Subject: Board Order R7-2006-0060, WDID No. 7B 36 2033 001 - Interim Measures Compliance Monitoring Program Groundwater Monitoring Report, First Quarter 2008, PG&E Topock Compressor Station, Needles, California.

Dear Mr. Yue and Mr. Perdue:

Enclosed is the *Groundwater Monitoring Report, First Quarter 2008* for the Interim Measure Compliance Monitoring Program (CMP) at the PG&E Topock Compressor Station. This monitoring report presents the results of the first quarter 2008 CMP groundwater monitoring event, and has been prepared in conformance with RWQCB Order No. R7-2006-0060, as well as with DTSC's July 15, 2005 letter approving the Compliance Monitoring Plan and June 9, 2006 letter modifying the reporting requirements.

On August 8, 2006, PG&E submitted a revised contingency plan flowchart for groundwater quality changes associated with the injection system. The contingency plan specifies the concentrations and values for hexavalent chromium, total chromium, total dissolved solids and pH to be used to determine if contingency plan actions were necessary based on sample results. The concentrations used to trigger the contingency plan are as follows: hexavalent chromium greater than 32.6 μ g/L, total chromium greater than 28.0 μ g/L, total dissolved solids greater than 10,800 mg/L, and pH outside of the range of 7.6 to 8.89. The following paragraph discusses first quarter 2008 data and associated contingency plan actions.

During the first quarter 2008 monitoring event, a sample from the well OW-2S exceeded the total chromium action level (36.2 μ g/L). A review of the water quality parameters indicative of treated groundwater injection (hexavalent chromium, total dissolved solids,

sulfate, nitrate/nitrite and fluoride) confirm that injected water has not yet reached OW-2S and that the concentration of total chromium is not related to injected water (which has significantly lower chromium concentrations), but instead is related to the natural variability within the shallower portions of the aquifer.

In a letter dated January 5, 2007, DTSC stated that it was not necessary to follow contingency plan requirements for hexavalent and total chromium with respect to OW-2S and OW-5S. The Colorado River Basin RWQCB concurred with this decision in a letter dated March 2, 2007. As such, the contingency plan was not triggered due to the total chromium concentration detected in OW-2S during the first quarter 2008.

No other samples exceeded the action levels for hexavalent chromium, total chromium, pH or total dissolved solids during first quarter 2008 sampling. The next CMP sampling event is scheduled to occur later in April 2008.

Please contact me at (805) 546-5243 if you have any questions on the compliance monitoring program.

Sincerely,

Yvonne Meeks

1.0 Introduction

Pacific Gas and Electric Company (PG&E) is implementing an Interim Measure (IM) to address chromium concentrations in groundwater at the Topock Compressor Station near Needles, California. The IM consists of groundwater extraction in the Colorado River floodplain and management of extracted groundwater. The groundwater extraction, treatment, and injection systems are collectively referred to as Interim Measure No. 3 (IM No. 3). Currently, the IM No. 3 facilities include a groundwater extraction system, conveyance piping, a groundwater treatment plant, and an injection well field for the discharge of the treated groundwater. Figure 1 shows the location of the IM No. 3 extraction, conveyance, treatment, and injection facilities. (All figures are provided at the end of this report.)

On October 13, 2004, the California Regional Water Quality Control Board, Colorado River Basin Region (Water Board) adopted Waste Discharge Requirements (WDR) Order No. R7-2004-0103. This WDR authorized PG&E to inject treated groundwater into wells located in the East Mesa area of the Topock site. This WDR was superseded on September 20, 2006 by WDR No. R7-2006-0060. Work described in this report was performed in accordance with the new WDR No. R7-2006-0060.

The WDR specifies effluent limitations, prohibitions, specifications, and provisions for subsurface injection. Monitoring and Reporting Program (MRP) No. R7-2004-0103 specified the requirements for the Compliance Monitoring Program (CMP) to monitor the aquifer in the injection well area to ensure that the injection of treated groundwater is not causing an adverse effect on the aquifer water quality. As with the WDR, MRP No. R7-2004-0103 was superseded on September 20, 2006 by MRP No. R7-2006-0060. This report adheres to requirements established in MRP No. R7-2006-0060. The *Groundwater Compliance Monitoring Plan for Interim Measures No. 3 Injection Area* (CH2M HILL, 2005a) was submitted to the Water Board and the California Department of Toxic Substances Control (DTSC) on June 17, 2005 (herein referred to as the Compliance Monitoring Plan). The Compliance Monitoring Plan and its addendum provide the objectives, proposed monitoring program, data evaluation methods, and reporting requirements for the CMP. In a letter dated June 9, 2006, DTSC modified the reporting requirements of the Compliance Monitoring Plan (DTSC, 2006). This report incorporates the additional requirements.

