 Components of paper and paperboard in contact with dry foods

Limitations: no more than required to produce intended technical effect.

FEDERAL WATER POLLUTION CONTROL ACT, CLEAN WATER ACT, 40 CFR 401.15 / formerly Sec. 307, 40 CFR 116.4 / formerly Sec. 311 :
Substances listed under this regulation are not intentionally added or expected to be present in this product. Listed components may be present at trace levels.

CLEAN AIR ACT, Sec. 112 (40 CFR 61, Hazardous Air Pollutants), Sec. 602 (40 CFR 82, Class I and II Ozone Depleting Substances) :
Substances listed under this regulation are not intentionally added or expected to be present in this product. Listed components may be present at trace levels.

CALIFORNIA PROPOSITION 65 :
Substances listed under California Proposition 65 are not intentionally added or expected to be present in this product.
Substances listed under California Proposition 65 are not intentionally added or expected to be present in this product.

MICHIGAN CRITICAL MATERIALS :
Substances listed under this regulation are not intentionally added or expected to be present in this product. Listed components may be present at trace levels. Substances listed under this regulation are not intentionally added or expected to be present in this product. Listed components may be present at trace levels.

STATE RIGHT TO KNOW LAWS :
Substances listed under this regulation are not intentionally added or expected to be present in this product. Listed components may be present at trace levels.

NATIONAL REGULATIONS, CANADA :

WORKPLACE HAZARDOUS MATERIALS INFORMATION SYSTEM (WHMIS) :
This product has been classified in accordance with the hazard criteria of the Controlled Products Regulations (CPR) and the MSDS contains all the information required by the CPR.

WHMIS CLASSIFICATION :
Not considered a WHMIS controlled product.

CANADIAN ENVIRONMENTAL PROTECTION ACT (CEPA) :
The substance(s) in this preparation are included in or exempted from the Domestic Substance List (DSL).

AUSTRALIA
All substances in this product comply with the National Industrial Chemicals Notification & Assessment Scheme (NICNAS).

CHINA
All substances in this product comply with the Provisions on the Environmental Administration of New Chemical Substances and are listed on the Inventory of Existing Chemical Substances China (IECSC).

EUROPE
The substances in this preparation have been reviewed for compliance with the EINECS or ELINCS inventories.

JAPAN
All substances in this product comply with the Law Regulating the Manufacture and Importation Of Chemical Substances and are listed on the Existing and New Chemical Substances list (ENCS).

KOREA
All substances in this product comply with the Toxic Chemical Control Law (TCCL) and are listed on the Existing Chemicals List (ECL)

NEW ZEALAND
All substances in this product comply with the Hazardous Substances and New Organisms (HSNO) Act 1996,and are listed on or are exempt from the New Zealand Inventory of Chemicals.

PHILIPPINES
All substances in this product comply with the Republic Act 6969 (RA 6969) and are listed on the Philippines Inventory of Chemicals & Chemical Substances (PICCS).

16. OTHER INFORMATION

Due to our commitment to Product Stewardship, we have evaluated the human and environmental hazards and exposures of this product. Based on our recommended use of this product, we have characterized the product's general risk. This information should provide assistance for your own risk management practices. We have evaluated our product's risk as follows:

* The human risk is: Low

* The environmental risk is: Moderate

Any use inconsistent with our recommendations may affect the risk characterization. Our sales representative will assist you to determine if your product application is consistent with our recommendations. Together we can implement an appropriate risk management process.

This product material safety data sheet provides health and safety information. The product is to be used in applications consistent with our product literature. Individuals handling this product should be informed of the recommended safety precautions and should have access to this information. For any other uses, exposures should be evaluated so that appropriate handling practices and training programs can be established to insure safe workplace operations. Please consult your local sales representative for any further information.

SECTION 1

Introduction

This Sampling and Monitoring Plan is Volume 2 of the Operation and Maintenance (O&M) Manual for the final groundwater remedy at the Pacific Gas and Electric Company (PG&E) Topock Compressor Station (TCS). This Plan is intended to satisfy the requirements under the Remedial Design/Remedial Action (RD/RA) Consent Decree (CD; DOI 2013) Stipulation 12(f)(5) and Appendix C Section 2.2.3(5); Corrective Action Consent Agreement (CACA; DTSC 1996) Attachment 6, Section B(9); Environmental Impact Report (EIR; DTSC 2011b) mitigation measure HYDRO-1; and Record of Decision (ROD; DOI 2010) applicable or relevant and appropriate requirements (ARARs) #81-82, #91-94, and 99 through 101.

In a coordinated effort, the United States Department of the Interior (DOI) and the California Department of Toxic Substance Control (DTSC) selected the final groundwater remedy to address chromium in groundwater resulting from discharges to Solid Waste Management Unit (SWMU) 1/Area of Concern (AOC) 1 and within AOC 10 (DOI 2010 and DTSC 2011a). When the selected final groundwater remedy is implemented, the current groundwater monitoring programs will be replaced by a new Corrective Measure/Remedial Action Monitoring Program with the focus of evaluating the performance of the remedy to attain the remedial action objectives (RAOs) and to comply with ARARs. The monitoring program will have several components: compliance monitoring, process control monitoring, and constituents of potential concern (COPCs) monitoring. These different monitoring program components will be used to evaluate remedy effectiveness and implementation, and to monitor contaminants in groundwater over time. Monitoring will also be used to ensure that the groundwater contaminant plume does not permanently expand or adversely impact potential receptors.

1.1 Compliance Monitoring During Remedy Implementation

The RAOs for the groundwater remedy are:

1. Prevent ingestion of groundwater as a potable water source having hexavalent chromium (Cr[VI]) in excess of the regional background concentration of 32 micrograms per liter (µg/L).
2. Prevent or minimize migration of total dissolved chromium (Cr[T]) and Cr(VI) in groundwater to ensure concentrations in surface water do not exceed water quality standards that support the designated beneficial uses of the Colorado River (11 µg/L Cr[VI]).
3. Reduce the mass of Cr(T) and Cr(VI) in groundwater at the site to achieve compliance with ARARs in groundwater. This RAO will be achieved through cleanup goal of regional background of 32 µg/L of Cr(VI).
4. Ensure that the geographic location of the target remediation area does not permanently expand following completion of the remedial action.

Compliance monitoring will focus on evaluating the groundwater remedy with regard to these RAOs. RAO 1, relating to prevention of ingestion of contaminated groundwater, will be met primarily through institutional controls. The Compliance Monitoring Program is designed to assess the groundwater remedy with regard to RAOs 2, 3, and 4, related to controlling migration and reducing mass to an adequate degree.

1.2 Process Control Monitoring During Remedy Implementation

Process control monitoring is conducted to assess the extent that the groundwater remedy is functioning as designed. The Process Control Monitoring Program will focus on issues such as assessing carbon dosing to maintain an effective In-situ Reactive Zone (IRZ), and the generation and attenuation of in-situ by-products.

In addition, water level monitoring will be conducted to assess the adequacy of hydraulic control measures. Although hydraulic control is not an RAO in itself, maintaining sufficient hydraulic influence in certain areas, such as the freshwater injection barrier and the East Ravine Extraction Wells, will enhance plume control and plume remediation.

In above-ground support systems, process control monitoring involves sampling from pipes and tanks to monitor changes in water quality for extracted water that will be treated, amended and/or re-injected and to monitor the effectiveness of the carbon amendment system.

1.2.1 Summary of In Situ Remediation Chemistry

IRZ components of the design involve biologically-mediated treatment of Cr(VI). This section summarizes the in situ processes and chemical reactions within and downgradient of the IRZ that form the basis for the monitoring requirements of this system.

IRZ treatment is achieved through the stimulation of native microorganisms by the delivery of a degradable source of organic carbon, providing an electron donor for microbial growth. The goal of this process is to provide a sufficient quantity of electron donor to overcome the aquifer's supply of aerobic electron acceptors (primarily oxygen and nitrate) so that Cr(VI) will be reduced by microbes (i.e., used as an electron acceptor) to its trivalent form (Cr[III]). Cr(VI) is relatively soluble (present in solution at neutral pH as the chromate anion, CrO_4^{2-}); whereas Cr (III) is relatively insoluble and precipitates out of solution as Cr(III)-hydroxide and mixed metal-hydroxide phases.

The utilization of electron acceptors in the system will generally be governed by the principles of thermodynamic equilibrium and redox kinetics. Dissolved oxygen (DO) and nitrate are thermodynamically more favorable electron acceptors than Cr(VI), while Cr(VI) is thermodynamically a more favorable electron acceptor than manganese oxides, iron oxides, and sulfate. However, given the relative availability of the electron acceptors and spatial heterogeneities of the subsurface aquifer environment, many of these reactions can occur simultaneously under field conditions. For example, iron and manganese reduction can proceed concurrently and sulfate reduction can begin before iron oxides are depleted, depending on the strength of the reducing environment. The strength of the reducing environment can be tuned by adjusting the concentration of organic carbon injected. This can help minimize the reduction of manganese, iron, and sulfate while still achieving adequate Cr(VI) reduction and removal. However, in order to create a reducing environment sufficient for the sustained removal of Cr(VI), some manganese, iron, and sulfate reduction will occur. Some iron reduction is actually desirable, as it provides stored Cr(VI) reduction capacity within the aquifer. These principles are discussed in more detail in Appendix B of the Basis of Design Report/Final (100%) Design Submittal (the Final BOD) to which this O&M Manual is Appendix L.

The oxidation-reduction (redox) reactions fostered in the IRZ may temporarily mobilize certain naturally-occurring metals within the treatment zone, including iron, manganese, arsenic, and barium. Reduction of insoluble manganese(III/IV)-oxides generates manganese(II), which is soluble. Similarly, reduction of iron(III)-oxides releases ferrous iron (Fe[II]), which in the process releases arsenic that was adsorbed and coprecipitated within the iron oxides. Barium, which may be largely present in the soil as barite ($BaSO_4$), can be released during sulfate reduction. Although the release of manganese, arsenic, and iron will be unavoidable, the system will be operated to limit sulfate reduction, which will substantially limit—and likely avoid—the release of barium. The concentrations of these by-products will attenuate downgradient of the treatment zone through various reactions, including sorption, reoxidation, and precipitation/coprecipitation, as discussed in more detail in Appendix B of the Final BOD.

Monitoring will be performed to assess the performance of the treatment remedy. Total organic carbon (TOC), Cr(VI), DO, nitrate, and sulfate will be monitored within the treatment zone to assess the effectiveness of organic carbon distribution. The concentrations of by-products (manganese, iron, arsenic, and barium) will also be monitored within, and downgradient of, the treatment zone to assess by-product generation and attenuation.

1.2.2 Adaptive Operations Approach

In the field, variations in Cr(VI) concentration distributions, lithology and hydrogeology will be encountered. To deal with the uncertainty in these parameters in implementation, the remedial system was designed to be flexible and the remedy will be implemented with an adaptive operational strategy. During system installation and baseline sampling, additional data will be collected that will refine the current conceptual model. Where appropriate, the data may be used to refine the design, for example, depth and length of remedial well screens

and perhaps locations. The data will also be used to update the groundwater flow and solute transport model (see Appendix B of the Final BOD, Section 12) and refine remedy projections, as needed. Model updates are planned to be conducted approximately annually during start-up and during five-year reviews thereafter. During remedy implementation, monitoring data will be collected and used to guide the operations of the system, including changes in operational flowrates, injection parameters, and potentially remediation well locations. Additional monitoring well locations may also be needed as data are collected during remedy construction and implementation. This monitoring program provides a plan for data collection, interpretation, and guidance for adapting operations as the remedy is implemented.

1.2.3 Short-Term Goals—Operating Properly and Successfully and Five-Year Reviews

In addition to the RAOs, short-term goals and criteria are being developed in coordination with DTSC and DOI to facilitate future evaluations of remedy performance, including assessments of whether the remedy is Operating Properly and Successfully (OPS). In addition to the RAOs for the project listed in Section 1.1, this Sampling and Monitoring Plan details explicit, discrete, and measurable goals and metrics that will be incorporated into the evaluation of whether the remedy is OPS. OPS is defined as:

1. The remedy is operating as designed;
2. The information obtained from remedy operation indicates that the remedy is protective of human health and the environment; and
3. The remedy is likely to be able to achieve the cleanup levels or performance goals delineated in the DTSC Statement of Basis (DTSC 2011a) and the DOI ROD (DOI 2010) for the groundwater remedy at the PG&E Topock site.

In general, OPS determination is expected within 1 to 2 years of remedy start-up. Some components of the system, for instance the National Trails Highway (NTH) In-situ Reactive Zone (IRZ), may be determined to be OPS earlier. Five-Year Reviews will also be conducted by DTSC and DOI to assess remedy performance. The short-term metrics and criteria provided throughout this volume and also summarized in Table 2.1-5 in Section 2 will be appropriate metrics for evaluating remedy performance for Five-Year Reviews.

SECTION 2

Monitoring Goals and Data Quality Objectives

The Compliance Monitoring Program and Process Control Monitoring Program are described in more depth in this section. The monitoring goals and data quality objectives (DQOs) for the remedy establish the process elements and decision points that will be considered during remedy implementation. These objectives guide data collection to assess operations of the remedial components and to optimize the remedial performance. This monitoring plan establishes the following components for each of the DQOs, as summarized in Table 2.1-1 (tables are located at the end of each section):

- Problem statements and decision statements (Section 2)
- Inputs to the decisions and study area boundaries (Sections 3 and 4)
- Decision rules (Section 2)
- Limits of decision errors and optimization of design for data collection (Sections 3 and 4)

For the remedy, the decision rules are effectively an adaptive operations framework that outlines how the data collected will be used to make operational adjustments. The DQOs and decision rules/operations framework dovetail with the Contingency Plan, presented in Volume 3 of this Operation and Maintenance (O&M) Manual. The Contingency Plan includes a failure modes analysis that anticipates potential operational issues that may occur with the remedy. The DQOs guide the adaptive operations elements to mitigate for these operational issues. Mitigations identified in the failure modes analysis that are not covered by design or adaptive operations may require additional contingency actions, as outlined in the plan.

Data from the monitoring programs will be received on a schedule indicated by the initial monitoring frequency outlined in Table 2.1-2. These data will be interpreted as they are received to inform any potential modifications to system operations. The sampling program will be re-evaluated after two years of operation, or two years following the OPS determination. If warranted, the sampling program may be re-evaluated sooner based on knowledge gained as the remedy is operated. Proposed changes to the monitoring program will be communicated as recommendations provided in quarterly progress reports, in accordance with the anticipated reporting procedures and schedules described in Section 6.5 and Exhibit 6.5-1.

2.1 Remedy Compliance Monitoring Program

The goal of the Compliance Monitoring Program will be to assess the operation of the remedy with regard to RAOs 2, 3, and 4. The program will involve periodic monitoring of groundwater collected from within and outside of the Cr(VI) plume (see Figure 2.1-1; figures are located at the end of each section) and from surface water sampling locations along the Colorado River (Figure 2.1-2). New monitoring well locations are being proposed to supplement the existing network and are highlighted on Figure 2.1-3. The RAOs and DQOs for compliance monitoring are described in detail below and summarized in Table 2.1-1. Note that RAO 1, which involves prevention of the ingestion of water with elevated Cr(VI), requires no action within the Compliance Monitoring Program described here, since the proper institutional controls will be used to meet this RAO.

Compliance DQO-1 (RAO 2) Problem Statement: Prevent or minimize migration of Cr(T) and Cr(VI) in groundwater to ensure concentrations in surface water do not exceed water quality standards that support the designated beneficial uses of the Colorado River (11 µg/L Cr[VI]).

RAO 2 will be satisfied during remedy operation by the in-situ treatment of Cr(VI) in groundwater; the treatment will minimize and prevent Cr(VI) and Cr(T) from reaching the Colorado River. The problem statement for this DQO is to implement the remedy in compliance with RAO 2 (Table 2.1-1). As the remedy is implemented, data will be collected under this DQO to answer the question, should operations or remedy components be modified to meet the RAO? To answer this question, surface water sampling will be conducted within the study area using the surface water sampling network. The surface water sampling locations define the study area boundaries and are shown on Figure 2.1-2 and listed in Table 2.1-2. As part of the Compliance Monitoring Program, surface water

samples will be collected periodically from the Colorado River from multiple locations upstream, midstream, and downstream of the zone where treated groundwater discharges to the river (see Section 3.1).

During initial start-up of the NTH IRZ, prior to operation of the River Bank Extraction Wells, Cr(VI) in the floodplain downgradient of the NTH IRZ will not be treated. Modeling results indicate that operations of the NTH IRZ during this period are protective of the Colorado River—i.e., the Cr(VI) plume does not migrate a significant distance in the floodplain during start-up, and the portion of the plume located downgradient of the NTH IRZ does not migrate past the capture zone of the River Bank Extraction Wells (see Appendix B of the Final BOD). To verify these predictions, quarterly sampling of the NTH IRZ downgradient monitoring well network and the surface water sampling locations will be conducted, as indicated on Table 2.1-2.

Although RAO 2 is specifically intended to address Cr(VI), the IRZ by-products arsenic and manganese will also be monitored. The surface water quality criteria for Cr(VI) is 11 µg/L and 150 µg/L for arsenic (Source: Table 2 of the ROD, ARAR #3, Federal Water Pollution Control Act. 33 USC 1251-1387, 40 CFR 131.38). There are no surface water quality criteria for Cr(T) and manganese. In general, determination of whether the Topock site is acting as a source of elevated Cr(VI), manganese, or arsenic in surface water will be made through the comparison of upstream sampling results with midstream and downstream sampling results, supported by floodplain groundwater sampling results. Elevated concentrations of Cr(VI), manganese, and arsenic can be potentially attributed to the Topock site if midstream and/or downstream surface water concentrations show statistically significant increases above upstream concentrations observed during the same sampling event. Decision error will be limited through collection of samples upriver and downriver of potentially affected areas to accurately attribute concentration changes to the Topock site and performing quarterly to semi-annual data collection throughout the lifetime of the remedy operations (analytes and frequencies specified in Section 3.2 and Table 2.1-3).

The surface water data will be used to evaluate the following decision rules:

- If Cr(VI), arsenic, or manganese concentrations increase in surface water samples, or are detected at locations that were previously non-detect, and are attributable to the Topock site, operational changes will be implemented per the process control decision rules outlined in Section 2.2 and presented in Figures 2.2-3, 2.2-5, and 2.2-8.
- If Cr(VI), arsenic, or manganese concentrations do not return to baseline as a result of the operational adjustments, the recommendations in the Contingency Plan measures (see Volume 3) will be implemented.

Compliance DQO-2 (RAO 3) Problem Statement: Reduce the mass of Cr(T) and Cr(VI) in groundwater at the site to achieve compliance with ARARs in groundwater. This RAO will be achieved through cleanup goal of regional background of 32 µg/L of Cr(VI).

The problem statement for this DQO is to implement the remedy in compliance with RAO 3 (Table 2.1-1). As the remedy is implemented, data will be collected under this DQO to answer the question, should operations or remedy components be modified to meet the RAO? As inputs to this decision, groundwater samples will be collected periodically from the compliance monitoring program well network inside the plume (the network is described in Section 3), which is the study area for this DQO. The compliance monitoring wells inside the plume are shown on Figure 2.1-1 and listed in Table 2.1-3 according to their intended function within the monitoring program.

As part of the data quality objectives for RAO 3, wells located within the plume boundary (defined by the current 32 µg/L Cr[VI] plume boundary) will be monitored for Cr(VI), and concentration trends will be reviewed to assess progress toward this RAO per the process outlined in IRL-DQO 1 in Section 2.2.2 and Freshwater DQO-1 in Section 2.2.4. Tables 2.1-4 and 2.1-5 include anticipated Cr(VI) concentration trends toward treatment to less than 32 µg/L for wells located within the plume boundary. As the remedy progresses, if the observed concentration trends are not consistent with anticipated Cr(VI) attenuation timeframes (i.e., if the monitoring results indicate that Cr[VI] attenuation is actually taking substantially longer than anticipated), then operational changes to the remediation system will be evaluated and implemented as presented in the process control decision rules/operational framework described in Section 2.2 and presented in Figures 2.2-2 through 2.2-9. If operational

adjustments are not successful in improving system performance, the Contingency Plan will be implemented as described in Volume 3 of this O&M Manual. Decision error will be limited by collecting monitoring data at multiple points distributed laterally and vertically across the plume (Figure 2.1-1), spanning a range in anticipated cleanup timeframes (Tables 2.1-3, 2.1-4 and 2.1-5). In addition, decision error will be limited by monitoring at a frequency consistent with anticipated cleanup timeframes.

Data will also be evaluated to determine when the appropriate time for monitored natural attenuation (MNA) arises. Per the Statement of Basis (DTSC 2011a) and ROD (DOI 2010), MNA is included as a long-term component of the groundwater remedy to address residual Cr(VI) that may remain in recalcitrant portions of the aquifer following in-situ treatment with flushing. Decisions on specific areas of the plume appropriate for MNA will be made based on: data collected under this DQO evaluating effectiveness of the active remediation systems for mass removal; the types and options for active remediation system adjustments; and the location of proposed MNA areas relative to natural reductive zones in the aquifer. Decision error will be limited by collecting monitoring data at multiple points distributed laterally and vertically across the plume, spanning a range in anticipated cleanup timeframes as detailed in Tables 2.1-3, 2.1-4, and 2.1-5. In addition, decision error will be limited by monitoring at a frequency consistent with anticipated cleanup timeframes as detailed in Tables 2.1-3, 2.1-4, and 2.1-5.

Compliance DQO-3 (RAO 4) Problem Statement: Ensure that the geographic location of the target remediation area does not permanently expand following completion of the remedial action.

The problem statement for this DQO is to implement the remedy in compliance with RAO 4 (Table 2.1-1). As the remedy is implemented, data will be collected under this DQO to answer the question, should operations or remedy components be modified to meet the RAO? As inputs to this decision, groundwater samples will be collected periodically from the Compliance Monitoring Program well network outside the plume, according to the DQO for this RAO, as described in Section 3. The compliance monitoring wells outside the plume in the study area for this DQO are shown on Figure 2.1-1 and listed in Table 2.1-3. The data collected will be analyzed to ensure that the concentrations of Cr(VI) and remedy by-products, specifically manganese and arsenic, do not permanently increase outside of the baseline Cr(VI) plume. Monitoring for COPCs will also be conducted as described in Section 5.1 and summarized in Table 2.1-6. If needed, tracer studies comprised of injection into TCS injection wells could also be used to verify that TCS injection is not resulting in expansion of the Cr(VI) plume.

Upgradient of the plume, if concentrations of Cr(VI), manganese, or arsenic increase above anticipated concentrations, operational adjustments for the Inner Recirculation Loop (IRL) injections and freshwater injections will be considered and groundwater modeling will be used to assess effects of the considered operational changes, as outlined in Figures 2.2-4 and 2.2-9. Based on the modeling assessment, the need for additional data collection and the benefits and timing of the operational adjustments will be reviewed and changes presented and implemented if warranted. The Process Control Monitoring Program and decision rules/operational framework are outlined in Sections 2.2.2 and 2.2.4, Figures 2.2-4 and 2.2-9. If operational adjustments are implemented, the effects will be assessed in the context of the overall plume remediation using the field data and re-calibrated groundwater modeling projections (see Appendix B of the Final BOD, Section 12). Model updates are planned to be conducted approximately annually during start-up and during five-year reviews thereafter.

If Cr(VI) concentrations show an increasing trend downgradient of the NTH IRZ compliance wells located outside of the baseline Cr(VI) plume in the floodplain, operational adjustments will be considered as outlined in Section 2.2.1, Figure 2.2-2 and in the Contingency Plan. Similarly, if by-product concentrations increase beyond expectations downgradient of the NTH IRZ in compliance wells located outside of the baseline Cr(VI) plume in the floodplain, operational adjustments will be considered as outlined in Section 2.2.1.

Decision errors will be limited through:

- Collection of samples from outside of the baseline hexavalent chromium plume (Table 2.1-3 and Figure 2.1-1).
- Sampling at a frequency based on the anticipated arrival time of water affected by various components of the remedy (Tables 2.1-3, 2.1-4, and 2.1-5)

- Quarterly collection of manual water level data and continuous collection of pressure transducer data to assess hydraulic performance, ensuring plume control (Table 2.1-3).
- Comparison of Cr(VI) and by-products dynamics with solute transport model predictions to assess performance.

2.2 Process Control Monitoring Program

The objective of the Process Control Monitoring Program will be to assess the extent to which the groundwater remedy is functioning as designed based on the DQOs. The process control monitoring network is shown on Figure 2.2-1.

2.2.1 National Trails Highway In-situ Reactive Zone (NTH IRZ)

NTH IRZ DQO-1 Problem Statement: The carbon substrate amendment system must be working to amend the organic carbon substrate into the recirculated groundwater.

The decision statement for this DQO is: is the carbon amendment system working properly? As inputs to this decision, samples will be collected from the MW-20 Bench distribution system and analyzed for TOC. The study area is the carbon distribution system. Samples will be collected from sampling ports located in each forcemain following the location where organic carbon substrate is added and passes through a static mixer (Exhibit 2.2-1; see also Section 4.2.8). Samples will also be collected from injection vaults (Exhibit 2.2-1), as needed. If TOC concentrations do not match the target mixing concentrations for a given injection, troubleshooting will be conducted to identify and repair any problems with the carbon amendment system.

During system start-up, samples will be collected frequently, approximately weekly or biweekly, until data suggest that the amendment system is working properly. Once the system operations are verified, sampling frequency will be reduced to quarterly or semi-annually. If semi-annual monitoring is proposed, sampling events may be performed on a quarterly basis with half of the injection vaults sampled on alternating quarters. This would ensure that information on the system is collected quarterly, even if any given injection vault would only require semi-annual sampling. Frequent collection during start up at key system locations will limit decision error.

NTH IRZ DQO-2 Problem Statement: The NTH IRZ must be complete and maintain Cr(VI) treatment over time.

The decision statements for this DQO are (Table 2.1-1):

- Should operations of the NTH IRZ be modified?
- Should NTH IRZ recirculation and organic carbon injections be started or stopped?
- Should the NTH IRZ design be modified?
- Should the monitoring well layout be modified?

The decision rules/operational framework for the NTH IRZ is shown on Figure 2.2-2. Operation of the NTH IRZ will involve extraction of groundwater from NTH IRZ Extraction Wells, amendment with organic carbon substrate, and re-injection into NTH IRZ Injection Wells to generate an IRZ to treat Cr(VI). DQO-2 for the NTH IRZ is to ensure that the IRZ has been sufficiently established in the subsurface as a result of the IRZ system operations.

As inputs to the decisions listed above, monitoring data from dose response wells, located in proximity to the NTH IRZ Injection Wells in the study area, will be collected. The dose response wells are shown on Figure 2.2-1 and identified on Table 2.1-2. The details of the sampling program for these wells are presented in Section 4.2.1 and summarized in Table 4.2-1 at the end of Section 4. It is important to note that, although Cr(VI) concentrations will be used as a line of evidence for establishment of a treatment zone, decreases in dissolved Cr(VI) alone in the short-term are not necessarily a definitive metric for treatment. Multiple lines of evidence will be used to evaluate the establishment of the treatment zone, including the following:

- TOC: The distribution of TOC is the primary mode of generating reducing conditions for treatment of Cr(VI) in groundwater.

- Dissolved iron: Dissolved iron is a Cr(VI) reductant that is generated under iron reducing conditions stimulated by the injection of organic carbon. If dissolved iron is distributed in the aquifer where TOC is not, Cr(VI) reducing conditions will still be established. As such, dissolved iron serves as a secondary indicator of the establishment of an IRZ.
- Cr(VI): the presence or absence of Cr(VI) in groundwater will also serve as a direct indicator of whether Cr(VI) treatment at a given location is occurring or necessary.

The process for evaluating the data collected from the monitoring wells and making operational adjustments according to the decision rules/operational framework is presented in a flowchart on Figure 2.2-2. As detailed on Figure 2.2-2, a combination of TOC, dissolved iron, and Cr(VI) data from dose response monitoring wells will be evaluated to determine if the IRZ has been established. TOC concentrations will be compared to the target concentration range established based on experience, pilot testing results, and solute transport modeling, provided in Table 2.2-1. The anticipated concentrations vary with distance from injection points, with higher concentrations anticipated close to injection points and lower concentrations anticipated further from injection points. If TOC concentrations are within the anticipated range, then operations will continue. If TOC concentrations are below the anticipated range, Cr(VI) and dissolved iron data will also be evaluated. If dissolved iron is above baseline and Cr(VI) is treated to less than 32 parts per billion (ppb), then the IRZ operation will be considered successful. If TOC concentrations are below the anticipated range, dissolved iron does not increase above baseline, and Cr(VI) is not treated, operational adjustments will be considered, as shown on Figure 2.2-2.

In addition, downgradient Cr(VI) concentrations (see also Section 4.2.2) will be evaluated as shown on Figure 2.2-2. The monitoring wells downgradient of the NTH IRZ, which define the study area boundaries, are shown on Figure 2.2-1 and identified on Table 2.1-2. The details of the sampling program for these wells are presented in Section 4.2.2 and summarized on Table 4.2-1. If Cr(VI) concentrations are not decreasing within expectations as outlined in Tables 2.1-4 and 2.1-5, then operational adjustments will be considered as shown on Figure 2.2-2. Table 2.2-1 includes anticipated timeframes for decrease of Cr(VI) to below 32 µg/L at monitoring wells downgradient of the NTH IRZ based on the results of solute transport modeling. Tables 2.1-4 and 2.1-5 provide additional information on anticipated Cr(VI) concentration trends at specific monitoring locations.

Short-term operational adjustments that may be made to improve TOC distribution and establishment of the IRZ include adjustment of the TOC injection concentration, dosing frequency or duration, injection and extraction rates, target injection intervals, or river bank extraction rates. Increasing the injection concentration and adjusting the dosing parameters would be implemented if data indicate that injected water is reaching the location, but there is not sufficient carbon remaining in solution to establish Cr(VI)-reducing conditions. A decrease in nitrate without increase in TOC or dissolved iron is an indication of this case. If injected water is not reaching the monitoring location as indicated by a lack of change in Cr(VI), nitrate and dissolved metals, an increase in flow rate could be used to improve distribution. The targeted treatment intervals may need to be adjusted if it appears that some intervals within a given injection location require more reagent distribution than others or if some intervals are already completely treated while others are not. River bank extraction rates may be adjusted if the hydraulic gradient being induced downgradient of the IRZ is preventing lateral distribution at the injection points. Adjustments to the river bank extraction rates would have to be balanced with the evaluation of the extraction for performance, as outlined in Section 2.2.2.

If short-term operational adjustments are not sufficient to improve the performance of the NTH IRZ, long-term operational changes such as adding the provisional injection wells and changing reagents will be considered (see Boxes 13 and 14 of Figure 2.2-2). The addition of provisional injection wells would decrease the required TOC injection concentration to achieve complete distribution. Selection of a carbon substrate with slower degradation rates (e.g., whey or molasses) could increase the distribution distances. If long-term operational changes are not sufficient to improve the performance of the NTH IRZ, further contingency measures will be implemented (see Contingency Plan in Volume 3).

It is anticipated that the IRZ operations will be cycled; for example the IRZ would be operated for six months to establish reducing conditions and then will be turned off for 18 months during which time residual reducing

capacity generated during injections will continue to treat Cr(VI) in groundwater. The decision process for turning the IRZ operations on and off is illustrated starting on Box 27 of Figure 2.2-2. Residual reducing capacity could potentially be stored during injections as reduced iron from iron reduction, sulfide from sulfate reduction, or as biomass from microbial growth. For dose response wells, dissolved iron concentrations, Cr(VI) concentrations below 32 μg/L, and other redox indicators such as nitrate and sulfate will be used to evaluate the establishment and maintenance of an adequate reducing capacity within the treatment zone. If these parameters collected from dose response wells indicate reducing conditions have been established, IRZ operations will be shut down and monitoring of these parameters will continue. As the data indicate that reducing conditions are lost, e.g., through a decrease in dissolved iron concentrations, an increase in Cr(VI) concentrations, or an increase in other redox indicators such as nitrate, the IRZ operations will be resumed. The monitoring data will provide information all along the IRZ, and it is possible that treatment may be complete and operations will be shut down in some areas, while additional treatment and operation will be needed in other areas.

Decision error will be limited through:

- Placement of monitoring locations at the weaker points of the IRZ (mid-point between injection locations) and downgradient (Sections 4.2.1 and 4.2.2, Figure 2.2-1, Table 2.1-2)
- Collection of a variety of parameters to evaluate establishment of hexavalent chromium reducing conditions (Table 4.2-1 in Section 4)
- Monthly to quarterly sampling during start-up and operational changes (Table 4.2-1)

NTH IRZ DQO-3 Problem Statement: By-product generation and migration from the NTH IRZ must be controlled.

The decision statements for this DQO are:

- Should operations of the NTH IRZ be modified based on by-product concentration trends?
- Should design of the NTH IRZ design be modified based on by-product concentration trends?

The decision rules/operational framework for the NTH IRZ by-product evaluation is also shown on Figure 2.2-2. DQO-3 for the NTH IRZ is to ensure that by-product generation from the NTH IRZ is adequately controlled. Inputs to these decisions are monitoring data from dose response wells to evaluate the generation of by-products within the IRZ (see also Section 4.2.1) and data from monitoring wells located downgradient of the IRZ in the mid-floodplain and monitoring wells located proximal to the river bank extraction system to monitor by-product attenuation and migration in the study area (see also Sections 4.2.2 and 4.2.3). By-product data collection will include sampling for dissolved arsenic, dissolved manganese, dissolved iron, and dissolved barium, as detailed in Section 4.

By-product concentration data will be compared to the anticipated concentration range and timing based on solute transport modeling as presented in Table 2.2-1. If by-product concentrations are above the anticipated range, operational adjustments will be made as discussed in the next paragraph. The maximum anticipated concentrations listed in Table 2.2-1 for NTH IRZ downgradient monitoring wells and River bank extraction monitoring wells will also be used as by-product action levels. The decision flowchart outlining agency notification requirements should action levels be exceeded is provided as Figure 2.2-11. If the constituent is detected in samples above the action level, the sample will be reanalyzed if within holding time. If the holding time has been exceeded, a new sample will be collected and re-analyzed within 45 days. If the re-sample confirms the exceedance, the DTSC will be notified and operational adjustments will be made as discussed in the next paragraph.

