Notes:
[a] EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m^3 = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.
NA = Not applicable. Hexavalent chromium is not absorbed via dermal contact.
NC = Not considered a carcinogen.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
[a] EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m^3 = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Hexavalent chromium is not absorbed via dermal contact.
NC = Not considered a carcinogen.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
[a] EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m^3 = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.
NA = Not applicable. Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m^3 = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
[a] EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m^3 = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
[a] EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m^3 = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
[a] EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
ILCR = Incremental Lifetime Cancer Risk.
na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.
NA = Not applicable. Hexavalent chromium is not absorbed via dermal contact.
NC = Not considered a carcinogen.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
[a] EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
HI = Hazard Index
na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.
NA = Not applicable. Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
[a] EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
HI = Hazard Index
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
[a] EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
HI = Hazard Index
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
[a] EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
HI = Hazard Index
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

1 INTRODUCTION

This appendix presents the ecological risk assessment (ERA) for soil at the combined Bat Cave Wash (BCW) 1 and Area of Concern 4 (AOC 4) potential exposure area (BCW+AOC4) located outside the Topock Compressor Station (TCS) in Needles, California. The BCW and AOC 4 potential exposure area (represented by tables starting with BCW+AOC4), shown on Figures BCW+AOC4-1.1a and BCW+AOC4-1.1b, is approximately 20 acres in total and includes sample locations in BCW (including the Tamarisk Thicket), AOC 4, Solid Waste Management Unit 1 (SWMU1), and AOC 28d, as shown in Table BCW+AOC4-1.1 of this appendix.

For the BCW and AOC 4 potential exposure area, available soil data from BCW and AOC 4 were used to conduct a quantitative ERA for three potential large home-range wildlife receptors: red-tailed hawk, desert kit fox, and Nelson's desert bighorn sheep. This appendix summarizes site use, data evaluation, potential receptors, potential exposure pathways, and the results of the ERA for soil in the BCW and AOC 4 potential exposure area. Tables and figures specific to the ERA are also presented in this appendix.

The ERA methodologies are described in the Soil Human Health and Ecological Risk Assessment (HHERA) Report for the TCS (the "main report") and the Human Health and Ecological Risk Assessment Work Plan (RAWP) documents (Arcadis U.S., Inc. [Arcadis] 2008, 2009a, 2015), and are not repeated in this appendix. Discussions of the historical uses of the TCS site and previous sampling and analysis activities are presented in the main report as well.

1.1 Summary of Site Use

The BCW and AOC 4 potential exposure area consists of BCW (including the Tamarisk Thicket), AOC 4, SWMU1, and AOC 28d, as shown on Figures BCW+AOC4-1.1a and b. The background and summary of the site use for BCW and AOC 4 is presented in the Appendices BCW and AOC 4, respectively, and not repeated herein.

2 DATA EVALUATION AND COPEC SELECTION

This section summarizes the data considered for the BCW and AOC 4 ERA and presents the constituents of potential ecological concern (COPECs) selected for the BCW and AOC 4 potential exposure area.

All soil sampling locations at the BCW and AOC 4 potential exposure area are presented on Figures BCW+AOC4-1.1a and BCW+AOC4-1.1b and in Table BCW+AOC4-1.1. The data were evaluated based on methodology described in the RAWP documents (Arcadis 2008, 2009a, 2015). Details of the soil sampling and analysis will be presented in the forthcoming Draft Resource Conservation and Recovery Act (RCRA) Facility Investigation/Remedial Investigation (RFI/RI) Report Volume 3 (currently being prepared by Jacobs). For the baseline scenario, soil data from 0 to 6 feet below ground surface (ft bgs) were included in the ERA. Because potential soil contact does not extend below 6 ft bgs for potential ecological receptors, deeper soil data (i.e., greater than 6 ft bgs) were excluded from the risk evaluation, as noted in Table BCW+AOC4-1.1. At AOC 4, due to extensive soil removal, soil samples collected after the time-critical removal action (TCRA) were at depths ranging from 0 to 3 ft bgs only, due to the presence of bedrock, as noted in Table BCW+AOC4-1.1.

Following the steps outlined in Section 3 of the main report, soil data considered usable for the risk assessment were identified and used in the quantitative ERA. For the BCW and AOC 4 potential exposure area, available soil data are presented in Attachment BCW+AOC4-A1. Soil data for the BCW and AOC 4 potential exposure area includes samples collected from BCW (including the Tamarisk Thicket area), AOC 28d, SWMU1, BCW, and AOC 4 (Figures BCW+AOC4-1.1a and BCW+AOC4-1.1b). In addition to the soil data from BCW, samples classified as soil transitioning to sediment from two locations (AOC1-BCW6 and SS-1) were included as part of the soil evaluation for the BCW and AOC 4 potential exposure area (Figure BCW+AOC4.1-1b). Because samples from seven AOC 4 locations (AOC4-1, AOC4-BCW1 through AOC4-BCW6) and one AOC 14 location (RR-1[1]) are within the BCW potential exposure area (Figure BCW+AOC4-1.1a), samples from these locations were included as part of the combined BCW and AOC 4 potential exposure area dataset. In addition, samples from seven perimeter area (PA) locations (PA-01, PA-03, PA-04, and PA-14 through PA-17), and nine storm drain (SD) locations (SD-14 through SD-19, SD-25, SD-26, and SD-OD33) were assigned to the BCW area (Figure BCW+AOC4-1.1a). Soil sampling was conducted at the mouth of AOC 4 where it enters BCW at the south end of BCW as part of the AOC 4 TCRA. Soil data for AOC 4 includes only those sample locations remaining in place after the TCRA activities including and additional samples collected after the TCRA was completed. As part of the TCRA, soil sampling was conducted at the mouth of AOC 4 where it enters BCW at the south end of AOC 1. During the installation of the gabions near the mouth of AOC 4, soil excavation was conducted. Soil samples collected at three gabion locations (AOC4-GB10, AOC4-GB11, and AOC4-GB12) and AOC4-1 are the only sample locations remaining in the mouth of AOC 4 where it enters BCW; therefore, these were evaluated as part of the BCW and AOC 4 potential exposure area.

For the BCW and AOC 4 potential exposure area, soil data are available from 889 samples, of which soil data from 574 samples collected from 0 to 6 ft bgs were considered for use in the ERA (i.e., data from 315 samples collected at depths greater than 6 ft bgs were excluded from the baseline evaluations) as noted in

[1] Evaluated as part of BCW and also as part of AOC 14.

Table BCW+AOC4-1.1. Within this dataset, some samples did not meet data quality criteria; therefore, nondetected results were qualified as rejected with an “R” data qualifier (which will be discussed in in the forthcoming Draft RFI/RI Report, currently being prepared by Jacobs). This occurred for all polycyclic aromatic hydrocarbons (PAHs) in two samples (AOC1-BCW24-245 and AOC1-BCW26-253) and a subset of PAHs in two additional samples (AOC1-BCW24-244 and AOC1-BCW26-252). These “R” qualified PAH data were not included in the ERA.

Data processed for the ERA (e.g., calculation of total concentrations for low molecular weight [LMW] and high molecular weight [HMW] PAHs, polychlorinated biphenyls [PCBs], and dioxin/furan toxicity equivalents [TEQ]) are described in detail in Section 3 of the main report.

The process for identifying COPECs included in the ERA is detailed in Section 3.4 of the main report. COPECs were selected for the BCW and AOC 4 potential exposure area using soil data encompassing all relevant exposure depths for the ERA (i.e., 0 to 6 ft bgs for the BCW and AOC 4 potential exposure area) as presented in Attachment BCW+AOC4-A1). Inorganics, LMW PAHs, HMW PAHs, and dioxin TEQ were above background levels in BCW and AOC 4 potential exposure area soil (0 to 6 ft bgs) and, therefore, are included as COPECs in the baseline exposure depths evaluated in the ERA. All other detected organic constituents in BCW and AOC 4 potential exposure area soil in the baseline evaluation are included as COPECs in the ERA. COPECs selected for exposure depths and scenarios evaluated in the ERA for the BCW and AOC 4 potential exposure area are summarized in Tables BCW+AOC4-2.1a through BCW+AOC4-2.1c for the three soil depth intervals included in the baseline evaluations (i.e., surface, shallow, and subsurface I soil). The selected COPECs are discussed further in Section 5 of this appendix.

3 EXPOSURE POINT CONCENTRATIONS

Depth-weighted and area-weighted exposure point concentrations (EPCs) for COPECs in soil at the BCW and AOC 4 potential exposure area were calculated as described in Section 4 of the main report. For the BCW and AOC 4 potential exposure area, one scenario was evaluated: Baseline (no scouring).

The following exposure depths were evaluated:

1. Surface soil (0 to 0.5 ft bgs)
2. Shallow soil (0 to 3 ft bgs)
3. Subsurface I soil (0 to 6 ft bgs).

For the ERA, consistent with evaluation of potential exposure areas for potential large home receptors described in the RAWP documents (Arcadis 2008, 2009a, 2015), scouring was not evaluated for the BCW and AOC 4 potential exposure area.

The depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment BCW+AOC4-A2. The summary statistics for the BCW and AOC 4 potential exposure area soil depth-weighted datasets and depth- weighted EPCs were calculated consistent with the RAWP documents (Arcadis 2008, 2009a, 2015). Per the RAWP, area-weighted EPCs are evaluated only if depth-weighted EPCs suggest potential risk to potential ecological receptors (i.e., hazard quotient [HQ] > 1 for any COPEC). For the BCW and AOC 4 potential exposure area, area-weighted EPCs were not deemed necessary for the ERA based on the risk estimates using depth-weighted EPCs and, therefore, were not calculated.

If the soil dataset had fewer than four detected values (i.e., concentrations reported above the detection limit) or fewer than eight total observations, the EPC defaulted to the maximum depth-weighted concentration in that dataset.

Soil summary statistics for constituents measured at the BCW and AOC 4[2] potential exposure area and depth--weighted EPCs for COPECs calculated using depth-weighted data from the exposure depths listed above for the BCW and AOC 4 potential exposure area for the baseline scenario are presented in Table BCW+AOC4-3.1. This table also presents the basis of the calculated depth-weighted EPCs, including if the EPC is based on the maximum detected concentration.

Soil exposure does not extend below 3 ft bgs at AOC 4 due to the presence of bedrock below this depth. However, for simplicity, the EPCs for the subsurface I interval in the combined BCW and AOC 4 potential exposure area were calculated using depth-weighted concentrations for the 0- to 6-ft bgs interval for locations in the BCW and AOC 4 potential exposure area. Table BCW+AOC4-3.2 compares the depth-weighted EPCs for AOC 4 for the 0- to 3-ft bgs and 0- to 6-ft bgs intervals and demonstrates that there is no difference in concentrations between the two exposure depths except for mercury. The difference in mercury concentrations between the two exposure depths is minimal (12 % higher in the 0 to 6 ft bgs) and, therefore, unlikely to impact potential risk estimates.

[2] The list of constituents shown in the Section 3 tables is based on analytes that were detected at least once at the site (including all potential exposure areas inside or outside the TCS) and measured at the BCW and AOC 4 potential exposure area.

4 HUMAN HEALTH RISK ASSESSMENT

A human health risk assessment was not conducted for the combined BCW and AOC 4 potential exposure area. The BCW and AOC 4 areas were evaluated for human exposures as part of the Outside the Compressor Station (OCS) (including BCW) potential exposure area. Risk estimates for potential human receptors exposed to soil in the OCS can be found in Appendix OCS.

5 ECOLOGICAL RISK ASSESSMENT

This section summarizes the ERA approach; presents the COPECs, EPCs, dose and risk tables for the BCW and AOC 4 ERA; and characterizes the potential risk to ecological receptors exposed to COPECs in soil at the BCW and AOC 4 potential exposure area. The overall ERA approach for the site is described in Section 6 of the main report, with supporting tables presented in Attachment BCW+AOC4-B.

Per the RAWP documents (Arcadis 2008, 2008, 2015) and California Department of Toxic Substances Control (DTSC) guidance (DTSC 1996), ecological risks were calculated using maximum depth-weighted concentrations and are presented in Attachment BCW+AOC4-C. Risks estimated using maximum depth-weighted concentrations are considered overly conservative and generally used for screening level purposes. Maximum concentrations are not recommended for making risk management decisions at the BCW and AOC 4 potential exposure area, where the area has been adequately characterized and data are available to estimate upper confidence limits (UCLs). Therefore, the risk results based on maximum depth-weighted concentrations are not discussed in this section but are presented in Attachment BCW+AOC4-C.

5.1 Ecological Conceptual Site Model

For potential large home-range receptors (red-tailed hawk, desert kit fox, Nelson's desert bighorn sheep), the BCW and AOC 4 areas were considered one potential exposure area due to the physical nature of these two areas. BCW and AOC 4 potential exposure area are geographically and topographically separated from the other AOCs outside the TCS. BCW and AOC 4 potential exposure area were grouped as a unique potential exposure area, primarily because these two areas are in close proximity and, therefore, the same wildlife populations, especially the potential large home-range receptors, can be expected to forage across both areas.

Following the steps outlined in Section 6.6 and on Figures 2-7 and 6-1 of the main report, risks were estimated for potentially complete and significant exposure pathways identified for the following potential receptors exposed to COPECs in soil at the combined BCW and AOC 4 potential exposure area.

- **Mammals –** may be exposed to COPECs via incidental ingestion of surface, shallow, or subsurface I soil (for burrowing animals) and/or ingestion of biota tissue (i.e., food items). The potential large home-range mammalian indicator receptors evaluated in this ERA for the BCW and AOC 4 potential exposure area included:
    - **Desert Kit Fox** – representative of carnivorous large home-range mammal populations, exposed to surface, shallow, and/or subsurface I soil (incidental) and exposed to only surface soil (through biota uptake). Threatened and endangered (T&E) carnivorous/omnivorous large home-range mammals (i.e., the ring-tailed cat [*Bassariscus astutus*], a California fully protected species) have been observed only in the BCW area. The desert kit fox is the most representative surrogate receptor for the ring-tailed cat and was used to qualitatively evaluate potential risk to the ring-tailed cat in this ERA (see Section 5.6.1.1.3).
    - **Nelson's Desert Bighorn Sheep –** representative of herbivorous large home-range mammal populations exposed to surface, shallow and/or subsurface I soil (incidental and through biota uptake)..

- **Birds –** may be exposed to COPECs via incidental ingestion of surface, shallow, or subsurface I soil and/or ingestion of biota tissue (i.e., food items). The large home-range bird indicator receptor evaluated in this ERA for the BCW and AOC 4 potential exposure area included:
    - **Red-tailed Hawk** – representative of carnivorous bird populations, exposed only to surface soil (incidental ingestion and through biota uptake).

Potential exposure pathways considered incomplete or insignificant were not quantitatively evaluated; these potential exposure pathways are identified and described in Section 6.3 of the main report.

Potential plants, invertebrate, and small home-range receptors (Merriam's kangaroo rat, desert shrew, cactus wren, and Gambel's quail) were evaluated for smaller potential exposure areas (individual AOCs/potential exposure areas) and are discussed in those potential exposure area-specific appendices.

5.1.1 Evaluation of Special-Status Species

The biological setting for the site and the adjacent areas are described in detail in various reports (see Section 2.4 of the main report). Potential habitat exists for special-status species at or near the site. Special status species include state- and federal-listed fully protected T&E species, state and federal species of concern, and traditionally culturally significant plants; however, protection at the no-observed adverse effects level (NOAEL) is warranted only for fully protected species. No special-status species have been observed at AOC 4; however, some have been observed at BCW.

Based on the discussions presented in the 2017 Floristic Survey Report and the Final Programmatic Biological Assessment (CH2M Hill (CH2M) 2014, 2017), the primary terrestrial vegetation at BCW include allscale scrub, also known as cattle saltbush (*Atriplex polycarpa*), in the upland area. Catclaw acacia (*Senegalia greggii*.) were also observed in the upland part of BCW. The primary vegetation present at AOC 4 is sparse creosote bush (*Larrea tridentate).* In the Tamarisk Thicket area of BCW, closer to the National Trails Highway on the northern part of BCW, the vegetation is characterized by open to dense stands of the nonnative and invasive tamarisk or salt cedar and/or athel tamarisk (*Tamarix aphylla*). The associated trees and shrubs include western honey mesquite (*Prosopis glandulosa var. torreyana*), blue palo verde (*Parkinsonia florida*), hillside palo verde (*Parkinsonia microphylla*), mousetail suncup (*Chylismia arenaria*), and desert smoke tree (*Psorothamnus spinosus*). Herbaceous vegetation is absent within dense thickets of tamarisk and athel tamarisk, but scattered herbaceous species such as fanleaf crinklemat (*Tiquilia plicata*), Spanish needle (*Palafoxia arida*), and *Cryptantha spp*. are often present in the openings between the trees in some areas. Many plant species have the potential to be present at the site and several species of plants have been incidentally observed during surveys and these are presented in Table 2-1 of the main report.

No federal or state listed T&E plants or candidates for listing were found at the site, including the BCW or AOC 4 potential exposure area (CH2M 2014, 2017). Of the plants listed above, several are culturally sensitive (ethnobotanical) plants as reported in the 2017 Floristic Survey Report (CH2M 2017) and presented in Table 2-1 of the main report. The mousetail suncup and the hillside palo verde are California Rare Plants. The largest population of mousetail suncup at the site (with approximately nine individuals) was located on a vertical conglomerate rock wall above BCW (CH2M 2017). Several of the plants that had been previously identified at this location, as well as the single plant that had previously been observed on a granitic rock face at the south end of the wash, had died, likely due to natural causes, as reported in the 2017 Floristic Survey Report, but a number of small seedlings were observed at the northernmost occurrence (CH2M 2017). Single

individuals also occur on a conglomerate rocks above the wash south of Interstate 40 (I-40) and on a granitic rock face at the southern end of the wash. It also occurs on a steep rocky slope next to the Burlington Northern Santa Fe (BNSF) railroad tracks. Two other mouse-tail suncup locations were observed along BCW to the south of I-40 and along the rock walls near the southern end of the Action Area. These populations represent a significant range extension for the species as they are more than 90 miles northeast of previously recorded populations in California. Hillside palo verde was found in areas to the south of I-40 on the rocky north-facing slopes of the Chemehuevi Mountains. The number of individuals in this population is approximately 150 trees.

