Results greater than the Interim Screening Level are circled.

--	not analyzed
ft bgs	feet below ground surface
ng/kg	nanograms per kilogram
DTSC-SL	DTSC Screening Levels
DTSC	California Department of Toxic Substances Control
FD	Field Dupliicate

J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
N	Primary Sample
NA	NA = not applicable
NE	not established
ND	not detected at the listed reporting limit
R	The result has been rejected; identification and/or quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample following a hold time of greater than one year).
USEPA	USEPA = United States Environmental Protection Agency

1 For individual dioxins and furans, selected value is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher. For TEQ values, selected value is the DTSC-SL.

2 United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

3 California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. JanuaryCalifornia Department of Toxic Substances Control (DTSC). 2017. Human Health Risk Assessment (HHRA) Note 2, Soil Remedial Goals for Dioxins and Dioxin-like Compounds for Consideration at California Hazardous Waste Sites. April.

4 ARCADIS. 2008. "Technical Memorandum 3: Ecological Comparison Values for Metals and Polycyclic Aromatic Hydrocarbons in Soil." May 28. ARCADIS. 2009. "Topock Compression Station - Final Technical Memorandum 4: Ecological Comparison Values for Additional Dectected Chemicals in Soil." July 1.

5 CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

Calculations:

TEQ = Sum of Result xToxic equivalency factor (TEF), 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.

TEQ Avian = Sum of Result x TEF, 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.

TEQMammals = Sum of Result x TEF, 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.

Teq Humans = Sum of Result x TEF, 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.

TABLE 3-5j

Constituent Concentrations in Soil Compared to Screening Values
AOC 9 – Southeast Fence Line
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
Pacific Gas and Electric Company Topock Compressor Station, Needles, California

Notes

All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background threshold value because it is greater than the respective screening level.
‡ Maxiumum Reporting Limit greater than or equal to the ISL

mg/kg	miligrams per kilogram
µg/kg	micrograms per kilogram
ng/kg	nanograms per kilogram
BK	Background Value
CSL	Commercial Screening Level
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
ISL	Interim Screening Level
NA	not applicable
ND	not detected in any of the samples
NE	not established
RSL	esidential screening level
RWQCB	Regional Water Quality Control Board
SL	screening level
USEPA	United States Environmental Protection Agency

1 CH2M HILL. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.) or ambient threshold value (CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

2 ARCADIS. 2008. "Technical Memorandum 3: Ecological Comparison Values for Metals and Polycyclic Aromatic Hydrocarbons in Soil." May 28. ARCADIS. 2009. "Topock Compression Station - Final Technical Memorandum 4: Ecological Comparison Values for Additional Detected Chemicals in Soil" July 1

3 Residential screening level - the lower of the residential DTSC-SL and USEPA regional screening level is used.

4 Water Board. 2016. “San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels, Table S-1: Soil Direct Exposure Human Health Screening Levels, Interim Final.” Febr

5 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used.

6 For metals, the ISL is background value. If background value is not available then the ISL is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value. For TPH, ISL is the RWQCB ESL. For dioxin/furan TEQ values, the ISL is the DTSC-SL unless the background value is higher. For all other analytes, ISL is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

7 Number of exceedences are the number of detections exceeding the background threshold value (BTV).

8 Number of exceedences are the number of detections that are equal to or exceeds the screening level (ecological comparison value, residential reporting limit, commercial reporting limit or interim screening level) or otherwise noted.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.
Results greater than the interim screening level are circled.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.
Results greater than the interim screening level are circled.

*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
B(a)P	Benzo (a) pyrene
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
N	primary sample
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is "R" qualified.
ND	not detected at the listed reporting limit
NE	not established
PAH	Polycyclic aromatic hydrocarbons
JR	The result has been rejected; identification and/quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample analyzed beyond the recommended hold time).
USEPA	United States Environmental Protection Agency

1 Selected value is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.
2 United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.
3 California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January.
4 ARCADIS. 2008. "Technical Memorandum 3: Ecological Comparison Values for Metals and Polycyclic Aromatic Hydrocarbons in Soil." May 28.
5 CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

Calculations:

B(a)P equivalent was calculated using relative potency factors for carcinogenic PAHs from U.S. Environmental Protection Agency. 1993. EPA's Provisional Guidance for Quantitative Risk Assessment of Polycyclic Aromatic Hydrocarbons. EPA 600/R-93-089. July.

Calculations of LMW-PAHs and HMW-PAHs were consistent with U.S. Environmental Protection Agency. 2007. Ecological Soil Screening Levels for Polycyclic Aromatic Hydrocarbons (PAHs) – Interim Final. OSWER Directive 9285.7-78. June.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the interim screening level are circled.

ϴ	white powder sample.
*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
meq/100g	milligrams per kilogram
mg/kg	milligrams per kilogram
mV	millivolts
ft bgs	feet below ground surface
µS/cm	microsiemens per centimeter
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
FD	field duplicate
J	concentration or reporting limit estimated by laboratory or data validation
N	primary sample
ND	not detected at the listed reporting limit
NE	not established
USEPA	United States Environmental Protection Agency

1 The selected value is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

2 United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the interim screening level are circled.

*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
FD	field duplicate
J	concentration or reporting limit estimated by laboratory or data validation
NE	not established
N	primary sample
ND	not detected at the listed reporting limit
USEPA	United States Environmental Protection Agency

[1] Selected value is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.
Results greater than the interim screening level are circled.

*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
FD	field duplicate
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
NE	not established
N	primary sample
ND	not detected at the listed reporting limit
ND	The result has been rejected; identification and/or quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample following a hold time of greater than one year).
USEPA	United States Environmental Protection Agency

1 Selected value is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

2 United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

3 California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January.

4 ARCADIS. 2008. "Technical Memorandum 3: Ecological Comparison Values for Metals and Polycyclic Aromatic Hydrocarbons in Soil." May 28. ARCADIS. 2009. "Topock Compression Station - Final Technical Memorandum 4: Ecological Comparison Values for Additional Dectected Chemicals in Soil." July 1.

5 Background values have not been established for polychlorinated biphenys.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.
Results greater than the Interim Screening Level are circled.

ϴ	white powder sample.
--	not analyzed
ft bgs	feet below ground surface
ng/kg	nanograms per kilogram
DTSC-SL	DTSC Screening Levels
DTSC	California Department of Toxic Substances Control
FD	Field Dupliicate
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
N	Primary Sample

TABLE 3-6i

Sample Results: Dioxins and Furans
AOC 10 – East Ravine
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

NA	NA = not applicable
NE	not established
ND	not detected at the listed reporting limit
R	The result has been rejected; identification and/or quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample following a hold time of greater than one year).
USEPA	USEPA = United States Environmental Protection Agency

1 For individual dioxins and furans, selected value is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher. For TEQ values, selected value is the DTSC-SL.

2 United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

3 California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. JanuaryCalifornia Department of Toxic Substances Control (DTSC). 2017. Human Health Risk Assessment (HHRA) Note 2, Soil Remedial Goals for Dioxins and Dioxin-like Compounds for Consideration at California Hazardous Waste Sites. April.

4 ARCADIS. 2008. "Technical Memorandum 3: Ecological Comparison Values for Metals and Polycyclic Aromatic Hydrocarbons in Soil." May 28. ARCADIS. 2009. "Topock Compression Station - Final Technical Memorandum 4: Ecological Comparison Values for Additional Dectected Chemicals in Soil." July 1.

5 CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

Calculations:

TEQ = Sum of Result xToxic equivalency factor (TEF), 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.

TEQ Avian = Sum of Result x TEF, 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.

TEQMammals = Sum of Result x TEF, 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.

Teq Humans = Sum of Result x TEF, 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.

TABLE 3-6j

Constituent Concentrations in Soil Compared to Screening Values
AOC 10 – East Ravine
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
Pacific Gas and Electric Company Topock Compressor Station, Needles, California

Notes

All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background threshold value because it is greater than the respective screening level.
‡ Maxiumum Reporting Limit greater than or equal to the ISL

mg/kg	miligrams per kilogram
µg/kg	micrograms per kilogram
ng/kg	nanograms per kilogram
BK	Background Value
CSL	Commercial Screening Level
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
ISL	Interim Screening Level
NA	not applicable
ND	not detected in any of the samples
NE	not established
RSL	esidential screening level
RWQCB	Regional Water Quality Control Board
SL	screening level
USEPA	United States Environmental Protection Agency

1 CH2M HILL. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.) or ambient threshold value (CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

2 ARCADIS. 2008. "Technical Memorandum 3: Ecological Comparison Values for Metals and Polycyclic Aromatic Hydrocarbons in Soil." May 28. ARCADIS. 2009. "Topock Compression Station - Final Technical Memorandum 4: Ecological Comparison Values for Additional Detected Chemicals in Soil" July 1

3 Residential screening level - the lower of the residential DTSC-SL and USEPA regional screening level is used.

4 Water Board. 2016. “San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels, Table S-1: Soil Direct Exposure Human Health Screening Levels, Interim Final.” Febr

5 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used.

6 For metals, the ISL is background value. If background value is not available then the ISL is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value. For TPH, ISL is the RWQCB ESL. For dioxin/furan TEQ values, the ISL is the DTSC-SL unless the background value is higher. For all other analytes, ISL is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

7 Number of exceedences are the number of detections exceeding the background threshold value (BTV).

8 Number of exceedences are the number of detections that are equal to or exceeds the screening level (ecological comparison value, residential reporting limit, commercial reporting limit or interim screening level) or otherwise noted.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the natur and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than interim screening level are circled.

*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
mg/kg	milligrams per kilogram
ft bgs	feet below ground surface
FD	field duplicate
J	concentration or reporting limit estimated by laboratory or data validation
N	primary sample
ND	not detected at the listed reporting limit
NE	not established

1 Interim screening level is equal to the to the lower value between the threshold effect concentration and probable effect concentration. If neither is available, then the soil background value, if available, is used.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.
Results greater than the interim screening level are circled.

*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
B(a)P	Benzo (a) pyrene
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
N	primary sample
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
ND	not detected at the listed reporting limit
NE	not established
PAH	Polycyclic aromatic hydrocarbons
JR	The result has been rejected; identification and/quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample analyzed beyond the recommended hold time).
USEPA	United States Environmental Protection Agency

1 Selected value is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.
2 United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.
3 California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January.

Calculations:

B(a)P equivalent was calculated using relative potency factors for carcinogenic PAHs from U.S. Environmental Protection Agency. 1993. EPA’s Provisional Guidance for Quantitative Risk Assessment of Polycyclic Aromatic Hydrocarbons. EPA 600/R-93-089. July.

Calculations of LMW-PAHs and HMW-PAHs were consistent with U.S. Environmental Protection Agency. 2007. Ecological Soil Screening Levels for Polycyclic Aromatic Hydrocarbons (PAHs) – Interim Final. OSWER Directive 9285.7-78. June.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.
Results greater than the interim screening level are circled.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the interim screening level are circled.

*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
FD	field duplicate
J	concentration or reporting limit estimated by laboratory or data validation
NE	not established
N	primary sample
ND	not detected at the listed reporting limit
USEPA	United States Environmental Protection Agency

1 Selected value is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

2 United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.
Results greater than the interim screening level are circled.

*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
FD	field duplicate
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is "R" qualified.
NE	not established
N	primary sample
ND	not detected at the listed reporting limit
ND	The result has been rejected; identification and/or quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample following a hold time of greater than one year).
USEPA	United States Environmental Protection Agency

1 Selected value is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.
Results greater than the Interim Screening Level are circled.

-- not analyzed
ft bgs feet below ground surface

TABLE 3-7i

Sample Results: Dioxins and Furans
AOC 11 – Topographic Low Areas
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

ng/kg	nanograms per kilogram
DTSC-SL	DTSC Screening Levels
DTSC	California Department of Toxic Substances Control
FD	Field Dupliicate
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
N	Primary Sample
NA	NA = not applicable
NE	not established
ND	not detected at the listed reporting limit
R	The result has been rejected; identification and/or quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample following a hold time of greater than one year).
USEPA	USEPA = United States Environmental Protection Agency

1 For individual dioxins and furans, selected value is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher. For TEQ values, selected value is the DTSC-SL.

2 United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

3 California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. JanuaryCalifornia Department of Toxic Substances Control (DTSC). 2017. Human Health Risk Assessment (HHRA) Note 2, Soil Remedial Goals for Dioxins and Dioxin-like Compounds for Consideration at California Hazardous Waste Sites. April.

4 ARCADIS. 2008. "Technical Memorandum 3: Ecological Comparison Values for Metals and Polycyclic Aromatic Hydrocarbons in Soil." May 28. ARCADIS. 2009. "Topock Compression Station - Final Technical Memorandum 4: Ecological Comparison Values for Additional Dectected Chemicals in Soil." July 1.

5 CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

Calculations:

TEQ = Sum of Result xToxic equivalency factor (TEF), 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.

TEQ Avian = Sum of Result x TEF, 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.

TEQMammals = Sum of Result x TEF, 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.

Teq Humans = Sum of Result x TEF, 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.

TABLE 3-7j

Constituent Concentrations in Soil Compared to Screening Values
AOC 11 – Topographic Low Areas
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
Pacific Gas and Electric Company Topock Compressor Station, Needles, California

Notes

All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background threshold value because it is greater than the respective screening level.
‡ Maxiumum Reporting Limit greater than or equal to the ISL

mg/kg	miligrams per kilogram
µg/kg	micrograms per kilogram
ng/kg	nanograms per kilogram
BK	Background Value
CSL	Commercial Screening Level
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
ISL	Interim Screening Level
NA	not applicable
ND	not detected in any of the samples
NE	not established
RSL	esidential screening level
RWQCB	Regional Water Quality Control Board
SL	screening level
USEPA	United States Environmental Protection Agency

1 CH2M HILL. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.) or ambient threshold value (CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

2 ARCADIS. 2008. "Technical Memorandum 3: Ecological Comparison Values for Metals and Polycyclic Aromatic Hydrocarbons in Soil." May 28. ARCADIS. 2009. "Topock Compression Station - Final Technical Memorandum 4: Ecological Comparison Values for Additional Detected Chemicals in Soil" July 1

3 Residential screening level - the lower of the residential DTSC-SL and USEPA regional screening level is used.

4 Water Board. 2016. “San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels, Table S-1: Soil Direct Exposure Human Health Screening Levels, Interim Final.” Febr

5 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used.

6 For metals, the ISL is background value. If background value is not available then the ISL is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value. For TPH, ISL is the RWQCB ESL. For dioxin/furan TEQ values, the ISL is the DTSC-SL unless the background value is higher. For all other analytes, ISL is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

7 Number of exceedences are the number of detections exceeding the background threshold value (BTV).

8 Number of exceedences are the number of detections that are equal to or exceeds the screening level (ecological comparison value, residential reporting limit, commercial reporting limit or interim screening level) or otherwise noted.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Notes

All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background threshold value because it is greater than the respective screening level.
‡ Maxiumum Reporting Limit greater than or equal to the ISL

mg/kg	miligrams per kilogram
µg/kg	micrograms per kilogram
ng/kg	nanograms per kilogram
BK	Background Value
CSL	Commercial Screening Level
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
ISL	Interim Screening Level
NA	not applicable
ND	not detected in any of the samples
NE	not established
RSL	esidential screening level
RWQCB	Regional Water Quality Control Board
SL	screening level
USEPA	United States Environmental Protection Agency

1 CH2M HILL. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.) or ambient threshold value (CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

2 ARCADIS. 2008. "Technical Memorandum 3: Ecological Comparison Values for Metals and Polycyclic Aromatic Hydrocarbons in Soil." May 28. ARCADIS. 2009. "Topock Compression Station - Final Technical Memorandum 4: Ecological Comparison Values for Additional Detected Chemicals in Soil" July 1

3 Residential screening level - the lower of the residential DTSC-SL and USEPA regional screening level is used.

4 Water Board. 2016. "San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels, Table S-1: Soil Direct Exposure Human Health Screening Levels, Interim Final." Febr

5 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used.

6 For metals, the ISL is background value. If background value is not available then the ISL is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value. For TPH, ISL is the RWQCB ESL. For dioxin/furan TEQ values, the ISL is the DTSC-SL unless the background value is higher. For all other analytes, ISL is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

7 Number of exceedences are the number of detections exceeding the background threshold value (BTV).

8 Number of exceedences are the number of detections that are equal to or exceeds the screening level (ecological comparison value, residential reporting limit, commercial reporting limit or interim screening level) or otherwise noted.

TABLE 3-9a

Sample Results: Metals
AOC 14 – Railroad Debris Area
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.
Results greater than the interim screening level are circled.

Θ	white powder sample.
ß	black sandy material
Y	debris sample
*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
ft bgs	feet below ground surface
mg/kg	milligrams per kilogram
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
J	concentration or reporting limit estimated by laboratory or data validation
N	primary sample
ND	not detected at the listed reporting limit
NE	not established
USEPA	United States Environmental Protection Agency

1 Interim screening level is background value. If background value is not available then the interim screening value is the lower of the Ecological Comparison Value , residential DTSC-SL, or USEPA residential regional screening value.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.
Results greater than the interim screening level are circled.

Θ	white powder sample.
ß	black sandy material
Y	debris sample
*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
B(a)P	Benzo (a) pyrene
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
N	primary sample
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
ND	not detected at the listed reporting limit
NE	not established
PAH	Polycyclic aromatic hydrocarbons
JR	The result has been rejected; identification and/quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample analyzed beyond the recommended hold time).
USEPA	United States Environmental Protection Agency

1 Selected value is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

2 United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

3 California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January.

4 ARCADIS. 2008. "Technical Memorandum 3: Ecological Comparison Values for Metals and Polycyclic Aromatic Hydrocarbons in Soil." May 28.

5 CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

Calculations:

B(a)P equivalent was calculated using relative potency factors for carcinogenic PAHs from U.S. Environmental Protection Agency. 1993. EPA's Provisional Guidance for Quantitative Risk Assessment of Polycyclic Aromatic Hydrocarbons. EPA 600/R-93-089. July.