Short-term operational adjustments that may be made to improve by-product generation and migration include adjustment of the TOC injection concentration, dosing frequency or duration, injection and extraction rates, target injection intervals, or river bank extraction rates. Decreasing the injection TOC concentration and adjusting the dosing parameters could decrease the generation of the by-products. Adjustments to the TOC injections to minimize by-product generation would have to be balanced with maintaining Cr(VI) treatment, as outlined in NTH IRZ DQO-2. River bank extraction rates may be adjusted if the hydraulic gradient downgradient being induced is

having detrimental influence on downgradient by-product migration. Adjustments to the river bank extraction rates would have to be balanced with the evaluation of the extraction for performance, as outlined in Section 2.2.2.

If short-term operational adjustments are not sufficient to improve by-product generation and migration from the NTH IRZ, long-term operational changes such as adding the provisional injection wells will be considered (see Box 14 of Figure 2.2-2). The addition of provisional injection wells would decrease the required TOC injection concentrations and decrease by-product generation.

If short-term and long-term operational adjustments are not sufficient to improve by-product generation and migration from the NTH IRZ, the river bank extraction system operation may be adjusted to ensure that by-products do not cause unacceptable impacts to the river, as indicated in Box 17 on the operational flowchart in Figure 2.2-2. The DQOs to evaluate operation of the river bank extraction system are presented in Section 2.2.2.

Decision errors will be limited by:

- Placement of monitoring wells at a variety of locations lateral and downgradient of injection wells (Sections 4.2.1 and 4.2.2, Figure 2.2-1, Table 2.1-2)
- Sampling frequency which ensures observation of concentration changes, based on anticipated timeframe for concentration changes (Tables 2.1-4, 2.1-5, and 4.2-1)

NTH IRZ DQO-4 Problem Statement: Extraction on the north end of the NTH IRZ will be conducted to control Cr(VI) with the NTH and river bank extraction systems.

The decision statement for this DQO is: Should extraction operations be modified to control hexavalent chromium migration on the north end of the NTH IRZ? The decision rules/operational framework for the NTH northern extraction is shown on Figure 2.2-3. On the northern end of the NTH IRZ, potential migration of Cr(VI) in groundwater will be controlled via extraction, rather than the establishment of an IRZ. As inputs to the decision, data will be collected on this end of the IRZ, the study area, to assess the ability of extraction to control Cr(VI) migration. This objective will be assessed through evaluation of data collected from northern NTH IRZ extraction monitoring wells (see also Section 4.2.3), the extraction wells themselves (see also Section 4.2.5), and the surface water sampling locations (see also Section 3.1). The monitoring well and surface water sampling locations are listed on Table 2.1-2 and shown on Figures 2.2-1 and 2.1-2, and the sampling programs are detailed in Sections 3 and 4.

The analytical and water level data collected will be used to adjust the flow model per the model update schedule, and a lines-of-evidence approach will be used to evaluate the hydraulic control of the Cr(VI) plume, as discussed in further detail in Section 4.3. Model updates are planned to be conducted approximately annually during start-up and during five-year reviews thereafter. The river bank extraction system operation will also be evaluated and adjusted to address control of the Cr(VI) plume. If it is assessed that control is not likely to be achieved, operational adjustments to the extraction rates of the northern NTH IRZ extraction wells or River Bank Extraction Wells will be considered, as detailed in the decision rules on Figure 2.2-3 (Box 5). If short-term operational adjustments do not adequately enhance the likelihood of Cr(VI) plume control, the installation of provisional wells will be considered (see Box 6 of Figure 2.2-3). The Contingency Plan will be implemented if performance is not improved by the operational adjustments or addition of provisional wells.

Decision error will be limited through:

- A multiple lines of evidence performance assessment (Sections 4.2.3 and 4.3).
- Use of existing and additional monitoring wells for data collection (Table 2.1-2).
- Quarterly data collection at start-up to ensure the system is working properly (Table 4.2-1).

NTH IRZ DQO-5 Problem Statement: Extraction will be conducted to minimize extraction of organic carbon and reduced metal by-products, e.g. iron and manganese.

The decision statement for this DQO is: Should operations be adjusted to minimize extraction of dissolved metals? The decision rules/operational framework for evaluating extracted water quality from the NTH IRZ is shown on Figure 2.2-2. The extraction of residual organic carbon substrate or reduced metals, such as iron and manganese, from NTH IRZ Extraction Wells may increase the potential for fouling of the NTH IRZ Injection Wells receiving the extracted water. Extraction wells IRZ-9 and IRZ-23 are the most likely to extract organic carbon or reduced metal by-products, given their proximity to the IRZ Injection Wells. As inputs to the decision, samples will be collected from the extraction wells and analyzed for organic carbon, iron, and manganese, among other water quality parameters, as outlined in Section 4.2.5 and summarized in Table 4.2-1.

Operational adjustments to address extracted organic carbon or reduced metals caused by injections in nearby injection wells include reducing TOC injection concentrations and changing injection or extraction flow rates, as detailed in the decision rules on Figure 2.2-2. By reducing TOC injection concentrations, the organic carbon substrate may be consumed before reaching the extraction well. Decreasing the injection flow rates or extraction flow rates would decrease the lateral hydraulic gradient and reduce the potential for extraction of water with residual organic carbon or reduced metal by-products by the extraction wells. Extraction wells may also need to be taken off-line for variable periods of time to control these impacts, or to maintain the well. These operational adjustments, including the shutdown of any given injection or extraction well, would be coupled with an assessment of the strength of the IRZ and Cr(VI) treatment in that area per NTH IRZ DQO-2. However, it is anticipated that if treated water is being extracted, the IRZ would be established in the area and continued operation would not be needed. In addition, the overall flow balance of the system will be considered when adjusting the injection and extraction flows to ensure that carbon distribution is still occurring in areas that need treatment.

Decision errors will be limited through:

- Water quality monitoring at each NTH IRZ extraction well (Section 4.2-5, Table 4.2-1).
- Quarterly or more frequent monitoring initially to evaluate extracted water quality (Table 4.2-1).

2.2.2 Inner Recirculation Loop (IRL)

The intent of the IRL is to: (1) induce a hydraulic gradient that will flush the Cr(VI) plume toward the NTH IRZ; (2) facilitate the cleanup of the Colorado River floodplain; and (3) control the migration of potential by-products generated by the NTH IRZ.

IRL DQO-1 Problem Statement: Inner loop recirculation will be operated to facilitate flushing of the Cr(VI) plume through the NTH IRZ.

The decision statement for this DQO is: should IRL operation be modified to facilitate flushing of the hexavalent chromium plume? The decision rules/operational framework for evaluating the development of hydraulic gradients to facilitate Cr(VI) plume flushing is illustrated on the right-hand side of the decision rules in Figure 2.2-4. Data will be compared to the anticipated concentration range and timing based on solute transport modeling as presented in Tables 2.1-4, 2.1-5, and 2.2-1.

Inputs to the decision include hydraulic gradient data, solute transport modeling, and hexavalent chromium concentration data. The hydraulic gradient will be evaluated through analysis of water levels collected across the site, including at IRL injection dose response wells where water level mounding is anticipated and at extraction wells where groundwater drawdown is anticipated (see also Section 4.3). The study area is across the site, as indicated by the IRL water level monitoring network listed in Table 2.1-2. Observed hydraulic gradients will be compared on a site-wide basis to anticipated gradients as simulated with flow modeling that will be updated per the model update schedule. Model updates are planned to be updated approximately annually during start-up and during five-year reviews thereafter.

In addition, Cr(VI) concentration changes from IRL injection downgradient monitoring wells will be compared to anticipated concentration changes and timeframes predicted from solute transport modeling, as summarized in Tables 2.1-4, 2.1-5, and 2.2-1. The IRL injection downgradient monitoring wells are shown on Figure 2.2-1 and identified on Table 2.1-2. The details of the sampling program for these wells are presented in Section 4.2.2 and summarized on Table 4.2-1. If the change in hydraulic gradient and the changes in downgradient monitoring well Cr(VI) concentration trends are not within expectations (see Boxes 22-26 on Figure 2.2-4), short-term adjustments to improve performance, such as increasing injection rates or adjusting the flow balance across the IRL, will be considered for implementation (see Boxes 29 and 30 on Figure 2.2-4). Changes to freshwater injection rates will be considered in concert with changes to River Bank Extraction Well flow rates (see Section 2.2.4). Longer-term changes may include installation of additional injection wells, such as provisional well IRL-5 (see Box 28 on Figure 2.2-4) if short-term operational adjustments are found to be insufficiently effective. An increase in injection rates in a given well or the addition of a well will require either decreasing injection rates in other wells or increased extraction rates from the River Bank Extraction Wells or freshwater source and may require additional extraction capacity. The changes will be made and flow rates will be balanced across the system to optimize the hydraulic gradient across the system. If the desired hydraulic gradients cannot be achieved and Cr(VI) concentrations are not declining within expectations such that the remedy duration is projected to be of an unacceptable duration, the Contingency Plan will be implemented.

Decision errors will be limited through:

- Placement of monitoring wells within the plume in locations to collect data on flushing of hexavalent chromium concentration trends (Figure 2.2-1, Tables 2.1-2, 2.1-4, 2.1-5).
- Sample collection frequency based on solute transport modeling predictions (See Tables 2.1-4 and 2.1-5)
- Evaluation of timeframe predictions based on model re-calibration with installation and operational data.

IRL DQO-2 Problem Statement: Cr(VI) in groundwater extracted from the River Bank Extraction Well system must be treated if levels exceed the target Cr(VI) concentration.

The decision statements for this DQO are;

- Does water extracted from the river bank contain Cr(VI) above background and require carbon amendment?
- If hexavalent chromium treatment is required, should carbon-amended injection well operations be modified to ensure Cr(VI) treatment?
- Are constituents in extracted water degrading injection well performance?

Inputs to the decision include Cr(VI) and extracted water quality data. The study area is the extracted water and monitoring wells, and the IRL injection wells and dose response wells. The decision rules evaluating data and making operational changes to the IRL carbon injections is presented on the left-hand side of Figure 2.2-4. Inputs to the decision-making are analytical data collected from the river bank extracted water (see Section 4.2.5). If Cr(VI) is present in groundwater extracted from the River Bank Extraction Wells at a blended concentration that exceeds the target clean-up level of 32 μg/L, the recirculated groundwater will be amended with carbon substrate and process control monitoring will be conducted to enhance treatment. Cr(VI) concentration data will be collected from the extracted groundwater. If the Cr(VI) concentration in the extracted water is greater than 32 μg/L, then the carbon amendment system will be turned on or continue to operate if already on. If the Cr(VI) concentration is less than 32 μg/L, the carbon amendment system will be turned off or remain off.

If the carbon amendment system is active, data will be collected from the IRL injection dose response monitoring wells, listed in Table 2.1-2 and shown on Figure 2.2-1, to evaluate Cr(VI) treatment and by-product generation. The sampling program for these wells, which define the study area boundaries, is detailed in Section 4.2.1 and summarized on Table 4.2-1. If TOC concentrations are less than anticipated (per Table 2.2-1) and Cr(VI) is not treated to less than 32 μg/L in samples collected from dose response wells, then operational adjustments such as increasing TOC injection concentrations or changing dosing parameters will be made. If by-product concentrations

are above the anticipated range, the TOC concentration will be decreased or other dosing parameters (i.e., duration or frequency of dosing) will be adjusted.

The process/decision rules for evaluating extracted water quality data is presented on the left-hand side of Figure 2.2-4. Inputs to the decision-making include analytical data collected from the river bank extracted water (see Section 4.2.5). If concentrations of reduced metals are elevated and it is affecting injection well performance (see O&M Manual Volume 1, Section 4 for details on evaluating injection well performance), then adjustments will be made to improve injection well performance. Short-term operational changes that will be considered include increasing the backwashing and chemical rehabilitation frequency, and adjusting extraction rates or the flow balance if concentrations of fouling constituents vary among wells. Adjustments of the extraction rates would have to be weighed against the hydraulic control needs and performance of the River Bank Extraction Wells as discussed in IRL DQO-3, below. The addition of low concentrations of TOC to maintain a slightly reduced water chemistry signature in the injection well may also be applied; this will be coupled with the complementary monitoring associated with TOC addition as described in the previous paragraph. If injection well maintenance becomes unacceptably costly or burdensome due to the re-injection of reduced metals, treatment for removal of those metals prior to re-injection may be considered. Should this occur, the regulatory agencies and Tribes will be informed prior to commitment.

Decision errors will be limited through:

- Collection of water quality data from individual extraction wells and from the combined stream (Section 4.2-5, Table 4.2-1)
- Monitoring in the immediate vicinity of injection wells to ensure injected water is treated adequately (Section 4.2-1, Table 4.2-1, Figure 4.2-1)
- Monthly to quarterly data collection at start-up, followed by continued quarterly monitoring to quickly address water quality changes (Table 4.2-1)

IRL DQO-3 Problem Statement: Migration of Cr(VI) will be controlled.
IRL DQO-4 Problem Statement: Migration of by-products will be controlled.

The decision statement for these DQOs are:

- Should operations of River Bank Extraction Wells be modified to improve control of hexavalent chromium and in situ by-products in the Floodplain?
- Are currently operating screen intervals of the River Bank Extraction Wells sufficient to control the hexavalent chromium or by-products, above ambient levels, in the Floodplain?

The decision rules/operational framework for the River Bank Extraction Wells are shown on Figure 2.2-5. The study area for this DQO is groundwater beneath the floodplain and Arizona and the surface water. As inputs to the decisions, Cr(VI) and by-product concentration trends will be monitored in floodplain process control monitoring wells and Arizona wells. Cr(VI) and by-products data from the river bank extraction monitoring well network (see also Section 4.2.3) and surface water sampling network (see also Section 3) will be used to evaluate the adequacy of the system's control of the Cr(VI) plume and by-product migration. The monitoring well and surface water sampling locations are listed on Table 2.1-2 and shown on Figure 2.2-1, and the sampling programs are detailed in Sections 3 and 4.

The analytical and water level data collected will be used to adjust the flow model per the model update schedule, and a lines-of-evidence approach will be used to evaluate the control of Cr(VI) and/or by-products, as discussed in further detail in Section 4.3. Model updates are planned to be conducted approximately annually during start-up and during five-year reviews thereafter. If control of Cr(VI) and by-products is assessed as not likely to be achieved, operational adjustments will be made, as shown on Figure 2.2-5. Operations may be improved by adjusting extraction rates or taking further contingency measures, such as adding provisional extraction wells . If it is determined from the evaluation of concentrations and hydraulic control evaluation that control for Cr(VI) and/or by-products is needed in the shallow unit, extraction from intervals in the shallow unit

will be considered as part of contingency plan implementation. If less extraction is needed to maintain hydraulic control of the target capture zone as defined in Section 4.3, extraction rates may be decreased. Specific metrics for defined well pairs located in the floodplain will address hydraulic control created by the River Bank Extraction Wells as discussed in Section 4.3.

If extraction rates need to be increased, the IRL injection system may need to be modified to accommodate increased injection rates (see Boxes 9 through 11 on Figure 2.2-5). Wells may be rehabilitated or the flow balance adjusted in the short term, while the addition of provisional injection wells can be considered in the long term if short-term increases in injection capacity are determined to be insufficient. If operational adjustments do not result in adequate control of the Cr(VI), additional contingency measures may be implemented.

IRL DQO-5 Problem Statement: The naturally-occurring reducing rind will be monitored for changes in water quality.

The decision statement for this DQO is: Do changes in the water quality parameters in the rind warrant additional investigation? Geochemical parameters indicative of reducing conditions in the floodplain reducing rind include low DO, low oxidation reduction potential (ORP), dissolved manganese and iron concentrations above detection limits, dissolved arsenic, and potentially low concentrations of dissolved nitrate. The analytes in the groundwater are indicative of reducing conditions generated by the rind. These analytes will be monitored to assess the character of the reducing rind during remedy operations as inputs to the decision (see also Section 4.2.3 and Table 4.2-1). The study area is the floodplain groundwater. The data will be monitored over time to assess changes in the groundwater quality. Trends will also be evaluated in light of other various factors that could cause changes. For instance, implementation of the remedy will involve changes to the flow regime (flow rates and directions) within the floodplain, which may cause shifts in the steady state concentrations of redox indicators. In addition, baseline analyte concentrations within floodplain monitoring wells are highly variable. Therefore, although the greatest emphasis will be placed on shallow monitoring wells within the NTH IRZ downgradient and river bank extraction monitoring well networks, the entire dataset will be considered when evaluating the overall impact to the reducing rind, and multiple lines of investigation will be evaluated to understand the data trends. This will be necessary to provide the proper context on any apparent impacts for a given well in the network. For example, water quality may be highly variable in any given monitoring well in the floodplain, particularly when the flow regime is changed. Accordingly, changes in concentrations of redox parameters in any given well over a short timeframe may or may not be indicative of overall impacts to the reducing rind; the change will need to be assessed within the context of the entire dataset, and within the context of solute transport model predictions (Appendix B of the Final BOD). The presence and effectiveness of the engineered reducing zone will also be considered when evaluating changes to the natural reducing zone. If broad changes to the reducing conditions occur, further investigations may be warranted. The types of additional investigations conducted will be dependent on the nature of the observations. These additional investigations may include (but would not be limited to) supplementary groundwater sampling for additional analytes and/or increased monitoring frequency, installation of provisional wells, and/or sampling of aquifer solids and solid-phase analyses. Decision errors will be limited through assessing multiple lines of geochemical evidence for assessing reducing rind impacts.

IRL DQO-6 Problem Statement: The river bank extracted groundwater will be monitored for changes in water quality over time.

The decision statement for this DQO is: Is there a change in water quality in extracted river bank water injected into IRL injection wells that merits agency notification? The inputs to the decision will be water quality data collected from the combined stream of extracted river bank water and analyzed for the suite of constituents per Table 5.2-4 in Section 5. For the purposes of the DQO, data are collected from the river bank extracted water, and the extracted water stream is therefore the “study area” for this DQO.

Action levels will serve as a mechanism to notify the agencies of changes in injected water quality. Initial concentrations of the combined extracted river bank water will be established at start-up and will guide the establishment of action levels. Data collected within the first six months of operation of the River Bank Extraction Wells will be considered initial extracted water concentrations. Section 4.2.6 details the planned sampling

frequency for inorganic and organic constituents. For inorganic constituents, samples will be collected monthly for the first six months prior to switching to a quarterly frequency, providing six samples for the establishment of initial extracted water concentrations. The maximum concentration detected in the six samples will serve as the initial extracted water concentration for establishing action levels, as described in the next paragraph. The organic suite will be sampled once in the first year of operation. The majority of constituents included in the organic suite are anticipated to be non-detect, in which case the initial extracted water concentration would be established as less than the reporting limit. If an organic analyte is detected in the first samples collected, three additional samples will be collected for that analyte within the first six months of operations, and the initial extracted concentration will be established as the maximum concentration detected.

Action levels for agency notifications will be determined once the initial extracted water quality has been established. Action levels will be established for metals, herbicides, pesticides, volatile organic compounds (VOCs), polycyclic aromatic hydrocarbons (PAHs), and radionuclides. Exceptions to this rule include arsenic and manganese, for which monitoring will be implemented to satisfy the DQOs established in Section 2—i.e., Freshwater DQO-2 (see Section 2.2.4) and Compliance DQO-3 (see Section 2.1) and for which action levels were not set. Action levels will also be established for field constituents, anions, and other general chemistry constituents that have an MCL/SMCL. This framework for establishing action levels is summarized in a flowchart format on Figure 2.2-10.

If the constituent is present in the initial samples of the extracted water, then the action level will be established as a 25% increase over the maximum initial extracted water concentration. If the constituent is not detected in the initial samples, then the action level will be established as a 25% increase over the reporting limit used for the analysis of the set of initial samples. If a site-wide background concentration representative of site-wide groundwater is available for a given constituent and is higher than a 25% increase over the maximum initial extracted water concentration, the action level will be 75% of the site-wide background concentration.

The decision flowchart outlining agency notification requirements is provided as Figure 2.2-11. If the constituent is detected in a sample above the action level, the sample will be reanalyzed if within holding time. If the holding time has been exceeded, a new sample will be collected and re-analyzed within 45 days. If the re-sample confirms the exceedance, the agencies will be notified and next steps will be considered. Next steps could include statistical analysis of the data to determine if the increase in concentration of the constituent is significant and/or additional monitoring of the extracted water source and groundwater monitoring wells.

2.2.3 Topock Compressor Station (TCS) Recirculation Loop

TCS DQO-1 Problem Statement: TCS injection wells will be operated to treat Cr(VI) in groundwater beneath the TCS.

The decision statement for this DQO is: should TCS loop injection well operations be modified to promote better hexavalent chromium treatment? The decision rules/operational framework for the TCS Injection Wells is shown on Figure 2.2-6. As inputs to the decision data will be collected from the TCS Recirculation Loop dose response monitoring wells (the study area), listed in Table 2.1-2 and shown on Figure 2.2-1. The sampling program for these wells, which define the study area boundaries, is detailed in Section 4.2.1 and summarized on Table 4.2-1. If TOC concentrations are less than anticipated (per Table 2.2-1) and Cr(VI) is not treated to less than 32 µg/L in samples collected from dose response wells, than operational adjustments such as increasing TOC injection concentrations or changing dosing parameters will be considered. If by-product concentrations are above the anticipated range, consideration will be given to decreasing the TOC concentration or adjusting the dosing parameters.

In addition, the TCS injection wells will only be operated if the freshwater injection at FW-2 is operating at an effective injection rate to control potential Cr(VI) or in-situ by-product migration from the TCS injections. Results of the modeling effort indicate that the potential for westward flow from the TCS Injection Wells, and the resulting westward expansion of the plume, is sufficiently mitigated by the natural eastward flow gradient and the injection of fresh water at FW-2, located outside of the plume footprint, at a nominal rate of 50 gallons per minute (gpm) (i.e., approximately double the combined nominal TCS injection flow rate of 27 gpm; see Appendix B of the Final BOD). Monitoring will be conducted to verify the model predictions, and lines of evidence

that will be used to evaluate groundwater flow and plume control in the area west of the TCS Injection Wells will include: trends in analytical data (e.g., Cr[VI], by-products, and potentially TOC) collected from the TCS Recirculation Loop by-product monitoring wells located to the west of the TCS Injection Wells (Table 2.1-2); and comparison of groundwater elevation data/observed hydraulic gradients to model-predicted gradients. The concentration trend analysis will include an evaluation of consecutive monitoring events post-remedy startup to determine whether a statistically significant increase with time is observed relative to historical data at each TCS Recirculation Loop by-product monitoring well; trends in Cr(VI), by-product, and TOC concentrations will be considered within expectations if no statistically significant increase is observed. In addition, tracer testing may be implemented if other lines of evidence are inconclusive. The sampling program for the TCS Recirculation Loop by-product monitoring wells is summarized on Table 4.2-1. The process for data evaluation and operational adjustments is presented on the Figure 2.2-6 flowchart. Tracer injections may also be used if other lines of evidence are inconclusive. If the lines of evidence suggest that freshwater injection at FW-2 is not sufficient to control potential Cr(VI) or in-situ by-product migration from the TCS injections, then operational adjustments (e.g., adjusting injection rates) will be considered as shown on Figure 2.2-6. The Contingency Plan will be implemented if performance is not improved by the operational adjustments. Decision errors will be limited through monitoring does response wells to ensure they system is working properly.

TCS DQO-2 Problem Statement: TCS Recirculation Loop Transwestern Bench Extraction Wells will be operated to remove Cr(VI) mass from the high concentration area in the vicinity of the TCS and control migration toward the East Ravine.

The decision statement for this DQO is: should extraction system operations or configuration be changed to improve Cr(VI) removal and migration control? The decision rules/operational framework for the TCS Recirculation Loop Transwestern Bench extraction are shown on Figure 2.2-7. As inputs to the decision, data will be collected from the extracted groundwater and the Transwestern Bench extraction monitoring well network (the study area), listed in Table 2.1-2 and shown on Figure 2.2-1. These sampling programs are detailed in Sections 4.2.5 and 4.2.4, respectively, and summarized on Table 4.2-1. Multiple lines of evidence will be used to evaluate and optimize the hydraulic control of the Transwestern Bench extraction system, as outlined in Section 4.3 and shown on Figure 2.2-7. If additional control is needed, operational changes will be made such as increasing extraction rates or adding provisional extraction wells (see Boxes 5 and 6, Figure 2.2-7). Increased extraction rates would be attempted in the short term, while the addition of provisional extraction wells would be considered if short-term extraction rate increases were found to be insufficiently effective.

Decision errors will be limited through assessment and optimization of extraction effectiveness through multiple lines of evidence.

TCS DQO-3 Problem Statement: East Ravine Extraction Wells will be operated to remediate Cr(VI) and control migration towards the river.

The decision statement for this DQO is: Should extraction systems be changed to optimize Cr(VI) treatment and migration control? The decision rules/operational framework for the TCS Recirculation Loop East Ravine extraction system is shown on Figure 2.2-8. Inputs to the decision include analytical data and solute transport modeling. The study area includes and East Ravine extraction network, monitoring network, and surface water. Analytical data collected from East Ravine Extraction Wells (see also Section 4.2.5), monitoring wells (see also Section 4.2.4) and surface water sampling locations (see also Section 3), as well as water level data collected from the East Ravine extraction monitoring well network, will be used to adjust the flow model per the model update schedule. Model updates are planned approximately annually during start-up and during five year reviews thereafter. These sampling locations are listed in Table 2.1-2, and the sampling programs are detailed in Sections 3 and 4. A lines-of-evidence approach will be used to evaluate the potential migration of Cr(VI), as discussed in further detail in Section 4.3. The proposed East Ravine Extraction Wells will be within the fractured bedrock; therefore, sufficient well depth will be important to (1) address depth of potential Cr[VI] in groundwater, and (2) allow for sufficient available drawdown in order to maximize groundwater extraction.

If hydraulic control is assessed to be inadequate, operational changes will be made such as adding provisional extraction wells to increase extraction rates if the existing extraction wells are operating at maximum capacity. However, if the East Ravine Extraction Wells are not operating at maximum capacity, increasing extraction rates in existing wells will be attempted (see Boxes 5 and 6 on Figure 2.2-8). If operational adjustments do not result in hydraulic control of the Cr(VI) plume, the Contingency Plan will be implemented.

If extraction rates are increased, the TCS injection system may need to be modified to accommodate increased injection rates (see Boxes 8 through 10 on Figures 2.2-7 and 2.2-8). Wells may be rehabilitated or the flow balance adjusted in the short term. Decision errors will be limited through evaluation of plume control.

2.2.4 Freshwater Injection

Freshwater DQO-1 Problem Statement: Freshwater injections will be operated to facilitate flushing of the Cr(VI) plume through the NTH IRZ and to contain carbon-amended water and in-situ by-products from the IRL.

The decision statement for this DQO is: Should freshwater injection well operations be modified to facilitate flushing of the Cr(VI) plume and IRL carbon-amended injection water? Inputs to the decision include Cr(VI) and extracted water quality data. The study area is the extracted water and monitoring wells, and the IRL injection wells and dose response wells. The decision rules for evaluating the development of hydraulic gradients to facilitate Cr(VI) plume flushing is illustrated on Figure 2.2-9. Water level data will be collected across the site, and IRL injection downgradient monitoring wells (see also Section 4.2.2) will be used to assess Cr(VI) concentration changes. Monitoring well locations are listed in Table 2.1-2. Data collected will be compared to model output, and if necessary the model will be adjusted to better reflect field data per the model update schedule. Model updates are planned to be conducted approximately annually during start-up and during five-year reviews thereafter. The model will then be used to project remedial timeframes, and the need for adjustments will be considered in the light of projected changes to the remedial timeframe or weaknesses in the remediation system. If needed, operational adjustments to the freshwater injections including increasing injection rates or adjusting the flow balance in the short term, as well as additional contingency measures such as adding injection wells, will be considered for implementation. Increasing injection rates in a given well will require either decreasing injection rates in other wells or increasing the extraction rate from the freshwater source. Changes to freshwater injection rates will be considered in concert with changes to River Bank Extraction Well flow rates (see Section 2.2.2).

Arsenic and manganese concentrations will be compared to expected concentrations in the IRL by-product monitoring wells, as summarized in Table 2.2-1. IRL by-product monitoring well locations, which define the study area boundaries, are shown in Figure 2.2-1 and listed in Table 2.1-2. The sampling program for these wells is detailed in Section 4.2.2. If concentration trends are not within expectations, short-term adjustments will be considered for implementation, similar to those listed above.

Decision errors will be limited through:

- Placement of monitoring wells within the plume in locations to collect data on flushing of hexavalent chromium concentration trends.
- Sample collection frequency based on solute transport modeling predictions (See Table 2.1-3, 2.1-4, and 2.1-5)
- Evaluation of timeframe predictions base on model re-calibration with installation and operational data.

Freshwater DQO-2 Problem Statement: Freshwater injection will be operated to manage migration of arsenic injected from the freshwater source.

The decision statement for this DQO is: should injection operations be modified to manage migration of arsenic injected from the freshwater source? The data collection program and decision rules for this DQO are based upon remedy requirements put forth by the State Water Resources Control Board (SWRCB) in a letter dated November 20, 2013 (the State Board letter; SWRCB 2013). The study area for this DQO is the vicinity of the injection wells that receive fresh water. Inputs to the decision are dissolved arsenic concentrations collected from the freshwater arsenic monitoring wells specified in Table 2.1-2. Additional water level data, analytical data, and operational data

may also be used. Injection wells that may receive fresh water during the course of the remedy include proposed injection wells FW-1, FW-2, IRL-1, IRL-2, IRL-3, and IRL-4. Per the State Board letter, freshwater arsenic monitoring wells are planned as shown on Figure 2.2-1. Details on the locations of the freshwater arsenic monitoring wells are provided in Section 4.2.7.

Decision rules for management of arsenic injected from fresh water are presented on the right side of Figure 2.2-9. If the leading edge of the arsenic plume above the 10 µg/L water quality objective extends more than 150 feet from injection locations receiving fresh water, action will be triggered. First, samples will be collected to verify the detection within 45 days. If the detection is confirmed, the DTSC and DOI will be notified and response actions will be taken. Response actions will include re-assessment of the modeling calculations in conjunction with an evaluation of interim actions that can be taken to limit migration of the arsenic plume, if needed. These interim actions may include control of arsenic through operational adjustments, such as rebalancing freshwater and river bank water injections (flow rates, number, and/or location of injection wells receiving fresh water versus river bank water), aeration of fresh water prior to injection to reduce arsenic mobility, or triggering of the contingent arsenic treatment system (see Section 2.3 of Volume 3 of this O&M Manual).

If dissolved arsenic is detected above the water quality objective of 10 µg/L at a 225-foot monitoring well due to injection of fresh water, then a verification sample will be collected and analyzed within 45 days. If the re-sample result confirms the exceedance, freshwater injection at the corresponding injection location will be shut down within 24 hours of receipt of the confirmation data, the DTSC and DOI will be notified, and the contingency plan will be implemented (Section 2.3 of Volume 3 of this O&M Manual). Implementation of the contingency plan may consist of pre-treatment for arsenic or evaluation of bringing online the contingent freshwater source(s) (Topock-2/-3 and Site B wells).

Note, the data collection and data evaluation described in this section apply to the 150- and 225-foot freshwater arsenic monitoring wells when fresh water is being injected at the associated injection well. When river bank water is injected, by-products (including arsenic) monitoring and data evaluation, will be conducted in accordance with Freshwater DQO-1. If arsenic concentrations and exceedances in the freshwater arsenic monitoring well network are related to the injection of river bank water or carbon amendment, rather than freshwater injection, the response actions would be modifications to the river bank injection or carbon amendment, rather than shutdown or modification of the freshwater injection.

Freshwater DQO-3 Problem Statement: The freshwater source will be monitored for changes in water quality over time.

The decision statement for this DQO is: Has there been a change in water quality in the freshwater source such that the agencies should be notified? The inputs to the decision will be water quality data collected from the freshwater source, i.e. the study area, and analyzed for the suite of constituents per Table 5.2.-4 in Section 5. For the purposes of the DQO, data is collected from the freshwater source, and the freshwater source stream is therefore the “study area” for this DQO.

Analytical data collected from the freshwater source will be used to track injected water quality based on action levels. Action levels will serve as a mechanism to notify the agencies of changes in water quality. Final action levels will be determined using initial data collected during startup of the freshwater injection system. These action levels will be selected according to the logic illustrated on Figure 2.2-10 and will be based on initial freshwater source data according to the same procedure as described above for IRL DQO-5. An action level for arsenic is not established given that this constituent will be evaluated under Freshwater DQO-2 according to SWRCB requirements. The decision flowchart outlining agency notification requirements and next steps is provided in Figure 2.2-11, as described above for IRL DQO-5. Next steps could include statistical analysis of the data to determine if the increase in concentration of the constituent is significant and/or additional monitoring of the freshwater source and groundwater monitoring wells.

