Mr. Robert Perdue Executive Officer California Regional Water Quality Control Board Colorado River Basin Region 73-720 Fred Waring Drive, Suite 100 Palm Desert, California 92260

Subject: PG&E Topock Compressor Station, Needles, California Upland In-Situ Pilot Test 2012 Annual Monitoring Report (Rescinded Board Order R7-2007-0015)

Dear Mr. Perdue:

Enclosed is the 2012 Annual Monitoring Report for the Pacific Gas and Electric Company (PG&E) Topock Compressor Station, Upland reductive zone in situ pilot test. Although the Waste Discharge Requirement (WDR) issued by the Colorado River Basin Regional Water Quality Control Board (Water Board) under Board Order R7-2007-0015 was rescinded in May 2009, PG&E is continuing to monitor the test area and is providing this report for your information.

If you have any questions regarding this report, please call me at (805) 234-2257.

Sincerely,

Monne Meche

Yvonne Meeks Topock Project Manager

2012 Annual Monitoring Report for the Upland Reductive Zone In-Situ Pilot Test

1.0 Introduction

Pacific Gas and Electric Company (PG&E) implemented an Upland reductive zone insitu pilot test (ISPT) to address chromium concentrations in groundwater at the Topock Compressor Station (the Site) near Needles, California. The purpose of the Upland ISPT was to evaluate the efficacy of using a reagent mixture to remove hexavalent chromium from groundwater using chemical reduction to form stable, insoluble trivalent chromium. The Upland ISPT consisted of the recirculation of the reagent mixture between the two recirculation wells (PTR-1 and PTR-2) from March 6, 2008 through November 1, 2008; results were monitored in surrounding groundwater monitoring wells (PT-7 Shallow/Middle/Deep [S/M/D] through PT-9S/M/D, MW-11, MW-24A/B, and MW-38S/D). Figure 1 provides a map of the PG&E Topock Compressor Station and ISPT area (all figures are provided at the end of the report).

California Regional Water Quality Control Board, Colorado River Basin Region (Water Board), Order No. R7-2007-0015 authorized PG&E to inject a total of approximately 38,000 gallons of reagent through the duration of the test. An automated reagent dosing system metered the reagent injections at regular intervals during each day of the pilot test. The pilot test concluded activities on December 3, 2008, at the end of the nine month period allowed in Order No. R7-2007-0015.

The Monitoring and Reporting Program (MRP) under Order No. R7-2008-0015 required a final report to be submitted within 90 days of the completion of the ISPT. The *Upland Reductive Zone In-Situ Pilot Test, Final Completion Report* (ARCADIS 2009a) was submitted on March 3, 2009 and summarizes the activities and results related to the Upland ISPT from March 2008 through December 3, 2008.

The Monitoring and Reporting Program (MRP) under Order No. R7-2007-0015 required monthly monitoring reports to be submitted by the 15th day of the following month. A letter requesting the Order be rescinded was submitted to the Water Board on March 20, 2009 (Appendix A). The rescission was approved on May 21, 2009. While active injection and operation of the in situ pilot test has ceased, ARCADIS has continued to take monitoring samples from the Upland ISPT area in order to document ongoing conditions at the site. This report describes monitoring activities and results related to the Upland ISPT for the last year, spanning from the fourth quarter of 2011 through the third quarter 2012; reports will continue to be submitted annually.

2012 Annual Monitoring Report for the Upland Reductive Zone In-Situ Pilot Test

2.0 In-Situ Pilot Test Sampling Locations

Table 1 summarizes the well construction details for the recirculation wells (PTR-1 and PTR-2) and monitoring wells (PT-7S/M/D through PT-9S/M/D, MW-11, MW-24A/B, and MW-38S/D). Figure 2 provides a map of the sampling locations. Figure 3 presents the well construction and cross section information for the monitoring wells sampled in the Upland ISPT. The sampling list includes the following wells: PT-7S/M/D through PT-9S/M/D, MW-11, and MW-24A/B.

PG&E Topock Compressor Station San Bernardino County, California

2

3.0 Description of Activities

During the past year, ARCADIS completed two sampling rounds associated with the Upland ISPT. Associated field activities were performed in accordance with the applicable procedures contained within the *Sampling, Analysis, and Field Procedures Manual, PG&E Topock Program, Revision 1 (*"SAFPM") (CH2M Hill, 2005).