Calculations of LMW-PAHs and HMW-PAHs were consistent with U.S. Environmental Protection Agency. 2007. Ecological Soil Screening Levels for Polycyclic Aromatic Hydrocarbons (PAHs) – Interim Final. OSWER Directive 9285.7-78. June.

PG&E Topock Compressor Station, Needles, California

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the interim screening level are circled.

Only detected SVOCs and VOCs are presented.

ϴ	white powder sample.
ß	black sandy material
Ƴ	debris sample
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
J	concentration or reporting limit estimated by laboratory or data validation
N	primary sample
NE	not established
ND	not detected at the listed reporting limit
R	The result has been rejected; identification and/quantitation could not be verified because critical QC specifications were not met.
USEPA	United States Environmental Protection Agency
VOCs	volatile organic compounds
SVOCs	semivolatile organic compounds

1 The selected value is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.
Results greater than the interim screening level are circled.

ϴ	white powder sample.
ß	black sandy material
Ύ	debris sample
---	not analyzed
mg/kg	milligrams per kilogram
ft bgs	feet below ground surface
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
J	concentration or reporting limit estimated by laboratory or data validation
N	primary sample
ND	not detected at the listed reporting limit
NE	not established
RWQCB	Regional Water Quality Control Board
TPH	total petroleum hydrocarbon
USEPA	United States Environmental Protection Agency

1 The interim screening level is the Regional Water Quality Control Board environmental screening level.

2 United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

3 California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January.

4 California Regional Water Quality Control Board (RWQCB). 2016. San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels, Table S-1: Soil Direct Exposure Human Health Screening Levels, Interim Final. February.

5 ARCADIS. 2008. "Technical Memorandum 3: Ecological Comparison Values for Metals and Polycyclic Aromatic Hydrocarbons in Soil. May 28 and ARCADIS. 2009. Topock Compression Station - Final Technical Memorandum 4: Ecological Comparison Values for Additional Detected Chemicals in Soil". July 1.

6 Background values have not been established for TPHs.

TABLE 3-9f

Sample Results: General Chemistry Parameters
AOC 14 – Railroad Debris Area
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the interim screening level are circled.

ϴ	white powder sample.
Ƴ	debris sample
*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
meq/100g	milligrams per kilogram
mg/kg	milligrams per kilogram
mV	millivolts
ft bgs	feet below ground surface
µS/cm	microsiemens per centimeter
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
FD	field duplicate
J	concentration or reporting limit estimated by laboratory or data validation
N	primary sample
ND	not detected at the listed reporting limit
NE	not established
USEPA	United States Environmental Protection Agency

1 The selected value is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

2 United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

3 California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January.

4 ARCADIS. 2008. "Technical Memorandum 3: Ecological Comparison Values for Metals and Polycyclic Aromatic Hydrocarbons in Soil." May 28.

5 CH2M HILL. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.
Results greater than the Interim Screening Level are circled.

--	not analyzed
ft bgs	feet below ground surface
ng/kg	nanograms per kilogram
DTSC-SL	DTSC Screening Levels
DTSC	California Department of Toxic Substances Control
FD	Field Dupliicate
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
N	Primary Sample
NA	NA = not applicable
NE	not established
ND	not detected at the listed reporting limit
R	The result has been rejected; identification and/or quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample following a hold time of greater than one year).
USEPA	USEPA = United States Environmental Protection Agency

1 For individual dioxins and furans, selected value is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher. For TEQ values, selected value is the DTSC-SL.

2 United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

3 California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. JanuaryCalifornia Department of Toxic Substances Control (DTSC). 2017. TABLE 3-9i
Sample Results: Dioxins and Furans
AOC 14 – Railroad Debris Area
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

Calculations:
TEQ = Sum of Result xToxic equivalency factor (TEF), 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.
TEQ Avian = Sum of Result x TEF, 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.
TEQMammals = Sum of Result x TEF, 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.
Teq Humans = Sum of Result x TEF, 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.

TABLE 3-9k

Constituent Concentrations in Soil Compared to Screening Values
AOC 14 – Railroad Debris Area
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
Pacific Gas and Electric Company Topock Compressor Station, Needles, California

Notes

All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background threshold value because it is greater than the respective screening level.
‡ Maxiumum Reporting Limit greater than or equal to the ISL

mg/kg	miligrams per kilogram
µg/kg	micrograms per kilogram
ng/kg	nanograms per kilogram
BK	Background Value
CSL	Commercial Screening Level
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
ISL	Interim Screening Level
NA	not applicable
ND	not detected in any of the samples
NE	not established
RSL	esidential screening level
RWQCB	Regional Water Quality Control Board
SL	screening level
USEPA	United States Environmental Protection Agency

1 CH2M HILL. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.) or ambient threshold value (CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

2 ARCADIS. 2008. "Technical Memorandum 3: Ecological Comparison Values for Metals and Polycyclic Aromatic Hydrocarbons in Soil." May 28. ARCADIS. 2009. "Topock Compression Station - Final Technical Memorandum 4: Ecological Comparison Values for Additional Detected Chemicals in Soil" July 1

3 Residential screening level - the lower of the residential DTSC-SL and USEPA regional screening level is used.

4 Water Board. 2016. "San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels, Table S-1: Soil Direct Exposure Human Health Screening Levels, Interim Final." Febr

5 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used.

6 For metals, the ISL is background value. If background value is not available then the ISL is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value. For TPH, ISL is the RWQCB ESL. For dioxin/furan TEQ values, the ISL is the DTSC-SL unless the background value is higher. For all other analytes, ISL is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

7 Number of exceedences are the number of detections exceeding the background threshold value (BTV).

8 Number of exceedences are the number of detections that are equal to or exceeds the screening level (ecological comparison value, residential reporting limit, commercial reporting limit or interim screening level) or otherwise noted.

TABLE 3-10a

Sample Results: Metals
AOC 27 – MW-24 Bench
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.
Results greater than the interim screening level are circled.

ψ	tar sample
Ж	wood sample
Ю	debris sample
*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
ft bgs	feet below ground surface
mg/kg	milligrams per kilogram
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
J	concentration or reporting limit estimated by laboratory or data validation
N	primary sample
ND	not detected at the listed reporting limit
NE	not established
USEPA	United States Environmental Protection Agency

1 Interim screening level is background value. If background value is not available then the interim screening value is the lower of the Ecological Comparison Value , residential DTSC-SL, or USEPA residential regional screening value.

2 United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

3 California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January.

4 ARCADIS. 2008. "Technical Memorandum 3: Ecological Comparison Values for Metals and Polycyclic Aromatic Hydrocarbons in Soil." May 28.

5 CH2M HILL. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.
Results greater than the interim screening level are circled.

*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
mg/kg	milligrams per kilogram
ft bgs	feet below ground surface
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
J	concentration or reporting limit estimated by laboratory or data validation
N	primary sample
ND	not detected at the listed reporting limit
NE	not established
USEPA	United States Environmental Protection Agency

1 Interim screening level is background value. If background value is not available then the interim screening value is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value.

2 United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

3 California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.
Results greater than the interim screening level are circled.

ψ	tar sample
ж	wood sample
ю	debris sample
*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
B(a)P	Benzo (a) pyrene
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
N	primary sample
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
ND	not detected at the listed reporting limit
NE	not established
PAH	Polycyclic aromatic hydrocarbons
JR	The result has been rejected; identification and/quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample analyzed beyond the recommended hold time).
USEPA	United States Environmental Protection Agency

1 Selected value is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

2 United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

3 California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January.

4 ARCADIS. 2008. "Technical Memorandum 3: Ecological Comparison Values for Metals and Polycyclic Aromatic Hydrocarbons in Soil." May 28.

5 CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

Calculations:

B(a)P equivalent was calculated using relative potency factors for carcinogenic PAHs from U.S. Environmental Protection Agency. 1993. EPA’s Provisional Guidance for Quantitative Risk Assessment of Polycyclic Aromatic Hydrocarbons. EPA 600/R-93-089. July.

Calculations of LMW-PAHs and HMW-PAHs were consistent with U.S. Environmental Protection Agency. 2007. Ecological Soil Screening Levels for Polycyclic Aromatic Hydrocarbons (PAHs) – Interim Final. OSWER Directive 9285.7-78. June.

TABLE 3-10e

Sample Results: Total Petroleum Hydrocarbons
AOC 27 – MW-24 Bench
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the interim screening level are circled.

---	not analyzed
mg/kg	milligrams per kilogram
ft bgs	feet below ground surface
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the interim screening level are circled.

*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
FD	field duplicate
J	concentration or reporting limit estimated by laboratory or data validation
NE	not established
N	primary sample
ND	not detected at the listed reporting limit
USEPA	United States Environmental Protection Agency

1 Selected value is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

2 United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.
Results greater than the interim screening level are circled.

*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
FD	field duplicate

TABLE 3-10h

Sample Results: Polychlorinated Biphenyls
AOC 27 – MW-24 Bench
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
NE	not established
N	primary sample
ND	not detected at the listed reporting limit
ND	The result has been rejected; identification and/or quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample following a hold time of greater than one year).
USEPA	United States Environmental Protection Agency

1 Selected value is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

2 United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

3 California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January.

4 ARCADIS. 2008. "Technical Memorandum 3: Ecological Comparison Values for Metals and Polycyclic Aromatic Hydrocarbons in Soil." May 28. ARCADIS. 2009. "Topock Compression Station - Final Technical Memorandum 4: Ecological Comparison Values for Additional Dectected Chemicals in Soil." July 1.

5 Background values have not been established for polychlorinated biphenys.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Interim Screening Level are circled.

--	not analyzed
ft bgs	feet below ground surface
ng/kg	nanograms per kilogram
DTSC-SL	DTSC Screening Levels
DTSC	California Department of Toxic Substances Control
FD	Field Dupliicate
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is "R" qualified.
N	Primary Sample
NA	NA = not applicable
NE	not established
ND	not detected at the listed reporting limit
R	The result has been rejected; identification and/or quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample following a hold time of greater than one year).
USEPA	USEPA = United States Environmental Protection Agency

1 For individual dioxins and furans, selected value is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher. For TEQ values, selected value is the DTSC-SL.

2 United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

3 California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. JanuaryCalifornia Department of Toxic Substances Control (DTSC). 2017. Human Health Risk Assessment (HHRA) Note 2, Soil Remedial Goals for Dioxins and Dioxin-like Compounds for Consideration at California Hazardous Waste Sites. April.

4 ARCADIS. 2008. "Technical Memorandum 3: Ecological Comparison Values for Metals and Polycyclic Aromatic Hydrocarbons in Soil." May 28. ARCADIS. 2009. "Topock Compression Station - Final Technical Memorandum 4: Ecological Comparison Values for Additional Dectected Chemicals in Soil." July 1.

5 CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

Calculations:

TEQ = Sum of Result xToxic equivalency factor (TEF), 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.

TEQ Avian = Sum of Result x TEF, 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.

TEQMammals = Sum of Result x TEF, 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.

Teq Humans = Sum of Result x TEF, 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.

Notes

All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background threshold value because it is greater than the respective screening level.
‡ Maxiumum Reporting Limit greater than or equal to the ISL

mg/kg	miligrams per kilogram
µg/kg	micrograms per kilogram
ng/kg	nanograms per kilogram
BK	Background Value
CSL	Commercial Screening Level
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
ISL	Interim Screening Level
NA	not applicable
ND	not detected in any of the samples
NE	not established
RSL	esidential screening level
RWQCB	Regional Water Quality Control Board
SL	screening level
USEPA	United States Environmental Protection Agency

1 CH2M HILL. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.) or ambient threshold value (CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

2 ARCADIS. 2008. "Technical Memorandum 3: Ecological Comparison Values for Metals and Polycyclic Aromatic Hydrocarbons in Soil." May 28. ARCADIS. 2009. "Topock Compression Station - Final Technical Memorandum 4: Ecological Comparison Values for Additional Detected Chemicals in Soil" July 1

3 Residential screening level - the lower of the residential DTSC-SL and USEPA regional screening level is used.

4 Water Board. 2016. “San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels, Table S-1: Soil Direct Exposure Human Health Screening Levels, Interim Final.” Febr

5 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used.

6 For metals, the ISL is background value. If background value is not available then the ISL is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value. For TPH, ISL is the RWQCB ESL. For dioxin/furan TEQ values, the ISL is the DTSC-SL unless the background value is higher. For all other analytes, ISL is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

7 Number of exceedences are the number of detections exceeding the background threshold value (BTV).

8 Number of exceedences are the number of detections that are equal to or exceeds the screening level (ecological comparison value, residential reporting limit, commercial reporting limit or interim screening level) or otherwise noted.

TABLE 3-11f

Constituent Concentrations in Soil Compared to Screening Values
AOC 28 – Pipeline Drip Legs
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
Pacific Gas and Electric Company Topock Compressor Station, Needles, California

Notes

All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background threshold value because it is greater than the respective screening level.
‡ Maxiumum Reporting Limit greater than or equal to the ISL

mg/kg	miligrams per kilogram
µg/kg	micrograms per kilogram
ng/kg	nanograms per kilogram
BK	Background Value
CSL	Commercial Screening Level
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
ISL	Interim Screening Level
NA	not applicable
ND	not detected in any of the samples
NE	not established
RSL	esidential screening level
RWQCB	Regional Water Quality Control Board
SL	screening level
USEPA	United States Environmental Protection Agency

1 CH2M HILL. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.) or ambient threshold value (CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

2 ARCADIS. 2008. "Technical Memorandum 3: Ecological Comparison Values for Metals and Polycyclic Aromatic Hydrocarbons in Soil." May 28. ARCADIS. 2009. "Topock Compression Station - Final Technical Memorandum 4: Ecological Comparison Values for Additional Detected Chemicals in Soil" July 1

3 Residential screening level - the lower of the residential DTSC-SL and USEPA regional screening level is used.

4 Water Board. 2016. “San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels, Table S-1: Soil Direct Exposure Human Health Screening Levels, Interim Final.” Febr

5 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used.

6 For metals, the ISL is background value. If background value is not available then the ISL is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value. For TPH, ISL is the RWQCB ESL. For dioxin/furan TEQ values, the ISL is the DTSC-SL unless the background value is higher. For all other analytes, ISL is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

7 Number of exceedences are the number of detections exceeding the background threshold value (BTV).

8 Number of exceedences are the number of detections that are equal to or exceeds the screening level (ecological comparison value, residential reporting limit, commercial reporting limit or interim screening level) or otherwise noted.

Notes

All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background threshold value because it is greater than the respective screening level.
‡ Maxiumum Reporting Limit greater than or equal to the ISL

mg/kg miligrams per kilogram
µg/kg micrograms per kilogram
ng/kg nanograms per kilogram
BK Background Value
CSL Commercial Screening Level
DTSC California Department of Toxic Substances Control
DTSC-SL DTSC Screening Level
ISL Interim Screening Level
NA not applicable
ND not detected in any of the samples
NE not established
RSL esidential screening level
RWQCB Regional Water Quality Control Board
SL screening level
USEPA United States Environmental Protection Agency

1 CH2M HILL. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.) or ambient threshold value (CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

2 ARCADIS. 2008. "Technical Memorandum 3: Ecological Comparison Values for Metals and Polycyclic Aromatic Hydrocarbons in Soil." May 28. ARCADIS. 2009. "Topock Compression Station - Final Technical Memorandum 4: Ecological Comparison Values for Additional Detected Chemicals in Soil" July 1

3 Residential screening level - the lower of the residential DTSC-SL and USEPA regional screening level is used.

4 Water Board. 2016. “San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels, Table S-1: Soil Direct Exposure Human Health Screening Levels, Interim Final.” Febr

5 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used.

6 For metals, the ISL is background value. If background value is not available then the ISL is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value. For TPH, ISL is the RWQCB ESL. For dioxin/furan TEQ values, the ISL is the DTSC-SL unless the background value is higher. For all other analytes, ISL is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

7 Number of exceedences are the number of detections exceeding the background threshold value (BTV).

8 Number of exceedences are the number of detections that are equal to or exceeds the screening level (ecological comparison value, residential reporting limit, commercial reporting limit or interim screening level) or otherwise noted.

TABLE 3-13c

Sample Results: Polycyclic Aromatic Hydrocarbons
UA-2 – Former 300B Pipeline Drip Tank Area
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.
Results greater than the interim screening level are circled.

*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
B(a)P	Benzo (a) pyrene
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
N	primary sample
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
ND	not detected at the listed reporting limit
NE	not established
PAH	Polycyclic aromatic hydrocarbons
JR	The result has been rejected; identification and/quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample analyzed beyond the recommended hold time).
USEPA	United States Environmental Protection Agency

1 Selected value is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

2 United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

3 California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January.

TABLE 3-13h

Constituent Concentrations in Soil Compared to Screening Values
UA-2 – Former 300B Pipeline Drip Tank Area
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
Pacific Gas and Electric Company Topock Compressor Station, Needles, California

Notes

All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background threshold value because it is greater than the respective screening level.
‡ Maxiumum Reporting Limit greater than or equal to the ISL

mg/kg	miligrams per kilogram
µg/kg	micrograms per kilogram
ng/kg	nanograms per kilogram
BK	Background Value
CSL	Commercial Screening Level
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
ISL	Interim Screening Level
NA	not applicable
ND	not detected in any of the samples
NE	not established
RSL	esidential screening level
RWQCB	Regional Water Quality Control Board
SL	screening level
USEPA	United States Environmental Protection Agency

1 CH2M HILL. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.) or ambient threshold value (CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

2 ARCADIS. 2008. "Technical Memorandum 3: Ecological Comparison Values for Metals and Polycyclic Aromatic Hydrocarbons in Soil." May 28. ARCADIS. 2009. "Topock Compression Station - Final Technical Memorandum 4: Ecological Comparison Values for Additional Detected Chemicals in Soil" July 1

3 Residential screening level - the lower of the residential DTSC-SL and USEPA regional screening level is used.

4 Water Board. 2016. “San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels, Table S-1: Soil Direct Exposure Human Health Screening Levels, Interim Final.” Febr

5 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used.