The injection system consists of two injection wells (IWs): IW-2 and IW-3. Operation of the treatment system was conditionally approved on July 15, 2005 (DTSC, 2005), and injection into IW-2 began on July 31, 2005. Table 1 summarizes the history of injection for IM No. 3. (All tables are provided at the end of this report.)

Figure 2 shows the locations of the injection wells and the groundwater monitoring wells (observation wells and compliance monitoring wells) in the CMP. Table 2 summarizes information on well construction and sampling methods for all wells in the CMP.

On January 22, 2007 (DTSC, 2007), DTSC approved a reduction of constituents analyzed during quarterly sampling of the CMP observation wells (details are provided in

PDX/081050116.DOC 1-1

CH2M HILL, 2006). The Water Board concurred in a letter dated January 23, 2007 (Water Board, 2007a). Observation wells (OWs) are now sampled for a limited suite of constituents during quarterly monitoring events. The first quarter 2007 sampling event was the first event to incorporate this change. Semiannual CMP events still retain the original constituent suite for the OWs and compliance wells (CWs).

Under the CMP, as of January 2008, samples are collected from OWs and CWs (Figure 2) according to the following schedule:

- Nine observation wells located near the IM No. 3 injection well field are sampled quarterly for a limited suite of constituents.
- Eight compliance monitoring wells and nine observation wells located around the IM No. 3 injection well field are sampled semiannually for a full suite of constituents.

On October 16, 2007, the Water Board approved collecting pH measurements in the field rather than through laboratory analysis due to the new 15-minute holding time for laboratory measurements with United States Environmental Protection Agency Method 150.1 (Water Board, 2007b). DTSC provided concurrence for the field pH change in an email dated January 22, 2008 (DTSC, 2008). This change became effective with the first quarter 2008 sampling event.

On November 13, 2007, the Water Board approved the modification to hexavalent chromium (Cr[VI]) analytical methods, which extended the holding time from 24 hours to 28 days (Water Board, 2007c). DTSC provided concurrence for the 28-day holding time for Cr(VI) analyses in an e-mail dated January 22, 2008 (DTSC, 2008). The first quarter 2008 sampling event was the first event to adhere to the new 28-day holding time for analyzing Cr(VI).

For both quarterly and semiannual sampling events, laboratory analyses include dissolved total chromium (Cr[T]), Cr(VI), metals, specific conductance, total dissolved solids (TDS), turbidity, and major inorganic cations and anions. For quarterly events the metals, cations, and anions list is reduced. Groundwater elevation data and field water quality data — including specific conductance, temperature, pH, oxidation-reduction potential, dissolved oxygen, turbidity and salinity — are also measured during each monitoring event (CH2M HILL, 2005a).

This report presents the results of the first quarter 2008 CMP groundwater monitoring event.

1-2 PDX/081050116.DOC

2.0 First Quarter 2008 Activities

This section provides a summary of the monitoring and sampling activities completed during the first quarter 2008. The first quarter 2008 monitoring event was conducted from January 21 through 23, 2008 and consisted of:

- Nine observation monitoring wells (OW series) were sampled for water quality analyses.
- Groundwater elevations and field water quality data were collected prior to sampling.
- One duplicate sample was collected at well OW-1S to assess field sampling and analytical quality control.

Continuous groundwater elevation data were collected using pressure transducers/data loggers at each of the 17 CMP wells and were downloaded monthly during the reporting period.

The sampling methods, procedures, field documentation of the CMP sampling, water level measurements, and field water quality monitoring were performed in accordance with the *Sampling, Analysis, and Field Procedures Manual* (CH2M HILL, 2005b).