Several species of mammals and birds have been observed at or near the site (Tables 2-2 and 2-4 of the main report). T&E species observed at the site (assuming at BCW; CH2M 2015a, b; DTSC 2018) included the ring-tail cat, primarily a carnivorous mammal. Bat surveys indicated presence of cave myotis (Myotis velifer) and pallid bat (*Antrozous pallidus),* both state species of concern, at BCW, BCW culverts, and railroad culverts (Harvey 2015). Yuma myotis (*Myotis yumanensis*), although not formally listed, was also observed at BCW. These potential receptors are all large home-range receptors and potential risk to these species are discussed below. The Tamarisk Thicket area in the north end of BCW is considered a potential habitat for the southwestern willow flycatcher (*Empidonax traillii extimus*), which is listed as a federal and state T&E species. In the Tamarisk Thicket potential exposure area, a southwestern willow flycatcher was observed in 2009 but not observed in subsequent surveys (Garcia and Associates [GANDA 2017]). To date, no active nests of any migratory birds have been documented during these surveys or by protocol-level surveys conducted up to 2017. In the 2014 survey, five southwestern willow flycatchers were observed, but none in the BCW and AOC 4 potential exposure area. Based on the single detections for each observation, it was concluded that they were most likely transient rather than nesting birds (GANDA 2014, 2017). The most recent survey was conducted in 2017 and no southwestern willow flycatchers were observed (GANDA 2017).

To be consistent with the GWRA (Arcadis 2009b) and observations made by a PG&E employee at the site, Nelson's desert bighorn sheep was evaluated quantitatively. As discussed in the special-status species memo (CH2M 2015b, DTSC 2018), surveys indicate potential suitable habitat for these species are available onsite in areas within California to the south of I-40 including BCW, the East Ravine, surrounding uplands, and the floodplain. Although site use by bighorn sheep cannot be excluded, it is likely limited by existing human activity at the TCS and near I-40 to the north. The site has relatively poor historical floodplain habitat that is dominated by large thickets of tamarisk that are generally dense, mono-specific stands, with little herbaceous vegetation. Because the project area foothills, uplands, and floodplain habitats are only expected to be used for foraging or transit. However, the area east/southeast of the site and along the Colorado River offers higher quality habitat and is where desert bighorn sheep have been observed during the summer or drought months.

The risk estimates presented here are considered to be protective of special-status species due to the conservative nature of the ERA where conservative parameters (e.g., small potential exposure areas, selected indicator species for each functional group considered on the high end of potential exposures for typical receptors at the site within that group, use of no-effects based toxicity values) were used to assess risks to a wide range of potential receptors at various trophic levels. Although a large home-range receptor representative of bats was not quantitatively evaluated, no unacceptable risk to bats are expected in the BCW and AOC 4 potential exposure area. Presence of bats roosting were observed at BCW; however, bats tend to forage near water (i.e., the river) where insects are likely to be abundant. Bats also have large home ranges (e.g., 42 acres for myotis [Henry et al. 2002]) and exposure to COPECs in the BCW and AOC 4 potential

exposure area soil is unlikely to result in unacceptable risk. Therefore, further evaluation of special-status bat species was not considered necessary.

Although potential risk to the ring-tailed cat and special-status bat species were not directly or quantitatively evaluated in this ERA, potential risks were evaluated qualitatively, as described below in Section 5.6.1.1.3. As presented below, based on the risk evaluations, weight of evidence (WOE), and uncertainties, potential unacceptable risk to special-status species is unlikely.

5.2 Constituents of Potential Ecological Concern

COPECs selected for either the individual BCW potential exposure area or AOC 4 potential exposure area were also selected as COPECs for the combined BCW and AOC 4 potential exposure area. These COPECs were selected in accordance with the RAWP (Arcadis 2008) and as described in Section 3.4 of the main report. Soil data encompassing all relevant exposure depths for the ERA (i.e., 0 to 6 ft bgs for the BCW and AOC 4 potential exposure area) and used in the COPEC selection process are presented in Attachment BCW+AOC4-A1.

Because a potential ecological receptor could be exposed to COPECs at various exposure depths either directly and/or through their diet for a given scenario, a single comprehensive COPEC list was selected based on the range of soil depths encountered by potential ecological receptors in the baseline exposure scenario. Additionally, essential nutrients (such as calcium and potassium) and analytes typically measured to evaluate geochemical conditions (such as chloride, nitrate, and sulfate), are not typically evaluated in ERAs and were not selected as COPECs. COPECs for the three exposure depths evaluated for the baseline scenario for this ERA are summarized in Table BCW+AOC4-5.1.

For the BCW and AOC 4 potential exposure area, COPECs included metals (antimony, barium, hexavalent chromium, total chromium, cobalt, copper, lead, mercury, nickel, thallium, vanadium, and zinc), volatile organic compounds (VOCs) (methyl acetate), semi-volatile organic compounds (SVOCs) (bis [2-ethylhexyl] phthalate), LMW PAHs, HMW PAHs, PCBs, and dioxin TEQ. Total petroleum hydrocarbons (TPHs) were also identified as COPECs; however, due to lack of appropriate toxicity values to evaluate TPHs for potential ecological receptors, indicator chemicals (e.g., benzene, toluene, ethylbenzene, and xylene [BTEX] and PAHs) when detected, are used to characterize TPH risks. COPECs lacking toxicity values and their impact to the ERA are discussed in Section 6.7 of the main report.

5.3 Exposure Point Concentration Summary

For the potentially complete and significant exposure pathways identified in the ecological conceptual site model (CSM), soil EPCs were calculated as described in Section 4.2 of the main report and presented in Section 3 of this appendix.

For the BCW and AOC 4 potential exposure area, risks to potential ecological receptors were estimated using depth-weighted EPCs. Depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment BCW+AOC4-A2. As noted above in Section 3, area-weighted EPCs were not deemed necessary for the ERA and, therefore, not calculated.

Biota tissue EPCs were calculated from the soil EPCs using soil-to-biota uptake relationships for plants, invertebrates, and small mammals, as described in Section 6.4.3 of the main report. As described in Section

6.4 and shown on Figure 6-1 of the main report, the depth intervals selected to represent exposure to soil and biota tissue for the risk calculations for each receptor are presented in Table BCW+AOC4-5.2.

To summarize:

- Carnivorous birds (red-tailed hawk) could potentially be exposed to COPECs in soil and/or biota at the surface (0 to 0.5 ft bgs). Therefore, exposures to carnivorous birds included the depth-weighted soil EPC from 0 to 0.5 ft bgs for incidental soil ingestion and the depth-weighted biota EPC from 0 to 0.5 ft bgs for dietary exposure (estimated using the surface soil depth-weighted EPC and soil-to-mammal bioaccumulation factor/model) for each COPEC.
- Carnivorous mammals (desert kit fox) could potentially be exposed to COPECs in soil down to 6 ft bgs and COPECs in biota at the surface (0 to 0.5 ft bgs). Therefore, exposures to carnivorous mammals included the maximum of the depth-weighted soil EPC from 0 to 0.5, 0 to 3, and 0 to 6 ft bgs for incidental soil ingestion and the depth-weighted biota EPC from 0 to 0.5 ft bgs for dietary exposure (estimated using the surface soil depth-weighted EPC and soil-to-mammal bioaccumulation factor/model) for each COPEC.
- Herbivorous mammals (Nelson's desert bighorn sheep) could potentially be exposed to COPECs in soil and biota down to 6 ft bgs. Therefore, exposures to herbivorous mammals included the maximum of the depth-weighted soil and biota EPC from 0 to 0.5, 0 to 3, and 0 to 6 ft bgs for incidental soil ingestion and the maximum of the depth-weighted soil and biota EPC from 0 to 0.5, 0 to 3, and 0 to 6 ft bgs for dietary exposure (estimated using the selected soil depth-weighted EPC and soil-to-plant uptake factor/model) for each COPEC.

Depth-weighted soil EPCs and biota tissue EPCs calculated from depth-weighted soil EPCs are presented in Table BCW+AOC4-5.3 and the representative soil and/or biota EPCs identified for the baseline risk calculations are bolded in this table. Of the COPECs identified at BCW and AOC 4, methyl acetate was not detected in surface soil; therefore, exposures to this COPEC by potential receptors only exposed to surface soil (carnivorous birds) were not estimated. Although VOCs were detected in shallow and subsurface I soil, uptake into biota is considered negligible (assumed to be zero for the risk calculations[3]); therefore, exposure through diet is considered incomplete. Therefore, for carnivorous mammals (desert kit fox), risks from methyl acetate were estimated only from incidental ingestion of soil and not from ingestion of biota.

Per the RAWP (Arcadis 2008) and DTSC guidance (DTSC 1996), risk calculations based on both the maximum depth-weighted concentration and the UCL for each COPEC are required. As mentioned earlier in this section, using the maximum depth-weighted concentrations results in overly conservative risks and is not recommended for supporting risk management decisions. The estimated risks based on maximum depth-weighted concentrations are presented in Attachment BCW+AOC4-C but results are not discussed in this report.

5.4 Estimation of Exposure Concentration or Dose

Exposures for wildlife (mammals and birds) are quantified as doses (e.g., in units of milligram per kilogram body weight per day [mg/kg-bw/day]). Exposure concentrations (ECs) and doses for COPECs in soil and

[3] VOCs have low bioaccumulation potential (octanol-water partition coefficient is low [log Kow < 2]) and uptake into biota is considered negligible for these constituents.

potentially complete pathways were calculated as described, including equations, in Section 6.4 of the main report. The exposure parameters selected to evaluate wildlife in this ERA include upper bound values from literature (e.g., ingestion rates) or assumed (e.g., 100% of one type of diet) which may result in conservative estimates of exposure dose and potential overestimation of actual exposure at the site.

For wildlife, doses were calculated using the exposure parameters and equations presented in Section 6.4 of the main report. Depth-weighted soil and biota tissue EPCs for COPECs at the BCW and AOC 4 potential exposure area are presented in Table BCW+AOC4-5.3 for the depth-weighted risk evaluations. Dose calculations using depth-weighted EPCs for wildlife potentially exposed to COPECs via ingestion of soil and biota tissue for the baseline scenario are presented in Attachment BCW+AOC4-B. Dose calculations using maximum depth-weighted concentrations for wildlife potentially exposed to COPECs via ingestion of soil and biota tissue for the baseline scenario are presented in Attachment BCW+AOC4-C.

5.5 Effects Assessment

Dose-based toxicity reference values (TRVs) for wildlife for COPECs were used to estimate risks to ecological receptors potentially exposed to COPECs in soil and biota tissue at the BCW and AOC 4 potential exposure area. TRVs are discussed in Section 6.5 and presented in Tables 6-7 through 6-10 of the main report.

A range of risks to wildlife were estimated using the NOAEL-based TRVs and lowest-observed adverse effects level (LOAEL)-based TRVs presented in the RAWP documents (Arcadis 2008, 2009a, 2015). These selected TRVs were primarily based on the TRVs used to develop the U.S. Environmental Protection Agency (USEPA) Ecological Soil Screening Levels (EcoSSLs; USEPA 2008); other sources included the Toxicological Benchmarks for Wildlife from the Oak Ridge National Laboratory (Sample et al. 1996) and USEPA the Region 6 ERA Guidance (USEPA 1999). In addition, for estimating potential risk to wildlife, a second set of NOAEL- and LOAEL-TRVs[4] based on the Navy/Biological Technical Assistance Group (BTAG) TRVs (DTSC 2002, 2009) were also used for COPECs, where available. Wildlife TRVs based on selected TRVs and BTAG TRVs are presented in the main report Tables 6-8 and 6-8, respectively. TRVs based on allometric conversions, when warranted, are presented in Tables 6-9 and 6-10, respectively.

TRVs are not available for antimony, barium, and methyl acetate for birds; therefore, risks to birds from exposure to these specific COPECs could not be estimated. In addition, appropriate TRVs are not available for TPHs; therefore, PAHs were used as indicator chemicals to characterize TPH risks at the BCW and AOC 4 potential exposure area (BTEX were not detected). The lack of TRVs and the impact to the ERA are discussed in Section 6.7.5 of the main report.

5.6 Ecological Risk Characterization

The risk characterization integrates the results of the exposure assessment and effects assessment and is subject to uncertainties in both of those efforts. Risk characterization includes two major components: risk estimation and risk description. As presented in tables and discussed below, risk estimates (i.e., HQs) involved integrating exposure profiles with the exposure-effects information. For each receptor and COPEC,

[4] Although these are referred to as LOAEL-based BTAG TRVs, they are based on a midpoint of a variety of adverse effects and are not necessarily lowest observed adverse effect levels. However, for simplicity, these BTAG TRVs are referred to as LOAEL-based TRVs.

risk descriptions including various lines of evidence (LOEs) and uncertainties, including HQs, supporting statistical and site use information, and the direction of uncertainty in the risk estimates, are discussed below for interpreting the risk results and identifying potential unacceptable risk to ecological receptors. Uncertainties specific to the BCW and AOC 4 potential exposure area are discussed in context with the risk characterization results presented below. Generic uncertainties in the ERA are discussed in detail in Section 6.7 of the main report.

For wildlife, a range of HQs was calculated using NOAEL- and LOAEL-based TRVs previously identified in the RAWP documents (Arcadis 2008, 2009a, 2015). HQs based on LOAEL-based TRVs selected in the RAWP are referred to as "LOAEL-based HQs." HQs based on NOAEL-based TRVs selected in the RAWP are referred as "NOAEL-based HQs." Additionally, NOAEL and LOAEL HQs were calculated using a second set of TRVs (i.e., NOAEL- and LOAEL-based BTAG TRVs), as described in Section 6.5 of the main report. The BTAG NOAEL-based TRVs are considered very conservative, resulting in a wide range of risks to wildlife. For this ERA, the selected TRVs are considered more robust than the BTAG TRVs, as discussed in Section 6.5 of the main report. Results associated with the selected TRVs are recommended for risk management decisions at the BCW and AOC 4 exposure area.

Following USEPA guidance (1998), the estimated HQs were evaluated a semi-quantitative WOE approach using multiple LOEs was used in reducing uncertainty and drawing risk conclusions.

Risk conclusions for wildlife used the following criteria:

- COPECs with NOAEL-based HQs less than or equal to 1 pose *de minimis* risk (i.e., negligible risk) to individuals and populations of potential wildlife receptors.
- COPECs with a NOAEL-based HQ greater than 1 but LOAEL-based HQ less than or equal to 1 pose no unacceptable risks to wildlife populations. However, as described in the RAWP (Arcadis 2008), unacceptable risk to individuals are uncertain because the NOAEL-based TRVs are thresholds with an interval that is an artifact of the dosing study and the nature and magnitude of the effects, if any, that may occur at exposures between these values is unknown. In such cases, a WOE approach, including multiple LOEs, were used in reducing uncertainty for characterizing potential risk to individual wildlife receptors.
- COPECs with LOAEL-based HQs greater than 1 indicate unacceptable risk is possible for populations of potential wildlife receptors. However, these LOAEL-based HQs greater than 1 are based on individual-level effects thresholds and only account for a single LOE. In such cases, a WOE approach was used in reducing uncertainty for characterizing potential risk to wildlife populations at BCW and AOC 4, as described in the above bullet.
- NOAEL-based HQs greater than 1 is considered one LOE in assessing potential risk to sensitive species, if present in this potential exposure area. Evaluation of T&E species for BCW and AOC 4 is presented in Section 5.1.1.

Ultimately three risk outcomes are possible for wildlife based on the HQs greater than 1 and WOE: (1) unacceptable risk to individual wildlife is possible (i.e., indicated by sufficient and strong supporting LOEs); (2) unacceptable risk to individual wildlife is unlikely (i.e., indicated by sufficient and strong LOEs supporting a conclusion of no unacceptable risk); or (3) unacceptable risk to individual wildlife is uncertain (i.e., indicated by insufficient LOEs).

For this ERA, the results of individual LOE evaluations were evaluated collectively to derive an overall WOE conclusion for each receptor. Key uncertainties were considered along with the strength, relevance, and other qualities of the LOEs in reaching the WOE conclusions.

For the BCW and AOC 4 potential exposure area, evaluations were completed using depth-weighted EPCs, as discussed in this section. In these evaluations, risk calculations were completed for all COPECs, as presented in Tables BCW+AOC4-5.4a and BCW+AOC4-5.4b Based on the risks estimated using depth-weighted EPCs, evaluation of the baseline scenario using area-weighted EPCs is not necessary and, therefore, is not presented. At the conclusion of the baseline scenario evaluation, risk drivers were identified based on those COPECs for which unacceptable population-level risk was predicted using the most refined exposure and effects assumptions (i.e., site-specific site use factor [SUF], area-weighted EPCs, and selected TRVs).

5.6.1 Risk Characterization (Baseline Scenario and Depth-Weighted EPCs)

Risk estimates for wildlife (mammals and birds) for the baseline scenario using depth-weighted EPCs are summarized in this section. As mentioned earlier in Section 5.4, ECs and doses for COPECs in soil and potentially complete pathways were calculated as described, including equations, in Section 6.4 of the main report. Detailed risk calculations for wildlife (Tables BCW+AOC4-B.1 through BCW+AOC4-B.4) are presented in Attachment BCW+AOC4-B. COPECs identified at the BCW and AOC 4 potential exposure area for the baseline scenario include 12 metals, PAHs, VOCs (methyl acetate), SVOCs (bis [2-ethylhexyl] phthalate), TPHs, PCBs, and dioxin TEQ in soil (Table BCW+AOC4-5.1). Potential risk to receptors exposed to these COPECs is described below.