6 For metals, the ISL is background value. If background value is not available then the ISL is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value. For TPH, ISL is the RWQCB ESL. For dioxin/furan TEQ values, the ISL is the DTSC-SL unless the background value is higher. For all other analytes, ISL is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

7 Number of exceedences are the number of detections exceeding the background threshold value (BTV).

8 Number of exceedences are the number of detections that are equal to or exceeds the screening level (ecological comparison value, residential reporting limit, commercial reporting limit or interim screening level) or otherwise noted.

Notes

Soil sample counts presented do not include duplicate (quality control) samples. At locations where duplicate samples were collected, the higher of the two values is considered
All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background value because it is greater than the respective screening level.

‡ Maxiumum Reporting Limit greater than or equal to the ISL

mg/kg	miligrams per kilogram

Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

2 Water Board. 2016. “San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels, Table S-1: Soil Direct Exposure Human Health Screening Levels, Interim Final.” Febr

3 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used, except for TEQ human, where the DTSC-SL is used. "

4 Number of exceedences are the number of detections exceeding the background threshold value (BTV).

5 Number of exceedences are the number of detections that are equal to or exceeds the screening level (ecological comparison value, residential reporting limit, commercial reporting limit or interim screening level) or otherwise noted.

SWMU 6 – Chromate Reduction Tank
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
Pacific Gas and Electric Company Topock Compressor Station, Needles, California

Notes

Soil sample counts presented do not include duplicate (quality control) samples. At locations where duplicate samples were collected, the higher of the two values is considered
All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background value because it is greater than the respective screening level.

‡ Maxiumum Reporting Limit greater than or equal to the ISL

Pacific Gas and Electric Company Topock Compressor Station, Needles, California

Notes

Soil sample counts presented do not include duplicate (quality control) samples. At locations where duplicate samples were collected, the higher of the two values is considered
All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background value because it is greater than the respective screening level.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the commercial screening level are circled.

*	Reporting limits greater than or equal to the commercial screening level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
CHHSL	California human health screening levels
DTSC	California Department of Toxic Substances Control
FD	field duplicate
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
N	primary sample
ND	not detected at the listed reporting limit
NE	not established
R	The result has been rejected; identification and/or quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample following a hold time of greater than one year).
USEPA	United States Environmental Protection Agency

1 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 Background values have not been established for polychlorinated biphenyls.

Pacific Gas and Electric Company Topock Compressor Station, Needles, California

Notes

Soil sample counts presented do not include duplicate (quality control) samples. At locations where duplicate samples were collected, the higher of the two values is considered
All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background value because it is greater than the respective screening level.

‡ Maxiumum Reporting Limit greater than or equal to the ISL

mg/kg	miligrams per kilogram

TABLE 3-19i

Constituent Concentrations in Soil Compared to Screening Values
AOC 5 – Cooling Tower A
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
Pacific Gas and Electric Company Topock Compressor Station, Needles, California

Notes

Soil sample counts presented do not include duplicate (quality control) samples. At locations where duplicate samples were collected, the higher of the two values is considered
All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background value because it is greater than the respective screening level.

‡ Maxiumum Reporting Limit greater than or equal to the ISL

mg/kg	miligrams per kilogram
µg/kg	micrograms per kilogram
ng/kg	nanograms per kilogram
BK	Background Value
CSL	Commercial Screening Level
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
ISL	Interim Screening Level
NA	not applicable
ND	not detected in any of the samples
NE	not established
RWQCB	Regional Water Quality Control Board
SL	screening level
USEPA	United States Environmental Protection Agency

1 CH2M HILL. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.) or ambient threshold value (CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

2 Water Board. 2016. “San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels, Table S-1: Soil Direct Exposure Human Health Screening Levels, Interim Final.” Febr

3 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used, except for TEQ human, where the DTSC-SL is used. "

4 Number of exceedences are the number of detections exceeding the background threshold value (BTV).

5 Number of exceedences are the number of detections that are equal to or exceeds the screening level (ecological comparison value, residential reporting limit, commercial reporting limit or interim screening level) or otherwise noted.

TABLE 3-20c

Sample Results: Polycyclic Aromatic Hydrocarbons
AOC 6 – Cooling Tower B
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.
B(a)P EQ Equivalent is calculated using half the reporting limit for non detects.

*	Reporting limits greater than or equal to the Commercial Screening Level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
B(a)P	Benzo (a) pyrene
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
N	primary sample
NA	not applicable
ND	not detected at the listed reporting limit
NE	not established
PAH	Polycyclic aromatic hydrocarbons
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
R	The result has been rejected; identification and/quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample analyzed beyond the recommended hold time).
USEPA	United States Environmental Protection Agency

1 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 Background values are either not established or not applicable.

Calculations:

B(a)P equivalent was calculated using relative potency factors for carcinogenic PAHs from U.S. Environmental Protection Agency. 1993. EPA’s Provisional Guidance for Quantitative Risk Assessment of Polycyclic Aromatic Hydrocarbons. EPA 600/R-93-089. July.

Calculations of LMW-PAHs and HMW-PAHs were consistent with U.S. Environmental Protection Agency. 2007. Ecological Soil Screening Levels for Polycyclic Aromatic Hydrocarbons (PAHs) – Interim Final. OSWER Directive 9285.7-78. June.

TABLE 3-20i

Constituent Concentrations in Soil Compared to Screening Values
AOC 6 – Cooling Tower B
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
Pacific Gas and Electric Company Topock Compressor Station, Needles, California

Notes

Soil sample counts presented do not include duplicate (quality control) samples. At locations where duplicate samples were collected, the higher of the two values is considered
All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background value because it is greater than the respective screening level.

‡ Maxiumum Reporting Limit greater than or equal to the ISL

mg/kg	miligrams per kilogram
µg/kg	micrograms per kilogram
ng/kg	nanograms per kilogram
BK	Background Value
CSL	Commercial Screening Level
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
ISL	Interim Screening Level
NA	not applicable
ND	not detected in any of the samples
NE	not established
RWQCB	Regional Water Quality Control Board
SL	screening level
USEPA	United States Environmental Protection Agency

1 CH2M HILL. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.) or ambient threshold value (CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

2 Water Board. 2016. “San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels, Table S-1: Soil Direct Exposure Human Health Screening Levels, Interim Final.” Febr

3 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used, except for TEQ human, where the DTSC-SL is used. "

4 Number of exceedences are the number of detections exceeding the background threshold value (BTV).

5 Number of exceedences are the number of detections that are equal to or exceeds the screening level (ecological comparison value, residential reporting limit, commercial reporting limit or interim screening level) or otherwise noted.

N	primary sample
ND	not detected at the listed reporting limit
NE	not established
J	concentration or reporting limit estimated by laboratory or data validation
USEPA	United States Environmental Protection Agency

1 Commercial creening evel - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 CH2M. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.

3 Commercial screening level is below background value; therefore, arsenic results are only screened against the background value.

TABLE 3-22b

Sample Results: Contract Laboratory Program Inorganics
AOC 8 – Paint Shed
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

				Contract Laboratory Program (CLP) Inorganics (mg/kg)							
			Commercial Screening Level [1]:	1,100,000	NE	820,000	NE	6,900	NE	NE	150
			Background [2]:	16,400	66,500	29,303	12,100	402	4,400	2,070	NE
Location	**Date**	**Depth (ft bgs)**	**Sample Type**	**Aluminum**	**Calcium**	**Iron**	**Magnesium**	**Manganese**	**Potassium**	**Sodium**	**Cyanide**
Category 1

TABLE 3-22c

Sample Results: Polycyclic Aromatic Hydrocarbons
AOC 8 – Paint Shed
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

				Polycyclic Aromatic Hydrocarbons (µg/kg)	
			Commercial Screening Level[1] :	17,000	2,100
			Background[2] :	NE	55
Location	Date	Depth (ft bgs)	Sample Type	Naphthalene	B(a)P Equivalent
Category 1					
AOC8-1	01/07/16	2 - 3	N	ND (5.9)	ND
AOC8-2	12/09/15	2 - 3	N	ND (6.8)	ND

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.
B(a)P EQ Equivalent is calculated using half the reporting limit for non detects.

*	Reporting limits greater than or equal to the Commercial Screening Level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
B(a)P	Benzo (a) pyrene
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
N	primary sample
NA	not applicable
ND	not detected at the listed reporting limit
NE	not established
PAH	Polycyclic aromatic hydrocarbons
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
R	The result has been rejected; identification and/quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample analyzed beyond the recommended hold time).
USEPA	United States Environmental Protection Agency

1 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 Background values are either not established or not applicable.

Calculations:

B(a)P equivalent was calculated using relative potency factors for carcinogenic PAHs from U.S. Environmental Protection Agency. 1993. EPA's Provisional Guidance for Quantitative Risk Assessment of Polycyclic Aromatic Hydrocarbons. EPA 600/R-93-089. July.

Calculations of LMW-PAHs and HMW-PAHs were consistent with U.S. Environmental Protection Agency. 2007. Ecological Soil Screening Levels for Polycyclic Aromatic Hydrocarbons (PAHs) – Interim Final. OSWER Directive 9285.7-78. June.

Pacific Gas and Electric Company Topock Compressor Station, Needles, California

Notes

Soil sample counts presented do not include duplicate (quality control) samples. At locations where duplicate samples were collected, the higher of the two values is considered
All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background value because it is greater than the respective screening level.

‡ Maxiumum Reporting Limit greater than or equal to the ISL

mg/kg	miligrams per kilogram
µg/kg	micrograms per kilogram
ng/kg	nanograms per kilogram
BK	Background Value
CSL	Commercial Screening Level

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.

Y debris sample
Ж wood sample
Reporting limits greater than or equal to the Commercial Screening Level.

--- not analyzed
mg/kg milligrams per kilogram
ft bgs feet below ground surface
DTSC California Department of Toxic Substances Control
DTSC-SL DTSC Screening Level
FD field duplicate
N primary sample
ND not detected at the listed reporting limit
NE not established
J concentration or reporting limit estimated by laboratory or data validation
USEPA United States Environmental Protection Agency

1 Commercial creening evel - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.
2 CH2M. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.
3 Commercial screening level is below background value; therefore, arsenic results are only screened against the background value.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.

J	concentration or reporting limit estimated by laboratory or data validation
*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
mg/kg	milligrams per kilogram
ft bgs	feet below ground surface
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
FD	field duplicate
N	primary sample
ND	not detected at the listed reporting limit
NE	not established
USEPA	United States Environmental Protection Agency

1 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.
B(a)P EQ Equivalent is calculated using half the reporting limit for non detects.

ß	black sandy material
Y	debris sample
ψ	tar sample
*	Reporting limits greater than or equal to the Commercial Screening Level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
B(a)P	Benzo (a) pyrene
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
N	primary sample
NA	not applicable
ND	not detected at the listed reporting limit
NE	not established
PAH	Polycyclic aromatic hydrocarbons
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is "R" qualified.
R	The result has been rejected; identification and/quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample analyzed beyond the recommended hold time).
USEPA	United States Environmental Protection Agency

1 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 Background values are either not established or not applicable.

Calculations:

B(a)P equivalent was calculated using relative potency factors for carcinogenic PAHs from U.S. Environmental Protection Agency. 1993. EPA's Provisional Guidance for Quantitative Risk Assessment of Polycyclic Aromatic Hydrocarbons. EPA 600/R-93-089. July.

Calculations of LMW-PAHs and HMW-PAHs were consistent with U.S. Environmental Protection Agency. 2007. Ecological Soil Screening Levels for Polycyclic Aromatic Hydrocarbons (PAHs) – Interim Final. OSWER Directive 9285.7-78. June.

TABLE 3-23d

Sample Results: Semivolatile and Volatile Organic Compounds
AOC 13 – Unpaved Areas within the Compressor Station
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the commercial screening level or RWQCB ESL are circled.

Only detected SVOCs and VOCs are presented.

ß	black sandy material
Ψ	tar sample
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
N	primary sample
NE	not established
ND	not detected at the listed reporting limit
J	concentration or reporting limit estimated by laboratory or data validation
USEPA	United States Environmental Protection Agency
SVOCs	semivolatile organic compounds
VOCs	volatile organic compounds

1 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 Background values have not been established for SVOCs and VOCs.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the commercial screening level are circled.

TABLE 3-23f

Sample Results: General Chemistry Parameters
AOC 13 – Unpaved Areas within the Compressor Station
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

Nots:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.

ϒ	debris sample
Ж	wood sample
*	Reporting limits greater than or equal to the Commercial Screening Level.
---	not analyzed
mg/kg	milligrams per kilogram
ft bgs	feet below ground surface
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
FD	field duplicate
N	primary sample
ND	not detected at the listed reporting limit
NE	not established
J	concentration or reporting limit estimated by laboratory or data validation
USEPA	United States Environmental Protection Agency

1 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used where available. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 Background values have not been established for general chemistry parameters.

TABLE 3-23g

Sample Results: Pesticides
AOC 13 – Unpaved Areas within the Compressor Station
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the commercial screening level are circled.

*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
FD	field duplicate
J	concentration or reporting limit estimated by laboratory or data validation
NE	not established
N	primary sample
ND	not detected at the listed reporting limit
USEPA	United States Environmental Protection Agency

1 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used where available. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 Background values have not been established for pesticides.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the commercial screening level are circled.

ß	black sandy material
Ƴ	debris sample
ψ	tar sample
*	Reporting limits greater than or equal to the commercial screening level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
CHHSL	California human health screening levels
DTSC	California Department of Toxic Substances Control
FD	field duplicate
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
N	primary sample
ND	not detected at the listed reporting limit
NE	not established
R	The result has been rejected; identification and/or quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample following a hold time of greater than one year).
USEPA	United States Environmental Protection Agency

Notes:
Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.

ß	black sandy material
Y	debris sample
ψ	tar sample
*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
ng/kg	nanograms per kilogram

TABLE 3-23i

Sample Results: Dioxins and Furans
AOC 13 – Unpaved Areas within the Compressor Station
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
FD	field duplicate
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
NA	not applicable
NE	not established
N	primary sample
ND	not detected at the listed reporting limit
R	The result has been rejected; identification and/quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample analyzed beyond the recommended hold time).
TEQ Human	Sum of Result x TEF, 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.
USEPA	United States Environmental Protection Agency

1 Commercial screening level - for individual dioxins and furans, the lower of the commercial DTSC-SL and USEPA regional screening level is used. For TEQ human, the DTSC-SL is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 Background values are not established or not applicable.

Notes

Soil sample counts presented do not include duplicate (quality control) samples. At locations where duplicate samples were collected, the higher of the two values is considered
All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background value because it is greater than the respective screening level.

‡ Maxiumum Reporting Limit greater than or equal to the ISL

mg/kg	miligrams per kilogram
µg/kg	micrograms per kilogram
ng/kg	nanograms per kilogram
BK	Background Value
CSL	Commercial Screening Level

SL	screening level
USEPA	United States Environmental Protection Agency

1 CH2M HILL. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.) or ambient threshold value (CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

2 Water Board. 2016. “San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels, Table S-1: Soil Direct Exposure Human Health Screening Levels, Interim Final.” Febr

3 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used, except for TEQ human, where the DTSC-SL is used. "

4 Number of exceedences are the number of detections exceeding the background threshold value (BTV).

5 Number of exceedences are the number of detections that are equal to or exceeds the screening level (ecological comparison value, residential reporting limit, commercial reporting limit or interim screening level) or otherwise noted.

Notes:
µg/m^3 = micrograms per cubic meter
DTSC = California Department of Toxic Substances Control
ft bgs = feet below ground surface
J = concentration or reporting limit estimated by laboratory or data validation
N = primary sample
U = not detected at the listed reporting limit
UJ = not detected, listed reporting limit estimated by laboratory or data validation
[a] All data presented are Category 1 data
[b] Soil gas screening levels (µg/m^3) calculated using 2011 DTSC attenuation factors and DTSC 2018 recommended screening levels
[c] Soil gas screening levels (µg/m^3) calculated using 2023 DTSC draft AFs and DTSC 2018 recommended SLs

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.
B(a)P EQ Equivalent is calculated using half the reporting limit for non detects.

§	Sample removed during 2020 excavation
*	Reporting limits greater than or equal to the Commercial Screening Level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
B(a)P	Benzo (a) pyrene
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
N	primary sample
NA	not applicable
ND	not detected at the listed reporting limit
NE	not established
PAH	Polycyclic aromatic hydrocarbons
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
R	The result has been rejected; identification and/quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample analyzed beyond the recommended hold time).
USEPA	United States Environmental Protection Agency

1 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 Background values are either not established or not applicable.

Calculations:

B(a)P equivalent was calculated using relative potency factors for carcinogenic PAHs from U.S. Environmental Protection Agency. 1993. EPA’s Provisional Guidance for Quantitative Risk Assessment of Polycyclic Aromatic Hydrocarbons. EPA 600/R-93-089. July.

Calculations of LMW-PAHs and HMW-PAHs were consistent with U.S. Environmental Protection Agency. 2007. Ecological Soil Screening Levels for Polycyclic Aromatic Hydrocarbons (PAHs) – Interim Final. OSWER Directive 9285.7-78. June.

Constituent Concentrations in Soil Compared to Screening Values
AOC 15 – Auxiliary Jacket Cooling Water Pumps
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
Pacific Gas and Electric Company Topock Compressor Station, Needles, California

Notes

Soil sample counts presented do not include duplicate (quality control) samples. At locations where duplicate samples were collected, the higher of the two values is considered
All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background value because it is greater than the respective screening level.

