Executive Summary

Startup of the Phase 1 groundwater remedy system began in December 2021, including the start of National Trails Highway (NTH) in-situ reactive zone (IRZ) system operation, maintenance, and monitoring to address hexavalent chromium (Cr6) in groundwater. Full and continuous operation of the IRZ injection and extraction wells using Topock Compressor Station (TCS) power continued in Second Quarter 2022. Periodic planned and unplanned downtime occurred throughout the quarter. Ethanol injections into operational IRZ injection wells occurred once weekly, when operating.

Groundwater and surface water monitoring was performed in Second Quarter 2022 in accordance with the Basis of Design Report/Final (100%) Design Submittal for the Final Groundwater Remedy (Final BOD; CH2M Hill 2015a), Groundwater Remedy Phase 1 Interim Monitoring Plan (Phase 1 Monitoring Plan; Arcadis 2021), Standard Operating Procedures presented in Appendix B of the Phase 1 Monitoring Plan, and the PG&E Program Quality Assurance Project Plan (QAPP; CH2M Hill 2014; Critigen 2020) to evaluate the performance of the groundwater remedy to attain the Remedial Action Objectives (RAOs) and comply with Applicable or Relevant and Appropriate Requirements (ARARs). Key observations of Second Quarter 2022 remedy performance are highlighted below:

- The process control monitoring results indicated that initial Cr6 treatment was observed at dose response monitoring wells MW-26, MW-31-060, MW-51, MW-78-070, MW-79-102, and MW-80-082. These results suggest heterogenous hydraulic distribution of injected water. To enhance hydraulic distribution from each injection well, flow to the southern IRZ injection wells (IRZ-27 [lower], IRZ-29, IRZ-31, IRZ-33, IRZ-35, and IRZ-37) was increased by approximately 50 percent on June 15, 2022.
- Cr6 concentrations in the downgradient monitoring wells are evaluated to determine if concentrations are within expectations provided in the Final BOD (CH2M Hill 2015a). In Second Quarter 2022, Cr6 concentrations were below 32 micrograms per liter (µg/L), except for MW-39-100 (170 µg/L; June 15, 2022) and MW-77-187 (33 µg/L; June 15, 2022). The sampling frequency at select downgradient monitoring wells was increased from quarterly in the Phase 1 Monitoring Plan to monthly to better evaluate changes in Cr6 concentrations over time in response to system operation. Cr6 concentrations at MW-39-100 and MW-77-187 and monitoring wells downgradient of those wells will be further evaluated in the monthly datasets.
- In-situ byproduct (dissolved arsenic, dissolved iron, and dissolved manganese) concentrations at the dose response and downgradient monitoring wells were below the action levels, except for the dissolved manganese concentration at MW-31-060, located 10 feet from injection well IRZ-18, collected on April 12, 2022 (5.4 milligrams per liter [mg/L]); see table below.
- On the northern end of the NTH IRZ, the Cr6 plume was controlled, as evidenced by the landward hydraulic gradient and Cr6 concentrations in the NTH IRZ extraction monitoring wells (below 32 µg/L) and surface water monitoring locations (non-detect).
- Remedy compliance monitoring data were collected in Second Quarter 2022 to evaluate progress towards achievement of RAOs 2, 3, and 4. RAO progress is anticipated to be evaluated throughout the duration of the remedy. Data collected each quarter will contribute to the overall evaluation.

- Constituents of Potential Concern (COPCs) Perimeter Assessment Plan (PAP) monitoring results in Second Quarter 2022 were below the trigger levels. Verification sampling at COPC PAP monitoring well MW-90-031 was performed on May 5, 2022 to confirm an exceedance of the trigger level in First Quarter 2022; see table below.

The table below provides a summary of in-situ byproduct action level and COPC PAP trigger level exceedances from Second Quarter 2022 and associated response actions.

Program	Well	Constituent	Action Level or Trigger Level	Second Quarter 2022 Result	Response Actions
Process Control Monitoring	MW-31-060	Dissolved manganese	Action Level: 5 mg/L	5.4 mg/L (April 12, 2022)	Re-sampled on May 20, 2022 (0.69 mg/L). Result was below the action level. No further actions needed
COPC Monitoring	MW-90-031	Nitrate as N	Trigger Level: 0.22 mg/L (nitrate/nitrite as N)	<0.5 mg/L nitrate as N (May 5, 2022; Method 300.0) <0.1 mg/L nitrate/nitrite as N (May 5, 2022; Method 353.2)	Notified Agencies of trigger level exceedance on April 29, 2022 Verification sampling performed on May 5, 2022. Nitrate/nitrite and nitrate results did not confirm the exceedance of a trigger level observed in First Quarter 2022. Notified Agencies on July 25, 2022. No further actions needed.

Note:
mg/L = milligram per liter

1 Introduction

Pacific Gas and Electric Company (PG&E) is implementing a final groundwater remedy to address hexavalent chromium (Cr6) in groundwater near the PG&E Topock Compressor Station (TCS) located in eastern San Bernardino County, 15 miles southeast of the City of Needles, California (the Site). PG&E is implementing the groundwater remedy at the TCS in conformance with the requirements of the Resource Conservation and Recovery Act (RCRA) and the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). The U.S. Department of the Interior (DOI) and the California Department of Toxic Substances Control (DTSC), collectively known at the 'Agencies,' executed a Memorandum of Understanding on November 22, 2011 establishing coordination guidelines for overseeing implementation of a groundwater response action at the TCS (DTSC and DOI 2011). In a coordinated effort, the DOI and DTSC selected the final groundwater remedy to address chromium in groundwater, which is presented in the Record of Decision (DOI 2010).

In November 2015, PG&E submitted a Basis of Design Report/Final (100%) Design Submittal (Final BOD), which presents the final design basis, design criteria, drawings, specifications, and operation and maintenance (O&M) requirements for the groundwater remedy (CH2M Hill, Inc. [CH2M Hill] 2015a). The infrastructure for the groundwater remedy is being constructed following the plans and procedures documented within the Construction/Remedial Action Work Plan (C/RAWP; CH2M Hill 2015b). Construction and startup of the groundwater remedy is proceeding in phases.

Construction of Phase 1 was completed in December 2021 sufficient for initial system startup. The design was modified during construction to accommodate conditions encountered including a plume footprint smaller than documented in the Final BOD. Modifications included changes to the remediation and monitoring well networks and associated infrastructure including deferral of wells to Phase 2. Construction of the Phase 2a remedy was initiated in First Quarter 2022. Construction of Phase 2b is anticipated to begin in 2023 and be completed in 2026.

In December 2021, startup began for Phase 1 of the groundwater remedy system including the start of National Trails Highway (NTH) in-situ reactive zone (IRZ) system operation, maintenance, and monitoring. O&M are being performed in accordance with the O&M Plan (Appendix L, Volume 1; CH2M Hill 2015a). Monitoring is being performed in accordance with the Sampling and Monitoring Plan (BOD SMP), with modifications, provided in the Final BOD O&M Manual (Appendix L, Volume 2; CH2M Hill 2015a) to evaluate the performance of the groundwater remedy to attain the Remedial Action Objectives (RAOs) and comply with Applicable or Relevant and Appropriate Requirements (ARARs). Because the groundwater remedy is being constructed in phases, a modified SMP was needed to suit the as-built Phase 1 of the groundwater remedy. PG&E submitted the Groundwater Remedy Phase 1 Interim Monitoring Plan (Phase 1 Monitoring Plan; Arcadis 2021) to the Agencies on October 1, 2021.

In accordance with the BOD SMP reporting requirements (CH2M Hill 2015a), this quarterly progress report provides a summary of the following elements for Second Quarter 2022 (April through June 2022; the reporting period):

- Overview of the groundwater remedy and RAOs;
- Communications Summary. Summary of remedy-related communications with the DTSC, DOI, PG&E, Tribes, and other project stakeholders, which have been distributed as part of community outreach efforts;
- Operations Summary. Description of routine and non-routine downtime, operational data, and process monitoring data; utilities and consumables used and waste handling/disposal; issues encountered with

system operation; system optimizations and maintenance performed; and material deviations from design documents and the O&M Plan;

- Performance Summary. Description of the monitoring events performed during the current reporting period, the monitoring results and interpretation of results, evaluation of Cr6 plume control, interpretation of progress towards the RAOs, and material deviations from design documents and the O&M Plan;
- O&M Green Remediation Evaluation Matrix (GREM) Summary. PG&E develops a semiannual GREM summary report to document various sustainability metrics generated by PG&E including the TCS. The GREM summary reports data regarding greenhouse gas reductions, savings from use of renewable energy, reductions in liquid and solid waste, and local economy boost. The GREM summary is reported under separate cover and is not provided in this quarterly progress report.
- Recommendations and planned activities for the next reporting period.

1.1 Remedial Action Objectives

As stated in the Final BOD (CH2M Hill 2015a), the RAOs for the groundwater remedy are to:

1. Prevent ingestion of groundwater as a potable water source exhibiting Cr6 concentrations that exceed the regional background concentration of 32 micrograms per liter (µg/L).
2. Prevent or minimize migration of total dissolved chromium and Cr6 in groundwater to ensure that concentrations in surface water do not exceed water quality standards that support the designated beneficial uses of the Colorado River (11 µg/L Cr6; United States Environmental Protection Agency [USEPA] 2022).
3. Reduce the mass of total dissolved chromium and Cr6 in groundwater at the Site to achieve compliance with ARARs in groundwater. This RAO will be achieved by meeting the cleanup goal of the regional background concentration of 32 µg/L of Cr6.
4. Ensure that the geographic location of the target remediation area does not permanently expand following completion of the remedial action.

1.2 Phase 1 Remedy Overview

Per the C/RAWP, Phase 1 of the groundwater remedy comprises the creation of an IRZ along NTH using a line of injection and extraction wells to circulate groundwater and distribute an organic carbon source to promote reduction of soluble Cr6 to the insoluble form: trivalent chromium (Cr3). The groundwater remedy is being constructed in two phases in accordance with the C/RAWP (CH2M Hill 2015b).

The infrastructure for the Phase 1 remedial system consists of the following components (**Figure 1.1**):

- A line of remedial wells along the NTH that comprise the NTH IRZ (18 remediation wells);
- A treatment system compound, situated on the MW-20 bench, that includes infrastructure for organic carbon amendment and system maintenance;
- A remedy-produced water conditioning (RPWC) system situated on the compressor station;
- Conveyance lines among the NTH IRZ remedials wells, the MW-20 bench treatment compound, and the RPWC system;

- A monitoring well network composed of monitoring wells that existed before the groundwater remedy (174 monitoring locations) and monitoring wells constructed for Phase 1 of the groundwater remedy (69 newly constructed monitoring locations; a total of 243 monitoring locations; see Section 3);
- Riverbank Extraction Wells (four extraction wells). The riverbank extraction wells are not currently plumbed into the remedial system, and were, therefore, not operated in Second Quarter 2022.

The NTH IRZ system is operated by extracting groundwater from the NTH IRZ extraction wells, amending the water with carbon substrate (ethanol), then injecting the amended water into the NTH IRZ injection wells. **Figure 1.2** shows a process flow diagram of the treatment compound at the MW-20 bench including the carbon amendment infrastructure. The ethanol injections stimulate microbially mediated reduction of Cr6 to Cr3. The simulated conditions may also reduce or release other constituents such as iron, manganese, sulfate, nitrate, and arsenic. These parameters are monitored in the Groundwater Remedy Phase 1 Monitoring Program (Phase 1 Monitoring Program) including the process control monitoring and remedy compliance monitoring programs (see Section 1.3). The groundwater and surface water monitoring data collected as part of the Phase 1 Monitoring Program are used to assess how biogeochemical conditions are changing in the subsurface in response to NTH I RZ system operations, inform system operational adjustments as needed, and evaluate overall remedy effectiveness.

During Phase 1, the NTH IRZ system is planned to operate for a period of time, nominally for 6 months, followed by a period of downtime, nominally 18 months. Actual duration of the operational and rest periods will be determined based on the amount of active operation runtime each month and data collected in the process control monitoring program (see Section 1.3). Based on data collected in the first 6 months of operation in 2022, operations are planned to continue through the rest of 2022.

1.3 Phase 1 Monitoring Program Overview

The BOD SMP detailed monitoring programs for the groundwater remedy and developed Data Quality Objectives (DQOs) that guided the design of sampling locations, constituents and frequencies, and the methodology for evaluating the data to inform operations (Appendix L, Volume 2; CH2M Hill 2015a). The relevant programs from the BOD SMP, as described in the Phase 1 Monitoring Plan (Arcadis 2021), include:

- *Process control monitoring*. This program assesses the extent to which the NTH IRZ is functioning as designed according to the NTH IRZ DQOs presented in the BOD SMP (CH2M Hill 2015a) and listed below. The DQOs guide data collection and establish decision rules that outline how the data collected will be used to adjust system operations. The NTH IRZ decision rules and operational framework are provided in Figure 2.2-2 of the BOD SMP (Appendix L, Volume 2; CH2M Hill 2015a).
    - The carbon substrate amendment system must be working to amend the organic carbon substrate into the recirculated groundwater (NTH IRZ DQO 1).
    - The NTH IRZ must be complete and maintain Cr6 treatment over time (NTH IRZ DQO 2).
    - In-situ byproduct (dissolved arsenic, dissolved manganese, dissolved iron, and dissolved barium) generation and migration from the NTH IRZ must be controlled (NTH IRZ DQO 3).
    - Extraction on the north end of the NTH IRZ will be conducted to control Cr6 with the NTH and riverbank extraction systems (NTH IRZ DQO 4).

  - Extraction will be conducted to minimize extraction of organic carbon and reduced metal byproducts (iron and manganese; NTH IRZ DQO 5).

  The process control monitoring program consists of five components: dose response monitoring, downgradient well monitoring, northern NTH IRZ extraction monitoring, extraction well monitoring, and carbon amendment system monitoring. The process control monitoring network is shown on **Figure 1.3**. The carbon amendment monitoring locations are shown on **Figure 1.2;** these samples are collected from sampling ports located downstream of each in-line static mixer. Results are presented in Sections 2.2 and 3.2.1.