5.6.1.1 Large Home-Range Mammals

For the BCW and AOC 4 potential exposure area, baseline risks were estimated for large home-range mammals using depth-weighted EPCs for the following evaluations and discussed in this section:

- Using the selected TRVs and a SUF equal to 1
- Using the BTAG TRVs and a SUF equal to 1
- Using the selected TRVs and a species and site-specific SUF
- Using the BTAG TRVs and a species and site-specific SUF.

5.6.1.1.1 Risks Evaluated Using an SUF Equal to 1

Risks Evaluated Using Selected TRVs

Table BCW+AOC4-5.4a summarizes HQs estimated for large home-range mammals at the BCW and AOC 4 potential exposure area using the selected TRVs, depth-weighted EPCs, and an SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized below. TRVs are not available for TPHs; however, risks to these potential receptors are characterized below based on indicator chemicals as described previously.

- **Desert Kit Fox (carnivorous mammal):** This receptor could potentially be exposed to COPECs in subsurface I soil (0 to 6 ft bgs) directly and surface soil (0 to 0.5 ft bgs) through its diet (i.e., uptake into

biota and ingestion of those biota). NOAEL- and LOAEL-based HQs in soil are less than 1 for all individual COPECs except dioxin TEQ. The potential risks from COPECs with HQs greater than 1 are characterized below.

- For dioxin TEQ, the NOAEL-HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of carnivorous mammals; however, unacceptable risk to individual potential receptors are uncertain for dioxin TEQ in soil based on the HQ. Dioxin TEQ was frequently detected in surface soil (frequency of detection = 99% in the 0- to 0.5-ft bgs and 0- to 6-ft bgs intervals) with 107 of 161 surface soil locations (0 to 0.5 ft bgs) and 109 of 165 subsurface I soil (0 to 6 ft bgs) locations having depth-weighted concentrations exceeding the background threshold value (BTV = 5.58 nanograms per kilogram [ng/kg]). Concentrations greater than 10 times the BTV are found at 25 locations in surface soil and 26 locations in subsurface I soil. As described in Section 6.7 of the main report, the mammalian TRVs (lowest available NOAEL and LOAEL) and uptake factors (bioaccumulation based on a single congener is considered overly conservative) selected for dioxins at these sites. The mammalian TRVs and uptake factors selected for dioxins at this site likely overestimate exposure and risk for this COPEC., T&E carnivorous/omnivorous large home-range mammals (i.e., the ring-tailed cat) have been observed in in parts of this potential exposure area (i.e., BCW, see Section 5.1.1). Unacceptable risk to individual carnivorous mammals from exposure to dioxin TEQ at BCW and AOC 4 potential exposure area is unlikely in this scenario.
- For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples and NOAEL- and LOAEL-based HQs for PAHs are less than 1, indicating that no unacceptable risk to carnivorous mammals from exposure to TPH is expected.
- The NOAEL- and LOAEL-based HQs for all other COPECs in soil are less than 1, indicating *de minimi*s risk to individuals and populations of carnivorous mammals for these COPECs**.**

- **Nelson's Desert Bighorn Sheep (herbivorous mammal):** This receptor could potentially be exposed to COPECs in subsurface I soil (0 to 6 ft bgs) directly and through its diet. NOAEL- and LOAEL-based HQs in soil are less than 1 for all individual COPECs, indicating *de minimis* risk to individuals and populations of herbivorous mammals.
  - For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples and NOAEL- and LOAEL-based HQs for PAHs are less than 1, indicating that no unacceptable risk to herbivorous large home-range mammals from exposure to TPH is expected.

Based on the risk estimates and potential uncertainties associated with the baseline risk from dioxin TEQ for carnivorous mammals, this COPEC was further evaluated site-specific SUFs below.

Risks Evaluated Using the BTAG TRVs

Table BCW+AOC4-5.4a also summarizes HQs estimated for large home-range mammals at the BCW and AOC 4 potential exposure area using the BTAG TRVs, depth-weighted EPCs, and an SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized below.

- **Desert Kit Fox (carnivorous mammal):** The NOAEL- and LOAEL-based HQs in soil are less than 1 for all COPECs, indicating *de minimis* risk to individual potential receptors and populations of carnivorous mammals.
- **Nelson's Desert Bighorn Sheep (herbivorous mammal):** The NOAEL- and LOAEL-based HQs in soil are less than 1 for all COPECs, indicating *de minimis* risk to individual potential receptors and populations of herbivorous large home-range mammals.

Summarized below are all HQ estimates for large home-range mammals for COPECs where at least one NOAEL-based HQ value (using the selected TRV or BTAG TRV) is greater than 1:

Hazard Quotient Summary for Large Home-Range Mammals (SUF = 1)								
	Desert Kit Fox				Nelson's Desert Bighorn Sheep			
COPEC	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
TEQ Mammals	**3E+00**	3E-01	--	--	5E-01	5E-02	--	--

Notes:
Bold indicates HQs > 1.
-- = HQ not estimated because TRVs are unavailable.

5.6.1.1.2 Risks Evaluated Using a Site-Specific SUF

Risks Evaluated Using Selected TRVs

Table BCW+AOC4-5.4b presents HQs calculated for large home-range mammals at the BCW and AOC 4 potential exposure area using the selected TRVs and BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized below.

- **Desert Kit Fox (carnivorous mammal):** The site-specific SUF for this receptor is 0.007 which reduced the NOAEL- and LOAEL-based HQs for dioxin TEQ to less than 1. (*De minimis* risk to individual and populations carnivorous mammals is expected when accounting for site use at the BCW and AOC 4 potential exposure area.
- **Nelson's Desert Bighorn Sheep (herbivorous mammal):** The site-specific SUF for this receptor is 0.02 which further reduced the NOAEL- and LOAEL-based HQs below 1. *De minimis* risk to individuals and populations herbivorous mammals is expected when accounting for site use at the BCW and AOC 4 potential exposure area.

Risks Evaluated Using the BTAG TRVs

Table BCW+AOC4-5.4b also summarizes HQs estimated for large home-range mammals at BCW and AOC4 potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized below:

- **Desert Kit Fox (carnivorous mammal):** The site-specific SUF for this receptor further reduced the NOAEL- and LOAEL-based HQs in soil to less than 1, indicating *de minimis* risk to individual potential receptors and populations of carnivorous large home-range mammals.
- **Nelson's Desert Bighorn Sheep (herbivorous mammal):** The site-specific SUF for this receptor further reduced the NOAEL- and LOAEL-based HQs in soil to less than 1, indicating *de minimis* risk to individual potential receptors and populations of herbivorous large home-range mammals.

For the COPECs with NOAEL-based HQs greater than 1 using a SUF of 1 (using the selected TRV or BTAG TRV), HQ estimates using the species- and site-specific SUF for large home-range mammals are summarized below:

Hazard Quotient Summary for Large Home-Range Mammals (Site-Specific SUF)								
	Desert Kit Fox (SUF = 0.007)				Nelson's Desert Bighorn Sheep (SUF = 0.02)			
COPEC	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
TEQ Mammals	2E-02	2E-03	--	--	9E-03	9E-04	--	--

Note:
-- = HQ not estimated because TRVs are unavailable.

5.6.1.1.3 Qualitative Risk Evaluation for Special-Status Mammals

As discussed earlier in Section 5.1.1, the ring-tailed cat (a California fully protected species) and two special-status species of bats including cave myotis and pallid bat, both state species of concern, have been observed at BCW, which is within the OCS. Although potential risks to these receptors were not directly or quantitatively evaluated in this ERA, potential risks were evaluated qualitatively, as described below:

- For the ring-tail cat, the desert kit fox is the most representative surrogate receptor based on body sizes, similar dietary preferences, and large home ranges. Unlike the fox, which lives and forages primarily in the open desert, on creosote bush flats, and amongst the sand dunes (National Park Service 2015), the ring-tail cat prefers habitat associated with water (California Department of Fish and Wildlife [CDFW] 2005) and is unlikely to use upland areas in the OCS potential exposure area frequently. Risk estimates for the fox are adequate to evaluate potential risk to the ring-tail cat. The NOAEL-based HQs greater than 1 estimated for the fox using a SUF of 1 are low in magnitude and would reduce to *de minimis* levels using a site-specific SUF for ring-tail cat based on a home range of 109 to 1,280 acres (CDFW 2005). Because the ring-tail cat is likely to forage in the riparian area, the risk characterization for the Tamarisk Thicket is considered adequate for evaluating for potential risk to the ring-tail cat as well (see Appendix TT).
- For bats, the desert shrew is the most representative surrogate receptor based on prey preferences (invertebrates); however, bats have significantly larger home ranges than shrews and are less exposed to soil, as they are aerial feeders. The NOAEL-based HQs for the shrew at BCW (see Appendix BCW) are less than 1 for all COPECs except for antimony, total chromium, and dioxin TEQ. The NOAEL-based HQs would be reduced to *de minimis* levels when using a site-specific SUF for bats (e.g., 42 acres for myotis

[Henry et al. 2002] compared to the home range of 0.1 for the shrew) in addition to the LOE discussed for BCW including compounded uncertainties related to dioxin uptake and TRVs.

Based on the results of the ERA, potential exposures to COPECs in soil at BCW and AOC 4 potential exposure area are not expected to pose unacceptable risk to potential ecological receptors including special-status species.

5.6.1.1.4 Baseline Risk Summary for Large Home-Range Mammals Using Depth-Weighted EPCs

To summarize, based on the risks characterized for large home-range mammals exposed to COPECs in soil at the BCW and AOC 4 potential exposure area using selected TRVs[5], depth-weighted EPCs, and a site- and species-specific SUF, the risk conclusions are as follows:

- **Desert Kit Fox (carnivorous mammal):** The NOAEL-based and LOAEL-based HQs are less than 1, indicating no unacceptable risk to individuals and populations of carnivorous large home-range mammals for all COPECs.
- **Nelson's Desert Bighorn Sheep (herbivorous mammal):** The NOAEL-based and LOAEL-based HQs are less than 1, indicating no unacceptable risk to individuals and populations of herbivorous large mammals for all COPECs.
- **Special-Status Species:** Qualitative evaluation of special-status species (ring-tail cat and bats), using HQs for surrogate receptors and species-specific SUFs, indicates no unacceptable risk resulting from exposure to soil in the BCW and AOC 4 potential exposure area for these species.

To summarize, based on the risks characterized for populations of large home-range mammals exposed to COPECs in soil at BCW and AOC 4 potential exposure area using selected TRVs, depth-weighted EPCs, and a site- and species-specific SUF, the NOAEL-based HQs and LOAEL-based HQs are less than 1 for all COPECs, indicating no unacceptable risk to individuals or populations of large home-range mammals, including T&E species from exposure to soil at the BCW and AOC 4 potential exposure area. No further evaluation of these potential receptors is required.

Potential Risk Drivers for Large Home-Range Mammals at the BCW and AOC 4 Exposure Area

No risk-driving COPECs for large home-range mammals were identified at the BCW and AOC 4 potential exposure area, as no unacceptable population-level risk (i.e., LOAEL-based HQs greater than 1) was predicted based on the HQs calculated using the most refined exposure and effects assumptions (i.e., site-specific SUF, depth-weighted EPCs[6], and selected TRVs) and additional supporting LOEs. Additionally, no COPECs with NOAEL-based HQs greater than 1 using the most refined exposure and effects assumptions and additional LOEs supporting the conclusions of unacceptable risk were identified at BCW and AOC 4 potential exposure area.

[5] Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

[6] Evaluation of area-weighted EPCs is not warranted for these receptors.

5.6.1.2 Large Home-Range Birds

For the BCW and AOC 4 potential exposure area, baseline risks were estimated for birds using depth-weighted EPCs for the following evaluations and are discussed in this section:

- Using the selected TRVs and SUF equal to 1
- Using the BTAG TRVs and a SUF equal to 1
- Using the selected TRVs and a species and site-specific SUF
- Using the BTAG TRVs and a species and site-specific SUF.

5.6.1.2.1 Risks Evaluated Using an SUF equal to 1

Risks Evaluated Using Selected TRVs

Table BCW+AOC4-5.4a summarizes HQs estimated for large home-range birds (i.e., red-tailed hawk) at the BCW and AOC 4 potential exposure area using the selected TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for this receptor are summarized below.

- **Red-Tailed Hawk (carnivorous bird):** This receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. NOAEL- and LOAEL-based HQs in soil are less than 1 for all COPECs, indicating *de minimis* risk to individuals and populations of carnivorous birds. TRVs are not available for TPHs; however, risks to this receptor is characterized below based on indicator chemicals as described previously.
    - For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples and NOAEL- and LOAEL-based HQs for PAHs are less than 1, indicating *de minimis* risk to carnivorous birds from exposure to TPH is expected.

No unacceptable risks to birds are expected for the baseline scenario. No further evaluation of COPECs using selected TRVs and site-specific SUFs for birds was required in this scenario.

Risks Evaluated Using the BTAG TRVs

Table BCW+AOC4-5.4a also summarizes HQs estimated for birds at the BCW and AOC 4 potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized below.

- **Red-Tailed Hawk (carnivorous bird):** NOAEL-based HQ for lead is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of carnivorous birds; however, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ. The risks from lead are likely overestimated due to the conservative avian TRV. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. NOAEL- and LOAEL-based HQs for other COPECs in soil are less than 1, indicating *de minimis* risk to individuals and populations of carnivorous birds for the remaining COPECs.

Summarized below are all HQ estimates for birds for COPECs where at least one NOAEL-based HQ value (using the selected TRV or BTAG TRV) is greater than 1:

COPEC	Red-Tailed Hawk (SUF = 1)			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Lead	2E-01	9E-02	**2E+01**	3E-02

Note:
Bold indicates HQs > 1.

5.6.1.2.2 Risks Evaluated Using a Site-Specific SUF

Risks Evaluated Using Selected TRVs

Table BCW+AOC4-5.4b presents HQs calculated using the selected TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for red-tailed hawk are summarized below.

- **Red-Tailed Hawk (carnivorous bird):** The site-specific SUF for this receptor is 0.008 which further reduced the NOAEL- and LOAEL-based HQs to less than 1 for all COPECs. *De minimis* risk to populations and individual carnivorous birds is expected when accounting for site use at the BCW and AOC 4 potential exposure area.

Risks Evaluated Using the BTAG TRVs

Table BCW+AOC4-5.4b also summarizes HQs estimated for birds at the BCW and AOC 4 potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for red-tailed hawk are summarized below.

- **Red-Tailed Hawk (carnivorous bird):** The site-specific SUF for this receptor is 0.008 which reduced the NOAEL HQs for lead to less than 1, indicating no unacceptable risk to individual potential receptors or populations of carnivorous birds. The risks from lead are likely overestimated due to the conservative avian BTAG TRV. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7 of the main report. NOAEL- and LOAEL-based HQs for other COPECs in soil are less than 1, indicating de minimis to populations of carnivorous birds for the remaining COPECs.

For the COPECs with NOAEL-based HQs greater than 1 using a SUF of 1 (using the selected TRV or BTAG TRV), HQ estimates using the species- and site-specific SUF for red-tailed hawk are summarized below.

COPEC	Red-Tailed Hawk (SUF = 0.008)			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Lead	1E-03	7E-04	2E-01	3E-04

5.6.1.2.3 Baseline Risk Summary for Large Home-Range Birds Using Depth-Weighted EPCs

To summarize, based on the risks characterized for populations of birds exposed to COPECs in soil at the BCW and AOC 4 potential exposure area using selected TRVs[7], depth-weighted EPCs, and a site-specific SUF, the risk conclusions are as follows:

- **Red-Tailed Hawk (carnivorous bird):** The NOAEL- and LOAEL-based HQs for all COPECs are less than 1, indicating *de minimis* risk to individuals and populations of carnivorous birds for all COPECs.

Based on the risks characterized for populations of large home-range birds (i.e., red-tailed hawk) exposed to COPECs in soil at the BCW and AOC 4 potential exposure area using selected TRVs, depth-weighted EPCs, and a site- and species-specific SUF, the NOAEL-based HQs and LOAEL-based HQs are less than 1 for all COPECs, indicating no *de minimis* risk to individuals or populations of birds due to exposure to soil at the BCW and AOC 4 potential exposure area. No further evaluation of this receptor is required.

Potential Risk Drivers for Large Home-Range Birds at the BCW and AOC 4 Exposure Area

No risk-driving COPECs for large home-range birds were identified at the BCW and AOC 4 exposure area as no unacceptable population-level risk (i.e., LOAEL-based HQs greater than 1) was predicted using the most refined exposure and effects assumptions (i.e., site-specific SUF, depth-weighted EPCs[8], and selected TRVs) and additional supporting LOEs. Additionally, no COPECs with NOAEL-based HQs greater than 1 using the most refined exposure and effects assumptions and additional LOEs supporting the conclusions of unacceptable risk were identified at BCW and AOC 4 potential exposure area.

[7] Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

[8] Evaluation of area-weighted EPCs is not warranted for these receptors.

6 SUMMARY AND CONCLUSIONS FOR THE ERA

Potential cumulative cancer risks and noncancer hazards for potential human receptors were not estimated for the BCW and AOC 4 potential exposure area, as this area is evaluated as part of the OCS potential exposure area for potential human receptors (Appendix OCS). For potential ecological receptors, risks were estimated as presented above in Section 5 of this appendix. Uncertainties related to the ERAs at the site are discussed in detail in Section 6.7 of the main report, and uncertainties specific to the BCW and AOC 4 potential exposure area are discussed in this appendix. For the BCW and AOC 4 potential exposure area, an ERA was conducted per the RAWP documents (Arcadis 2008, 2009a, 2015). One scenario (baseline, i.e., no scouring) was evaluated, and risks were estimated for various potential receptors using depth-weighted EPCs. Risks estimated based on depth- weighted EPCs did not suggest potential risk to ecological receptors (i.e., HQs were less than or equal to 1 for all COPECs); therefore, risks based on area-weighted EPCs were not necessary. As such, risks based on only the depth-weighted EPCs are discussed in this appendix. Three potential large home-range wildlife receptors (red-tailed hawk, desert kit fox, and Nelson's desert bighorn sheep) were evaluated for exposure to COPECs in the BCW and AOC 4 soil potential exposure area.