‡ Maxiumum Reporting Limit greater than or equal to the ISL

mg/kg	miligrams per kilogram

SL	screening level
USEPA	United States Environmental Protection Agency

1 CH2M HILL. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.) or ambient threshold value (CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

2 Water Board. 2016. “San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels, Table S-1: Soil Direct Exposure Human Health Screening Levels, Interim Final.” Febr

3 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used, except for TEQ human, where the DTSC-SL is used. "

4 Number of exceedences are the number of detections exceeding the background threshold value (BTV).

5 Number of exceedences are the number of detections that are equal to or exceeds the screening level (ecological comparison value, residential reporting limit, commercial reporting limit or interim screening level) or otherwise noted.

PAH	Polycyclic aromatic hydrocarbons
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
R	The result has been rejected; identification and/quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample analyzed beyond the recommended hold time).
USEPA	United States Environmental Protection Agency

1 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 Background values are either not established or not applicable.

Calculations:

B(a)P equivalent was calculated using relative potency factors for carcinogenic PAHs from U.S. Environmental Protection Agency. 1993. EPA’s Provisional Guidance for Quantitative Risk Assessment of Polycyclic Aromatic Hydrocarbons. EPA 600/R-93-089. July.

Calculations of LMW-PAHs and HMW-PAHs were consistent with U.S. Environmental Protection Agency. 2007. Ecological Soil Screening Levels for Polycyclic Aromatic Hydrocarbons (PAHs) – Interim Final. OSWER Directive 9285.7-78. June.

Constituent Concentrations in Soil Compared to Screening Values
AOC 16 – Sandblast Shelter
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
Pacific Gas and Electric Company Topock Compressor Station, Needles, California

Notes

Soil sample counts presented do not include duplicate (quality control) samples. At locations where duplicate samples were collected, the higher of the two values is considered
All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background value because it is greater than the respective screening level.

‡ Maxiumum Reporting Limit greater than or equal to the ISL

TABLE 3-26c

Sample Results: Polycyclic Aromatic Hydrocarbons
AOC 17 – Onsite Septic System
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.
B(a)P EQ Equivalent is calculated using half the reporting limit for non detects.

*	Reporting limits greater than or equal to the Commercial Screening Level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
B(a)P	Benzo (a) pyrene
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
N	primary sample
NA	not applicable
ND	not detected at the listed reporting limit
NE	not established
PAH	Polycyclic aromatic hydrocarbons
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
R	The result has been rejected; identification and/quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample analyzed beyond the recommended hold time).
USEPA	United States Environmental Protection Agency

1 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 Background values are either not established or not applicable.

Calculations:

B(a)P equivalent was calculated using relative potency factors for carcinogenic PAHs from U.S. Environmental Protection Agency. 1993. EPA’s Provisional Guidance for Quantitative Risk Assessment of Polycyclic Aromatic Hydrocarbons. EPA 600/R-93-089. July.

Calculations of LMW-PAHs and HMW-PAHs were consistent with U.S. Environmental Protection Agency. 2007. Ecological Soil Screening Levels for Polycyclic Aromatic Hydrocarbons (PAHs) – Interim Final. OSWER Directive 9285.7-78. June.

Constituent Concentrations in Soil Compared to Screening Values
AOC 17 – Onsite Septic System
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
Pacific Gas and Electric Company Topock Compressor Station, Needles, California

Notes

Soil sample counts presented do not include duplicate (quality control) samples. At locations where duplicate samples were collected, the higher of the two values is considered
All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background value because it is greater than the respective screening level.

‡ Maxiumum Reporting Limit greater than or equal to the ISL

TABLE 3-27a

Sample Results: Metals
AOC 18 – Combined Hazardous Waste Transference Pipelines
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.

ϴ	white powder sample.
*	Reporting limits greater than or equal to the Commercial Screening Level.
---	not analyzed
mg/kg	milligrams per kilogram
ft bgs	feet below ground surface
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
FD	field duplicate
N	primary sample
ND	not detected at the listed reporting limit
NE	not established
J	concentration or reporting limit estimated by laboratory or data validation
USEPA	United States Environmental Protection Agency

1 Commercial creening evel - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 CH2M. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.

3 Commercial screening level is below background value; therefore, arsenic results are only screened against the background value.

TABLE 3-27c

Sample Results: Polycyclic Aromatic Hydrocarbons
AOC 18 – Combined Hazardous Waste Transference Pipelines
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.
B(a)P EQ Equivalent is calculated using half the reporting limit for non detects.

*	Reporting limits greater than or equal to the Commercial Screening Level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
B(a)P	Benzo (a) pyrene
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
N	primary sample
NA	not applicable
ND	not detected at the listed reporting limit
NE	not established
PAH	Polycyclic aromatic hydrocarbons
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
R	The result has been rejected; identification and/quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample analyzed beyond the recommended hold time).
USEPA	United States Environmental Protection Agency

1 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 Background values are either not established or not applicable.

Calculations:

B(a)P equivalent was calculated using relative potency factors for carcinogenic PAHs from U.S. Environmental Protection Agency. 1993. EPA’s Provisional Guidance for Quantitative Risk Assessment of Polycyclic Aromatic Hydrocarbons. EPA 600/R-93-089. July.

Calculations of LMW-PAHs and HMW-PAHs were consistent with U.S. Environmental Protection Agency. 2007. Ecological Soil Screening Levels for Polycyclic Aromatic Hydrocarbons (PAHs) – Interim Final. OSWER Directive 9285.7-78. June.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.

TABLE 3-27h

Constituent Concentrations in Soil Compared to Screening Values
AOC 18 – Combined Hazardous Waste Transference Pipelines
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
Pacific Gas and Electric Company Topock Compressor Station, Needles, California

Notes

Soil sample counts presented do not include duplicate (quality control) samples. At locations where duplicate samples were collected, the higher of the two values is considered
All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background value because it is greater than the respective screening level.

‡ Maxiumum Reporting Limit greater than or equal to the ISL

mg/kg	miligrams per kilogram
µg/kg	micrograms per kilogram
ng/kg	nanograms per kilogram
BK	Background Value
CSL	Commercial Screening Level
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
ISL	Interim Screening Level
NA	not applicable
ND	not detected in any of the samples
NE	not established
RWQCB	Regional Water Quality Control Board
SL	screening level
USEPA	United States Environmental Protection Agency

1 CH2M HILL. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.) or ambient threshold value (CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

2 Water Board. 2016. “San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels, Table S-1: Soil Direct Exposure Human Health Screening Levels, Interim Final.” Febr

3 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used, except for TEQ human, where the DTSC-SL is used. "

4 Number of exceedences are the number of detections exceeding the background threshold value (BTV).

5 Number of exceedences are the number of detections that are equal to or exceeds the screening level (ecological comparison value, residential reporting limit, commercial reporting limit or interim screening level) or otherwise noted.

TABLE 3-28c

Sample Results: Polycyclic Aromatic Hydrocarbons
AOC 19 – Former Cooling Liquid Mixing and Hotwell Area
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.
B(a)P EQ Equivalent is calculated using half the reporting limit for non detects.

*	Reporting limits greater than or equal to the Commercial Screening Level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
B(a)P	Benzo (a) pyrene
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
N	primary sample
NA	not applicable
ND	not detected at the listed reporting limit
NE	not established
PAH	Polycyclic aromatic hydrocarbons
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
R	The result has been rejected; identification and/quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample analyzed beyond the recommended hold time).
USEPA	United States Environmental Protection Agency

1 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 Background values are either not established or not applicable.

Calculations:

B(a)P equivalent was calculated using relative potency factors for carcinogenic PAHs from U.S. Environmental Protection Agency. 1993. EPA’s Provisional Guidance for Quantitative Risk Assessment of Polycyclic Aromatic Hydrocarbons. EPA 600/R-93-089. July.

Calculations of LMW-PAHs and HMW-PAHs were consistent with U.S. Environmental Protection Agency. 2007. Ecological Soil Screening Levels for Polycyclic Aromatic Hydrocarbons (PAHs) – Interim Final. OSWER Directive 9285.7-78. June.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.

*	Reporting limits greater than or equal to the Commercial Screening Level.

Notes

Soil sample counts presented do not include duplicate (quality control) samples. At locations where duplicate samples were collected, the higher of the two values is considered
All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background value because it is greater than the respective screening level.

‡ Maxiumum Reporting Limit greater than or equal to the ISL

mg/kg	miligrams per kilogram
µg/kg	micrograms per kilogram
ng/kg	nanograms per kilogram
BK	Background Value
CSL	Commercial Screening Level
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
ISL	Interim Screening Level
NA	not applicable
ND	not detected in any of the samples
NE	not established
RWQCB	Regional Water Quality Control Board
SL	screening level
USEPA	United States Environmental Protection Agency

1 CH2M HILL. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.) or ambient threshold value (CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

2 Water Board. 2016. “San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels, Table S-1: Soil Direct Exposure Human Health Screening Levels, Interim Final.” Febr

3 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used, except for TEQ human, where the DTSC-SL is used. "

4 Number of exceedences are the number of detections exceeding the background threshold value (BTV).

5 Number of exceedences are the number of detections that are equal to or exceeds the screening level (ecological comparison value, residential reporting limit, commercial reporting limit or interim screening level) or otherwise noted.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.

*	Reporting limits greater than or equal to the Commercial Screening Level.
---	not analyzed
mg/kg	milligrams per kilogram
ft bgs	feet below ground surface
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
FD	field duplicate
N	primary sample
ND	not detected at the listed reporting limit
NE	not established
J	concentration or reporting limit estimated by laboratory or data validation
USEPA	United States Environmental Protection Agency

1 Commercial creening evel - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 CH2M. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.

3 Commercial screening level is below background value; therefore, arsenic results are only screened against the background value.

TABLE 3-29b

Sample Results: Polycyclic Aromatic Hydrocarbons
AOC 20 – Industrial Floor Drains
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.
B(a)P EQ Equivalent is calculated using half the reporting limit for non detects.

*	Reporting limits greater than or equal to the Commercial Screening Level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
B(a)P	Benzo (a) pyrene
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
N	primary sample
NA	not applicable
ND	not detected at the listed reporting limit
NE	not established
PAH	Polycyclic aromatic hydrocarbons
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
R	The result has been rejected; identification and/quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample analyzed beyond the recommended hold time).
USEPA	United States Environmental Protection Agency

1 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 Background values are either not established or not applicable.

Calculations:

B(a)P equivalent was calculated using relative potency factors for carcinogenic PAHs from U.S. Environmental Protection Agency. 1993. EPA’s Provisional Guidance for Quantitative Risk Assessment of Polycyclic Aromatic Hydrocarbons. EPA 600/R-93-089. July.

Calculations of LMW-PAHs and HMW-PAHs were consistent with U.S. Environmental Protection Agency. 2007. Ecological Soil Screening Levels for Polycyclic Aromatic Hydrocarbons (PAHs) – Interim Final. OSWER Directive 9285.7-78. June.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

TABLE 3-29e

Sample Results: Polychlorinated Biphenyls
AOC 20 – Industrial Floor Drains
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

Results greater than the commercial screening level are circled.

*	Reporting limits greater than or equal to the commercial screening level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
CHHSL	California human health screening levels
DTSC	California Department of Toxic Substances Control
FD	field duplicate
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
N	primary sample
ND	not detected at the listed reporting limit
NE	not established
R	The result has been rejected; identification and/or quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample following a hold time of greater than one year).
USEPA	United States Environmental Protection Agency

1 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 Background values have not been established for polychlorinated biphenyls.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.

*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
ng/kg	nanograms per kilogram
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
FD	field duplicate
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
NA	not applicable
NE	not established
N	primary sample
ND	not detected at the listed reporting limit
R	The result has been rejected; identification and/quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample analyzed beyond the recommended hold time).
TEQ Human	Sum of Result x TEF, 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.
USEPA	United States Environmental Protection Agency

1 Commercial screening level - for individual dioxins and furans, the lower of the commercial DTSC-SL and USEPA regional screening level is used. For TEQ human, the DTSC-SL is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 Background values are not established or not applicable.

TABLE 3-29g

Constituent Concentrations in Soil Compared to Screening Values
AOC 20 – Industrial Floor Drains
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
Pacific Gas and Electric Company Topock Compressor Station, Needles, California

Notes

Soil sample counts presented do not include duplicate (quality control) samples. At locations where duplicate samples were collected, the higher of the two values is considered
All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background value because it is greater than the respective screening level.

‡ Maxiumum Reporting Limit greater than or equal to the ISL

mg/kg	miligrams per kilogram
µg/kg	micrograms per kilogram

ISL	Interim Screening Level
NA	not applicable
ND	not detected in any of the samples
NE	not established
RWQCB	Regional Water Quality Control Board
SL	screening level
USEPA	United States Environmental Protection Agency

1 CH2M HILL. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.) or ambient threshold value (CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

2 Water Board. 2016. “San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels, Table S-1: Soil Direct Exposure Human Health Screening Levels, Interim Final.” Febr

3 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used, except for TEQ human, where the DTSC-SL is used. "

4 Number of exceedences are the number of detections exceeding the background threshold value (BTV).

5 Number of exceedences are the number of detections that are equal to or exceeds the screening level (ecological comparison value, residential reporting limit, commercial reporting limit or interim screening level) or otherwise noted.

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.

ϴ	white powder sample.
*	Reporting limits greater than or equal to the Commercial Screening Level.

TABLE 3-30c

Sample Results: Polycyclic Aromatic Hydrocarbons
AOC 21 – Round Depression near Sludge Drying Bed
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.
B(a)P EQ Equivalent is calculated using half the reporting limit for non detects.

ϴ	white powder sample.
*	Reporting limits greater than or equal to the Commercial Screening Level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
B(a)P	Benzo (a) pyrene
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
N	primary sample
NA	not applicable
ND	not detected at the listed reporting limit
NE	not established
PAH	Polycyclic aromatic hydrocarbons
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is "R" qualified.
R	The result has been rejected; identification and/quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample analyzed beyond the recommended hold time).
USEPA	United States Environmental Protection Agency

1 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 Background values are either not established or not applicable.

Calculations:

B(a)P equivalent was calculated using relative potency factors for carcinogenic PAHs from U.S. Environmental Protection Agency. 1993. EPA's Provisional Guidance for Quantitative Risk Assessment of Polycyclic Aromatic Hydrocarbons. EPA 600/R-93-089. July.

Calculations of LMW-PAHs and HMW-PAHs were consistent with U.S. Environmental Protection Agency. 2007. Ecological Soil Screening Levels for Polycyclic Aromatic Hydrocarbons (PAHs) – Interim Final. OSWER Directive 9285.7-78. June.

					Background Value (BK) [1]		RWQCB Environmental Screening Levels (ESL) [2]		Commercial Screening Level (CSL) [3]	
Parameter	**Units**	**Number of Locations**	**Frequency of Detection**	**Maximum Detected Value**	**# of Exceedences [4]**	**(BK)**	**# of Exceedences [5]**	**(ESL)**	**# of Exceedences [5]**	**(CSL)**
Polycyclic Aromatic Hydrocarbons										
Benzo (a) anthracene	µg/kg	10	1 / 18 (5.6%)	25	NA	(NE)	NA	(NA)	0	(21,000)
Benzo (a) pyrene	µg/kg	10	1 / 18 (5.6%)	51	NA	(NE)	NA	(NA)	0	(2,100)
Benzo (b) fluoranthene	µg/kg	10	5 / 18 (28%)	120	NA	(NE)	NA	(NA)	0	(21,000)
Chrysene	µg/kg	10	2 / 18 (11%)	51	NA	(NE)	NA	(NA)	0	(2,100,000)
Fluoranthene	µg/kg	10	3 / 18 (17%)	67	NA	(NE)	NA	(NA)	0	(30,000,000)
Phenanthrene	µg/kg	10	1 / 18 (5.6%)	12	NA	(NE)	NA	(NA)	0	(230,000,000)
Pyrene	µg/kg	10	2 / 18 (11%)	61	NA	(NE)	NA	(NA)	0	(23,000,000)
B(a)P Equivalent	µg/kg	10	6 / 18 (33%)	94	5	(55)	NA	(NA)	0	(2,100)
Polychlorinated biphenyls										
Aroclor 1254	µg/kg	10	6 / 17 (35%)	71	NA	(NE)	NA	(NA)	0	(970)
Aroclor 1260	µg/kg	10	1 / 17 (5.9%)	49	NA	(NE)	NA	(NA)	0	(990)
Total PCBs	µg/kg	10	6 / 17 (35%)	138	NA	(NE)	NA	(NA)	0	(940)
Total Petroleum Hydrocarbons										
TPH as diesel	mg/kg	10	3 / 17 (18%)	33	NA	(NE)	0	(230)	0	(1,100)
TPH as motor oil	mg/kg	10	12 / 17 (71%)	290	NA	(NE)	0	(11,000)	0	(140,000)
TPH as gasoline	mg/kg	10	0 / 12 (0%)	ND (3.5)	NA	(NE)	0	(740)	0	(3,900)

Notes

Soil sample counts presented do not include duplicate (quality control) samples. At locations where duplicate samples were collected, the higher of the two values is considered
All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background value because it is greater than the respective screening level.

‡ Maxiumum Reporting Limit greater than or equal to the ISL

mg/kg	miligrams per kilogram
µg/kg	micrograms per kilogram
ng/kg	nanograms per kilogram
BK	Background Value
CSL	Commercial Screening Level
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
ISL	Interim Screening Level
NA	not applicable
ND	not detected in any of the samples
NE	not established
RWQCB	Regional Water Quality Control Board
SL	screening level
USEPA	United States Environmental Protection Agency

1 CH2M HILL. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.) or ambient threshold value (CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

2 Water Board. 2016. “San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels, Table S-1: Soil Direct Exposure Human Health Screening Levels, Interim Final.” Febr

3 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used, except for TEQ human, where the DTSC-SL is used. "

4 Number of exceedences are the number of detections exceeding the background threshold value (BTV).

5 Number of exceedences are the number of detections that are equal to or exceeds the screening level (ecological comparison value, residential reporting limit, commercial reporting limit or interim screening level) or otherwise noted.

TABLE 3-31c

Sample Results: Polycyclic Aromatic Hydrocarbons
AOC 22 – Unidentified Three-sided Structure
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.
B(a)P EQ Equivalent is calculated using half the reporting limit for non detects.

