1 INTRODUCTION

This appendix presents the human health and ecological risk assessment (HHERA) for the combined areas of concern (AOCs) and other investigation areas located outside the Topock Compressor Station (TCS) in Needles, California (henceforth referred to as the outside the compressor station [OCS] potential exposure area). The OCS potential exposure area as shown on Figure OCS-1.1, occupies approximately 38 acres in total and includes sample locations shown in Table OCS-1.1 of this appendix. The individual exposure areas in the OCS potential exposure area are: AOCs 1 (Bat Cave Wash [BCW] including the Tamarisk Thicket), 4, 9 (which includes subarea 10a), 10 (which includes subareas 10b, 10c, and 10d), 11, 12, 14, 27, 28 (a, b, c, and d), 31, solid waste management unit (SWMU) 1, and undesignated area (UA) location UA-2/300B. Available soil data from the OCS potential exposure area were used to conduct a quantitative HHERA as presented herein. A summary of the human health risk assessment (HHRA) and the ecological risk assessment (ERA) results are presented in Sections 5 and 6, respectively of the Soil Human Health and Ecological Risk Assessment Report for the TCS (the “main report”). This appendix refers to “HHRA” when discussing specific information for assessing risks to human health, “ERA” when discussing specific information for assessing risks to potential ecological receptors, and “HHERA” when discussing topics that are common to both the HHRA and the ERA.

The HHERA methodologies are provided in the main report in accordance with the final Human Health and Ecological Risk Assessment Work Plan (RAWP) documents (Arcadis U.S, Inc. [Arcadis] 2008, 2009a, 2015) and are not repeated in this appendix. Discussions of the historical uses and sampling and analysis are presented in the main report as well.

This appendix summarizes site use, data evaluation, potential receptors, exposure pathways, and the results of the HHERA risk characterization for soil in the OCS potential exposure area. Tables and figures specific to the OCS potential exposure area HHERA are also presented in this appendix.

1.1 Summary of Site Use

The background and summary of site use for each AOC/investigation area included as part of the OCS potential exposure area are presented is the respective potential exposure area appendices and are not repeated herein.

2 DATA EVALUATION AND COPC/COPEC SELECTION

This section summarizes the data considered for the OCS potential exposure area HHERA and presents the constituents of potential concern (COPCs) for human health and constituents of potential ecological concern (COPECs) selected for the OCS potential exposure area.

All soil sampling locations at the OCS potential exposure area are presented on Figures OCS-1.1a and OCS-1.1b and in Table OCS-1.1. The data were evaluated based on methodology described in the RAWP documents (Arcadis 2008, 2009a, 2015) and the main report. Details of the soil sampling and analysis will be presented in the forthcoming Resource Conservation and Recovery Act Facility Investigation/Remedial Investigation (RFI/RI) Report Volume 3 being prepared by Jacobs. For the OCS potential exposure area, soil data from 0 to 10 feet (ft) below ground surface (bgs) were included in the baseline scenario evaluated in the HHERA. Because potential soil contact does not extend below 10 ft bgs, deeper soil data (i.e., greater than 10 ft bgs) were excluded from the risk evaluation, as noted in Table OCS.1-1.

Following the steps outlined in Section 3 of the main report, soil data considered usable for the risk assessment were identified and used in the quantitative HHERA. All available soil data (including white powder) for the OCS potential exposure area are presented in Attachment OCS-A1 and shown on Figures OCS-1.1a and b. Soil data for the OCS potential exposure area include samples collected from AOCs 1 (SWMU 1, BCW including the Tamarisk Thicket), 4, 9, 10, 11, 12, 14, 27, 28 (a, b, c, and d), 31, and UA-2/300B. In addition to the soil data from BCW, samples classified as soil transitioning to sediment from two locations (AOC1-BCW6 and SS-1) were included as part of the OCS soil evaluation (Figure OCS-1.1b). Additionally, samples from 22 perimeter area (PA) locations (PA-OS1, PA-01, PA-03 through PA-21, and PA-23) and 28 storm drain (SD) locations (SD-1 through SD-23, SD-25 through SD-27, SD-OD33, and SD-OS37) were evaluated as part of the OCS area (Figure OCS-1.1a).