CMP groundwater samples were analyzed by Truesdail Laboratories, Inc. in Tustin, California and EMAX Laboratories, Inc. in Torrance, California, both California-certified analytical laboratories. Analytical methods, sample volumes and containers, sample preservation, and quality control sample requirements were in accordance with the *Sampling, Analysis, and Field Procedures Manual* (CH2M HILL, 2005b). Data validation and management were conducted in accordance with the *Quality Assurance Project Plan* (QAPP) provided as Appendix D of the *Sampling, Analysis, and Field Procedures Manual*.

PDX/081050116.DOC 2-1

3.0 First Quarter 2008 Results

This section summarizes the results of the CMP groundwater sampling conducted during the first quarter of 2008. Figure 2 presents the locations of the CMP groundwater wells.

The data presented include results for Cr(VI), Cr(T), specific conductance, metals, TDS, turbidity, and major inorganic cations and anions. Laboratory data quality review, water level measurements, and water quality field parameter data are also presented in this section. The laboratory reports and field data sheets for the first quarter 2008 monitoring are presented in Appendices A and B.

3.1 Analytical Results

Nine observation wells were sampled during the first quarter 2008 sampling event. Analytical results for Cr(VI) and Cr(T), other metals, and general chemistry parameters are presented in Tables 3 and 4 and are discussed below. Interim action levels/water quality objectives (WQOs) were updated in the *Addendum to the Compliance Monitoring Plan*, which was submitted to DTSC and the Water Board on December 13, 2005 (CH2M HILL, 2005c). On August 8, 2006, PG&E submitted a revised contingency plan flowchart for groundwater quality changes associated with the injection system. The contingency plan specifies the concentrations and values for Cr(VI), Cr(T), TDS, and pH to be used to determine if contingency plan actions were necessary based on sample results.

3.1.1 Hexavalent and Total Chromium

Table 3 presents the Cr(VI) and Cr(T) results for groundwater in the shallow, middle, and deep wells for the first quarter 2008 CMP sampling event. For shallow wells, the maximum detected Cr(VI) concentration was 31.0 micrograms per liter (μ g/L) in well OW-2S on January 22, 2008. For the middle wells, the maximum detected Cr(VI) concentration was 0.97 μ g/L in well OW-2M on January 22, 2008. For the deep wells, the maximum detected Cr(VI) concentration was 0.32 μ g/L in well OW-2D on January 22, 2008.

During the first quarter 2008, none of the samples collected from shallow, middle, and deep wells exceeded the WQO of 32.6 μ g/L for Cr(VI).

For shallow wells, the maximum detected Cr(T) concentration was 36.2 $\mu g/L$ in well OW-2S on January 22, 2008. For the middle wells, the maximum detected Cr(T) concentration was 1.4 $\mu g/L$ in well OW-2M on January 22, 2008. For the deep wells, the maximum detected Cr(T) concentration was 1.1 $\mu g/L$ in well OW-1D on January 21, 2008.

During the first quarter 2008, a sample from one well exceeded the WQO of $28 \mu g/L$ for Cr(T). The January 22, 2008 sample from well OW-2S had a concentration of $36.2 \mu g/L$. For this exceedance, the result is not considered to be the result of injection of treated groundwater as the average effluent concentration of Cr(T) from the IM No. 3 treatment plant is normally non-detect with a reporting limit of $1.0 \mu g/L$ (CH2M HILL, 2008a). Cr(T) and Cr(VI) concentrations at OW-2S have been consistently above the WQOs since

PDX/081050116.DOC 3-1

November 2005. These exceedances of Cr(T) are thus considered reflective of the natural variance in background water quality.

3.1.2 Other Metals and General Chemistry

Table 4 presents the other metals and general chemistry results for the CMP groundwater wells sampled during the first quarter 2008. Since the first quarter 2007, the observation wells have been sampled for a limited suite of constituents during quarterly monitoring events. Metals and ions detected in the first quarter 2008 sampling included boron, chloride, fluoride, molybdenum, nitrate/nitrite as nitrogen, and sulfate. Concentrations of metals and ions detected during the first quarter 2008 sampling event are similar to those detected in previous sampling events.

During the first quarter 2008, the sampling results from all wells were within the WQOs for TDS (10,800 milligrams per liter [mg/L]) and pH (7.6 to 8.89). Sampling results for TDS varied from 900 mg/L in well OW-5S to 4,400 mg/L in well OW-1M, and for pH varied from 7.62 in well OW-5D to 7.91 in well OW-2M.