*	Reporting limits greater than or equal to the Commercial Screening Level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
B(a)P	Benzo (a) pyrene
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
N	primary sample
NA	not applicable
ND	not detected at the listed reporting limit
NE	not established
PAH	Polycyclic aromatic hydrocarbons
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
R	The result has been rejected; identification and/quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample analyzed beyond the recommended hold time).
USEPA	United States Environmental Protection Agency

1 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 Background values are either not established or not applicable.

Calculations:

B(a)P equivalent was calculated using relative potency factors for carcinogenic PAHs from U.S. Environmental Protection Agency. 1993. EPA's Provisional Guidance for Quantitative Risk Assessment of Polycyclic Aromatic Hydrocarbons. EPA 600/R-93-089. July.

Calculations of LMW-PAHs and HMW-PAHs were consistent with U.S. Environmental Protection Agency. 2007. Ecological Soil Screening Levels for Polycyclic Aromatic Hydrocarbons (PAHs) – Interim Final. OSWER Directive 9285.7-78. June.

Constituent Concentrations in Soil Compared to Screening Values
AOC 22 – Unidentified Three-sided Structure
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
Pacific Gas and Electric Company Topock Compressor Station, Needles, California

Notes

Soil sample counts presented do not include duplicate (quality control) samples. At locations where duplicate samples were collected, the higher of the two values is considered
All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background value because it is greater than the respective screening level.

‡ Maxiumum Reporting Limit greater than or equal to the ISL

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.

*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
ng/kg	nanograms per kilogram
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
FD	field duplicate
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
NA	not applicable
NE	not established
N	primary sample
ND	not detected at the listed reporting limit
R	The result has been rejected; identification and/quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample analyzed beyond the recommended hold time).
TEQ Human	Sum of Result x TEF, 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.
USEPA	United States Environmental Protection Agency

1 Commercial screening level - for individual dioxins and furans, the lower of the commercial DTSC-SL and USEPA regional screening level is used. For TEQ human, the DTSC-SL is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 Background values are not established or not applicable.

Notes

Soil sample counts presented do not include duplicate (quality control) samples. At locations where duplicate samples were collected, the higher of the two values is considered
All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background value because it is greater than the respective screening level.

‡ Maxiumum Reporting Limit greater than or equal to the ISL

TABLE 3-33c

Sample Results: Polycyclic Aromatic Hydrocarbons
AOC 24 – Stained Area and Former API Oil/Water Separator
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.
B(a)P EQ Equivalent is calculated using half the reporting limit for non detects.

*	Reporting limits greater than or equal to the Commercial Screening Level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
B(a)P	Benzo (a) pyrene
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
N	primary sample
NA	not applicable
ND	not detected at the listed reporting limit
NE	not established
PAH	Polycyclic aromatic hydrocarbons
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
R	The result has been rejected; identification and/quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample analyzed beyond the recommended hold time).
USEPA	United States Environmental Protection Agency

1 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 Background values are either not established or not applicable.

Calculations:

B(a)P equivalent was calculated using relative potency factors for carcinogenic PAHs from U.S. Environmental Protection Agency. 1993. EPA’s Provisional Guidance for Quantitative Risk Assessment of Polycyclic Aromatic Hydrocarbons. EPA 600/R-93-089. July.

Calculations of LMW-PAHs and HMW-PAHs were consistent with U.S. Environmental Protection Agency. 2007. Ecological Soil Screening Levels for Polycyclic Aromatic Hydrocarbons (PAHs) – Interim Final. OSWER Directive 9285.7-78. June.

TABLE 3-33i

Constituent Concentrations in Soil Compared to Screening Values
AOC 24 – Stained Area and Former API Oil/Water Separator
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
Pacific Gas and Electric Company Topock Compressor Station, Needles, California

Notes

Soil sample counts presented do not include duplicate (quality control) samples. At locations where duplicate samples were collected, the higher of the two values is considered
All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background value because it is greater than the respective screening level.

‡ Maxiumum Reporting Limit greater than or equal to the ISL

mg/kg	miligrams per kilogram
µg/kg	micrograms per kilogram
ng/kg	nanograms per kilogram
BK	Background Value
CSL	Commercial Screening Level
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
ISL	Interim Screening Level
NA	not applicable
ND	not detected in any of the samples
NE	not established
RWQCB	Regional Water Quality Control Board
SL	screening level
USEPA	United States Environmental Protection Agency

1 CH2M HILL. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.) or ambient threshold value (CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

2 Water Board. 2016. “San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels, Table S-1: Soil Direct Exposure Human Health Screening Levels, Interim Final.” Febr

3 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used, except for TEQ human, where the DTSC-SL is used. "

4 Number of exceedences are the number of detections exceeding the background threshold value (BTV).

5 Number of exceedences are the number of detections that are equal to or exceeds the screening level (ecological comparison value, residential reporting limit, commercial reporting limit or interim screening level) or otherwise noted.

TABLE 3-34a
Sample Results: Metals
AOC 26 – Former Scrubber Oil Sump
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.

*	Reporting limits greater than or equal to the Commercial Screening Level.
---	not analyzed
mg/kg	milligrams per kilogram
ft bgs	feet below ground surface
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
FD	field duplicate
N	primary sample
ND	not detected at the listed reporting limit
NE	not established
J	concentration or reporting limit estimated by laboratory or data validation
USEPA	United States Environmental Protection Agency

1 Commercial creening evel - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 CH2M. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.

3 Commercial screening level is below background value; therefore, arsenic results are only screened against the background value.

TABLE 3-34b

Sample Results: Polycyclic Aromatic Hydrocarbons
AOC 26 – Former Scrubber Oil Sump
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the Background value are bolded. Results greater than the commercial screening level or RWQCB ESL are circled.
B(a)P EQ Equivalent is calculated using half the reporting limit for non detects.

*	Reporting limits greater than or equal to the Commercial Screening Level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
B(a)P	Benzo (a) pyrene
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Levels
FD	field duplicate
N	primary sample
NA	not applicable
ND	not detected at the listed reporting limit
NE	not established
PAH	Polycyclic aromatic hydrocarbons
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is “R” qualified.
R	The result has been rejected; identification and/quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample analyzed beyond the recommended hold time).
USEPA	United States Environmental Protection Agency

1 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 Background values are either not established or not applicable.

Calculations:

B(a)P equivalent was calculated using relative potency factors for carcinogenic PAHs from U.S. Environmental Protection Agency. 1993. EPA’s Provisional Guidance for Quantitative Risk Assessment of Polycyclic Aromatic Hydrocarbons. EPA 600/R-93-089. July.

Calculations of LMW-PAHs and HMW-PAHs were consistent with U.S. Environmental Protection Agency. 2007. Ecological Soil Screening Levels for Polycyclic Aromatic Hydrocarbons (PAHs) – Interim Final. OSWER Directive 9285.7-78. June.

Notes:
$\mu g/m^3$ = micrograms per cubic meter
AF = attenuation factor
DTSC = California Department of Toxic Substances Control
FD = field duplicate
ft bgs = feet below ground surface
J = concentration or reporting limit estimated by laboratory or data validation
N = primary sample
SL = screening level
U = not detected at the listed reporting limit
UJ = not detected, listed reporting limit estimated by laboratory or data validation
[a] All data presented are Category 1 data
[b] Soil gas screening levels ($\mu g/m^3$) calculated using 2011 DTSC AFs and DTSC 2018 recommended SLs
[c] Soil gas screening levels ($\mu g/m^3$) calculated using 2023 DTSC draft AFs and DTSC 2018 recommended SLs

Notes:

Category 1: Validated data suitable for all uses, including risk assessment and remedial action decisions.
Category 2: Validated data suitable for use in characterization of the chemicals of potential concern at the facility and to help define the nature and extent of contamination.
Category 3: Validated data suitable only for use in qualitative characterization of the nature and extent of contamination.

Results greater than the commercial screening level are circled.

* Reporting limits greater than or equal to the commercial screening level.
--- not analyzed

TABLE 3-34g

Sample Results: Polychlorinated Biphenyls
AOC 26 – Former Scrubber Oil Sump
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
CHHSL	California human health screening levels
DTSC	California Department of Toxic Substances Control
FD	field duplicate
J	concentration or reporting limit estimated by laboratory or data validation
JR	estimated value, one or more input values is "R" qualified.
N	primary sample
ND	not detected at the listed reporting limit
NE	not established
R	The result has been rejected; identification and/or quantitation could not be verified because critical QC specifications were not met (e.g., a non-detect result obtained for an archive sample following a hold time of greater than one year).
USEPA	United States Environmental Protection Agency

1 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used. Sources: California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January. United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

2 Background values have not been established for polychlorinated biphenyls.

Constituent Concentrations in Soil Compared to Screening Values
AOC 26 – Former Scrubber Oil Sump
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
Pacific Gas and Electric Company Topock Compressor Station, Needles, California

Notes

Soil sample counts presented do not include duplicate (quality control) samples. At locations where duplicate samples were collected, the higher of the two values is considered
All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background value because it is greater than the respective screening level.

‡ Maxiumum Reporting Limit greater than or equal to the ISL

mg/kg	miligrams per kilogram
µg/kg	micrograms per kilogram
ng/kg	nanograms per kilogram
BK	Background Value
CSL	Commercial Screening Level

DTSC-SL	DTSC Screening Level
ISL	Interim Screening Level
NA	not applicable
ND	not detected in any of the samples
NE	not established
RWQCB	Regional Water Quality Control Board
SL	screening level
USEPA	United States Environmental Protection Agency

1 CH2M HILL. 2009. "Final Soil Background Technical Memorandum at Pacific Gas and Electric Company Topock Compressor Station, Needles, California." May.) or ambient threshold value (CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

2 Water Board. 2016. “San Francisco Bay Regional Water Quality Control Board Environmental Screening Levels, Table S-1: Soil Direct Exposure Human Health Screening Levels, Interim Final.” Febr

3 Commercial screening level - the lower of the commercial DTSC-SL and USEPA regional screening level is used, except for TEQ human, where the DTSC-SL is used. "

4 Number of exceedences are the number of detections exceeding the background threshold value (BTV).

5 Number of exceedences are the number of detections that are equal to or exceeds the screening level (ecological comparison value, residential reporting limit, commercial reporting limit or interim screening level) or otherwise noted.

Notes

Soil sample counts presented do not include duplicate (quality control) samples. At locations where duplicate samples were collected, the higher of the two values is considered
All statistics presented in this table consider Category 1 and Category 2 data only.
* Number of exceedances are calculated using background value because it is greater than the respective screening level.

‡ Maxiumum Reporting Limit greater than or equal to the ISL

Notes
Screening levels in micrograms per kilogram (µg/kg)
[a] Based on lowest recreator value
[b] Based on lowest wildlife value
[c] Based on lowest worker value
NC = not calculated
NE = not established
RBRG = risk-based remedial goal
RBC = risk-based concentration
SC() = RBC is greater than the theoretical soil saturation limit for that compound or the threoretical ceiling limit of 100,000 mg/kg

Notes

Screening levels in micrograms per kilogram (µg/kg)

[a] Based on lowest recreator value

[b] Based on lowest wildlife value

[c] Based on lowest worker value

NA = not applicable

NC = not calculated

NE = not established

RBRG = risk-based remedial goal

RBC = risk-based concentration

SC() = RBC is greater than the theoretical soil saturation limit for that compound or the threoretical ceiling limit of 100,000 mg/kg

[a] Silt assumed as fine fraction for NP samples

°C = degrees Celsius

cc = cubic centimeter

CL = clay of low plasticity

g = grams

ML = silt of low plasticity

NA = Not analyzed

NP = Non-plastic

USCS = Unified Soil Classification Code

Vb = bulk volume

wt = weight

%wt = percent weight

[a] Silt assumed as fine fraction for NP samples

[b] Insufficient sample to perform test

[c] Sample was placed on hold and not released for analysis

°C = degrees Celsius
cc = cubic centimeter
CL = clay of low plasticity
g = grams
ML = silt of low plasticity
NA = Not analyzed
NP = Non-plastic
USCS = Unified Soil Classification Code
Vb = bulk volume
wt = weight
%wt = percent weight

TABLE 3-39c
Sample Results: Polycyclic Aromatic Hydrocarbons
Offsite Migration Assessment
RFI/RI Report, Volume 3 – Results of Soil and Sediment Investigation
PG&E Topock Compressor Station, Needles, California

Only Category 1 data shown (i.e., validated data suitable for all uses, including risk assessment and remedial action decisions).

Results greater than or equal to the interim screening level are circled.

§	Sample removed during 2020 excavation
Y	debris sample
ψ	tar sample
*	Reporting limits greater than or equal to the interim screening level.
---	not analyzed
µg/kg	micrograms per kilogram
ft bgs	feet below ground surface
B(a)P	Benzo (a) pyrene
DTSC	California Department of Toxic Substances Control
DTSC-SL	DTSC Screening Level
FD	field duplicate
N	primary sample
ND	not detected at the listed reporting limit
NE	not established
PAH	Polycyclic aromatic hydrocarbons
J	concentration or reporting limit estimated by laboratory or data validation
USEPA	United States Environmental Protection Agency

1 Selected value is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

2 United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

3 California Department of Toxic Substances Control (DTSC). 2018. Human Health Risk Assessment (HHRA) Note Number 3. January.

4 ARCADIS. 2008. "Technical Memorandum 3: Ecological Comparison Values for Metals and Polycyclic Aromatic Hydrocarbons in Soil." May 28.

5 CH2M. 2017. Revised Ambient Study of Dioxins and Furans at the Pacific Gas and Electric Company, Topock Compressor Station, Needles, California. October.

Only Category 1 data shown (i.e., validated data suitable for all uses, including risk assessment and remedial action decisions).
Results greater than or equal to the Interim Screening Level are circled.

§ Sample removed during 2020 excavation
-¥ debris sample / not analyzed
ψ tar sample

ft bgs ft bgs = feet below ground surface
ng/kg ng/kg = nanograms per kilogram
DTSC DTSC = California Department of Toxic Substances Control
DTSC-SL DTSC-SL = DTSC Screening Level
FD FD = Field Dupliicate
N N = Primary Sample
NA NA = not applicable
NE NE = not established
ND ND = not detected at the listed reporting limit
J J = concentration or reporting limit estimated by laboratory or data validation
R R = rejected by laboratory or data validation
TEQ TEQ = Sum of Result x Toxic equivalency factor (TEF), 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.
TEQ Avian TEQ Avian = Sum of Result x TEF, 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U.
TEQ Mammals TEQ Mammals = Sum of Result x TEF, 1/2 reporting limit used for nondetects. If all Dioxins and Furans are nondetect, the final qualifier code is U

USEPA USEPA = United States Environmental Protection Agency

1 Selected value is the lower of the ECV, residential DTSC-SL, or USEPA residential regional screening value, unless the background value is higher.

2 United States Environmental Protection Agency (USEPA). 2017. Regional Screening Levels (RSLs) for Chemical Contaminants at Superfund Sites. November.

[1]The factor of exceedance is calculated by dividing the sample concentration by the applicable screening level.
µg/kg = microgram per kilogram
B(a)P = benzo(a)pyrene
FD = field duplicate
HMW PAHs = high molecular weight polycyclic aromatic hydrocarbons
ISL = interim screening level
J = concentration or reporting limit estimated by laboratory or data validation
mg/kg = milligrams per kilogram
N = primary sample
ng/kg = nanogram per kilogram
PCBs = polychlorinated bisphenyls
TEQ = toxic equivalency factor
TPH = total petroleum hydrocarbons

[a] All data presented are Category 1 data.

[b] Catch basin sediments were removed during implementation of the Soil RFI/RI Work Plan and are no longer present on site.