The two sampling events were conducted in February 2012 and July 2012. Data from three events (the November 2011 data is also included as it has not been previously reported) are included in this report.

Samples were collected, labeled, and packaged according to the SAFPM, as summarized in Section 4.0. Table 2 presents the field parameter results. Tables 3 and 4 present the groundwater analytical results, including historical data from July 2007 to present. Calibration logs for field-monitoring instruments are included in Appendix B. Groundwater sampling logs are included in Appendix C.

With the rescission of the Waste Discharge Requirements for the pilot test, the groundwater analytical suite was reduced to the following parameters: total dissolved chromium, hexavalent chromium, fluorescein, rhodamine, nitrate, sulfate, dissolved iron, dissolved manganese, dissolved arsenic, dissolved molybdenum, dissolved selenium, total organic carbon, and bicarbonate alkalinity. Barium analysis was added to the sampling program in the first quarter of 2010 after baseline samples collected in the third quarter of 2009 indicated barium concentrations had increased.

4.0 Sampling and Analytical Procedures

4.1 Groundwater Sampling

Groundwater sampling and associated tasks were performed in accordance with the applicable procedures contained in the SAFPM (CH2M Hill, 2005) and are summarized below.

Monitoring wells were purged and sampled. Prior to groundwater sampling, the depth to water was recorded for each well. These data were used to evaluate the volume of standing water in the well. The monitoring wells were purged using a WaTerra[®] purge pump with dedicated polyethylene tubing. Purging continued until three casing volumes had been removed. The field parameters, such as pH, specific conductance, and temperature were recorded (Table 2). After completion of purging, the groundwater samples were collected in the appropriate containers.

The samples were stored in coolers at approximately 4 degrees Celsius and transported to Truesdail, Calscience, and Ozark via a courier service under chain-of-custody documentation. Truesdail and Calscience are certified by the California Department of Health Services (Certification #1237 and #1230, respectively) under the State of California's Environmental Laboratory Accreditation Program.

Analyses were performed in accordance with the latest edition of the "Guidelines Establishing Test Procedures for Analysis of Pollutants" (40 CFR Part 136), or equivalent methods promulgated by the USEPA.

Sample results are summarized in Tables 3, 4, and 5. Calibration logs for fieldmonitoring instruments are presented in Appendix B. Sampling logs are presented in Appendix C. Copies of laboratory analytical results are presented on compact disc in Appendix D.

Table 6 identifies the laboratory that performed each analysis and lists the following required monitoring information:

- Sample Location
- Sample identification
- Sampler name

Higher doses of carbon in the vicinity of PT-7M and PT-7D resulted in the temporary generation of carbon dioxide gas beyond the ability of the aquifer to diffuse the gas naturally. There were issues in the past regarding use of the down-well pump because it could not be primed due to the amount of gas present in the purge water from the well. However, the down-well pump has been used to collect samples from PT-7D and PT-7M since the July 2011 event.

Groundwater samples from the sampling events were analyzed for hexavalent chromium (United States Environmental Protection Agency [USEPA] Method 218.6 SM 2500-Cr) and total dissolved chromium (USEPA Method SW 6020) by Truesdail Laboratories (Truesdail); dissolved arsenic, dissolved barium, dissolved manganese, dissolved molybdenum, dissolved selenium, and dissolved iron (USEPA 200.8), sulfate and nitrate (USEPA 300), alkalinity bicarbonate (USEPA Method 2320B), and total organic carbon (TOC) (USEPA Method 5310B), by Calscience Environmental Laboratories, Inc. (Calscience); and for fluorescein and Rhodamine WT by Ozark Underground Laboratories, Inc. (fluorescence spectroscopy according to Ozark standard operating procedures). Hexavalent chromium was also analyzed in the field at the Interim Measures 3 facility using HACH Method 8023 - program 1560.

5.0 Analytical Results

5.1 Groundwater Analytical Results

Summaries of the field test parameters, primary and secondary parameters, and supplementary metals are presented in Tables 2, 3, 4, and 5, respectively.

Approximately three and a half years after completing the pilot study, Cr(VI) continues to be treated in areas where TOC distribution was greatest and strong reducing conditions were established during the pilot study operation. In addition, by-product concentrations have either returned to baseline levels or are following generally declining trends.