At the BCW and AOC 4 potential exposure area, the COPECs identified for the ERA include metals (antimony, barium, hexavalent chromium, total chromium, cobalt, copper, lead, mercury, nickel, thallium, vanadium, and zinc), VOCs (methyl acetate), SVOCs(bis [2-ethylhexyl] phthalate), LMW PAHs, HMW PAHs, PCBs, TPHs, and dioxin TEQ. Risks could not be estimated for potential receptors lacking available TRVs for COPECs; such cases are discussed in the uncertainty analysis of the main report. These COPECs are unlikely to be risk drivers and are assumed to have minimal impact to the conclusions of the ERA.

Risks were estimated using depth-weighted EPCs. Evaluation of area-weighted EPCs was not necessary based on the results of the depth-weighted EPC evaluation. Risk conclusions were based on the following criteria:

- COPECs with NOAEL-based HQs less than or equal to 1 pose *de minimis* risk to potential wildlife receptors.
- COPECs with NOAEL-based HQs greater than 1 but LOAEL-based HQs less than or equal to 1 pose no unacceptable risk to wildlife populations; however, potential for unacceptable risk to individuals is uncertain based on the HQ. A WOE approach was used to characterize potential risk to individual potential receptors.
- COPECs with LOAEL-based HQs greater than 1 pose possible unacceptable risk to populations of potential wildlife receptors based on the HQ LOE.

The risk estimates (i.e., HQs) represent a single LOE in the risk characterization. A qualitative WOE approach, incorporating other LOEs and uncertainties, was used to characterize risk to wildlife populations at the BCW and AOC 4 potential exposure area. HQs for all the COPECs for the baseline scenario calculated using depth-weighted EPCs, selected TRVs, and site- and species-specific SUFs are summarized in Table BCW+AOC4-6.1. The LOAEL HQs based on depth-weighted EPCs were less than one for desert kit fox, Nelson's desert bighorn sheep, and red-tailed hawk. The various LOEs considered in the WOE assessment and risk conclusions are presented in Table BCW+AOC4-6.2.

Based on the ecological risk characterization for the BCW and AOC 4 potential exposure area, using depth-weighted EPCs, site and species-specific SUFs, and selected TRVs, the following conclusions were made.

6.1 Mammals

Overall, no unacceptable risks to populations of large home-range mammals exposed to COPECs in soil are expected. *De minimis* risk to carnivorous mammals (represented by the desert kit fox) and herbivorous mammals (represented by Nelson's desert bighorn sheep) is expected from exposure to COPECs in soil based on NOAEL- and LOAEL-based HQs less than 1 for all COPECs. T&E mammals with large home ranges have been observed in the BCW and AOC 4 potential exposure area. However, no unacceptable risk to individual potential receptors exposed to COPECs in soil at BCW and AOC 4 are expected based on the HQs.

6.2 Birds

Overall, no unacceptable risks to populations of large home-range birds exposed to COPECs in soil are expected. *De minimis* risk to carnivorous birds (represented by the red-tailed hawk) is expected from exposure to COPECs in soil based on NOAEL-based and LOAEL-based HQs less than 1 for all COPECs.

T&E birds with large home ranges have not been observed in the BCW and AOC 4 potential exposure area. No unacceptable risk to individual potential receptors exposed to COPECs in soil at the BCW and AOC 4 potential exposure area are expected.

6.3 Potential Risk Drivers for BCW and AOC 4 Exposure Area

As presented in Table BCW+AOC4-6.2 and summarized below, no risk drivers were identified for BCW and AOC 4 based on unacceptable individual or population-level risk (i.e., NOAEL/LOAEL-based HQs greater than 1 for mammals and birds) predicted using the most refined exposure and effects assumptions (i.e., site-specific SUF, depth-weighted EPCs, and selected TRVs) and additional LOEs supporting the conclusion of unacceptable risk.

Scenario	Potential Receptors and Risk Drivers for BCW+AOC4 Exposure Area		
	Carnivorous Mammals (Desert Kit Fox)	Herbivorous Mammals (Nelson's Desert Bighorn Sheep)	Carnivorous Birds (Red-Tailed Hawk)
Baseline	None	None	None

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

Chemical	Detection Frequency (Detections/ Samples Analyzed)	Range of Detected Site Concentrations	Units	Included in Risk Assessment [a]	Basis for selection as COPEC in Risk Assessment
Inorganics					
Aluminum	38 / 38	5,700 - 14,000	mg/kg	No	Within Background
Antimony	4 / 222	2.1 - 18	mg/kg	Yes	Above Background
Arsenic	151 / 222	1.1 - 14	mg/kg	No	Within Background
Barium	222 / 222	37 - 1,300	mg/kg	Yes	Above Background
Beryllium	0 / 222	ND	mg/kg	No	Not Detected
Cadmium	12 / 222	1.1 - 1.7	mg/kg	No	Within Background
Calcium [b]	43 / 43	9,100 - 280,000	mg/kg	No	Essential Nutrient (No Toxicity Values Available)
Chromium, Hexavalent	74 / 248	0.060 - 48	mg/kg	Yes	Above Background
Chromium, total	246 / 246	8.2 - 2,600	mg/kg	Yes	Above Background
Cobalt	221 / 221	3.7 - 20	mg/kg	Yes	Above Background
Copper	246 / 246	3.0 - 790	mg/kg	Yes	Above Background
Cyanide	0 / 36	ND	mg/kg	No	Not Detected
Iron	43 / 43	4,760 - 29,000	mg/kg	No	Within Background
Lead	220 / 222	1.1 - 220	mg/kg	Yes	Above Background
Magnesium [b]	43 / 43	4,700 - 14,300	mg/kg	No	Within Background
Manganese [b]	43 / 43	67 - 420	mg/kg	No	Within Background
Mercury (inorganic)	10 / 221	0.10 - 0.74	mg/kg	Yes	Above Background
Molybdenum	16 / 222	1.0 - 20	mg/kg	No	Within Background
Nickel	246 / 246	3.6 - 75	mg/kg	Yes	Above Background
Nitrate	2 / 2	8.0 - 54	mg/kg	Yes	Detected
Phosphate	2 / 2	161 - 358	mg/kg	Yes	Detected
Potassium [b]	43 / 43	1,040 - 4,900	mg/kg	No	Within Background
Selenium	0 / 222	ND	mg/kg	No	Not Detected
Silver	0 / 222	ND	mg/kg	No	Not Detected
Sodium [b]	32 / 43	140 - 2,700	mg/kg	No	Within Background
Thallium	1 / 222	2.4	mg/kg	Yes	Above Background
Vanadium	222 / 222	18 - 100	mg/kg	Yes	Above Background
Zinc	246 / 246	12 - 673	mg/kg	Yes	Above Background
Volatile Organic Compounds

Notes:

[a] Applicable to ecological risk assessment (ERA).

[b] Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the ERA. Ecological toxicity values are available for manganese, thus this chemical is evaluated in the ERA, if above background levels.

[c] Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.

[d] Dioxins are evaluated in toxic equivalents.

Abbreviations:

mg/kg = milligrams per kilogram.
ng/kg = nanograms per kilogram.
ug/kg = micrograms per kilogram.
COPEC = Constituent of Potential Ecological Concern.
ND = Not detected.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Sulfate	mg/kg	0-6	3 / 3	100	53	1010	NA	NA	503.7	503.7	448	231286	480.9	X	1010	Max Detect

Notes:

[a] The constituent consists of analytes detected at least once at the Topock Compressor Station site and measured in soil in this exposure area.

[b] If fewer than eight total locations and four total detected concentrations, the maximum depth-weighted concentration was selected as the EPC. Otherwise, the UCL was selected as the EPC.

[c] EPCs and summary statistics were not calculated for some constituents (i.e., dioxin congeners and essential nutrients). Those data, if available, are presented in Attachment A1 of each exposure area-specific appendix.

Abbreviations:

"--" = not applicable
B(a)P equivalent = benzo(a)pyrene equivalent
AOC = area of concern
BCA = Bias-corrected accelerated bootstrap method
BCW = Bat Cave Wash
COPEC = constituent of potential ecological concern
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
EPC = exposure point concentration
FOD = frequency of detection
ft bgs = feet below ground surface
KM = Kaplan-Meier
µg/kg = micrograms per kilogram
mg/kg = milligrams per kilogram
NA = not applicable
ND = not detected
ng/kg = nanograms per kilogram
PAH = polycyclic aromatic hydrocarbons
PCB = polychlorinated biphenyls
PG&E = Pacific Gas and Electric Company
TCDD = Tetrachlorodibenzo-p-dioxin
TEQ = toxic equivalent
TPH = total petroleum hydrocarbons
UCL = upper confidence limit
X = COPEC in the exposure depth interval

Notes:

[a] WOE Result is risk conclusion based on 1.) HQ/LOAEL HQ using depth-weighted EPCs, and 2.) supporting LOE. Area-weighted EPCs were not evaluated for this exposure area.

NOAEL HQ greater than 1

LOAEL HQ greater than 1

LOAEL HQ greater than 10

LOAEL HQ greater than 100

Table BCW+AOC4-6.1
Ecological Risk Estimate Summary for Baseline Scenario Using Depth-Weighted Exposure Point Concentrations (Wildlife Species-Specific SUF, Selected TRVs) for BCW+AOC4

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

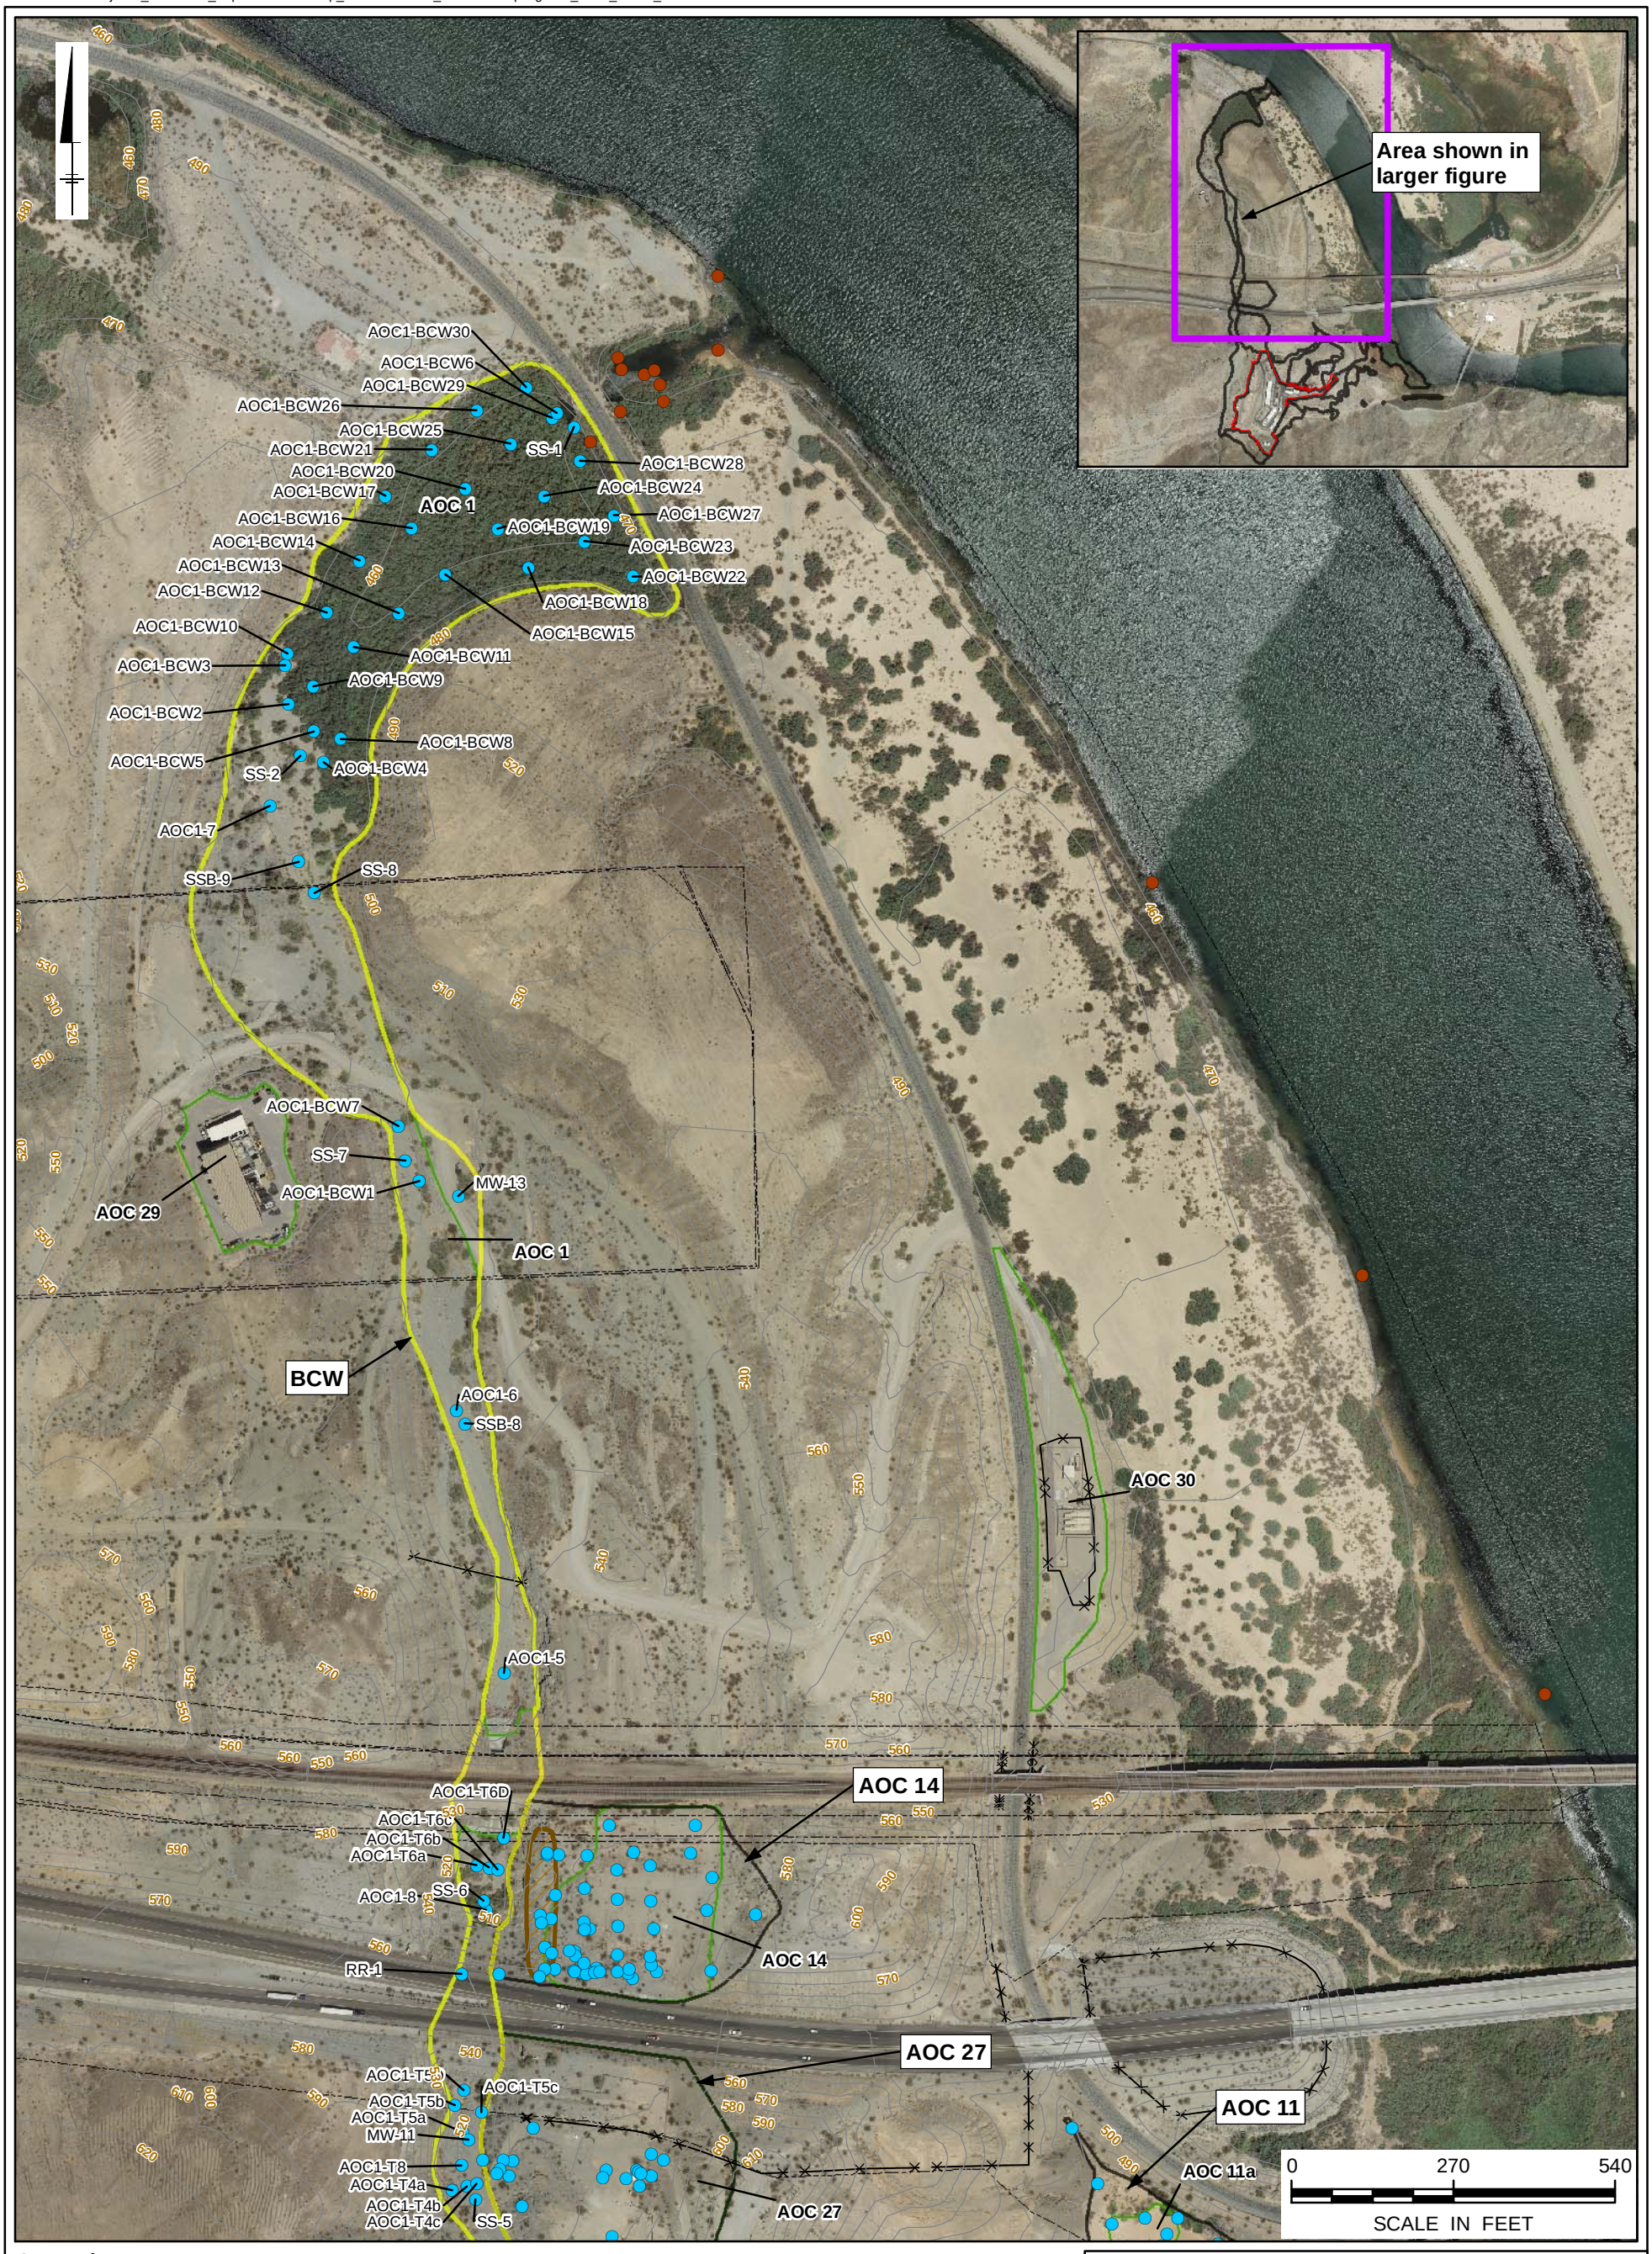
Abbreviations:
-- = no toxicity value available, HQs could not be estimated
AOC = area of concern
BCW = Bat Cave Wash
HQ = hazard quotient
LOE = line of evidence
LOAEL = lowest observed adverse effect level
ND = not detected
NOAEL = no-observed adverse effect level
no SL = no screening level available
PAH = polycyclic aromatic hydrocarbons
PCB = polychlorinated biphenyl
TEQ = toxic equivalent
WOE = weight of evidence, considering multiple LOE. If LOAEL HQs > 1, WOE Result is either 1) not expected, 2) unlikely, or 3) possible.