Volume 2: Sampling and Monitoring Plan
PG&E Topock Compressor Station, Needles, California

	1. State the Problem	2. Decision Statements	3. Inputs to the Decision	4. Study Area Boundaries	5. Decision Rules	6. Limits of Decision Errors	7. Optimize the Design for Data Collection
COMPLIANCE							
1) Surface Water (RAO 2)	The remedy must be implemented in compliance with RAO 2 (prevent or minimize migration of total chromium and hexavalent chromium to ensure concentrations in surface water do not exceed water quality standards).	Modify operations or remedy components to meet the RAO?	Surface water sampling results (Section 3.2, Table 2.1-3)	Surface water sampling location network.	If Cr(VI), arsenic, or manganese concentrations increase in surface water samples and are attributable to the Topock site, operational changes will be implemented per the process control decision rules. (Figures 2.2-3, 2.2-5, 2.2-8) If Cr(VI), arsenic, or manganese concentrations do not return to baseline as a result of the operational adjustments, the contingency plan will be implemented.	Limit decision error through: - Collection of samples upriver and downriver of potentially affected areas to accurately attribute concentration changes to the Topock site (Figure 2.1-1). - Quarterly to semi-annual data collection throughout the lifetime of remedy operations (Table 2.1-3).	See Section 3.1
2) Inside the Plume (RAO 3)	The remedy must be implemented in compliance with RAO 3 (reduce the mass of total chromium and hexavalent chromium in groundwater at the site to achieve compliance with ARARs in groundwater).	Modify operations or remedy components to meet the RAO?	hexavalent chromium concentration data from monitoring wells in the interior of the plume (Table 2.1-3).	Interior of the plume	If hexavalent chromium concentrations are not decreasing within expected timeframes, operational changes (potentially including the addition of provisional IRZ wells) will be implemented per the process control decision rules (Figures 2.2-2 through 2.2-9). If operational changes do not improve the hexavalent chromium concentration trends, the contingency plan will be implemented.	Limit decision error through: - Groundwater monitoring at multiple points distributed laterally and vertically across plume, spanning a range in anticipated cleanup timeframes (Figures 2.2-1, Tables 2.1-3, 2.1-4, 2.1-5). - Monitoring with a frequency consistent with anticipated cleanup timeframes (Table 2.1-3).	See Section 3.1
3) Outside the Plume (RAO 4)	The remedy must be implemented in compliance with RAO 4 (the target remediation area does not permanently expand following completion of the remedial action)	Modify operations or remedy components to meet the RAO?	hexavalent chromium and byproduct concentration data from monitoring wells outside of the baseline plume (Table 2.1-3)	Outside of the Plume	If Cr(VI), arsenic or manganese concentrations increase and persist above long term expectations outside the baseline hexavalent chromium plume, operational changes will be implemented per the process control decision rules (Figures 2.2-1, 2.1-4, 2.2-9). If operational changes do not improve the Cr(VI), arsenic or manganese concentrations outside the baseline hexavalent chromium plume, the contingency plan will be implemented.	Limit decision error through: - Collection of samples from outside of the baseline hexavalent chromium plume (Table 2.1-3, Figure 2.2-1). - Sampling frequency based on anticipated arrival times of water affected by various components of the remedy (Table 2.1-3). - Quarterly collection of water level data and continuous collection of transducer data to assess hydraulic performance, ensuring plume control (Table 2.1-3). - Comparison of Cr(VI) and byproduct dynamics with solute transport model predictions to assess performance .	See Section 3.1

PROCESS CONTROL							
National Trails Highway In-Situ Reactive Zone (NTH IRZ)							
1	The carbon substrate amendment system must be working to amend the organic carbon substrate into the recirculated groundwater.	Is the carbon amendment system working properly?	Organic carbon samples collected from the MW-20 Bench and Transwestern Bench distribution systems (Exhibits 2.2-1 and 2.2-2).	Distribution systems.	If carbon amendment systems are not delivering desired TOC concentrations, troubleshooting and repair, if needed, will be conducted.	Limit decision error through: - Collection of samples at key system locations (Section 4.2.7, Exhibits 2.2-1 and 2.2-2). - Monthly data collection at start-up to ensure system is working properly and routine sampling thereafter (Section 2.2.1).	See Section 4
2	The NTH IRZ must be complete and maintain hexavalent chromium treatment over time.	Modify operations of the NTH IRZ? Start or stop NTH IRZ recirculation and organic carbon injections? Modify the NTH IRZ design? Modify the monitoring well layout?	Organic carbon, Cr(VI), and dissolved metals analytical data from NTH IRZ dose response and downgradient monitoring wells (Table 4.2-1).	Floodplain (NTH IRZ dose response and downgradient monitoring wells)	See decision rules/operational framework in Figure 2.2-2. If operational adjustments in Figure 2.2-2 are not sufficient to control hexavalent chromium migration in the Floodplain, refer to inner recirculation loop riverbank extraction decision rules on Figure 2.2-5	Limit decision error through: - Placement of monitoring well locations at the weak points of the IRZ (mid-point between injection locations) and downgradient (Section 4.2.1, 4.2.2, Figure 2.2-1, Table 2.1-2). - Collection of a variety of parameters to evaluate establishment of hexavalent chromium reducing conditions (Table 4.2-1). - Monthly to quarterly sampling during start-up and operational changes (Table 4.2-1).	See Section 4.2.6
3	Byproduct generation and migration from the NTH IRZ must be controlled.	Modify NTH IRZ operations based on byproduct concentration trends? Modify NTH IRZ design based on byproduct concentration trends?	Organic carbon and byproduct concentration data collected from dose response wells, downgradient monitoring wells, and Riverbank extraction monitoring wells located in the Floodplain (Table 4.2-1).	Floodplain downgradient of NTH IRZ (NTH IRZ dose response wells, downgradient monitoring wells, and Riverbank extraction monitoring wells)	See decision rules/operational framework in Figure 2.2-2. If operational adjustments in Figure 2.2-2 are not sufficient to control by-product generation and migration, refer to inner recirculation loop riverbank extraction decision rules on Figure 2.2-5	Limit decision error through: - Placement of monitoring wells at a variety of locations lateral and downgradient of injection wells (Sections 4.2.1, 4.2.2, Figure 2.2-1, Table 2.1-2). - Design sampling frequency to ensure observation of concentration changes, based on anticipated timeframe for concentration changes (Table 2.1-4, 2.1-5, 4.2-1).	See Section 4.2.1, 4.2.2
4	Extraction on the north end of the NTH IRZ will be conducted to control hexavalent chromium with the NTH and Riverbank extraction systems.	Should extraction operations be modified to control hexavalent chromium migration on the north end of the NTH IRZ?	hexavalent chromium and water level data from monitoring wells on the north end of the NTH (Table 4.2-1). Groundwater modeling capture estimates. Surface water sampling hexavalent chromium data.	North end of the NTH IRZ (Northern extraction monitoring wells)	See decision rules/operational framework in Figure 2.2-3.	Limit decision error through: - A multiple lines of evidence performance assessment (Section 4.3). - Use of existing and additional monitoring wells for data collection. - ~~Monthly to Q~~uarterly data collection at start-up to ensure system is working properly.	Section 4.3
5	Extraction will be conducted to minimize extraction of TOC and reduced metal by-products, e.g. iron and manganese.	Should operations be adjusted to minimize extraction of ~~treated~~ dissolved metals?	Water quality data collected from the NTH IRZ extraction wells (Table 4.2-1).	NTH IRZ	See decision rules/operational framework in Figure 2.2-2.	Limit decision error through: - Water quality monitoring at each NTH IRZ extraction well (Table 4.2-1, Section 4.2.5). - Quarterly or more frequent monitoring initially to evaluate extracted water quality (Table 4.2-1).	See Section 4.2.5

Inner Recirculation Loop (IRL)							
1	Inner loop recirculation will be operated to facilitate flushing of the hexavalent chromium plume through the NTH IRZ.	Should inner recirculation loop injection well operations be modified to facilitate flushing of the hexavalent chromium plume?	Water level data and hexavalent chromium concentration data from across the site (Figure 2.2-1, Table 2.1-3).	Project Area	See decision rules/operational framework in Figure 2.2-4.	Limit decision error through: - Placement of monitoring wells within the plume in locations to collect data on flushing of hexavalent chromium concentration trends (Figure 2.2-1, Tables 2.1-2, 2.1-4, 2.1-5). - Sampling collection frequency based on solute transport modeling predictions (Tables 2.1-4, 2.1-5, 4.2-1). - Evaluation of timeframe predictions based on model re-calibrated with installation and operational data.	See Section 4
2	Hexavalent chromium in groundwater extracted from the Riverbank extraction well system must be treated if levels exceed the target hexavalent chromium concentration.	Does water extracted from the Riverbank contain hexavalent chromium above background and require treatment? If hexavalent chromium treatment is required, should carbon-amended injection well operations be modified to ensure hexavalent chromium treatment? Are constituents in extracted water degrading injection well performance?	Water quality analytical data from samples collected from Riverbank extracted water (Section 4.2.3). Organic carbon, Cr(VI), and dissolved metals analytical data from dose response wells (Section 4.2.1). Injection well performance (O&M Manual Volume 1, Section 4).	Riverbank Extraction Monitoring Wells and Extraction Wells Inner Recirculation Loop Dose Response Wells	See decision rules/operational framework in Figure 2.2-4.	Limit decision error through: - Collection of water quality data from individual extraction wells and from the combined stream (Section 4.2.5, Table 4.2-1). - Monitoring in the immediate vicinity of injection wells to ensure injected water is treated adequately (Section 4.2.1, Table 4.2-1). - Monthly to quarterly data collection at start-up, followed by continued quarterly monitoring to quickly address water quality changes (Table 4.2-1).	See Section 4
3	Control migration of Cr(VI).	Should operations of Riverbank extraction wells be modified to improve control of hexavalent chromium in the Floodplain? Are currently operating screen intervals of the Riverbank extraction wells sufficient to control the hexavalent chromium in the Floodplain?	Water level and hydraulic gradient data (contour maps and well pair analysis) (Section 4.3.3.1). Hexavalent chromium concentration trends in groundwater (Section 4.3.3.3). Groundwater modeling (Section 4.3.3.2). Surface water sampling hexavalent chromium data (4.3.3.3).	Focus on Riverbank extraction monitoring network and surface water sampling locations. Data from sitewide water level monitoring may also be used.	See decision rules/operational framework in Figure 2.2-5.	Limit decision error through: - A multiple lines of evidence performance assessment (Section 4.3). - Use of existing and additional monitoring wells for data collection (Table 2.1-2).	See Section 4.3

Inner Recirculation Loop (IRL) continued							
4	Control the migration of by-products.	Should operations of Riverbank extraction wells be modified to improve control of in situ by-products in the Floodplain? Are currently operating screen intervals of the Riverbank extraction wells sufficient to control in situ by-products, above ambient levels, in the Floodplain?	Water level and hydraulic gradient data (contour maps and well pair analysis) (Section 4.3.3.1). Byproduct concentration trends in groundwater (Section 4.3.3.3). Groundwater modeling (Section 4.3.3.2). Surface water sampling for dissolved arsenic and manganese (Table 2.1-2).	Focus on Riverbank extraction monitoring network and surface water sampling locations. Data from sitewide water level monitoring may also be used.	See decision rules/operational framework in Figure 2.2-5.	Limit decision error through: - A multiple lines of evidence performance assessment (Section 4.3). - Use of existing and additional monitoring wells for data collection (Table 2.1-2).	See Section 4.3
5	The naturally-occurring reducing rind will be monitored for changes in water quality	Do changes in the water quality parameters in the rind warrant additional investigation?	Geochemical data and water levels from fluvial monitoring wells (Section 2.2.2)	Floodplain Fluvial Aquifer	See section 2.2.2	Limit decision error through: - Assessing multiple geochemical lines of evidence for assessing reducing rind impacts (Section 2.2.2).	See Section 4
6	The Riverbank extracted groundwater will be monitored for changes in water quality over time.	Is there a change in water quality in extracted Riverbank water injected into IRL injection wells that merits agency notification?	Riverbank extraction stream groundwater quality data (Section 4.2.6)	Riverbank Extraction pipeline	See Figures 2.2-10 and 2.2-11	Limit decision error through: -Collection of quarterly to biannual from the riverbank extraction stream (Section 4.2.6) -Establishment of action levels	See Section 4.2.6
Topock Compressor Station (TCS) Recirculation Loop							
1	TCS injection wells will be operated to treat hexavalent chromium in groundwater beneath the compressor station	Should TCS loop injection well operations be modified to promote better hexavalent chromium treatment?	Organic carbon, Cr(VI), and dissolved metals analytical data from monitoring wells downgradient of the injection wells (Section 4.2.1).	TCS loop dose response and downgradient monitoring wells	See decision rules/operational framework in Figure 2.2-6.	Limit decision error through: - Monitoring of dose response wells to ensure system is working properly (Section 4.2.1, Table 4.2-1).	See Section 4
2	TCS loop Transwestern bench extraction wells will be operated to remove hexavalent chromium mass from the high concentration area in the vicinity of the TCS and control migration toward the East Ravine.	Should extraction system operations or configuration be changed to optimize hexavalent chromium migration control?	hexavalent chromium analytical and water level data from TCS loop embayment extraction monitoring wells Groundwater modeling. (Section 4.3)	TCS Loop Transwestern bench extraction monitoring wells	See decision rules/operational framework in Figure 2.2-7.	Limit decision error through: - Assessment and optimization of extraction effectiveness through multiple lines of evidence.	See Section 4.3

Topock Compressor Station (TCS) Recirculation Loop continued							
3	East Ravine extraction wells will be operated to remediate hexavalent chromium and control migration towards the river	Should extraction system operations or configuration be changed to optimize hexavalent chromium treatment and migration control?	hexavalent chromium analytical data from East Ravine monitoring and extraction wells Water level data from monitoring well network Surface water sampling hexavalent chromium data. (Section 4.3)	TCS Loop East Ravine extraction monitoring wells and surface water	See decision rules/operational framework in Figure 2.2-8.	Limit decision error through: - A multiple lines of evidence evaluation of plume control (Section 4.3).	See Section 4.3
Freshwater Injection							
1	Freshwater injections will be operated to facilitate flushing of the hexavalent chromium plume through the NTH IRZ and to contain carbon-amended water and in-situ by-products from the inner recirculation loop	Should freshwater injection well operations be modified to facilitate flushing of the hexavalent chromium plume and inner recirculation loop carbon-amended injection water?	Water level data from across the site and analytical data from freshwater injection observation wells (Figure 2.2-1, Table 2.1-3)	Project Area	See decision rules/operational framework in Figure 2.2-9.	Limit decision error through: - Placement of monitoring wells within the plume in locations to collect data on flushing of hexavalent chromium concentration trends (Figure 2.2-1, Table 2.1-3). - Sampling collection frequency based on solute transport modeling predictions (Table 2.1-3, 2.1-4, 2.1-5). - Evaluation of timeframe predictions based on model re-calibrated with installation and operational data.	See Section 4
2	Freshwater injection will be operated to manage migration of arsenic injected from the freshwater source.	Should injection operations be modified to manage migration of arsenic injected from the freshwater source?	Dissolved arsenic concentrations collected from the freshwater arsenic monitoring wells (Table 4.2-1).	Vicinity of injection wells receiving freshwater.	See decision rules/operational framework in Figure 2.2-9.	Limit decision error through: -sampling at specified distances 150 and 225 feet from injection locations, where possible (Section 4.2.7, Table 2.1-2)	Monitoring network based on modeling per State Board letter dated November 20, 2013.
3	The freshwater source will be monitored for changes in water quality over time.	Has there been a change in water quality in the freshwater source such that the agencies should be notified?	Freshwater source water quality data (Section 4.2.6)	Freshwater pipeline	See Figures 2.2-10 and 2.2-11	Limit decision error through: -Collection of quarterly to biannual samples from the freshwater source (Section 4.2.6) -Establishment of action levels (Figure 2.2-10)	See Section 4.2.6

Notes:
Sampling program will be re-evaluated after two years of operation.
[1] Dose Response Wells are defined as within the carbon footprint as predicted by the fate and transport model.
[2] Baseline data indicate no detectable nitrate.
[3] If associated injection well is amended with carbon
[4] A deeper boring and replacement monitoring well will be constructed at this location if the alluvium is deeper in this area.
[5] Well was influenced by historical in-situ pilot testing and may be sampled periodically to evaluate persistence of byproducts/reducing conditions.
[6] Two wells MW-45-095a and MW-45-095b exist at this location and are screened within the same interval. MW-45-095a is currently active and MW-45-095b is considered inactive.
[7] Well is currently inactive.
[8] As approved in the first quarter of 2013, packers have been removed and single zone micro-purge sampling is being performed at 165 feet in MW-58BR and at 255 feet in MW-64BR.
[9] If sampling at TW-1 fails to provide adequate data, TW-1 will be removed from the monitoring program in the future and, if necessary, replaced.
[10] Parentheses (X) indicate hexavalent chromium has previously been detected at concentrations greater than 32 micrograms per liter at this location.
[11] Ammonium and nitrite will be monitored for the first year. If not detected within the first year of monitoring, sampling for these analytes will be discontinued. If increases in ammonium or nitrite concentrations are detected in dose response wells, recommendations for continued sampling and potential expansion of the monitoring network for these analytes will be provided.
[12] Pending/future provisional

Frequencies:
T: Potentially monitored continuously via transducer
M: Monthly
Q: Quarterly
SA: Semi-Annually
A: Annually
BE: Biennially
(yr): Frequency for the first year/month/quarter, frequency reduction to be considered thereafter

SW-2 (East Ravine)	Riverbank and East Ravine Extraction	Q	SA	Q (Mn, As)	Q

Notes:
Asterisk (*) indicates Cr(VI) has previously been detected at concentrations greater than 32 micrograms per liter at this location.

[1] Sampling program will be re-evaluated after two years of operation.

[2] Timeframes are based on nominal baseline values and current solute transport model predictions. These estimates may be updated as the system is installed and baseline sampling is conducted, and continually adjusted during the remedy as the solute transport model is refined. The basis for these ranges and maximum thresholds are described in the text.

[3] Unless otherwise indicated, sampling frequencies are based on the Process Control Monitoring Program sampling frequencies.

[4] Based on Process Control Monitoring Program sampling frequency for analytes other than Cr(VI) and Cr(T).

[5] Based on current sampling frequency

[6] Not regularly sampled currently and not in Process Control Monitoring Program for sample collection.

[7] Based on anticipated treatment timeframe

[8] A deeper boring and replacement monitoring well will be constructed at this location if the alluvium is deeper in this area.

[9] Two wells MW-45-095a and MW-45-095b exist at this location and are screened within the same interval. MW-45-095a is currently active and MW-45-095b is considered inactive.

[10] Well is not operational.

[11] As approved in the first quarter of 2013, packers have been removed and single zone micro-purge sampling is being performed at 165 feet in MW-58BR and at 255 feet in MW-64BR.

Frequencies:
T: Potentially monitored continuously via transducer
M: Monthly
Q: Quarterly
SA: Semi-Annually
A: Annually
BE: Biennially
(yr): Frequency for the first year

Analytes:
Cr(VI): Chromium (VI)
Cr(T): Total dissolved chromium
Mn: Manganese
As: Arsenic

Notes

CW-02D	Blue highlight indicates wells included in the COPC Perimeter Assessment Plan (PAP)
A	Gray highlight indicates avg. concentration above threshold (10 mg/L for Nitrate, 70 ug/L for Molybdenum, 50 ug/L for Selenium).
SA	Gray font indicates wells monitored for nitrate under compliance or process control programs, at frequency indicated.

Note – although more frequent monitoring may occur at some wells, the minimum monitoring frequency for all PAP wells is annually.
Sampling program will be re-evaluated after two years of operation.

PG&E Topock Compressor Station, Needles, California

Location ID	Nitrate	Molybdenum	Selenium

[1] Dose Response Wells are defined as within the carbon footprint as predicted by the fate and transport model.

[2] Baseline data indicates no detectable nitrate.

[3] If associated injection well is amended with carbon

Frequencies:

M: Monthly

Q: Quarterly

SA: Semi-Annually

A: Annually

Freshwater Injection						
Arsenic Monitoring Wells	N/A	N/A	N/A	150 ft: 10-12 ppb 225 ft: <10 ppb	---	Injected water: months Arsenic: no arrival predicted

Notes:

[1] Concentration ranges and arrival/attenuation timeframes are based on nominal baseline values and current solute transport model predictions. These estimates may be updated as the system is installed and baseline sampling is conducted, and continually adjusted during the remedy as the solute transport model is refined. The basis for these ranges and maximum thresholds are described in the text.

[2] Concentration ranges and maximum thresholds do not apply to individual wells that already exhibit natural baseline levels above the given ranges/thresholds.

[3] Total organic carbon concentration range applies to dose response wells midway between injection points. Higher concentrations are anticipated in the immediate vicinity of injection wells depending on injection concentrations.

[4] Greater than 10 year byproduct arrival time expected for more distant wells, such as MW-43, MW-52, and MW-53.

[5] Range does not apply to Arizona wells MW-54, MW-55, and MW-56, which are not anticipated to receive byproducts.

[6] Solute transport modeling for iron was not conducted. It is therefore assumed that iron will follow concentration trends similar to manganese, which is a conservative assumption given that iron typically attenuates more quickly than manganese downgradient of an in-situ reactive zone.

[7] Note that the anticipated concentration range and maximum for dissolved arsenic, as listed in this table, are exclusive of monitoring wells located in the vicinity of FW-2 (MW-09 and MW-II). Simulated arsenic concentrations at these locations (MW-09 and MW-II) are impacted by naturally occurring arsenic levels in injected freshwater.

HYDRAULIC CONTROL EVALUATTION

2. Adjust flow model per model update schedule[3]. Use all available lines of evidence to evaluate hydraulic control per Section 4.3

3. Are Cr(VI) and/or byproducts controlled by the northern NTH IRZ and River Bank Extraction Wells (see also Figure 2.2-5)?

YES

NO

ADAPTIVE MANAGEMENT IMPROVEMENT PROCESS

4. Evaluate/implement operational modifications.[1]

SHORT TERM

LONG TERM

5. Adjust NTH IRZ or riverbank extraction rates (see also Figure 2.2-5)

6. Add future provisional extraction wells

7. Can NTH IRZ Injection Wells (for NTH IRZ extraction) or IRL injection wells (for Riverbank extraction) accommodate increased flow?

NO

SHORT TERM

8. Rehabilitate injection wells[1]

9. Adjust the flow balance across the system[1]

LONG TERM

10. Bring future provisional injection wells online[1]

11. Is injection capacity now adequate?

NO

YES

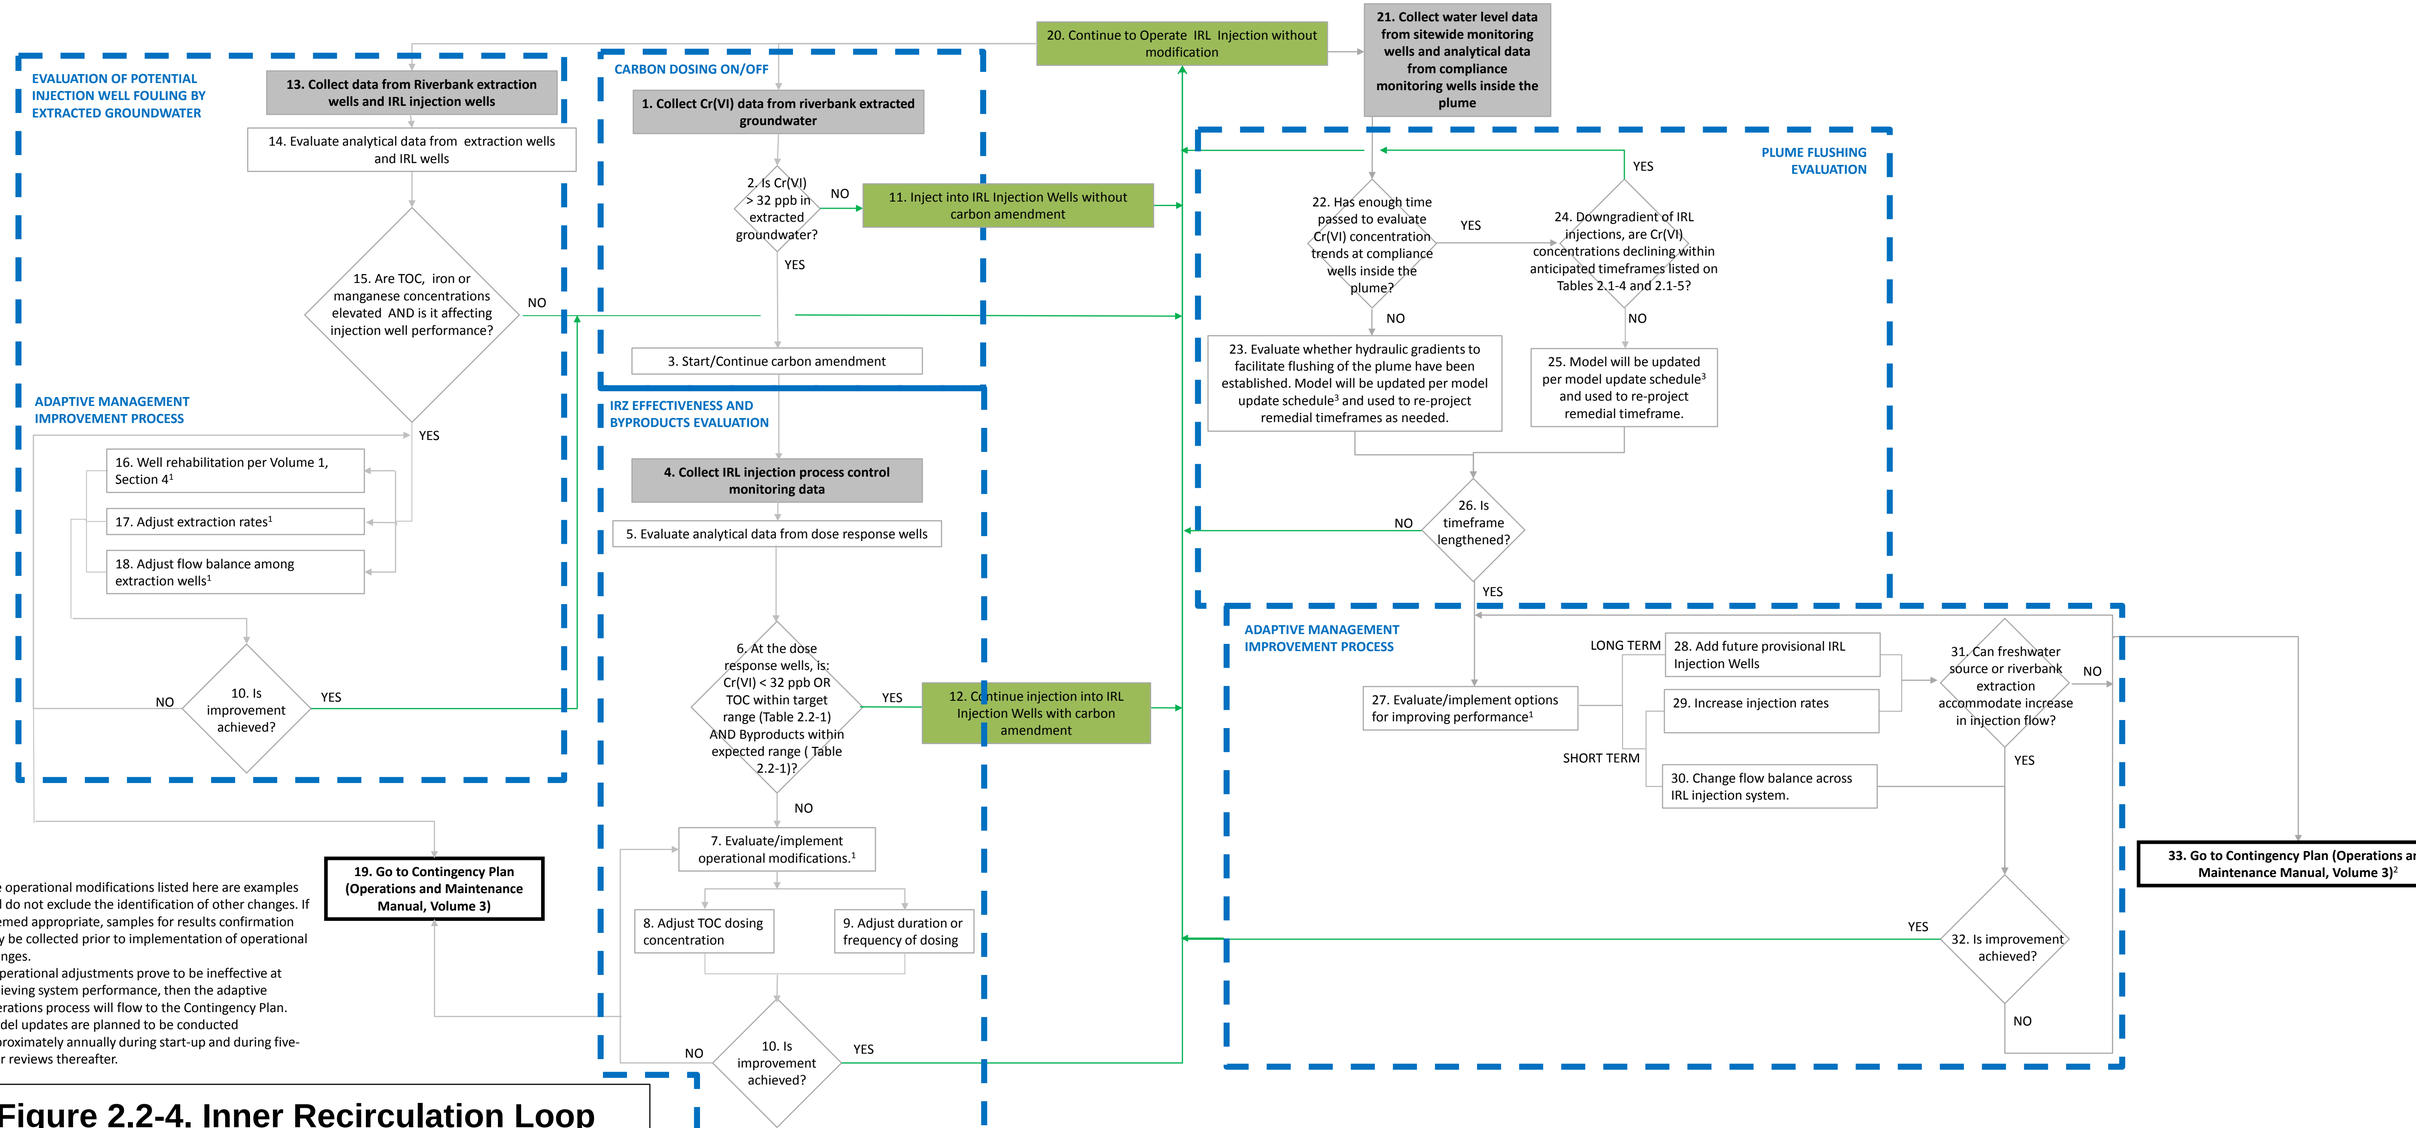
YES

12. Is extraction performance improvement achieved (see Box 3)?

YES

NO

14. Go to Contingency Plan (Operations and Maintenance Manual, Volume 3)[2]



Notes:
1.The operational modifications listed here are examples and do not exclude the identification of other changes. If deemed appropriate, samples for results confirmation may be collected prior to implementation of operational changes.
2. If operational adjustments prove to be ineffective at achieving system performance, then the adaptive operations process will flow to the Contingency Plan
3. Model updates are planned to be conducted approximately annually during start-up and during five-year reviews thereafter.

SECTION 3

Remedy Compliance Monitoring

As described in Section 2, groundwater and surface water will be periodically sampled to ensure that RAO-2, -3, and -4 are being met as part of the compliance monitoring program. This section will describe the sampling locations, anticipated changes in concentrations and timeframes, and sampling analytes and frequencies for the monitoring program.

3.1 Monitoring Locations, Anticipated Concentration Changes, and Timeframes

The compliance monitoring program will include pre-existing monitoring wells, 35 proposed future monitoring wells, and surface water sampling locations. For the compliance monitoring program, monitoring wells and surface water sampling locations are shown on Figures 2.1-1 and 2.1-2, respectively, and listed in Tables 2.1-2 and 2.1-3. Monitoring well locations are also located on maps representing the current Cr(VI) plume, at different depth intervals, in Figures 3.1-1, 3.1-2, 3.1-3, and 3.1-4. Figures 3.1-5, 3.1-6, 3.1-7, and 3.1-8 show the well network overlaid with the predicted manganese distribution at 30 years. Figures 3.1-9, 3.1-10, 3.1-11, and 3.1-12 show the well network overlaid with the predicted arsenic distribution at 30 years. Predicted manganese and arsenic distributions are based on the results of the base case solute transport model, described in Appendix B of the Final BOD. This section describes the optimized monitoring program for the Compliance DQOs detailed in Section 2.1.

The surface water sampling network includes ten river channel sampling points, four shoreline sampling points located along the Colorado River, and two surface water sampling points in the East Ravine. In-channel surface water samples are collected with a peristaltic pump from a boat at two depths: 1 foot from the river bottom and 1 foot from the water surface. Shoreline samples are collected with a bailer or sampling pole from 4 to 6 inches below the water surface. These details are described in the Depth-Specific Surface Water Sampling SOP (SOP-A4). These locations are currently being sampled quarterly as part of the ongoing Interim Measures Performance Monitoring Program; therefore no new locations are being proposed. Locations C-NR1, C-NR3, C-NR4, C-CON, and RRB are located upriver from the site, with C-CON and RRB capturing the potential effects of small surface water inlets to the main channel. Similarly, C-MAR is located at the outlet of the Topock Marsh to characterize surface water inputs that may affect water quality downstream of the site. Shoreline and river channel sampling points R-19, R-28, R-63, C-R27, C-BNS, and C-R-22A are located on the river bank or in the channel downgradient of the River Bank Extraction Wells and the TCS Recirculation Loop East Ravine Extraction Wells. Finally, river channel points C-I-3 and C-TAZ will be sampled to monitor for changes in river chemistry in the body of the river channel directly downstream of the site.

The outer compliance monitoring well network consists of wells that lie outside of the Cr(VI) plume boundary, defined as the 32 μg/L Cr(VI) concentration contour (Figure 2.1-1, Table 2.1-3), based on the most recent groundwater monitoring data. The outer compliance well network has been designed to obtain adequate coverage surrounding the plume, while taking full advantage of the pre-existing monitoring well network and minimizing the need for additional wells. New monitoring wells proposed as part of the Process Control Monitoring Program (Section 4) will also be used for compliance monitoring. The majority of the existing wells are located on the eastern portion of the site within the floodplain, downgradient of the Cr(VI) plume, since this area will need to be monitored most intensively to assess the potential Cr(VI) plume migration into the river. Outer compliance wells are also located to the northwest of the plume, in the vicinity of the IRL and freshwater injection areas (Figure 2.1-1). Other regions to the north, west, and south of the plume do not have high well densities due to a lack of suitable installation areas (e.g., culturally-sensitive land to the northwest and complex topography and access restrictions in the southwest).