For the OCS potential exposure area, soil data are available from 1,679 samples, of which soil data from 1,460 samples collected from 0 to 10 ft bgs were considered for use in the HHERA (i.e., data from 219 samples collected at depths greater than 10 ft bgs were excluded from the baseline evaluations) as noted in Table OCS-1.1. In addition, 10 samples from seven locations collected in 1998 with no sample depth information[1] were excluded from the HHERA. However, as newer samples were collected in, at, or near these locations, the exclusion of these 10 samples is unlikely to impact the COPC/COPEC selection and exposure point concentration (EPC) calculations.

Within this dataset, some analytical data did not meet data quality criteria; therefore, non-detected results were qualified rejected with an “R” data qualifier (and will be discussed in the forthcoming RFI/RI, currently being prepared by Jacobs). This occurred for all polycyclic aromatic hydrocarbons (PAHs) in two samples from BCW (AOC1-BCW24-245 and AOC1-BCW26-253), two samples from AOC 10 (AOC10-10-5201 and AOC10-10-5202), and one sample from AOC 11 (AOC11e-6-6172). A subset of PAHs in two additional BCW samples (AOC1-BCW24-244 and AOC1-BCW26-252) and two additional AOC 10 samples (AOC10-10-5200 and AOC10c-6-5241) were also rejected. Polychlorinated biphenyl (PCB) results were rejected in three

[1] Ten historical samples from seven locations excluded were Bank – b, Bank – WP, P-1, P-2, T-1, T-2, and WP-Floor; all collected within SWMU1.

samples from AOC 10 (AOC10d-9-5243, -5244, and -5246) and one sample from AOC 9 (AOC9-18-4111). Additionally, 1,2,3,7,8-pentachlorodibenzofuran (PeCDF) results were rejected in one AOC 11 sample (SD-11-02), and analytical results for four organic compounds (2,4-dinitrophenol, 4,6-dinitro-2-methylphenol, benzoic acid, and hexachlorocyclopentadiene) in one AOC 14 sample (AOC14-20-8138) received an “R” data qualifier. These “R” qualified PAH data were not included in the HHERA.

Data processed for the HHERA (e.g., calculation of total concentrations for low molecular weight [LMW] and high molecular weight [HMW] PAHs, benzo(a)pyrene equivalent [B(a)PEQ], PCBs, and dioxin/furan toxicity equivalents [TEQ]) are described in detail in Section 3 of the main report.

The process for identifying COPCs and COPECs included in the HHERA is detailed in Section 3.4 of the main report. COPCs and COPECs were selected for the OCS potential exposure area using soil data encompassing all relevant exposure depths for the HHERA (i.e., 0 to 10 ft bgs) as presented in Attachment OCS-A1. Metals, LMW PAHs, HMW PAHs, B(a)PEQ, and dioxin TEQ concentrations were above background levels in the OCS potential exposure area soil (0 to 10 ft bgs), and therefore, are included as COPCs and/or COPECs in the HHERA. When detected at concentrations above background, carcinogenic PAHs (i.e., benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, dibenzo[a,h]anthracene, chrysene, and indeno[1,2,3-cd]pyrene) associated with B(a)PEQ are also selected as COPCs in the HHRA for the evaluation of the noncancer endpoint for each individual PAH. All other detected organic constituents in the OCS potential exposure area soil in the baseline evaluation are included as COPCs and/or COPECs in the HHERA. COPCs and/or COPECs selected for exposure depths and scenarios evaluated in the HHERA for the OCS potential exposure area are summarized in Tables OCS-2.1a through OCS-2.1d for the four baseline exposure depth intervals and are discussed further in Sections 4 and 5 of this appendix, respectively.

3 EXPOSURE POINT CONCENTRATIONS

Depth-weighted and area-weighted EPCs for COPCs/COPECs in soil at the OCS potential exposure area were calculated as described in Section 4.2 of the main report. For the OCS potential exposure area, one scenario was evaluated: Baseline (no scouring).