Table BCW+AOC4-6.2
Risk Conclusions and Lines of Evidence Summary for BCW and AOC 4

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

AOC	Receptor	COPEC[a]	Area-Weighted HQs		Additional Lines of Evidence[c]										Risk Conclusions		Risk Driver (LOAEL HQ > 1 and Supporting LOE)[g]
			Mammal/ Bird					Background HQs[d]									
			NOAEL	LOAEL	Low FOD (Max = EPC)[b]	Locations > BTV	Locations > 10xBTV	NOAEL	LOAEL	BAFs	Quality of SL or TRV	Exposure Assumptions[e]	Observation of T&E species[f]	Other LOE	Individuals	Populations	
Large Home Range Receptors																	
BCW + AOC 4	Desert kit fox	None	HQs < 1	HQs < 1	--	--	--	--	--	--	--	--	--	--	Not expected	Not expected	No
	Nelson's Desert Bighorn Sheep	None	HQs < 1	HQs < 1	--	--	--	--	--	--	--	--	--	--	Not expected	Not expected	No
	Red-tailed hawk	None	HQs < 1	HQs < 1	--	--	--	--	--	--	--	--	--	--	Not expected	Not expected	No

Notes:
a COPECs are presented for HQs greater than 1 based on the depth-weighted EPC and/or area-weighted EPC and species and site-specific SUF.
b The EPC is based on the maximum depth-weighted concentration due to the small dataset size.
c The additional lines of evidence for COPECs with NOAEL and LOAEL HQs less than or equal to 1 (based on the area-weighted EPC and species and site-specific SUF) are not included in the table.
d For plants and s LOAEL and NOAEL HQs ≤ 1 for the receptor
e Applicable to wildlife, unless noted.
f In areas where observations were noted, the T&E species observed have large home ranges and unlikely to forage in upland habitat. See text for details.
g For dioxin TEQ, LOAEL HQs less than 10 with supporting LOE were considered unlikely to pose an unacceptable risk to populations of wildlife receptors due to the compounded conservative assumptions included in the ecological risk assessment. See Section 6.7.6 of the main report.
h Depth-weighted EPC resulted in an HQ or NOAEL-based HQ less than 1, and is less than the area-weighted HQ or NOAEL-based HQ.
i Although a BTV is not available, concentrations were at or below the reporting limit except for the number of locations noted.



LOAEL and NOAEL HQs ≤ 1 for the receptor

Abbreviations:

"--" = not applicable
AOC = area of concern
BAF = bioaccumulation factor
BG NA = background value not available
BTV = background threshold value
COPEC = constituent of potential ecological concern
EPC = exposure point concentration
FOD = frequency of detection
HQ = hazard quotient
LOAEL = lowest observed adverse effect limit
LOE = line of evidence
MDC = maximum depth-weighted concentration
NC = not calculated
NOAEL = no observed adverse effect limit
SL = screening level
SWMU 1 = solid waste management unit 1
T&E = threatened and endangered
TCS-4= Topock Compressor Station Well #4
TEQ = toxic equivalent
TRV = toxicity reference value

AOC = area of concern
BHC = benzene hexachloride
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
TPH = total petroleum hydrocarbon
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyls

ATTACHMENT B

Dose and Risk Calculations for Ecological Receptors at BCW and AOC4 Using Depth-Weighted EPCs

Attachment BCW+AOC4-B
Dose and Risk Calculations for Ecological Receptors at BCW+AOC4 Using Depth-Weighted EPCs

Table BCW+AOC4-B.1	Terrestrial Wildlife Risk Calculations for Baseline Scenario Using Depth-Weighted Exposure Point Concentrations (SUF = 1, Selected TRVs) for BCW and AOC4
Table BCW+AOC4-B.2	Terrestrial Wildlife Risk Calculations for Baseline Scenario Using Depth-Weighted Exposure Point Concentrations (SUF = 1, BTAG TRVs) for BCW and AOC4
Table BCW+AOC4-B.3	Terrestrial Wildlife Risk Calculations for Baseline Scenario Using Depth-Weighted Exposure Point Concentrations (Species-Specific SUF, Selected TRVs) for BCW and AOC4
Table BCW+AOC4-B.4	Terrestrial Wildlife Risk Calculations for Baseline Scenario Using Depth-Weighted Exposure Point Concentrations (Species-Specific SUF, BTAG TRVs) for BCW and AOC4
Table BCW+AOC4-C Table Notes	Notes for Terrestrial Wildlife Risk Calculations

Table BCW+AOC4-B.1

Table BCW+AOC4-B Table Notes
Notes for Terrestrial Wildlife Risk Calculations

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

Notes:

[a] Dioxin presented in ng/kg.

[b] Total dose equation is presented below:

$$\text{Total Dose (mg/kg-day)} = [(EPC^{soil} \times SIR) + (C^{plants} \times FIR \times F^{plants}) + (C^{insects} \times FIR \times F^{insects}) + (C^{mammals} \times FIR \times F^{mammals})] \times SUF$$

[c] HQ = Total Dose / TRV

Abbreviations:

AOC = area of concern
BCW = Bat Cave Wash
BTAG = Biological Technical Assistance Group
COPEC = constituent of potential ecological concern
dw = dry weight
EPC^{soil} = exposure point concentration in soil (mg/kg dw)
EPC^{plants} = exposure point concentration in plants (mg/kg dw)
$EPC^{insects}$ = exposure point concentration in insects (mg/kg dw)
$EPC^{mammals}$ = exposure point concentration in mammals (mg/kg dw)
F^{plants} = fraction of plants in diet
$F^{insects}$ = fraction of insects in diet
$F^{mammals}$ = fraction of mammals in diet
FIR = food ingestion rate (kg dw/kg bw-day)
HQ = hazard quotient (unitless)
kg = kilogram
kg dw/kg bw-day = kilograms per kilogram of body weight per day
LOAEL = lowest observed adverse effect level (mg/kg-day)
m = maximum detected concentration
mg/kg = milligrams per kilogram
mg/kg-day = milligrams per kilogram per day
ND = not detected
ng/kg = nanograms per kilogram
NOAEL = no observed adverse effect level (mg/kg-day)
SIR = soil ingestion rate (kg dw/kg bw-day)
SUF = site use factor (fraction)
TRV = toxicity reference value (mg/kg-day)

Table BCW+AOC4-C.1
Baseline Scenario Maximum Exposure Point Concentrations for Soil and Biota for BCW and AOC 4

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

Notes:
[a] Calculated using selected soil EPC and uptake model. See Section 6 of the main report.
[b] Biota EPCs presented as 0.0 indicate no bioaccumulation from soil.

Bold indicates EPC selected to estimate plant uptake from soil (maximum of surface, shallow, and subsurface l soil.

Abbreviations:

-- = soil EPC or uptake model not available, biota EPCs could not be estimated.
AOC = area of concern
EPC = exposure point concentration
ft bgs = feet below ground surface
m = maximum depth-weighted concentration
mg/kg = milligrams per kilogram
nd = not detected in this depth interval
ng/kg = nanograms per kilogram

a Dioxin presented in ng/kg.

b Total dose equation is presented below:

$$\text{Total Dose (mg/kg-day)} = [(EPC^{soil} \times SIR) + (C^{plants} \times FIR \times F^{plants}) + (C^{insects} \times FIR \times F^{insects}) + (C^{mammals} \times FIR \times F^{mammals})] \times SUF$$

c HQ = Total Dose / TRV

Abbreviations:

AOC = area of concern
BCW = Bat Cave Wash
BTAG = Biological Technical Assistance Group
COPEC = constituent of potential ecological concern
dw = dry weight
EPC^{soil} = exposure point concentration in soil (mg/kg dw)
EPC^{plants} = exposure point concentration in plants (mg/kg dw)
$EPC^{insects}$ = exposure point concentration in insects (mg/kg dw)
$EPC^{mammals}$ = exposure point concentration in mammals (mg/kg dw)
F^{plants} = fraction of plants in diet
$F^{insects}$ = fraction of insects in diet
$F^{mammals}$ = fraction of mammals in diet
FIR = food ingestion rate (kg dw/kg bw-day)
HQ = hazard quotient (unitless)
kg = kilogram
kg dw/kg bw-day = kilograms per kilogram of body weight per day
LOAEL = lowest observed adverse effect level (mg/kg-day)
m = maximum detected concentration
mg/kg = milligrams per kilogram
mg/kg-day = milligrams per kilogram per day
ND = not detected
ng/kg = nanograms per kilogram
NOAEL = no observed adverse effect level (mg/kg-day)
SIR = soil ingestion rate (kg dw/kg bw-day)
SUF = site use factor (fraction)
TRV = toxicity reference value (mg/kg-day)

1 INTRODUCTION

This appendix presents the ecological risk assessment (ERA) for the combined areas of concern (AOCs) potential exposure area located outside the Topock Compressor Station (TCS) in Needles, California, excluding Bat Cave Wash (BCW) and AOC 4. The AOCs/potential exposure areas evaluated in this appendix consist of combined AOCs 9, 10, 11, 12, 14, 27, 28 (a, b, c), and 31, and Undesignated Area (UA-) 2/300B. The combined AOCs outside the compressor station (OCS) excluding BCW and the AOC 4 potential exposure area (referred to hereafter as the OCSxBCW+AOC4 potential exposure area), shown on Figure OCSxBCW+AOC4-1.1, is approximately 18 acres in total and includes sample locations shown in Table OCSxBCW+AOC4-1.1 of this appendix.

For this potential exposure area, available soil data from the OCSxBCW+AOC4 potential exposure area were used to conduct a quantitative ERA for the large home-range receptors: red-tailed hawk, desert kit fox, and Nelson's desert bighorn sheep. This appendix summarizes site use, data evaluation, potential receptors, potential exposure pathways, and the results of the ERA risk characterization for soil in the OCSxBCW+AOC4 potential exposure area. Tables and figures specific to this potential exposure area are also presented in this appendix. To enable comparison of the OCSxBCW+AOC4 potential exposure area to the OCS potential exposure area, the constituents of potential ecological concern (COPECs) selected for the OCS potential exposure area were used as the basis for COPECs in the OCSxBCW+AOC4 potential exposure area. A human health risk assessment (HHRA) was not conducted for the OCSxBCW+AOC4 soil potential exposure area; human exposures to soil in these areas are evaluated in the OCS excluding the BCW potential exposure area (see Appendix OCSxBCW).

The ERA methodologies are provided in the Soil Human Health and Ecological Risk Assessment Report for the TCS (the "main report") in accordance with the final Human Health and Ecological Risk Assessment Work Plan (RAWP) documents (Arcadis U.S., Inc. [Arcadis] 2008, 2009, 2015) and are not repeated in this appendix. Discussions of the historical uses of the TCS site and sampling and analysis activities are presented in the main report, as well.

1.1 Summary of Site Use

The OCSxBCW+AOC4 potential exposure area consists of AOCs 9, 10, 11, 12, 14, 27, 28 (a, b, c), and 31, and UA-2/300B. The background and summary of site use for each AOC/potential exposure area included as part of the OCSxBCW+AOC4 are presented in the respective AOC/potential exposure area appendices and are not repeated herein.

2 DATA EVALUATION AND COPEC SELECTION

This section summarizes the data considered for the OCSxBCW+AOC4 ERA and presents the COPECs selected for the OCSxBCW+AOC4 potential exposure area.

All soil sampling locations at OCSxBCW+AOC4 are presented on Figure OCSxBCW+AOC4-1.1 and in Table OCSxBCW+AOC4-1.1. Although location RR-1 falls outside the potential exposure area boundary for AOC 14, data from this sampling location were included in the AOC 14 potential exposure area and, thus, in the OCSxBCW+AOC4 dataset because they were collected to support site characterization for this AOC (and will be discussed in the forthcoming Draft Resource Conservation and Recovery Act (RCRA) Facility Investigation/Remedial Investigation [RFI/RI] Report Volume 3, currently being prepared by Jacobs). The data were evaluated based on methodology described in the RAWP documents (Arcadis 2008, 2009, 2015). Details of the soil sampling and analysis will be presented in the forthcoming Draft RFI/RI Report Volume 3 (currently being prepared by Jacobs). For the OCSxBCW+AOC4 potential exposure area, soil data from 0 to 6 feet (ft) below ground surface (bgs) were included in the baseline scenario evaluated in the ERA. Because potential soil contact does not extend below 6 ft bgs, deeper soil data (i.e., greater than 6 ft bgs) were excluded from the risk evaluation, as noted in Table OCSxBCW+AOC4-1.1.

Following the steps outlined in Section 3 of the main report, soil data considered usable for the risk assessment were identified and used in the quantitative ERA. For the OCSxBCW+AOC4 potential exposure area, all available soil data are presented in Attachment OCSxBCW+AOC4-A1. Soil data for the OCSxBCW+AOC4 potential exposure area includes samples collected from AOCs 9, 10, 11, 12, 14, 27, 28 (a, b, c), and 31, solid waste management unit (SWMU) 1, and UA-2/300B. Additionally, samples from 14 perimeter area (PA) locations (PA-05 through PA-13, PA-18 through PA-21, and PA-23), and 19 storm drain (SD) locations (SD-01 through SD-06, SD-08 through SD-13, SD-11A, SD-20 through SD-23, SD-27, and SD-OS37) were evaluated as part of this potential exposure area.

For the OCSxBCW+AOC4 potential exposure area, soil data are available from 790 samples, of which soil data from 616 samples collected from 0 to 6 ft bgs were considered for use in the ERA (i.e., data from 174 samples collected at depths greater than 6 ft bgs were excluded from the baseline evaluations) as noted in Table OCSxBCW+AOC4-1.1.

Within this dataset, some samples did not meet data quality criteria; therefore, nondetected results were rejected with an “R” data qualifier (and will be discussed in the forthcoming Draft RFI/RI Report Volume 3, currently being prepared by Jacobs). This occurred for the following samples: all polycyclic aromatic hydrocarbons (PAHs) in one sample (AOC11e-6-6172); 1,2,3,7,8-pentachlorodibenzofuran results in one sample (SD-11-02) in the AOC 11 potential exposure area dataset; four organic compounds (2,4-dinitrophenol, 4,6-dinitro-2-methylphenol, benzoic acid, and hexachlorocyclopentadiene) in a single sample (AOC14-20-8138) in the AOC 14 potential exposure area dataset; and all Aroclors except Aroclor 1254 in one sample (AOC9-18-4111) in which most Aroclor data were rejected (except for Aroclor 1254) in the AOC 9 potential exposure area dataset.

Data processed for the ERA (e.g., calculation of total concentrations for low molecular weight [LMW] and high molecular weight [HMW] PAHs, benzo(a)pyrene equivalent [B(a)PEQ], polychlorinated biphenyls [PCBs], and dioxin/furan toxicity equivalents [TEQ]) are described in detail in Section 3 of the main report.