- *Remedy compliance monitoring*. This program consists of surface water and groundwater sampling to evaluate achievement of RAOs 2, 3, and 4, as defined in Section 1.1. Note that RAO 1, which involves prevention of the ingestion of water with elevated Cr6 concentrations, requires no action within the remedy compliance monitoring program because institutional controls are being implemented to achieve this RAO. The remedy compliance groundwater monitoring and surface water monitoring network is shown on **Figure 1.4**. Results are presented in Section 3.2.2.
- *Constituent of potential concern (COPC) monitoring*. The DTSC and DOI consider selenium, molybdenum, and nitrate as COPCs potentially related to site activities and have directed that these constituents be monitored throughout remediation. The RAOs defined in Section 1.1 are not applicable to the COPCs. The COPC monitoring program consists of surface water and groundwater sampling to monitor COPC concentrations during Phase 1 of remedy startup. The COPC monitoring network is shown on **Figure 1.5.** Results are presented in Section 3.2.3.
- *Water level monitoring*. The purpose of this program is to assess changes in hydraulic gradients in the floodplain affected by system operations. The pressure transducer monitoring network is shown on **Figure 1.6.** Results are presented in Sections 2.1 and 3.2.
- *RPWC system monitoring*. The purpose of this program is to monitor the quality of water at the RPWC system. The primary objective is to evaluate effluent water quality as it affects the reuse options. During Phase 1, the planned reuse is re-injection to the NTH IRZ wells. Results are presented in Section 2.3.
- *Former IM-3 injection area monitoring*. The purpose of this program is to evaluate the change in conditions in the IM-3 injection area following the end of injection associated with IM-3 operations. Former IM-3 injection area monitoring is performed annually; therefore, it is not discussed in this quarterly progress report. The next monitoring event is planned for Fourth Quarter 2022.
- *Domestic well sampling*. Per direction from the DTSC, domestic/private wells are sampled to evaluate the potential effects the remedy could impart to domestic wells chemically and hydraulically. Domestic well sampling is performed biennially; therefore, it is not discussed in this quarterly progress report. The next sampling event is planned for Fourth Quarter 2022.

The Phase 1 Monitoring Program is intended to evaluate the first 2 years of remedy operation; the monitoring program will be re-evaluated and updated (as needed) after 2 years of operation of Phase 1.

1.4 Second Quarter 2022 Communications

This section summarizes key PG&E communications in Second Quarter 2022 associated with Phase 1 of the groundwater remedy:

- On June 3, 2022, PG&E submitted the First Quarter 2022 Quarterly Progress Report (Arcadis 2022c) to the DTSC and DOI.
- On June 28, 2022, PG&E notified the DTSC and DOI about a planned outage for the remedy the week of June 27 for transformer repairs.
- On June 30, 2022, PG&E submitted the First Quarter 2022 Well Performance Report (Arcadis 2022d) to the DTSC and DOI.
- On July 25, 2022, PG&E submitted a follow-up notification to the DTSC and DOI about the March 2022 nitrate detection in COPC Perimeter Assessment Plan (PAP) monitoring well MW-90-031, which exceeded the COPC PAP trigger level in First Quarter 2022 (Arcadis 2022e).

2 Second Quarter 2022 Operations Summary

This section provides a summary of the O&M tasks performed at the Site in Second Quarter 2022.

Operation using TCS power continued in Second Quarter 2022. System runtime, ethanol and recirculated groundwater injection volumes and flowrates, and average flowrates are summarized in **Tables 2.1** and **2.2**. An IRZ system operations and non-routine maintenance log is presented as **Table 2.3**.

A notable operational change during Second Quarter 2022 was the increase of flowrates by approximately 50 percent for the injection wells along the southern forcemain (IRZ-27 [lower], IRZ-29, IRZ-31, IRZ-33, IRZ-35, and IRZ-37) to further influence development of an IRZ for Cr6 treatment. Additionally, multiple planned and unplanned shutdowns occurred during Second Quarter 2022. One planned shutdown period occurred in late June to conduct transformer repairs. TCS turning off power to the remedy based on station activities.

2.1 Water Level Monitoring Results

Water level monitoring was performed at a subset of monitoring wells to assess hydraulic gradients in the floodplain affected by system operations. Pressure transducer data were downloaded on June 6, 2022. Therefore, April and May data are analyzed in this quarterly progress report and June data will be analyzed in the Third Quarter 2022 quarterly progress report.

Figure 2.1 shows the average daily groundwater elevations for April and May 2022 and the associated groundwater contours for Layers 1 and 2, Layer 3, and Layers 4 and 5. **Table 2.2** provides the active operation time for each IRZ extraction and injection well in April and May 2022. The NTH IRZ extraction and injection wells were actively operating for longer periods in May 2022 compared to April 2022.

The following observations were made based on the April and May 2022 potentiometric surface maps:

- During active extraction, cones of depression formed near IRZ extraction wells IRZ-13S (Layers 1 and 2), IRZ-13D (Layers 4 and 5), and IRZ-23 (Layer 3).
- In the area near injection wells, particularly near IRZ-17 through IRZ-20 in Layers 4 and 5, mounding was observed during periods of injection.
- During April and May 2022, the Colorado River stage was high, resulting in the river generally losing to the aquifer within the floodplain area, with groundwater flow from the river toward the NTH IRZ.

2.2 Ethanol Injections and Carbon Amendment System Monitoring Results

In April, May, and June 2022, ethanol was generally injected into operational injection wells once weekly. A total of 347 gallons of ethanol was injected in Second Quarter 2022. Volumes of ethanol injected per month and per individual well are provided in **Tables 2.1** and **2.2**.

In Second Quarter 2022, carbon amendment system monitoring was performed to verify that the carbon amendment system was injecting at the target dose (NTH IRZ DQO 1). The carbon substrate is fed into two force mains: one conveying amended water to northern injection wells and one conveying amended water to the southern injection wells, each equipped with an in-line static mixer. Samples were collected from two sampling ports (CAB_MIXER_606 and CAB_MIXER_607) located immediately downstream of each in-line static mixer (**Figure 1.2**).

Total organic carbon (TOC) and ethanol samples were collected in April, May, and June 2022 (see **Table 2.4**, below). Both TOC and ethanol were analyzed because the initial TOC results collected from January through April 2022 were very low in comparison to anticipated TOC concentrations (540 milligrams per liter [mg/L] TOC in each injection pulse). Low results could indicate that the carbon amendment system may not have been achieving the targeted ethanol dose, but, in this case, the dosing equipment appeared to be functioning properly and the measured volumes of ethanol used matched expectations (**Table 2.4**). Therefore, it was suspected that the laboratory analysis was not accurate. In addition to measuring ethanol specifically, verification of the TOC analytical method was performed on May 24, 2022 by analyzing the carbon amendment system samples using TOC methods 5310C (listed in the PG&E Program Quality Assurance Project Plan [QAPP], CH2M Hill 2014; Critigen 2020) and 5310B (alternative TOC analytical method).

In the May troubleshooting analysis, TOC analysis by both methods 5310C and 5310B yielded concentrations within the anticipated order of magnitude, although 5310B results were somewhat lower than 5310C results. Both methods provided TOC results that were higher than those in January through April 2022 including the previously used 5310C method. The data suggest that TOC method 5310C is now providing representative TOC concentrations and will continue to be used to analyze for TOC, although it is not clear what change occurred between April and May to bring the results within expectations. Ethanol results from March through June also confirm that ethanol was being properly dosed and support the interpretation that the January through April TOC results by method 5310C were not accurate.

As stated in the BOD SMP (CH2M Hill 2015a), carbon amendment system monitoring is required to be performed weekly or biweekly during remedy startup until the data verify that the system is working properly. Once the system operations are verified, the sampling frequency can be reduced to quarterly or semi-annually. Because the recent TOC and ethanol results confirm that the system is working properly, the sampling frequency of the carbon amendment system will be reduced to semi-annually. The next TOC and ethanol samples from the carbon amendment system will be collected in Fourth Quarter 2022.

2.3 Well Fouling Monitoring and Prevention

The potential for extraction well fouling as the result of carbon injection is monitored during system operations (NTH IRZ DQO 5). This monitoring includes measuring TOC and metal byproducts at the extraction wells for conditions that may generate well fouling and specific capacity of the IRZ injection wells. The Second Quarter 2022 Well Performance Report (in progress), to be submitted under separate cover, provides an evaluation of overall well performance. However, the extraction well monitoring analytical results are provided herein.

Table 2.5 shows the baseline and monthly analytical results from extraction wells IRZ-9, IRZ-23, IRZ-13S, and IR Z-13D. TOC, total iron, dissolved iron, and dissolved manganese concentrations were generally lower than the reporting limits, with several isolated exceptions. The isolated detections do not indicate a consistent trend that would be of concern for causing well fouling; therefore, no adjustments to operations were needed in Second Quarter 2022. Extraction well IRZ-9 was not operated in Second Quarter 2022.

The extraction wells will continue to be monitored monthly in Third Quarter 2022.

[1]Total iron was inadvertently not analyzed in June 2022

The IRZ injection wells were backwashed weekly when they were operating. The backwash water was stored in frac tanks at the MW-20 bench while the RPWC system was being finished. The RPWC system is planned to begin operation in Third Quarter 2022. Before re-injection into the IRZ injection wells, the backwash water was analyzed for field parameters and select constituents (Cr6, total chromium, dissolved iron, and dissolved manganese). A summary of field parameters and analytical results from the backwash water is provided in **Table 2.6**. The data demonstrate that the water met the conditions specified in the BOD SMP for re-injection into IRZ injection wells (pH between 6.5 and 8.5).

2.4 Waste Management

In Second Quarter 2022, IRZ backwash water, purge water from well sampling, and stormwater pumped from vaults was stored in frac tanks at the MW-20 bench. The water was filtered and used for re-injection into IRZ injection wells.

3 Second Quarter 2022 Performance Summary

This section describes the groundwater and surface water monitoring performed in Second Quarter 2022 and summarizes the Second Quarter 2022 monitoring results.

Table 3.1 provides a summary of the Phase 1 Monitoring Program including monitoring locations, monitoring frequencies, and constituents. Remediation well and monitoring well construction details are provided in **Tables 3.2** and **3.3**, respectively.

3.1 Summary of Second Quarter 2022 Monitoring Performed

Groundwater and surface water monitoring was performed in Second Quarter 2022 in accordance with the Phase 1 Monitoring Plan (Arcadis 2021), Standard Operating Procedures (SOPs) presented in Appendix B of the Phase 1 Monitoring Plan, and the QAPP (CH2M Hill 2014; Critigen 2020). The elements of the Phase 1 Monitoring Program performed in Second Quarter 2022 are listed below:

- Process control monitoring;
- Remedy compliance monitoring;
- COPC monitoring; and
- Water level monitoring.

Note that the monitoring wells included in each monitoring program vary by quarter. **Table 3.1** and **Figure 3.1** show the monitoring wells and surface water monitoring locations monitored in Second Quarter 2022.

The following monitoring and extraction wells were not sampled in Second Quarter 2022 for the reasons noted below:

- MW-57-050 and MW-58-065: dry;
- PGE-07BR: inoperable pump;
- TW-01: inaccessible due to remedy construction.

Field parameters (temperature, pH, specific conductivity, oxidation-reduction potential [ORP], turbidity, total dissolved solids [TDS], and salinity) were measured before groundwater and surface water sample collection. Samples were sent to Asset Laboratories in Las Vegas, Nevada for laboratory analysis. Samples collected from monitoring wells in Arizona were sent to EMAX Laboratories, Inc. in Torrance, California. Total iron was inadvertently not analyzed for extraction wells IRZ-9, IRZ-13S, IRZ-13D, and IRZ-13 in June 2022; total iron will be analyzed at these locations in Third Quarter 2022.

3.1.1 Modifications to the Phase 1 Monitoring Program

The following modifications were made to the Phase 1 Monitoring Program in Second Quarter 2022:

- Extraction wells IRZ-9, IRZ-13S, IRZ-13D, and IRZ-23 continued to be sampled monthly (see **Section 2.3**).

- Inactive injection wells IRZ-15, IRZ-21, and IRZ-25 were incorporated into the dose response monitoring program in Second Quarter 2022 to further evaluate the influence of active IRZ operations adjacent to extraction wells. The wells were sampled in April 2022; however, they were not sampled in May or June 2022 because the equipment at the wells was removed and transferred to other wells in the system after the March 29, 2022 storm damage while waiting for replacement parts.
- The sampling frequency at select downgradient monitoring wells (MW-30-050, MW-34-080, MW-36-090, MW-36-100, MW-39-040, MW-39-050, MW-39-060, MW-39-070, MW-39-080, MW-39-100, MW-44-115, MW-44-125, MW-45-095a, MW-77-046, MW-77-102, MW-77-158, MW-77-187, MW-81-043, MW-81-098, MW-82-046, MW-82-112, MW-82-168, and MW-82-198) increased from quarterly to monthly starting in June 2022 to better evaluate changes in Cr6 concentrations over time in response to system operation. Samples collected from these wells were analyzed for the constituents listed in **Table 3.1** as well as sulfate.
- The sampling frequency at monitoring wells MW-167-185 and MW-168-180, located in the vicinity of the TCS, was increased to monthly to evaluate changes in Cr6 concentrations over time.
- Starting in May 2022, samples collected from the COPC PAP monitoring wells were analyzed for nitrate using USEPA Method 300.0 and nitrate/nitrite using USEPA Method 353.2. Refer to Section 3.2.3 for additional details.

3.1.2 Data Validation and Completeness

Analytical results were validated in accordance with the QAPP (CH2M Hill 2014; Critigen 2020). Analytical results were evaluated using the criteria of precision, accuracy, representativeness, comparability, and completeness (PARCC) to demonstrate that a sufficient number of representative samples was collected, and the resulting analytical data can be used to support the decision-making process as measured by the PARCC findings. The following summary highlights the PARCC findings:

- Precision of the data was verified through the review of the laboratory data quality indicators that include matrix spike/matrix spike duplicate (MS/MSD) and field duplicate relative percent differences. Precision for several analytes fell outside of performance indicators due to matrix interference; data validation qualifiers were applied for results that did not meet quality control criteria.
- Accuracy of the data was verified through the review of the calibration, laboratory control samples, MS/MSDs, as well as the evaluation of method/field blank data. Accuracy was acceptable for all analyses with some exceptions due to matrix interference; data validation qualifiers were applied for results that did not meet quality control criteria.
- Representativeness of the data was verified through the samples' collection, storage, and preservation procedures and the verification of holding-time compliance. The laboratory did not note any problems with the samples' collection, holding time, and storage. Chain-of-custody issues were minor and were resolved and documented in the data packages.
- Comparability of the data was ensured using standard analytical procedures and standard units for reporting. Results obtained are comparable to industry standards in that the collection and analytical techniques followed approved, documented procedures.
- Completeness is a measure of the number of valid measurements obtained in relation to the total number of measurements planned. Completeness is expressed as the percentage of valid or usable measurements

compared to planned measurements. Valid data are defined as all data that are not rejected for project use and flagged “R” for rejected during validation. All data are considered valid except for the following results:

- MW-39-060-Q222 and MW-39-100-Q222 (May 2022): These results were rejected because the analytical results indicated the samples had been switched (sample delivery group number 50583).
- TW-03D-Q222 and MW-913-Q222 (June 2022): Two nitrite results were rejected because there was no recovery in the MS associated with the samples.