Cr(VI) concentrations have been stable over the last two years. Cr(VI) continues to be treated as indicated by concentrations below baseline, although the extent of reduction varies across the pilot study area and is correlated with the extent of organic carbon distribution achieved during the pilot study. During operation, the distribution of organic carbon varied with distance from the injection locations, as shown in Figure 3. Significant concentrations of organic carbon were distributed and maintained at MW-24A and PT-8S from injection at PTR-2 and at PT-7M and PT-7D from injection at PTR-1 (areas shown in dark blue on Figure 3). At these locations, Cr(VI) concentrations have remained at, or below, the reporting limit of 1 microgram per liter $(\mu g/L)$ since the end of the pilot test; suggesting complete reduction has been maintained. In locations where organic carbon concentrations were distributed at lower concentrations and less consistently over time (areas shown in light blue on Figure 3), Cr(VI) concentrations are stable below baseline levels, indicating incomplete reduction has been maintained (e.g. in July 2012, PT-7S yielded a Cr(VI) concentration of 496 µg/L compared to a baseline concentration of 1,200 µg/L and PT-8D yielded a Cr(VI) concentration of 1,330 µg/L compared to baseline concentration of 6,540 µg/L). At PT-8M, where organic carbon was not distributed during operation, Cr(VI) concentrations continue to decline and reached a minimum during the July 2012 event $(45 \mu g/L)$ compared to a baseline concentration of 3,960 $\mu g/L$, indicating the arrival of treated groundwater that was distributed upgradient of this location during operation.

Arsenic and manganese concentrations have also been relatively stable or changing gradually over the last year. At locations where organic carbon was distributed during operation (PT-7S, PT-7M, PT-7D, PT-8S, PT-8D, and MW-24A), as shown in dark blue on Figure 3, manganese and arsenic concentrations temporarily increased as a result of the anaerobic dissolution of manganese and arsenic-bearing minerals. Arsenic

2012 Annual Monitoring Report for the Upland Reductive Zone In-Situ Pilot Test

PG&E Topock Compressor Station San Bernardino County, California

concentrations have returned to baseline levels across the pilot test monitoring well network.

Manganese concentrations decreased by an order of magnitude in the first year and a half following the end of active operations and have been relatively stable over the past year, with the following exceptions:

• Elevated manganese concentrations were detected in samples from PT-7M and PT-7D. Manganese concentrations varied over time in post-pilot test samples collected from PT-7M and PT-7D, likely due to the locally heterogeneous generation and distribution of manganese during the pilot. The detection of several milligrams per liter of manganese in some samples is likely a result of delivering higher ethanol concentrations to the aquifer during the pilot and total organic carbon is still present in these locations.

• Manganese concentrations at PT-8M began increasing after the pilot study concluded. Organic carbon was not distributed at this location during recirculation. The arrival of manganese after recirculation ended indicates that organic carbon was distributed upgradient of this location and manganese dissolved into water is now traveling through PT-8M. The July 2012 result at PT-8M presents the current maximum manganese concentration at the site. In 2011, the increase in manganese concentration at PT-8M coincided with an increase in fluorescein tracer concentration, which was injected at PTR-1 during the ISPT injections in 2007, indicating that reduced groundwater influenced the pilot test injections continues to flux through the vicinity of the pilot test monitoring well network.

• In addition, total organic carbon concentrations declined to less than 5 milligrams per liter (mg/L) throughout the pilot study area by early 2010, with the exception of PT-7M where the highest concentrations had been distributed during the pilot study. TOC concentrations at PT-7M fell below 5 mg/L in July 2011 but significantly increased thereafter, with concentrations at 97 mg/L in July 2012. Similarly, TOC concentrations increased during the November 2011 and February and July 2012 events at all pilot study wells. Current TOC concentrations range from 15 mg/L at PT-7S to 45 mg/L at PT-7D. The systematic detection of TOC at all pilot monitoring locations, including upgradient locations, indicates a natural variation in concentrations rather than a result of the pilot test injections.

7.0 Certification

PG&E submitted a signature delegation letter to the Water Board on July 5, 2006. The letter delegated PG&E's signature authority to Mr. Curt Russell and Ms. Yvonne Meeks.