The process for identifying COPECs included in the ERA is detailed in Section 3.4 of the main report. To enable comparison of the OCSxBCW+AOC4 potential exposure area to the OCS potential exposure area, the COPECs selected for the OCS potential exposure area were used as the basis for COPECs in the OCSxBCW+AOC4 potential exposure area. COPECs were selected for these two potential exposure areas using soil data encompassing all relevant exposure depths for the OCS HHERA (i.e., 0 to 10 ft bgs for OCS) as presented in Appendix OCS (Attachment OCS-A1). Inorganics, LMW PAHs, HMW PAHs, and dioxin TEQ were above background levels in the OCS dataset and, therefore, are included as COPECs in the OCSxBCW+AOC4 ERA. All other detected organic constituents in the OCSxBCW+AOC4 evaluation are included as COPECs in the ERA. COPECs selected for exposure depths and scenarios evaluated in the ERA for the OCSxBCW+AOC4 potential exposure area are summarized in Tables OCSxBCW+AOC4-2.1a through OCSxBCW+AOC4-2.1c for the three soil depth intervals included in the baseline evaluations (i.e., surface, shallow, and subsurface I soil). The selected COPECs are discussed further in Section 5 of this appendix.

3 EXPOSURE POINT CONCENTRATIONS

Depth-weighted and area-weighted exposure point concentrations (EPCs) for COPECs in soil at the OCSxBCW+AOC4 potential exposure area were calculated as described in Section 4.2 of the main report. For the OCSxBCW+AOC4 potential exposure area, one scenario was evaluated: baseline (no scouring).

The following exposure depths were evaluated:

1. Surface soil (0 to 0.5 ft bgs)
2. Shallow soil (0 to 3 ft bgs)
3. Subsurface I soil (0 to 6 ft bgs).

For the ERA, consistent with evaluation of potential exposure areas for large home receptors described in the RAWP documents (Arcadis 2008, 2009, 2015), scouring was not evaluated for the OCSxBCW+AOC4 potential exposure area.

The depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment OCSxBCW+AOC4-A2. The summary statistics for the OCSxBCW+AOC4 potential exposure area soil depth-weighted datasets and depth-weighted EPCs were calculated consistent with the RAWP documents (Arcadis 2008, 2009, 2015). Per the RAWP, area-weighted EPCs are evaluated only if depth-weighted EPCs suggest potential risk to ecological receptors (i.e., hazard quotient [HQ] > 1 for any COPEC). For the OCSxBCW+AOC4 potential exposure area, area-weighted EPCs were not deemed necessary for the ERA based on the risk estimates using depth-weighted EPCs and, therefore, were not calculated.

Soil summary statistics for constituents measured at the OCSxBCW+AOC4[1] potential exposure area and depth-weighted EPCs for COPECs calculated using depth-weighted data from the exposure depths listed above are presented in Table OCSxBCW+AOC4-3.1.

[1] The list of constituents shown in the Section 3 tables is based on analytes that were detected at least once at the site (including all exposure areas inside or outside the TCS) and measured at OCSxBCW+AOC4.

4 HUMAN HEALTH RISK ASSESSMENT

A human health risk assessment was not conducted for the OCSxBCW+AOC4 soil potential exposure area. As noted above, the OCSxBCW+AOC4 is evaluated for human exposures as part of the OCS excluding BCW potential exposure area. Risk estimates for potential human receptors exposed to soils in the OCSxBCW+AOC4 can be found in Appendix OCSxBCW.

5 ECOLOGICAL RISK ASSESSMENT

This section summarizes the ERA approach; presents the COPECs, EPCs, dose and risk tables for the OCSxBCW+AOC4 potential exposure area ERA; and characterizes potential risk to potential ecological receptors exposed to COPECs in soil at the OCSxBCW+AOC4 potential exposure area. Details of the overall ERA approach are presented in Section 6 of the main report. Supporting tables are presented in Attachment OCSxBCW+AOC4-B and described below.

Per the RAWP documents (Arcadis 2008, 2009, 2015) and California Department of Toxic Substances Control (DTSC) guidance (1996), ecological risks were also calculated using maximum depth-weighted concentrations and are presented in Attachment OCSxBCW+AOC4-C. Risks estimated using maximum depth-weighted concentrations are considered overly conservative and generally used for screening level purposes. Maximum concentrations are not recommended for making risk management decisions at OCSxBCW+AOC4, where the area has been adequately characterized and data are available to estimate upper confidence limits (UCLs). Therefore, the risk results based on maximum depth-weighted concentrations are not discussed in this section but are presented in Attachment OCSxBCW+AOC4-C.

5.1 Ecological Conceptual Site Model

Following the steps outlined in Section 6.6 and Figures 2-7 and 6-1 of the main report, risks were estimated for potentially complete and significant exposure pathways identified for the following potential large home-range receptors exposed to COPECs in soil at the OCSxBCW+AOC4 potential exposure area:

- **Mammals** – may be exposed to COPECs via incidental ingestion of surface, shallow, or subsurface I soil (for burrowing animals) and/or ingestion of biota tissue (i.e., food items). The large home range mammalian indicator receptors evaluated in this ERA for the OCSxBCW+AOC4 potential exposure area included:
    - **Desert Kit Fox** – representative of carnivorous large home range mammal populations, exposed to surface, shallow and/or subsurface I soil (incidental) and exposed to only surface soil (through biota uptake). Threatened and endangered (T&E) carnivorous/omnivorous large home-range mammals have not been observed in the OCSxBCW+AOC4 potential exposure area.
    - **Nelson's Desert Bighorn Sheep** – representative of herbivorous large home range mammal populations exposed to surface, shallow and/or subsurface I soil (incidental ingestion and through biota uptake).
- **Birds** – may be exposed to COPECs via incidental ingestion of surface, shallow, or subsurface I soil and/or ingestion of biota tissue (i.e., food items). The large home-range bird indicator receptor evaluated in this ERA for the OCSxBCW+AOC4 potential exposure area included:
    - **Red-Tailed Hawk** – representative of carnivorous bird populations, exposed only to surface soil (incidental ingestion and through biota uptake).

Exposure pathways considered incomplete or insignificant were not quantitatively evaluated; these exposure pathways are identified and described in Section 6.3 of the main report.

Potential plants, soil invertebrates, and small home-range receptors (Merriam's kangaroo rat, desert shrew, cactus wren, and Gambel's quail) were evaluated for smaller potential exposure areas (individual AOCs/potential exposure areas) and are discussed in those specific appendices.

5.1.1 Evaluation of Special-Status Species

The biological setting for the site and the adjacent areas are described in detail in various reports (see Section 2.4 of the main report). Although potential habitat exists for special-status[2] species at or near the site, none have been recorded as observed at the OCSxBCW+AOC4 potential exposure area.

Based on the discussions presented in the 2017 Floristic Survey Report (CH2M HILL [CH2M] 2017), the primary vegetation present at the OCSxBCW+AOC4 potential exposure area is sparse creosote bush (*Larrea tridentate).* Other species of terrestrial plants are present but limited to smaller areas and are discussed in the individual potential exposure area appendices and are not repeated here. No federal- or state-listed T&E plants or candidates for listing were found at the Topock site, including the OCSxBCW+AOC4 potential exposure area. Many other plant species have the potential to be present at the site and several species of plants have been observed during surveys (CH2M 2013, 2017). Plant species observed in the Action Area and/or within the Topock site during the March 2017 pre-construction survey and reported in the 2017 Floristic Report (CH2M 2017) are presented in Tables 2-1 and 2-3 of the main report.

Several species of mammals and birds have been observed at or near the site (Tables 2-2 and 2-4 of the main report). However, no federal- or state-listed T&E wildlife species or candidates for listing were observed at the OCSxBCW+AOC4 potential exposure area.

Nelson's desert bighorn sheep are not a protected species but were quantitatively evaluated in this ERA at the request of the U.S. Department of the Interior. As discussed in the special-status species memo (CH2M 2015; DTSC 2018), surveys indicate potential suitable habitat for these species are available onsite in areas within California to the south of Interstate 40 (I-40) including BCW, the East Ravine, surrounding uplands, and the floodplain. Although site use by bighorn sheep cannot be excluded, it is likely limited by existing human activity at the TCS and near I-40 to the north. The site has relatively poor historical floodplain habitat that is dominated by large thickets of tamarisk that are generally dense, mono-specific stands, with little herbaceous vegetation. Because the project area foothills, uplands, and floodplain habitats are only expected to be used for foraging or transit. However, the area east/southeast of the site and along the Colorado River offers higher quality habitat and is where desert bighorn sheep have been observed during the summer or drought months.

5.2 Constituents of Potential Ecological Concern

To enable comparison of the OCSxBCW+AOC4 potential exposure area, the COPECs selected for the OCS potential exposure area were used as the basis for selection of COPECs for the OCSxBCW+AOC4 potential exposure area. COPECs for the OCS and OCSxBCW+AOC4 were selected in accordance with the RAWP (Arcadis 2008) and as described in Section 3.4 of the main report. Soil data encompassing all relevant

[2] Special-status species include state- and federal-listed fully protected T&E species, state and federal species of concern, and traditionally culturally significant plants; however, protection at the no-observed adverse effects level (NOAEL) is warranted only for fully protected species.

exposure depths for the OCS ERA (i.e., 0 to 10 ft bgs for OCS) and used in the COPEC selection process are presented in Appendix OCS (Attachment OCS-A1). Inorganics, PAHs, and dioxin/furans were selected as COPECs based on the background screening conducted for the OCS potential exposure area, as described in Section 2. All other detected organic constituents in OCSxBCW+AOC4 soil are included as COPECs in the ERA. Because a potential ecological receptor could be exposed to COPECs at various exposure depths either directly and/or through their diet for a given scenario, a single comprehensive COPEC list was selected based on the range of soil depths encountered by potential ecological receptors in the baseline exposure scenario. Additionally, essential nutrients (such as calcium and potassium) and analytes typically measured to evaluate geochemical conditions (such as chloride, nitrate, and sulfate), are not typically evaluated in ERAs and were not selected as COPECs. COPECs for the three exposure depths evaluated for the baseline scenario for this ERA are summarized in Table OCSxBCW+AOC4-5.1.

For the OCSxBCW+AOC4 potential exposure area, COPECs included nine inorganics (antimony, hexavalent chromium, total chromium, copper, cyanide, lead, mercury, thallium, and zinc), volatile organic compounds (VOCs; bromomethane, chloromethane, chloroform, and methyl acetate), semivolatile organic compounds (SVOCs; 4-methylphenol, bis (2-ethylhexyl) phthalate, and isophorone), LMW PAHs, HMW PAHs, pesticides (4,4-dichlorodiphenyltrichloroethane [4,4-DDT], 4,4-dichlorodiphenyldichloroethylene [4,4-DDE], alpha-chlordane, dieldrin, and gamma-chlordane), PCBs, and dioxin TEQ. Total petroleum hydrocarbons (TPHs) were also identified as COPECs; however, due to lack of appropriate toxicity values to evaluate TPH for ecological receptors, indicator chemicals (e.g., benzene, toluene, ethylbenzene, and xylene [BTEX] and PAHs), when detected, are used to characterize TPH risks. COPECs lacking toxicity values and their impact to the ERA are discussed in Section 6.7.5 of the main report.

5.3 Exposure Point Concentration Summary

For the potentially complete and significant exposure pathways identified in the ecological conceptual site model, soil EPCs were calculated as described in Section 4.2 of the main report and presented in Section 3 of this appendix.

For the OCSxBCW+AOC4 potential exposure area, risks to potential ecological receptors were estimated using depth-weighted EPCs. Depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment OCSxBCW+AOC4-A2. As noted above in Section 3, area-weighted EPCs were not deemed necessary for the ERA and, therefore, were not calculated.

Biota tissue EPCs were calculated from the soil EPCs using soil-to-biota uptake relationships for plants, invertebrates, and small mammals, as described in Section 6.4.3 of the main report. As described in Section 6.4 and shown in Figure 6-1 of the main report, the depth intervals selected to represent exposure to soil and biota tissue for the risk calculations for each potential receptor are presented in Table OCSxBCW+AOC4-5.2.

To summarize:

- Carnivorous birds (red-tailed hawk) could potentially be exposed to COPECs in soil and/or biota at the surface (0 to 0.5 ft bgs). Therefore, exposures to carnivorous birds included the depth-weighted soil EPC from 0 to 0.5 ft bgs for incidental soil ingestion and the depth-weighted biota EPC from 0 to 0.5 ft bgs for dietary exposure (estimated using the surface soil depth-weighted EPC and soil-to-mammal bioaccumulation factor/model).

- Carnivorous mammals (desert kit fox) could potentially be exposed to COPECs in soil down to 6 ft bgs and COPECs in biota at the surface (0 to 0.5 ft bgs). Therefore, exposures to carnivorous mammals included the maximum of the depth-weighted soil EPC from 0 to 0.5, 0 to 3, and 0 to 6 ft bgs for incidental soil ingestion and the depth-weighted biota EPC from 0 to 0.5 ft bgs for dietary exposure (estimated using the surface soil depth-weighted EPC and soil-to-mammal bioaccumulation factor/model).
- Herbivorous mammals (Nelson's desert bighorn sheep) could potentially be exposed to COPECs in soil and biota down to 6 ft bgs. Therefore, exposures to herbivorous mammals included the maximum of the depth-weighted soil and biota EPC from 0 to 0.5, 0 to 3, and 0 to 6 ft bgs for incidental soil ingestion and the maximum of the depth-weighted soil and biota EPC from 0 to 0.5, 0 to 3, and 0 to 6 ft bgs for dietary exposure (estimated using the selected soil depth-weighted EPC and soil-to-plant uptake factor/model).

Depth-weighted soil EPCs and biota tissue EPCs calculated from depth-weighted soil EPCs are presented in Table OCSxBCW+AOC4-5.3 and the representative soil and/or biota EPCs identified for the baseline risk calculations are bolded in this table. Of the COPECs identified at the OCSxBCW+AOC4 potential exposure area for the baseline scenario, thallium and VOCs (bromomethane, chloromethane, chloroform, and methyl acetate) were not detected in surface soil; therefore, exposure to these COPECs by potential receptors only exposed to surface soil (carnivorous birds) were not estimated. Although VOCs were detected in shallow and subsurface I soil, uptake into biota is considered negligible (assumed to be zero for the risk calculations[3]); therefore, exposure to VOCs through diet is considered incomplete. As such, for carnivorous mammals (desert kit fox), risks from VOCs were estimated quantitatively only from incidental soil ingestion and not from ingestion of biota.

Per the RAWP (Arcadis 2008) and DTSC guidance (1996), risk calculations based on both the maximum depth-weighted concentration and the UCL for each COPEC are required. As mentioned earlier in this section, using the maximum depth-weighted concentrations results in overly conservative risks and is not recommended for supporting risk management decisions. The estimated risks based on maximum depth-weighted concentrations are presented in Attachment OCSxBCW+AOC4-C but results are not discussed in this report.

5.4 Estimation of Exposure Concentration or Dose

Exposures for wildlife (mammals and birds) are quantified as doses (e.g., in units of milligrams per kilogram body weight per day [mg/kg-bw/day]). Exposure concentrations and doses for COPECs in soil and potentially complete pathways were calculated as described, including equations, in Section 6.4 of the main report. The exposure parameters selected to evaluate wildlife in this ERA include upper bound values from literature (e.g., ingestion rates) or assumed (e.g., 100% of one type of diet), which may result in conservative estimates of exposure dose and potential overestimation of actual exposure at the site.

For wildlife, doses were calculated using the exposure parameters and equations presented in Section 6.4 of the main report. Depth-weighted soil and biota tissue EPCs for COPECs at the OCSxBCW+AOC4 are presented in Table OCSxBCW+AOC4-5.3 for the depth-weighted risk evaluations. Dose calculations using depth-weighted EPCs for wildlife potentially exposed to COPECs via ingestion of soil and biota tissue for the

[3] VOCs have low bioaccumulation potential (octanol-water partition coefficient is low [log Kow < 2]) and uptake into biota is considered negligible for these constituents.

baseline scenario are presented in Attachment OCSxBCW+AOC4-B. Based on the risk estimates using depth-weighted EPCs, area-weighted EPCs were not necessary for the OCS potential exposure area ERA. Dose calculations using maximum depth-weighted concentrations for wildlife potentially exposed to COPECs via ingestion of soil and biota tissue for the baseline scenario are presented in Attachment OCSxBCW+AOC4-C.

5.5 Effects Assessment

Dose-based toxicity reference values (TRVs) for wildlife for COPECs were used to estimate risks to potential ecological receptors potentially exposed to COPECs in soil and biota tissue at the OCSxBCW+AOC4 potential exposure area. TRVs are discussed in Section 6.5 and presented in Tables 6-7 through 6-10 of the main report.

A range of risks to wildlife were estimated using the NOAEL-based TRVs and lowest-observed adverse effects level (LOAEL)-based TRVs presented in the RAWP documents (Arcadis 2008, 2009, 2015). These selected TRVs were primarily based on the TRVs used to develop the U.S. Environmental Protection Agency (USEPA) Ecological Soil Screening Levels (EcoSSLs; USEPA 2008); other sources included the Toxicological Benchmarks for Wildlife from Oak Ridge National Laboratory (ORNL; Sample et al. 1996) and USEPA Region 6 ERA Guidance (1999). In addition, for estimating potential risk to wildlife, a second set of NOAEL- and LOAEL-TRVs[4] based on the Navy/Biological Technical Assistance Group (BTAG) TRVs (DTSC 2002, 2009) were also used for COPECs, where available. Wildlife TRVs based on selected TRVs and BTAG TRVs are presented in the main report Tables 6-7 and 6-8, respectively. TRVs based on allometric conversions, when warranted, are presented in main report Tables 6-9 and 6-10, respectively.