The completeness goal of 90 percent was met for all method/constituent combinations.

3.2 Summary of Second Quarter 2022 Monitoring Results

This section summarizes the Second Quarter 2022 process control monitoring, remedy compliance monitoring, and COPC monitoring results. Field parameter monitoring results are presented in **Appendix A**. Analytical results for all monitoring wells and surface water monitoring locations in the Phase 1 Monitoring Program from January 2020 to June 2022 are provided in **Appendix B**. Laboratory reports from Second Quarter 2022 are provided in **Appendix C**.

3.2.1 Process Control Monitoring Results

This section summarizes the Second Quarter 2022 process control monitoring results and describes how the results are used to assess the NTH IRZ DQOs 2, 3, and 4 (Section 1.3). The Second Quarter 2022 process control monitoring results are presented in **Table 3.4**.

3.2.1.1 Dose Response and Downgradient Well Monitoring Results

Cr6 and in-situ byproduct results from the dose response and downgradient monitoring wells are used to determine development of NTH IRZ treatment (NTH IRZ DQO 2) and if in-situ byproduct generation and migration from the NTH IRZ is controlled (NTH IRZ DQO 3). The decision rules and operational framework for evaluating IRZ effectiveness and in-situ byproduct generation and migration are provided on Figure 2.2-2 of the BOD SMP (Appendix L, Volume 2; CH2M Hill 2015a). The following sections provide a Second Quarter 2022 performance summary of the dose response and downgradient monitoring wells based on the decision rules outlined on Figure 2.2-2 of the BOD SMP.

3.2.1.1.1 NTH IRZ Treatment Results

Dose response well monitoring results, including changes in TOC, Cr6, and/or dissolved iron concentrations, are used to determine establishment of the NTH IRZ and Cr6 treatment. **Table 3.5** provides a performance summary for these parameters for the dose response wells in Second Quarter 2022. The performance summary is based on the decision rules and operational framework provided on Figure 2.2-2 of the BOD SMP.

As indicated in **Table 3.5**, initial Cr6 treatment, based on declining Cr6 concentrations and/or increasing dissolved iron concentrations, was observed at the following monitoring wells (listed from north to south):

- MW-26;

- MW-31-060;
- MW-51;
- MW-78-070;
- MW-79-102; and
- MW-80-082.

TOC was sampled at the dose response wells, and concentrations were non-detect. The lack of TOC detections could reflect the periodic ethanol dosing or organic carbon consumption before reaching the dose response wells, as reducing conditions were initially being established or could indicate that not enough ethanol is being injected to reach the monitoring well locations.

Although Cr6 treatment is being observed at dose response wells monitoring several different IRZ injection wells, treatment has not been observed at all depth intervals and directions from those injection wells. For example, on the southern end of the NTH IRZ, three dose response wells (MW-78-142, MW-79-058, and MW-80-057) yielded results that do not show evidence of arrival of treated water, while wells in other directions and depth intervals listed above did show evidence of arrival of treated water. These results indicate heterogenous hydraulic distribution of injected water. To enhance hydraulic distribution from each injection well, flow to the southern IRZ injection wells (IRZ-27 [lower], IRZ-29, IRZ-31, IRZ-33, IRZ-35, and IRZ-37) was increased by approximately 50 percent on June 15, 2022. The Third Quarter 2022 results will be evaluated to determine whether the increased flow improved hydraulic distribution.

Based on operation to date, continued NTH IRZ system operation is warranted to further generate sustained Cr6 reducing conditions.

3.2.1.1.2 Downgradient Hexavalent Chromium Results

In the floodplain (i.e., downgradient of the NTH IRZ), Cr6 concentrations in downgradient monitoring wells are anticipated to decrease to below 32 µg/L within 2 to 10 years based on the results of solute transport modeling (refer to Table 2.2-1 of the BOD SMP; Appendix L, Volume 2; CH2M Hill 2015a). Within the first 6 months of system operation, Cr6 concentration trends are expected to vary: concentrations at some downgradient monitoring wells may increase, whereas concentrations at other wells may remain stable or decrease. Table 2.1-4 of the BOD SMP (Appendix L, Volume 2; CH2M Hill 2015a) describes the anticipated changes in Cr6 concentrations at specific monitoring wells during the first 6 months to 1 year of system operation.

Table 3.6 provides a performance summary of the downgradient monitoring wells in Second Quarter 2022 to evaluate Cr6 distribution and changes in Cr6 concentrations downgradient of the NTH IRZ. **Figure 3.2** shows the distribution of Cr6 in downgradient monitoring wells in Second Quarter 2022 for wells monitoring Layers 1 through 5**.** Cr6 concentrations were below 32 µg/L at all monitoring wells, except at the following two wells:

- MW-39-100 (170 µg/L; June 15, 2022). Table 2.1-4 of the BOD SMP (Appendix L, Volume 2; CH2M Hill 2015a) indicates that Cr6 concentrations at this monitoring well may increase during the initial remedy operation. Although the June Cr6 concentration at MW-39-100 exceeded 32 µg/L, concentrations at monitoring wells further downgradient (MW-34-080, MW-34-100, MW-36-070, MW-36-090, MW-36-100, and MW-45-095a) remained below 32 µg/L (non-detect to 0.93 µg/L). In addition, **Figure 2.1** indicates that flow in this area was generally toward active extraction well IRZ-23. Cr6 concentrations at MW-39-100 and downgradient wells will continue to be monitored monthly.

- MW-77-187 (33 µg/L; June 15, 2022). Cr6 concentrations at MW-77-187 increased since startup of remedy operations in December 2021. However, Cr6 concentrations at monitoring wells further downgradient of MW-77-187 (MW-46-175 and MW-46-205) remained below 32 µg/L in May 2022 (non-detect to 6.9 µg/L). As the IRZ is established by injections at IRZ-18, it is expected that treated water will flow toward MW-77-187 and the Cr6 concentration will decline. To verify this expectation, MW-77-187, along with the rest of the wells in the MW-77, MW-81, and MW-82 monitoring well clusters, will continue to be sampled monthly to evaluate changes in Cr6 concentrations over time in response to system operation.

3.2.1.1.3 In-Situ Byproduct Results

In-situ byproduct (dissolved arsenic, dissolved manganese, dissolved iron, and dissolved barium) generation and migration from the NTH IRZ are evaluated using results from the dose response and downgradient monitoring wells. The BOD SMP (CH2M Hill 2015a) provides maximum concentrations (i.e., action levels) for dissolved arsenic, dissolved manganese, and dissolved iron, which are presented in **Tables 3.5 and 3.6**. Barium is also monitored as part of the process control monitoring program, but action levels for barium are not specified in the BOD SMP; dissolved barium monitoring results from Second Quarter 2022 are presented in **Table 3.4**. If an individual monitoring well exhibits a natural baseline concentration above the given maximum, then the baseline concentration is used as the action level. Baseline concentrations for dissolved arsenic, dissolved iron, and dissolved manganese, presented in **Tables 3.5** and **3.6**, were established as follows:

- For monitoring wells installed before 2019, the maximum historical result was selected.
- For monitoring wells installed after 2019, the maximum result between January 2020 and December 2021 was selected, which did not include initial samples collected after well installation and allowed for water quality stabilization after installation.

If in-situ byproduct concentrations at a dose response or downgradient monitoring well are above the action levels, then a new sample is collected from the monitoring well within 45 days. If the re-sample confirms the exceedance, then the DTSC is notified, and operation of the remedial system will be adjusted as needed.

Figures 3.3 through **3.5** show the distribution of Second Quarter 2022 dissolved arsenic, dissolved iron, and dissolved manganese concentrations for the dose response and downgradient monitoring wells monitoring Layers 1 through 5. In-situ byproduct concentrations at the dose response and downgradient monitoring wells were below the action levels, except for the dissolved manganese concentration at dose response well MW-31-060 (located 10 feet from IRZ-18) collected on April 12, 2022 (5.4 mg/L; above the action level of 5 mg/L). The dissolved manganese concentration at MW-31-060 previously exceeded the action level in February 2022 (7.8 mg/L). In response to the February 2022 action level exceedance, the ethanol injection frequency was reduced from two dosses per week to one dose per week on March 7, 2022. Monitoring well MW-31-060 was subsequently sampled on May 20 and June 13, 2022, and the dissolved manganese concentrations decreased to 0.69 mg/L and 0.024 mg/L, respectively. Both results were below the action level of 5 mg/L; therefore, no operational changes were warranted in Second Quarter 2022.

3.2.1.2 Northern NTH IRZ Extraction Monitoring Results

On the northern end of the NTH IRZ, the system is designed to control potential migration of Cr6 via groundwater extraction rather than the establishment of an IRZ. **Figure 1.3** shows the area addressed by northern extraction, with the northern extraction monitoring wells identified in green. Multiple lines of evidence can be used to evaluate

achievement of control of the Cr6 plume at the northern end of the NTH IRZ (NTH IRZ DQO 4), including interpreted water levels, concentration trends, and numerical modeling (CH2M Hill 2015a).

In Second Quarter 2022, Cr6 concentrations and groundwater elevation data demonstrate control of the Cr6 plume in this area. Cr6 concentrations in the northern NTH IRZ extraction monitoring wells (green symbols on **Figure 1.3**) were below 32 µg/L and Cr6 concentrations at the surface water monitoring locations were non-detect at the reporting limit (see **Tables 3.4** and **3.8** and **Figure 3.2)**, indicating Cr6 plume control in Second Quarter 2022**.** It should be noted that Cr6 concentrations have fluctuated at MW-75-033, which yielded 40 µg/L in First Quarter 2022. Nearby monitoring wells MW-76-039/-156/-181/-218 yielded maximum Cr6 concentrations of 88, 15, 2,200, and 460 µg/L, respectively, in Second Quarter 2022. This northern portion of the contiguous Cr6 plume at the MW-76 cluster will ultimately be treated by injection at IRZ-15, but injections have not been conducted to date. In the meantime, northern extraction at IRZ-13S and IRZ-13D is being evaluated to understand the influence of IRZ operations on this portion of the Cr6 plume, as described below.

Hydraulic influence of IRZ-13S and IRZ-13D was evaluated using potentiometric surface maps (see Section 2.1) and horizontal hydraulic gradient vectors. Gradient vectors were calculated using water level elevations in three wells located in a triangular fashion (“triplets”). These vectors provide a unique solution for each well triplet and viewing multiple such vectors in an area can describe the approximate groundwater flow field in an area. This is done for the area around IRZ-13S and IRZ-13D in Layers 1 and 2 and Layers 4 and 5, which are the layers where Cr6 is or has been present above 32 µg/L in the MW-75 and MW-76 monitoring well clusters. The monitoring wells used in the triplets are shown on **Figure 3.6** and flow vector azimuth directions calculated from average monthly water levels from pressure transducers are listed in **Table 3.7**. Note that April and May 2022 data are analyzed in this quarterly progress report and June 2022 data will be analyzed in the Third Quarter 2022 quarterly progress report.

IRZ-13S and IRZ-13D operated approximately 32 percent of the month in April 2022 and approximately 63 percent of the month in May 2022. The potentiometric surface map for Layers 1 and 2 (**Figure 2.1a**) shows an area of groundwater flow toward IRZ-13S achieved by extraction operations in April and May 2022, including the area by MW-75-033 and MW-76-039. Flow vectors described by triplets MW-75-033/MW-96-045/MW-97-042 and MW-76-039/MW-86-030/MW-97-042 (**Figure 3.6a**) also show flow towards IRZ-13S in April and May 2022. The potentiometric surface map for Layers 4 and 5 (**Figure 2.1c**) shows an area of groundwater flow toward IRZ-13D, including the area by MW-76-156/-181. Flow vectors described by triplets MW-35-135/MW-49-135/MW-76-181 shows landward flow in April and May 2022 and flow vectors described by triplets MW-76-181/MW-86-120/MW-77-158 and MW-76-181/MW-86-140/MW-77-187 show flow toward IRZ-13D in April and May 2022 (**Figure 3.6b**).

Collectively, Cr6 concentration and water level data demonstrate that any potential migration of the Cr6 plume targeted by northern extraction is controlled.

3.2.2 Remedy Compliance Monitoring Results

This section summarizes the Second Quarter 2022 remedy compliance monitoring results and provides a brief overview of progress towards achievement of RAOs 2, 3, and 4, as defined in Section 1.1, during remedy startup. RAO progress is anticipated to be evaluated during the remedy; data collected each quarter will contribute to the overall evaluation.

The Second Quarter 2022 remedy compliance monitoring results are presented in **Table 3.8**. Progress towards achievement of RAOs 2, 3, and 4 is summarized below.

- *RAO 2*. RAO 2 is evaluated by monitoring Cr6 concentrations in the Colorado River to verify that concentrations do not exceed the surface water quality standard (11 µg/L). In Second Quarter 2022, Cr6 concentrations at the 16 surface water monitoring locations were below the water quality standard of 11 µg/L (USEPA 2022); all results were non-detect at the reporting limit.

  Although RAO 2 is specifically intended to address Cr6, IRZ in-situ byproducts dissolved arsenic and dissolved manganese are also monitored in the Colorado River to verify that concentrations do not exceed the surface water quality standards. In Second Quarter 2022, dissolved arsenic concentrations at the 16 surface water monitoring locations were below the National Recommended Water Quality Criteria (NRWQC) for aquatic life of 150 µg/L. There is no NRWQC for aquatic life for dissolved manganese (USEPA 2022). Dissolved arsenic and dissolved manganese concentrations were below the California primary and secondary maximum contaminant levels (MCLs) of 10 µg/L (primary MCL) and 0.05 mg/L (secondary MCL), respectively (State of California 2022).

- *RAO 3*. RAO 3 is evaluated by monitoring changes in groundwater Cr6 concentrations inside the plume boundary (i.e., mass reduction) and assessing the lateral and vertical distributions of Cr6 concentrations across the plume. This RAO will be achieved by meeting the cleanup goal of 32 µg/L of Cr6.

  Changes in Cr6 concentrations inside the plume as a result of IRZ system operations are discussed in Section 3.2.1.1. In Second Quarter 2022, Cr6 treatment (i.e., decreasing Cr6 concentrations) was observed at six dose response monitoring wells. **Figure 3.2** shows the distribution of Cr6 in groundwater across the Site in Second Quarter 2022 for wells monitoring Layers 1 through 5. As IRZ system operations continue, Cr6 data from monitoring wells located inside the plume will continue to be collected and assessed to evaluate progress towards this RAO.