Certification Statement:

I declare under the penalty of law that I have personally examined and am familiar with the information submitted in this document, and that based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of a fine and imprisonment for knowing violations.

2012 Annual Monitoring Report for the Upland Reductive Zone In-Situ Pilot Test

| Location Name | Sample S Date | Sample Type | Screen Interval (ft bgs) | ORP (mV) | рН | Specific Conductance (µS/cm) | Temperature (ºC) | DO (mg/L) | Depth to Water (feet below TOC) | Hexavalent Chromium Field (µg/L) | |
|------------------|------------------|----------------|--------------------------------|-------------|----|------------------------------------|---------------------|-----------|------------------------------------|--|--|
|------------------|------------------|----------------|--------------------------------|-------------|----|------------------------------------|---------------------|-----------|------------------------------------|--|--|

Notes:

Current quarter data indicated in BOLD

Depth to water recorded prior to any sampling activities. Recirculation wells PTR-1 and PTR-2 cannot be gauged post-construction due to necessary piping and well caps

| ft bgs | Feet below ground surface |
|--------|--------------------------------------|
| mV | Millivolts |
| µS/cm | Microsiemens per centimeter |
| °C | Degrees Celsius |
| µg/L | Micrograms per liter |
| mg/L | Milligrams per liter |
| ORP | Oxidation Reduction Potential |
| Ν | Normal |
| DO | Dissolved oxygen |
| TOC | Top of Casing |
| | Not analyzed/Not available |

* PTR-1 Screen: 125-160 and 175-220 ft bgs. PTR-2 Screen: 118-158 and 173-218 ft bgs.

Oct result for PT-7M & PT-7D are grab samples. Unable to effectively purge well because of gas buildup in the well.

Oct ORP value for PT-7S is under review; likely a mis-reading was recorded.

Table 3

Summary of Primary Analytical Parameters

PG&E Topock

Needles, California

2012 Annual Monitoring Report for the Upland Reductive Zone In-Situ Pilot Test

| Location Name | Sample Date | Not es | Sampl e Type | Hexavalent Chromium (µg/L) | Total Dissolved Chromium (μg/L) | Total Chromium (µg/L) | Fluorescein (ppb) | Fluorescein (ppb dye) | Rhodamine (ppb) | Rhodamine (ppb dye) | Nitrate-N (mg/L) | Nitrite-N (mg/L) | Total Iron (µg/L) | Dissolved Iron (µg/L) | Dissolved Manganese (µg/L) | Total Manganese (μg/L) | Sulfate (mg/L) | Total Organic Carbon (mg/L) | Dissolved Molybdenum (µg/L) | Dissolved Selenium (µg/L) | |
|------------------|----------------|-----------|--------------------|----------------------------------|--|-----------------------------|----------------------|--------------------------|--------------------|------------------------|---------------------|---------------------|----------------------|-----------------------------|----------------------------------|------------------------------|-------------------|--------------------------------------|-----------------------------------|---------------------------------|--|
|------------------|----------------|-----------|--------------------|----------------------------------|--|-----------------------------|----------------------|--------------------------|--------------------|------------------------|---------------------|---------------------|----------------------|-----------------------------|----------------------------------|------------------------------|-------------------|--------------------------------------|-----------------------------------|---------------------------------|--|

Notes:

- Current quarter data indicated in BOLD
 - a Samples were diluted in the laboratory
- Dissolved Samples were field filtered with a 0.45 micron filter.
- ft bgs Feet below ground surface
- mg/L Milligrams per liter
- µg/L Micrograms per liter
- < Symbol indicates not detected at or above laboratory detection limit as noted
- J Reported value is estimated
- N Normal
- ND Non-detect
- EB Equipment blank
- FB Field blank
- FD Field duplicate

Nitrate-N Nitrate as Nitrogen

Nitrite-N Nitrite as Nitrogen

- UB The analyte was not detected, but the analyte was found in the associated blank.
- UJ The analyte was not detected above reporting limit. However, the reporting limit is approximate and may be inaccurate or imprecise.
- --- Not analyzed/Not available
- * PTR-1 Screen: 125-160 and 175-220 ft bgs. PTR-2 Screen: 118-158 and 173-218 ft bgs.
- ** Sample IDs were transcribed in the field. Data here are presented with the appropriate ID.