The outer compliance wells will be sampled for Cr(VI) and Cr(T) to evaluate RAO 3. In addition, several of the outer compliance wells and surface water points will also be sampled for by-products. All of the river bank

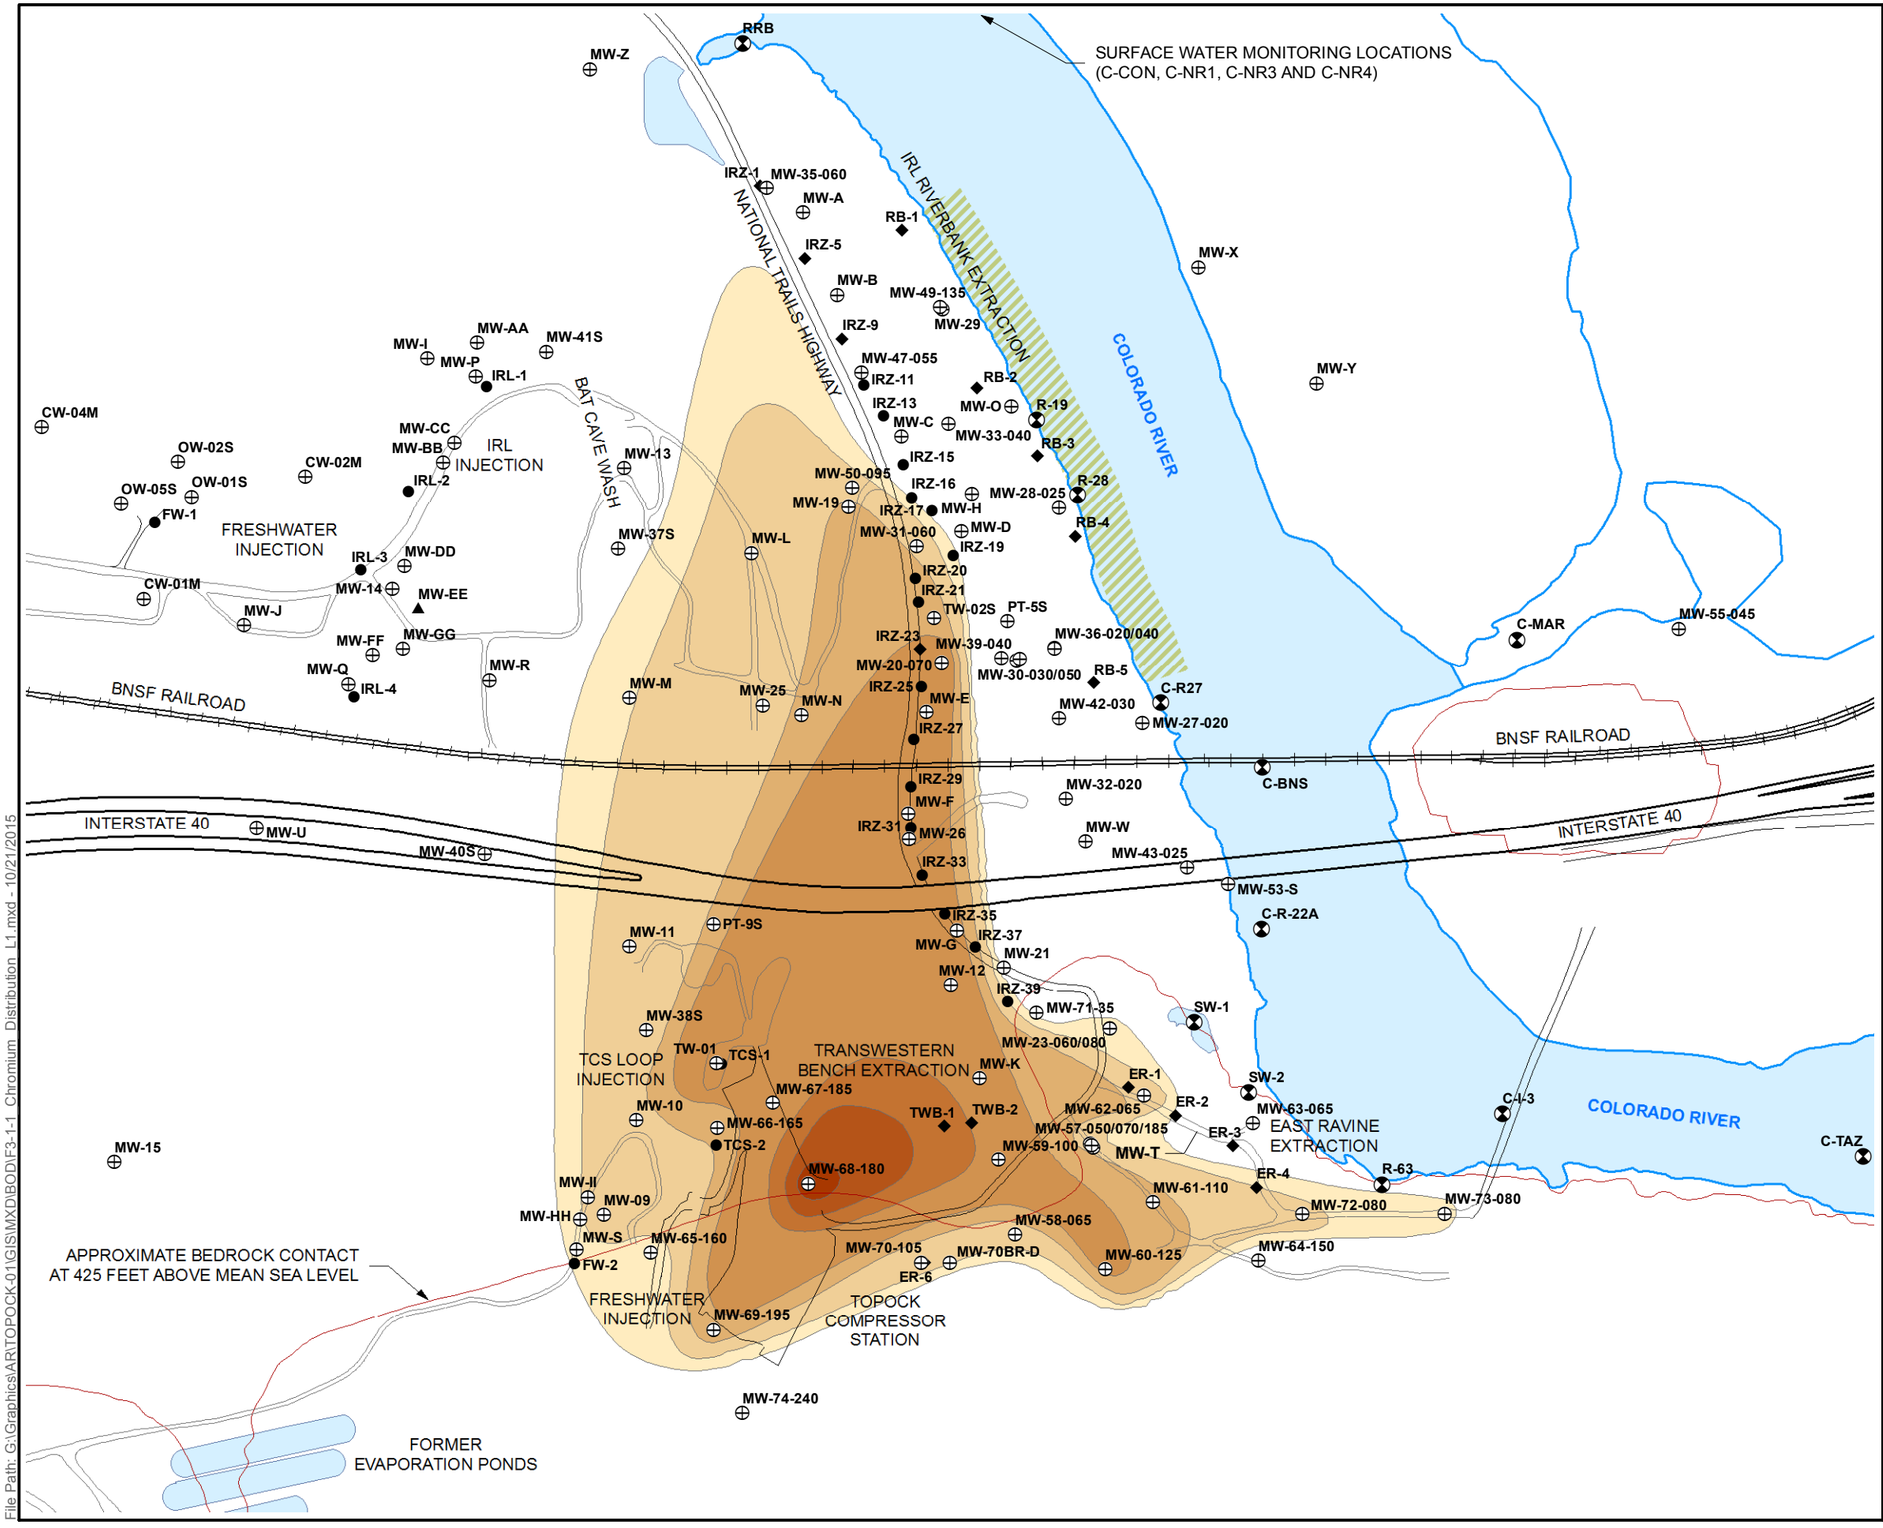
extraction monitoring wells listed within the Process Control Monitoring Program will be sampled for manganese and arsenic as part of the Compliance Monitoring Plan; anticipated by-product concentrations and arrival timeframes for this area are discussed in Section 4. By-products will also be monitored in wells in the vicinity of the IRL injection wells northwest of the plume. Solute transport model results indicate that arsenic and/or manganese generated by IRL injections will not reach these wells within the remedial timeframe; therefore the wells will be monitored to assess this prediction (manganese predictions shown with monitoring well network on Figures 3.1-5 through 3.1-8). Outer compliance wells closer to injection points, located in the vicinity of the IRL Injection Wells (Figure 2.1-1), will be monitored to assess the likelihood of arsenic and manganese concentrations exceeding anticipated ranges as determined by solute transport model results. Anticipated by-product concentrations and arrival timeframes for these wells are discussed in Section 4.

The inner compliance network consists of wells that currently lie inside of the Cr(VI) plume boundary based on the most recent groundwater monitoring data. These wells are also shown on Figure 2.1-1 as well as Figures 3.1-1, 3.1-2, 3.1-3, and 3.1-4. Wells from across the site within the plume will be used to monitor Cr(VI) concentrations as the remedy proceeds and demonstrate removal of Cr(VI) and Cr(T) from groundwater. To increase spatial coverage within the center of the plume where the existing monitoring well network did not provide coverage, new monitoring well locations are being proposed as part of the Compliance Monitoring Program (including MW-L, MW-M, and MW-N; Figure 2.1-1, Table 2.1-2). As the Cr(VI) plume shrinks, wells will potentially be re-categorized as outer compliance monitoring wells, and their functions will change accordingly. In this way, the compliance well network will evolve as the remedy proceeds.

The currently anticipated Cr(VI) remediation timeframe for the well classifications is listed in Tables 2.1-4 and 2.1-5. The anticipated concentrations and timeframes are based on nominal baseline values and current solute transport model predictions, as presented in Appendix B of the Final BOD. These estimates will be updated as the system is installed and as baseline sampling is conducted. The estimates will also be adjusted during remedy implementation as data are collected during operations and the solute transport model is refined. Model updates are planned to be conducted approximately annually during start-up and during five-year reviews thereafter. Cr(VI) remediation timeframes vary from less than six months for wells in the vicinity of carbon injection points, to approximately 30 years for zones just upgradient of the IRZ that will be the last to be flushed as the plume is flushed towards the NTH IRZ line.

3.2 Sampling Analytes and Frequencies

Sampling analytes and frequencies for the Compliance Monitoring Program are summarized in Table 2.1-3. The sampling program presented is an initial program. As data are collected during remedy installation and initial operations, the conceptual site model (CSM) will be updated. The monitoring program may be refined based on baseline data prior to remedy operation, and the sampling program will be revisited and refined after the first two years of operation.



All compliance monitoring wells and surface water sampling locations will be sampled for Cr(VI) and Cr(T). Field sampling will follow the protocol outlined in Section 7 of this plan and will also include collection of field parameters (pH, DO, ORP, temperature, and specific conductance). Regardless of sampling frequency specified in the Compliance Monitoring Program, baseline data will be collected from all monitoring wells in the program for the full suite of analytes listed in Table 4.2-1 in Section 4 where these data do not already exist or have not been collected within the past two years.

For wells that are also sampled for process control monitoring, the sampling frequencies follow the frequencies proposed within the Process Control Monitoring Program (Section 4; see Table 4.2-1). Outer compliance wells that are not part of the Process Control Monitoring Program will either be sampled annually or at their current sampling frequency, as outlined in Table 2.1-3. Inner compliance wells not within the Process Control Monitoring Program will be sampled at the frequency listed in Table 2.1-3, depending on the anticipated Cr(VI) concentration trends as summarized in Tables 2.1-4 and 2.1-5.

Water level measurements will be collected at all locations on a quarterly basis for comparison against groundwater flow model predictions. The frequency of water level collection will be re-assessed after the first two years of operation. These results will be used to measure hydraulic gradients and directions as lines of evidence in the assessment of hydraulic plume control, as discussed in Section 4.3. In addition, water levels will potentially be monitored on a continuous basis via in-well transducers in specific wells noted on Tables 2.1-2 and 2.1-3. These wells are selected based on their assigned function within the groundwater remedy.

Outer compliance wells near and downgradient of carbon injection points will be monitored for the IRZ by-products manganese and arsenic to assess whether concentrations remain within expected ranges. Monitoring frequencies will follow the same frequencies outlined for Cr(VI).

Locations, analytes, and sampling frequencies within the Compliance Monitoring Program overlap substantially with the Process Control Monitoring Program, outlined in Section 4. In these cases, the same analytical results are intended to be used for both compliance and process-control monitoring.

SECTION 4

In-Situ Remediation Performance Monitoring

Process control monitoring will involve sampling of groundwater and surface water to verify that the different components of the remedy are functioning as anticipated and to guide adaptive operations. The following sections describe the locations and functions of different monitoring wells, the construction of new monitoring wells, analytes to be monitored and their collection frequencies, and anticipated concentration changes and timeframes.

4.1 Anticipated Concentration Ranges and Timeframes

To guide the operations of the remedy, this section will establish the anticipated timeframes over which changes in concentrations of Cr(VI), by-products, and other water quality parameters is expected to occur. These expectations are based on solute transport modeling completed in support of the design, as summarized in Appendix B of the Final BOD. The anticipated concentrations and timeframes are based on nominal baseline values and current solute transport model predictions. These estimates will be updated as the system is installed and as baseline sampling is conducted. The estimates will also be adjusted during remedy implementation as data are collected during operations and the solute transport model is refined. Model updates are planned to be conducted approximately annually during start-up and during five-year reviews thereafter. The timeframes set forth will be also used to evaluate progress toward achieving RAO 3 regarding reduction of Cr(VI) and Cr(T) mass in groundwater, in accordance with compliance DQO-2. The anticipated concentrations and timeframes will also serve as triggers for implementing adaptive operations as laid out in the decision rules/operational flowcharts in Section 2.2.

Table 2.2-1 summarizes the anticipated timeframes for the arrival of the treated groundwater for various components of the Process Control Monitoring Program. These estimates were based on the solute transport modeling and provide part of the basis for the sampling frequencies of the Process Control Monitoring Program.

For the IRZ portions of the remedy, Table 2.2-1 also summarizes the predicted concentration ranges and timeframes for TOC that will be distributed by in-situ injections and for by-products (arsenic, iron, and manganese) that will be generated by in-situ treatment. Note, barium concentrations are not predicted and are not anticipated to be significant unless strong sulfate reducing conditions develop.

In addition to anticipated concentration ranges for by-products, Table 2.2-1 also lists maximum concentrations in parentheses for manganese, iron, and arsenic. The purpose of these thresholds is to provide flexibility for individual wells that may exhibit behavior deviating from the average. Although it is expected that the majority of the wells will exhibit by-product concentrations within the anticipated ranges, it is possible that any given well may exhibit deviations outside of those ranges based on spatial variability in the hydraulic and geochemical characteristics of the aquifer that may cause locally high by-product concentrations. If a relatively small number of monitoring wells fall above the anticipated range but below the maximum, operational adjustments may not be necessary as long as the majority of the wells still fall within the anticipated range.

TOC

TOC will be analyzed to evaluate the distribution of organic carbon substrate in the subsurface within the IRZs. For dose response wells located at the midpoint between injection locations along the NTH IRZ, TOC concentrations of 15 to 50 milligrams per liter (mg/L) are targeted. For monitoring wells located closer to injection points within the NTH IRZ, IRL injection area, and TCS injection area, higher concentrations are anticipated and may exceed the average target injection concentrations depending on how continuously the substrate is applied. TOC arrival, and Cr(VI) removal, are anticipated to be observed in dose response wells generally within the first six months of operation.

Arsenic

Baseline concentrations and anticipated concentration ranges for arsenic are given in Table 2.2-1. The anticipated ranges are based on a combination of generalized baseline concentrations and solute transport model predictions. The simulated arsenic concentrations considered in this analysis for the IRZs are a function of by-product generation from carbon injections into the IRZs and are independent from arsenic concentrations associated with the freshwater source (HNWR-1A) that will be injected into the upland injection wells receiving fresh water. Solute transport model results used in determining anticipated concentration ranges included the base-case parameter model run (i.e., all parameters for sorption, precipitation, and generation are set at their nominal values) and one sensitivity model run testing an increased arsenic generation rate (Appendix B of the Final BOD). Some wells exhibit baseline concentrations above these ranges and are anticipated to remain above the anticipated ranges during remedy implementation.

At freshwater injection locations—assumed to include FW-1, FW-2, IRL-3, and IRL-4 for the nominal design scenario—levels of naturally occurring arsenic in the freshwater source were also considered and simulated. The modeling results indicate that arsenic levels from freshwater injection generally remain at concentrations less than the injected concentration beyond 150 feet from injection locations (Figures 3.1-9 through 3.1-12). Model results indicate arrival of arsenic at concentrations at the injected concentration at some 150-foot monitoring locations toward the end of the modeled timeframe. For comparison against baseline data and model predictions, concentration maps for arsenic will be prepared periodically using color dots or concentration shading to illustrate the distribution of this by-product in groundwater.

NTH IRZ monitoring wells. Although arsenic concentrations are expected to increase due to IRZ operations, arsenic is expected to attenuate rapidly outside of the IRZ footprint. In NTH IRZ dose response wells, concentrations are expected to be between 2 and 10 μg/L, with a maximum of 15 μg/L. This concentration range accounts for background values in the 2 to 5 μg/L range, combined with maximum modeled arsenic concentrations between 5 and 10 μg/L in the immediate vicinity of injection wells (based on the base-case modeling runs, as well as the increased-generation sensitivity runs presented in Appendix B of the Final BOD). Downgradient of the IRZ, by-product arsenic concentrations are not expected to exceed 5 μg/L; however, baseline concentrations are higher in some locations due to the naturally reducing conditions within the floodplain. A similar anticipated concentration range of 2 to 10 μg/L is expected for most wells, based on observed baseline concentrations and uncertainty in how those baseline concentrations may change as Interim Measure No. 3 pumping is switched off and the flow regime changes. Timing of by-product arrival in dose response wells is expected to roughly coincide with TOC arrival (generally within the first six months of operation).

The anticipated concentration range is lower in river bank extraction monitoring wells (2 to 5 μg/L for most wells, with a maximum of 8 μg/L), since no by-product arsenic is expected to reach these wells, and since baseline concentrations are generally lower than in the mid-floodplain.

TCS injection monitoring wells. Since similar TOC concentrations will be used in the NTH IRZ and TCS Recirculation Loop injections, a similar concentration range for arsenic of 1 to 10 μg/L is expected in the TCS Recirculation Loop dose response wells, while arsenic is not expected to increase significantly above baseline in downgradient monitoring wells (MW-67 cluster; Table 2.2-1).

Iron and Manganese

Anticipated concentration ranges for iron and manganese are based on a combination of generalized baseline values and by-product concentration predictions determined from solute transport modeling. Solute transport model results used in determining anticipated concentration ranges included the base-case parameter model run and parameter sensitivity analysis runs, including a run with an increased manganese generation rate and a run considering TOC injection in the IRL, as described in Appendix B of the Final BOD. Solute transport modeling for iron was not conducted. It is therefore assumed that iron will follow concentration trends similar to manganese, which is a conservative assumption given that iron typically attenuates more quickly than manganese downgradient of an IRZ. For comparison against baseline data and model predictions, concentration maps for iron

and manganese will be prepared periodically using color dots or concentration shading to illustrate the distribution of this by-product in groundwater.

Dose response wells. Based on the solute transport modeling results, including the base-case parameter run (Figures 3.1-5 through 3.1-8) and the increased-generation parameter sensitivity run (Appendix B of the Final BOD), IRZ dose response wells are expected to see a range in dissolved manganese concentrations between 1 and 2.5 mg/L, with an maximum concentration of 5 mg/L. As described above, this maximum value reflects potential spatial variability in hydraulic properties and solid phase manganese distributions within the aquifer. Such variability may cause manganese concentrations in any given well to increase above the anticipated range, even though on average the majority of the wells are expected to lie within the anticipated range. Arrival of TOC and by-products and the treatment of Cr(VI) at these dose response wells is expected within the first six months of operation.

Downgradient and river bank extraction monitoring wells. Monitoring wells downgradient of the NTH IRZ are expected to see a similar range in manganese concentrations, based on baseline and modeled by-product concentrations (base-case and increased manganese generation runs). Manganese and iron concentrations in the vicinity of the IRL Injection Wells will depend strongly on the concentration and duration of TOC dosing. A solute transport model parameter sensitivity run was conducted that included phased TOC injection into the IRL (Appendix B of the Final BOD). Based on this run, manganese concentrations in dose response wells (MW-P, MW-Q, MW-14) are expected within 1 to 2.5 mg/L (maximum of 5 mg/L).

4.2 Sampling Locations, Analytes and Frequencies

Analytes and monitoring frequencies are outlined below according to location and category within the Process Control Monitoring Program. The sampling program presented is an initial program optimized for the process control DQOs detailed in Section 2.2. As data are collected during remedy installation and initial operations, the CSM will be updated. The monitoring program may be refined based on baseline data prior to remedy operation, and the sampling program will be revisited and refined after the first two years of operation.

All sampling events, regardless of the analytes being sampled, will also include collection of field parameters (pH, DO, ORP, temperature, and specific conductance). Field sampling will follow the protocols outlined in Section 7 of this manual. Regardless of sampling frequency specified in the Process Control Monitoring Program, baseline data will be collected from all monitoring wells in the program for the full suite of analytes listed in Table 4.2-1 where these data do not already exist or have not been collected within the past two years.

4.2.1 IRZ, IRL, and TCS Dose Response Monitoring Wells

Wells that will receive organic carbon injections as part of the IRZ remedy will include NTH IRZ Injection Wells (Figure 2.2-1), TCS Injection Wells (TCS-1 and -2), and potentially the IRL Injection Wells (IRL-1 through -4). Dose response monitoring wells are identified (Table 2.1-2) within the immediate vicinity of these IRZ injection wells, within the anticipated IRZ footprint. The dose response wells are used to verify that the NTH IRZ is completely established and that Cr(VI) treatment is initiated and maintained over time.

To establish the NTH IRZ, the organic carbon substrate will be distributed laterally from the injection points. Monitoring wells located in between the injection points will be used to assess the completeness of the organic carbon distribution and/or establishment of Cr(VI) reducing conditions. It will be the most difficult to establish the IRZ at locations roughly halfway between the injection points given that these locations are the farthest from the injection points. As such, additional monitoring locations (MW-C, -D, -E, -F, and –G) are proposed in the spaces between approximately every other pair of injection wells. The placement in every other space allows for data collection along the full extent of the IRZ, providing a balance in data density appropriate for evaluating the effect of potentially varying hydrogeological environments while minimizing the total number of locations required (i.e., the number of boreholes would be roughly doubled if a monitoring well was placed between every space). In addition, many pre-existing monitoring wells in the near vicinity of injection wells (within approximately 60 feet) will be used to provide additional data on TOC distribution, Cr(VI) treatment, and by-product generation closer to the injection points where reducing conditions are expected to be stronger and develop faster.

For the IRL Injection Wells, organic carbon will be amended if Cr(VI) concentrations in the injection water are above 32 μg/L. New monitoring wells (MW-P and MW-Q) will be installed within 50 to 100 feet of the injection wells to monitor water levels, TOC distribution, and by-product generation within the injection zone, and to verify the treatment of Cr(VI). MW-14 located further downgradient of IRL-3 may also be used to monitor dose response, if IRL-3 injections are amended with carbon.

For the TCS IRZ, pre-existing monitoring wells located less than 100 feet from injection wells TCS-1 and -2 will function as dose response wells.

IRZ dose response wells will be monitored for the following constituents:

- **TOC, Cr(VI), and dissolved iron:** These three parameters are critical for monitoring the establishment of the IRZ at the dose response wells. TOC will be sampled to evaluate and verify distribution of organic carbon substrate in subsurface, Cr(VI) will be sampled to evaluate reduction of Cr(VI), and dissolved iron will be sampled to evaluate the generation of the Cr(VI) reductant ferrous iron through the stimulation of iron reduction. As discussed in Section 4.1, the changes at the dose response wells are anticipated to happen within the first six months of operation. As such, at the NTH IRZ, where IRZ establishment and maintenance is most critical (see NTH IRZ DQO-2), dose response well monitoring will be conducted monthly for the first year, which is planned to include a six-month period of operation followed by a six-month period of shutdown. If results are within expectations, the sampling frequency may be reduced to quarterly thereafter. For the TCS Recirculation Loop and the IRL, the dose response well monitoring frequency will be quarterly, less than for the NTH IRZ given the less critical nature of establishing a complete IRZ in these areas. Given the timeframes required for the establishment of microbial communities and the transport of injection reagents and by-products from the injection wells to the dose response wells, monitoring more frequently than monthly at the dose response wells will likely not be necessary. However, more frequent sampling may be considered within the first year if it is deemed valuable based on the initial results obtained at dose response wells.
- **Cr(T):** This parameter will be sampled to verify that chromium is precipitating out of groundwater following reduction. Results to date have not indicated any issues with precipitation of Cr(III) formed by reduction, and as such the Cr(T) sampling frequency is less than the Cr(VI) sampling frequency (i.e., quarterly for the first year, followed by semi-annually for the IRZ dose response wells).
- **In-situ by-products (arsenic, manganese, iron, barium):** These parameters will also be monitored at the dose response wells to evaluate by-product generation and to refine the estimates used to predict by-product generation in the solute transport model (see Appendix B of the Final BOD). By-products are also an indication of the establishment of reducing conditions. Sampling for by-products will be conducted at the same frequency as sampling for TOC and Cr(VI). As noted above, sampling more frequently than monthly during startup will likely not be useful given transport timeframes, but may be considered if deemed valuable based on the results obtained.
- **Nitrate:** The removal of nitrate from solution is a primary indicator of the establishment of reducing conditions that are sufficient for the reduction of Cr(VI). Nitrate is a good indicator of the arrival of treated water and may provide information on whether the hydraulics of injection versus the amount of organic carbon delivered is controlling treatment effectiveness. In general, nitrate will be sampled at the same frequency as TOC and Cr(VI) in the IRZ dose response wells.
- **Sulfate:** Sulfate will be monitored at the same frequency as TOC, Cr(VI), and in-situ by-products in the NTH IRZ dose response wells to ensure that the reducing environment is such that excessive sulfate reduction and release of barium does not occur.
- **General water quality parameters:** Cations and anions may be useful to evaluate the potential for mineral deposit formation and may serve as tracers of injected solution. Alkalinity may be measured to monitor changes due to microbial activity and the potential for mineral deposits formation, i.e. as carbonate minerals. Total dissolved solids (TDS) may be measured as an additional water quality indicator for evaluation of

changes in water chemistry. These parameters may be used to answer specific questions that arise, but will not be monitored on a routine basis at dose response wells to ensure the effectiveness of the IRZs.

- **Other nitrogen compounds:** In addition, nitrite and ammonium (potential by-products of incomplete nitrate reduction and ammonification, respectively) will also be sampled at dose response wells where reactions producing these analytes could potentially occur. If no ammonium or nitrite is detected within the first year of monitoring, sampling for these analytes will be discontinued. If increases in ammonium or nitrite concentrations are detected in dose response wells, recommendations for continued sampling and potential expansion of the monitoring network for these analytes will be provided.

4.2.2 IRZ, IRL, and TCS Downgradient Monitoring Wells

For the NTH IRZ, downgradient monitoring wells (Figure 2.2-1; Table 2.1-2) will be on the edge or outside of the anticipated TOC footprint to observe downgradient Cr(VI) and by-product concentration trends. Downgradient of the NTH IRZ line, downgradient monitoring wells are located midway between the NTH and the river bank, running roughly along a north-south transect. Existing monitoring wells will provide adequate downgradient coverage, with the exception of: the region between IRZ-17 and extraction well RB-3 where well MW-H is being proposed; and the area west of the southern portion of the IRZ line where MW-W is being proposed.

For the IRL IRZ, downgradient monitoring wells will be located within 300 to 900 feet downgradient of the IRL Injection Wells. This will include existing well clusters between IRL-1 through -4 and the NTH IRZ line and proposed monitoring wells (MW-R and MW-M) to obtain better downgradient coverage to the southeast, if needed to monitor carbon injections at IRL-4. MW-I and MW-J are being proposed as by-product monitoring wells for the IRL injections. These locations were selected because they were the optimal locations that were located more than 200 feet from injection points upgradient of IRL-1 and IRL-4 on the ends of the IRL injection line. Other locations considered within varying distances and directions from IRL-1 and IRL-4 were not as optimal based on topographic, access, and cultural considerations. Existing well clusters (CW-02 and CW-03) will also serve as by-product monitoring wells upgradient of the IRL injection points to monitor for Cr(VI) and potential injection by-products.

For the TCS IRZ, the pre-existing well cluster MW-67 will be used to monitor downgradient of the TCS injection zone. Because of the location of the injection wells within the interior of the plume upgradient of the extraction zones, more extensive downgradient monitoring will not be necessary.

Downgradient monitoring wells will be monitored for the following constituents:

- **Cr(VI), nitrate, and Cr(T):** These constituents will be sampled to evaluate the arrival of treated water. The frequency of sampling varies depending on the anticipated arrival of treated water at downgradient wells in the different systems. These wells double as inner compliance monitoring wells, and the anticipated arrival times are summarized in Table 2.1-4 and 2.1-5. Cr(T) will be sampled on a less frequent basis at the downgradient monitoring wells, similar to at the dose response wells.
- **TOC:** This will be sampled to verify the downgradient edge of TOC distribution (NTH IRZ and TCS Recirculation Loop downgradient wells only). Sampling frequency will be the same as for Cr(VI) and nitrate.
- **In-situ by-products:** These constituents will be sampled to evaluate the downgradient migration of by-products generated by the IRZ. Sampling frequency will be the same as for Cr(VI) and nitrate.
- **Sulfate and general water quality parameters:** As for the dose response wells, sulfate and general water quality parameters will be sampled on an as-needed frequency to answer specific questions as they arise.

4.2.3 River Bank Extraction and Northern NTH Extraction Monitoring Wells

The NTH IRZ downgradient monitoring wells (Figure 2.2-1; Table 2.1-2) will also serve as river bank extraction monitoring wells, along with additional proposed and pre-existing wells closer to the river bank. The goal of these wells will be to monitor water levels and water quality specifically as it relates to water that will be extracted by the River Bank Extraction Wells or potentially discharged to the river. As such, the river bank extraction

monitoring program includes newly installed wells and one proposed well located in between River Bank Extraction Wells (MW-O), as well as surface water sampling points to monitor the effects of groundwater discharge on river water quality. Monitoring wells on the Arizona side of the river (existing well clusters MW-54, MW-55, and MW-56, and proposed wells MW-X and MW-Y) will also be included in the river bank extraction monitoring well network. These will serve as sentinel wells to assess the potential for Cr(VI) and by-product concentrations to increase above baseline in this area.

In response to agency comments on the monitoring well network proposed in the 60% design, future provisional locations for angled (i.e., slant) well construction on the California bank of the Colorado River have also been added. As discussed with the agencies during development of the Final BOD (See Section 3.6 of the Final BOD), elevated detections of Cr(VI) in monitoring wells MW-X and MW-Y, which will be constructed on the Arizona side of the river, would trigger a discussion as to whether the slant well(s) should be constructed.

River bank extraction monitoring wells will be monitored for the same constituents as the IRZ downgradient monitoring wells and at a similar frequency. In addition to evaluating the arrival of treated groundwater and by-products, the data from these locations will be used to evaluate hydraulic control and the condition of the reducing rind, as described in IRL DQO-5.

Monitoring wells, including the MW-35 cluster and proposed wells MW-A and MW-B, will be located on the northern end of the NTH IRZ network in the vicinity of extraction wells IRZ-1, -5, and -9. Monitoring in this area, which will focus on Cr(VI) and water levels, will be used to assess hydraulic control of the Cr(VI) plume on the northern end of the NTH IRZ and will be conducted on a monthly basis for the first quarter of operation, as the new hydraulic regime is established, and quarterly thereafter.

4.2.4 Transwestern Bench and East Ravine Extraction Monitoring Wells

As part of the TCS Recirculation Loop, water containing elevated Cr(VI) will be extracted from the Transwestern Bench and East Ravine areas. The monitoring network (Figure 2.2-1; Table 2.1-2) will primarily include pre-existing wells surrounding the extraction wells on all sides within approximately 500 feet. MW-K is proposed to enhance monitoring coverage to the east of the Transwestern Bench extraction. A piezometer (MW-T) will be located along the line of East Ravine Extraction Wells.

Wells will be sampled on a quarterly basis for Cr(VI) and on a semi-annual basis for Cr(T). More distant wells will also be monitored, including MW-73-080, which has shown elevated Cr(VI) concentrations, and the Arizona wells, but at a lower frequency.

4.2.5 Extraction Wells

In addition to the monitoring wells, the remedy extraction wells in the NTH IRZ, IRL, and TCS Recirculation Loop will also be sampled as a part of the process control monitoring. Individual extraction wells will be sampled, as well as the combined stream of extracted groundwater. In addition to monitoring for water quality parameters, water level measurements will be collected with a probe in two locations: within the well via a stilling tube and within the filter pack via a piezometer.

Samples collected from the extraction wells and combined extracted groundwater streams will be analyzed for Cr(VI). The data will be used to evaluate hydraulic control of the plume (Section 4.3) and to determine if treatment is required prior to re-injection in the IRL (Section 2.2.2).

Because several of the NTH IRZ Extraction Wells are located close to the injection wells, the extraction wells will be sampled for dissolved and total iron and manganese and TOC which may be extracted from nearby injection locations and which may cause fouling. Oxidation of dissolved iron and/or manganese may form mineral deposits and cause fouling of pipelines and injection wells. Excess TOC can cause biological growth in pipelines and extraction wells, causing fouling.

Additional water quality parameters can be used to evaluate the potential for precipitate formation that could lead to fouling and will be evaluated if needed for troubleshooting.