- *RAO 4*. RAO 4 is evaluated by monitoring Cr6 and in-situ byproduct concentrations (dissolved arsenic and dissolved manganese) outside of the target remediation area (i.e., baseline Cr6 plume boundary) to verify that concentrations do not permanently increase following completion of the remedial action. Additional data collection over a longer period is needed to evaluate progress towards this RAO.

3.2.3 COPC Monitoring Results

This section summarizes the Second Quarter 2022 COPC monitoring results (dissolved selenium, dissolved molybdenum, and nitrate) and provides an evaluation of the results in accordance with the COPC PAP. The Second Quarter 2022 COPC monitoring results are presented in **Table 3.9**.

The COPC PAP was developed to notify the DTSC when COPC threshold concentrations (i.e., trigger levels) in select outer plume compliance groundwater monitoring wells (i.e., COPC PAP monitoring wells) are exceeded. Thirty-one monitoring wells are included in the COPC PAP; however, not all COPC PAP monitoring wells were scheduled for sampling in Second Quarter 2022 (see **Table 3.1**). The trigger levels are based on Shewhart control limits calculated from the most recent eight sample results for each monitoring well; the method for calculating the trigger levels is provided in Appendix D of the Fourth Quarter 2021 Quarterly Progress Report (Arcadis 2022a). The COPC PAP decision tree, also provided in Appendix D of the Fourth Quarter 2021 Quarterly Progress Report (Arcadis 2022a), outlines notifications and actions to be taken when COPC concentrations in a COPC PAP monitoring well exceed a trigger level.

In First Quarter 2022, the nitrate concentration in COPC PAP monitoring well MW-90-031 (0.66 mg/L nitrogen [N]) exceeded the trigger level of 0.22 mg/L N (see Appendix D of the Fourth Quarter 2021 Quarterly Progress

Report [Arcadis 2022a]). The trigger level was calculated for the baseline dataset using nitrate/nitrite results since nitrate was not historically analyzed at this monitoring well. In accordance with the COPC PAP decision tree, PG&E notified the Agencies of this exceedance on April 29, 2022 (Arcadis 2022b), and a verification sample was collected on May 5, 2022, within 45 days of receipt of the validated data. Both nitrate/nitrite (USEPA Method 353.2) and nitrate (USEPA Method 300.0) were analyzed.

The May 2022 nitrate/nitrite and nitrate results were non-detect at a reporting limit of 0.1 mg/L N and 0.5 mg/L N, respectively. These results do not confirm the exceedance of the trigger level observed in First Quarter 2022. In accordance with the PAP procedures, PG&E notified the Agencies of the May 2022 verification results on July 25, 2022 (Arcadis 2022e; Appendix D), and remedial operations continued. In addition, groundwater samples collected from MW-90-031 will continue to be analyzed for both nitrate/nitrite (Method 353.2) and nitrate (Method 300.0) until sufficient nitrate data are collected to establish a nitrate COPC PAP trigger level.

4 Recommendations and Planned Activities for Next Reporting Period

Phase 1 remedy operations and the Phase 1 Monitoring Program will continue to be performed in Third Quarter 2022 (July to September 2022) in accordance with the O&M Plan (CH2M Hill 2015a) and Phase 1 Monitoring Plan (Arcadis 2021). Because the system operated intermittently in the First Half of 2022, reducing conditions are still being established; therefore, IRZ operations will continue (see Figure 2.2-2 of the BOD SMP [CH2M Hill 2015a]). The monitoring program outlined in **Table 3.1** will continue with modifications as noted below.

In addition to routine remedy operations and monitoring, the following activities are planned for Third Quarter 2022:

- Injection wells closest to an extraction well (IRZ-15, IRZ-21, and IRZ-25), along with extraction well IRZ-9, will remain offline.
- Initiate operation of the RPWC system and perform RPWC system monitoring in accordance with the BOD SMP (CH2M Hill 2015a).
- Continue to sample extraction wells IRZ-9, IRZ-13S, IRZ-13D, and IRZ-23 monthly (while operational) in Third Quarter 2022 to evaluate the potential for well fouling. In addition, sulfate and nitrate will be analyzed to determine the concentrations that are extracted at each well.
- Continue to incorporate wells IRZ-15, IRZ-21, and IRZ-25 into the dose response monitoring program to further evaluate the influence of active IRZ operations adjacent to extraction wells.
- Continue to sample select downgradient monitoring wells (MW-30-050, MW-34-080, MW-36-090, MW-36-100, MW-39-040, MW-39-050, MW-39-060, MW-39-070, MW-39-080, MW-39-100, MW-44-115, MW-44-125, MW-45-095a, MW-67-185, MW-68-180, MW-77-046, MW-77-102, MW-77-158, MW-77-187, MW-81-043, MW-81-098, MW-82-046, MW-82-112, MW-82-168, and MW-82-198) monthly to evaluate changes in Cr6 concentrations in response to system operation.
- Continue construction of the Phase 2a remedy.

IRZ operations, monitoring, and monitoring results will be reported in a Third Quarter 2022 Quarterly Progress Report. A Third Quarter 2022 Well Performance Report will also be submitted to document well performance tracking data from Third Quarter 2022 in accordance with the O&M Plan (CH2M Hill 2015a).

Notes:

1. The monitoring program will be re-evaluated after 2 years of operation.

[1] Ammonium and nitrite will be monitored for the first year. If not detected within the first year of monitoring, sampling for these analytes will be discontinued. If increases in ammonium or nitrite concentrations are detected in dose response wells, recommendations for continued sampling and potential expansion of the monitoring network for these analytes will be provided.

[2] Other dissolved metals: boron, calcium, magnesium, potassium, sodium, and vanadium

[3] Chloride and fluoride

[4] Dissolved calcium, dissolved magnesium, dissolved potassium, dissolved sodium, chloride, fluoride

[5] Samples are collected biweekly (1 time every 2 weeks) until the system operations are verified. The sampling frequency is reduced to semi-annual thereafter.

X(X): Frequency for the first year (yr) or quarter (Q); frequency reduction to be considered thereafter
A = Annually
B = biennially (every 2 years)
COPC = constituent of potential concern
ID = identification
IM-3 = Interim Measure 3

Notes:
a. Baseline TOC concentrations are defined by the most recent sampling result prior to IRZ system startup. Note that if a result was non-detect at an elevated reporting limit, previous sampling events were considered to develop a more conservative baseline concentration.
b. Anticipated target ranges were set forth in the NTH IRZ Injection Decision Rules and Operational Framework (CH2M Hill 2015).
c. Baseline Cr6 concentrations represent the maximum concentration observed at each monitoring well between January 2020 and December 2021.
d. In comparison to the baseline concentration, a negative value indicates a decrease in concentration and a positive value indicates an increase in concentration.
e. Anticipated comparison values were set forth in the NTH IRZ Injection Decision Rules and Operational Framework (CH2M Hill 2015).
f. Baseline dissolved iron, dissolved arsenic, and dissolved manganese concentrations represent the maximum historical concentration observed at each monitoring well. For wells installed after 2019, baseline concentrations represent the maximum concentration observed at each monitoring well between January 2020 and December 2021.
g. Evidence of treated groundwater at the monitoring well is determined by changes in TOC, Cr6, and/or in-situ byproduct (dissolved iron, dissolved arsenic and dissolved manganese) concentrations, as outlined in the NTH IRZ Injection Decision Rules and Operational Framework (CH2M Hill 2015). Additional information, including changes in nitrate and sulfate concentrations, is also used to support evidence of treated groundwater.
h. The need for an operational response is determined based on evidence of treated groundwater at the monitoring well and control of in-situ byproducts, as outlined in the NTH IRZ Injection Decision Rules and Operational Framework (CH2M Hill 2015).

Abbreviations:
<x = not detected at the reporting limit
< = less than
Cr6 = hexavalent chromium
ID = identification
IRZ = in-situ reactive zone
J = estimated concentration
mg/L= milligram(s) per liter
N = no
N* = No, the result is not detected at the reporting limit, and as such is not considered within the target range or above baseline.
NTH = National Trails Highway
TOC = total organic carbon
Y = yes
µg/L = microgram(s) per liter

Notes:

a. Baseline Cr6 concentrations represent the maximum concentration observed at each monitoring well between January 2020 and December 2021.

b. In comparison to the baseline concentration, a negative value indicates a decrease in concentration and a positive value indicates an increase in concentration.

c. Anticipated change in Cr6 concentrations and comparison values were determined from the NTH IRZ Injection Decision Rules and Operational Framework (CH2M Hill 2015).

d. Baseline dissolved iron, dissolved arsenic, and dissolved manganese concentrations represent the maximum historical concentration observed at each monitoring well. For wells installed after 2019, baseline concentrations represent the maximum concentration observed at each monitoring well between January 2020 and December 2021.

e. The need for an operational response is determined based on anticipated changes in Cr6 concentrations and control of in-situ byproducts, as outlined in the NTH IRZ Injection Decision Rules and Operational Framework (CH2M Hill 2015).

Abbreviations:

<x = not detected at the reporting limit
Cr6 = hexavalent chromium
ID = identification
IRZ = in-situ reactive zone
J = estimated value
mg/L= milligram(s) per liter
N = no
NTH = National Trails Highway
Y = yes
Y* = Yes, the result is not detected at an elevated reporting limit, and as such is not considered above the comparison criteria.
µg/L = microgram(s) per liter

REPORTING CONVENTIONS

DATA QUALIFIERS:

Lab Qualifier	AFCEE Qualifier	Description
J	F	Indicates that the analyte is positively identified and the result is less than LOQ/RL but greater than LOD/MDL/DL.
N		Indicates presumptive evidence of a compound.
B	B	Indicates that the analyte is found in the associated method blank as well as in the sample at above QC level.
E	J	Indicates that the result is above the maximum calibration range or estimated value.
*	*	Out of QC limit.

Note: The above qualifiers are used to flag the results unless the project requires a different set of qualification criteria.

CASE NARRATIVE

Client : ARCADIS

Project: PG&E TOPOCK-GMP

SDG : 22F145

METHOD SW6020A
DISSOLVED METALS BY ICP-MS

A total of eight(8) water samples were received on 06/16/22 to be analyzed for Dissolved Metals by ICP-MS in accordance with Method SW6020A and project specific requirements.

Holding Time
Samples were digested and analyzed within the prescribed holding time.

Calibration
Initial Calibration was established as prescribed by the method and was verified using a secondary source(ICV). Interference checks were performed and results were within required limits. Continuing calibration verifications and continuing calibration blanks were carried out at the frequency specified by the project. All calibration requirements were satisfied.

Method Blank
Method blank was prepared and analyzed at the frequency required by the project. For this SDG, one(1) method blank was analyzed. IMF024WB - result was compliant to project requirement. Refer to sample result summary form for details.

Lab Control Sample
Lab control sample was prepared and analyzed at a frequency required by the project. For this SDG, one(1) set of LCS/LCD was analyzed. IMF024WL/IMF024WC were within LCS limits. Refer to LCS summary form for details.

Matrix QC Sample
Matrix spike sample was prepared and analyzed at a frequency required by the project. For this SDG, one(1) set of MS/MSD was analyzed. Chromium was within MS QC limits in F145-01M/F145-01S. Refer to Matrix QC summary form for details.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. Results were evaluated in accordance to project requirements. For this SDG, all quality control requirements were met. Samples analyzed at dilution due to high saturation.

CASE NARRATIVE

Client : ARCADIS

Project: PG&E TOPOCK-GMP

SDG : 22F145

METHOD E218.6
HEXAVALENT CHROMIUM

A total of thirteen (13) water samples were received on 06/16/22 to be analyzed for Hexavalent Chromium in accordance with Method E218.6 and project specific requirements.

Holding Time
Samples were analyzed within the prescribed holding time.

Calibration
Calibration was performed as prescribed by the method and was verified using a secondary source (ICV). All calibration requirements were within acceptance criteria.

Method Blank
Method blank was prepared and analyzed at the frequency required by the project. For this SDG, one (1) method blank was analyzed. Hexavalent Chromium was not detected in HCF011WB. Refer to sample result summary form for details.

Lab Control Sample
Lab control sample was prepared and analyzed at a frequency required by the project. For this SDG, one (1) set of LCS/LCD was analyzed. HCF011WL/HCF011WC were within LCS limits. Refer to LCS summary form for details.

Matrix QC Sample
Matrix spike sample was prepared and analyzed at a frequency required by the project. For this SDG, two (2) sets of MS/MSD were analyzed. Hexavalent Chromium was within MS QC limits in F145-04M/-04S and F145-08M/-08S. Refer to Matrix QC summary forms for details.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. Results were evaluated in accordance to project requirements. For this SDG, all quality control requirements were met.

Samples F145-04/-04M/-04S were reported at 5X dilution due to matrix interference.

REPORTING CONVENTIONS

DATA QUALIFIERS:

Lab Qualifier	AFCEE Qualifier	Description
J	F	Indicates that the analyte is positively identified and the result is less than LOQ/RL but greater than LOD/MDL/DL.
N		Indicates presumptive evidence of a compound.
B	B	Indicates that the analyte is found in the associated method blank as well as in the sample at above QC level.
E	J	Indicates that the result is above the maximum calibration range or estimated value.
*	*	Out of QC limit.

Note: The above qualifiers are used to flag the results unless the project requires a different set of qualification criteria.

CASE NARRATIVE

Client : ARCADIS

Project: PG&E TOPOCK-GMP

SDG : 22F145

METHOD SW6020A
DISSOLVED METALS BY ICP-MS

A total of eight(8) water samples were received on 06/16/22 to be analyzed for Dissolved Metals by ICP-MS in accordance with Method SW6020A and project specific requirements.

Holding Time
Samples were digested and analyzed within the prescribed holding time.

Calibration
Initial Calibration was established as prescribed by the method and was verified using a secondary source(ICV). Interference checks were performed and results were within required limits. Continuing calibration verifications and continuing calibration blanks were carried out at the frequency specified by the project. All calibration requirements were satisfied.

Method Blank
Method blank was prepared and analyzed at the frequency required by the project. For this SDG, one(1) method blank was analyzed. IMF024WB - result was compliant to project requirement. Refer to sample result summary form for details.

Lab Control Sample
Lab control sample was prepared and analyzed at a frequency required by the project. For this SDG, one(1) set of LCS/LCD was analyzed. IMF024WL/IMF024WC were within LCS limits. Refer to LCS summary form for details.

Matrix QC Sample
Matrix spike sample was prepared and analyzed at a frequency required by the project. For this SDG, one(1) set of MS/MSD was analyzed. Chromium was within MS QC limits in F145-01M/F145-01S. Refer to Matrix QC summary form for details.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. Results were evaluated in accordance to project requirements. For this SDG, all quality control requirements were met. Samples analyzed at dilution due to high saturation.