FD = field duplicate

ft bgs = feet below ground surface

J = concentration or reporting limit estimated by laboratory or data validation

mg/kg = milligrams per kilogram

N = primary sample

U = not detected at the listed reporting limit

UJ = not detected above the detection limit objective; however, the reported detection limit is approximate and might not represent the actual limit of quantitation necessary to accurately and precisely measure the analyte in the sample

TABLE 3-42
Summary of Storm Drain Survey
RFI/RI Report, Volume 3 – Soil Investigation
PG&E Topock Compressor Station, Needles, California

Feature Number	Pipe Diameter (inches)	Approximate Total Length (feet)	Pipe Material and Length (feet)	Bends and Joints (feet)	Key Observations	Flow Pathway from Catchment Basin (CB) or Trench Drain Line (TDL) to Outfalls (SD samples)	Constituents Exceeding Screening Levels[a] in Catch Basin (CB) and Trench Drain (TD) Samples	Constituents Exceeding Screening Levels[a] in Soil (Outfall samples are bolded)	Constituents in Flow Test Water that Exceed Concentrations in Source Water
Storm Drain Lines (SDLs) (Extending Outside Topock Compressor Station [TCS])									
SDL-1	--	--	--	--	Not located		--	--	--
SDL-2	6	122	Cast Iron – 0 to 3.5 Black PVC – 3.5 to 5.67 Blue PVC – 4.67 to 47.5 Corrugated Steel – 47.5 to 122	90˚ bend from vertical to horizontal East at 0.83 45˚ bend North at 5.75 45˚ bend South and down at 58 45˚ bend North at 119.33	Pipe begins at Trench Drain 1; no sediment in trench drain Bottom of corrugated steel pipe rusty and corroded with possible small holes from 89.92 feet to 100 feet Transitions from horizontal to downward pipe at 58 feet	1. TDL-1 2. SD-01	No sediment	**Locations: SD-01** **Metals:** copper, total chromium (CrT), nickel, zinc **Organics:** none	**Metals:** arsenic, barium, hexavalent chromium (CrVI), CrT, copper, molybdenum, selenium, vanadium, zinc **Organics**: Total petroleum hydrocarbons (TPH)-diesel, TPH-motor oil
SDL-3 Segment A	4	65	Red Clay – 0 to 37.7 White PVC – 37.7 to 47.4 Red Clay – 47.4 to 65 Part of the section from 25 to 33 was cut and removed during December 2016 and replaced with new CPVC pipe. The entire section of line was videoed from CB-4 to CB-3.	90˚ bend South at 28	Pipe begins at Catch Basin (CB)-4 and joins SDL-3b at CB-3; sediment was present in CB-3 only Clay pipe has scale, but free of debris Silt in bottom of pipe at 14.1 feet and blockage from 25 to 33 feet (which is a 90-degree bend) Video from 33 to 65 feet was taken from the outfall, starting at CB-3, towards CB-4, so footage for the 33 to 65 feet segment is in reverse with 0 feet being at the outfall of CB-3 and 33 feet being 32 feet being the end of the blockage, located at 33 feet from CB-4. An excavation was conducted at the 90-degree elbow to unplug the pipe. Once the pipe was exposed, cracks were noted at the 90˚ elbow and also just north of the handicap ramp. Soil samples were collected at the two locations where the cracks were observed in the 5-inch diameter clay pipe (one near the 90˚ elbow and another 5.5 feet downstream of the 90˚ elbow). The clay pipe was cut so that the two cracks and the plugged section of pipe were removed and replaced with new CPVC pipe and fittings. The blockage at the 90-degree elbow was the result of a spray paint can cap. Approximately 47 feet east of CB-3 a line beginning at CB-6 junctions into SDL-3. The junction was exposed and soil samples were collected (SD-44).	1. CB-4 2. CB-3 3. CB-2 4. SD-03 5. SD-02 6. CB-5 (possibly) 7. CB-6 (possibly)	**Locations:** CB-1, -3 and -5 (no sediment in CB-2 and -4) **Metals:** antimony, barium, cadmium CrVI, CrT, copper, iron, lead, mercury, molybdenum, nickel, zinc **Organics:** PAH high molecular weight, benzo(a)pyrene equivalents, TPH-diesel	**Locations:** **SD-02 and -03** **Metals:** barium, copper, CrT, CrVI, lead, mercury, molybdenum, zinc **Organics:** PAH High Molecular Weight, PAH Low Molecular Weight, benzo(a)pyrene, TPH-diesel **Locations:** **SD-OS34, SD-OS34A, SD-OS36, and SD-OS44** **Metals:** antimony, barium, cadmium, copper, CrT, CrVI, cobalt, lead, mercury, molybdenum, nickel, thallium, zinc **Organics:** PAH High Molecular Weight, TEQ-human, TEQ-avian, and TEQ-mammal total polychlorinated biphenyls (PCBs), Aroclor 1254	**Metals:** barium, CrVI, CrT, copper, lead, molybdenum, nickel, selenium **Organics**: TPH-diesel, TPH-motor oil, benzo(a)pyrene equivalents
SDL-3 Segment B	5	20	Red Clay	Elbow joints at 12.10 and 16.1 "Y" joint at 19.9	Pipe begins at Catch Basins 1 and connects to Strom Drain Line 3 – Segment C. A small amount of debris at 7.11 feet Approximately 14 feet east from CB-1, an offset was observed. Samples were collected above and below the noted offset in the pipe. The depth of the pipe was approximately 44 inches below the ground surface. The clay pipe and joint appeared to be in good condition at the location of the offset.	1. CB-1 2. SD-03 3. SD-02			
SDL-3 Segment C	8	94	Red Clay	CB-2 from 2 to 4.8 "Y" joint at 36.7	From CB-5, the storm drain line goes into a utility trench (9.7 to 14.5 feet), and then goes to CB-2.	1. CB-5 2. CB-2			

Feature Number	Pipe Diameter (inches)	Approximate Total Length (feet)	Pipe Material and Length (feet)	Bends and Joints (feet)	Key Observations	Flow Pathway from Catchment Basin (CB) or Trench Drain Line (TDL) to Outfalls (SD samples)	Constituents Exceeding Screening Levels[a] in Catch Basin (CB) and Trench Drain (TD) Samples	Constituents Exceeding Screening Levels[a] in Soil (Outfall samples are bolded)	Constituents in Flow Test Water that Exceed Concentrations in Source Water
					No debris in pipe "Y" joint at 35.1 where SDL-3 – Segment B enters the line Piece of broken red clay pipe inside of red clay pipe at 88.5 feet and 90.9 feet	3. SD-03 4. SD-02			
CB-6	6	Unknown	8" Steel – 0 to 2 8" Red Clay – 2 to 25	Steel globe valve at 1-2	A valve 1 foot south of CB 6 was closed and locked when the catch basin was initially evaluated. The valve was unlocked and opened by TCS staff, but the pipe was completely filled with material. The fill material, which was oily and stained soil, was removed and the video survey was conducted. Soil samples were collected just south of the valve vault (SD-OS35A), above and below the pipe. The video survey continued 25 feet south where sediment or fill was encountered, stopping the video survey. The red clay line was oriented south and appeared to continue south towards SDL-3. A pothole was conducted in the visitor parking lot along the SDL-3 mainline and a "T" was found and samples were collected above and below the pipe (SD-44). The pipe appeared in good condition, based on observation from the pothole. It is assumed that the "T" is, or was, connected to CB-6 at one time. The line near CB-6 that traveled east then north from the "T" fitting in the vault was traced to the oil collection area north of CB-6.	None	**Location:** CB-6 **Metals:** barium, cadmium, copper, CrVI, CrT, lead, mercury, molybdenum, zinc **Organics:** PAH High Molecular Weight, PAH Low Molecular Weight, benzo(a)pyrene equivalents, TPH-diesel	**Locations: SD-OS35A, SD-OS35, and SD-OS44** **Metals:** cadmium, copper, CrVI, CrT, lead, mercury, thallium, zinc **Organics:** PAH High Molecular Weight, benzo(a)pyrene equivalents	--
SDL-4	4	13	Gray PVC	None	Pipe begins at CB-32; no sediment in catch basin Pipe free of debris Video was conducted from the outfall upstream towards CB-32, which was not identified in the field prior to the video survey for this pipe CB-32 was covered by dead plant debris	1. CB-32 2. SD-04	**Location:** CB-32 No sediment	**Location: SD-04** No exceedances	--
SDL-4B	5	48	Gray PVC – 0 to 41 Red Clay – 41 to 48	Horizontal Bend at 39	No catch basin found for this pipe; started video survey at outfall, so lengths are reported from outfall upstream Gravel and debris at 46 feet and blockage starting at 47.5 feet, survey terminated at 47.7 feet Blockage is likely associated with the decommissioning of the former trench drain across the road to the north (identified in the work plan Figure D-2)	None	--	**Location: SD-21** **Metals**: zinc **Organics**: none **Locations: SD-05, -06 and -22** **Metals**: lead, molybdenum, zinc **Organics**: none	--
SDL-5	8	34	Corrugated Steel	None	Pipe begins at CB-7, which is an open pipe above ground surface, no sediment present in catch basin Pipe free of debris, corrosion and rust Slight gap in pipe at 26 feet (note – the pipe sections were pushed back together after the video survey to try and limit the gap)	1. CB-7 2. SD-07	**Location:** CB-7 No sediment	**Location: SD-07** **Metals**: lead, zinc **Organics**: none	**Metals**: arsenic, barium, CrVI, CrT, molybdenum, selenium, vanadium, zinc

TABLE 3-42
Summary of Storm Drain Survey
RFI/RI Report, Volume 3 – Soil Investigation
PG&E Topock Compressor Station, Needles, California

Feature Number	Pipe Diameter (inches)	Approximate Total Length (feet)	Pipe Material and Length (feet)	Bends and Joints (feet)	Key Observations	Flow Pathway from Catchment Basin (CB) or Trench Drain Line (TDL) to Outfalls (SD samples)	Constituents Exceeding Screening Levels[a] in Catch Basin (CB) and Trench Drain (TD) Samples	Constituents Exceeding Screening Levels[a] in Soil (Outfall samples are bolded)	Constituents in Flow Test Water that Exceed Concentrations in Source Water
SDL-6	8	52	Corrugated Steel	"T" joint at 37	Pipe begins at CB-8; sediment present in catch basin Blockage at "T" joint and could not advance camera down the line or into the adjoining unnamed branch to the south Some corrosion in the bottom of the pipe Palm tree roots in pipe at 36.1 feet, at the "T" joint Pipe is very corroded and broken 5-10 feet inside the TCS fence line, and storm water discharges (soil sample location SD-24). An upstream segment of video was conducted from this outfall location to the "T" joint	1. CB-8 2. SD-24 3. SD-08	**Location:** CB-8 **Metals**: copper, lead, mercury, molybdenum, zinc **Organics**: PAH High Molecular Weight, benzo(a)pyrene equivalents	**Locations: SD-08 and SD-24** **Metals**: copper, cadmium, CrVI, lead, molybdenum, zinc **Organics**: PAH High Molecular Weight, benzo(a)pyrene equivalents, dioxins and furans TEQ-mammal	**Metals**: arsenic, barium, cadmium, cobalt, copper, lead, CrVI, CrT, molybdenum, nickel, vanadium, zinc **Organics**: TPH-diesel, TPH-motor oil, benzo(a)pyrene equivalents
SDL-7	4	107	Green PVC – 0 to 1.5 Corrugated Steel – 1.5 to 2.5 PVC – 2.5 to 17.1 Unknown material pipe – at 17.1 PVC – 17.3 to 107	Elbow downhill at 15.1	Pipe begins at CB-9 and flows into and out of CB-10; sediment present in CB-9 only Debris in CB-10 Transition from PVC pipe to an unknown material at 17.1, very small portion of line, debris appears to be entering the transition piece from the top PVC joint is clean and in good condition	1. CB-9 2. CB-10 3. SD-10	**Location:** CB-9 (no sediment in CB-10) **Metals**: copper, lead, molybdenum, zinc **Organics**: PAH High Molecular Weight, benzo(a)pyrene equivalents, TPH-diesel	**Location: SD-10** **Metals**: CrVI, lead, mercury, zinc **Organics**: none **Location: SD-09** No exceedances	**Metals**: arsenic, barium, copper, lead, CrVI, CrT, molybdenum, **Organics**: TPH-diesel, TPH-motor oil
SDL-8	8	140	Red Clay – 0 to 7.4 PVC or Concrete – 7.4 to 39 Red Clay - 39 to 53.9 PVC – 53.9 to 98.9 Corrugated Steel – 98.9 to 140	Elbow at 39 to the north Elbow downhill at 41 Elbow downhill and to the north at 54	Pipe begins at CB-11; sediment present in catch basin Pipe back flows for the first 8 feet Cracks or scale present top of pipe at 9.1 feet and bottom of pipe at 12.8 feet and 29 feet Offset in clay pipe at 51.5 feet PVC joint at 58.3 feet joined, at least in part, by four screws Pipe transitions from underground to above ground on the slope outside of the fence line Approximately 57 feet from CB-11a transition from red clay pipe to PVC pipe was noted. The transition from red clay pipe to PVC was encapsulated in concrete and pipe was approximately 24 to 35 inches below the ground surface. Both the red clay pipe and gray PVC pipe appeared to be in good condition; however, during the flow test there was a leak at this location. Soil samples were collected below and above the pipe at the red clay pipe to PVC pipe transition. Near the outfall and adjacent to SDL-8, there is an abandoned parallel storm drain line. This abandoned line was assessed by video survey from the outfall up to the point where it goes into the hillside, where it was blocked by gravel (approximately 10 feet into the hillside). Soil samples were collected above and below the abandoned line immediately upslope of where the pipe exits the side of the hill (SD-27).	1. CB-11 2. SD-23 3. SD-12	**Location:** CB-11 **Metals**: antimony, arsenic, cadmium, cobalt, copper, CrT, iron, lead, manganese, mercury, molybdenum, nickel, selenium, zinc **Organics**: PAH High Molecular Weight, benzo(a)pyrene equivalents	**Location: SD-11, -11A, -12, and -23** **Metals**: copper, CrVI, CrT, lead, zinc **Organics**: Total PCBs, PAHs High Molecular Weight, Aroclor 1254, Aroclor 1260, TPH-diesel, benzo(a)pyrene equivalents, dioxins and furans TEQ-human, avian, and mammal **Locations: SD-OS37 and SD-27** **Metals**: cadmium, copper, lead, molybdenum, zinc **Organics**: Total PCBs, PAHs High Molecular Weight, Aroclor 1254, Aroclor 1260, benzo(a)pyrene equivalents	**Metals**: barium, copper, lead, CrVI, molybdenum, selenium, vanadium, zinc **Organics**: TPH-diesel, TPH-motor oil

RFI/RI Report, Volume 3 – Soil Investigation
PG&E Topock Compressor Station, Needles, California

Feature Number	Pipe Diameter (inches)	Approximate Total Length (feet)	Pipe Material and Length (feet)	Bends and Joints (feet)	Key Observations	Flow Pathway from Catchment Basin (CB) or Trench Drain Line (TDL) to Outfalls (SD samples)	Constituents Exceeding Screening Levels[a] in Catch Basin (CB) and Trench Drain (TD) Samples	Constituents Exceeding Screening Levels[a] in Soil (Outfall samples are bolded)	Constituents in Flow Test Water that Exceed Concentrations in Source Water
SDL-8 (old)	8		Corrugated Steel		Pipe is not in service and was not video surveyed Pipe is on the south side of SDL-8 and approximately parallel Pipe may or may not be in place from when it was operational	1. CB-not determined 2. SD-11 and -11A 3. SD-23 4. SD-12	No catch basin		
SDL-9	8	215	White PVC – 0 to 24 Corrugated Steel – 24 to 215 Note that red clay pipe does not exist at CB-13 – it is white PVC pipe.	Elbow at 32.9 Gentle curve towards the south from 80 to 170	Pipe begins at CB-13 – 10-inch diameter PVC pipe; sediment present in catch basin Heavily corroded top and bottom of pipe 24.8 feet Corrosion and holes in bottom of pipe at 25.2 feet The pipe was assessed by video survey to locate the PVC-steel transition located approximately 26 feet from CB-13. The PVC to steel transition was encapsulated in concrete and the depth of pipe was 20 to 30 inches below ground surface. Samples were collected above and below the pipe. Steel pipe was corroded and a piece broke off while using the vac-truck. The pipe was repaired by wrapping the pipe with corrugated plastic pipe, plastic, a gravel blanket and then encapsulating the material with concrete. The pipe is separated at 76 feet, which is an above-ground section of the pipe. Soil sample SD-20 was collected at this location. Observations during flow testing indicates that some water discharges at this break, and some water continues down the SDL line and discharges through large holes in the bottom of the pipe at 89 to 92 feet. Debris in pipe at 105 feet	1. CB-13 2. SD-20 3. SD-13	**Location:** CB-13 **Metals**: copper, lead, molybdenum, zinc **Organics**: TPH-diesel, TPH-motor oil	**Locations: SD-13 and -20** **Metals**: CrVI, sodium, zinc **Organics**: benzo(a)pyrene equivalents **Location: SD-OS39** **Metals**: Lead **Organics**: total PCBs, Aroclor 1254	**Metals**: barium, copper, CrVI, molybdenum, selenium **Organics**: TPH-diesel, TPH-motor oil, benzo(a)pyrene equivalents
SDL-10	10	156	Green PVC	Elbow at 21.9	Pipe starts at CB-15; sediment present in catch basin Plant material at pipe joint at 65.8 feet, but no sign of cracked or broken pipe. The pipe was exposed and inspected during soil sampling at this location (below the 45˚ elbow) and appeared in good condition.	1. CB-15 2. SD-14	**Location:** CB-15 **Metals**: cadmium, copper, CrVI, CrT, lead, zinc **Organics**: Total PCBs, PAH High Molecular Weight, Aroclor 1254, benzo(a)pyrene equivalents, TEQ-human, avian, and mammal	**Location: SD-14** **Metals**: calcium, copper, CrVI, CrT, lead, molybdenum, zinc **Organics**: Total PCBs, TEQ-human, mammal and avian, PAH High Molecular Weight, benzo(a)pyrene equivalents, Aroclor 1254, Aroclor 1260, TPH-diesel **Location SD-OS33** No exceedances	--