4.2.6 Combined Extraction Streams and Freshwater Source

Samples for IRL DQO-5 will be collected from the sampling port located in the River Bank Extraction Well network header where it enters the IRZ Carbon Amendment Building, upstream of the static mixer, as shown on Exhibit 2.2-1. Samples for Freshwater DQO-3 will be collected from the freshwater source prior to the injection location. The monitoring program will include a wide range of constituents, both organic and inorganic, that have never been tracked at the Topock site but could be undesirable if present in the injected water. Inorganics will include metals, common anions and cations, total dissolved and suspended solids, stable isotopes of oxygen and hydrogen, et cetera. These analyses provide a means for tracking overall changes in injected water quality with time. Samples will be analyzed for the constituents listed in Table 5.2-4 in Section 5.

Because of the lack of nearby sources, the likelihood of organic contaminants being present in the freshwater source or extracted river bank water is small; therefore, the frequency of analysis for organics and pesticides will be lower than for metals and common ions. Monitoring frequency for the inorganic suite will be monthly for the first six months and quarterly for the remainder of the first year of operation, assuming the water quality is generally stable at that time (if the water quality appears to be changing rapidly, monthly sampling would be continued beyond the first 6 months). Following the first year, monitoring frequency will switch to semi-annual. Monitoring frequency for the organic analytical suite will be annual for the first two years, switching to every other year in subsequent years.

4.2.7 Freshwater Arsenic Monitoring Wells

Freshwater arsenic monitoring wells (Table 2.1-2) are proposed at locations as shown on Figure 2.2-1. Per the State Board letter, these wells are located at 150 and 225 feet, with a few exceptions based on DTSC direction related to accessibility, constructability, and cultural considerations. Existing monitoring wells were utilized, where possible. New monitoring wells are proposed where existing monitoring wells did not exist at the requisite distances from the injection well.

The locations for freshwater arsenic monitoring per the State Board letter requirements are as follows:

- New well location MW-AA will serve as the 150-foot monitoring location for IRL-1.
- Existing well cluster MW-41S/M/D will be used for the 225-foot monitoring location for IRL-1.
- New well location MW-BB will serve as the 150-foot monitoring location for IRL-2. MW-BB was previously presented, in the 90% BOD (CH2M HILL 2014b), as a specific location north of the dirt access road (approximately 90 feet from IRL-2). Subsequent to submittal of the 90% BOD, as presented in the Supplemental 90% submittal (CH2M HILL 2015a), MW-BB was moved to its current location (i.e., onto the access road at the appropriate distance from IRL-2) based on input from the Tribes and agencies, as well as general design concurrence from Southwest Gas. Southwest Gas reserves final concurrence pending the review of final construction plans and their direct observations in the field during construction.
- New well location MW-CC will serve as the 225-foot monitoring location for IRL-2. The location of MW-CC was previously presented, in the 90% BOD, as an area south-southeast of the road. Subsequent to submittal of the 90% BOD, as presented in the Supplemental 90% submittal, the current specific location for MW-CC was selected (i.e., on the access road at the appropriate distance from IRL-2). The change was made based on input from the Tribes and agencies, as well as general design concurrence from Southwest Gas. Southwest Gas reserves final concurrence pending the review of final construction plans and their direct observations in the field during construction.
- New well location MW-DD will serve as the 150-foot monitoring location for IRL-3.
- New well location MW-EE (Figure 2.2-1) is currently under consideration to serve as the 225-foot monitoring location for IRL-3. Since submittal of the 90% BOD, as presented in the Supplemental 90% submittal, the specific location for MW-EE was moved to the south-southeast in accordance with the agencies' direction. As detailed in the December 23, 2014 direction letter (DOI and DTSC 2014), this location is estimated based on

the map presented by the Tribes during the November 18 and 19, 2014 Technical Working Group (TWG) meeting and is a placeholder location pending the review of additional data. MW-EE is a future provisional well dependent on groundwater monitoring data collected from other wells during remedy construction and operation. If MW-EE is directed for construction following the review of data and discussion between PG&E, the agencies, and the Tribes, it will be constructed at either the current location shown on Figures 2.2-1, or at an alternative location that better matches the desired outcome.

- New well locations MW-FF and MW-GG will serve as the 150- and 225-foot monitoring locations, respectively, for IRL-4.
- New well locations MW-HH and MW-II will serve as the 150- and 225-foot monitoring locations, respectively, for FW-2.

Sampling for arsenic will be conducted at these monitoring locations on a quarterly frequency, as indicated in Table 2.1-2.

4.2.8 Carbon Amendment System Sampling Locations

Samples will be collected from sampling points located throughout the carbon amendment system to evaluate its effectiveness. At the MW-20 Bench, the carbon substrate will be fed into four conveyance forcemains (one to the IRL Injection Wells, one to the northern NTH IRZ injection leg, one to the southern NTH IRZ injection leg, and one to the TCS Injection Wells), each equipped with an in-line static mixer. As shown in Exhibit 2.2-1, samples for each line will be collected from sampling ports located just downstream of each mixer (M-IRZ00-0605, M-IRZ00-0606, M-IRZ00-0607, and M-IRZ00-0608). In addition, sampling ports are available within each injection vault to sample the distribution of organic carbon to individual injection well screens (Exhibit 2.2-1), as needed.

4.2.9 Water Level Monitoring

Water levels will be measured in all monitoring wells, injection wells, and extraction wells in support of addressing the hydraulic and hydrogeologic components of remedy assessment. The measurements will be made by in-well pressure transducers and/or manual methods. The wells proposed to have in-well pressure transducers are noted on Tables 2.1-2 and 2.1-3 and selected based on their assigned function within the groundwater remedy. For these wells, water level measurements will periodically be made by manual methods in addition to continuous pressure transducer readings. The water level measurements will be converted to elevations referenced to sea level so that the water levels can be integrated site-wide for interpretation of potentiometric levels and hydraulic gradients. Corrections to the water levels necessary due to salinity and temperature effects will be made as appropriate following standard operating procedures (SOP-A22, Procedures for Calculation of Freshwater Equivalent Heads Standard Operating Procedures for PG&E Topock Program). Tables 2.1-3 and 4.2-1 indicate the frequency of water level measurements.

Monitoring at the site has shown that water levels in monitoring wells located near the Colorado River fluctuate in a sinusoidal pattern with a frequency of approximately one day. Wells located closest to the river exhibit a daily fluctuation magnitude of between 1 and 2 feet per day (compared to a daily river stage fluctuation of up to 3 feet). However, this oscillation does not prohibit assessment of longer-term trends. To do this, averaging of water levels over a selected period of time will be implemented to define a representative water level for assessments including mapping. This will be done for all data from wells located within proximity of the river that produces such effects. The use of pressure transducers in monitoring wells will facilitate the implementation of this method.

4.3 Hydraulic Control Evaluation

4.3.1 Objective and Approach

The objective of RAO 2 is to limit Cr(VI) dissolved in groundwater at the site from migrating into the Colorado River. The remedy addresses this requirement through in-situ remediation and groundwater pumping. The groundwater extraction wells are to be installed as part of the NTH IRZ (River Bank Extraction Wells) and the TCS Loop (East Ravine Extraction Wells). The hydraulic control evaluation is to assess the performance of the

groundwater extraction well element of the remedy. The approach and methodology for this assessment will be consistent with regulatory guidance prepared and distributed by the U.S. Environmental Protection Agency (USEPA), including the document *A Systematic Approach for Evaluation of Capture Zones at Pump and Treat Systems*, dated January 2008 (USEPA 2008).

The approach is considered iterative because assessments will be conducted periodically as additional data are collected as part of performance and compliance monitoring. These additional data will also be used to continually refine the CSM and to make operational improvements to the remedy. Thus, as additional data are collected at the site, additional monitoring locations and/or additional types of information will be identified to address any identified data gaps and ambiguities.

The approach includes these three basic steps consistent with the USEPA guidance:

1. Define what requires hydraulic control in conjunction with the CSM and the RAOs.
2. Interpret the actual zone of hydraulic control.
3. Demonstrate consistency between required control and the actual zone of hydraulic control.

This approach reflects the process of assessing information to determine what requires hydraulic control, analyzing performance data to determine the dimensions of the actual zone of hydraulic control created by groundwater extraction, and assessing whether the requirements are met by the created zone. The ability to perform these steps successfully depends in large part on whether the appropriate information has been collected at the site. These three steps are discussed in the following sections.

4.3.2 Definition of Hydraulic Control Requirements in Conjunction with CSM and RAOs

The current extent of Cr(VI) concentrations in groundwater that exceed 32 μg/L, the regional background concentration, is illustrated in Figure 2.1-1. The RAOs that apply to hydraulic control of Cr(VI) in groundwater are stated in Section 2.1:

> *RAO 2: Prevent or minimize migration of Cr(T) and Cr(VI) in groundwater to ensure concentrations in surface water do not exceed water quality standards that support the designated beneficial uses of the Colorado River (11 μg/L Cr[VI]).*
>
> *RAO 4: Ensure that the geographic location of the target remediation area does not permanently expand following completion of the remedial action.*

Based on RAO 2, one objective of hydraulic control of Cr(VI) in groundwater at the site is to protect the designated beneficial uses of the Colorado River. The degree to which Cr(VI) in groundwater requires containment with respect to the numeric level associated with the designated beneficial uses (11 μg/L Cr[VI]) has not been quantified. However, due to several factors, it can be assumed that the amount of mass of Cr(VI) that could migrate from groundwater into the Colorado River to result in a detectable concentration of Cr(VI) above 11 μg/L would translate to a concentration of Cr(VI) in groundwater significantly above the 11 μg/L surface water quality standard and the 32 μg/L regional background level.

Based on RAO 4, a second objective of hydraulic control of Cr(VI) in groundwater is to protect the groundwater basin as a resource. The groundwater remedy design is a combination of in-situ groundwater treatment and hydraulic control, and is intended to remediate the Cr(VI) plume through implementation of IRZs as well as the hydraulic control in specific areas. While some portions of the Cr(VI) plume (i.e., Cr[VI] concentrations exceeding 32 μg/L) will be controlled by extraction wells, the remedy is designed to treat remaining Cr(VI) greater than 32 μg/L that may not be hydraulically controlled. With this considered, and for the purpose of providing a metric for hydraulic control assessments, the Target Capture Zone will include portions of the Cr(VI) plume that are not reduced by the IRZ, including: (1) where Cr[VI] is greater than 32 μg/L within the floodplain and to the east of the planned IRZ wells; and (2) where Cr[VI] is greater than 32 μg/L within bedrock in the East Ravine area. Note that achieving this metric will not be necessary for groundwater extraction to achieve RAO 2 as discussed herein.

4.3.3 Interpretation of the Actual Zone of Hydraulic Control

Numerous factors influence the resulting dimensions of the actual zone of hydraulic control created by groundwater extraction. These factors indicate the potential complexity of determining the zone of hydraulic control created by groundwater extraction, because the subsurface—and the response to it being stressed by pumping—is complex, due in large part to natural heterogeneities. In other words, interpreting the zone of hydraulic control is difficult due to inherent uncertainties. Consequently, a single line of evidence is not considered sufficient to demonstrate plume control because the uncertainties inherent to any single method are likely too great. Therefore, plume control is best demonstrated through multiple lines of evidence.

There are a number of methods or tools available to assess plume control. Each of these methods is considered a separate line of evidence. The lines of evidence considered for this assessment are grouped into four main categories and are discussed in the following sections.

1. Interpretation of water levels
    - Groundwater flow direction based on water level pairs / three-point gradient analysis and river stage measurements
    - Groundwater flow direction based on water level contour maps (including river stage measurements)
2. Calculations
    - Simple analytical modeling
    - Groundwater discharge comparison: aquifer seepage versus pumping
    - Numerical modeling
3. Concentration trends
    - Contaminant concentrations in wells downgradient of extraction wells
4. Field methods
    - Tracer testing

4.3.3.1 Interpretation of Water Level Data

Lines of evidence involving the interpretation of water levels are the most common for hydraulic control assessments. The particular lines of evidence in this group are: (1) gradient analyses using either well pairs or three-point gradient assessments that can provide information regarding lateral flow directions in the vicinity of extraction wells; and (2) construction of water level contour maps, either hand-drawn or automated, to interpret capture zones.

Water Level Pairs / Three-Point Gradient Analysis

Assessment of water levels via water level pairs is performed to determine a sufficient hydraulic gradient that would be reflective of hydraulic plume control. In order to provide quantifiable metrics for the hydraulic control analysis associated with the river bank extraction wells, groundwater flow model runs were conducted to calculate anticipated average hydraulic gradients for select floodplain monitoring well pairs under differing extraction rate scenarios.

In model layers 3 and 4 (the deep portion of the aquifer where the river bank wells are screened and where the majority of the floodplain Cr(VI) plume exists), 6 well pairs in each model layer were selected to define the expected average hydraulic gradient differences for four scenarios: (1) ambient (non-pumping), (2) nominal river bank extraction (150 gpm), (3) decreased river bank extraction (75 gpm), and (4) increased river bank extraction (300 gpm). In all scenarios, the simulated flow conditions had the NTH IRZ turned off as this is the remedy operating condition for 75% of the time (6 months ON/ 18 months OFF). The “decreased river bank extraction” scenario (75 gpm) represents an approximation of the threshold where complete hydraulic plume control is achieved above this pumping rate and hydraulic plume control is potentially compromised below this rate. Thus, the well pair average hydraulic gradients simulated for this pumping scenario represent thresholds for hydraulic plume control. To provide a factor of “safety” or increased confidence, the same assessment was performed with a scenario of an extraction rate twenty percent greater than the 75 gpm threshold rate (90 gpm) and the well pair

average hydraulic gradients from this pumping scenario correspond to proposed gradients for this line of evidence as follows.

Model Layer 3

- MW-33-090 / MW-O: 0.0024 ft/ft
- MW-H / MW-46-175: 0.0026 ft/ft
- MW-D / MW-46-175: 0.0034 ft/ft
- MW-36-090 / MW-34-080: 0.0017 ft/t
- MW-39-080 / MW-36-090: 0.0020 ft/ft

Model Layer 4

- MW-33-210 / MW-O: 0.0023 ft/ft
- MW-H / MW-46-205: 0.0024 ft/ft
- MW-D / MW-46-205: 0.0031 ft/ft
- MW-36-100 / MW-34-100: 0.0019 ft/t
- MW-39-100 / MW-36-100: 0.0018 ft/ft

In addition, river stage measurements will be used and compared to water levels in monitoring wells representing the water table to evaluate the effect of the River Bank and East Ravine Extraction Wells on minimizing the potential discharge of groundwater containing Cr(VI) into the river.

Water Level Contour Maps

With a sufficient number of monitoring locations, the water level elevation data can be spatially integrated by contouring, either manually or via an automated method. Hand contouring will be performed as the preferred method to produce water level elevation contour lines.

For water level values at extraction wells, well efficiency effects will be considered. First, step tests will be performed at some extraction wells. Such test data will then be used to estimate well efficiency and, thus, a corrected water level will be calculated. Second, in lieu of having piezometers immediately adjacent to extraction wells, piezometers will be installed within the filter pack (outside of the extraction well casing) in some wells, and the difference between the water levels in the piezometer and in the extraction well casing during pumping will also aid in proper correction for well efficiency effects.

4.3.3.2 Calculations

Lines of evidence involving calculations generally range from a simple groundwater flux/pumping rate calculation to simple analytical models, to complex numerical flow models, including: (1) simple analytical modeling using an equation representing a well pumping from an aquifer to estimate the dimensions of a capture zone; (2) groundwater discharge comparison; and (3) numerical modeling.

Simple Analytical Modeling

A simple equation representing a well pumping from an aquifer, such as that presented in the USEPA (USEPA 2008) guidance document, can be used as a line of evidence for assessing hydraulic plume control. The equation is an expression of Darcy's Law with a 'factor,' as recommended by the USEPA guidance, to account for other potential contributions of water to the extraction location. The addition of the factor increases the requisite extraction rate to achieve a capture zone of a given width. The equation can be used to determine the maximum width of the zone of hydraulic control created when pumping at a certain extraction rate from an aquifer with certain properties.

This method is based on assumptions similar to those used for Darcy's Law itself, but nonetheless is considered a useful line of evidence. It should be noted that this assessment method is based on a single pumping well. The operation of multiple pumping wells will create four zones of hydraulic control that, with sufficient individual extraction rates, will each be larger in dimension due to the superposition of drawdown effects. Thus, this line of

evidence should be viewed as conservative (i.e., understates the dimensions of the zone of hydraulic control) with respect to the potential for intersecting pumping cones.

Groundwater Discharge Comparison

This line of evidence relies on: (1) an estimation of groundwater discharge through the cross-sectional area of a plume where the groundwater extraction system is located; and (2) the measured rates of groundwater extracted by the pumping wells. If the groundwater extraction rate of the plume control system exceeds the estimated natural groundwater discharge through the portion of the aquifer requiring hydraulic control, then the containment system is shown to be successfully controlling the contaminant plume. The limitations of this method are similar to the limitations associated with the previous calculation method for estimating the dimensions of a zone of hydraulic control (e.g., most notably, the variability of hydraulic conductivity), and thus groundwater discharge comparisons will only be used as one of multiple lines of evidence.

Numerical Modeling

The most robust line of evidence involving calculations is numerical modeling. MODFLOW, a three-dimensional groundwater flow simulation program developed by the United States Geological Survey (USGS)—and currently being used to simulate groundwater flow at the site and to assist in the design of the remedy—will continue to be used to evaluate hydraulic control. MODFLOW will generate a simulated flow field, and groundwater flow paths can then be assessed using path line or particle-tracking procedures such as the MODPATH or MODALL simulations. Due to the limitations associated with locating monitoring wells downgradient of the River Bank and East Ravine Extraction Wells (i.e., the presence of the Colorado River), the use of numeric modeling will be an important line of evidence.

4.3.3.3 Concentration Trends

Although the concentration trends line-of-evidence approach is completely different from other approaches (i.e., water levels analysis or hydraulic calculations), it can be integrated with those other lines of evidence. In the concentration trends approach, assessment of hydraulic plume control is performed by evaluating the contaminant concentration trends in wells downgradient of the extraction wells as well as surface water samples from the river. If the analysis of water level data indicates that an extraction system is likely to be preventing any further migration of a plume, then this should also be evident in the concentration response. There are two principles that are applied for this line of evidence:

1. If hydraulic plume control is likely achieved, wells that are not currently impacted by contaminants (e.g., sentinel wells in Arizona) will remain without impacts over time as long as the dimensions of the zone of hydraulic control do not expand beyond the locations of the sentinel wells to the extent that the sentinel wells are within the capture zone.
2. If hydraulic plume control is likely achieved, wells located downgradient of the capture system, but still within the plume, will show decreasing concentrations over time. At the Topock site, there currently are no monitoring wells that are within the Cr(VI) plume but downgradient of the expected dimensions of the zone of hydraulic control. Therefore, this principle is not expected to be applied for the concentration trends line of evidence.

Due to various stresses that will be placed on the aquifer over time from changes in injection and extraction along with natural stresses such as changes in river stage and other various natural phenomena, the timing of groundwater sample collection will be assessed with the transient water level data collected via pressure transducers in order to potentially alter the timing of sample collection to better reflect water quality variability as a function of seasonal variations in river stage and corresponding groundwater level changes.

4.3.3.4 Field Methods

The one field method that establishes the actual path of groundwater migration is injecting a tracer into an aquifer and observing that tracer at some location downgradient of the injection point. The use of tracers has several advantages. However, as outlined in the USEPA (USEPA 2008) guidance document, the use of tracer

testing can have significant limitations. For this reason, tracer testing will be considered as a line of evidence for hydraulic control assessments as a method to address particular uncertainties at specific locations rather than as a general, widespread indicator.

4.3.4 Demonstration of Consistency Between Required Control and the Actual Zone of Hydraulic Control

The final step in the assessment process is evaluating consistency between the requirement for hydraulic control and the interpreted zone of hydraulic control created by groundwater extraction. This step comprises four main components illuminated by key questions:

1. Assess the requirements and objectives. Does the current system achieve RAOs with respect to hydraulic plume control?
2. Assess uncertainties in the interpretation of the zone of hydraulic control. Are alternative interpretations possible that would change the conclusions as to whether or not sufficient plume control is achieved? In other words, are there data gaps that could be practicably filled?
3. Assess the need for additional characterization and/or monitoring. Is there a need for additional plume delineation or additional monitoring locations to increase the confidence in whether or not actual hydraulic plume control is sufficient?
4. Evaluate the need to reduce or increase extraction rates. Should extraction rates, number of extraction wells, and/or locations be modified based on the results of the analysis?

This assessment will be presented in a way consistent with the recommended approach as outlined in the USEPA (USEPA 2008) guidance document (pp. 26-29). PG&E will present an overview of the assessment in a table that juxtaposes each of the steps and lines of evidence with the conclusions relevant to each of the steps/lines of evidence (consistent with Exhibit 9 of the guidance document, p. 29). This will include references to appropriate maps, model outputs, and other graphics as necessary to provide the basis for the conclusions. It is expected that demonstrations of hydraulic control at the Topock site will rely more on some lines of evidence (e.g., numerical modeling) than others because of the nature of the site and challenges presented by the relative location of the extraction wells to the Colorado River (i.e., the river precludes the installation of wells and collection of data in areas normally investigated for such demonstrations). However, all site data available will be used in support of the assessments in an iterative way to identify any data gaps that create uncertainty in the conclusions and to fill those data gaps as practicable and necessary.

SECTION 5

Other Sampling and Monitoring

5.1 Monitoring for COPCs

The RCRA Facility Investigation/Remedial Investigation Volume 2 Report and Volume 2 Addendum (CH2M HILL 2009a, 2009b) described that, in addition to Cr(VI), three constituents in groundwater—namely molybdenum, selenium, and nitrate—are potentially related to past releases from SWMU 1/AOC 1. Although the groundwater risk assessment concluded that these three constituents were not present in groundwater at levels of potential concern to future human health or the environment (ARCADIS 2009), DTSC and DOI directed that molybdenum, selenium, and nitrate be monitored in the site-wide groundwater monitoring program and that their associated impacts be considered in future soil and soil to groundwater risk evaluations (DTSC 2009, DOI 2009). The agencies concluded that although the non-cancer hazards associated with these constituents are much lower than those associated with Cr(VI), these constituents do have risks above a hazard index (HI) of 1 and they do contribute to a hazard quotient greater than 1 at localized areas within the plume.

This section provides a description of the monitoring program proposed for these three non-chromium COPCs.

5.1.1 Sampling Locations

The sampling locations for the non-chromium COPCs were selected based on the distribution of these compounds in groundwater. Figures 5.1-1 through 5.1-3 show the average concentrations of one or more COPCs in groundwater. Monitoring wells where COPCs exceed background were included in the monitoring program. In addition, monitoring wells that will be downgradient from areas where COPC concentrations are elevated above background when the remedy is active were also included. Because the remedy is designed to move groundwater across the IRZ, most of these downgradient wells are located on the floodplain or near National Trails Highway. This monitoring network is designed to track COPC concentrations in areas where they are currently elevated as well as areas where they may be transported during the remedial action. The monitoring locations and frequencies for the non-chromium COPCs are shown in Table 2.1-2. Per DTSC's request (60% BOD Report Response to Comment (RTC) #710 DTSC-223; see Appendix I of the Final BOD Report for a complete listing of comments, responses to comments, and resolution on the 60% design documents), a separate COPC monitoring table (Table 2.1-6 in Section 2) was prepared with input from DTSC to provide more information about which wells have elevated concentrations of COPCs and to include wells where nitrate will be sampled for process control monitoring.

Based on monitoring data collected to date, molybdenum is the COPC for which elevated concentrations above background are most widespread (Figure 5.1-1). Many of the bedrock wells in the East Ravine have molybdenum concentrations above background. Molybdenum is also more widespread in the alluvial aquifer, particularly in the deep zone. At the final design stage, there are 72 wells identified for molybdenum sampling.

Selenium is elevated above background in just a few wells scattered across the site and only in the alluvial aquifer. The highest concentrations are in the vicinity of the compressor station (Figure 5.1-2). It is not elevated in bedrock wells. At the final design stage, there are 41 wells identified for selenium sampling.

Nitrate is distributed similarly to selenium, with highest concentrations near the compressor station and a few sporadic other locations (Figure 5.1-3). Because nitrate is a sensitive geochemical indicator parameter, extensive nitrate monitoring is proposed to be performed as part of the process control monitoring for the final remedy (see Section 4.0). The 47 sampling locations where nitrate is assigned an annual monitoring frequency in Table 2.1-4 are intended primarily for monitoring nitrate as a non-chromium COPC. The sampling locations where nitrate is assigned a more frequent monitoring interval are intended for process control monitoring.

If there is a need to perform another risk assessment in the future, it is recommended that a wider network of wells be included for non-chromium COPC monitoring. The network proposed herein is specifically designed to

monitor the highest concentrations of these compounds and will therefore not accurately reflect their average concentrations across the site.

5.1.2 COPC Perimeter Assessment Plan

The Perimeter Assessment Plan (PAP) has been developed in response to comments from DTSC requesting that threshold concentrations and a decision tree be developed for COPC monitoring. Because COPCs will be moved around by the pumping and injection necessary to push the chromium plume through the IRZ, COPC concentrations in interior wells are expected to change throughout the course of the remedial action. Some wells will show increases in COPC concentrations and some will show decreases. It is therefore not practical or useful to establish numerical COPC threshold values for wells in the interior of the chromium plume.

Ultimately, the remedial action should not result in elevated concentrations of COPCs being spread beyond the chromium plume footprint (it is recognized that there are areas where elevated COPCs already exist outside the boundary of the chromium plume). The PAP is designed to monitor the edges of the chromium plume and the elevated COPC areas outside the chromium plume to provide assurance that elevated concentrations of COPCs are being contained with the area of active remediation. The PAP is modeled after the IM-3 Performance Monitoring Program, which was designed to monitor the edge of the chromium plume in the northern part of the floodplain. The wells that will be included in the PAP for monitoring of molybdenum, selenium, and nitrate are shown on Figures 5.1-4, 5.1-5, and 5.1-6, respectively.

Note that bedrock wells in the East Ravine are not included in the PAP. This is due to the fact that there is no injection in the East Ravine that would spread COPCs. The East Ravine will be remediated using extraction wells, so all gradients will be inward with regard to the current COPC distribution. If COPC concentrations were to go up in an East Ravine well, there would be no appropriate mitigating measures that could be made to address it, other than continuing the pump and treat process until the concentrations eventually went back down. This would be analogous to the situation with increasing chromium concentrations in well MW-34-100 during the first few years of IM-3 operations. After continued IM-3 pumping, concentrations in MW-34-100 eventually began to decline.

The PAP decision tree is shown in Figure 5.1-7. This is modeled after the PMP decision tree. It incorporates notifications and actions to be taken when a PAP well exceeds a trigger level. Trigger levels would be established prior to the startup of the remedial action, when additional COPC data will be available for the existing PAP wells and several rounds of samples will be available for the yet to be installed PAP wells.

Trigger levels will be based on Shewhart control limits calculated from the most recent eight sample results, consistent with what is currently done for wells with Cr(VI) concentrations above 20 µg/L in the IM3 Performance Monitoring Program. For the PAP, Shewhart control limits would be calculated for all wells. Initially, some control limits may need to be calculated using fewer than eight samples for newly installed wells where sampling may have recently been initiated. Control limits would be updated on at least an annual basis. If the Shewhart control limit is higher than the ARAR concentration in a well where the baseline concentration (defined based on the median of the available data) is below the ARAR, then the ARAR concentration would be used as the trigger level. For all other wells, the Shewhart control limit would be the trigger level. In wells where baseline concentrations are less than ARAR concentrations, this approach provides a conservative means of establishing a trigger value that will bring attention to rising COPC concentration before the ARAR concentration is reached. In wells where baseline concentrations are above ARAR concentration, the Shewhart control limit provides a means of identifying wells where a statistically significant increase in concentration has occurred.

5.1.3 Sampling Frequencies

An annual sampling frequency is proposed for the non-chromium COPCs. This is considered to be adequate for tracking the changes in the distribution of these constituents during the remedial action. Trend analysis will be conducted using the data collected and monitoring frequency can be increased or decreased if needed in any wells or areas.

5.2 Monitoring of Freshwater Source (HNWR-1A)

This section describes the program that will be implemented to monitor the quality of water produced by the Havasu National Wildlife Reserve (HNWR) well HNWR-1A during the implementation of the Topock remedial action. The purpose of this monitoring program is to ensure that the quality of the fresh water meets the desired water quality for the freshwater injection system at the Topock site (i.e., desired quality to prevent well and aquifer plugging and to protect the receiving aquifer water quality). A detailed discussion of the desired water quality for injection is included in the Final BOD Report (Section 3.3, Freshwater Supply).

The existing, nearby HNWR-1 well has been sampled and analyzed by Pacific Gas and Electric Company (PG&E) between November 2010 and January 2013 (see Table 5.2-1), and again in October 2013 and February 2014 during the field implementation of the Alternative Freshwater Source Evaluation (see Table 5.2-2). The analytical suite has included a broad range of compounds, both organic and inorganic. Arsenic and Cr(VI) were the only two compounds that exceeded the Maximum Contaminant Levels (10 µg/L). The naturally occurring arsenic concentration in well HNWR-1 ranges from 14 to 16 µg/L, below the site background concentration of 24.3 µg/L but above the concentration in existing wells near the freshwater injection area. The Cr(VI) concentration ranges from 14 to 20 µg/L, which is well below the site background concentration of 31.8 µg/L.

PG&E has sampled the new well HNWR-1A during the field implementation of the Alternative Freshwater Source Evaluation (see Table 5.2-3). Similar to HNWR-1, arsenic and Cr(VI) were the only two compounds that exceeded the Maximum Contaminant Levels. The naturally occurring arsenic concentration ranges from 12 to 13 µg/L, below the site background concentration of 24.3 µg/L. The Cr(VI) concentration ranges from 16 to 18 µg/L, which is well below the site background concentration of 31.8 µg/L (see Table 5.2-3).

Generally, the water from HNWR-1 and HNWR-1A contain concentrations of selenium, molybdenum, and nitrate that are significantly lower than those found at the Topock site. In HNWR-1A, the selenium concentration ranges from 0.88 to 1.0 µg/L; the molybdenum concentration ranges from 9.3 to 9.8 µg/L; and the nitrate concentration is 2.6 mg/L (see Table 5.2-3).

5.2.1 Proposed Analytes and Frequencies

The monitoring program for HNWR-1A is designed to track concentrations of the COC and COPCs associated with Topock as well as to provide periodic monitoring for a wide range of potential contaminants, both organic and inorganic, that have never been detected at the Topock site but could be undesirable or harmful if present in the injected water. Because of the lack of nearby sources, the likelihood of organic contaminants being present in HNWR-1A is small; therefore, the frequency of analysis for organics and pesticides will be lower than for metals and common ions.

The monitoring program will include metals, common anions and cations, total dissolved and suspended solids, total organic carbon, and stable isotopes of oxygen and hydrogen. These analyses provide a means for tracking overall changes in water quality with time. In addition, one of the common cations, manganese (Mn), has been found to be an important factor in partial plugging of injection wells at the Topock site, so it will be important to track Mn concentrations in order to maintain the performance of the injection wells. The proposed analytes list for HNWR-1A is provided in Table 5.2-4.

Monitoring frequency for the inorganic suite will be monthly for the first 6 months and quarterly for the remainder of the first year of operation, assuming the water quality is generally stable at that time (if the water quality appears to be changing rapidly, monthly sampling would be continued beyond the first 6 months). Following the first year, monitoring frequency will switch to semi-annual. Monitoring frequency for the organic analytical suite will be annual for the first 2 years, switching to every other year in subsequent years.

It is not anticipated that the freshwater flow rate would be varied on any regular basis; however, if there was a future reconfiguration of the remedy that caused a significant increase in freshwater pumping rate, the need for additional sampling frequency would be evaluated based on the data available at that time. Further, the

monitoring frequency can be adjusted as needed based on actual data and information collected at the supply well (HNWR-1A) as well as at the monitoring locations for the freshwater injection points.

5.2.2 Source Water Assessment

In response to comments received at the May 16, 2012 TWG meeting on protection of the water quality at HNWR-1A and the potential need for additional monitoring wells for source protection, a source water assessment was conducted to identify potential sources of contaminants within the radius of influence of a supply well (HWNR-1A). Arizona guidelines provide a method of calculating the appropriate radius for this assessment, based on a simple equation that represents the area from which water would be drawn over a specific period of time. Arizona uses a travel time of five years for public water supply assessments.

The calculated fixed-radius equation from Arizona guidance (ADEQ 1999) is as follows:

$$r = \sqrt{\left(\frac{Qt}{\pi n H}\right)}$$

Where:

Q = well's discharge in cubic feet per year (31,620,321 ft^3/yr)
t = time of travel in years (5 years for public supply wells in Arizona)
π = 3.1416
n = aquifer porosity (11 percent)
H = screen length in feet (110 feet)
r = radius (defines the boundary of the delineated source water protection area in feet around the well)

For the HNWR-1A well, with a screened interval spanning 110 feet and pumping at the current design (modeled) flow rate of 450 gpm, this equation resolves to a radius of 2,039 feet. This radius extends to within 1,200 feet of the Kinder Morgan Mojave Topock Compressor Station in Arizona[1] (see Exhibit 5.2-1). As shown in Exhibit 5.2-1, the majority of the property in this radius is undeveloped (most is HNWR land); known/planned developments in the area include the Topock Marina on Historic Route 66, Topock Mobile Home Park, nearby private properties, Southwest Water Company, BNSF Railroad, Interstate 40, and Kinder Morgan Mojave Topock Compressor Station. Also within this radius is an area that consists of rusty cans and other metal debris scattered on the land surface[2].

Water produced by HNWR-1 is expected to be a mix of water recharged from the Colorado River and groundwater flowing down from the Sacramento Valley to the east (CH2M HILL 2012c). Note that groundwater travel time from the river to a well located at the distance of HNWR-1 well is likely many months to a few years. Depending on the transport properties, some contaminants move much slower than the water. All contaminants are subject to dispersion and dilution between the river and a well. So if a contaminant is found in the river, there is ample time to stop pumping or institute additional monitoring before it shows up in a well near the river, and the concentration of the contaminant in the well is likely to be considerably less than in the river.