TRVs are not available for antimony, bromomethane, chloromethane, chloroform, methyl acetate, 4-methylphenol, and isophorone for birds; TRVs are not available for bromomethane, chloromethane, 4-methylphenol, and isophorone for mammals. However, VOCs were not detected in surface soil, and exposure to these COPECs by potential receptors only exposed to surface soil (carnivorous birds) were not estimated. In addition, appropriate TRVs are not available for TPH; therefore, PAHs were used as indicator chemicals to characterize TPH risks (BTEX were not detected). The lack of TRVs and the impact to the ERA are discussed in Section 6.7.5 of the main report.

5.6 Ecological Risk Characterization

The risk characterization integrates the results of the exposure assessment and effects assessment and is subject to uncertainties in both of those efforts. Risk characterization includes two major components: risk estimation and risk description. As presented in tables and discussed below, risk estimates (i.e., HQs) involved integrating exposure profiles with the exposure-effects information. For each potential receptor and COPEC, risk descriptions including various lines of evidence (LOEs) and uncertainties, including HQs, supporting statistical and site use information, and the direction of uncertainty in the risk estimates, are discussed below for interpreting the risk results and identifying potential unacceptable risk to potential ecological receptors. Uncertainties specific to the OCSxBCW+AOC4 potential exposure area are discussed in

[4] Although these are referred to as LOAEL-based BTAG TRVs, they are based on a midpoint of a variety of adverse effects and are not necessarily lowest observed adverse effect levels. However, for simplicity, these BTAG TRVs are referred to as LOAEL-based TRVs.

context with the risk characterization results presented below. Generic uncertainties in the ERA are discussed in detail in Section 6.7 of the main report.

For wildlife, a range of HQs were calculated using NOAEL- and LOAEL-based TRVs previously identified in the RAWP documents (Arcadis 2008, 2009, 2015). HQs based on LOAEL-based TRVs selected in the RAWP are referred to as "LOAEL-based HQs." HQs based on NOAEL-based TRVs selected in the RAWP are referred as "NOAEL-based HQs." Additionally, NOAEL- and LOAEL-based HQs were calculated using a second set of TRVs (i.e., NOAEL- and LOAEL-based BTAG TRVs), as described in Section 6.5 of the main report. The BTAG NOAEL-based TRVs are considered very conservative, resulting in a wide range of risks to wildlife. For this ERA, the selected TRVs are considered more robust than the BTAG TRVs, as discussed in Section 6.5 of the main report. Results associated with the selected TRVs are recommended for risk management decisions at the OCSxBCW+AOC4 potential exposure area.

Following USEPA guidance (1998), the estimated HQs were evaluated using a semi-quantitative weight-of-evidence (WOE) approach and multiple LOEs to reduce uncertainty in drawing risk conclusions. Risk conclusions for wildlife used the following criteria:

- COPECs with NOAEL-based HQs less than or equal to 1 pose *de minimis* risk (i.e., negligible risk) to individuals and populations of potential wildlife receptors.
- COPECs with a NOAEL-based HQ greater than 1 but LOAEL-based HQ less than or equal to 1 pose no unacceptable risks to wildlife populations. However, as described in the RAWP (Arcadis 2008), unacceptable risk to individuals are uncertain because the NOAEL-based TRVs are thresholds with an interval that is an artifact of the dosing study, and the nature and magnitude of the effects, if any, that may occur at exposures between these values is unknown. In such cases, a WOE approach, including multiple LOEs, were used in reducing uncertainty for characterizing potential risk to individual potential wildlife receptors.
- COPECs with LOAEL-based HQs greater than 1 indicate unacceptable risk is possible for populations of potential wildlife receptors. However, these LOAEL-based HQs greater than 1 are based on individual-level effects thresholds and only account for a single LOE. In such cases, a WOE approach was used in reducing uncertainty for characterizing potential risk to wildlife populations at the OCSxBCW+AOC4 potential exposure area, as described in the above bullet.
- NOAEL-based HQs greater than 1 is considered one LOE in assessing potential risk to sensitive species if present in this potential exposure area. Evaluation of T&E species for the OCSxBCW+AOC4 potential exposure area is presented in Section 5.1.1.

Ultimately, three risk outcomes are possible for wildlife based on the HQs greater than 1 and WOE: (1) unacceptable risk to individual wildlife is possible (i.e., indicated by sufficient and strong supporting LOEs); (2) unacceptable risk to individual wildlife is unlikely (i.e., indicated by sufficient and strong LOE supporting a conclusion of no unacceptable risk); or (3) unacceptable risk to individual wildlife is uncertain (i.e., indicated by insufficient LOE).

For this ERA, the results of individual LOE evaluations were evaluated collectively to derive an overall WOE conclusion for each potential receptor. Key uncertainties were considered along with the strength, relevance, and other qualities of the LOE in reaching the WOE conclusions.

Evaluations for the OCSxBCW+AOC4 potential exposure area were completed using depth-weighted EPCs, as discussed in this section.

In these evaluations, risk calculations were completed for all COPECs, as presented in Tables OCSxBCW+AOC4-5.4a and OCSxBCW+AOC4-5.4b. Based on the risks estimated using depth-weighted EPCs, evaluation of the baseline scenario using area-weighted EPCs is not necessary and, therefore, is not presented. At the conclusion of the baseline scenario evaluation, risk drivers were identified based on those COPECs for which unacceptable population-level risk was predicted using the most refined exposure and effects assumptions (i.e., site-specific site use factor [SUF], area-weighted EPCs, and selected TRVs).

5.6.1 Risk Characterization (Baseline Scenario and Depth-Weighted EPCs)

Risk estimates for large home range wildlife (mammals and birds) for the baseline scenario using depth-weighted EPCs are summarized in this section. As mentioned earlier in Section 5.4, exposure concentrations and doses for COPECs in soil and potentially complete pathways were calculated as described, including equations, in Section 6.4 of the main report. Detailed risk calculations for wildlife (Tables OCSxBCW+AOC4-B.1 through OCSxBCW+AOC4-B.4) are presented in Attachment OCSxBCW+AOC4-B. COPECs identified at OCS for the baseline scenario include nine inorganics (antimony, hexavalent chromium, total chromium, copper, cyanide, lead, mercury, thallium, and zinc), PAHs, TPHs, VOCs (bromomethane, chloromethane, chloroform, and methyl acetate), SVOCs (4-methylphenol, bis [2-ethylhexyl] phthalate, and isophorone), pesticides (4,4-DDT, 4,4-DDE, alpha-chlordane, dieldrin, and gamma-chlordane), PCBs, and dioxin TEQ (Table OCSxBCW+AOC4-5.1). Potential risk to potential receptors exposed to these COPECs is described below.

5.6.1.1 Large Home Range Mammals

For the OCSxBCW+AOC4 potential exposure area, risks were estimated for large home range mammals using depth-weighted EPCs for the following evaluations and discussed in this section:

- Using the selected TRVs and a SUF equal to 1
- Using the BTAG TRVs and a SUF equal to 1
- Using the selected TRVs and a species- and site-specific SUF
- Using the BTAG TRVs and a species- and site-specific SUF.

5.6.1.1.1 Risks Evaluated Using a SUF Equal to 1

Risks Evaluated Using Selected TRVs

Table OCSxBCW+AOC4-5.4a summarizes HQs estimated for large home range mammals at the OCS using the selected TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized below. TRVs are not available for TPHs; however, risks to these potential receptors are characterized below based on indicator chemicals as described previously.

- **Desert Kit Fox (carnivorous mammal):** This potential receptor could potentially be exposed to COPECs in subsurface I soil (0 to 6 ft bgs) directly and surface soil (0 to 0.5 ft bgs) through its diet (i.e., uptake into

biota and ingestion of those biota). The NOAEL- and LOAEL-based HQs in soil are less than 1 for all individual COPECs, except 4,4-DDE and dioxin TEQ. The potential risks from COPECs with HQs greater than 1 are characterized below.

- For 4,4-DDE, the NOAEL-HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of carnivorous mammals; however, unacceptable risk to individual potential receptors is uncertain for 4,4-DDE based on the HQ. 4,4-DDE was detected in only three of 68 locations in surface soil (frequency of detection [FOD] = 4% in 0 to 0.5 ft bgs) and the EPC was based on the maximum depth-weighted concentration (6.1 milligrams per kilogram [mg/kg]). The magnitude of the HQ is low. For areas where a constituent is largely not detected, use of a maximum concentration as the EPC may not appropriately characterize risk; therefore, potential risk to the fox from exposure to 4,4-DDE is likely overestimated. Unacceptable risk to individual carnivorous mammals from exposure to 4,4-DDE at the OCSxBCW+AOC4 potential exposure area is unlikely in this scenario.
- For dioxin TEQ, the NOAEL-HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of carnivorous mammals; however, unacceptable risk to individual potential receptors is uncertain for dioxin TEQ based on the HQ. Dioxin TEQ was frequently detected in surface soil (FOD = 100% in the 0 to 0.5 ft bgs and 0 to 6 ft bgs intervals) with 45 of 73 surface soil locations (0 to 0.5 ft bgs) and 49 of 80 subsurface I soil (0 to 6 ft bgs) locations having depth-weighted concentrations exceeding the background threshold value (BTV; 5.58 nanograms per kilogram [ng/kg]). Concentrations greater than 10 times the BTV are found at 17 locations in surface soil and 23 locations in subsurface I soil. As described in Section 6.7.6 of the main report, the mammalian TRVs (lowest available NOAEL and LOAEL) and uptake factors (bioaccumulation based on a single congener is considered overly conservative) selected for dioxins at this site likely overestimate exposure and risk for this COPEC. As discussed in Section 5.1.1, T&E carnivorous large home range mammals have not been observed in this area. Unacceptable risk to individual carnivorous mammals from exposure to dioxin TEQ at the OCSxBCW+AOC4 potential exposure area is unlikely.
- For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples and NOAEL- and LOAEL-based HQs for PAHs are less than 1, indicating that *de minimis* risk to carnivorous mammals from exposure to TPHs is expected.
- The NOAEL- and LOAEL-based HQs for all other COPECs in soil are less than 1, indicating *de minimis* risk to individuals and populations of carnivorous mammals for these COPECs**.**

- **Nelson's Desert Bighorn Sheep (herbivorous mammal):** This potential receptor could potentially be exposed to COPECs in subsurface I soil (0 to 6 ft bgs) directly and through its diet. The NOAEL- and LOAEL-based HQs in soil are less than 1 for all individual COPECs, except antimony and dioxin TEQ.
  - For antimony, the NOAEL-HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of herbivorous large home range mammals; however, unacceptable risk to individual receptors are uncertain for antimony based on the HQ. Antimony was detected in only 1 of 178 locations in surface soil (FOD = 1% in 0 to 0.5 ft bgs) and the EPC was based on the maximum depth-weighted concentration (15 mg/kg). The magnitude of the HQ is low. For areas where a constituent is largely not detected, use of a maximum concentration as the EPC may not appropriately characterize risk. Antimony was not detected in the background dataset; therefore, a

BTV could not be developed for comparison. Additionally, there is uncertainty in the TRVs for antimony. The selected LOAEL TRV[5] (0.59 mg/kg-bw/day) is based on the paired value from the selected NOAEL (0.059 mg/kg-bw/day) in a study by Rossi et al. (1987) reported in the EcoSSL guidance (USEPA 2005). Other studies cited in the EcoSSL and ORNL guidance indicate the selected TRVs are the most conservative. ORNL (Sample et al. 1996) reports a LOAEL TRV of 1.25 mg/kg-bw/day. The EcoSSL guidance reports paired LOAEL values ranging from 42 to 835 mg/kg-bw/day, which are orders of magnitudes greater than the selected LOAEL. Potential risk to the bighorn sheep from exposure to antimony is likely overestimated. Unacceptable risk to individual herbivorous large mammals from exposure to antimony at the OCSxBCW+AOC4 potential exposure area is unlikely in this scenario.

- For dioxin TEQ, the NOAEL-HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of herbivorous large mammals; however, unacceptable risk to individual receptors is uncertain for dioxin TEQ based on the HQ. As noted above for the desert kit fox, dioxin TEQ was frequently detected in surface soil but locations having concentrations greater than 10 times the BTV (5.58 ng/kg) are found only at 17 locations in surface soil (0 to 0.5 ft bgs) and 23 locations in subsurface I soil (0 to 6 ft bgs). As described in Section 6.7.6 of the main report, the mammalian TRVs and uptake factors selected for dioxins at this site likely overestimate exposure and risk for this COPEC. The Nelson's bighorn desert sheep have been observed at the site. Unacceptable risk to individual herbivorous large mammals from exposure to dioxin TEQ at the OCSxBCW+AOC4 potential exposure area is uncertain in this scenario.
- For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples and the NOAEL- and LOAEL-based HQs for PAHs are less than 1, indicating that no unacceptable risk to herbivorous large mammals from exposure to TPHs are expected.
- The NOAEL- and LOAEL-based HQs for other COPECs in soil are less than 1 for the remaining COPECs, indicating *de minimis* risk to individuals and populations of herbivorous mammals for the remaining COPECs.

Based on the risk estimates and potential uncertainties associated with the baseline risk from 4,4-DDE and dioxin TEQ for carnivorous mammals, and antimony and dioxin TEQ for herbivorous large mammals, these COPECs were further evaluated using site-specific SUFs as discussed below.

Risks Evaluated Using the BTAG TRVs

Table OCSxBCW+AOC4-5.4a also summarizes HQs estimated for large home-range mammals at the OCSxBCW+AOC4 potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized below.

[5] Values before allometric adjustments for Nelson's desert bighorn sheep.

- **Desert Kit Fox (carnivorous mammal):** The NOAEL- and LOAEL-based HQs in soil are less than 1 for all COPECs, indicating *de minimis* risk to individual receptors and populations of carnivorous large home-range mammals.
- **Nelson's Desert Bighorn Sheep (herbivorous mammal):** The NOAEL- and LOAEL-based HQs in soil are less than 1 for all COPECs, indicating *de minimis* risk to individual receptors and populations of herbivorous large home-range mammals.

Summarized below are all HQ estimates for mammals for COPECs where at least one NOAEL-based HQ value (using the selected TRV or BTAG TRV) is greater than 1:

Hazard Quotient Summary for Large Home Range Mammals (SUF = 1)								
	Desert Kit Fox				Nelson's Desert Bighorn Sheep			
COPEC	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Antimony	7E-01	7E-02	--	--	**2E+00**	2E-01	--	--
4,4-DDE	**3E+00**	5E-01	5E-01	2E-02	5E-04	1E-04	8E-05	4E-06
TEQ Mammals	**1E+01**	1E+00	--	--	**2E+00**	2E-01	--	--

Notes:
Bold indicates HQs > 1.
-- = HQ not estimated because TRVs are unavailable.

5.6.1.1.2 Risks Evaluated Using a Site-Specific SUF

Risks Evaluated Using Selected TRVs

Table OCSxBCW+AOC4-5.4b presents HQs calculated using the selected TRVs and BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized below.

- **Desert Kit Fox (carnivorous mammal):** The site-specific SUF for this receptor is 0.006 which reduced the NOAEL- and LOAEL-based HQs for 4,4-DDE and dioxin TEQ to less than 1. *De minimis* risk to individuals and populations of carnivorous mammals is expected when accounting for site use at the OCSxBCW+AOC4 potential exposure area.
- **Nelson's Desert Bighorn Sheep (herbivorous mammal):** The site-specific SUF for this receptor is 0.01 which further reduced the NOAEL- and LOAEL-based HQs below 1. *De minimis* risk to individuals and populations of herbivorous mammals is expected when accounting for site use at the OCSxBCW+AOC4 potential exposure area.

Risks Evaluated Using the BTAG TRVs

Table OCSxBCW+AOC4-5.4b also summarizes HQs estimated for mammals at the OCSxBCW+AOC4 potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF.

Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized below.

- **Desert Kit Fox (carnivorous mammal):** The site-specific SUF for this potential receptor further reduced the NOAEL- and LOAEL-based HQs in soil to less than 1, indicating *de minimis* risk to individual receptors and populations of carnivorous mammals.
- **Nelson's Desert Bighorn Sheep (herbivorous mammal):** The site-specific SUF for this potential receptor further reduced the NOAEL- and LOAEL-based HQs in soil to less than 1, indicating *de minimis* risk to individual receptors and populations of herbivorous mammals.

For the COPECs with NOAEL-based HQs greater than 1 using a SUF of 1 (using the selected TRV or BTAG TRV), HQ estimates using the species- and site-specific SUF for large home range mammals are summarized below:

Hazard Quotient Summary for Large Home Range Mammals (site-specific SUF)								
	Desert Kit Fox (SUF = 0.006)				Nelson's Desert Bighorn Sheep (SUF = 0.01)			
COPEC	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Antimony	4E-03	4E-04	--	--	2E-02	2E-03	--	--
4,4-DDE	1E-02	3E-03	3E-03	1E-04	7E-06	1E-06	1E-06	6E-08
TEQ Mammals	7E-02	7E-03	--	--	3E-02	3E-03	--	--

Note:
-- = HQ not estimated because TRVs are unavailable.

5.6.1.1.3 Baseline Risk Summary for Large Home Range Mammals Using Depth-Weighted EPCs

To summarize, based on the risks characterized for large home range mammals exposed to COPECs in soil at the OCSxBCW+AOC4 potential exposure area using selected TRVs[6], depth-weighted EPCs, and a site and species-specific SUF, the risk conclusions are discussed below.

- **Desert Kit Fox (carnivorous mammal):** The NOAEL-based and LOAEL-based HQs are less than 1, indicating *de minimis* risk to individuals and populations of carnivorous large home range mammals for all COPECs.
- **Nelson's Desert Bighorn Sheep (herbivorous mammal):** The NOAEL-based and LOAEL-based HQs are less than 1, indicating *de minimis* risk to individuals and populations of herbivorous large home range mammals for all COPECs.

[6] Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

To summarize, based on the risks characterized for populations of large home range mammals exposed to COPECs in soil at the OCSxBCW+AOC4 using selected TRVs, depth-weighted EPCs, and a site and species-specific SUF, the NOAEL-based HQs and LOAEL-based HQs are less than 1 for all COPECs, indicating no unacceptable risk to individual or populations of large home range mammals, including Nelson's desert bighorn sheep, due to exposure to soil at the OCSxBCW+AOC4 potential exposure area. No further evaluation of these potential receptors is required.