Feature Number	Pipe Diameter (inches)	Approximate Total Length (feet)	Pipe Material and Length (feet)	Bends and Joints (feet)	Key Observations	Flow Pathway from Catchment Basin (CB) or Trench Drain Line (TDL) to Outfalls (SD samples)	Constituents Exceeding Screening Levels[a] in Catch Basin (CB) and Trench Drain (TD) Samples	Constituents Exceeding Screening Levels[a] in Soil (Outfall samples are bolded)	Constituents in Flow Test Water that Exceed Concentrations in Source Water
Abandoned line near SDL-10	8	Unknown, but likely 30 to 50	Corrugated Steal	None observed	On February 15, 2017, soil samples (SD-31) were collected above, below and from within an old, abandoned drain line that was located on the west-facing slope (from the upper to lower yard) below the B-Line Cooling Tower. The samples were collected approximately half way down the slope, where the abandoned pipe could still be identified but was very corroded with no structural integrity remaining. The pipe collapsed during sampling (at the sample location) and was completely filled with soil – this soil was collected in addition to samples collected above and below the pipe	--	--	**Location: SD-31** **Metals:** cadmium, copper, CrVI, CrT, lead, zinc **Organics:** benzo(a)pyrene equivalents, PAH High Molecular Weight, total PCBs, Aroclor 1254, Aroclor 1260, TEQ-human, avian, and mammal	--
SDL-11 Area A: Everything above CB-22 CB-28 - CB-30	8	66	White PVC	--	Pipe in good condition Sand in pipe at 28.3 feet Flow is from north to southwest from CB-28 to the CB-30.	1. CB-28 2. CB-30	**Location:** CB-28 **Metals**: copper, CrT, lead, mercury, molybdenum, nickel, zinc **Organics**: benzo(a)pyrene equivalents	No outfall	--
CB-31 – CB-30	4	17.5	White PVC	Downward elbows at 2 and 16.2	PVC pipe outfalls into pipe from CB-30 at 17.5 feet and flows from southwest to north, from CB-31 to CB-30. Pipe is in good condition and free of debris No sediment in catch basin	1. CB-31 2. CB-30	No sediment	No outfall	
CB-30 – CB-22	8	120	Red clay	90˚ elbow from south to west at 2 At 26 feet, pipe drops below mesh box then flows towards CB-22, but could not advance the camera beyond 27 feet due to the angled pipe downstream of the mesh box. It is assumed that a “Y” or “T” fitting from CB-26 is located at roughly 28, where we could not advance the camera A south facing “T” was observed at 22 east of CB-22	Pipe appears in good condition except cracks noted where metal box is located at 26 feet, which is where flow enters from CB-25. Flow is from east to west from CB-30 towards CB-22. An excavation was conducted to remove a section of clogged pipe east of CB-22 (debris sample location SD-OS42). During the excavation, it was determined that the outflow from the CB-30 section of pipe into CB-22 was lower in elevation than the outflow elevation from CB-22 towards CB-19 (flow is to the west). Therefore, debris or sediment originating upstream of CB-22 would accumulate in CB-22 and in the pipe upstream of CB-22, which resulted in a total blockage. The pipe was nearly 100% filled with imbricated, oily debris (a sample [SD-OS42, 3-4 ft bgs] of the debris inside the pipe was collected). The CB-22 basin was full of debris so that the entire pipe flowing into the CB was covered and not initially visible. An 8-foot section of pipe was removed, along with the oily debris inside the pipe. The pipe upstream of the excavation was cleared, 25 feet upstream towards CB-30, but physical limitations prevented clearance of the blockage further east. A video survey towards CB-30 was completed over the cleared 25-foot length. A south facing “T” was observed 22 feet east of CB-22. This “T” could not be excavated for observation because of the very close proximity to a gas pipeline between the compressor building and the A cooling tower.	1. CB-30 2. CB-22	**Location:** CB-30 **Metals**: cadmium, copper, CrVI, CrT, iron, lead, mercury, molybdenum, nickel, selenium, zinc **Organics**: PAH High Molecular Weight, benzo(a)pyrene equivalents	No outfall **Location: SD-OS42** **Metals:** arsenic, barium, cadmium, cobalt, cooper, CrT, lead, mercury, molybdenum, nickel, thallium, vanadium, zinc **Organics**: total PCBs, Aroclor 1254, TPH-diesel, TPH-motor oil, benzo(a)pyrene equivalents, PAH High Molecular Weight, Di-n-butyl phthalate	

Feature Number	Pipe Diameter (inches)	Approximate Total Length (feet)	Pipe Material and Length (feet)	Bends and Joints (feet)	Key Observations	Flow Pathway from Catchment Basin (CB) or Trench Drain Line (TDL) to Outfalls (SD samples)	Constituents Exceeding Screening Levels[a] in Catch Basin (CB) and Trench Drain (TD) Samples	Constituents Exceeding Screening Levels[a] in Soil (Outfall samples are bolded)	Constituents in Flow Test Water that Exceed Concentrations in Source Water
CB-25 - SDL-11	4	3.0	Gray PVC Mesh Box	Box with a mesh top, and a "T" from 4" line from above, that is coming from CB-25.	Flow testing indicated that water leaks around the box once the pipe backed up with water. Water backed up in the pipe due to a blockage located east of CB-22 (see description above). Soil samples were collected above and below the pipe just upstream of the mesh box (SD-29), where flow from CB-25 would enter the main line. No sediment in CB-25	1. CB-25 2. Into the mainline downstream of CB-30, upstream of the CB-26 "T"	No sediment	No outfall **Location: SD-29** No exceedances	
CB 27 – CB-26	8	15.9	White PVC	--	Pipe in good condition No debris in pipe Flow is from north to southwest from CB-27 to CB-26. Pipe ends at CB-26	1. CB-27 2. CB 26	**Location:** CB-27 **Metals**: copper, CrT, lead, molybdenum, zinc **Organics**: benzo(a)pyrene equivalents, TPH-diesel	No outfall	
CB-26 - SDL-11	6	~50	Red clay	It is assumed that a "Y" or "T" fitting from CB-26 is located at approximately 28, where the camera could not be advanced.	Pipe in good condition Sediment in CB-26 Blockage in pipe extending to the southwest at 36 feet It is assumed that this pipe is plumbed into the SDL-11 main line, downstream (or west) of the CB-25 mesh box junction.	1. Southwest (from CB 27) 2. CB-26 3. Southwest (to SDL-11)	**Location:** CB-26 **Metals**: copper, CrVI, CrT, lead, mercury, molybdenum, nickel, zinc **Organics**: PAH High Molecular Weight, benzo(a)pyrene equivalents	No outfall	
SDL-11 Area B Below CB-22 in Upper Yard	8	200 from CB-22 to CB-19 ~300 from CB-19 to outfall (SD-15)	From CB-22 (which is part of the SDL-11 mainline): Red clay – 0 to 22 (small offset at 22) White PVC – 22 to 28 Red clay – 28 to 35 Gray PVC – 35 to 66 39 – "T" from CB-21 line 41 – "T" from south (TD-3 line) Red clay – 66 to 71 72 – "Y" Fitting (from CB-20) 6" White PVC – 73 to 74 Grey CPVC – 74 to 79 (installed on December 15, 2016) 76 – "T" from 4" PVC line to the south (this "T" removed on December 15, 2016) White PVC – 79 to 83	From CB-22 39 – "T" from CB-21 line 41 – "T" from south (maybe TD-3) 72 – "Y" Fitting (from CB-20) 76 "T" from 4" PVC line to the south (this "T" removed on December 15, 2016) 200 – CB-19	A soil sample was collected from CB-22 after the deeper metal grate was cut and removed. This had blocked access to this catch basin during previous investigations. Video surveying displayed a blockage 74 feet downstream of CB-22. This location was 2 feet downstream of where the CB-20 line was plumbed into the mainline. The area was excavated to remove the blockage. Within the excavation, three pipes were encountered that all joined the mainline. Samples were collected below a 90-degree fitting and below the pipe line and fittings. Video surveys were conducted in all four directions from the cut pipes in the excavation. Approximately 2 feet downstream from the excavation to CB-19 the PVC pipe transitioned to 8" red clay pipe, then sloped downhill. The pipe between the bottom of the slope and CB-19 was full of debris (sand and gravel). The video camera entered CB-19 but could not be advanced beyond it. Several cracks were observed at the bottom of the steep, downhill portion of the line (from the upper yard to lower yard). Soil samples (SD-41) were collected above the pipe and next to the pipe, where the cracks were observed in the lower yard. When the pipe was daylighted for soil sample collection, the pipe fitting from steep to horizontal was observed to be encased in concrete. Not video surveyed north of CB-19. The camera did enter the CB-19 box from the SD-40 excavation video survey. Catch basin is not visible at ground surface, but was identified as a junction point for the upper and lower portions of SDL-11. The camera could not be	1. CB-22 2. CB-21 3. TD-3 4. CB-20 5. CB-19	**Locations:** CB-17, CB-20, CB-21, CB-22, and TDL-3 (no sediment in TDL-2 and CB-18 and -19 were not accessible) **Metals**: cadmium, copper, CrT, lead, mercury, molybdenum, nickel, zinc **Organics**: benzo(a)pyrene equivalents, PAH High Molecular Weight, total PCBs, Aroclor 1254, Aroclor 1260	**Location: SD-15** **Metals**: none **Organics**: TEQ-avian and mammals **Locations: SD-28, SD-OS30, SD-OS38, SD-OS40, SD-OS41 and SD-OS43** **Metals:** CrVI, CrT, copper, lead, molybdenum, thallium, zinc **Organics**: Total PCBs, Aroclor 1254, benzo(a)pyrene equivalents, TPH-diesel, TEQ-mammal	

Feature Number	Pipe Diameter (inches)	Approximate Total Length (feet)	Pipe Material and Length (feet)	Bends and Joints (feet)	Key Observations	Flow Pathway from Catchment Basin (CB) or Trench Drain Line (TDL) to Outfalls (SD samples)	Constituents Exceeding Screening Levels[a] in Catch Basin (CB) and Trench Drain (TD) Samples	Constituents Exceeding Screening Levels[a] in Soil (Outfall samples are bolded)	Constituents in Flow Test Water that Exceed Concentrations in Source Water
			Red clay – 83 to 200 200 – CB-19 202 to 350 (no video)		guided through this buried CB, which was potentially covered during construction of the new A line scrubber The video survey of the 4-inch line (south from the "T") in the excavation, was blocked 4 feet west of the 90˚ fitting. The blockage was cleared and it was determined that the 4-inch pipe drained storm water that would collect in the concrete trench/vault, located to the south of the SD-40 excavation. The pipe starts in CB-21, and within the catch basin, the PVC pipe is within at 10-inch diameter red clay pipe. There was a 1-2 inch gap between one side of the inner PVC pipe and outer red clay pipe. Sediment was present in CB-21. Soil samples (SD-38) were collected on the west (or downstream) side of CB-21 above and below the pipe. Concrete was used to encase the white PVC pipe that was inside of the red clay pipe. Compressed air was used to test for leaks between the two pipes and air did not leak between the two pipes. In order to locate the “T” fitting that was noted in a previous video from the SDL-11 mainline to TD-3, an excavation was conducted 17 feet south of the “T” of the main line. Soil samples (SD-43) were collected south of the SDL-11 mainline near where the TD-3 line “T” was plumbed to the SDL-11 mainline. An excavation was completed to locate the TD-3 line and to examine the pipe. The pipe was cut to gain access to video survey. A video was conducted upstream towards TD-3, a total length of 93 feet and downstream towards SDL-11 mainline, 17 feet. The end of the pipe near TD-3 was located roughly 5 feet northwest of the west side of the trench. The pipe was “broken” on the end, meaning not a clean cut or break and was full of sediment, which was sampled as part of SD-30 sample. Multiple potholes were completed between the SD-30 sample location and the southern point the video camera reached, in order to examine the pipe and to find the end of the pipe (at SD-30). The pipe was in good condition.				
	8	18 from CB-21 to the SDL-11 main line	White PVC	“Y” Joint at 47.6	Pipe starts at CB-21; sediment present in catch basin Defect or dent in pipe, but not broken at 26.3 feet “Y” joint at 47.6 where connects into SDL-11 – Segment B Rock and gravel blockage at 52.5 feet				
	8	185 from TD-3 to SDL-11 mainline	From TD-3 towards SDL-11 mainline Red clay pipe is missing for the first 5 feet (between trench and located pipe) Red clay – 0 to 184 White PVC – 184 to 185 (“T” fitting into mainline at 185)						
	8	47.6 from CB-20 to	White PVC						

TABLE 3-42
Summary of Storm Drain Survey
RFI/RI Report, Volume 3 – Soil Investigation
PG&E Topock Compressor Station, Needles, California

Feature Number	Pipe Diameter (inches)	Approximate Total Length (feet)	Pipe Material and Length (feet)	Bends and Joints (feet)	Key Observations	Flow Pathway from Catchment Basin (CB) or Trench Drain Line (TDL) to Outfalls (SD samples)	Constituents Exceeding Screening Levels[a] in Catch Basin (CB) and Trench Drain (TD) Samples	Constituents Exceeding Screening Levels[a] in Soil (Outfall samples are bolded)	Constituents in Flow Test Water that Exceed Concentrations in Source Water
		the 11 main line							
SDL-11 Segment C	10	46 from TD-2, to CB-17	Green PVC from TD-2 to CB-17, 46.5 feet 3" white PVC from CB-18 to outfall into the Green PVC pipe 30 feet downstream of TD-2	None between TD-2 and CB-17 Unknown between CB-18 and green PVC pipe	Video is upstream from CB-17 to TD-2; sediment present in CB-17 only Pipe begins at Trench Drain 2 and flows into and through CB-17 Outfall from CB-18 (a 3 inch white PVC pipe) connects to this segment at 31.1 feet. Did not video the portion of pipe between this connection and CB-18 due to not being able to open CB-18	1. TD-2 and CB-18 2. CB-17 3. SD-15			
SDL-11 Segment D	10	14 from CB-17 to 11 main line, an additional 78 (92 total) of main line video downstream , but a total of 180 to outfall	Red Clay – 0 to 52 White PVC – 52 to 132	"Y" joint at 14.1 Elbow at 70.1	Pipe begins at CB-17; sediment present in catch basin "Y" joint connecting to SDL-11 – Segment B Grout intruding into pipe at 5.1 feet and 11.4 feet Pipe is offset at the red clay pipe to PVC transition. Soil samples were collected above and below the SDL-11 where the offset was noted (SD-28). PVC joint at 92 feet, camera could not make it through the joint, finished the survey by going upstream from outfall	1. CB-17 (from TDL-2 and CB-18) 2. SD-15			
SDL-11 Segment E	10	67 from outfall upstream	White PVC	22.5 elbow to the south 22.5 elbow to the east	Video is from the outfall upstream and redundant with the Segments A-D The upper 40 feet of pipe was not video surveyed between the outfall and the lower extent of the Segment D survey				
SDL-12	10	97	Blue PVC	Downward elbow at 29.3 Elbow to the north at 46	Pipe begins at Trench Drain 4 and flows into and through CB-16; sediment was present in the catch basin and trench drain Video surveying was conducted upstream from CB-16 towards Trench Drain 4, then downstream from CB-16 to the outfall Pipe is free of debris	1. TDL-4 2. CB-16 3. SD-16	**Locations:** TDL-4 and CB-16 **Metals**: copper, lead, molybdenum, zinc **Organics**: benzo(a)pyrene equivalents	**Location: SD-16** **Metals**: manganese **Organics**: none **Location: SD-17** **Metals**: lead, zinc **Organics**: none	**Metals**: arsenic, copper, lead, molybdenum, nickel, selenium, vanadium **Organics**: TPH-diesel, TPH-motor oil
SDL-13a	6 5.5	118	6" Corrugated Steel 5.5" Gray PVC inside the Steel Pipe starting at 1 foot	None	No catch basins associated with this pipe; however, this pipe was potentially associated with CB-24 and may have been disconnected or removed during construction in this area (see CB-24 item below) Video surveying was conducted from the outfall in the upstream direction Sand and gravel blockage encountered at 118 feet	None	--	**Location: SD-18** **Metals**: copper, zinc **Organics**: none	--
SDL-13b	8	125	8" Corrugated Steel - 0 to 47 8" White PVC – 48.5 125	Downward elbow at 42 Flow is through CB-23 at 47 90° upward elbow at 122.5	CB-23 does not represent the upstream origin of the line, but no additional catch basin upstream of CB-23 was observed. The video survey was conducted from the outfall in the upstream direction through CB-23 Sediment present in CB-23 CB-23 located at 46.4 feet	1. CB-23 2. SD-18	**Location:** CB-23 **Metals**: copper, lead, zinc **Organics**: none	**Location: SD-18** **Metals**: copper, zinc **Organics**: none **Location:** SD-19 **Metals**: mercury **Organics**: none	**Metals**: arsenic, barium, CrVI, CrT, molybdenum, selenium, vanadium, zinc **Organics**: TPH-diesel, TPH-motor

TEQ dioxins and furans toxicity equivalent quotient
TPH total petroleum hydrocarbons

TABLE 3-43
Summary of Industrial Floor Drain Survey
RFI/RI Report, Volume 3 – Soil Investigation
PG&E Topock Compressor Station, Needles, California

Feature	Pipe Diameter (inches)	Approximate Total Length (feet)	Material and Length of Material (feet)	Bends/Joints and Location (feet)	Observations	Constituents Exceeding Screening Levels[a] in Soil
Floor Drain 1	--	--	--	--	Not surveyed	--
Floor Drain 2	Unknown	Unknown	Steel	None	Standing water at 1.7 feet Blockage and narrow pipe at 3.2 feet, end of survey	--
Floor Drain 3	--	--	--	--	Not surveyed	--
Floor Drain 4	Unknown	Unknown	Steel	None	Pipe appears corroded at 2.4 feet 100 percent blockage at 2.3 feet, end of survey	--
Floor Drain 5	Unknown	Unknown	Steel	Elbow at 2.3 feet	Pipe appears corroded at 2.3 feet Diameter of pipe narrows and camera could not pass, corrosion at 11.9 feet, end of survey	--
Floor Drain 6	--	--	--	--	Not surveyed	--
Floor Drain 7	Unknown	Unknown	Red Clay – 1.5 to unknown	None	Two aboveground pipes discharge into this floor drain: 1) pipe trench sump located near west side of Visitor's Parking Lot, and 2) pipe from the jacket water pumps and cooling tower Liquid in pipe at 1.5 feet Connects into main drainage lint at 1.7 feet and heavy sludge present 1.7 feet Blockage due to heavy sludge at 29 feet, end of survey	--
Floor Drain 8	4	Unknown	Red Clay – 0 to unknown	Elbow joint at 12.6	Pipe free of debris and sludge Connects into main drainage line at 12.6 feet Camera covered in heavy sludge in main line at 14.5 feet, end of survey	--
Floor Drain 9	4	Unknown	Red Clay – 0 to unknown	Elbow joint at 11.1	Pipe free of debris and sludge Grout intruding at pipe joint at 11.4 feet Connects into main drainage line at 11.9 feet Camera covered in heavy sludge in main line at 13.9 feet, end of survey	--
Floor Drain 10	4	Unknown	Red Clay – 0 to unknown	Elbow joint at 9.1	Pipe free of debris and sludge Connects into main drainage line at 9.1 feet Camera covered in heavy sludge in main line at 14.7 feet, end of survey	--
Floor Drain 11	Unknown	Unknown	Unknown	None	Pipe free of debris and sludge Empty water bottle encountered at 11 feet, end of survey	--
Floor Drain 12	Unknown	Unknown	Unknown	None	Pipe free of debris and sludge Empty water plastic bag was encountered at 9.2 feet; this bag was pushed to 13 feet end of survey to prevent the bag from entering the main line.	--
Floor Drain 13	Unknown	Unknown	Unknown	None	Pipe free of debris and sludge Connects to main line at 12.8 feet and camera got covered in heavy sludge, end of survey	--
Floor Drain 14	Unknown	Unknown	Unknown	None	Debris present in pipe 6.9 feet and 9 feet 100 percent blockage at 9.8 feet, end of survey	--
Floor Drain 15	Unknown	Unknown	Unknown	Elbow joint at 15.8	Pipe free of debris and sludge Connects to main line at 20.5 feet and camera got covered in heavy sludge, end of survey	--
Floor Drain 16	Unknown	Unknown	Unknown	Unknown	100 percent blockage at 1 foot, end of survey	--
Floor Drain 17	Unknown	Unknown	Unknown	Elbow joint at 16.1	Debris encountered at 8 feet Connects to main line at 19.8 feet, end of survey Soil samples were collected below the junction of floor drain 17 and the main line (soil sample location AOC20-OS16) at 0.5, 3, 6, and 9.5 (below red clay pipe) feet bgs. Top of main pipe was approximately 8 feet bgs.	**Metals**: hexavalent chromium, total chromium, copper, lead, molybdenum, and zinc