[1] Per DTSC's request in 60% BOD Report RTC #156 DTSC-56 (see Appendix I of the Final BOD Report), an internet search regarding the former underground storage tanks (USTs) at the Topock Marina was conducted. There were four USTs at the Marina; the first one was permanently removed in October 1990, two were permanently removed in January 1993, and the fourth was permanently removed in November 2010. There was a release reported in October 1990; that case was closed in March 1998.

[2] As detailed in 60% BOD Report RTC #158 DTSC-57, a question was raised in a public meeting about a rumored former "Topock Dump" located within this radius that reportedly contained trash from local residents. PG&E was not aware of any such former dump. A member of the Fort Mojave Indian Tribe who has lived in the area for many years indicated that the area of debris and can scatter was the only "dump" that he knew of in the area and speculated that it might have been trash left from a railroad work camp. DTSC visited the cited area in Arizona and it did not appear to be a significant threat to groundwater resources. PG&E agrees that this debris does not appear to represent a threat to groundwater.

LEGEND

⊙ Existing Well

Notes:
1. It is likely that an abandoned well owned by Southwest Gas, was once located at the site where Topock-2 and 3 wells currently exist.

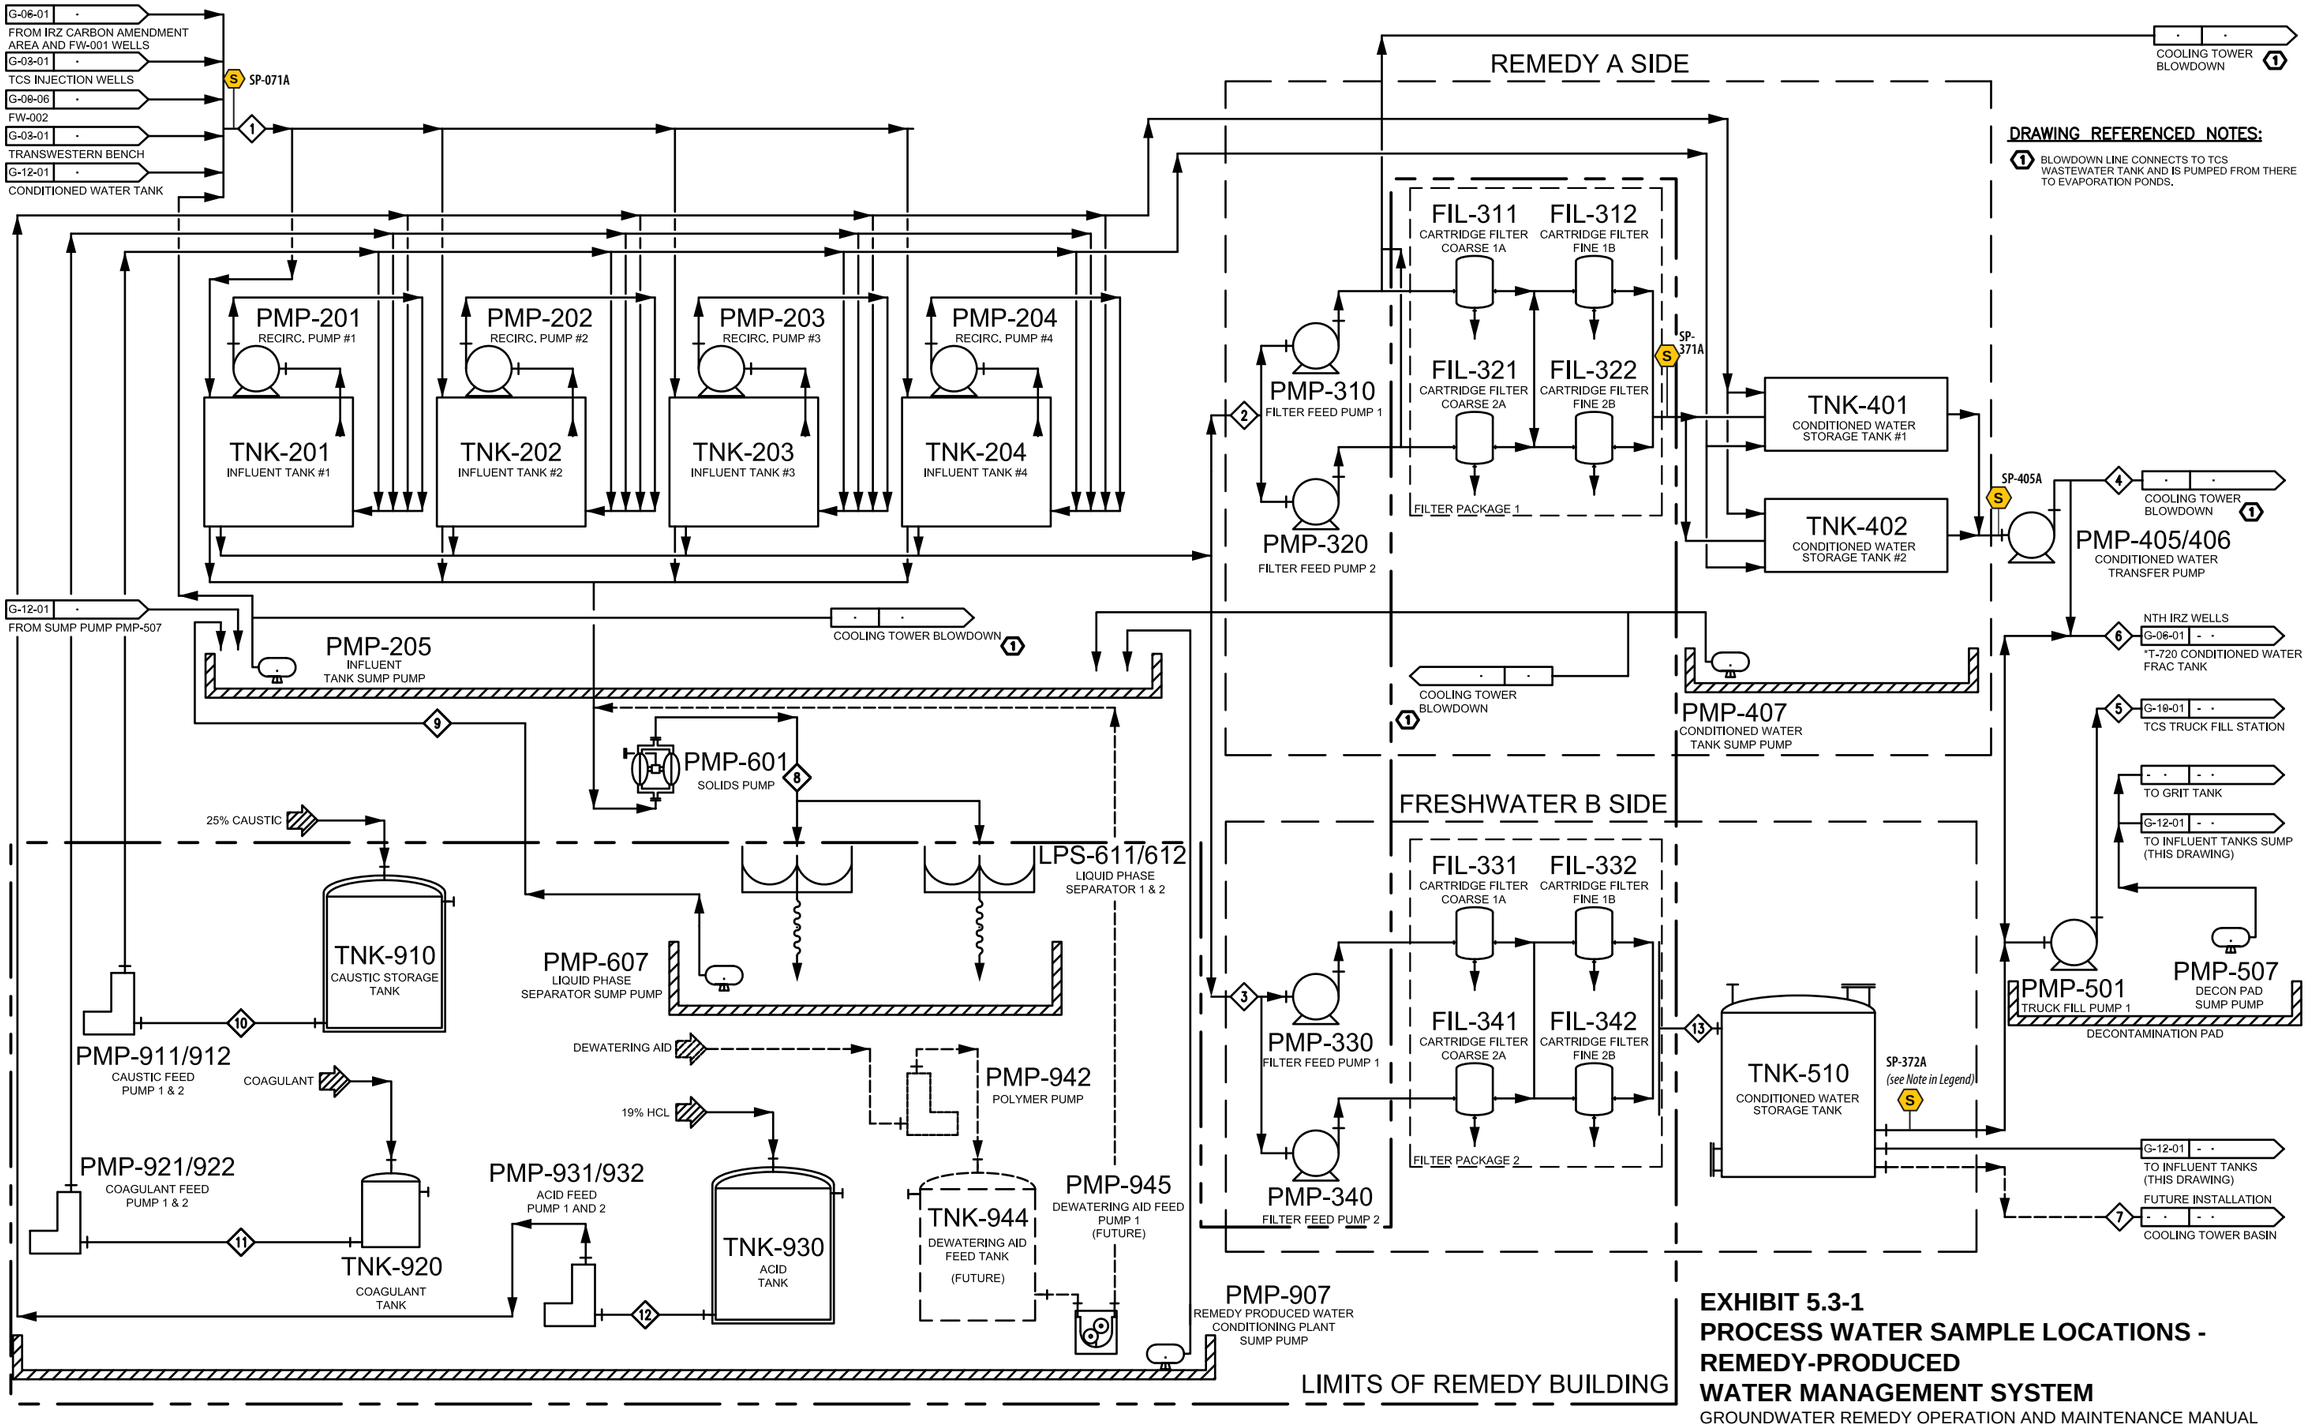
EXHIBIT 5.2-1
RADIUS OF 5 YEAR GROUNDWATER TRAVEL TIME TO HNWR-1A
GROUNDWATER REMEDY OPERATION AND MAINTENANCE MANUAL
VOLUME 2: SAMPLING AND MONITORING PLAN
PG&E TOPOCK COMPRESSOR STATION, NEEDLES CALIFORNIA

PG&E is not aware of any monitoring wells in Sacramento Wash. The property upstream in Sacramento Wash is undeveloped for miles. The ADEQ conducted a survey of water quality in the Sacramento Valley in 1999 (ADEQ 2001). This survey found fluoride, chloride, and TDS to be the only constituents present in slightly elevated concentrations in the Topock area. Considering the lack of existing contaminant sources in the Sacramento Valley (Exhibit 5.2-1), the installation of monitoring wells in Sacramento Wash upstream of HNWR-1A for source water protection is not considered warranted. The Topock-2 and -3 wells are located between HNWR-1A and the area with rusty can and other metal debris, so in the unlikely event that groundwater contaminants are migrating from the dump area, they would be expected to be detected first at Topock-2 and -3. In response to DTSC's request (60% RTC #709 DTSC-222), PG&E will provide water quality information from Topock-2 and -3 wells as PG&E receives the information from Southwest Water.

As mentioned previously, the majority component of the water produced from HNWR-1 should originate from the Colorado River. The travel time of constituents in river water to a nearby well may take many years, depending on their mobility (CH2M HILL 2012c); therefore, river water quality is a good indicator and should be used for source water protection of HNWR-1A. There is an abundance of water quality data available for the Colorado River. The river in the immediate vicinity of the site and downstream is monitored by the Metropolitan Water District of Southern California (MWD). MWD samples for a wide range of parameters, including emerging contaminants. In addition, the Lower Colorado River Regional Water Quality Database (http://www.snwa.com/apps/wq_database/index.cfml) contains more than 2 million records covering nearly 1,000 different parameters, including depth, temperature, pH, conductivity, dissolved oxygen, nutrients, metals, and organics. Information in the database is provided by Southern Nevada Water Authority, City of Las Vegas, Clark County Water Reclamation District, University of Nevada Las Vegas (UNLV), U.S. Bureau of Reclamation Denver, U.S. Bureau of Reclamation Lower Colorado River, City of Henderson, MWD, Clark County Regional Flood Control District, and the Colorado River Regional Sewer Coalition. Considering the large volume of good quality data available on water quality in the Lower Colorado River, additional river sampling for the purposes of source water protection of HNWR-1A is not considered warranted.

At DTSC's request and per resolution of 60% RTC #161 DTSC-60, the MW-55 well cluster will be sampled periodically as data at this location could have some value in detecting contaminants originating from any sources in the developed area around the Topock Marina (see Table 5.2-5).

5.3 Process Control Monitoring for Remedy-produced Water Management System



This section describes the program that will be implemented to monitor the quality of water at the Remedy-produced Water Management System during the implementation of the Topock remedial action. The primary objective for process control monitoring is to evaluate effluent water quality and its possible effects with regard to the reuse options (Cooling Tower makeup and re-injection to the NTH IRZ wells), and allow for process optimization/adjustment. Periodic monitoring of influent water will also assist with process optimization.

5.3.1 Sampling Locations

Samples will be collected from the following areas of the Remedy-produced Water Management System:

- Interconnecting piping sampling port to the four influent tanks
- Remedy A-Side filter system effluent sampling port
- Conditioned water storage tank (TNK-RTP01-1410) discharge piping sampling port
- Conditioned water tank farm (TNK-RTP01-1401 and TNK-RTP01-1402) discharge piping sampling port

Sample locations are identified on the piping and instrumentation diagram (P&ID) shown on Exhibit 5.3-1. Samples will be collected only during regular daytime working hours on the weekdays and while the Remedy-produced Water Management System is in service.

LEGEND (S) Sampling Port

Note for SP-372A:
A single sampling port will be installed on the common effluent pipe of TNK-510.

5.3.2 Sampling Analytes and Frequencies

The monitoring program will include metals, common anions and cations, total dissolved and suspended solids, and total organic carbon. The proposed analytical suite for process control monitoring is provided in Table 5.3-1.

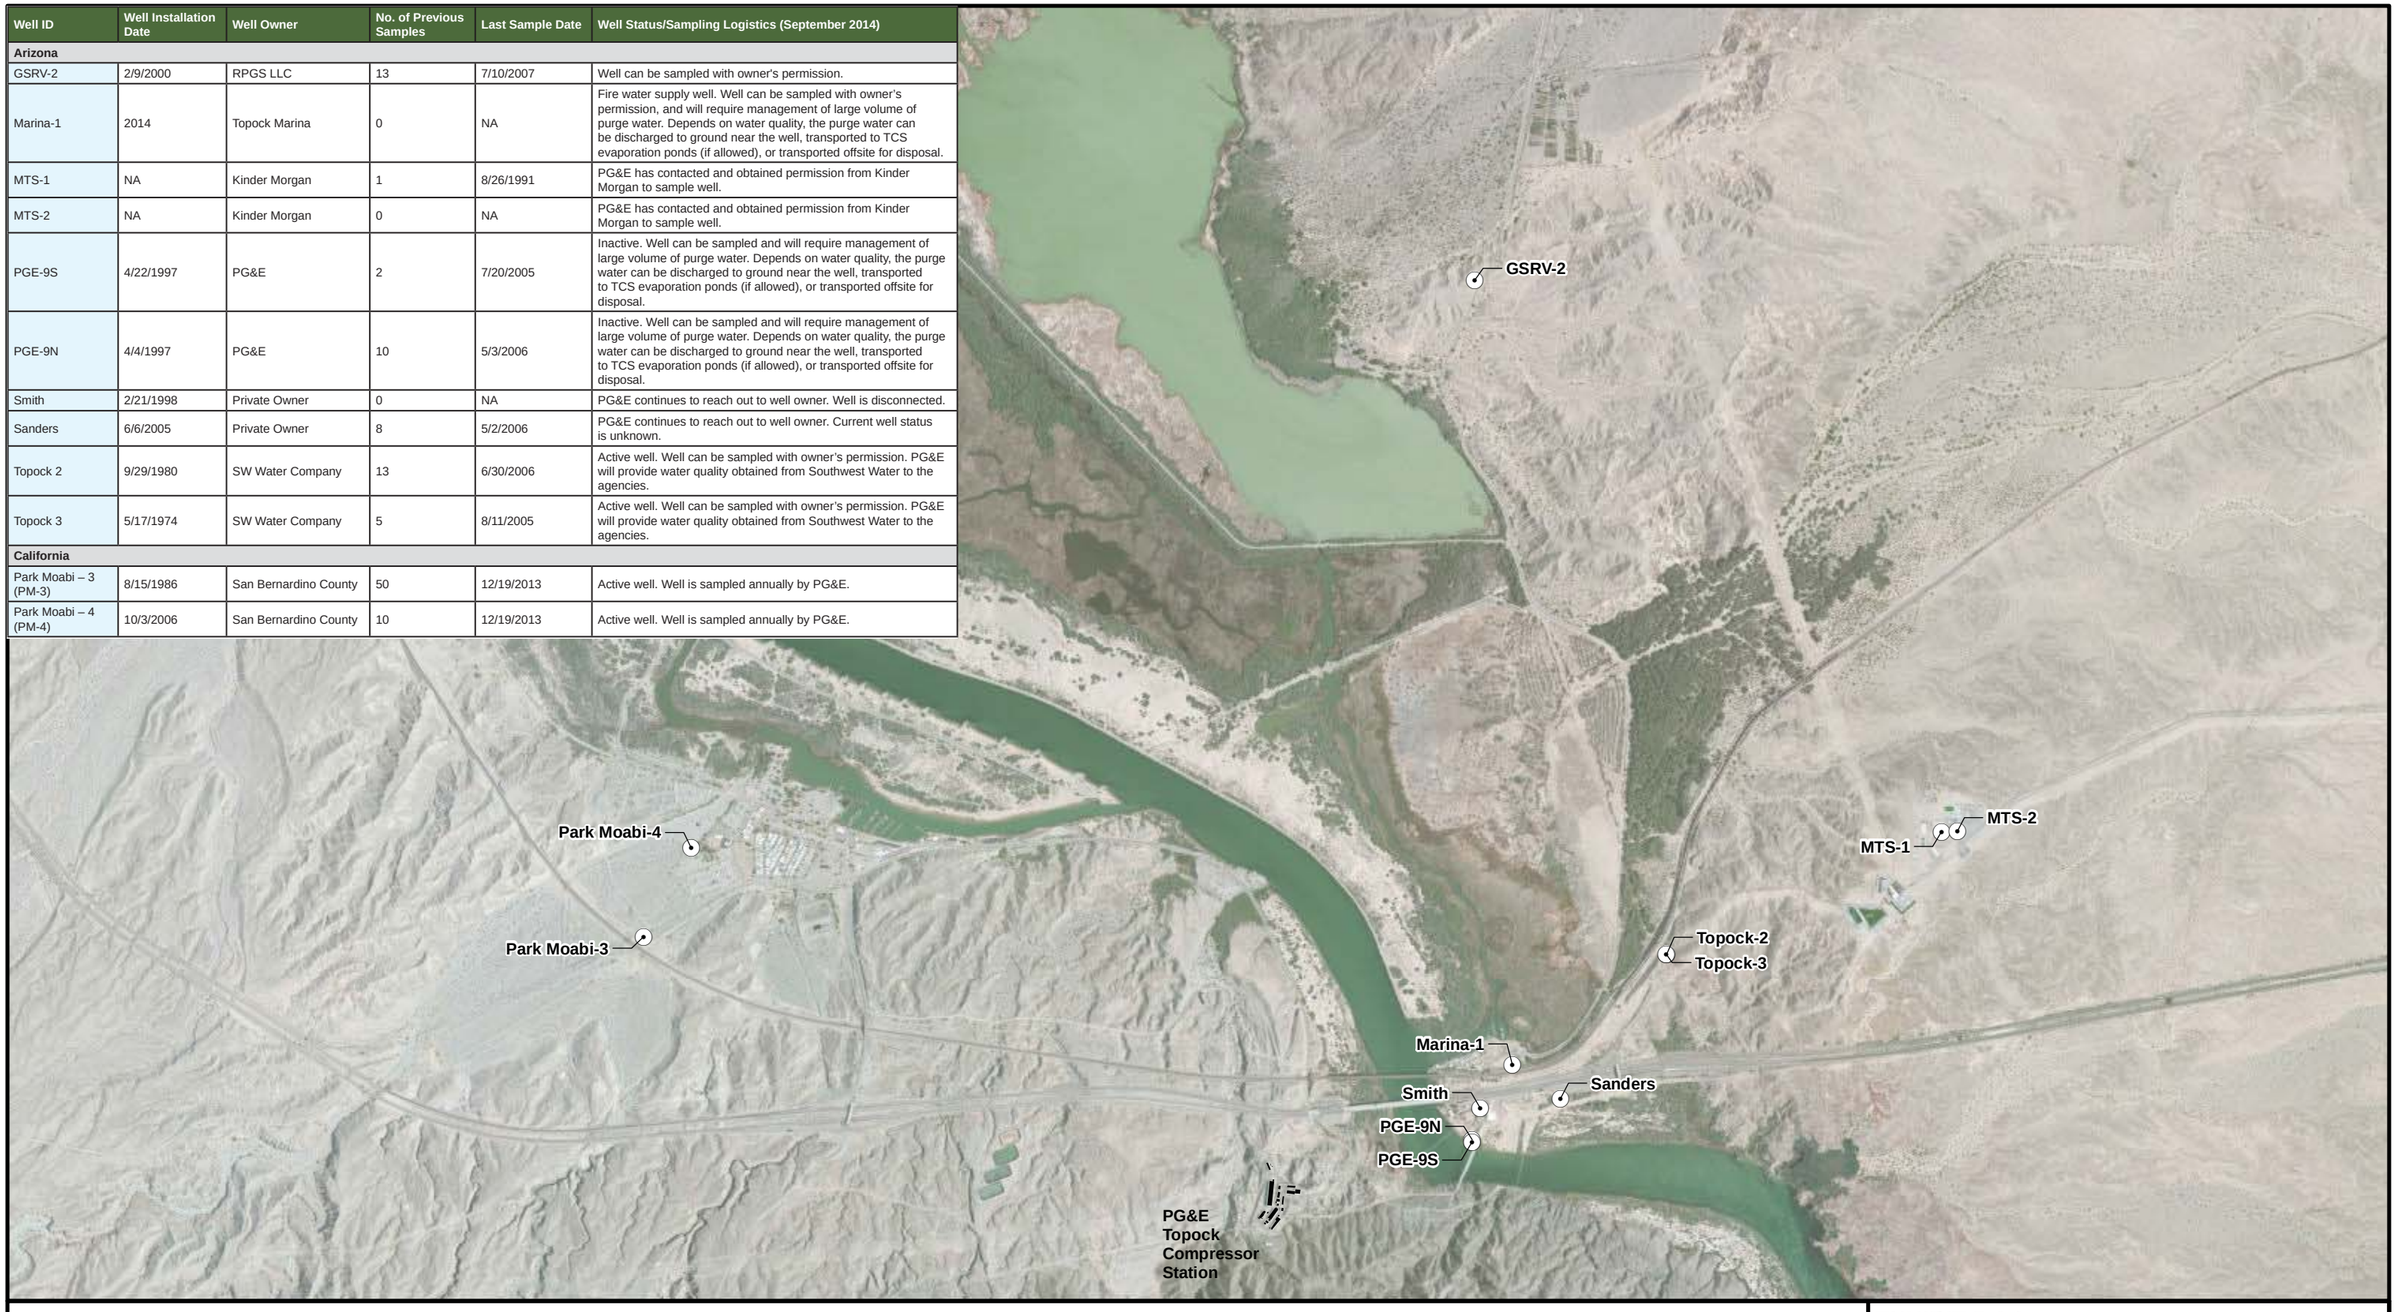
Samples will be collected for the inorganic analytical suite annually. Field parameters will be measured on a daily or weekly basis as shown on Table 5.3-1. The monitoring frequency can be adjusted as needed based on actual data and information collected during operation of the Remedy-produced Water Management System.

5.4 Monitoring for Domestic/Private Wells

Per 60% RTC #709 DTSC-222, DTSC directed PG&E to implement a domestic/private water well monitoring program to evaluate potential effects the remedy could impart to private wells both chemically and hydraulically. Specific wells mentioned in the 60% directive include: a) those located in the vicinity of the groundwater remedy (e.g., Marina-1, Sanders, and Smith wells) to ensure the viability of the wells is not jeopardized by the remedy; b) well GRSV-2 (also known as RPGS)/MTS-1/MTS-2 to assess potential effects to the Arizona freshwater pumping well; c) Topock-2 and -3 wells; and d) Moabi Regional Park wells. In compliance with the above directive, PG&E researched the logistics associated with sampling the above wells and provided a summary in Exhibit 5.4-1.

5.4.1 Sampling Locations and Logistics

On the California side of the Colorado River, PG&E has been and will continue to collect and report data from the two Moabi Regional Park wells. On the Arizona side of the Colorado River, PG&E has received permission to sample Marina-1 from the Topock Marina owner, and MTS-1 and MTS-2 from Kinder Morgan. PG&E has and will continue to reach out to the owners of the GSRV-2, Sanders, and Smith wells. It appears that the Smith well has been disconnected at the ground surface (i.e., the connection pipe was severed). The status of the Sanders well is unknown.



PG&E is making arrangements to assess the condition and sampling logistics of the Marina-1, MTS-1, and MTS-2 wells. If the Marina-1 well cannot be sampled, PG&E may propose to sample PGE-9S or 9N in its place.

Topock-2 and -3 wells are currently being sampled and reported by Southwest Water as the water purveyor. As a customer of Southwest Water, PG&E receives the water quality information and will provide it to the agencies.

5.4.2 Sampling Analytes and Frequencies

With the exception of the Moabi Regional Park wells, PG&E proposes to initially conduct a baseline sampling event for the proposed sampling locations prior to remedy startup, and subsequent sampling every two years with options to modify frequency based on better understanding of actual flow dynamics and chemical transport as the remedy progresses. Please note that PG&E will continue to sample Moabi Regional Park wells on an annual basis until remedy start-up, then will switch to the proposed biennial frequency for consistency with other wells. Table 5.4-1 presents the analytical suites for the domestic/private wells.

Well ID	Well Installation Date	Well Owner	No. of Previous Samples	Last Sample Date	Well Status/Sampling Logistics (September 2014)
Arizona					
GSRV-2	2/9/2000	RPGS LLC	13	7/10/2007	Well can be sampled with owner's permission.
Marina-1	2014	Topock Marina	0	NA	Fire water supply well. Well can be sampled with owner's permission, and will require management of large volume of purge water. Depends on water quality, the purge water can be discharged to ground near the well, transported to TCS evaporation ponds (if allowed), or transported offsite for disposal.
MTS-1	NA	Kinder Morgan	1	8/26/1991	PG&E has contacted and obtained permission from Kinder Morgan to sample well.
MTS-2	NA	Kinder Morgan	0	NA	PG&E has contacted and obtained permission from Kinder Morgan to sample well.
PGE-9S	4/22/1997	PG&E	2	7/20/2005	Inactive. Well can be sampled and will require management of large volume of purge water. Depends on water quality, the purge water can be discharged to ground near the well, transported to TCS evaporation ponds (if allowed), or transported offsite for disposal.
PGE-9N	4/4/1997	PG&E	10	5/3/2006	Inactive. Well can be sampled and will require management of large volume of purge water. Depends on water quality, the purge water can be discharged to ground near the well, transported to TCS evaporation ponds (if allowed), or transported offsite for disposal.
Smith	2/21/1998	Private Owner	0	NA	PG&E continues to reach out to well owner. Well is disconnected.
Sanders	6/6/2005	Private Owner	8	5/2/2006	PG&E continues to reach out to well owner. Current well status is unknown.
Topock 2	9/29/1980	SW Water Company	13	6/30/2006	Active well. Well can be sampled with owner's permission. PG&E will provide water quality obtained from Southwest Water to the agencies.
Topock 3	5/17/1974	SW Water Company	5	8/11/2005	Active well. Well can be sampled with owner's permission. PG&E will provide water quality obtained from Southwest Water to the agencies.
California					
Park Moabi – 3 (PM-3)	8/15/1986	San Bernardino County	50	12/19/2013	Active well. Well is sampled annually by PG&E.
Park Moabi – 4 (PM-4)	10/3/2006	San Bernardino County	10	12/19/2013	Active well. Well is sampled annually by PG&E.

Time (hours):	--	1	6	12	24	48	72
Parameter / **Units**							
Polyaromatic Hydrocarbons							
1-Methyl naphthalene µg/L	---	ND (0.2)	---	---	---	---	ND (0.21)
2-Methyl naphthalene µg/L	---	ND (0.2)	---	---	---	---	ND (0.21)
Acenaphthene µg/L	---	ND (0.2)	---	---	---	---	ND (0.21)
Acenaphthylene µg/L	---	ND (0.2)	---	---	---	---	ND (0.21)
Anthracene µg/L	---	ND (0.2)	---	---	---	---	ND (0.21)
Benzo (a) anthracene µg/L	---	ND (0.2)	---	---	---	---	ND (0.21)
Benzo (a) pyrene µg/L	---	ND (0.2)	---	---	---	---	ND (0.21)
Benzo (b) fluoranthene µg/L	---	ND (0.2)	---	---	---	---	ND (0.21)
Benzo (ghi) perylene µg/L	---	ND (0.2)	---	---	---	---	ND (0.21)
Benzo (k) fluoranthene µg/L	---	ND (0.2)	---	---	---	---	ND (0.21)
Chrysene µg/L	---	ND (0.2)	---	---	---	---	ND (0.21)
Dibenzo (a,h) anthracene µg/L	---	ND (0.2)	---	---	---	---	ND (0.21)
Fluoranthene µg/L	---	ND (0.2)	---	---	---	---	ND (0.21)
Fluorene µg/L	---	ND (0.2)	---	---	---	---	ND (0.21)
Indeno (1,2,3-cd) pyrene µg/L	---	ND (0.2)	---	---	---	---	ND (0.21)
Naphthalene µg/L	---	ND (0.2)	---	---	---	---	ND (0.21)
Phenanthrene µg/L	---	ND (0.2)	---	---	---	---	ND (0.21)
Pyrene µg/L	---	ND (0.2)	---	---	---	---	ND (0.21)
Polychlorinated Biphenyls							
Aroclor 1016 µg/L	---	ND (0.5)	---	---	---	---	ND (0.52)
Aroclor 1221 µg/L	---	ND (1.0)	---	---	---	---	ND (1.0)
Aroclor 1232 µg/L	---	ND (0.5)	---	---	---	---	ND (0.52)
Aroclor 1242 µg/L	---	ND (0.5)	---	---	---	---	ND (0.52)
Aroclor 1248 µg/L	---	ND (0.5)	---	---	---	---	ND (0.52)
Aroclor 1254 µg/L	---	ND (0.5)	---	---	---	---	ND (0.52)
Aroclor 1260 µg/L	---	ND (0.5)	---	---	---	---	ND (0.52)
Radiochemistry							
Gross Alpha pCi/L	---	**7.42**	---	---	---	---	6.34 J
Gross Beta pCi/L	---	ND (4.0)	---	---	---	---	ND (4.0)
Total Petroleum Hydrocarbons							
Orthophosphate, dissolved mg/L	---	ND (0.02)	---	---	---	---	ND (0.02)
TPH as diesel µg/L	---	ND (50)	---	---	---	---	ND (50)
TPH as gasoline µg/L	---	ND (100)	---	---	---	---	ND (100)
TPH as motor oil µg/L	---	ND (50)	---	---	---	---	ND (50)

Notes:

---	not collected or not available.
0/00	differences from global standards in ppt.
J	analyte was present, but reported value was estimated.
mg/L	milligrams per liter.
ND	parameter not detected at the listed reporting limit.
NTU	nephelometric turbidity units.
pCi/L	picocurries per liter.
µg/L	micrograms per liter.

Notes:

---	not collected or not available.
0/00	differences from global standards in ppt.
gpm	gallons per minute.
J	analyte was present, but reported value was estimated.
mg/L	milligrams per liter.
ND	parameter not detected at the listed reporting limit.
NTU	nephelometric turbidity units.
pCi/L	picocurries per liter.
µg/L	micrograms per liter.

TABLE 5.2-4
Analytical Suite for Freshwater Supply Well (HNWR-1A) and Extracted River Bank Water Samples
Groundwater Remedy Operation and Maintenance Manual
Volume 2: Sampling and Monitoring Plan
PG&E Topock Compressor Station, Needles, California

INORGANIC ANALYTICAL SUITE – Monthly for the first six months, Quarterly for next 6 months (if the water quality appears to be changing rapidly, monthly sampling would be continued beyond the first 6 months). Following the 1st year, switch to Semi-Annual.