- The Calculated Value is a value calculated from the weight of a starting material that has been certified directly vs. a National Institute of Standards and Technology (NIST) SRM/RM. See Sec 4.2 for balance traceability.

The following equations are used in the calculation of the certified value and the uncertainty. Reported uncertainties represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of k = 2.

exp. 07|20|2022 W

Characterization of CRM/RM by Two or More Methods

Certified Value, $X_{CRM/RM}$, where two or more methods of characterization are used is the weighted mean of the results:

$X_{CRM/RM} = \Sigma(w_i)(X_i)$

X_i = mean of Assay Method i with standard uncertainty $u_{char\ i}$

w_i = the weighting factors for each method calculated using the inverse square of the variance:

$w_i = (1/u_{char\ i})^2 / (\Sigma(1/(u_{char\ i})^2)$

CRM/RM Expanded Uncertainty (±) = $U_{CRM/RM} = k\,(u^2_{char} + u^2_{bb} + u^2_{lts} + u^2_{ts})^{½}$

k = coverage factor = 2

$u_{char} = [\Sigma((w_i)^2 (u_{char\ i})^2)]^{½}$ where $u_{char\ i}$ are the errors from each characterization method

u_{bb} = bottle to bottle homogeneity standard uncertainty

u_{lts} = long term stability standard uncertainty (storage)

u_{ts} = transport stability standard uncertainty

Characterization of CRM/RM by One Method

Certified Value, $X_{CRM/RM}$, where one method of characterization is used is the mean of individual results:

$X_{CRM/RM} = (X_a)\,(u_{char\ a})$

X_a = mean of Assay Method A with

$u_{char\ a}$ = the standard uncertainty of characterization Method A

CRM/RM Expanded Uncertainty (±) = $U_{CRM/RM} = k\,(u^2_{char\ a} + u^2_{bb} + u^2_{lts} + u^2_{ts})^{½}$

k = coverage factor = 2

$u_{char\ a}$ = the errors from characterization

u_{bb} = bottle to bottle homogeneity standard uncertainty

u_{lts} = long term stability standard uncertainty (storage)

u_{ts} = transport stability standard uncertainty

4.0 TRACEABILITY TO NIST

- This product is traceable to NIST via an unbroken chain of comparisons. The uncertainties for each certified value are reported, taking into account the SRM/RM uncertainty error and the measurement, weighing and volume dilution errors. In rare cases where no NIST SRM/RM are available, the term 'in-house std.' is specified.

4.1 Thermometer Calibration

- All thermometers are NIST traceable through thermometers that are calibrated by an accredited calibration laboratory.

4.2 Balance Calibration

- All analytical balances are calibrated by an accredited calibration laboratory and procedure. The weights used for testing are annually compared to master weights and are traceable to NIST.

4.3 Glassware Calibration

- An in-house procedure is used to calibrate all Class A glassware used in the manufacturing and quality control of CRM/RMs.

5.0 TRACE METALLIC IMPURITIES (TMI) DETERMINED BY ICP-MS AND ICP-OES (µg/mL)

CRM/RMs are tested for trace metallic impurities by Axial ICP-OES and ICP-MS. The result from the most sensitive method for each element, is reported below. Solutions tested by ICP-MS were analyzed in an ULPA-Filtered Clean Room. An ULPA-Filter is 99.9985% efficient for the removal of particles down to 0.3 µm.

6.0 INTENDED USE

- For the calibration of analytical instruments and validation of analytical methods as appropriate.

7.0 INSTRUCTIONS FOR THE CORRECT USE OF THIS REFERENCE MATERIAL

7.1 Storage and Handling Recommendations

- Store between approximately 4° - 30° C while in sealed TCT bag.

- While stored in the sealed TCT bag, transpiration of this CRM/RM is negligible. After opening the sealed TCT bag transpiration of the CRM/RM will occur, resulting in a gradual increase in the analyte concentration(s). It is the responsibility of the user to account for this effect. When the bottle is weighed both before and after being placed in storage, the mass difference observed will be a measure of transpiration mass loss.

- After opening the sealed TCT bag, keep cap tightly sealed when not in use and store between 4° - 24° C to minimize the effects of transpiration. Use at 20° ± 4° C to minimize volumetric dilution error when using the reported density. Do not pipette from the container. Do not return removed aliquots to container.

- For more information, visit www.inorganicventures.com/TCT

- The Calculated Value is a value calculated from the weight of a starting material that has been certified directly vs. a National Institute of Standards and Technology (NIST) SRM/RM. See Sec 4.2 for balance traceability.

The following equations are used in the calculation of the certified value and the uncertainty. Reported uncertainties represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of k = 2.

Characterization of CRM/RM by Two or More Methods

Certified Value, $X_{CRM/RM}$, where two or more methods of characterization are used is the weighted mean of the results:

$X_{CRM/RM} = \Sigma(w_i)(X_i)$

X_i = mean of Assay Method i with standard uncertainty $u_{char\ i}$

w_i = the weighting factors for each method calculated using the inverse square of the variance:

$w_i = (1/u_{char\ i})^2 / (\Sigma(1/(u_{char\ i})^2)$

CRM/RM Expanded Uncertainty (±) = $U_{CRM/RM} = k\,(u^2_{char} + u^2_{bb} + u^2_{lts} + u^2_{ts})^{½}$

k = coverage factor = 2

$u_{char} = [\Sigma((w_i)^2\,(u_{char\ i})^2)]^{½}$ where $u_{char\ i}$ are the errors from each characterization method

u_{bb} = bottle to bottle homogeneity standard uncertainty

u_{lts} = long term stability standard uncertainty (storage)

u_{ts} = transport stability standard uncertainty

Characterization of CRM/RM by One Method

Certified Value, $X_{CRM/RM}$, where one method of characterization is used is the mean of individual results:

$X_{CRM/RM} = (X_a)\,(u_{char\ a})$

X_a = mean of Assay Method A with

$u_{char\ a}$ = the standard uncertainty of characterization Method A

CRM/RM Expanded Uncertainty (±) = $U_{CRM/RM} = k\,(u^2_{char\ a} + u^2_{bb} + u^2_{lts} + u^2_{ts})^{½}$

k = coverage factor = 2

$u_{char\ a}$ = the errors from characterization

u_{bb} = bottle to bottle homogeneity standard uncertainty

u_{lts} = long term stability standard uncertainty (storage)

u_{ts} = transport stability standard uncertainty

4.0 TRACEABILITY TO NIST

- This product is traceable to NIST via an unbroken chain of comparisons. The uncertainties for each certified value are reported, taking into account the SRM/RM uncertainty error and the measurement, weighing and volume dilution errors. In rare cases where no NIST SRM/RM are available, the term 'in-house std.' is specified.

4.1 Thermometer Calibration

- All thermometers are NIST traceable through thermometers that are calibrated by an accredited calibration laboratory.

4.2 Balance Calibration

- All analytical balances are calibrated by an accredited calibration laboratory and procedure. The weights used for testing are annually compared to master weights and are traceable to NIST.

4.3 Glassware Calibration

- An in-house procedure is used to calibrate all Class A glassware used in the manufacturing and quality control of CRM/RMs.

5.0 TRACE METALLIC IMPURITIES (TMI) DETERMINED BY ICP-MS AND ICP-OES (µg/mL)

CRM/RMs are tested for trace metallic impurities by Axial ICP-OES and ICP-MS. The result from the most sensitive method for each element, is reported below. Solutions tested by ICP-MS were analyzed in an ULPA-Filtered Clean Room. An ULPA-Filter is 99.9985% efficient for the removal of particles down to 0.3 µm.

6.0 INTENDED USE

- For the calibration of analytical instruments and validation of analytical methods as appropriate.

7.0 INSTRUCTIONS FOR THE CORRECT USE OF THIS REFERENCE MATERIAL

7.1 Storage and Handling Recommendations

- Store between approximately 4° - 30° C while in sealed TCT bag.

- While stored in the sealed TCT bag, transpiration of this CRM/RM is negligible. After opening the sealed TCT bag transpiration of the CRM/RM will occur, resulting in a gradual increase in the analyte concentration(s). It is the responsibility of the user to account for this effect. When the bottle is weighed both before and after being placed in storage, the mass difference observed will be a measure of transpiration mass loss.

- After opening the sealed TCT bag, keep cap tightly sealed when not in use and store between 4° - 24° C to minimize the effects of transpiration. Use at 20° ± 4° C to minimize volumetric dilution error when using the reported density. Do not pipette from the container. Do not return removed aliquots to container.

- For more information, visit **www.inorganicventures.com/TCT**

11.1 Certification Issue Date

July 04, 2021

- The certification is valid within the measurement uncertainty specified provided the CRM/RM is stored and handled in accordance with instructions given in Sec 7.1. This certification is nullified if instructions in Sec 7.1 are not followed or if the CRM/RM is damaged, contaminated, or otherwise modified.

11.2 Lot Expiration Date

- The date after which this CRM/RM should not be used.

- The lot expiration date reflects the period of time that the stability of a CRM/RM can be supported by long term stability studies conducted on properly stored and handled CRM/RMs. Lot expiration is limited primarily by transpiration (loss of water from the solution) and infrequently by chemical stability.

11.3 Period of Validity

- Sealed TCT Bag Open Date: _____

- This CRM/RM should not be used longer than one year (or six months in the case of a 30 mL bottle) from the date of opening the aluminized bag or after the date given in Sec. 11.2, whichever comes first. This is contingent upon the CRM/RM being stored and handled in accordance with the instructions given in Sec. 7.1.

The following equations are used in the calculation of the certified value and the uncertainty. Reported uncertainties represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of k = 2.

Characterization of CRM/RM by Two or More Methods

Certified Value, $X_{CRM/RM}$, where two or more methods of characterization are used is the weighted mean of the results:

$X_{CRM/RM} = \Sigma(w_i)(X_i)$

X_i = mean of Assay Method i with standard uncertainty $u_{char\ i}$

w_i = the weighting factors for each method calculated using the inverse square of the variance:

$w_i = (1/u_{char\ i})^2 / (\Sigma(1/(u_{char\ i})^2)$

CRM/RM Expanded Uncertainty (±) = $U_{CRM/RM} = k\,(u^2_{char} + u^2_{bb} + u^2_{lts} + u^2_{ts})^{1/2}$

k = coverage factor = 2

$u_{char} = [\Sigma((w_i)^2 (u_{char\ i})^2)]^{1/2}$ where $u_{char\ i}$ are the errors from each characterization method

u_{bb} = bottle to bottle homogeneity standard uncertainty

u_{lts} = long term stability standard uncertainty (storage)

u_{ts} = transport stability standard uncertainty

Characterization of CRM/RM by One Method

Certified Value, $X_{CRM/RM}$, where one method of characterization is used is the mean of individual results:

$X_{CRM/RM} = (X_a)(u_{char\ a})$

X_a = mean of Assay Method A with

$u_{char\ a}$ = the standard uncertainty of characterization Method A

CRM/RM Expanded Uncertainty (±) = $U_{CRM/RM} = k\,(u^2_{char\ a} + u^2_{bb} + u^2_{lts} + u^2_{ts})^{1/2}$

k = coverage factor = 2

$u_{char\ a}$ = the errors from characterization

u_{bb} = bottle to bottle homogeneity standard uncertainty

u_{lts} = long term stability standard uncertainty (storage)

u_{ts} = transport stability standard uncertainty

4.0 TRACEABILITY TO NIST

- This product is traceable to NIST via an unbroken chain of comparisons. The uncertainties for each certified value are reported, taking into account the SRM/RM uncertainty error and the measurement, weighing and volume dilution errors. In rare cases where no NIST SRM/RM are available, the term 'in-house std.' is specified.

4.1 Thermometer Calibration

- All thermometers are NIST traceable through thermometers that are calibrated by an accredited calibration laboratory.

4.2 Balance Calibration

- All analytical balances are calibrated by an accredited calibration laboratory and procedure. The weights used for testing are annually compared to master weights and are traceable to NIST.

4.3 Glassware Calibration

- An in-house procedure is used to calibrate all Class A glassware used in the manufacturing and quality control of CRM/RMs.

5.0 TRACE METALLIC IMPURITIES (TMI) DETERMINED BY ICP-MS AND ICP-OES (µg/mL)

CRM/RMs are tested for trace metallic impurities by Axial ICP-OES and ICP-MS. The result from the most sensitive method for each element, is reported below. Solutions tested by ICP-MS were analyzed in an ULPA-Filtered Clean Room. An ULPA-Filter is 99.9985% efficient for the removal of particles down to 0.3 µm.

6.0 INTENDED USE

- For the calibration of analytical instruments and validation of analytical methods as appropriate.

7.0 INSTRUCTIONS FOR THE CORRECT USE OF THIS REFERENCE MATERIAL

7.1 Storage and Handling Recommendations

- Store between approximately 4° - 30° C while in sealed TCT bag.

- While stored in the sealed TCT bag, transpiration of this CRM/RM is negligible. After opening the sealed TCT bag transpiration of the CRM/RM will occur, resulting in a gradual increase in the analyte concentration(s). It is the responsibility of the user to account for this effect. When the bottle is weighed both before and after being placed in storage, the mass difference observed will be a measure of transpiration mass loss.

- After opening the sealed TCT bag, keep cap tightly sealed when not in use and store between 4° - 24° C to minimize the effects of transpiration. Use at 20° ± 4° C to minimize volumetric dilution error when using the reported density. Do not pipette from the container. Do not return removed aliquots to container.

- For more information, visit www.inorganicventures.com/TCT

8.0 HAZARDOUS INFORMATION

- Please refer to the Safety Data Sheet for information regarding this CRM/RM.

9.0 HOMOGENEITY

- This solution was mixed according to an in-house procedure and is guaranteed to be homogeneous. Homogeneity data indicate that the end user should take a minimum sample size of 0.2 mL to assure homogeneity.

11.0 CERTIFICATION, LOT EXPIRATION AND PERIOD OF VALIDITY

11.1 Certification Issue Date

January 08, 2021

- The certification is valid within the measurement uncertainty specified provided the CRM/RM is stored and handled in accordance with instructions given in Sec 7.1. This certification is nullified if instructions in Sec 7.1 are not followed or if the CRM/RM is damaged, contaminated, or otherwise modified.

11.2 Lot Expiration Date

- January 08, 2025

- The date after which this CRM/RM should not be used.

- The lot expiration date reflects the period of time that the stability of a CRM/RM can be supported by long term stability studies conducted on properly stored and handled CRM/RMs. Lot expiration is limited primarily by transpiration (loss of water from the solution) and infrequently by chemical stability.