Starting with the February 2009 results, Calscience Laboratories was used for analysis, not EMAX laboratories.

- ¹ Molybdenum and selenium results are Total, not Dissolved
- ² TOC data from 3rd quarter 2010 is not used for trend evaluation due to calibration concerns in regards to the calculation method of TOC.

Needles, California

2012 Annual Monitoring Report for the Upland Reductive Zone In-Situ Pilot Test

| Location | | | | Dissolved | Dissolved | Dissolved | Total | Dissolved | Dissolved | Alkalinity | Alkalinity | Chloride | Orthophosphat | Sulfide | Fluoride |
|-------------------|--------|-------|--------|-----------|-----------|-----------|---------|-----------|-----------|-------------|------------|----------|---------------|---------|----------|
| Location Name: | Sample | | Sample | Calcium | Magnesium | Arsenic | Arsenic | Potassium | Sodium | bicarbonate | carbonate | | е | | |
| Name. | Date: | Notes | Type: | µg/L | µg/L | µg/L | µg/L | µg/L | µg/L | mg/L | mg/L | mg/L | mg/L | mg/L | mg/L |

Notes:

Current quarter data indicated in BOLD

a Samples were diluted in the laboratory

ft bgs Feet below ground surface

mg/L Milligrams per liter

µg/L Micrograms per liter

< Symbol indicates not detected at or above laboratory detection limit as noted.

EB Equipment blank

FB Field blank

FD Field duplicate

Reported value is estimated. J

Ν Normal

NA Not applicable

Dissolved Samples were field filtered with a 0.45 micron filter.

Not analyzed/not sampled
 PTR-1 Screen: 125-160 and 175-220 ft bgs. PTR-2 Screen: 118-158 and 173-218 ft bgs.

Starting with the February 2009 results, Calscience Laboratories was used for analysis, not EMAX laboratories

Mr. Robert Purdue Executive Officer California Regional Water Quality Control Board Colorado River Basin Region 73-720 Fred Waring Drive, Suite 100 Palm Desert, California 92260

Subject: Board Order R7-2007-0015 PG&E Topock Compressor Station, Needles, California Upland In-Situ Pilot Test Changes in Pilot Test Operations

Dear Mr. Purdue:

As we discussed yesterday, PG&E is submitting this letter is to notify the Regional Water Quality Control Board (RWQCB) that PG&E would like to temporarily discontinue injection of reagent for the Upland In-Situ Pilot Test (ISPT) operating under Board Order No. R7-2007-0015. Currently, the concentration of total dissolved carbon (TOC) within the aquifer is sufficient to sustain a viable in-situ reactive zone (IRZ). The plan is to withhold treatment discharge (reagent dosing via the recirculation wells) for approximately one month to monitor the recirculation systems ability to distribute the TOC sufficiently through the recirculation cell. There will be no change in the recirculation rate - the system will continue to circulate water during this time period.

To evaluate the TOC distribution, PG&E is recommending that weekly sampling of TOC be collected from eight wells: PT-7M, PT-7D, PT-8S, PT-8M, PT-8D, MW-24A, PTR-1, and PTR-2 during the one month evaluation period. After the evaluation period, PG&E will identify a path forward to continue the dosing of the Upland ISPT, potentially at a reduced rate, or will discuss other options with the RWQCB. All supplemental data collected and the plan for continued dosing the Upland ISPT will be communicated to the RWQCB.

From an engineering perspective, because of the continual evaluation inherent in any pilot test, the optimal approach to the Upland ISPT was anticipated to be conducted in a semi-continuous manner, with breaks as needed to assess progress or fine-tune approaches. PG&E discussed this type of phasing with the RWQCB during the preparation of the Waste Discharge Requirement (WDR), e.g. as described in Finding II.A.1, the pilot test "...is expected to take up to six months and will be conducted within a nine-month calendar period".

Based on our review of the Waste Discharge Requirements, it does not appear as though the proposed actions fall under the Effluent Limitations and Discharge Specifications IV.A.5 that states, "Any changes in the type of amount of treatment chemicals added to the process water, duration of the pilot test, or other specific design elements as described in this Board Order shall be made with prior written approval of the Regional Water Board's Executive Officer." or Provision V.A.1.e that states, "Prior to modifications in this facility, which would results in material change in the quality or quantity of wastewater treated or discharged, or any material change in the location of discharge, the Discharger shall report all pertinent information in writing to the RWQCB and obtain revised requirements before modifications are implemented."