Field Parameters			
Dissolved oxygen	pH	Specific conductance	Turbidity
Oxidation reduction potential	Salinity	Temperature	
Anions (Method E300.0)			
Chloride	Fluoride	Nitrate (as nitrogen)	Sulfate
Radionuclides			
Gross alpha (SM7110C)	Gross beta (E900.0)		
General Chemistry (Methods SM2320-B, SM4500-NH3, SM4500-CN, SM4500-Si C/D, SM2540-C, SM2540, SM5310, CF-IRMS)			
Alkalinity, total as $CaCO_3$	Deuterium	Soluble silica	Total organic carbon (TOC)
Ammonia as nitrogen	Oxygen 18	Total dissolved solids (TDS)	Total suspended solids (TSS)
Cyanide			
Metals (Methods SW6010C, SW6020A, SW7470A, E218.6)			
Aluminum, dissolved	Calcium, dissolved	Magnesium, dissolved	Silver, dissolved
Antimony, dissolved	Chromium, Hexavalent	Manganese, dissolved	Sodium, dissolved
Arsenic, dissolved	Chromium, total dissolved	Mercury, dissolved	Thallium, dissolved
Barium, dissolved	Cobalt, dissolved	Molybdenum, dissolved	Vanadium, dissolved
Beryllium, dissolved	Copper, dissolved	Nickel, dissolved	Zinc, dissolved
Boron, dissolved	Iron, dissolved	Potassium, dissolved	
Cadmium, dissolved	Lead, dissolved	Selenium, dissolved	

ORGANIC ANALYTICAL SUITE –Annually for 1st two years, every other year in subsequent years

Herbicides (Method SW8151A)			
2,4,5-T	2,4-DB	Dicamba	MCPA
2,4,5-TP (Silvex)	4-Nitrophenol	Dichlorprop	MCPP
2,4-D	Dalapon	Dinoseb	Pentachlorophenol
Pesticides (Method SW8081A)			
4,4-DDD	alpha-Chlordane	Endo sulfan II	gamma-Chlordane
4,4-DDE	beta-BHC	Endosulfan sulfate	Heptachlor
4,4-DDT	delta-BHC	Endrin	Heptachlor epoxide
Aldrin	Dieldrin	Endrin aldehyde	Methoxychlor
alpha-BHC	Endo sulfan I	gamma-BHC	Toxaphene
Polyaromatic Hydrocarbons (Method SW8270SIM)			
1-Methyl naphthalene	Benzo (a) anthracene	Chrysene	Naphthalene
2-Methyl naphthalene	Benzo (a) pyrene	Dibenzo (a,h) anthracene	Phenanthrene
Aenaphthene	Benzo (b) fluoranthene	Fluoranthene	Pyrene
Acenaphthylene	Benzo (ghi) perylene	Fluorene	
Anthracene	Benzo (k) fluoranthene	Indeno (1,2,3-cd) pyrene	
Volatile Organic Compounds (Method SW8260B or C)			
1,1,1,2-Tetrachloroethane	1,3,5-Trimethylbenzene	Carbon tetrachloride	Methylene chloride
1,1,1-Trichloroethane	1,3-Dichlorobenzene	Chloro methane	N-Butylbenzene
1,1,2,2-Tetrachloroethane	1,3-Dichloropropane	Chlorobenzene	N-Propylbenzene
1,1,2-Trichloroethane	1,4-Dichlorobenzene	Chloroethane	o-Xylene
1,1,2-Trichlorotrifluoroethane	2,2-Dichloropropane	Chloroform	p-Chlorotoluene
1,1-Dichloroethane	2-Chlorotoluene	cis-1,2-Dichloroethene	sec-Butylbenzene
1,1-Dichloroethene	4-Isopropyltoluene	cis-1,3-Dichloropropene	Styrene
1,1-Dichloropropene	Acetone	Dibromochloromethane	tert-Butylbenzene
1,2,3-Trichlorobenzene	Acrolein	Dibromomethane	Tetrachloroethene
1,2,3-Trichloropropane	Acrylonitrile	Dichlorodifluoromethane	Toluene
1,2,4-Trichlorobenzene	Benzene	Ethylbenzene	trans-1,2-Dichloroethene
1,2,4-Trimethylbenzene	Bromobenzene	Hexachlorobutadiene	trans-1,3-Dichloropropene
1,2-Dibromo-3-chloropropane	Bromochloromethane	Isopropylbenzene	Trichloroethene
1,2-Dibromoethane	Bromodichloromethane	m,p-Xylenes	Trichlorofluoromethane (Freon
1,2-Dichlorobenzene	Bromoform	Methyl ethyl ketone	11)
1,2-Dichloroethane	Bromomethane	Methyl isobutyl ketone	Vinyl chloride
1,2-Dichloropropane	Carbon disulfide	Methyl tert-butyl ether (MTBE)	Xylenes, total

LEGEND

- Groundwater Well completed in Alluvial Aquifer (Shallow, Mid-depth or Deep Zones)
- Groundwater Well completed in Bedrock

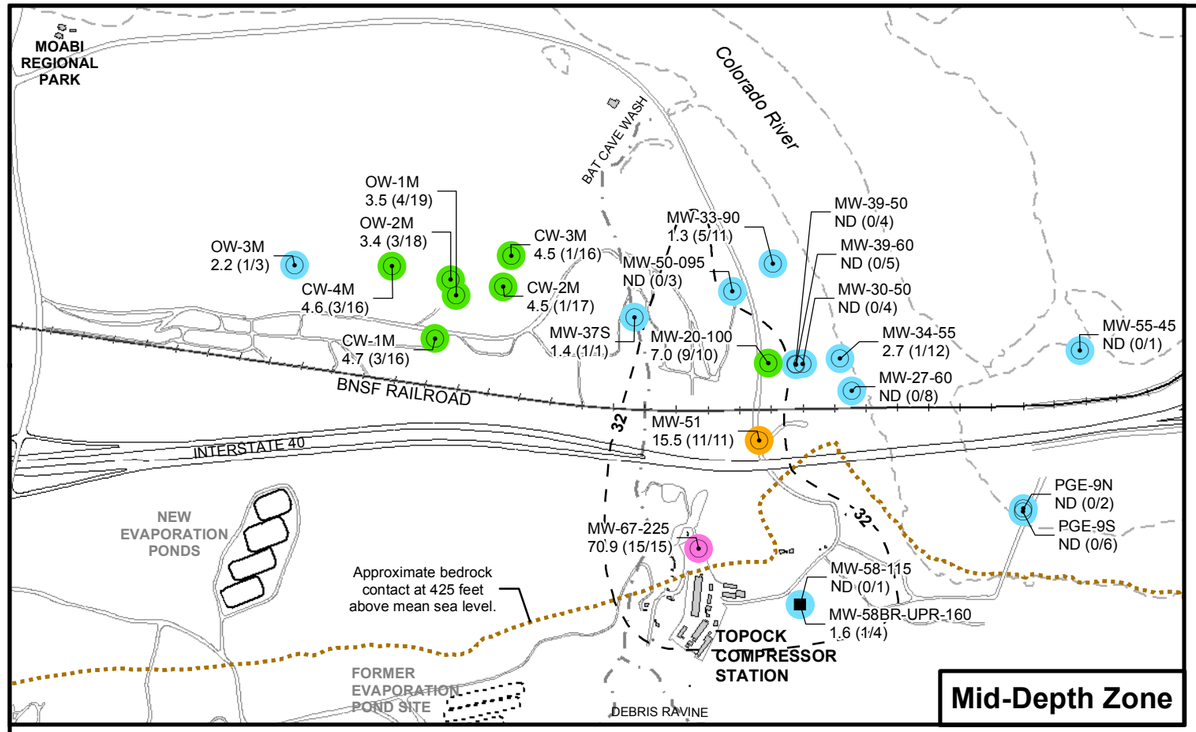
Dissolved Molybdenum Average Concentrations

MW-17 ← Well ID

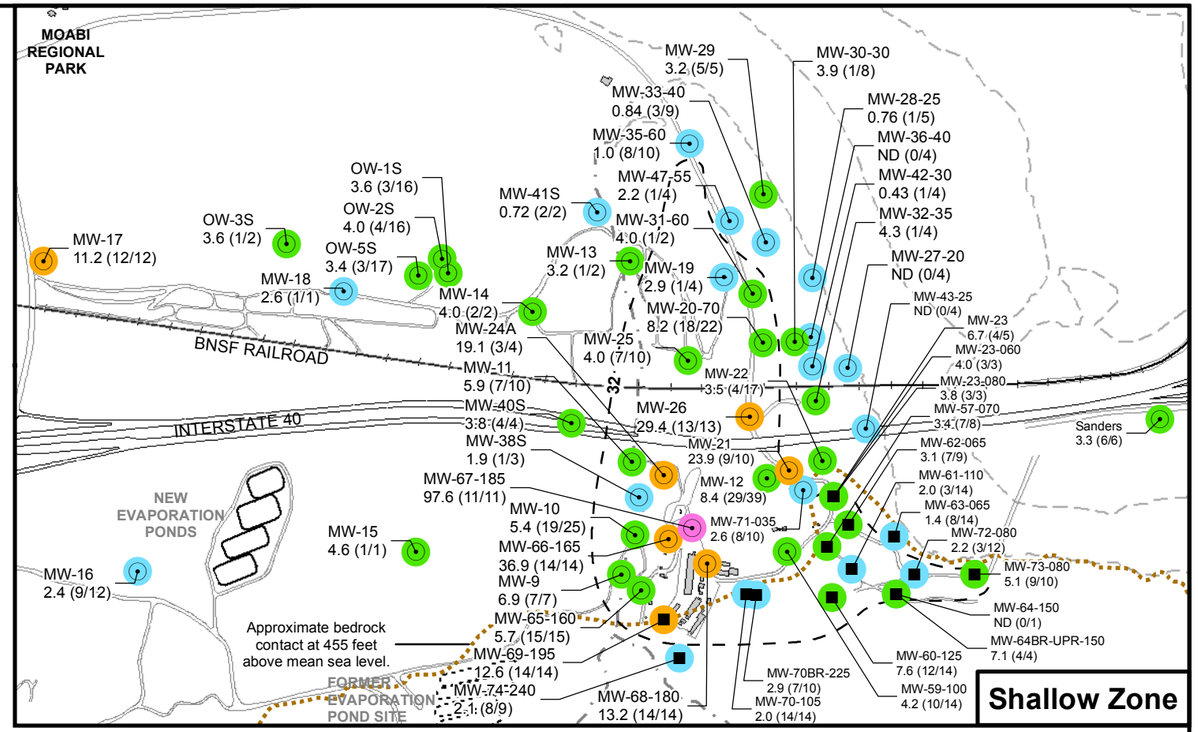
5.8 (8/16) ← (No. of detections / No. of samples)

Average concentration, micrograms per liter (µg/L) 1997 - 2013 groundwater sampling

- ≤ 15.0 µg/L
- 15.0 - 36.3 µg/L
- 36.4 - 70.0 µg/L
- > 70.0 µg/L



Approximate outline of Cr(VI) in Alluvial Aquifer depth zone ≥ 32 µg/L, Fourth Quarter 2013



Notes:
1. Molybdenum Background Study Upper Tolerance Limit (UTL) = 36.3 µg/L
2. In computing averages, non-detects were assigned half of the reporting limit concentration. Some averages may be elevated due solely to high reporting limits for non-detect samples. Refer to the complete data set in Appendix A1 of the BOD Report for verification.

Notes:

1. The wells subject to this contingency plan are defined in Table 2.1-4 and shown on Figures 5.1-4, 5.1-5, and 5.1-6.
2. Notification will be provided within 5 days following receipt of validated laboratory results.
3. Re-sampling to occur with 45 days of receipt of validated laboratory results.
4. Data needed to assess trend or condition may include increased sampling frequency at triggered well, increased sampling at adjacent wells (i.e., lateral, vertical), or collection of additional data to assess change in geochemical conditions.
5. Assess the gradient direction near the triggered well and evaluate potential for remedial measure optimization accordingly. Optimization may include change to pumping or injection rates.
6. Changes to manage COPCs will be balanced against optimization for chromium removal.

SECTION 6

Data Management, Documentation, and Reporting

6.1 Data Validation

Data validation procedures are provided in Sections 6.3 and 6.4 of the PG&E Program Quality Assurance Program Plan (QAPP) (CH2M HILL 2012b). In summary, laboratory data will be imported into the project database and the data will be validated by the project chemist or designee. A combination of automated data validation (AutoDV) and manual validation will be performed on the project data. A data quality evaluation form will be generated for all sample results. Data quality evaluation results will be summarized and included in the quarterly progress reports to the agencies. The summary will list and discuss data that do not meet the data quality objectives specified in the QAPP, if any.

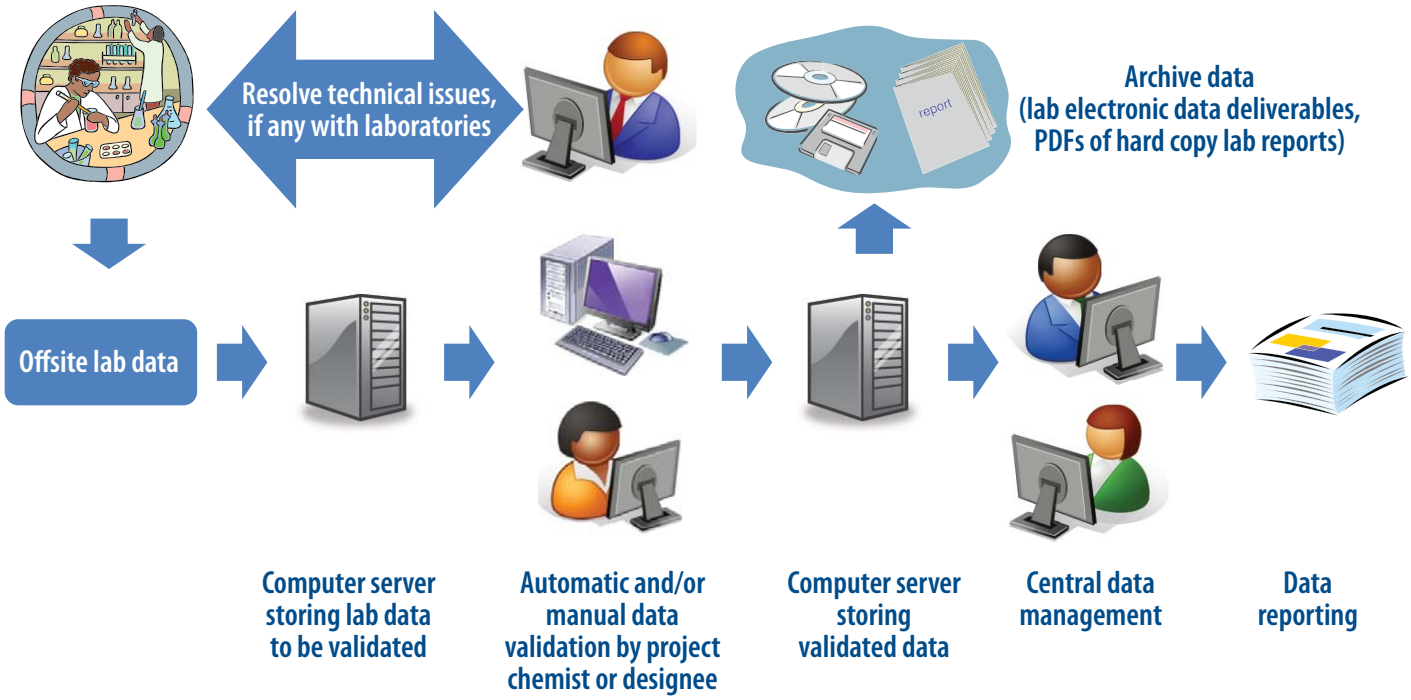
6.2 Data Evaluation

Analytical results will be evaluated for attainment of the RAOs presented in Section 1.1.1 and to determine remedy performance. Data evaluation summaries will be provided in quarterly progress reports following implementation of the remedy.

6.3 Data Management

Three types of data are expected to be collected during implementation of the remedy: field measurement/ process monitoring data, onsite laboratory data, and offsite laboratory data. The management of each type of data is described below. Exhibit 6.3-1 presents a simplified data management process for the project.

Field Measurement/Process Monitoring Data



Field measurements will be collected from the monitoring and remediation well network, the carbon amendment facilities, and the remedy-produced water conditioning plant. Measurements will be conducted in accordance with the Standard Operating Procedure (SOPs) (as described in Section 7.1), and are recorded manually in a field logbook, field sampling form, and/or process monitoring checklist, or recorded automatically by stationary or handheld data loggers and transmitted to a database using a telemetry system. Periodic field audits by experienced staff will be conducted to verify that SOPs are being followed. Equipment calibration will follow manufacturers' recommendation to ensure data quality. Manually recorded data will be entered into a field database. In addition, process monitoring and control data generated in facilities/plants will be automatically recorded into a data historian that resides in the plant control system. The data will be maintained in a database and reviewed by an experienced field staff member or chemist. Historical trends, water quality data, and well construction details will also be made available to the field crew so that anomalous data (compared to historical values) can be identified in a timely manner and field verified/corrected after consulting with an experienced scientist or chemist, as appropriate.

Onsite Laboratory Data

Certain testing for process control monitoring will be performed at an onsite laboratory in accordance with site-specific SOPs (see Section 7.1 and Appendix A). Onsite lab measurements include Cr(VI), Cr(T), ferrous iron (Fe[II]), conductivity, turbidity, pH, nitrate, sulfate, alkalinity, total organic carbon, orthophosphate, manganese, and total dissolved solids. Additional measurements could be added in the future.

The onsite lab data will be recorded in a bench log book and entered into a spreadsheet and/or database periodically. Although the onsite data will not be validated using the same procedures as the offsite lab data, they will be reviewed, and anomalous results will be reviewed, and if needed, reanalyzed at the direction of the project chemist. After quality control (QC) review, data will be stored in a database for use by the project team.

Onsite laboratory samples will be analyzed in conjunction with offsite analysis, at a rate of 10% for Cr(VI), Cr(T), ferrous iron, conductivity, turbidity, pH, nitrate, sulfate, alkalinity, total organic carbon, orthophosphate,

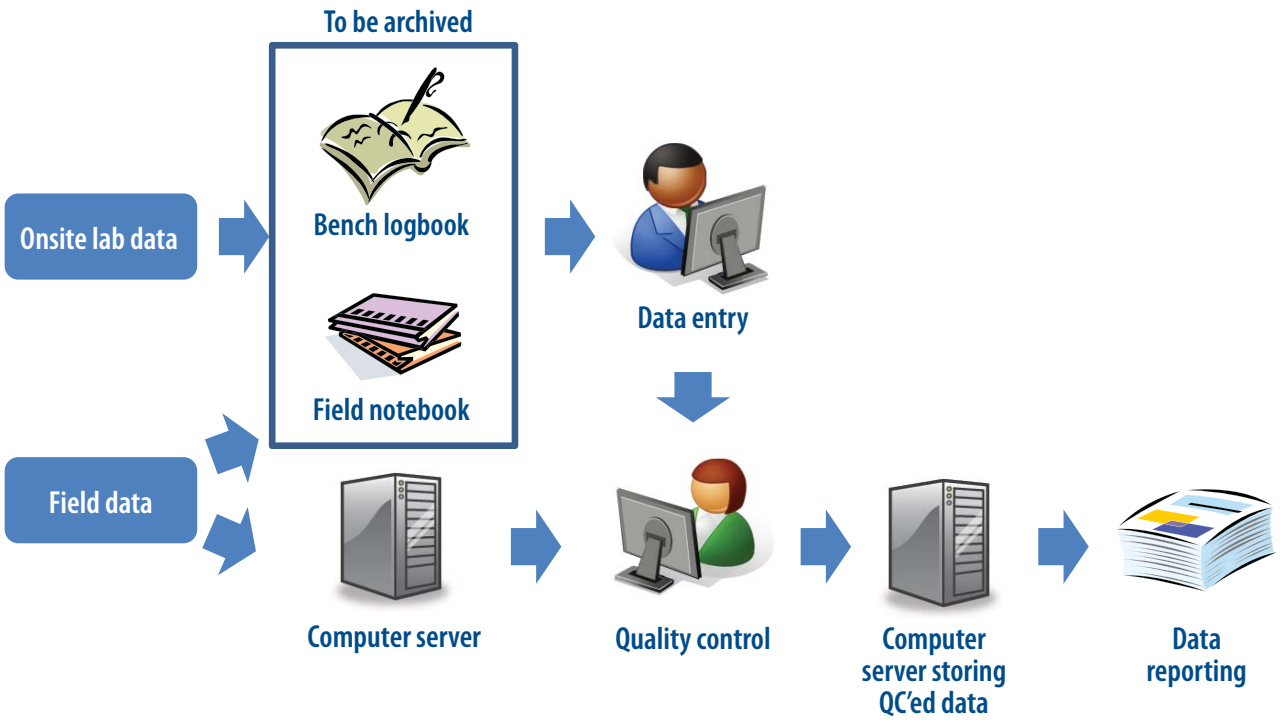


Exhibit 6.3-1
Simplified Data Management Process
Groundwater Remedy Operation and Maintenance Manual
Volume 2: Sampling and Monitoring Plan
PG&E Topock Compressor Station, Needles, California

manganese, and total dissolved solids. Data will be reviewed/compared for quality and accuracy and reported to the agencies. The frequency of comparative analysis will be evaluated after assessment of data.

Offsite Laboratory Data

The data flow (electronic and hard copy) from offsite laboratory to the project chemist is tracked to ensure that the data are reviewed and validated in a timely manner. The project chemist will discuss and resolve technical issues, if any, with the laboratory. Electronic data will be entered into a database where they will undergo QC checks before being validated. Validated data will be stored in a database for use by the project team. The laboratory will maintain electronic and hardcopy records sufficient to re-create each analytical event. At a minimum, the laboratory will maintain the following records:

- Raw data, including instrument printouts, bench work sheets, and chromatograms, with compound identification and quantitation reports.
- Laboratory-specific, written SOPs for each analytical method and quality assurance/quality control (QA/QC) function implemented during the analysis of project samples.

In compliance with Section XXV of the CD (DOI 2013), PG&E will maintain offsite laboratory records for 10 years following receipt of certification of completion. At the conclusion of the record retention period, PG&E will notify DOI and DTSC in writing at least 90 days prior to the destruction of any records and will provide DOI and DTSC with the opportunity to take possession of any records.

Maintenance Records

It is the responsibility of the plant/system operators to incorporate regular preventative maintenance into the routine work schedule based on guidelines presented in this plan, and the maintenance recommendations provided in the manufacturer's manual for each piece of equipment in the plant. Computerized maintenance management programs will be implemented at the facility, as appropriate, to keep track of maintenance requirements. In those cases, operators will access the program to determine required maintenance tasks. Records documenting completion of preventative maintenance tasks will be kept onsite.

Hardcopy and electronic versions will be archived in project files, on electronic archive tapes, and/or on other electronic storage media for the duration of remedy operation as specified below in Section 6.4. All electronic data will be subject to routine back-up until it is archived for long-term retention.

6.4 Recordkeeping

In compliance with Section XII of the 1996 CACA (DTSC 1996) and Section XXV of the RD/RA CD (DOI 2013), PG&E will maintain all records for 10 years following receipt of certification of completion. At the conclusion of the record retention period, PG&E will notify DOI and DTSC in writing at least 90 days prior to the destruction of any records and will provide DOI and DTSC with the opportunity to take possession of any records.

6.5 Reporting

In compliance with Attachment 7 of the 1996 CACA (DTSC 1996), Section XXIV and Appendix C of the CD Scope of Work and Section 5 of the RD/RA CD (DOI 2013), progress reports will be submitted monthly during RA construction and quarterly after the remedy has been implemented and demonstrated to be operating as intended. Exhibit 6.5-1 presents a quarterly report template that was developed with guidance from the *O&M Report Template for Ground Water Remedies (with Emphasis on Pump and Treat Systems)* (USEPA 2005). A monthly construction report template is included in the Construction/Remedial Action Work Plan (CH2M HILL 2015b) that is being submitted concurrently with the final design documents (see Exhibit 2.3-2 of the Work Plan). It is noted that the agencies may request additional information or reports as the remedy progresses.

Communications on changes to the monitoring program or operational adjustments will be communicated with the agencies in the quarterly reports (see Exhibit 6.5-1).

PG&E Topock Compressor Station Groundwater Remediation Project Quarterly Progress Report for Remedy Operation and Maintenance [*Indicate Reporting Period*]

Table of Contents

1.0 Introduction

PG&E is implementing the groundwater remedy to address chromium in groundwater at Solid Waste Management Unit (SWMU) 1/Area of Concern (AOC) 1 and AOC 10 near the Topock Compressor Station, in conformance with the requirements of the Resource Conservation and Recovery Act (RCRA) Corrective Action and the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The groundwater remedy includes:

- Construction of an In-situ Reactive Zone (IRZ) along National Trails Highway (NTH) using a line of wells that may be used as both injection and extraction wells to circulate groundwater and distribute an organic carbon source to promote reduction of the Cr(VI) to Cr(III).
- Flushing accomplished through a combination of fresh water injection and injection of carbon-amended water in wells upgradient of the plume.
- Extraction wells near the Colorado River to provide hydraulic capture of the plume, clean up the floodplain downgradient of the NTH IRZ, and enhance the flow of contaminated groundwater through the IRZ line.
- East Ravine Extraction Wells in the eastern (downgradient) end of the East Ravine to provide hydraulic capture of contaminated groundwater in bedrock; and Transwestern Bench Extraction Wells in the area northeast of the TCS to accelerate capture of Cr(VI) impacted groundwater from the alluvial deposits located downgradient of the TCS.
- Institutional controls to restrict surface land uses and prevent the use of groundwater.
- Monitored natural attenuation (MNA) as a long-term component to address residual Cr(VI) that may remain in recalcitrant portions of the aquifer after enhanced in-situ treatment.

The Remedial Action Objectives (RAOs) for the groundwater remedy are to:

1. Prevent ingestion of groundwater as a potable water source having Cr(VI) in excess of the regional background concentration of 32 micrograms per liter (µg/L).
2. Prevent or minimize migration of total chromium (Cr[T]) and Cr(VI) in groundwater to ensure concentrations in surface water do not exceed water quality standards that support the designated beneficial uses of the Colorado River (11 µg/L Cr[VI]).
3. Reduce the mass of Cr(T) and Cr(VI) in groundwater at the site to achieve compliance with ARARs in groundwater. This RAO will be achieved through the cleanup goal of the regional background concentration of 32 µg/L of Cr(VI).
4. Ensure that the geographic location of the target remediation area does not permanently expand following completion of the remedial action.

The completion criteria or performance standards for the groundwater remedy is mainly driven by RAO #3, reducing Cr(VI) concentrations throughout the plume to concentrations of 32 µg/L or less. Attainment of the completion criteria or achievement of performance standards, Cr(VI) concentrations of 32 µg/L or less, is intended to be applied throughout the area of contaminated groundwater. In establishing this criterion, the following are recognized:

- Attaining the cleanup criteria of 32 µg/L Cr(VI) in groundwater may be through active remediation or through MNA after active remediation has been employed and optimized.
- Different areas of the plume may reach the cleanup criteria of 32 µg/L Cr(VI) in groundwater at different times

In compliance with the 1996 CACA (Attachment 6, Part B, Section 12 and Attachment 7) and the RD/RA CD, Appendix C, Section 5 this quarterly report describes activities taken to implement the Corrective Measure/Remedial Action since last reporting period and activities planned for the next reporting period, presents available results from sampling and testing since last reporting period, summarizes progress towards attaining the RAOs, any issues encountered/deviations

EXHIBIT 6.5-1

from design documents, O&M Manual, and Construction/Remedial Action Work Plan, and any optimizations and enhancements. In addition, this report discusses personnel changes and summarizes activities performed and activities planned in support of DTSC's Community Outreach Plan, DOI's Community Involvement Plan, and any contacts with local community, representatives of the press, and stakeholders/Tribes.

2.0 Operations Summary

Describe routine and non-routine system downtime, operational data (listed below) and process monitoring data (listed below) (including percentage of time treatment systems were operational on a monthly basis, quantity of water recovered for treatment/recirculated for in-situ remedy, as well as cumulative total, quantity of ethanol injected, etc.), utilities and consumables used and waste handling/disposal, any issues encountered with system operation, any personnel changes, any system optimizations and maintenance that were performed, and any material deviations from design documents, O&M Manual, and Construction/Remedial Action Work Plan.

- In-situ remediation – *Volume of water recirculated, volume of ethanol (or other carbon substrate) injected, volume of well rehabilitation chemicals used, carbon amendment system monitoring data (as needed)*
- Freshwater supply – *Volume of water extracted and injected, percentage of time the extraction pumps were operating on a monthly basis*
- Remedy-produced water management – *Volume of water managed through the conditioning process, percentage of time the conditioning system was operational on a monthly basis*

3.0 Performance Summary

Describe monitoring events and sampling performed during the current reporting period, the sampling results and interpretation of results (including volume of water collected and treated, Cr(VI) mass treated, influent-effluent data, etc., where applicable), an evaluation of the hydraulic control of the plume, an interpretation of progress toward RAOs, and any material deviations from design documents, O&M Manual, and Construction/Remedial Action Work Plan (e.g., gaps or inconsistencies in the site conceptual model)

- In-situ remediation
- Freshwater supply
- Remedy-produced water management
- *Material changes to the model including updates and recalibrations will be noted in the corresponding quarterly report, and presented in detail in the annual report*.

4.0 Green Remediation Evaluation Matrix (GREM) Summary

Summarize the O&M GREM and any changes since last reporting period.

5.0 Summary of Activities in Support of the Community Relations Plan and Contacts with the Press, Local Community, and Stakeholders/Tribes

Summarize activities performed in support of DTSC's Community Outreach Plan and DOI's Community Involvement Plan, as well as contacts with local community, representatives of the press, and stakeholders/Tribes, if any.

6.0 Recommendations

Provide suggestions for system optimizations or procedural enhancements, as applicable, to improve performance, reduce costs, reduce wastes, etc. Optimizations and/or enhancements could be based on system inefficiencies, technological developments, modified regulations, etc. If applicable, discuss whether or not recommendations from the previous quarter were adopted and if not, why not.

7.0 Planned Activities for Next Reporting Period

Provide planned activities of the next reporting period (O&M activities, groundwater/surface monitoring events, activities in support of the Community Relations Plan, etc.)

8.0 References

PG&E Topock Compressor Station, Needles, California PAGE 2 OF 2

SECTION 7

Sampling Methods and Procedures

Sampling and field measurements will be performed in accordance with the Standard Operating Procedures presented in Appendix A. Required sample containers, preservation requirements, sample storage, and QC methods and requirements are described in further detail in the PG&E Program QAPP (CH2M HILL 2012b) and QAPP Addendum (see Appendix B).

In continued efforts to integrate sustainability practices into remedial implementation (see Section 4 of the Final BOD Report), trials of alternative sampling and data collection methods have been conducted at Topock to further reduce the overall sampling and project footprint and minimize potential impacts to sensitive resources (e.g., reduce trips to well sites, reduce purge water generation and management, reduce time spent at well sites, etc.). Sections 7.1 and 7.2 discuss these trial efforts. Trial results have been evaluated and the resulting information incorporated into the sampling and monitoring for the final remedy, as appropriate.

Additional SOPs may be developed and added to the lists below, or existing SOPs may be modified and amended. The latest version of the SOPs will be available to the sampling crews at the Operations Facility (located at the Transwestern Bench), and in project files onsite. Material changes to the SOPs will be reported in the quarterly progress reports. For administrative changes to the SOPs, such as changes in point of contact information, a log of changes will be maintained by PG&E. For efficiency, administrative changes will be bundled and/or opportunistically combined with updates to incorporate material changes. Current SOPs and change logs will be made available on a SharePoint site for reference by agencies, stakeholders, and Tribes.

7.1 Field/On-site Lab Measurements

Field measurements will be collected in accordance with the following SOPs (included in Appendix A). Additional SOPs may be added as appropriate.

- SOP-A7 – Water Level Measurements
- SOP-A8 – Field Water Quality Measurements Using a Flow-through Cell
- SOP-A9 – Calibration of Field Instruments
- SOP-A11 – Total Depth Measurements
- SOP-A12 – Field Water Quality Measurements for Grab Samples
- SOP-A22 – Procedures for Calculation of Freshwater Equivalent Heads
- SOP-B16 – Field-Portable X-Ray Fluorescence Soil Sampling
- SOP-C1 – Solinst Pressure Transducers
- SOP-C2 – Pressure Transducer Upload to Topock Database

In addition, on-site laboratory measurements will be performed to assist with remedy process evaluation and monitoring of in-plant treatment performance (e.g., within the remedy-produced water conditioning plant); these measurements are not intended for formal reporting, but rather to provide operators with operational information to adjust or optimize system performance as needed. Only validated results from certified laboratories will be used for reporting purposes. Onsite lab measurements will be conducted in accordance with the following SOPs (included in Appendix A); additional SOPs may be added as appropriate:

- SOP-L1 – Hexavalent Chromium Analysis by Hach Method 1560
- SOP-L2 – Ferrous Iron Analysis by Hach Method 8146
- SOP-L3 – Total Chromium Analysis by Hach Method 8024
- SOP-L4 – Conductivity Analysis by Hach Method 8160
- SOP-L8 – Matrix Spike Preparation
- SOP-L9 – pH Measurement
- SOP-L10 – Hach Model 2100P Turbidimeter Calibration and Analysis Procedures
- SOP-L13 – Nitrate Analysis by Hach Method 8171

- SOP-L14 – Sulfate Analysis by Hach Method 8051
- SOP-L15 – Alkalinity Analysis
- SOP-L16 – Total Organic Carbon Analysis by Hach Method 10129
- SOP-L17 – Orthophosphate Analysis by Hach Method 8048
- SOP-L18 – Manganese Analysis by Hach Method 8149
- SOP-L19 – Total Dissolved Solids Analysis

Equipment-specific and site-specific training will initially be provided by senior on-site personnel (experienced field personnel) familiar with the necessary techniques for proper use and calibration of on-site equipment. Field personnel will be trained on the appropriate procedures by the experienced field personnel using SOPs and equipment manufacturer's manuals as primary references. Periodic audits and training will be conducted by the project manager and project chemist. This practice will continue for remedy monitoring.

Field versus Standard Laboratory-certified Analyses

The following discussion is presented in response to a comment received on the 30% design document regarding comparison of field vs. laboratory measurement for Cr(VI).