11.3 Period of Validity

- Sealed TCT Bag Open Date: _____

- This CRM/RM should not be used longer than one year (or six months in the case of a 30 mL bottle) from the date of opening the aluminized bag or after the date given in Sec. 11.2, whichever comes first. This is contingent upon the CRM/RM being stored and handled in accordance with the instructions given in Sec. 7.1.

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and/or certified under a quality management system that is registered/accredited to **ISO 9001**, **ISO 17034**, and **ISO/IEC 17025**. This CRM was prepared to a nominal concentration of 1000 µg/mL by gravimetric methods using 99.999% pure arsenic (As) metal. The solution was diluted with filtered (0.22 µm), 18 M-ohm deionized water and stabilized with the appropriate high-purity acid as indicated in the listed matrix. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentration and uncertainty were determined using the "High Performance ICP-OES" protocol developed by NIST, and both the certified concentration and uncertainty values are traceable to **NIST SRM 3103a, lot #100818**. The uncertainty associated with the certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Indicative Values: ICP-MS was used to determine trace metal concentrations for this product (nd = not determined).

Instructions for Use: We recommend that the solution be thoroughly mixed by repeated shaking or swirling of the bottle immediately prior to use. To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

Single-Element Aqueous CRM

Product #: S4400-1000121

Chromium (Cr) – 1000 µg/mL

Lot #: 1123848-53

Matrix: 2% HNO_3

Element	Certified Concentration & Uncertainty
Cr	1003 ± 5 µg/mL (w/v)
	995.0 ± 5.0 µg/g (w/w)

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and/or certified under a quality management system that is registered/accredited to **ISO 17034, ISO/IEC 17025 and ISO 9001**. This CRM was prepared to a nominal concentration of 1000 µg/mL by gravimetric methods using 99.996% pure chromium (Cr). The solution was diluted with filtered (0.22um), 18 M-ohm water and stabilized with the appropriate high-purity acid as indicated in the listed matrix. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentration and uncertainty were determined using the "High Performance ICP-OES" protocol developed by NIST, and both the certified concentration and uncertainty values are traceable to **NIST SRM 3112a, lot #170630**. The uncertainty associated with the certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Indicative Values: ICP-MS was used to determine trace metal concentrations for this product (nd = not determined).

Instructions for Use: We recommend that the solution be thoroughly mixed by repeated shaking or swirling of the bottle immediately prior to use. To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

Single-Element Aqueous CRM

Product #: S4400-10M311

Magnesium (Mg) – 10,000 µg/mL

Lot #: 1075232-33

Matrix: 4% HNO_3

Element	Certified Concentration & Uncertainty
Mg	9902 ± 42 µg/mL (w/v)
	9424 ± 40 µg/g (w/w)

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and/or certified under a quality management system that is registered/accredited to **ISO 17034, ISO/IEC 17025 and ISO 9001**. This CRM was prepared to a nominal concentration of 10,000 µg/mL by gravimetric methods using 99.999% pure magnesium nitrate [$Mg(NO_3)_2$]. The solution was diluted with filtered (0.22um), 18 M-ohm water and stabilized with the appropriate high-purity acid as indicated in the listed matrix. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentration and uncertainty were determined using the "High Performance ICP-OES" protocol developed by NIST, and both the certified concentration and uncertainty values are traceable to **NIST SRM 3131a, lot #140110**. The uncertainty associated with the certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Indicative Values: ICP-MS was used to determine trace metal concentrations for this product (nd = not determined).

Instructions for Use: We recommend that the solution be thoroughly mixed by repeated shaking or swirling of the bottle immediately prior to use. To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

Packaging, Storage, Instructions For Use

Store tightly capped at room temperature (15-30°C).

This certified reference material (CRM) is packaged in low density polyethylene. Small aliquots should be poured out of the bottle rather than directly pipetted out of bottle in order to prevent contamination or premature degradation. A 1 mL sample size is recommended. Smaller sample volumes may negatively affect estimated uncertainty.

Traceability Information

Analyte Source Materials: The highest purity analyte source materials are used in the manufacture of this CRM. The actual purity is referenced above. Analyte source material purity and associated uncertainty has been analytically verified against appropriate NIST SRMs, if available.

Method: Certified concentration confirmed by ICP against NIST SRM # 3136 with n=5.

Balance: All analytical balances are calibrated on a semiannual basis by an ISO 17025 accredited calibration laboratory and are traceable to NIST. Traceable Calibration Certificate available upon request.

All balances are checked daily by an in-house standard operating procedure. The weights used for this daily verification are calibrated annually by an ISO 17025 accredited calibration laboratory and are certified traceable to NIST. Certificate of Calibration and Traceability available upon request.

Thermometer: All thermometers are NIST traceable through thermometers that are calibrated annually by an ISO 17025 accredited calibration laboratory.

Glassware: All glassware used in the manufacture of our CRMs is Class A. An in-house standard operating procedure is used to verify all glassware prior to it being placed into service. Volumetric pipetors are calibrated every four months by an ISO 17025 accredited calibration laboratory.

Uncertainty

The ± uncertainty associated with the certified concentration is the expanded uncertainty at 95% confidence interval (CI) with K=2. This expanded uncertainty incorporates contributions from manufacturing, homogeneity, and stability.

Homogeneity

This CRM was thoroughly mixed in production. Batch homogeneity was established through analysis of samples chosen at random. A minimum 1 mL sample size is recommended.

Stability/Expiration

The stability of this CRM is based on short-term and long-term monitoring of the certified concentration. The expiration date is guaranteed to be valid from the manufacture date and is based on results of long-term monitoring.

Single-Element Aqueous CRM

Product #: S4400-1000511

Silver (Ag) – 1000 µg/mL

Lot #: 1106123-69

Matrix: 2% HNO_3

Element	Certified Concentration & Uncertainty
Ag	1009 ± 5 µg/mL (w/v)
	1001 ± 4 µg/g (w/w)

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and/or certified under a quality management system that is registered/accredited to **ISO 9001**, **ISO 17034**, and **ISO/IEC 17025**. This CRM was prepared to a nominal concentration of 1000 µg/mL by gravimetric methods using 99.999% pure silver (Ag) metal dissolved in high purity nitric acid (HNO_3) and diluted with filtered (0.22 µm), 18 M-ohm deionized water. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentration and uncertainty were determined using the "High Performance ICP-OES" protocol developed by NIST, and both the certified concentration and uncertainty values are traceable to **NIST SRM 3151, lot #160729**. The uncertainty associated with the certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Indicative Values: ICP-MS was used to determine trace metal concentrations for this product (nd = not determined).

Instructions for Use: We recommend that the solution be thoroughly mixed by repeated shaking or swirling of the bottle immediately prior to use. To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

Single-Element Aqueous CRM

Product #: S4400-1000641

Uranium (U) – 1000 µg/mL

Lot #: 1112440-15

Matrix: 2% HNO_3

Rec 2/7/22 TH

Element	Certified Concentration & Uncertainty
U	996.0 ± 5.0 µg/mL (w/v)
	990.0 ± 5.0 µg/g (w/w)

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and/or certified under a quality management system that is registered/accredited to **ISO 17034**, **ISO/IEC 17025 and ISO 9001**. This CRM was prepared to a nominal concentration of 1000 µg/mL by gravimetric methods using 99.99% Uranyl (VI) Nitrate Hexahydrate [$UO_2(NO_3)_2{\cdot}6H_2O$]. The solution was diluted with filtered (0.22um), 18 M-ohm water and stabilized with the appropriate high-purity acid as indicated in the listed matrix. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentration and uncertainty were determined using the "High Performance ICP-OES" protocol developed by NIST, and both the certified concentration and uncertainty values are traceable to **NIST SRM 3164**. The uncertainty associated with the certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Indicative Values: ICP-MS was used to determine trace metal concentrations for this product (nd = not determined).

To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

Single-Element Aqueous CRM

Product #: 4400-10PPM331-100

Mercury (Hg) – 10.0 µg/mL

Lot #: 1082269-9

Matrix: 2% HNO_3

Element	Certified Concentration & Uncertainty
Hg	10.00 ± 0.10 µg/mL (w/v)
	9.933 ± 0.100 µg/g (w/w)

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and/or certified under a quality management system that is registered/accredited to **ISO 17034, ISO/IEC 17025 and ISO 9001**. This CRM was prepared to a nominal concentration of 10.0 µg/mL by gravimetric methods using single-element concentrate. The solution was diluted with filtered (0.22um), 18 M-ohm water and stabilized with the appropriate high-purity acid as indicated in the listed matrix. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentration and uncertainty were determined using the "High Performance ICP-OES" protocol developed by NIST, and both the certified concentration and uncertainty values are traceable to **NIST SRM 3133, lot #160921**. The uncertainty associated with the certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Indicative Values: ICP-MS was used to determine trace metal concentrations for this product (nd = not determined).

Instructions for Use: We recommend that the solution be thoroughly mixed by repeated shaking or swirling of the bottle immediately prior to use. To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

1. The **Certified Concentration** is the actual made-to concentration confirmed by ERA analytical verification.

2. The stated **Uncertainty** is the total propagated uncertainty at the 95% confidence interval. The uncertainty is based on the preparation of the product and includes uncertainty related to the starting material used and the volumetric and gravimetric measurements made. The method of calculating uncertainty is taken from the ISO Guide to the Expression of Uncertainty in Measurement (current version). The uncertainty applies to the product as supplied and does not take into account any required or optional dilutions and/or preparations the laboratory may perform while using this product.

3. Traceability Recovery = ((% Recovery certified standard)/(% Recovery NIST SRM))*100.

   The traceability data shown were compiled by analyzing the ERA standards or their associated stock solutions against the applicable NIST SRMs.

This standard **expires 01/15/2024**. The certified values are monitored and purchasers will be notified of any significant changes resulting in recertification or withdrawal of this certified reference material during the period of validity of this certificate.

This product is intended to be used as either a calibration standard or a quality control check of the entire analytical process for the analytes/matrix included in the standard.

METHOD SW6020A
DISSOLVED METALS BY ICP-MS

A total of eight(8) water samples were received on 06/16/22 to be analyzed for Dissolved Metals by ICP-MS in accordance with Method SW6020A and project specific requirements.

Holding Time
Samples were digested and analyzed within the prescribed holding time.

Calibration
Initial Calibration was established as prescribed by the method and was verified using a secondary source(ICV). Interference checks were performed and results were within required limits. Continuing calibration verifications and continuing calibration blanks were carried out at the frequency specified by the project. All calibration requirements were satisfied.

CASE NARRATIVE

Client : ARCADIS

Project: PG&E TOPOCK-GMP

SDG : 22F146

METHOD SW6020A
DISSOLVED METALS BY ICP-MS

A total of eight(8) water samples were received on 06/16/22 to be analyzed for Dissolved Metals by ICP-MS in accordance with Method SW6020A and project specific requirements.

Holding Time
Samples were digested and analyzed within the prescribed holding time.

Calibration
Initial Calibration was established as prescribed by the method and was verified using a secondary source(ICV). Interference checks were performed and results were within required limits. Continuing calibration verifications and continuing calibration blanks were carried out at the frequency specified by the project. All calibration requirements were satisfied.

Method Blank
Method blank was prepared and analyzed at the frequency required by the project. For this SDG, one(1) method blank was analyzed. IMF024WB - result was compliant to project requirement. Refer to sample result summary form for details.

Lab Control Sample
Lab control sample was prepared and analyzed at a frequency required by the project. For this SDG, one(1) set of LCS/LCD was analyzed. IMF024WL/IMF024WC were within LCS limits. Refer to LCS summary form for details.

Matrix QC Sample
No matrix QC sample was provided on this SDG.

Sample Analysis
Samples were analyzed according to prescribed analytical procedures. Results were evaluated in accordance to project requirements. For this SDG, all quality control requirements were met. Samples analyzed at dilution due to high saturation.

Assay Information:

Assay Method #1 **1002 ± 4 µg/mL**
ICP Assay NIST SRM 3121 Lot Number: 991806

Assay Method #2 **1001 ± 5 µg/mL**

- The Calculated Value is a value calculated from the weight of a starting material that has been certified directly vs. a National Institute of Standards and Technology (NIST) SRM/RM. See Sec 4.2 for balance traceability.

The following equations are used in the calculation of the certified value and the uncertainty. Reported uncertainties represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of k = 2.

exp. 07|20|2022 W

Characterization of CRM/RM by Two or More Methods

Certified Value, $X_{CRM/RM}$, where two or more methods of characterization are used is the weighted mean of the results:

$X_{CRM/RM} = \Sigma(w_i)(X_i)$

X_i = mean of Assay Method i with standard uncertainty $u_{char\ i}$

w_i = the weighting factors for each method calculated using the inverse square of the variance:

$w_i = (1/u_{char\ i})^2 / (\Sigma(1/(u_{char\ i})^2)$

CRM/RM Expanded Uncertainty (±) = $U_{CRM/RM} = k\,(u^2_{char} + u^2_{bb} + u^2_{lts} + u^2_{ts})^{½}$

k = coverage factor = 2

$u_{char} = [\Sigma((w_i)^2 (u_{char\ i})^2)]^{½}$ where $u_{char\ i}$ are the errors from each characterization method

u_{bb} = bottle to bottle homogeneity standard uncertainty

u_{lts} = long term stability standard uncertainty (storage)

u_{ts} = transport stability standard uncertainty

Characterization of CRM/RM by One Method

Certified Value, $X_{CRM/RM}$, where one method of characterization is used is the mean of individual results:

$X_{CRM/RM} = (X_a)\,(u_{char\ a})$

X_a = mean of Assay Method A with

$u_{char\ a}$ = the standard uncertainty of characterization Method A

CRM/RM Expanded Uncertainty (±) = $U_{CRM/RM} = k\,(u^2_{char\ a} + u^2_{bb} + u^2_{lts} + u^2_{ts})^{½}$

k = coverage factor = 2

$u_{char\ a}$ = the errors from characterization

u_{bb} = bottle to bottle homogeneity standard uncertainty

u_{lts} = long term stability standard uncertainty (storage)

u_{ts} = transport stability standard uncertainty

4.0 TRACEABILITY TO NIST

- This product is traceable to NIST via an unbroken chain of comparisons. The uncertainties for each certified value are reported, taking into account the SRM/RM uncertainty error and the measurement, weighing and volume dilution errors. In rare cases where no NIST SRM/RM are available, the term 'in-house std.' is specified.

4.1 Thermometer Calibration

- All thermometers are NIST traceable through thermometers that are calibrated by an accredited calibration laboratory.

4.2 Balance Calibration

- All analytical balances are calibrated by an accredited calibration laboratory and procedure. The weights used for testing are annually compared to master weights and are traceable to NIST.

4.3 Glassware Calibration

- An in-house procedure is used to calibrate all Class A glassware used in the manufacturing and quality control of CRM/RMs.