Potential Risk Drivers for Large Home Range Mammals at the OCSxBCW+AOC4 Exposure Area

No risk-driving COPECs for large home range mammals were identified at the OCSxBCW+AOC4 potential exposure area as no potential for unacceptable population-level risk (i.e., LOAEL-based HQs greater than 1) was predicted based on HQs calculated using the most refined exposure and effects assumptions (i.e., site-specific SUF, depth-weighted EPCs[7], and selected TRVs) and additional supporting LOE. Additionally, no COPECs with NOAEL-based HQs greater than 1 using the most refined exposure and effects assumptions and additional LOE supporting the conclusions of unacceptable risk were identified at the OCSxBCW+AOC4 potential exposure area.

5.6.1.2 Large Home Range Birds

For the OCSxBCW+AOC4 potential exposure area, baseline risks were estimated for birds using depth-weighted EPCs for the following evaluations and are discussed in this section:

- Using the selected TRVs and SUF equal to 1
- Using the BTAG TRVs and a SUF equal to 1
- Using the selected TRVs and a species- and site-specific SUF
- Using the BTAG TRVs and a species- and site-specific SUF.

5.6.1.2.1 Risks Evaluated Using a SUF Equal to 1

Risks Evaluated Using Selected TRVs

Table OCSxBCW+AOC4-5.4a summarizes HQs estimated for large home range birds (i.e., red-tailed hawk) at the OCSxBCW+AOC4 potential exposure area using the selected TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for this potential receptor are summarized below.

- **Red-Tailed Hawk (carnivorous bird):** This potential receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. NOAEL- and LOAEL-based HQs in soil are less than 1 for all COPECs, except 4,4-DDE. TRVs are not available for TPH; however, risks to this receptor is characterized below based on indicator chemicals as described previously.
    - For 4,4-DDE, the NOAEL-HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of carnivorous birds; however, unacceptable risk to individual

[7] Evaluation of area-weighted EPCs is not warranted for these receptors.

receptors is uncertain for 4,4-DDE based on the HQ. 4,4-DDE was detected in only 3 of 68 locations in surface soil (FOD = 4% in 0 to 0.5 ft bgs). The magnitude of the HQ is low. Potential risk to the hawk from exposure to 4,4-DDE is likely overestimated. T&E carnivorous large home range birds have not been observed in this area (see Section 5.1.1). Unacceptable risk to carnivorous birds from exposure to 4,4-DDE at the OCSxBCW+AOC4 potential exposure area is unlikely.

- For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples and the NOAEL- and LOAEL-based HQs for PAHs are less than 1, indicating *de minimis* risk to carnivorous birds from exposure to TPH is expected.
- The NOAEL- and LOAEL-based HQs for all other COPECs in soil are less than 1, indicating *de minimis* risk to individuals and populations of carnivorous birds for these COPECs**.**

Based on the risk estimates and potential uncertainties associated with the baseline risk for 4,4-DDE for carnivorous birds, this COPEC was further evaluated site-specific SUFs as discussed below.

Risks Evaluated Using the BTAG TRVs

Table OCSxBCW+AOC4-5.4a summarizes HQs estimated for large home range birds at the OCS excluding BCW and AOC4 potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized below.

- **Red-Tailed Hawk (carnivorous bird):** The NOAEL-based HQs for lead, 4,4-DDT, and 4,4-DDE are greater than 1 and the LOAEL-based HQs are less than or equal to 1, indicating no unacceptable risk to populations of carnivorous birds; however, unacceptable risk to individual receptors is uncertain for these COPECs based on the HQs. The risks from lead are likely overestimated due to the conservative avian TRV. The risks from 4,4-DDT and 4,4-DDE are likely overestimated due to the depth-weighted EPCs based on the maximum depth-weighted concentration in surface soil. Uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. The NOAEL- and LOAEL-based HQs for other COPECs in soil are less than 1, indicating *de minimis* risk to individuals and populations of carnivorous birds for the remaining COPECs.

Summarized below are all HQ estimates for birds for COPECs where at least one NOAEL-based HQ value (using the selected TRV or BTAG TRV) is greater than 1:

COPEC	Red-Tailed Hawk (SUF =1)			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Lead	3E-01	2E-01	**4E+01**	6E-02
4,4-DDE	**4E+00**	4E-01	**9E+01**	1E+00
4,4-DDT	1E-01	1E-02	**3E+00**	2E-02

Note:
Bold indicates HQs > 1.

5.6.1.2.2 Risks Evaluated Using a Site-Specific SUF

Risks Evaluated Using Selected TRVs

Table OCSxBCW+AOC4-5.4b presents HQs calculated using the selected TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for red-tailed hawk are summarized below.

- **Red-Tailed Hawk (carnivorous bird):** The site-specific SUF for this potential receptor is 0.007 which reduced the NOAEL- and LOAEL-based HQs to less than 1 for all COPECs. D*e minimis* risk to individual receptors and populations of carnivorous birds is expected when accounting for site use at the OCSxBCW+AOC4 potential exposure area.

Risks Evaluated Using the BTAG TRVs

Table OCSxBCW+AOC4-5.4b also summarizes HQs estimated for large home range birds at the OCSxBCW+AOC4 using the BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized below.

- **Red-Tailed Hawk (carnivorous bird):** The site-specific SUF for this potential receptor is 0.007 which reduced the NOAEL HQs for lead, 4,4-DDE, and 4,4-DDT to less than 1. *De minimis* risk to individual receptors and populations of carnivorous birds is expected when accounting for site use at the OCSxBCW+AOC4 potential exposure area.

For the COPECs with NOAEL-based HQs greater than 1 using a SUF of 1 (using the selected TRV or BTAG TRV), HQ estimates using the species- and site-specific SUF for red-tailed hawk are summarized below:

COPEC	Red-Tailed Hawk (SUF = 0.007)			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Lead	2E-03	1E-03	3E-01	5E-04
4,4-DDE	3E-02	3E-03	7E-01	1E-02
4,4-DDT	1E-03	1E-04	3E-02	2E-04

Note:
Bold indicates HQs > 1.

5.6.1.2.3 Baseline Risk Summary for Large Home Range Birds Using Depth-Weighted EPCs

To summarize, based on the risks characterized for populations of large home range birds exposed to COPECs in soil at the OCSxBCW+AOC4 using selected TRVs[8], depth-weighted EPCs, and a site-specific SUF, the risk conclusions are as follows:

[8] Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

- **Red-Tailed Hawk (carnivorous bird):** The NOAEL- and LOAEL-based HQs for all COPECs are less than 1, indicating *de minimis* risk to individuals and populations of carnivorous birds for all COPECs.

Based on the risks characterized for populations of large home range birds exposed to COPECs in soil at the OCSxBCW+AOC4 potential exposure area using selected TRVs, depth-weighted EPCs, and a site and species-specific SUF, the NOAEL-based HQs and LOAEL-based HQs are less than 1 for all COPECs, indicating *de minimis* risk to individual or populations of birds due to exposure to soil at the OCSxBCW+AOC4 potential exposure area. No further evaluation of this potential receptor is required.

Potential Risk Drivers for Large Home Range Birds at the OCSxBCW+AOC4 Exposure Area

No risk-driving COPECs for large home range birds were identified at the OCSxBCW+AOC4 potential exposure area as no potential for unacceptable population-level risk (i.e., LOAEL-based HQs greater than 1) was predicted based on HQs calculated using the most refined exposure and effects assumptions (i.e., site-specific SUF, depth-weighted EPCs[9], and selected TRVs) and additional supporting LOE. Additionally, no COPECs with NOAEL-based HQs greater than 1 using the most refined exposure and effects assumptions and additional LOE supporting the conclusions of unacceptable risk were identified at the OCSxBCW+AOC4 potential exposure area.

[9] Evaluation of area-weighted EPCs is not warranted for these receptors.

6 SUMMARY AND CONCLUSIONS FOR THE ERA

Potential cumulative cancer risks and noncancer hazards for potential human receptors were not estimated for the OCSxBCW+AOC4 potential exposure area, as this area is evaluated as part of the OCS excluding BCW potential exposure area (Appendix OCSxBCW). For potential ecological receptors, potential risks were estimated as presented in Section 5 of this appendix. Uncertainties related to the ERAs at the site are discussed in detail in Section 6.7 of the main report, and uncertainties specific to OCSxBCW+AOC4 are discussed in this appendix. For the OCSxBCW+AOC4 potential exposure area, an ERA was conducted per the RAWP documents (Arcadis 2008, 2009, 2015). One scenario (baseline [no scouring]) was evaluated, and risks were estimated for various receptors using depth-weighted EPCs. Risks based on depth- weighted EPCs did not suggest potential risk to ecological receptors (i.e., HQs were less than or equal to 1 for all COPECs); therefore, risks based on area-weighted EPCs were not necessary. Three large home range wildlife receptors (red-tailed hawk, desert kit fox, and Nelson's desert bighorn sheep) were evaluated for exposure to COPECs in the OCSxBCW+AOC4 potential exposure area.

At the OCSxBCW+AOC4 potential exposure area, inorganics (antimony, hexavalent chromium, total chromium, copper, cyanide, lead, mercury, thallium, and zinc), VOCs (bromomethane, chloromethane, chloroform, and methyl acetate), SVOCs (4-methylphenol, bis [2-ethylhexyl] phthalate, and isophorone), LMW PAHs, HMW PAHs, pesticides (4,4-DDT, 4,4-DDE, alpha-chlordane, dieldrin, and gamma-chlordane), PCBs, dioxin TEQ, and TPHs were identified as COPECs. Risks could not be estimated for potential receptors lacking available TRVs for COPECs; such cases are discussed in the uncertainty analysis of the main report. These COPECs are unlikely to be risk drivers and are assumed to have minimal impact to the conclusions of the ERA.

Risks were estimated using depth-weighted EPCs. Evaluation of area-weighted EPCs was not necessary based on the results of the depth-weighted EPC evaluation. Risk conclusions were based on the following criteria:

- COPECs with NOAEL-based HQs less than or equal to 1 pose *de minimis* risk to potential wildlife receptors.
- COPECs with NOAEL-based HQs greater than 1 but LOAEL-based HQs less than or equal to 1 pose no unacceptable risks to wildlife populations; however, potential for unacceptable risk to individuals is uncertain based on the HQ. A WOE approach was used to characterize potential risk to individual potential receptors.
- COPECs with LOAEL-based HQs greater than 1 pose possible unacceptable risk to populations of potential wildlife receptors.

The risk estimates (i.e., HQs) represent a single LOE in the risk characterization. A qualitative WOE approach incorporating other LOEs and uncertainties was used to characterize risk to wildlife populations at the OCSxBCW+AOC4 potential exposure area. HQs for all the COPECs for the baseline scenario calculated using depth-weighted EPCs, selected TRVs, and site- and species-specific SUFs are summarized in Table OCSxBCW+AOC4-6.1. The LOAEL HQs based on depth-weighted EPCs were less than one for desert kit fox, Nelson's desert bighorn sheep, and red-tailed hawk. The various LOE considered in the WOE assessment and risk conclusions are presented in Table OCSxBCW+AOC4-6.2.

Based on the ecological risk characterization for the OCSxBCW+AOC4 potential exposure area, using depth-weighted EPCs, selected TRVs, and site- and species-specific SUFs, the following conclusions were made.

6.1.1 Mammals

Overall, no unacceptable risks to populations of large home range mammals exposed to COPECs in soil are expected. *De minimis* risk to carnivorous mammals (represented by the desert kit fox) and herbivorous mammals (represented by Nelson's desert bighorn sheep) is expected from exposure to COPECs in soil based on NOAEL-based and LOAEL-based HQs less than 1 for all COPECs.

No large home range T&E species have been observed in this area. Concentrations of COPECs at the OCSxBCW+AOC4 potential exposure area do not pose unacceptable risk to individual potential receptors.

6.1.2 Birds

Overall, no unacceptable risks to populations of large home range birds exposed to COPECs in soil are expected. *De minimis* risk to carnivorous birds (represented by the red-tailed hawk) is expected from exposure to COPECs in soil based on NOAEL- and LOAEL-based HQs less than 1 for all COPECs.

T&E birds with large home ranges have not been observed in OCSxBCW+AOC4. No unacceptable risk to individual potential receptors exposed to COPECs in soil at the OCSxBCW+AOC4 potential exposure area are expected.

6.1.3 Potential Risk Drivers for OCSxBCW+AOC4 Exposure Area

As presented in Table OCSxBCW+AOC4-6.2 and summarized in the table below, no risk drivers were identified for the OCSxBCW+AOC4 potential exposure area based on unacceptable population-level risk (i.e., LOAEL-based HQs greater than 1 for mammals and birds) predicted from HQs calculated using the most refined exposure and effects assumptions (i.e., site-specific SUF, depth-weighted EPCs, and selected TRVs) and additional LOE supporting the conclusion of unacceptable risk.

Scenario	Potential Receptors and Risk Drivers at the OCSxBCW+AOC4 Exposure Area		
	Carnivorous Mammals (Desert Kit Fox)	Herbivorous Mammals (Nelson's Desert Bighorn Sheep)	Carnivorous Birds (Red-Tailed Hawk)
Baseline	None	None	None

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

Notes:

[a] Applicable to ecological risk assessment (ERA).

[b] Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the ERA. Ecological toxicity values are available for manganese, thus this chemical is evaluated in the ERA, if above background levels.

[c] Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.

[d] Dioxins are evaluated in toxic equivalents.

Abbreviations:

mg/kg = milligrams per kilogram.
ng/kg = nanograms per kilogram.
ug/kg = micrograms per kilogram.
COPEC = Constituent of Potential Ecological Concern.
ND = Not detected.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:

[a] Applicable to ecological risk assessment (ERA).

[b] Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the ERA. Ecological toxicity values are available for manganese, thus this chemical is evaluated in the ERA, if above background levels.

[c] Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.

[d] Dioxins are evaluated in toxic equivalents.

Abbreviations:

mg/kg = milligrams per kilogram.
ng/kg = nanograms per kilogram.
ug/kg = micrograms per kilogram.
COPEC = Constituent of Potential Ecological Concern.
ND = Not detected.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:

[a] Applicable to ecological risk assessment (ERA).

[b] Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the ERA. Ecological toxicity values are available for manganese, thus this chemical is evaluated in the ERA, if above background levels.

[c] Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.

[d] Dioxins are evaluated in toxic equivalents.

Abbreviations:

mg/kg = milligrams per kilogram.
ng/kg = nanograms per kilogram.
ug/kg = micrograms per kilogram.
COPEC = Constituent of Potential Ecological Concern.
ND = Not detected.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
[a] The constituent consists of analytes detected at least once at the Topock Compressor Station site and measured in soil in this exposure area.
[b] If fewer than eight total locations and four total detected concentrations, the maximum depth-weighted concentration was selected as the EPC. Otherwise, the UCL was selected as the EPC.
[c] EPCs and summary statistics were not calculated for some constituents (i.e., dioxin congeners and essential nutrients). Those data, if available, are presented in Attachment A1 of each exposure area-specific appendix.

Abbreviations:
"--" = not applicable
AOC = area of concern
B(a)P equivalent = benzo(a)pyrene equivalent
BCA = Bias-corrected accelerated bootstrap method
BCW = Bat Cave Wash
COPEC = constituent of potential ecological concern
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
EPC = exposure point concentration
FOD = frequency of detection
ft bgs = feet below ground surface
KM = Kaplan-Meier
µg/kg = micrograms per kilogram
mg/kg = milligrams per kilogram
NA = not applicable
ND = not detected
ng/kg = nanograms per kilogram
PAH = polycyclic aromatic hydrocarbons
PCB = polychlorinated biphenyls
PG&E = Pacific Gas and Electric Company
TCDD = Tetrachlorodibenzo-p-dioxin
TEQ = toxic equivalent
TPH = total petroleum hydrocarbons
UCL = upper confidence limit
X = COPEC in the exposure depth interval

Notes:

[a] COPECs selected over the entire soil depth interval (0-6 ft bgs) potentially contacted by ecological receptors. COPECs based on background screening for metals, PAHs, and dioxins. All detected organic compounds were selected as COPECs. See Section 2 of Appendix OCSxBCW+AOC4 for details.

Abbreviations:

AOC = area of concern
BCW = Bat Cave Wash
COPEC = constituent of potential ecological concern
ERA = ecological risk assessment
ft bgs = feet below ground surface
OCS = Outside Compressor Station
PAH = polycyclic aromatic hydrocarbons
PCB = polychlorinated biphenyl
TPH = total petroleum hydrocarbon
X = COPEC in that exposure depth interval

Table OCSxBCW+AOC4-5.2
Soil Exposure Point Concentration Matrix for Terrestrial Ecological Receptors

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

Ecological Receptor	Exposure Depth Intervals for Calculation of EPCs				
	Soil EPCs[a]		Biota Tissue EPCs		
	All AOCs		All AOCs		
	0-0.5 ft bgs	Maximum EPC (0-0.5, 0-3, 0-6 ft bgs)	Plants - Maximum EPC (0-0.5, 0-3, 0-6 ft bgs)	Insects (0-0.5 ft bgs)	Invertivorous Mammals (0-0.5 ft bgs)
Terrestrial Receptors					
Red-Tailed Hawk	X				X
Desert Kit Fox		X			X
Nelson's Desert Bighorn Sheep		X	X		

Notes:

[a] Exposure point concentrations for ecological receptors will be represented by the maximum detected concentation, depth-weighted 95% UCL, and spatially-weighted 95% UCL, as relevant for this AOC. See Section 5 of Appendix OCSxBCW+AOC4 for details.

Abbreviations:

95% UCL = 95 percent upper confidence limit
AOC = area of concern
BCW = Bat Cave Wash
EPC = exposure point concentration
ft bgs = feet below ground surface
OCS = Outside Compressor Station
X = representative EPC for the pathway/receptor