The Hualapai comment stated that "Comparison of data from the Upland ISPT suggests field-analyzed Cr(VI) concentrations were greater than laboratory-analyzed Cr(VI) concentrations. This appears to be linked to high TOC concentrations in the water samples (Figure 2)." There could be many possible reasons that the subject Cr(VI) data may appear to suggest that additional reduction is occurring after field collection; however, if samples were filtered and preserved in the field, no additional reduction should occur. Regardless, based on examination of the cited data, possible reasons for the elevated field results and potential remedial solution(s) include, but are not limited to, the following:

- The samples analyzed in the field were probably not filtered and low levels of suspended matter (turbidity) caused elevated results. The remedial solution is to filter all Cr(VI) samples in the field (this will be accomplished by following SOP-L1, Hexavalent Chromium Analysis by Hach Method 1560).
- Although the field Cr(VI) colorimetric method is considered fairly robust, there is always the remote possibility of a false positive reaction occurring. The remedial solution requires identifying the issue first. Once identified, a series of steps can be performed to clarify/overcome the issue. Analyzing a matrix spike can often clarify the problem and analyzing a serial dilution can often overcome the issue. This is addressed in SOP-L1, Hexavalent Chromium Analysis by Hach Method 1560.
- If the samples collected for laboratory analysis were not field filtered and preserved, there is a possibility of further reduction prior to the analysis. The remedial solution is to follow SOP A6, Sample Field Filtration and Preservation for Metals Analyses and follow proper transport and storage procedures.

As for the Technical Review Committee (TRC) comment regarding "Other potentially unstable constituents," because sulfide (S[II-]) is so unstable in the environment and is difficult to use in a systematic way, it will not be used for monitoring the remedial system on a regular basis and will primarily be a field analysis if used for "additional knowledge." However, if preserved at the time of collection, it can be transported to a lab for analysis without additional reactions occurring. Unlike Cr(VI) and S(II-), Fe(II) cannot be preserved and has a very short holding time. However, by filtering and preserving the sample we remove all the ferric iron Fe(III) (primarily found in a solid form) and only have Fe(II) remaining, thus allowing Fe(II) to easily be transported and analyzed in the lab.

Data Telemetry System

To reduce the sampling footprint and minimize potential impacts to sensitive resources, trials of data telemetry systems have been conducted at Topock since 2011 with an eye towards potential integration into remedial implementation (see Exhibit 7.1-1). Telemetry systems can provide near-real-time access to data with data transmission intervals as short as one minute via cellular or satellite signals. Units can generate email alerts when user-defined minimum or maximum parameters, such as temperature or pressure, are exceeded or if a system

fails to transmit data according to schedule. The trial consisted of five telemetry units from two separate manufacturers deployed at five different well cluster locations on the site. Three of the units were from YSI's EcoNet remote telemetry line of devices while the remaining two were Solinst STS-9100 telemetry devices.

EXHIBIT 7.1-1
Pictures of Telemetry Units Used During Trial
Groundwater Remedy Operation and Maintenance Manual
Volume 2: Sampling and Monitoring Plan
PG&E Compressor Station, Needles, California

All five telemetry systems are solar-powered. While the telemetry trial included only these devices, additional systems or sensors may be tested in the future due to the rapidly evolving nature of telemetry technology. In addition to water level measurement transducers, the trial also tested telemetry of other in-well water quality data relevant to in-situ remediation. A multi-parameter water quality probe was used for in-well measurements when not in use above-ground for water quality measurement during well purging. This “sonde” type probe fits inside 2-inch monitoring wells or in flow-through cells and measures specific conductance, dissolved oxygen, ORP, and pH, as well as measuring temperature and pressure like typical water level transducers.

The telemetry system trial demonstrated success in:

- Automating the data retrieval process, allowing for efficient data collection, management, and access
- Reducing field labor, on-site footprint and fuel use, and activity in the vicinity of floodplain nesting habitat (because telemetry-equipped wells are currently accessed for quarterly salinity profiling or as-needed equipment maintenance, not for routine manual downloads)
- Increasing data quality/reliability (because transducer equipment failure is evident from telemetry data, rather than detected only after weekly or monthly manual downloads)
- Compatibility with existing and planned future infrastructure
- Use of various power source options, including solar-charged 12V marine batteries which minimize the amount of conduit runs and the number of field visits for battery maintenance
- Blending in with the natural surroundings so as to minimize visual impact to the site

7.2 Surface Water, Groundwater, and Process Water Sampling

Surface water, groundwater, and process water sampling will be performed in accordance with the following SOPs (included in Appendix A) (note that SOP-A7, SOP-A8, SOP-A9, and SOP-A11 are listed above in Section 7.1 and are also applicable to surface water/groundwater/process water sampling). Additional SOPs may be added as appropriate.

- SOP-A1 – Purging and Sampling of Groundwater Monitoring Wells, Well-Volume Method
- SOP-A2 – Purging and Sampling of 1-inch-diameter Groundwater Monitoring Wells, Modified Well-Volume Method
- SOP-A3 – Purging and Sampling of Active and Inactive Water Supply Wells
- SOP-A4 – Depth-Specific Surface Water Sampling (supersedes SOP-A12)
- SOP-A5 – Groundwater Sampling from Sonic Drilling Boreholes
- SOP-A6 – Sample Field Filtration and Preservation for Metals Analyses
- SOP-A10 – Decontamination of Water Sampling Equipment
- SOP-A13 – Spill Prevention, Containment, and Control Measures for Monitoring Well Sampling
- SOP-A14 – Pore Water Sampling
- SOP-A16 – Access Routes
- SOP-A17 – Groundwater and Surface Water Mobile Integrated Sample Tracking
- SOP-A18 – Purging and Sampling of Groundwater Wells Minimal Drawdown Method
- SOP-A19 – Sampling of Groundwater Monitoring Wells Hydrasleeve No Purge Method
- SOP-A23 – Sample Handling and Custody

- Remedy-SOP-01 – Process Water Sampling
- Remedy-SOP-02 – Safe Fueling and Fuel Handling Policy

In continued efforts to integrate sustainability practices into remedial implementation (see Section 4 of the Final BOD Report), PG&E has conducted a trial of alternative groundwater sampling approaches at Topock to further reduce the overall sampling footprint (e.g., reduce purge water generation and management, reduce time spent at each well, minimize potential impacts to sensitive resources) while maintaining or increasing data quality.

The trial began in third quarter 2012 (September) and continued through first quarter 2013; it involved testing of two alternative sampling approaches at 18 site wells: the no-purge HydraSleeve™ sampling system and the minimal drawdown (low flow purging) sampling technique. Additional information about these two approaches can be found in numerous publications and public websites including but not limited to the following:

- HydraSleeve™ sampling system (www.hydrasleeve.com): A joint study completed by the U.S. Army Corps of Engineers, the Air Force Center for Environmental Excellence and the Air Force Real Property Agency in 2005 (Parsons 2005)
- Minimal drawdown (low flow purging or micro-purge) sampling technique: USEPA guidance on sampling procedures including the *Groundwater Issue Paper: Low-Flow (Minimal Drawdown) Ground-Water Sampling Procedures* (Puls and Barcelona 1996) and the *Groundwater Sampling Guidelines for Superfund and RCRA Project Managers* (USEPA 2002)

Trial results were compared to the current standard three-volume purge technique, and evaluated for use in monitoring of the final groundwater remedy. The 2013 Annual Groundwater Monitoring Report (CH2M HILL 2014a; available on the project website at http://dtsc-topock.com/) presented the trial results (see Recommendations section and Appendix H) along with detailed correlations between the two alternative sampling methods and the current three-volume purge method.

Based on the trial results, PG&E recommended to DTSC the use of micro-purge as the default sampling method for the existing groundwater monitoring and compliance monitoring programs. While micro-purge was recommended for groundwater/compliance monitoring, HydraSleeve and other grab sampling methods are also seen as useful tools for process monitoring during remedy implementation. DTSC completed review of PG&E's recommendations on June 26, 2014, and approved the use of micro-purge techniques for wells with screen length of up to 20-foot saturated thickness in alluvial and fluvial sediments (upland and floodplain locations) (DTSC 2014). Additional trials using alternative sampling techniques may be conducted at monitoring wells with 30- to 50-foot screen lengths, and at bedrock open borehole wells located in TCS or the East Ravine. Implementation of the micro-purge technique commenced in the third quarter of 2014. SOPs associated with these alternative techniques have been included in Appendix A.

7.3 Sample Containers, Preservation, and Storage

The contracted analytical laboratory will provide the required sample containers for all samples including QC samples. All containers will have been cleaned and certified free of the analytes of concern for this project. No sample containers will be reused. The contracted laboratory will add preservatives, if required, prior to shipping the sample containers to the field or supply the preservative as appropriate. The laboratory, upon receipt of the samples, will verify and record the adequacy of preservation and will add additional preservative, if necessary.

The containers, minimum sample quantities, required preservatives, and maximum holding times for many parameters are shown in Table 7.3-1. Table 7.3-1 includes a list of sample containers, preservation, and holding times for analytes anticipated to be monitored during operation and maintenance of the remedy (see Sections 2 through 4).

7.4 Sampling Documentation and Shipment

Pre-preserved sample containers will be received from the laboratory. The laboratory markings will indicate the type of preservative in the container. The date and time of sampling and the initials of the sampler will be recorded on the pre-printed label immediately prior to collection. The waterproof labels will be placed carefully on the proper container, and if waterproof labels are unavailable, they will be secured using clear tape to protect the label. When shipping samples using a freight carrier such as Federal Express, the ice used in shipping containers will be double-bagged and laser printed labels and indelible ink pens will be used to complete sample labels to ensure that the samples arrive at the laboratory dry and appropriately marked. If a laboratory courier is used, no bagging of ice is necessary. Vital information regarding the collection of each sample will be recorded in a field logbook, field sampling form, and/or chain-of-custody (CoC) form, as appropriate.

Logbooks will be bound with consecutively numbered pages. All entries will be legibly written in black or blue ink and signed and dated by the individual making the entries. Factual and objective language will be used. All entries will be complete and accurate to allow reconstruction of each field activity. A line will be placed through any portion of a field notebook that is unused. One line strike-through will be used to show corrections to entries. The strike-through will be initialed and dated. No correction fluid will be used. The following information for each sample will be recorded in the field logbook, field sampling form, or CoC form, whichever is appropriate:

- Sampling location and description (sketch and measured distances from reference points will be recorded if there is no established identification for the sample location)
- Sample ID
- Sampler's name
- Date and time of sampling
- Sample designation (e.g., composite, grab, etc.)
- Sample matrix
- Type and ID of sampling equipment
- Field measurement data (e.g., pH, temperature, conductivity)
- Field observations that may be relevant to the analysis or sample integrity (e.g., odor, color, and weather conditions)
- Associated QC blanks
- Shipping details (if the laboratory is providing courier service, the courier must sign and date the CoC forms; copies of the signed CoC forms should be transmitted to the office as soon as practical; if FedEx, UPS, or other courier is used, include shipping information for each shipment)
- Destination laboratory

Sample coolers will be transported to the laboratory immediately after sample collection. An overnight courier may be used to transport the samples. Intermediate stops will be avoided, except for emergencies, in which case the situation will be noted in the field notebooks. The laboratory will be notified that samples are being shipped.

7.5 Quality Control

Laboratory QC checks indicate the state of control that prevailed at the time of sample analysis. QC checks that involve field samples, such as matrix and surrogate spikes and field duplicates, also provide an indication of the presence of matrix effects. Field-originated blanks provide a way to monitor potential contamination that field samples are subjected to. The QAPP and QAPP Addendum specify requirements for method blanks, laboratory control samples (LCSs), surrogate spikes, and matrix spike/matrix spike duplicates (MS/MSDs) that must be followed by subcontracting laboratories.

A laboratory QC batch is defined as a method blank, LCS, MS/MSD, or a sample duplicate (depending upon the method) and 20 or fewer environmental samples of similar matrix that are extracted or analyzed together. For gas chromatography/mass spectrometry volatile analyses, a method blank, LCS, and MS/MSD must be analyzed in each 12-hour calibration period. The number of environmental samples allowed in the laboratory QC batch is defined by the remaining time in the method-prescribed 12-hour calibration period divided by the analytical run time. Each preparation or analytical batch will be identified in a way that will associate environmental samples with the appropriate laboratory QC samples.

The laboratory will maintain a quality assurance manual or equivalent document. The manual will include all of the requirements provided in the California Environmental Laboratory Accreditation Program (ELAP), and, if applicable, the National Environmental Laboratory Accreditation Program (NELAP).

The laboratory will also maintain SOPs for all analytical methods and laboratory operations. The format for SOPs will conform with the following:

- *Test Methods for Evaluating Solid Waste, Physical and Chemical Methods, SW-846, Third Edition, Update III, Section 1* (USEPA 1996)
- "Good Laboratory Practices" in *Principles and Guidance to Regulations for Ensuring Data Integrity in Automated Laboratory Operations* (USEPA 1995)

All SOPs will have a unique identification number that is traceable to previous revisions of the same document.

TABLE 7.3-1

(***Provided on CD-ROM Only***)

APPENDIX A

SOPs for Groundwater, Surface Water, and Process Water Sampling

This appendix contains the following SOPs for the Final Groundwater Remedy at Topock Compressor Station:

- Remedy-SOP-01 – Process Water Sampling
- Remedy-SOP-02 – Safe Fueling and Fuel Handling Policy
- SOP-A1 – Purging and Sampling of Groundwater Monitoring Wells, Well-Volume Method
- SOP-A2 – Purging and Sampling of 1-inch-diameter Groundwater Monitoring Wells, Modified Well-Volume Method
- SOP-A3 – Purging and Sampling of Active and Inactive Water Supply Wells
- SOP-A4 – Depth-Specific Surface Water Sampling (supersedes SOP-A12)
- SOP-A5 – Groundwater Sampling from Sonic Drilling Boreholes
- SOP-A6 – Sample Field Filtration and Preservation for Metals Analyses
- SOP-A7 – Water Level Measurements
- SOP-A8 – Field Water Quality Measurements Using a Flow-through Cell
- SOP-A9 – Calibration of Field Instruments
- SOP-A10 – Decontamination of Water Sampling Equipment
- SOP-A11 – Total Depth Measurements
- SOP-A12 – Field Water Quality Measurements for Grab Samples
- SOP-A13 – Spill Prevention, Containment, and Control Measures for Monitoring Well Sampling
- SOP-A14 – Pore Water Sampling
- SOP-A16 – Access Routes
- SOP-A17 – Groundwater and Surface Water Mobile Integrated Sample Tracking
- SOP-A18 – Purging and Sampling of Groundwater Wells Minimal Drawdown Method
- SOP-A19 – Sampling of Groundwater Monitoring Wells Hydrasleeve No Purge Method
- SOP-A22 – Procedures for Calculation of Freshwater Equivalent Heads
- SOP-A23 – Sample Handling and Custody
- SOP-B16 – Field-Portable X-Ray Fluorescence Soil Sampling
- SOP-C1 – Solinst Pressure Transducers
- SOP-C2 – Pressure Transducer Upload to Topock Database
- SOP-L1 – Hexavalent Chromium Analysis by Hach Method 1560
- SOP-L2 – Ferrous Iron Analysis by Hach Method 8146
- SOP-L3 – Total Chromium Analysis by Hach Method 8024
- SOP-L4 – Conductivity Analysis by Hach Method 8160
- SOP-L8 – Matrix Spike Preparation
- SOP-L9 – pH Measurement
- SOP-L10 – HACH Model 2100P Turbidimeter Calibration and Analysis Procedures
- SOP-L13 – Nitrate Analysis by Hach Method 8171
- SOP-L14 – Sulfate Analysis by Hach Method 8051
- SOP-L15 – Alkalinity Analysis
- SOP-L16 – Total Organic Carbon Analysis by Hach Method 10129
- SOP-L17 – Orthophosphate Analysis by Hach Method 8048
- SOP-L18 – Manganese Analysis by Hach Method 8149
- SOP-L19 – Total Dissolved Solids Analysis

Standard Operating Procedure
PG&E Topock Groundwater Remedy
Operation and Maintenance Plan

Title: Process Water Sampling

Number: Remedy-SOP-01_Rev0

Created Date: June 19, 2012

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS). This standard operating procedure (SOP) addresses the procedures to be used for collection of process water samples from the groundwater remediation system.

2 Required Documents

1. Event-specific sampling and analysis plan (SAP), work plan, or field instructions.
2. Applicable project work plan, monitoring plan, quality assurance project plan (QAPP), and/or Operation and Maintenance (O&M) Manual.
3. Topock Program Health and Safety Plan (HSP).
4. Blank sampling log and field notebook.

3 Preparation, Setup, and Sampling Procedures

1. Review event-specific SAP or event-specific field instructions, O&M Manual, and HSP.
2. Review sampling procedures and equipment and planned sample ports with field crew.
3. Inventory sample bottles, review required analyses, and understand lab courier schedule.
4. Prepare sampling log (use field notebook and summarize relevant information on sampling form).
5. Gather sample containers and equipment and mobilize to the first sample location.
6. Open the sampling port and allow enough water to flow to flush the 'off main pipe'.
7. Remove the cap of the sample container and collect the sample. Continue one container at a time, beginning with the containers for metals [including Cr(VI) and Cr(T)] and then the containers for general chemistry parameters.
8. After all containers for that sampling location have been filled, complete the sampling log sheet.
9. Repeat steps 5 through 8 for each sampling location.

Refer to the O&M Manual for sample handling and management, equipment decontamination, and waste management procedures.

Standard Operating Procedure
PG&E Topock Groundwater Remedy
Operation and Maintenance Plan

Title: Safe Fueling and Fuel Handling Policy

Number: Remedy-SOP-02_Rev0

Created Date: July 15, 2013

1 Background and Scope

Pacific Gas and Electric Company (PG&E) is implementing a groundwater remedy near the intersection of Park Moabi Road and Interstate 40, approximately 12 miles southeast of Needles, California at the PG&E Topock Compressor Station (TCS). The objective of this Standard Operating Procedure (SOP) is to describe the policy required to refuel vehicles, fuel tanks, and equipment/portable containers safely during work on and off the project site.

2 Approvals

Each vendor/contractor must obtain approval from PG&E Topock Site Operations Manager, and or Sr. Environmental Inspector of a) the planned fueling and re-fueling methods for the contracted activities to be performed at the site, and b) the commercial fuel supplier prior to first use for contracted activities.

3 Safety Guidelines During Fueling Operations

PG&E requires all vendors/contractors to follow appropriate procedures during fueling/refueling activities in order to avoid spills and incidents. The following general guidelines will be followed unless pre-approved otherwise:

Preparation, Pre-Fueling and Fueling Guidelines

- Turn off all equipment or engines before refueling.
- When fueling at a pump, remain attentive to the fuel nozzle.
- When not fueling at a fixed pump, stage splash pad containment as needed.
- Identify and locate fire extinguisher prior to fueling.
- Do not become distracted while fueling by electronic devices, reading materials, or conversations with bystanders.
- Use only UL-approved containers for portable gasoline storage cans.
- When filling a portable container, always place the container on level ground and keep the pump nozzle in contact with the container when refueling to avoid a static electricity ignition of fuel vapors. Fill slowly to avoid spillage and skin/clothing contact and use a funnel if needed.
- When fueling from a portable container, stage splash containment as needed.
- Only store fuel in locations approved by PG&E, and never near any ignition sources.

- In the event of a fire, make use of fire extinguisher that is available. If fire cannot be contained, relocate yourself to a safe location and call 911.

General Remote Fueling Considerations

- Position the fuel supply source as close to the equipment to be fueled as is practicable and safe.
- Inspect fuel conveyance hose/equipment and all connections and fittings for signs of wear or defects prior to the initiation of fuel pumping or pouring. If pouring fuel from a portable container, a funnel constructed of suitable material must be used to avoid splashing.
- Stage splash containment and fire extinguisher as needed.
- Ensure the area is free from ignition sources (i.e., hot equipment/work, sources of spark or static electricity).
- Once fueling is complete, deactivate the fuel supply pump prior to removing the fill nozzle from the equipment, and ensure that residual fuel has been emptied from the conveyance hose (as appropriate based on design of the equipment used).
- Inspect work area for any signs of spills, and remove spill pad(s), as appropriate.

3 Communication and Contingency Action

If a spill occurs the appropriate clean-up actions should commence as efficiently and safely as possible. Use a natural fiber push broom and/or a spark resistant shovel or scoop.

In addition, the reason for the spill will be investigated, and the team will modify the fueling procedure or conduct equipment repairs as determined appropriate to minimize the potential for future spills. Further, PG&E Site Operations Manager/Sr. Environmental Inspector must be notified immediately.

4 Waste Management

All waste generated during refueling, such as oily absorbent pads, must be transported and disposed of as directed by PG&E immediately following generation. Do not dispose of any oil/fuel contaminated pads or rags in the soil roll-off bins or waste dumpsters.

SOP-A1

Purging and Sampling of Groundwater Monitoring Wells
Well-Volume Method
Standard Operating Procedures for PG&E Topock Program

This standard operating procedure (SOP) addresses the procedures and equipment to be used for purging and sampling all groundwater monitoring wells at the Topock site with casing diameters in excess of 1-inch. This SOP will be used for sampling groundwater monitoring wells using a dedicated electric submersible pump with a single discharge rate, a dedicated electric pump with a controllable discharge rate, or a portable electric pump with a controllable discharge rate. A peristaltic pump or inertial pump (Waterra or similar) can be used if an electrical submersible pump is not appropriate. A well-volume based purging and sampling method will be used for these wells. This SOP does not apply to FLUTe wells, or Blatypus pump equipped wells (MW-58BR). Those wells will be sampled according to the relevant Field Activities Work Plan (available from on-site field coordinator).

REQUIRED DOCUMENTS:

- Event-specific planned sample table (PST).
- Applicable project work plan or monitoring plan. Refer to the Topock Program Sampling, Analysis, and Field Procedures Manual (Procedures Manual).
- Construction/Remedial Action Work Plan (C/RAWP) during the construction phase.
- Operation and Maintenance Manual (O&M Manual) and Quality Assurance Project Plan (QAPP) (Appendix B of the O&M Manual Volume 2, Sampling and Monitoring Plan) as required during the O&M phase.
- Topock Program Health and Safety Plan (HSP)
- Well construction logs/specifications
- Mobile Integrated Sample Tracking (MIST) handheld database
- Previous sampling logs or tabular historic field data tables
- Current site access map
- Blank sampling logs, maps, sample labels, chains of custody (COCs), and the designated groundwater sampling field notebook
- Applicable SOPs may include:
  - SOP-A2, *Purging and Sampling of 1-inch Diameter Groundwater Monitoring Wells, Modified Well-Volume Method*
  - SOP-A3, *Purging and Sampling of Active and Inactive Water Supply Wells*
  - SOP-A4, *Depth-Specific River Water Sampling*
  - SOP-A5, *Groundwater Sampling from Sonic Drilling Boreholes*

- SOP-A6, *Field Filtration*
- SOP-A7, *Water Level Measurements*
- SOP-A8, *Field Water Quality Measurements Using a Flow-through Cell*
- SOP-A9, *Calibration of Field Instruments*
- SOP-A10, *Decontamination of Water Sampling Equipment*
- SOP-A11, *Total Depth Measurements*
- SOP-A12, *Field Water Quality Measurements for Grab Samples*
- SOP-A13, *Spill Prevention, Containment, and Control Measures for Monitoring Well Sampling*
- SOP-A14, *Pore Water Sampling*
- SOP-A16, *Access Routes*
- SOP-A18, *Purging and Sampling of Groundwater Monitoring Wells, Minimal Drawdown Method*
- SOP-A19, *Sampling of Groundwater Monitoring Wells, Hydrasleeve No Purge Method*
- SOP-A23, *Sample Handling and Custody*
- SOP-C1, *Solinst Pressure Transducers*

REQUIRED EQUIPMENT:

- 2 or more (i.e. one is backup) YSI-556 WQ instruments with flow through cells, or equivalent.
- Hach 2100P turbidimeter or equivalent.
- 200 foot (or longer as needed) water level indicator (WLI).
- Trimble Rugged Reader hand held instrument for MIST data collection.
- Two, 200 gallon capacity purge tanks.
- Utility vehicles (UTV's) as necessary.
- Back-up 2-inch pump and controller.
- Honda 2000 watt generator or alternate power source.

PREPARATION & SETUP:

- Review event-specific PST or event-specific field instructions, previous sampling logs, Procedures Manual, HSP, and groundwater sampling supplies and equipment check list. (NOTE: the PST should also be reviewed for required "non-analytical event activities" such as water level measurements or other data collection that is planned in association with the groundwater sampling event).
- Acquire the existing field logbook for groundwater sampling and initiate entries.

- Inspect all equipment and verify that the field water quality (WQ) meters have been calibrated prior to use according to the manufacturer's instructions and SOP-A9, *Calibration of Field Instruments*.
- Inventory sample bottles, build sample sets for the required analytes at each sample location, ensure a sufficient supply of lab de-ionized water for equipment blanks, and confirm the lab courier schedule.
- Field-check sampling equipment and supplies: water level indicator (WLI), WQ meters, flow-through cell, pump controller, power supply, pump discharge/sampling tubing, N-dex gloves, D.I water sprayers, 5 gallon buckets, paper towels, 0.45 micron in-line filters, etc.

FIELD PROCEDURES:

- **Prior to opening any monitor well, remove all pens, lighters, calculators, or any other loose items from vest pockets, or from any other location where they could fall into the well.**
- Upon arrival at the monitoring well, at least 2 members of the sampling team must confirm the well ID. Wells should be clearly marked on the well monument. If the well cannot be positively identified by the marking, measure total depth of the well and compare to the well installation details to confirm the correct location. Report worn or unclear well markings to the on-site field coordinator.
- Place spill containment according to SOP-A13, *Spill Prevention, Containment, and Control Measures for Monitoring Well Sampling.*
- Collect an "EB", equipment blank, ***prior to pump installation*** if necessary according to the PST.
- Open the protective casing lid and, ***prior to moving it***, note the exact configuration of the transducer installation if present. Measure static WL according to SOP-A7, *Water level Measurements,* moving the transducer if necessary, and record WL value in MIST and on the sampling log.
- If the well is equipped with a transducer and does not have a dedicated pump installed, remove the transducer from the well according to SOP-C1, *Solinst Pressure Transducers*.
- If the well does not have a dedicated pump installed, but does have dedicated sample tubing, attach the dedicated tubing to the appropriate pump and install decontaminated pump at the same intake/sampling depth as used in prior events. There is a marking on the purge tubing which corresponds with the monitor well top of casing (TOC) to facilitate this requirement. Purge and sample the well as described below.
- If the well does not have a dedicated pump ***or*** tubing, or has not been previously sampled, use new low-density polyethylene tubing and install the pump with the intake 15 feet below the surface of the static water column, or at the depth prescribed by the Project Manager (PM) or Field Team Manager (FTM), and record the intake depth in MIST and on the field data sheet. Purge and sample the well as described below.

- If the well ***does*** have a dedicated pumping system, connect the discharge tubing and purge and sample the well as described below.
- Collect daily equipment blanks and duplicate samples as required by the PST and instructed by the field team leader.

PURGING AND SAMPLING PROCEDURES:

- Prepare the groundwater sampling log. Use the static water level and the total depth provided on the field data sheet and in the PST to calculate the volume of one casing of standing water in the well.
- Calculate 3 casing volumes for the minimum required purge amount and record on sampling log.
- Evaluate previous purge rates, amount of drawdown, stability of field parameters, and total purge volume prior to sample collection from previous sampling records and historical data tables (Appendix B of *Monitoring Plan for Groundwater and Surface Water Monitoring Program*). If the well has not been previously sampled, estimate the expected purge rate using previous sampling information from nearby wells.
- If the pumping rate is in excess of one gpm, install the provided flow splitter so that the pumping rate does not need to be decreased to collect the sample. If the flow rate is at two gpm or above, install a second flow splitter to control the flow through the flow through cell.
- Install the pump as previously described. Immediately after installation, stuff a large trash bag, or place another barrier into the well bore around the pump discharge tubing. This will help to prevent foreign objects from falling into the well.
- Ensure that all tubing connections are properly tightened and then start the pump. Check for any leaks, monitor drawdown, and calculate/set the purge rate. The purge rate can be determined using the fill-time of a graduated container, or using a flow meter if available. The well specific purge rate and pump setting should be available on the previous purge form. Record pump setting (i.e. hertz) on sampling log if available.
- Purge water should be contained in a portable purge water storage tank. If approved by well owner and the governing regulatory agencies, water may be discharged directly to the ground (this presently applies to PM-03 and PM-04 water supply wells), as directed by the FTM.
- Continue purging, measuring WL and field indicator parameters periodically (time, pH, conductivity, turbidity, dissolved oxygen, temperature, salinity, TDS, ORP, appearance, and any odors present). Time the readings such that there are a minimum of 4 sets of data collected over the course of the full purge.
- If significant drawdown is observed or turbidity increases dramatically, decrease the purge rate and measure/record new purge rate. Significant drawdown is considered to be 5 percent of the total height of the water column or to the top of screen. Record time for all measurements collected. Note and provide qualifying remarks if parameter readings are anomalous or unstable due to instrument problems and change out the instrument.

- During the purge, compare the field parameters to historical purge data. If the parameters are significantly different (greater than 50% difference for SC, pH, and/or ORP) re-confirm the ID of the well. If the well ID is re-confirmed by 2 crew members, and the readings continue to be significantly different than prior readings, set up a second WQ instrument in series to confirm readings. If the anomalous readings are confirmed by the second instrument, contact the field coordinator to resolve the issue. If the second WQ instrument produces readings that are comparable to historic values, note an instrument change and use the second instrument's readings.
- Continue purging until ***3-casing volumes*** have been removed ***and*** field parameters stabilize. Indicator parameters are considered stabilized when 3 consecutive readings made several minutes apart fall within the following EPA stabilization criteria:
  - pH +/- 0.1 pH units
  - Specific conductance +/- 3%
  - ORP +/- 10 millivolts
  - Turbidity 10 NTU units or less unless other parameters have stabilized during an extended purge and turbidity is trending flat if still over 10 NTU units. The target turbidity goal (but not a hard criterion) is 5 to 10 NTUs.
  - Dissolved oxygen +/- 0.3 mg/L
  - Temperature +/- 2^{o} Celsius
- When the requirements above have been satisfied and the purge cycle is complete, disconnect the flow through cell and prepare to collect samples directly from the pump discharge tubing for analyses according to event-specific PST.
- If flow splitters have been used, do not change the flow rate, and collect the sample from the dedicated sampling port of the first splitter in line.
- Prepare sample containers and collect gas-sensitive analytes first. The preferred collection order will be volatile organic compounds (VOCs), semi-volatile organic compound (SVOCs), metals (including hexavalent chromium [Cr(VI)] and total chromium [Cr(T)]; see SOP-A6), then general chemistry (cations, anions, stable isotopes).
- For filtered samples, attach a 0.45 micron in-line filter to the pump discharge and allow approximately 500 mL of sample to pass through the filter before beginning sample collection in accordance with SOP-A6, *Field filtration* and the QAPP.
- When sample collection is complete, record sample information, final WL, and purge volume data in MIST and on the field sampling log.
- If transient pump previously installed, remove the pump from the well, detach the dedicated tubing and carefully drain any residual water to the purge water tank. Install appropriate tubing cap to prevent any residual water from leaking from the sample tubing. Store the dedicated tubing in a sealed, labeled trash bag. Decontaminate the pump according to SOP-A10, *Decontamination of Water Sampling Equipment.*

- If well was equipped with a transducer, replace the transducer in exactly the same configuration in which it was found and in accordance with SOP-C1, *Solinst Pressure Transducers*.
- Close and secure well protection lid.
- Follow the applicable SOPs, O&M Manual and the Procedures Manual for sample handing and management, equipment decontamination, and investigation-derived waste (IDW) management (O&M Manual Volume 1, Section 6 during O&M or Appendix R of the C/RAWP during construction).

LOW VOLUME AND POOR RECOVERY WELLS:

Some groundwater monitoring wells under the GMP may exhibit slow or poor recovery upon purging. These monitoring wells may not recharge sufficiently during purging, and may run completely dry without an opportunity to collect the required series of groundwater stabilization parameters, or requisite samples. The following procedures will be followed for collecting representative groundwater samples from wells that go dry during purging.

PREPARATION & SETUP:

Follow the steps above.

PURGING AND SAMPLING PROCEDURES FOR LOW RECOVERY WELLS:

- Prepare the groundwater sampling log. Use the static water level and the total depth provided on the field data sheet (comparing to the previous values used on the PST) to calculate the volume of one casing of standing water in the well.
- Calculate 3 casing volumes for the minimum required purge amount, and record on purge log.
- Evaluate previous purge rates, amount of drawdown, stability of field parameters, and total purge volume prior to sample collection from previous sampling records and historical data tables (Appendix B of *Monitoring Plan for Groundwater and Surface Water Monitoring Program*). If the well has not been previously sampled, estimate the expected purge rate using previous sampling information from nearby wells.
- Connect the dedicated purge tubing if available or use new tubing if necessary. Install the pump within the well screen or to the previously determined depth and start the purge. Monitor drawdown, and calculate/set the purge rate. Record the pump setting (i.e. hertz) on the sampling log if available.
- Continue purging, measuring WL and field indicator parameters periodically (time, pH, conductivity, turbidity, dissolved oxygen, temperature, salinity, TDS, ORP, and any odors present). Space the readings such that there are a minimum of 4 sets of data collected over the course of the available purge volume.
- During the purge, compare the field parameters to previous purge data. If the parameters are significantly different (greater than 50% difference for SC, pH, and/or ORP) confirm the ID of the well. If the well ID is confirmed by 2 crew members, and the

readings continue to be significantly different than prior readings, set up a second WQ instrument in series to confirm readings. If the anomalous readings are confirmed by the second instrument, contact the field coordinator to resolve the issue. If the second WQ instrument produces readings that are comparable to historic values, note an instrument change and use the second instrument's readings.

- Continue purging until ***3-casing volumes*** have been removed ***and*** field parameters stabilize, or until the well purges dry. If 3 casing volumes are removed, sample as described above. If the well runs dry, continue as instructed below.
- If previously installed, remove the pump from the well and decontaminate according to SOP A-10, *Decontamination of Water Sampling Equipment*. The pump may also be left in place to facilitate subsequent purging and sampling.
- Record the final water level, time, the volume of water discharged and the elapsed time for the dewatering of the well.
- Allow the well to recharge to 80 percent of the original height of the water column. Ideally, this should be within 24 hours of the monitoring well being purged dry. The recovery period to achieve 80 percent of the height of the water column could take longer than 24 hours in some instances (MW-48).
- ***At MW-24BR only,*** return to the well the following day and continue purging until a total of 190 gallons have been removed, then sample normally.