5.0 TRACE METALLIC IMPURITIES (TMI) DETERMINED BY ICP-MS AND ICP-OES (µg/mL)

CRM/RMs are tested for trace metallic impurities by Axial ICP-OES and ICP-MS. The result from the most sensitive method for each element, is reported below. Solutions tested by ICP-MS were analyzed in an ULPA-Filtered Clean Room. An ULPA-Filter is 99.9985% efficient for the removal of particles down to 0.3 µm.

6.0 INTENDED USE

- For the calibration of analytical instruments and validation of analytical methods as appropriate.

7.0 INSTRUCTIONS FOR THE CORRECT USE OF THIS REFERENCE MATERIAL

7.1 Storage and Handling Recommendations

- Store between approximately 4° - 30° C while in sealed TCT bag.

- While stored in the sealed TCT bag, transpiration of this CRM/RM is negligible. After opening the sealed TCT bag transpiration of the CRM/RM will occur, resulting in a gradual increase in the analyte concentration(s). It is the responsibility of the user to account for this effect. When the bottle is weighed both before and after being placed in storage, the mass difference observed will be a measure of transpiration mass loss.

- After opening the sealed TCT bag, keep cap tightly sealed when not in use and store between 4° - 24° C to minimize the effects of transpiration. Use at 20° ± 4° C to minimize volumetric dilution error when using the reported density. Do not pipette from the container. Do not return removed aliquots to container.

- For more information, visit www.inorganicventures.com/TCT

- The Calculated Value is a value calculated from the weight of a starting material that has been certified directly vs. a National Institute of Standards and Technology (NIST) SRM/RM. See Sec 4.2 for balance traceability.

The following equations are used in the calculation of the certified value and the uncertainty. Reported uncertainties represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of k = 2.

Characterization of CRM/RM by Two or More Methods

Certified Value, $X_{CRM/RM}$, where two or more methods of characterization are used is the weighted mean of the results:

$X_{CRM/RM} = \Sigma(w_i)(X_i)$

X_i = mean of Assay Method i with standard uncertainty $u_{char\ i}$

w_i = the weighting factors for each method calculated using the inverse square of the variance:

$w_i = (1/u_{char\ i})^2 / (\Sigma(1/(u_{char\ i})^2)$

CRM/RM Expanded Uncertainty (±) = $U_{CRM/RM} = k\,(u^2_{char} + u^2_{bb} + u^2_{lts} + u^2_{ts})^{½}$

k = coverage factor = 2

$u_{char} = [\Sigma((w_i)^2\,(u_{char\ i})^2)]^{½}$ where $u_{char\ i}$ are the errors from each characterization method

u_{bb} = bottle to bottle homogeneity standard uncertainty

u_{lts} = long term stability standard uncertainty (storage)

u_{ts} = transport stability standard uncertainty

Characterization of CRM/RM by One Method

Certified Value, $X_{CRM/RM}$, where one method of characterization is used is the mean of individual results:

$X_{CRM/RM} = (X_a)\,(u_{char\ a})$

X_a = mean of Assay Method A with

$u_{char\ a}$ = the standard uncertainty of characterization Method A

CRM/RM Expanded Uncertainty (±) = $U_{CRM/RM} = k\,(u^2_{char\ a} + u^2_{bb} + u^2_{lts} + u^2_{ts})^{½}$

k = coverage factor = 2

$u_{char\ a}$ = the errors from characterization

u_{bb} = bottle to bottle homogeneity standard uncertainty

u_{lts} = long term stability standard uncertainty (storage)

u_{ts} = transport stability standard uncertainty

4.0 TRACEABILITY TO NIST

- This product is traceable to NIST via an unbroken chain of comparisons. The uncertainties for each certified value are reported, taking into account the SRM/RM uncertainty error and the measurement, weighing and volume dilution errors. In rare cases where no NIST SRM/RM are available, the term 'in-house std.' is specified.

4.1 Thermometer Calibration

- All thermometers are NIST traceable through thermometers that are calibrated by an accredited calibration laboratory.

4.2 Balance Calibration

- All analytical balances are calibrated by an accredited calibration laboratory and procedure. The weights used for testing are annually compared to master weights and are traceable to NIST.

4.3 Glassware Calibration

- An in-house procedure is used to calibrate all Class A glassware used in the manufacturing and quality control of CRM/RMs.

5.0 TRACE METALLIC IMPURITIES (TMI) DETERMINED BY ICP-MS AND ICP-OES (µg/mL)

CRM/RMs are tested for trace metallic impurities by Axial ICP-OES and ICP-MS. The result from the most sensitive method for each element, is reported below. Solutions tested by ICP-MS were analyzed in an ULPA-Filtered Clean Room. An ULPA-Filter is 99.9985% efficient for the removal of particles down to 0.3 µm.

6.0 INTENDED USE

- For the calibration of analytical instruments and validation of analytical methods as appropriate.

7.0 INSTRUCTIONS FOR THE CORRECT USE OF THIS REFERENCE MATERIAL

7.1 Storage and Handling Recommendations

- Store between approximately 4° - 30° C while in sealed TCT bag.

- While stored in the sealed TCT bag, transpiration of this CRM/RM is negligible. After opening the sealed TCT bag transpiration of the CRM/RM will occur, resulting in a gradual increase in the analyte concentration(s). It is the responsibility of the user to account for this effect. When the bottle is weighed both before and after being placed in storage, the mass difference observed will be a measure of transpiration mass loss.

- After opening the sealed TCT bag, keep cap tightly sealed when not in use and store between 4° - 24° C to minimize the effects of transpiration. Use at 20° ± 4° C to minimize volumetric dilution error when using the reported density. Do not pipette from the container. Do not return removed aliquots to container.

- For more information, visit **www.inorganicventures.com/TCT**

11.0 CERTIFICATION, LOT EXPIRATION AND PERIOD OF VALIDITY

11.1 Certification Issue Date

July 04, 2021

- The certification is valid within the measurement uncertainty specified provided the CRM/RM is stored and handled in accordance with instructions given in Sec 7.1. This certification is nullified if instructions in Sec 7.1 are not followed or if the CRM/RM is damaged, contaminated, or otherwise modified.

11.2 Lot Expiration Date

- July 04, 2025

- The date after which this CRM/RM should not be used.

- The lot expiration date reflects the period of time that the stability of a CRM/RM can be supported by long term stability studies conducted on properly stored and handled CRM/RMs. Lot expiration is limited primarily by transpiration (loss of water from the solution) and infrequently by chemical stability.

11.3 Period of Validity

- Sealed TCT Bag Open Date: _____

- This CRM/RM should not be used longer than one year (or six months in the case of a 30 mL bottle) from the date of opening the aluminized bag or after the date given in Sec. 11.2, whichever comes first. This is contingent upon the CRM/RM being stored and handled in accordance with the instructions given in Sec. 7.1.

The following equations are used in the calculation of the certified value and the uncertainty. Reported uncertainties represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of k = 2.

Characterization of CRM/RM by Two or More Methods

Certified Value, $X_{CRM/RM}$, where two or more methods of characterization are used is the weighted mean of the results:

$X_{CRM/RM} = \Sigma(w_i)(X_i)$

X_i = mean of Assay Method i with standard uncertainty $u_{char\ i}$

w_i = the weighting factors for each method calculated using the inverse square of the variance:

$w_i = (1/u_{char\ i})^2 / (\Sigma(1/(u_{char\ i})^2)$

CRM/RM Expanded Uncertainty (±) = $U_{CRM/RM} = k\,(u^2_{char} + u^2_{bb} + u^2_{lts} + u^2_{ts})^{1/2}$

k = coverage factor = 2

$u_{char} = [\Sigma((w_i)^2 (u_{char\ i})^2)]^{1/2}$ where $u_{char\ i}$ are the errors from each characterization method

u_{bb} = bottle to bottle homogeneity standard uncertainty

u_{lts} = long term stability standard uncertainty (storage)

u_{ts} = transport stability standard uncertainty

Characterization of CRM/RM by One Method

Certified Value, $X_{CRM/RM}$, where one method of characterization is used is the mean of individual results:

$X_{CRM/RM} = (X_a)(u_{char\ a})$

X_a = mean of Assay Method A with

$u_{char\ a}$ = the standard uncertainty of characterization Method A

CRM/RM Expanded Uncertainty (±) = $U_{CRM/RM} = k\,(u^2_{char\ a} + u^2_{bb} + u^2_{lts} + u^2_{ts})^{1/2}$

k = coverage factor = 2

$u_{char\ a}$ = the errors from characterization

u_{bb} = bottle to bottle homogeneity standard uncertainty

u_{lts} = long term stability standard uncertainty (storage)

u_{ts} = transport stability standard uncertainty

4.0 TRACEABILITY TO NIST

- This product is traceable to NIST via an unbroken chain of comparisons. The uncertainties for each certified value are reported, taking into account the SRM/RM uncertainty error and the measurement, weighing and volume dilution errors. In rare cases where no NIST SRM/RM are available, the term 'in-house std.' is specified.

4.1 Thermometer Calibration

- All thermometers are NIST traceable through thermometers that are calibrated by an accredited calibration laboratory.

4.2 Balance Calibration

- All analytical balances are calibrated by an accredited calibration laboratory and procedure. The weights used for testing are annually compared to master weights and are traceable to NIST.

4.3 Glassware Calibration

- An in-house procedure is used to calibrate all Class A glassware used in the manufacturing and quality control of CRM/RMs.

5.0 TRACE METALLIC IMPURITIES (TMI) DETERMINED BY ICP-MS AND ICP-OES (µg/mL)

CRM/RMs are tested for trace metallic impurities by Axial ICP-OES and ICP-MS. The result from the most sensitive method for each element, is reported below. Solutions tested by ICP-MS were analyzed in an ULPA-Filtered Clean Room. An ULPA-Filter is 99.9985% efficient for the removal of particles down to 0.3 µm.

6.0 INTENDED USE

- For the calibration of analytical instruments and validation of analytical methods as appropriate.

7.0 INSTRUCTIONS FOR THE CORRECT USE OF THIS REFERENCE MATERIAL

7.1 Storage and Handling Recommendations

- Store between approximately 4° - 30° C while in sealed TCT bag.

- While stored in the sealed TCT bag, transpiration of this CRM/RM is negligible. After opening the sealed TCT bag transpiration of the CRM/RM will occur, resulting in a gradual increase in the analyte concentration(s). It is the responsibility of the user to account for this effect. When the bottle is weighed both before and after being placed in storage, the mass difference observed will be a measure of transpiration mass loss.

- After opening the sealed TCT bag, keep cap tightly sealed when not in use and store between 4° - 24° C to minimize the effects of transpiration. Use at 20° ± 4° C to minimize volumetric dilution error when using the reported density. Do not pipette from the container. Do not return removed aliquots to container.

- For more information, visit www.inorganicventures.com/TCT

8.0 HAZARDOUS INFORMATION

- Please refer to the Safety Data Sheet for information regarding this CRM/RM.

9.0 HOMOGENEITY

- This solution was mixed according to an in-house procedure and is guaranteed to be homogeneous. Homogeneity data indicate that the end user should take a minimum sample size of 0.2 mL to assure homogeneity.

11.0 CERTIFICATION, LOT EXPIRATION AND PERIOD OF VALIDITY

11.1 Certification Issue Date

January 08, 2021

- The certification is valid within the measurement uncertainty specified provided the CRM/RM is stored and handled in accordance with instructions given in Sec 7.1. This certification is nullified if instructions in Sec 7.1 are not followed or if the CRM/RM is damaged, contaminated, or otherwise modified.

11.2 Lot Expiration Date

- January 08, 2025

- The date after which this CRM/RM should not be used.

- The lot expiration date reflects the period of time that the stability of a CRM/RM can be supported by long term stability studies conducted on properly stored and handled CRM/RMs. Lot expiration is limited primarily by transpiration (loss of water from the solution) and infrequently by chemical stability.

11.3 Period of Validity

- Sealed TCT Bag Open Date: _____

- This CRM/RM should not be used longer than one year (or six months in the case of a 30 mL bottle) from the date of opening the aluminized bag or after the date given in Sec. 11.2, whichever comes first. This is contingent upon the CRM/RM being stored and handled in accordance with the instructions given in Sec. 7.1.

Certification & Traceability: This CRM was manufactured, processed, and/or certified under a quality management system that is registered/accredited to **ISO 9001**, **ISO 17034**, and **ISO/IEC 17025**. This CRM was prepared to a nominal concentration of 1000 µg/mL by gravimetric methods using 99.999% pure arsenic (As) metal. The solution was diluted with filtered (0.22 µm), 18 M-ohm deionized water and stabilized with the appropriate high-purity acid as indicated in the listed matrix. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentration and uncertainty were determined using the "High Performance ICP-OES" protocol developed by NIST, and both the certified concentration and uncertainty values are traceable to **NIST SRM 3103a, lot #100818**. The uncertainty associated with the certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Indicative Values: ICP-MS was used to determine trace metal concentrations for this product (nd = not determined).

Instructions for Use: We recommend that the solution be thoroughly mixed by repeated shaking or swirling of the bottle immediately prior to use. To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

Single-Element Aqueous CRM

Product #: S4400-1000121

Chromium (Cr) – 1000 µg/mL

Lot #: 1123848-53

Matrix: 2% HNO_3

Element	Certified Concentration & Uncertainty
Cr	1003 ± 5 µg/mL (w/v)
	995.0 ± 5.0 µg/g (w/w)

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and/or certified under a quality management system that is registered/accredited to **ISO 17034, ISO/IEC 17025 and ISO 9001**. This CRM was prepared to a nominal concentration of 1000 µg/mL by gravimetric methods using 99.996% pure chromium (Cr). The solution was diluted with filtered (0.22um), 18 M-ohm water and stabilized with the appropriate high-purity acid as indicated in the listed matrix. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentration and uncertainty were determined using the "High Performance ICP-OES" protocol developed by NIST, and both the certified concentration and uncertainty values are traceable to **NIST SRM 3112a, lot #170630**. The uncertainty associated with the certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Indicative Values: ICP-MS was used to determine trace metal concentrations for this product (nd = not determined).