The following exposure depths were evaluated:

1. Surface soil (0 to 0.5 ft bgs)
2. Shallow soil (0 to 3 ft bgs)
3. Subsurface I soil (0 to 6 ft bgs)
4. Subsurface II soil (0 to 10 ft bgs).

For the HHRA, the scouring scenarios were evaluated for BCW and AOC 10 in the individual AOC appendices (Appendices BCW and AOC 10), and therefore, were not evaluated again for the OCS potential exposure area.

For the ERA, consistent with evaluation of potential exposure areas for large home receptors described in the RAWP documents (Arcadis 2008, 2009a, 2015), scouring was not evaluated for the OCS potential exposure area. The depth intervals listed above for the baseline scenario (surface, shallow, and subsurface I soil) were evaluated. Subsurface II soil (0 to 10 ft bgs) was not evaluated for the ERA.

The depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment OCS-A2. The summary statistics for the OCS potential exposure area soil depth-weighted datasets and depth-weighted EPCs were calculated consistent with the RAWP documents (Arcadis 2008, 2009a, 2015). Per the RAWP documents, area-weighted EPCs for the HHRA are evaluated only if depth-weighted EPCs suggest that cumulative cancer risks and/or noncancer hazards may be significant for any given HHRA exposure scenario (cumulative cancer risks exceed a 10^{-6} cancer risk level, and/or the noncancer hazard index [HI] exceeds 1). Similarly, for the ERA, area-weighted EPCs are evaluated only if depth-weighted EPCs suggest potential risk to ecological receptors (i.e., hazard quotient [HQ] greater than 1 for any COPEC). For the OCS potential exposure area, area-weighted EPCs were deemed necessary for the HHRA only and, therefore, were calculated. The area-weighted data used in the calculation of area-weighted EPCs are presented in Attachment OCS-A3.

Soil summary statistics for constituents measured at the OCS[2] potential exposure area and depth- and area-weighted EPCs for COPCs/COPECs calculated using depth-weighted data from the exposure depths listed above are presented in Table OCS-3.1. If the soil dataset had fewer than four detected values (i.e., concentrations reported above the detection limit) or fewer than eight total observations, the EPC defaulted to the maximum depth-weighted concentration in that dataset. Table OCS-3.1 also presents the basis of the calculated depth- and area-weighted EPCs, including if the EPC is based on the maximum detected concentration.

[2] The list of constituents shown in the Section 3 tables is based on analytes that were detected at least once at the site (including all exposure areas inside or outside the TCS) and measured at the OCS potential exposure area.

Note that soil summary statistics for constituents measured at the OCS Excluding SWMU1 and AOC10-20 potential exposure area and depth- and area-weighted EPCs for COPCs calculated using depth-weighted data from the exposure depths listed above are presented in Table OCS-3.2 for used in the sensitivity analysis discussed in Section 4.6.

4 HUMAN HEALTH RISK ASSESSMENT

This section briefly summarizes the HHRA approach; presents the COPC, EPC, risk and hazard summary tables; and discusses the results of the risk characterization and uncertainties in the risk assessment for the OCS potential exposure area. Details of the overall HHRA approach are presented in Section 5 of the main report. Dose, exposure concentration (EC), risk, and hazard calculation tables for potential human health receptors at the OCS potential exposure area are presented in Attachments OCS-B1 and OCS-B2 for depth- and area-weighted EPCs, respectively.

Risks/hazards estimated for the combination of all individual exposure areas evaluated as the OCS potential exposure area are considered more representative of the realistic or likely potential exposures for the human populations that could be present in the areas outside the TCS (such as maintenance workers, recreational users, and tribal users) than the risks/hazards estimated for individual exposure areas. Risks/hazards calculated separately for individual AOCs are conservative and likely overestimate site risks/hazards. As described in the RAWP (Arcadis 2008), these human populations would more likely be exposed randomly, over the course of a lifetime, to soil present in all OCS potential exposure areas, rather than have a lifetime of contact limited to the area of a single exposure area. Therefore, risks/hazards presented for the OCS potential exposure area, rather than individual exposure areas, are believed to be most representative of the potential health risks to humans potentially contacting the soil in all potential exposure areas outside the TCS.