We understand however that you will determine if the proposal to temporarily discontinue discharge, and subsequent restart requires a simple notification to the RWQCB or if the permit requires that Board or Executive Officer approval is necessary. If such approval is necessary, please consider this letter our request for approval.

We have a scheduled ethanol delivery on June 2nd that we may be able to reschedule if we are allowed to cease the dosing operation per the information provided above. We appreciate your timely consideration of this letter.

If you have any questions regarding this information, please call me at (805) 234-2257.

Sincerely,

Monne Mecke

May 29, 2008

Yvonne J. Meeks, Project Manager Pacific Gas & Electric Company 4325 S. Higuera Street San Luis Obispo, CA 93401

SUBJECT: APPROVAL OF A CESSATION IN THE REAGENT INJECTION PROCESS, WASTE DISCHARGE REQUIREMENTS BOARD ORDER NO. R7-2007-0015 (WDRs), PG&E TOPOCK COMPRESSOR STATION

We received your letter, dated May 29, 2008 (Letter), requesting approval to temporarily discontinue reagent injections while continuing to pump and monitor recirculation wells associated with the Upland In-situ Pilot Test (Upland ISPT) at the subject facility. You explain the reason for your request by stating: "Currently, the concentration of total dissolved carbon (TOC) within the aquifer is sufficient to sustain a viable in-situ reactive zone (IRZ)." You explain further that PG&E would like "to withhold treatment discharge for approximately one month to monitor the recirculation systems ability to distribute the TOC sufficiently through the recirculation cell." You add that no change in the recirculation rate will occur during this time period. Also, you indicate that to evaluate the TOC distribution, weekly sampling of TOC will be conducted from eight specified monitoring wells. Following this one-month evaluation period, you state that PG&E would continue the dosing of the Upland ISPT, potentially at a reduced rate, or would discuss other options with the Colorado River Basin Regional Water Quality Control Board (Board), and that the monitoring data and continued dosing plans would be communicated to the Board.

The latter part of your letter discusses your view that the proposed temporary cessation of reagent injection appears to be the type of testing approach to the Upland ISPT that was anticipated to be conducted in a semi-continuous manner, with breaks as needed to assess progress or fine-tune approaches. You point out that this type of phasing was discussed with Board staff during the drafting of the subject Board Order, as reflected in Finding II.A.1, which provides that the Upland ISPT "is expected to take up to six months and will be conducted within a nine-month calendar period." Based on this Finding, you conclude that the proposed temporary cessation and subsequent "fine-tuning" for determining the optimal dosing rate for the reagent injections do not appear to fall under Effluent Limitations and Discharge Specifications IV.A.5 to require

California Environmental Protection Agency

Reagent Injection Process - 2 -Upland ISPT, Topock Compressor Station

formal written approval by the Regional Board's Executive Officer.¹ In the event that the Executive Officer does not share this conclusion, you requested that your letter be considered a request for the Executive Officer's approval.

I have concluded that the temporary cessation of reagent injection for one month in a testing protocol that envisions that the injection portion of the pilot test would take up to six months and be conducted within a nine-month calendar period (Finding II.A.1) is a significant enough delay to be considered a "change[] in the amount of treatment chemicals added to the process water" or, at a minimum, a "change[] in ... other specific design elements as described in [the Board Order]." (Specification IV.A.5.) Thus, the proposed temporary cessation of reagent injection is subject to Specification IV.A.5. As such, my written approval is required. Accordingly, I have treated your letter as requesting that approval, which is hereby granted.

As for the "fine-tuning" of the dosing rate, which is proposed to occur upon restart of the reagent injection process, I agree that the starts/stops and breaks involved for this fine-tuning work are of a short-term nature and thus, would not rise to the level of specific design element changes that would require my written approval. Therefore, with respect to the fine-tuning phase of the Upland ISPT, your notice regarding this phase of the work is sufficient.

Please keep in mind, however, that it is necessary that you keep the Regional Board and the Department of Toxic Substances Control staff apprised, at the earliest practicable time, of all design and operational parameters involved in the Upland ISPT.