3.2 Analytical Data Quality Review

The laboratory analytical data generated from the first quarter 2008 CMP monitoring event were independently reviewed by project chemists to assess data quality and identify deviations from analytical requirements. The quality assurance and quality control requirements are outlined in the QAPP for the PG&E Topock Program, which is Appendix D of the *Sampling, Analysis, and Field Procedures Manual, Revision 1* (CH2M HILL, 2005b). A detailed discussion of data quality for CMP sampling data is presented in the data validation reports, which are kept in the project file and are available upon request.

3.2.1 Matrix Interference

Matrix interference was encountered in three groundwater samples that affected the sensitivity for Cr(VI) when using Method E218.6. The Cr(VI) sample results from OW-1D, OW-1M, and OW-5D reflected an adjusted reporting limit of 1 μ g/L as a result of the serial dilution that was required to overcome the matrix interference and provide an acceptable matrix spike recovery. All three samples returned results of non-detect at the adjusted reporting limit. No qualifier flags were applied.

3.2.2 Matrix Spike Samples

All matrix spike acceptance criteria were met.

3.2.3 Quantitation and Sensitivity

With the exception of the matrix interference issues discussed in Section 3.2.1 all method and analyte combinations met the project reporting limit objectives.

3.2.4 Holding Time Data Qualification

For the first quarter 2008 sampling event, all method holding time requirements were met.

3-2 PDX/081050116.DOC

3.2.5 Field Duplicates

For the first quarter 2008 sampling event, all field duplicate acceptance criteria were met.

3.2.6 Method Blanks

For the first quarter 2008 sampling event, method blank acceptance criteria were met.

3.2.7 Equipment Blanks

For the first quarter 2008 sampling event, equipment blank acceptance criteria were met.

3.2.8 Laboratory Duplicates

For the first quarter 2008 sampling event, laboratory duplicate acceptance criteria for the methods were met.

3.2.9 Calibration

For the first quarter 2008 sampling event, initial and continuing calibrations were performed as required by the methods. All calibration criteria were met.

3.2.10 Conclusion

For the first quarter 2008 sampling event, the completeness objectives were met for all method and analyte combinations. The analyses and data quality met the QAPP and laboratory method quality control criteria except as noted above. Overall, the analytical data are considered acceptable for the purpose of the CMP.

3.3 Influence of Treated Water

3.3.1 Post-injection Versus Pre-injection

Injection of treated water began on July 31, 2005. Under WDR No. R7-2006-0060 for the IM No. 3 groundwater treatment system, PG&E is required to submit WDR monitoring reports on the operation of the system. These reports contain the analytical results of treated water effluent sampling and, as such, the reports are useful in determining the baseline water quality of the treated water being injected into the IM No. 3 injection well field. Table 5 provides selected analytical results from three of the monthly reports: August 29, 2005, March 18, 2006, and January 3, 2008. While there are differences among some parameters in these samples, a number of parameters show relatively consistent concentrations in the effluent over time. Analytes that are relatively consistent over the injection time period include Cr(VI), Cr(T), fluoride, molybdenum, nitrate as nitrogen, sulfate, and TDS. These seven constituents provide a characterization of the effluent that does not appear to vary greatly over time and can serve as a basis for determining if a groundwater monitoring well is being affected by injection. In general terms, treated water has the following characteristics (based on review of August 2005 through January 2008 effluent characteristics):

- Cr(VI): typically non-detect (1.0) μg/L
- Cr(T): typically non-detect (1.0) μg/L

PDX/081050116.DOC 3-3

- Fluoride: approximately 2 mg/L
- Molybdenum: approximately 8 to 15 μg/L
- Nitrate/nitrite as nitrogen: approximately 3 mg/L
- Sulfate: approximately 500 mg/L
- TDS: approximately 4,000 mg/L

These treated water quality characteristics are meant to serve as a general guideline and not as a statistically representative sampling of the treated water quality over time.