4.1 Human Health Conceptual Site Model

Following the steps outlined in Section 5.5 of the main report, risks were estimated for potentially complete and significant exposure pathways identified in the human health conceptual site model (CSM) for receptors potentially exposed to COPCs in soil present at the OCS potential exposure area. These included:

- **Short- and Long-Term Maintenance Workers –** Incidental ingestion of soil, dermal contact with soil, inhalation of particulates and volatile organic compound (VOC) vapors in ambient outdoor air from soil
- **Recreational Users (child and/or adult camper, hiker, hunter, and off-highway vehicle [OHV] rider)** – Incidental ingestion of soil, dermal contact with soil, and inhalation of particulates and VOC vapors in ambient outdoor air from soil
- **Tribal Users** – Inhalation of particulates and VOC vapors in ambient outdoor air from soil.

Exposure pathways considered incomplete or insignificant were not quantitatively evaluated and are discussed in Section 5.3.1 of the main report.

4.2 Constituents of Potential Concern

COPCs for the OCS potential exposure area were selected in accordance with the RAWP (Arcadis 2008) and as described in Section 3.4 of the main report. The COPC selection process using soil data encompassing all relevant exposure depths for the HHERA (i.e., 0 to 10 ft bgs for the OCS exposure area) are presented in Attachment OCS-A. COPCs for the four exposure depths and one scenario (baseline) evaluated for the OCS potential exposure area HHRA are summarized in Table OCS-4.1 (details are presented in Tables OCS-2.1a through OCS-2.1d).

COPCs included metals (antimony, hexavalent chromium, total chromium, copper, lead, mercury, thallium, and zinc) and inorganic compounds (cyanide, nitrate, othrophosphate, and phosphate), VOCs (bromomethane, chloromethane, chloroform, isophorone, and methyl acetate), semi-volatile organic compounds (SVOCs; 4-methylphenol, bis[2-ethylhexyl] phthalate, and butylbenzylphthalate), PAHs, pesticides (4,4-dichlorodiphenyldichloroethylene [4,4-DDE], 4,4-dichlorodiphenyltrichloroethane [4,4-DDT], alpha-chlordane, dieldrin, and gamma-chlordane), PCBs, dioxin TEQ, total petroleum hydrocarbon (TPH) as diesel, and TPH as motor oil in surface, shallow, subsurface I, and/or subsurface II soil.

4.3 Exposure Point Concentration Summary

For the potentially complete and significant exposure pathways identified in the CSM, EPCs were calculated as described in Section 4.2 of the main report and presented in Section 3 of this appendix. Depth-weighted data used in the calculation of depth- and area-weighted EPCs are presented in Attachment OCS-A. Depth-weighted EPCs for COPCs in soil and estimated outdoor air concentrations associated with dust and used to estimate risk in the HHRA are summarized in Tables OCS-4.2a through OCS-4.2h for the four exposure depth intervals evaluated in the baseline scenario.

Area-weighted EPCs for COPCs in soil and estimated outdoor air concentrations associated with dust and used to estimate risk in the HHRA are summarized in Tables OCS-4.3a through OCS-4.3f for the four exposure depth intervals evaluated in the baseline scenario.

As described in detail in Section 5.3.3 of the main report, the following exposure depths and corresponding EPC datasets were used to evaluate potential exposure to COPCs in soil for human receptors:

- **Short- and Long-Term Maintenance Workers –** surface, shallow, subsurface I, and subsurface II soil
- **Recreational Users (child and/or adult camper, hiker, hunter, and OHV rider)** – surface and shallow soil
- **Tribal Users –** surface and shallow soil.

4.4 Estimation of Dose

The EC and chronic daily intake (CDI) for potential carcinogenic and noncarcinogenic effects were calculated, as described in Section 5.5.1 of the main report, for COPCs in soil for potentially complete exposure pathways. The calculated EC and CDI values using depth-weighted EPCs are presented in Tables OCS-B1.1a through OCS-B1.1g (carcinogenic effects) and Tables OCS-B1.2a through OCS-B1.2g (noncarcinogenic effects) in Attachment OCS-B1 for the potential receptors evaluated. The calculated EC and CDI values using area-weighted EPCs are presented in Tables OCS-B2.1a through OCS-B2.1e (carcinogenic effects) and OCS-B2.2a through OCS-B2.2e (noncarcinogenic effects) in Attachment OCS-B2 for the potential receptors evaluated.