Instructions for Use: We recommend that the solution be thoroughly mixed by repeated shaking or swirling of the bottle immediately prior to use. To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

Single-Element Aqueous CRM

Product #: S4400-10M311

Magnesium (Mg) – 10,000 µg/mL

Lot #: 1075232-33

Matrix: 4% HNO_3

Element	Certified Concentration & Uncertainty
Mg	9902 ± 42 µg/mL (w/v)
	9424 ± 40 µg/g (w/w)

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and/or certified under a quality management system that is registered/accredited to **ISO 17034, ISO/IEC 17025 and ISO 9001**. This CRM was prepared to a nominal concentration of 10,000 µg/mL by gravimetric methods using 99.999% pure magnesium nitrate [$Mg(NO_3)_2$]. The solution was diluted with filtered (0.22um), 18 M-ohm water and stabilized with the appropriate high-purity acid as indicated in the listed matrix. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentration and uncertainty were determined using the "High Performance ICP-OES" protocol developed by NIST, and both the certified concentration and uncertainty values are traceable to **NIST SRM 3131a, lot #140110**. The uncertainty associated with the certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Indicative Values: ICP-MS was used to determine trace metal concentrations for this product (nd = not determined).

Instructions for Use: We recommend that the solution be thoroughly mixed by repeated shaking or swirling of the bottle immediately prior to use. To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

Packaging, Storage, Instructions For Use

Store tightly capped at room temperature (15-30°C).

This certified reference material (CRM) is packaged in low density polyethylene. Small aliquots should be poured out of the bottle rather than directly pipetted out of bottle in order to prevent contamination or premature degradation. A 1 mL sample size is recommended. Smaller sample volumes may negatively affect estimated uncertainty.

Traceability Information

Analyte Source Materials: The highest purity analyte source materials are used in the manufacture of this CRM. The actual purity is referenced above. Analyte source material purity and associated uncertainty has been analytically verified against appropriate NIST SRMs, if available.

Method: Certified concentration confirmed by ICP against NIST SRM # 3136 with n=5.

Balance: All analytical balances are calibrated on a semiannual basis by an ISO 17025 accredited calibration laboratory and are traceable to NIST. Traceable Calibration Certificate available upon request.

All balances are checked daily by an in-house standard operating procedure. The weights used for this daily verification are calibrated annually by an ISO 17025 accredited calibration laboratory and are certified traceable to NIST. Certificate of Calibration and Traceability available upon request.

Thermometer: All thermometers are NIST traceable through thermometers that are calibrated annually by an ISO 17025 accredited calibration laboratory.

Glassware: All glassware used in the manufacture of our CRMs is Class A. An in-house standard operating procedure is used to verify all glassware prior to it being placed into service. Volumetric pipetors are calibrated every four months by an ISO 17025 accredited calibration laboratory.

Uncertainty

The ± uncertainty associated with the certified concentration is the expanded uncertainty at 95% confidence interval (CI) with K=2. This expanded uncertainty incorporates contributions from manufacturing, homogeneity, and stability.

Homogeneity

This CRM was thoroughly mixed in production. Batch homogeneity was established through analysis of samples chosen at random. A minimum 1 mL sample size is recommended.

Stability/Expiration

The stability of this CRM is based on short-term and long-term monitoring of the certified concentration. The expiration date is guaranteed to be valid from the manufacture date and is based on results of long-term monitoring.

Product #: S4400-1000511

Silver (Ag) – 1000 µg/mL

Lot #: 1106123-69

Matrix: 2% HNO_3

Element	Certified Concentration & Uncertainty
Ag	1009 ± 5 µg/mL (w/v)
	1001 ± 4 µg/g (w/w)

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and/or certified under a quality management system that is registered/accredited to **ISO 9001**, **ISO 17034**, and **ISO/IEC 17025**. This CRM was prepared to a nominal concentration of 1000 µg/mL by gravimetric methods using 99.999% pure silver (Ag) metal dissolved in high purity nitric acid (HNO_3) and diluted with filtered (0.22 µm), 18 M-ohm deionized water. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentration and uncertainty were determined using the "High Performance ICP-OES" protocol developed by NIST, and both the certified concentration and uncertainty values are traceable to **NIST SRM 3151, lot #160729**. The uncertainty associated with the certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Indicative Values: ICP-MS was used to determine trace metal concentrations for this product (nd = not determined).

Instructions for Use: We recommend that the solution be thoroughly mixed by repeated shaking or swirling of the bottle immediately prior to use. To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

Single-Element Aqueous CRM

Product #: S4400-1000641

Uranium (U) – 1000 µg/mL

Lot #: 1112440-15

Matrix: 2% HNO_3

Rec 2/7/22 TH

Element	Certified Concentration & Uncertainty
U	996.0 ± 5.0 µg/mL (w/v)
	990.0 ± 5.0 µg/g (w/w)

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and/or certified under a quality management system that is registered/accredited to **ISO 17034**, **ISO/IEC 17025 and ISO 9001**. This CRM was prepared to a nominal concentration of 1000 µg/mL by gravimetric methods using 99.99% Uranyl (VI) Nitrate Hexahydrate [$UO_2(NO_3)_2{\cdot}6H_2O$]. The solution was diluted with filtered (0.22um), 18 M-ohm water and stabilized with the appropriate high-purity acid as indicated in the listed matrix. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentration and uncertainty were determined using the "High Performance ICP-OES" protocol developed by NIST, and both the certified concentration and uncertainty values are traceable to **NIST SRM 3164**. The uncertainty associated with the certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Indicative Values: ICP-MS was used to determine trace metal concentrations for this product (nd = not determined).

To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

Single-Element Aqueous CRM

Product #: 4400-10PPM331-100

Mercury (Hg) – 10.0 µg/mL

Lot #: 1082269-9

Matrix: 2% HNO_3

Element	Certified Concentration & Uncertainty
Hg	10.00 ± 0.10 µg/mL (w/v)
	9.933 ± 0.100 µg/g (w/w)

Intended Use: This solution is intended for use as a certified reference material (CRM) or calibration standard for inductively coupled plasma optical emission spectroscopy (ICP-OES), inductively coupled plasma mass spectrometry (ICP-MS), flame or furnace atomic absorption spectroscopy (AA or GFAA), and other techniques for elemental analysis.

Certification & Traceability: This CRM was manufactured, processed, and/or certified under a quality management system that is registered/accredited to **ISO 17034, ISO/IEC 17025 and ISO 9001**. This CRM was prepared to a nominal concentration of 10.0 µg/mL by gravimetric methods using single-element concentrate. The solution was diluted with filtered (0.22um), 18 M-ohm water and stabilized with the appropriate high-purity acid as indicated in the listed matrix. The balances used in the preparation of this CRM are calibrated regularly with traceability to NIST, using a calibration provider that is accredited to ISO/IEC 17025 by a mutually recognized accreditation body. All volumetric dilutions are performed in Class A calibrated glassware. The certified concentration and uncertainty were determined using the "High Performance ICP-OES" protocol developed by NIST, and both the certified concentration and uncertainty values are traceable to **NIST SRM 3133, lot #160921**. The uncertainty associated with the certified concentration represents the expanded uncertainty at the 95% confidence level using a coverage factor of k=2.

Indicative Values: ICP-MS was used to determine trace metal concentrations for this product (nd = not determined).

Instructions for Use: We recommend that the solution be thoroughly mixed by repeated shaking or swirling of the bottle immediately prior to use. To achieve the highest accuracy, the analyst should: (1) use only pre-cleaned containers and transferware, (2) not pipette directly from the CRM's original container, (3) never pour used product back into the original container, (4) make dilutions using calibrated balances or certified class A volumetric flasks and pipettes, (5) use a minimum sub-sample size of 500 µL, and (6) dilute with the same matrix as the original CRM or other chemically suitable matrix. The solution should be kept tightly capped and stored under normal laboratory conditions. Do not freeze, heat, or immerse the bottle or its contents, and avoid exposure to direct sunlight or moisture.

Period of Validity: CPI International ensures the accuracy of this solution for **18 months** from the certification date shown below, provided the instructions for use are followed. During the period of validity, the purchaser will be notified if this product is recalled due to any significant changes in the stability of the solution.

1. The **Certified Concentration** is the actual made-to concentration confirmed by ERA analytical verification.

2. The stated **Uncertainty** is the total propagated uncertainty at the 95% confidence interval. The uncertainty is based on the preparation of the product and includes uncertainty related to the starting material used and the volumetric and gravimetric measurements made. The method of calculating uncertainty is taken from the ISO Guide to the Expression of Uncertainty in Measurement (current version). The uncertainty applies to the product as supplied and does not take into account any required or optional dilutions and/or preparations the laboratory may perform while using this product.

3. Traceability Recovery = ((% Recovery certified standard)/(% Recovery NIST SRM))*100.

   The traceability data shown were compiled by analyzing the ERA standards or their associated stock solutions against the applicable NIST SRMs.

This standard **expires 01/15/2024**. The certified values are monitored and purchasers will be notified of any significant changes resulting in recertification or withdrawal of this certified reference material during the period of validity of this certificate.

This product is intended to be used as either a calibration standard or a quality control check of the entire analytical process for the analytes/matrix included in the standard.

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

All sample containers were received intact with proper chain of custody documentation.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Samples were analyzed within method holding time.

Analytical Comments for EPA 218.6:

Dilution was necessary for samples N050274-003 and -004 due to matrix interference. Samples were analyzed at lower dilution however matrix spike recovery and/or retention time criteria were not met indicating possible matrix interference. Samples were reported at dilution that meets matrix spike recovery limit and the detected peak within retention time window.

Analytical Comments for EPA 300.0:

Dilution was necessary due to precipitation of samples upon the addition of eluent.

Analytical Comments for EPA 6020_Dissolved:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria in QC samples N050274-005CMS and N050274-005CMSD since the analyte concentration in the sample is disproportionate to the spike level. Post Spike (PS) and Dilution Test (DT) were performed however, PS failed acceptance criteria. The associated Laboratory Control Sample (LCS) recovery was acceptable.

Analytical Comments for SM 5310C:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria in QC samples N050274-005DMS and N050274-005DMSD at lower dilutions possibly due to matrix interference. QC samples were diluted and recovery passed criteria. Thus sample reference N050274-005 and MS/MSD were reported at 20x dilution. The associated Laboratory Control Sample (LCS) recovery was acceptable.

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

All sample containers were received intact with proper chain of custody documentation.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Samples were analyzed within method holding time.

Analytical Comments for EPA 218.6:

Because the results for total dissolved chromium (260 ug/L) and hexavalent chromium (320 ug/L) for sample N050275-005 (IRZ-15-200-0422) are discrepant, sample re-analysis and Matrix Spike protocol were performed and result confirmed initial analysis.

Analytical Comments for EPA 300.0:

Dilution was necessary due to precipitation of samples upon the addition of eluent.

Analytical Comments for EPA 6010B_Total:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria for Iron in QC samples N050275-001D-MS and N050275-001D-MSD since the analyte concentration in the sample is disproportionate to the spike level. Post Spike (PS) and Dilution Test (DT) were performed however, PS failed acceptance criteria. The associated Laboratory Control Sample (LCS) recovery was acceptable.

Analytical Comments for EPA 6020_Dissolved:

Because the results for total dissolved chromium (260 ug/L) and hexavalent chromium (320 ug/L) for sample N050275-005 (IRZ-15-200-0422) are discrepant, sample from both the total dissolved chromium and hexavalent chromium containers were redigested and analyzed for total dissolved chromium. The results from the redigested samples were 277 and 285 ug/L, respectively. Since these data confirmed the original result for total dissolved chromium, the original result is reported.

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria for some analytes in QC samples N050274-005C-MS, N050274-005C-MSD, N050298-003CMS and N050298-003CMSD since the analyte concentration in the sample is disproportionate to the spike level. Post Spike (PS) and Dilution Test (DT) were performed however, PS failed acceptance criteria. The associated Laboratory Control Sample (LCS) recovery was acceptable.

Analytical Comments for SM 5310C:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria in QC samples N050274-005DMS/MSD at lower dilution possibly due to matrix interference. QC samples were diluted and recovery passed criteria. Thus sample reference N050274-005 and MS/MSD were reported at 20x dilution. The associated Laboratory Control Sample (LCS) recovery was acceptable.

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria in QC samples N050298-003DMS/MSD at lower dilution possibly due to matrix interference. QC samples were diluted and recovery passed criteria. Thus sample reference N050298-003 and MS/MSD were reported at 5x dilution. The associated Laboratory Control Sample (LCS) recovery was acceptable.

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

All sample containers were received intact with proper chain of custody documentation.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Samples were analyzed within method holding time.

Analytical Comments for SM 5310C:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria in QC samples N050298-003DMS/MSD at lower dilution possibly due to matrix interference. QC samples were diluted and recovery passed criteria. Thus sample reference N050298-003D and MS/MSD were reported at 5x dilution. The associated Laboratory Control Sample (LCS) recovery was acceptable.

Analytical Comments for EPA 6010B:

Matrix Spike (MS) is outside recovery for Iron in QC samples N050298-003CMS possibly due to matrix interference. Post Spike (PS) and Dilution Test (DT) were performed however, PS failed acceptance criteria. The associated Laboratory Control Sample (LCS) recovery was acceptable.

Analytical Comments for EPA 6020:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery for Barium in QC samples N050298-003CMS and N050298-003CMSD possibly due to matrix interference. Post Spike (PS) and Dilution Test (DT) were performed however, PS failed acceptance criteria. The associated Laboratory Control Sample (LCS) recovery was acceptable.

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

All sample containers were received intact with proper chain of custody documentation.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Samples were analyzed within method holding time.

Analytical Comments for EPA 6020:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) is outside recovery criteria for Chromium in QC samples N050322-001B-MS and N050322-001B-MSD since the analyte concentration in the sample is disproportionate to the spike level. Post Spike (PS) and Dilution Test (DT) were performed however, PS failed acceptance criteria. The associated Laboratory Control Sample (LCS) recovery was acceptable.

CASE NARRATIVE

SAMPLE RECEIVING/GENERAL COMMENTS:

All sample containers were received intact with proper chain of custody documentation.

Information on sample receipt conditions including discrepancies can be found in attached Sample Receipt Checklist Form.

Cooler temperature and sample preservation were verified upon receipt of samples if applicable.

Samples were analyzed within method holding time.

Analytical Comments for EPA 5310C:

Matrix Spike and Matrix Spike Duplicate (MSD) are outside recovery criteria in QC samples N050323-004DMS and N050323-004DMSD at several dilutions possibly due to matrix interference. QC samples were further diluted and recovery passed criteria. Thus sample reference N050323-004D and MS/MSD were reported at 5x dilution. The associated Laboratory Control Sample (LCS) recovery was acceptable.

Analytical Comments for EPA 6010B:

Sample N050323-007 was reported ND with dilution. Dilution was necessary due to associated internal standard not meeting method criteria possibly due to matrix interference.

Analytical Comments for EPA 6020:

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) are outside recovery criteria for Barium in QC samples N050298-003CMS and N050298-003CMSD possibly due to matrix interference. Post Spike (PS) and Dilution Test (DT) were performed however, PS failed acceptance criteria. The associated Laboratory Control Sample (LCS) recovery was acceptable.