TABLE 3-43
Summary of Industrial Floor Drain Survey
RFI/RI Report, Volume 3 – Soil Investigation
PG&E Topock Compressor Station, Needles, California

Feature	Pipe Diameter (inches)	Approximate Total Length (feet)	Material and Length of Material (feet)	Bends/Joints and Location (feet)	Observations	Constituents Exceeding Screening Levels[a] in Soil
Floor Drain 38	Unknown	Unknown	Unknown	Unknown	100 percent blockage at 4.3 feet, end of survey	--
Floor Drain 39	Unknown	Unknown	Unknown	Unknown	Soil samples were collected below the junction of the line from floor drain 39 and the main line (soil sample location AOC20-OS09) at 0.5 and 5 (below pipe junction) feet bgs.	**Metals**: hexavalent chromium, total chromium, copper, lead, molybdenum, and zinc **Organics**: Aroclor 1254 and Aroclor 1260
Floor Drain 41	Unknown	Unknown	Unknown	Unknown	Soil samples were collected below the junction of floor drain 41 and the main line (soil sample location AOC20-OS12) at 0.5, 3, and 6 (below pipe junction) feet bgs.	**Metals**: hexavalent chromium, total chromium, copper, lead, molybdenum, and zinc **Organics**: Benzo(a)pyrene equivalents, Aroclor 1254, and Aroclor 1260
Floor Drain 42	Unknown	Unknown	Unknown	Unknown	Soil samples were collected below the junction of floor drain 42 and the main line (sample location AOC20-OS13) at 0.5, 3, and 6 (below pipe junction) feet bgs.	**Metals**: hexavalent chromium, total chromium, copper, lead, nickel, and zinc
Floor Drain 44	4	29	Steel 0 to 12.8 Gray PVC 12.8 to 28.11	Elbow joint at 18.4 Elbow joint at 27.6	Pipe ends at pipe trench sump located on the west side of the Visitor's Parking Lot Debris encountered at 4.3 feet 70 percent blockage with debris at 8.4 feet and 11.1 feet Transition to gray PVC pipe at 12.8 feet Connects to sump at 28.9 feet No leaks detected The junction between the steel pipe and gray PVC pipe was located within the concrete slab of the wash rack foundation, so daylighting of the pipe was not feasible.	--
Manhole 1	8 10	Unknown	Red Clay	None	Downstream pipe had stagnant liquid, 90 percent blockage at 3.6 feet Upstream pipe had stagnant liquid, 90 percent blockage at 3.7 feet In the direction of Cleanout 2. The junction of floor drain 5 and the main line was clear; however, debris was noted. Soil samples were collected below the floor drain lateral and main line (soil sample location AOC20-OS14) at 0.5, 3, and 7 (below pipe junction) feet bgs.	None
Manhole 2	8	Unknown	White PVC - unknown Red Clay – unknown	None	Sludge was immediately present in the downstream pipe, heavy build up started at 5 feet Unknown when downstream pipe transitioned to red clay Sludge became too thick to proceed downstream at 40.8 feet Upstream pipe starts off as white PVC and transitions to red clay at 5 feet and sludge is present Debris and sludge in the pipe at 21 feet Heavy sludge/oil on camera lens, end of survey	--
Manhole 3 – Downstream Pipe	8	165	Green PVC 0 to 125 Black Steel 125 to 165	Elbow joint at 34.3 Elbow joint at 119 Elbow joint at 123 Elbow joint at 132 Elbow joint at 164.6	Valve visible above the grit tank at 160.9 feet Connects to grit tank at 164.6 feet Soil samples were collected above and below a PVC/Steel/PVC flange spool transition (soil sample location AOC20-OS18) at 0.5 and 3.5 (below pipe fitting) feet bgs. The spool, flange, pipe, and PVC pipe were all in good condition with no apparent leaks. Attempted to collect soil samples at the 90-degree elbow where line goes from green PVC to steel 90-degree elbow fitting, toward the grit tank. Cut asphalt and potholed location but could not expose pipe or collect soil samples due to pipe and fitting being completely encased in a large block of concrete, preventing sampling beneath.	None

TABLE 3-43
Summary of Industrial Floor Drain Survey
RFI/RI Report, Volume 3 – Soil Investigation
PG&E Topock Compressor Station, Needles, California

Feature	Pipe Diameter (inches)	Approximate Total Length (feet)	Material and Length of Material (feet)	Bends/Joints and Location (feet)	Observations	Constituents Exceeding Screening Levels[a] in Soil
Manhole 3 – Upstream Pipe	8	Unknown	Blue PVC 0 to 10 Red Clay 10 to unknown	None	Outlet at 40.1 feet where main line flows north along the west side of the compressor building and oil on camera lens Increasing sludge at 46.2 feet and heavy sludge at 50.1 feet About half the pipe is filled with sludge at 54.4 feet Sludge blocked pipe at 56.4 feet, end of survey Soil samples were collected at the junction of the main line west of the compressor building and the main line from manhole 2, which is just upstream of manhole 3. Samples were collected above and below the junction (soil sample location AOC20-OS21) at 0.5, 3, 6, and 9 (below pipe junction) feet bgs.	**Metals**: hexavalent chromium, total chromium, copper, lead, molybdenum, and zinc
Cleanout 1	Unknown	Unknown	Unknown	Unknown	100 percent blocked at 2.5 feet, end of survey	--
Cleanout 2	Unknown	Unknown	White PVC – unknown Red Clay – unknown	"T" joint at 32.9 "T" joint at 33.3	Liquid and debris present in pipe at 9.9 feet, no debris at 31.7 feet "T" joint where CO_2 line discharges at 32.9 feet "T" joint where connects to main line at 33.3 feet Sludge, debris, and water present at 36.6 feet through 160 feet, end of survey A flow test was conducted from FD-1, and flow goes from this floor drain to Cleanout 2. A leak was discovered at a joint or junction of the line from FD-1/CO-2 and presumably the FD-3 line, during the flow test. Samples were collected below the leak (soil sample location AOC20-OS08) at 0.5 and 5 (below pipe junction) feet bgs.	**Metals**: cadmium, hexavalent chromium, total chromium, copper, lead, molybdenum, nickel, and zinc
Cleanout 3	6	Unknown	Gray PVC 0 to 12.6 Blue PVC 12.6 to unknown	"T" joint at 91.1	Junction at 54.1 feet where pipe from Floor Drain 39 enters, which is the south floor drain in the north cooling tower "T" joint at top of pipe at 91.1 feet; could not find access at the surface End of survey at 140 feet	--
Cleanout 4	6	Unknown	Gravy PVC 0 to unknown Blue PVC unknown	Elbow joint at 271	Elbow joint at 271 feet at location of Clean Out 5 End of survey at 273.1 feet	--
Cleanout 5	Unknown	Unknown	Blue PVC	Elbow joint at 1.2 Elbow joint 35 "T" joint 44.4	Unknown pipe material until connects to blue PVC main line at 1.8 feet Pipe is full of water and debris at 141 feet End of survey at 160 feet Soil samples were collected downstream of CO-5 under a "T" fitting (soil sample location AOC20-OS11) at 0.5, 3, and 7 (below "T" fitting) feet bgs.	None
Cleanout 6/7	Unknown	Unknown	Blue PVC	Elbow joint at 0.1 "T" joint 6.6 "4-way" junction 56.5	Unknown pipe material until connects to blue PVC main line at 3.7 feet "T" joint at 6.6 feet where north floor drain of the south cooling tower discharges "4-way" junction at 56.5 feet where the south floor drain of the south cooling tower discharges into main line and then flows to the oil water separator View of Cleanout 7 at 58.5 feet and main line capped at 61.5 feet	--

Notes:

[a] Applicable background values and commercial human health screening levels were used to screen data.

Notes
µg/kg = micrograms per kilogram
CSL = commercial screening level
DTSC = California Department of Toxic Substances Control
mg/kg = milligrams per kilogram
n/a = not applicable
ng/kg = nanograms per kilogram
PAH = polycyclic aromatic hydrocarbom
PCB = polychlorinated biphenyl
SL = screening level
SVOC = semivolatile organic compound
VOC = volatile organic compound

TABLE 4-1
Wastewater Pipelines Status Summary
AOC 18 - Combined Wastewater Transference Pipelines
RFI/RI Report, Volume 3 - Soil Investigation
Pacific Gas and Electric Company Topock Compressor Station, Needles California

Sub-Segment	Connection	Diameter (inches)	Material	Length (feet)	Pressure Test Results	Associated Samples	Sample Rationale	Segment Status
Pipeline Segment A								
	Cooling towers to chromate reduction tank	3	PVC	1,500 (750 feet per tower)				
A-1	Chromate reduction tank to east bend at former oily water holding tank				Pass, unable to measure volume loss			Not removed; active pipeline; wastewater had acceptable concentrations of chromium
A-2	End of A1 to east of new oil water treatment system				Pass			Removed; clean-closed
A-3	End of A2 to junction of Cooling Tower A and B wastewater lines				Not tested, active line	PA-3 (1042-51-10)	Operating pipeline, sampled below joint at 1 foot bgs (same sample as for F-3), after underlying soil and the pipelines were removed.	Active line; wastewater had acceptable concentrations of chromium; ample flushing has occurred; clean-closed for contamination
Pipeline Segment B								
B-1	Chromate reduction tank to transfer sump	3	PVC	30	Pass			Removed; clean-closed
Pipeline Segment C								
C-1	Transfer sump to transfer pumps	3	PVC	15	Pass, slight leak at gate valve	PC-1 (1042-51-03)	Sampled at 1 foot bgs, beneath slight leak at valve.	Removed; clean-closed
Pipeline Segment D								
	Process pump tank to transfer pumps	3	PVC	500				
D-1[a]	Transfer pumps to east bend at former oily water holding tank				Pass			Removed; clean-closed
D-2	End of D1 to easy of new oily water treatment system				Pass			Removed; clean-closed
D-3	End of D3 to process pump				Pass, unable to measure volume loss			Portion of pipe removed; remainder abandoned in place (capped); clean-closed
Pipeline Segment E								
E-1	Precipitation tank to process pump tank	4	Steel	15	Short aboveground pipe, not tested, visual inspection			Removed; clean-closed
Pipeline Segment F								
	Transfer pumps to precipitation tank	3	PVC	500				
F-1[b]	to east bend at former oily water holding tank				Pass			Removed; clean-closed
F-2	End of F1 to east of new oily water treatment system				Pass			Removed; clean-closed
F-3	End of F2 to				Fail	PA-3 (1042-51-10)	Section railed pressure test (same sample as for A-3). Sampled at 1 foot bgs, after underlying soil and the pipelines were removed.	Most of pipe and underlying soil removed; clean-closed
F-4	10- to 15-foot section damaged by backhoe				Not tested; damaged by backhoe			Removed; clean-closed
F-5					Pass, unable to measure volume loss, slight seepage at coupling	PF-6 (1042-43-11 and duplicate 1042-43-12) PF-8 (1042-51-09)	Sampled 1 foot bgs beneath slight leak at PVC slip joint. Sampled at 1 foot bgs beneath the end of previous cut in the pipe, no visible evidence of leaks.	Portion of pipe removed; remainder abandoned in place (capped); clean-closed
Pipeline Segment G								
	Transfer pumps to old evaporation pond	3	PVC and aluminum (aboveground portion), polyethylene (buried portion)	1,500				

TABLE 4-1
Wastewater Pipelines Status Summary
AOC 18 - Combined Wastewater Transference Pipelines
RFI/RI Report, Volume 3 - Soil Investigation
Pacific Gas and Electric Company Topock Compressor Station, Needles California

Sub-Segment	Connection	Diameter (inches)	Material	Length (feet)	Pressure Test Results	Associated Samples	Sample Rationale	Segment Status
G-1	Transfer pumps to west bend in pipeline south of sludge drying beds.				Pass, unable to measure volume loss	PG-2 (1042-51-06)	No evidence of leak; sampled white material around pipe; fizzes with HCl; probably calcium carbonate from water-softening process.	Portions not removed; clean-closed
G-2	End of G1 to T at former evaporation pond 1				Pass (air tested)			Not removed; wastewater had acceptable concentrations of chromium; closed in place; section crossing Bat Cave Wash removed in 2007
G-3	End of G2 to end of pipe at former evaporation pond 4				Pass (air tested)			Not removed; wastewater had acceptable concentrations of chromium; closed in place
Pipeline Segment H								
	Precipitation tank to sludge drying bends	6	Vitrified clay; first 60 feet of H-1 were cast iron	500				
H-1					Not tested, visual inspection for leaks and contamination	PH-8 (1042-43-18)	Sampled 3 inches below pipe at 3 feet bgs after removal of soil contaminated with green sludge.	Removed; clean-closed
						PH-8 (1042-43-29)	Second confirmation sample following additional excavation.	
						PH-9 (1042-43-20)	Samples 3 inches below pipe at 3 feet bgs after removal of soil contaminated with white sludge.	
						PH-10 (1042-43-20)	Sampled 6 inches below pipe at 2 feet bgs after removed of soil contaminated with green sludge.	
						PH-10 (1042-43-26)	Second confirmation sample following additional excavation.	
H-2[c]					Not tested, visual inspection for leaks and contamination	PH-6 (1042-43-15)	Sampled 1.5 feet beneath clay pipe at 1.5 feet bgs after removal of soil contaminated with white sludge.	Removed; clean-closed
						PH-6 (1042-43-28)	Second confirmation sample following additional excavation.	
						PH-7 (1042-43-15 and duplicate 1042-43-16)	Sampled 3 inches beneath clay pipe at 5 feet bgs after removing soil where pipe was previously broken.	
						PH-11 (1042-43-21)	Sampled 6 inches beneath clay pipe at 4 feet bgs after removing soil where pipe was previously broken.	
						PH-12 (1042-43-22)	Sampled 3 inches beneath clay pipe at 4 feet bgs after removing soil where pipe was previously broken.	
						PH-13 (1042-43-23)	Sampled off end of previous break in pipe at 6 feet bgs; no visible evidence of leakage.	
H-3[c]	East of new oily water treatment system				Not tested, visual inspection for leaks and contamination	PH-4 (1042-43-04)	Sampled 3 feet beneath the end of previous break in pipe; no visible evidence of leakage.	Removed; clean-closed
						PH-5 (1042-43-105)	Sampled 65 feet off end of previous break at probable location of former pipe at 6 feet bgs.	

TABLE 4-1
Wastewater Pipelines Status Summary
AOC 18 - Combined Wastewater Transference Pipelines
RFI/RI Report, Volume 3 - Soil Investigation
Pacific Gas and Electric Company Topock Compressor Station, Needles California

Sub-Segment	Connection	Diameter (inches)	Material	Length (feet)	Pressure Test Results	Associated Samples	Sample Rationale	Segment Status
H-4[c]	West of new oily water treatment system to sludge drying beds				Not tested, visual inspection for leaks and contamination	PH-1 (1042-43-01) PH-2 (1042-43-02) PH-2 (1042-43-30) PH-3 (1042-43-03) PH-3 (1042-43-31)	Sampled 3 inches below gate valve after removal of soil contaminated with green sludge. Sampled below gate valve, no visible evidence of leakage. Second confirmation sample following additional excavation. Sampled beneath joint in clay pipe at 3 feet bgs, no visible evidence of leakage. Second confirmation sample following additional excavation.	Removed; clean-closed
Pipeline Segment I[d]								
		NA	NA	NA				
I-1	Oily water treatment system influent from valve box east of new oily water treatment system to former oily water holding tank			NA	Fail	OWS-PI-1 (1042-55-4) OWS-Valve-PI-1 (1042-55-6)	Sampled after removal of visibly contaminated soil at aboveground portion of pipe adjacent to OWS Sampled at 8 inches bgs after removal of stained soil by valve.	Portion of pipe removed; remaining 10 feet abandoned in place (capped); clean-closed
I-2	Oil/water separator to chromate reduction tank			Approx. same length as A-1	Pass	None	No evidence of leak.	Removed
Pipeline Segment J[e]								
J-2	Sludge drying beds to transfer sump	NA	NA	Est. 30 feet	NA	NA	NA	Removed

Notes
[a] This pipeline is shown as terminating just north of the Chromate Reduction Tank; the missing partial segment is interpreted as removed.
[b] This pipeline is shown as terminating just north of the Chromate Reduction Tank; the missing partial segment is interpreted as removed.
[c] Long section of pipe between H-2 and H-3 not shown in Mittelhauser drawing, interpreted as previously removed; similarly, a section of pipelines is shown as missing between H-3 and H-4, in the area where the new oily water treatment system was installed, this unit was also interpreted as removed.
[d] Pipeline segments listed in oily water treatment system closer report (Mittelhauser, 1990a); see discussion for Units 4.3 to 4.5 in Appendix B24
[e] Pipeline segment shown in figure in closure report but not listed in tables.
NA = not available
PVC = polyvinyl chloride