Exposure parameters used in the dose calculations are presented in Table 5-1 of the main report.

4.5 Toxicity Assessment

The toxicity assessment characterizes the relationship between the magnitude of exposure to a constituent and the potential for adverse health effects. More specifically, the toxicity assessment identifies agency-

promulgated or derived toxicity values that can be used to estimate the likelihood of adverse health effects occurring in humans at different exposure levels. The approach for the toxicity assessment was provided in Section 4.5 of the RAWP (Arcadis 2008) and in Section 4.2 of the RAWP Addendum 2 (Arcadis 2015). Consistent with regulatory risk assessment policy, adverse health effects resulting from potential chemical exposures are evaluated in two categories: carcinogenic effects and noncarcinogenic effects. The hierarchy of sources for the toxicity criteria to be used for the HHRA generally corresponds to California Department of Toxic Substances Control (DTSC) guidance (2015). Toxicity values for carcinogenic and noncarcinogenic effects for COPCs selected and used for the HHRA are described in Section 5.4 of the main report and were used to estimate potential cancer risks and noncancer hazards.

4.6 Human Health Risk Characterization

For human receptors potentially exposed to soil in the OCS potential exposure area, the estimated incremental lifetime cancer risks (ILCRs) and/or noncancer HQs were calculated for each COPC and potentially complete exposure pathway. Cumulative ILCRs (i.e., sum of chemical-specific ILCRs for each exposure depth for a scenario) were calculated and compared to the DTSC point of departure for risk management decision of 1×10^{-6}. Note that risk management decisions may raise this criterion depending on site-specific conditions. As indicated in the National Oil and Hazardous Substances Pollution Contingency Plan (40 Code of Federal Regulations 300), cancer risks between one in a million and one hundred in a million probability of occurrence (1×10^{-6} and 1×10^{-4}) fall within a risk management range. This is generally referred to as the acceptable risk range. Within this estimated cancer risk range, there is flexibility for risk managers in deciding what action, if any, is necessary and appropriate for the protection of human health. Cumulative noncancer hazards (i.e., HIs) are calculated and compared to an HI of 1 (DTSC 2015). Chemical exposures that yield HIs of less than or equal to 1 are not expected to result in adverse noncancer health effects (United States Environmental Protection Agency [USEPA] 1989).

4.6.1 Risk Characterization for Exposure to Soil (Baseline Scenario and Depth-Weighted EPCs)

Table OCS-4.4 summarizes cumulative ILCRs and HIs estimated for potential exposure to soil for each human receptor evaluated at the OCS potential exposure area in the baseline scenario, calculated using depth-weighted EPCs. The dose, EC, ILCR, and HI equations are presented in detail in Section 5.5.1 of the main report. The detailed cancer risk estimates (Tables OCS-B1.3a through OCS-B1.3g) and noncancer hazard calculations (Tables OCS-B1.4a through OCS-B1.4g) are presented in Attachment OCS-B1.

Risk and hazard estimates for the baseline scenario are summarized in the tables and discussed below. Assuming lifetime soil contact occurs randomly over the entire OCS potential exposure area, the depth-weighted estimated cumulative ILCRs and/or HIs for each receptor potentially exposed to COPCs in OCS soil at all exposure depths are at or below the *de minimis* levels of 1×10^{-6} and 1, respectively, for the hunter and tribal user. HI estimates are also below 1 for all other potential receptors. Risk estimates for potential soil contact at the OCS potential exposure area are above *de minimis* levels but within the acceptable risk management range for short- and long-term maintenance workers and certain recreational users (camper, hiker, and OHV rider).