Table 5 also lists the results of baseline sampling for the observation wells and compliance wells. A full set of nine OW groundwater samples were collected on July 27 and 28, 2005, and a full set of eight CW groundwater samples were collected on September 15, 2005. These samples are considered representative of conditions unaffected by injection and serve to characterize the pre-injection water quality. In comparing these sampling results to the treated injection water sampling results, there are some similarities in the constituent concentrations. For example, most of the pre-injection OW or CW deep well samples (OW-1D, OW-2D, OW-5D, CW-3D, and CW-4D) contain no detectable Cr(VI) or Cr(T), which is similar to the treated injection water. Most of the well samples show concentrations similar to the treated water for two or three constituents but observable differences in concentration from the treated water for the remaining four or five. By considering the entire suite of seven analytes and focusing on those parameters that show differences, it is relatively easy to distinguish between the pre-injection water quality at the monitoring wells and the treated water effluent quality.

Table 6 presents a comparison between the treated water quality and the results from the most recent sampling event, the first quarter 2008 sampling event. These samples were collected after approximately 30 months of injection. While the pre-injection OW and CW sample results were significantly different from the treated water quality, a number of the OW and CW first quarter 2008 sample results have changed in that these results show a marked similarity to the treated water results. The following wells display the general characteristics of treated water: OW-1M, OW-1D, OW-2M, OW-2D, OW-5M, and OW-5D.

Wells OW-1M, OW-1D, OW-2M, OW-2D, OW-5M, and OW-5D are locations and depths where the treated water injection front has largely replaced the local pre-injection groundwater. To date, all shallow observations wells (wells OW-1S, OW-2S, and OW-5S) show no water quality effects due to injection of treated water, indicating that injected water has not yet reached these depths and locations.

3.3.2 Water Quality Hydrographs

Trend data can be used to determine when a rapid change has occurred between sampling events, such as the arrival of the injection front. It can also be used to look at more gradual changes that occur over several sampling events, such as seasonal effects or the interaction of treated water with local groundwater and host aquifer material. Eleven analytes were selected for time-series analysis; these analytes are considered to be most representative of the IM No. 3 injection well field area and have sufficient detections to make time series analysis useful. The analytes include chloride, Cr(T), fluoride, Cr(VI), molybdenum, nitrate/nitrite as nitrogen, pH, sodium, sulfate, TDS, and vanadium. Water quality

3-4 PDX/081050116.DOC

hydrographs (time-series plots) of these 11 analytes in each observation wells within the IM No. 3 injection well field are presented in Figures 3A through 3C.

These hydrographs show the same overall patterns: wells that are identified as affected by treated water injection show a shift in water quality for characteristic parameters, while those identified as being unaffected by injection show no net trends. The water quality change brought on by the arrival of the treated water injection front can be either gradual (OW-5M) or step-wise (OW-2D), with most affected wells showing a pattern of change somewhere between the two. Based on the variability in response, it is inferred that the movement of treated water is non-uniform laterally between wells. This variability in lateral movement can be inferred from differences in the water quality hydrographs in both the mid-depth and deep wells. The OW shallow-depth wells (OW-1S, OW-2S, and OW-5S) show little water quality variation over time and generally have no net trends over time. TDS, sulfate, and molybdenum are particularly consistent and show that the local groundwater quality at shallow depths is not being affected by injection of treated water or outside water sources.

3.4 Water Level Measurements

Table 7 presents the manual water level measurements and groundwater elevations for the first quarter 2008 monitoring events.

As a requirement of the conditional approval by DTSC (DTSC, 2005), water level measurements were used to produce hydrographs for each well cluster. Figures 4A through 4G present hydrographs that illustrate groundwater elevation trends and vertical hydraulic gradients observed over the first quarter 2008 reporting period at the observation and compliance monitoring wells. Some hydrographs may vary slightly from those in the second-half 2007 report (CH2M HILL, 2008b) due to adjustments made from density correction updates.

Average groundwater elevation maps for shallow, middle, and deep wells are also provided as Figures 5A through 5C. Water levels used to produce the monthly average groundwater elevation contour plots were taken from a select number of days in which the levels remained reasonably constant. These dates are noted on each figure.

3.4.1 Groundwater Flow Characteristics

The injection well field is located in the East Mesa area of the Topock site (Figure 2). Overall sitewide water level contour maps for shallow wells are prepared annually, with flow consistently being shown to move to the east across the uplands portions of the site (CH2M HILL, 2008c).