The subject Board Order remains in full effect and is not modified by this letter. If you have any questions, or require additional information regarding this matter, please call Cliff Raley at (760) 776-8962.

-----Original Message-----From: Meeks, Yvonne J [mailto:YJM1@pge.com] Sent: Monday, August 04, 2008 4:12 PM To: Robert Perdue; Cliff Raley; Tom Vandenberg Cc: Gilbert, David; Doss, Robert; Jayo, Juan (Law); Kellogg, Lisa; Robert Lucas Subject: PGE Uplands ISPT Reagent Dosing

Robert and all -- Per the attached letter from the RWQCB, we are providing this notice that PG&E intends to re-start ethanol dosing in uplands pilot study well PTR-2 at a rate of between 15 and 45 gallons per day (a reduction from the 100 gallons per day specified in the WDR).

As you recall, with your approval, we temporarily discontinued reagent injection in both injection wells in late May. At that time, we proposed to evaluate the data results and make a recommendation for the restarting reagent dosing. PG&E has evaluated the recent monitoring data and intends to begin recirculation with ethanol dosing in PTR-2 within the next week. PG&E will continue to review the data and plans to make a recommendation regarding dosing in PTR-1 at the end of August.

We will continue to keep the RWQCB informed. Let me know if you have any questions.

Yvonne Meeks

Subject: Topock - Notification request to the RWQCB regarding Uplands dosing

Robert --

In accordance with the attached letter from the RWQCB, we are providing this notice that tomorrow, October 24, PG&E intends to increase the ethanol dosing in uplands pilot study wells, PTR-1 and PTR-2, to a rate of 100 gallons per day for each well. We are essentially going back to the injection rate as was originally specified in Board Order No. R7-2007-0015. You will recall that we had decreased the rate back in August to 15-45 gallons per day.

Looking ahead, weplan to complete the ethanol dosing on November 6, the final day per the WDR permit. After that we will just be recirculating groundwater until December 3rd, also consistent with the WDR. Since these timeframes are consistent with the timeframes in the WDR permit, these completion activities didn't require notification, but I thought you might like to know that we are finishing up another (successful) pilot test.

Let me know if you have any questions, Yvonne

Preston, Kelli Jo

| Subject: | Notification regarding PG&E Topock Uplands pilot test |
| Attachments: | Appendix A-Communications.pdf |

Robert --

In accordance with the attached letter from the RWQCB, we are providing this notice that PG&E intends to modify the flow pattern in uplands pilot study well PTR-2 to perform a hydraulic extraction test. PTR-1 will be brought off-line and the recirculation pattern in PTR-2 will be reversed. This reversal will be allowed to run for 4-6 hours to evaluate the extraction capacity of the well. Once the 4-6 hour test is complete, the downhole equipment will be removed. As specified within Board Order No. R7-2007-0015, the pilot will be concluded on December 3rd, after 9 months of operation.

Let me me know if you have any questions regarding this email or any other aspect of the uplands test.

March 20, 2009

Mr. Robert Perdue Executive Officer California Regional Water Quality Control Board Colorado River Basin Region 73-720 Fred Waring Drive, Suite 100 Palm Desert, California 92260

Subject: Request to Rescind the Waste Discharge Requirements under Board Order R7-2007-0015 PG&E Topock Compressor Station, Needles, California

Dear Mr. Perdue:

Pacific Gas and Electric Company (PG&E) is requesting to rescind the Waste Discharge Requirements (WDRs) issued by the Colorado River Basin Regional Water Quality Control Board (Water Board) under Board Order R7-2007-0015 related to the PG&E Topock Compressor Station upland reductive zone in situ pilot test.

Reagent injections were completed in November 2008 followed by monitoring events as required in the Monitoring and Reporting Program (MRP) Attachment C. The in situ pilot test was deemed to be complete in December 2008 and the *Upland Reductive Zone In-Situ Pilot Test*, *Final Completion Report* was submitted on March 3, 2009. Since March 3, 2009, activity has consisted solely of quarterly sampling of sixteen upland pilot study wells. No additional injections are planned in this area. Therefore, it is PG&E's understanding that the WDR need not be renewed, and instead rescinded.

If you have any questions regarding this report, please call me at (805) 234-2257.

Sincerely,

Monne Meche

Yvonne Meeks Topock Project Manager