The effects of injection in the IM No. 3 injection well field are superimposed on the more regional Topock site flow system and, as expected, a groundwater mound can be seen around the injection wells. This mound is centered around the active injection well IW-3. The potentiometric surfaces in prior CMP reports mapped the growth of the groundwater mound over time and show that, after 30 months of injection, the mound has increased in height by several tenths of a foot in elevation above the surrounding water level elevations. Figures 5B and 5C present groundwater elevation contours for the average groundwater

PDX/081050116.DOC 3-5

elevation of the mound within the middle and deep wells using January 15 through February 15, 2008 averages. As expected with a mound, the potentiometric surface of the deep wells is broader, while the potentiometric surface of the middle wells is more localized to the vicinity of the injection wells. The mound is elliptical in shape, with the major axis running in a southwest to northeast direction. The lower gradients (broader contours) in the direction of the major axis are an indication that the aquifer permeabilities are greater in this direction, indicating that there may be a preferred direction to flow in this area.

During the first quarter 2008, groundwater injection occurred at IW-3 only. From February 5 through February 13, 2008, groundwater was pumped from IW-2 during well maintenance activities. Pumping occurring from this well at this time did not noticeably impact groundwater levels during the first quarter 2008, see Figures 4A through 4G.

The vertical gradient in the IM No. 3 injection well field area is directed upward at all of the CW and OW well clusters and also upward between each of the depth intervals in those same well clusters. Table 8 presents the vertical gradient data calculated using the January 15 through February 15, 2008 average groundwater levels. The magnitude of the vertical gradients is similar between clusters and between the depth intervals, indicating that the vertical gradient is of the same order of magnitude throughout the injection area. A component of the vertical gradients calculated in the vicinity of the IM No. 3 injection well field is undoubtedly related to the injection of treated water in the lower portions of the aquifer. The observed groundwater gradients in the IM No. 3 injection well field are consistent with expected regional groundwater flow within the southern Mohave Valley.

3.5 Field Parameter Data

A field water quality instrument and flow-through cell were used to measure water quality parameters during well purging and groundwater sampling. The measured field parameters included specific conductance, temperature, pH, oxidation-reduction potential, dissolved oxygen, turbidity, and salinity. Table 9 summarizes the field water quality data measured during the first quarter 2008 monitoring event. Field data sheets for the first quarter 2008 event are presented in Appendix B.

3.6 WDR Monitoring Requirements

Table 10 identifies the laboratory that performed each analysis and lists the following information as required by the WDR for the first quarter of 2008 monitoring event:

- Sample location
- Sample identification number
- Sampler name
- Sample date
- Sample time
- Laboratory performing analysis
- Analysis method
- Parameter
- Analysis date

- Reporting limit
- Minimum detection limit

PDX/081050116.DOC 3-7

4.0 Status of Monitoring Activities

4.1 Quarterly Monitoring

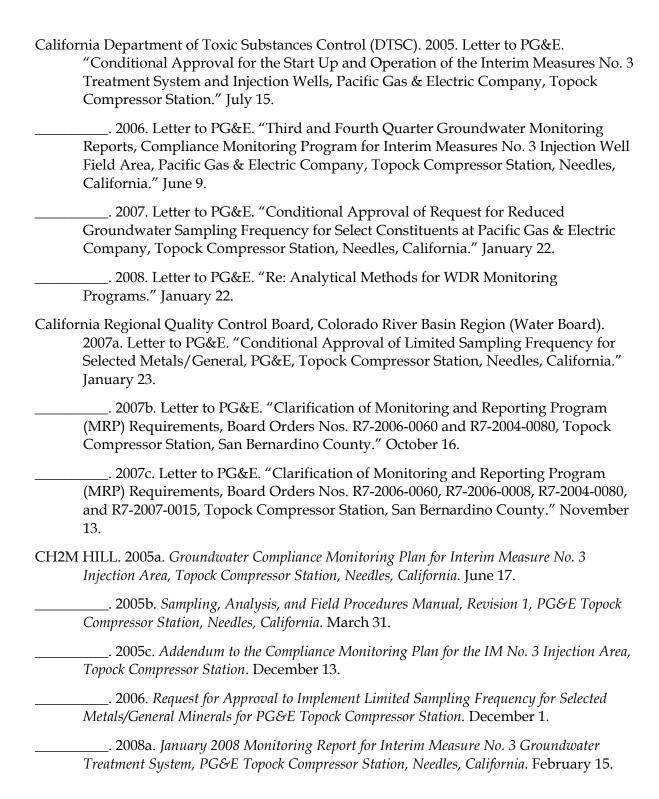

The next quarterly monitoring event will occur in October during the third quarter of 2008. This event will include the sampling and analysis scope that was presented in the Compliance Monitoring Plan (CH2M HILL, 2005a, c) and subsequent approved scope revisions (DTSC, 2007, 2008; Water Board, 2007a-c). The groundwater monitoring report for this quarterly CMP monitoring event will be submitted by October 15, 2008.

4.2 Semiannual Monitoring

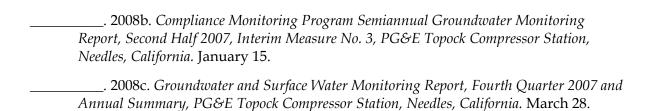

The next semiannual monitoring event will occur in April during the second quarter of 2008. This CMP monitoring event, which encompasses both the OW and CW wells, will include the sampling and analysis scope presented in the Compliance Monitoring Plan (CH2M HILL, 2005a and 2005c) and subsequent approved scope revisions (DTSC, 2007, 2008; Water Board, 2007a-b). The groundwater monitoring report for this semiannual CMP monitoring event will be submitted by July 15, 2008.

6.0 Certification

PG&E submitted a signature delegation letter to the Water Board on September 20, 2006. The letter delegated PG&E signature authority to Mr. Curt Russell and Ms. Yvonne Meeks for correspondence regarding Board Order R7-2006-0060.

Certification Statement:

I declare under the penalty of law that I have personally examined and am familiar with the information submitted in this document, and that based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of a fine and imprisonment for knowing violations.

Signature:	Sponne Mucks
	Yvonne J. Meeks
Company: _	Pacific Gas and Electric Company
Title:	Topock Project Manager
Date:	April 15, 2008

TABLE 1
Operational Status of Interim Measures No. 3 Injection Wells Through First Quarter 2008
PG&E Topock Compliance Monitoring Program

Time Period	Injection Status
July 31, 2005 to Fourth Quarter 2005	Injection occurred at IW-2.
First Quarter 2006	Injection occurred primarily at IW-2 except during periods of operational testing, when injection was divided equally between IW-2 and IW-3.
Second Quarter 2006	Injection occurred at IW-2.
Third Quarter 2006	In August 2006, IW-2 went offline for routine maintenance, and injection commenced at IW-3.
Fourth Quarter 2006	Injection occurred at IW-3, except during routine maintenance.
First Quarter 2007	Injection occurred at IW-3 and transitioned over to IW-2 on March 8.
Second Quarter 2007	Injection occurred at IW-3 from April 3 through June 20. Injection switched to IW-2 on June 20 and continued through July 20, 2007.
Third Quarter 2007	Injection occurred at IW-3 after July 20. Injection occurred at IW-2 on August 30 for an injection test and then returned to IW-3 after August 31.
Fourth Quarter 2007	Injection occurred at IW-3 and then switched to IW-2 on September 25 for routine maintenance. Injection returned to IW-3 after October 9.
First Quarter 2008	Injection occurred at IW-3 only. From February 5 through February 13, well maintenance activities were conducted at IW-2.

NOTES:

MDL method detection limit corrected for sample dilution

RL reporting limit

ND parameter not detected at the listed reporting limit

μmhos/cm micro-mhos per centimeter
NTU Nephelometric Turbidity Unit

mg/L milligrams per liter micrograms per liter

TLI Truesdail Laboratories, Inc.
WDR Waste Discharge Requirements

SC specific conductance TDS total dissolved solids

TRB turbidity

CRTD chromium, dissolved CR6 hexavalent chromium

CL chloride FL fluoride

BD boron, dissolved

MOD molybdenum, dissolved NO3NO2N nitrate/nitrite (as N)

SO4 sulfate

NO2NO3NC nitrate/nitrite as nitrogen was calculated as the sum of nitrate as nitrogen and nitrite as nitrogen.