Maintenance Workers

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		OCS Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Short-Term Maintenance Worker	Surface	**3E-06**	CrVI (3E-06)	0.2	NA
	Shallow	**2E-06**	CrVI (2E-06)	0.1	NA
	Subsurface I	1E-06	NA	0.1	NA
	Subsurface II	9E-07	NA	0.1	NA
Long-Term Maintenance Worker	Surface	**2E-05**	CrVI (2E-05) TEQ human (1E-06)	0.09	NA
	Shallow	**2E-05**	CrVI (1E-05) TEQ human (1E-06)	0.07	NA
	Subsurface I	**9E-06**	CrVI (8E-06) TEQ human (1E-06)	0.07	NA
	Subsurface II	**7E-06**	CrVI (5E-06) TEQ human (1E-06)	0.06	NA

Notes:
CrVI = hexavalent chromium
NA = Not applicable. ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.
TEQ human = dioxin toxicity equivalents for humans

Assuming lifetime soil contact occurs randomly over the entire OCS potential exposure area, the depth-weighted estimated cumulative ILCRs for the short-term maintenance worker potentially exposed to COPCs in subsurface I and subsurface II soil are at or below 1×10^{-6}, the point of departure for risk management decisions (Table OCS-B1.3a). However, the depth-weighted estimated cumulative ILCRs for the short-term maintenance worker potentially exposed to COPCs in surface and shallow soil are slightly above the point of departure for risk management decisions of 1×10^{-6}, but well within the risk management range of 1×10^{-6} and 1×10^{-4}. For this potential receptor, risk estimates above *de minimis* levels were primarily attributed to hexavalent chromium in soil via the soil ingestion and inhalation of particulates pathways (Table OCS-B1.3a).

Assuming lifetime soil contact occurs randomly over the entire OCS potential exposure area, the depth-weighted estimated cumulative ILCRs for the long-term maintenance worker potentially exposed to COPCs in surface, shallow, subsurface I, and subsurface II soil are above the point of departure for risk management decisions of 1×10^{-6}, but within the risk management range of 1×10^{-6} and 1×10^{-4}. For this potential receptor, risk estimates above *de minimis* levels were primarily attributed to dioxin TEQ in soil via the dermal contact and soil ingestion pathways and to hexavalent chromium in soil via the inhalation of particulates pathway (Table OCS-B1.3b).

Elevated concentrations of hexavalent chromium and dioxin TEQ appear to be localized in the SWMU 1 and TCS-4 areas within the BCW and at location AOC10-20. See Figure OCS-1.1a for locations within SWMU 1, locations around location TCS-4, and location AOC10-20. The highest concentrations of hexavalent chromium and dioxin TEQ in the OCS potential exposure area soil were measured in these areas/locations, as shown in the Theissen polygon figures for area-weighting included in Attachment OCS-A3. Specifically, the hexavalent chromium concentration ranges are presented on Figures OCS-A3.9, OCS-A3.54, OCS-A3.105, and OCS-A3-

157 for the four baseline exposure depth intervals, respectively. For dioxin TEQ, the concentration ranges are presented on Figures OCS-A3.3, OCS-A3.48, OCS-A3.97, and OCS-A3-148 for the four baseline exposure depth intervals, respectively. Accordingly, the depth-weighted EPCs and corresponding estimated ILCRs for hexavalent chromium and dioxin TEQ may be biased high. To reduce the uncertainty associated with this potential bias, area-weighted estimated cumulative ILCRs for short- and long-term maintenance workers were estimated, as discussed below in Section 4.6.2.

Assuming lifetime soil contact occurs randomly over the entire OCS potential exposure area, the depth-weighted estimated cumulative HIs for the short- and long-term maintenance workers (Tables OCS-B1.4a and OCS-B1.4b, respectively) potentially exposed to COPCs in surface, shallow, subsurface I, and subsurface II soil under the baseline scenario are below an HI of 1. The depth-weighted EPCs for lead in surface shallow, subsurface I, and subsurface II soil at the OCS potential exposure area under the baseline scenario are not expected to result in an increase in blood lead levels above the Office of Environmental Health Hazard Assessment (OEHHA) benchmark value of 1 microgram per deciliter (µg/dL) in the fetus of short- or long-term maintenance workers (Tables OCS-B1.5a and OCS-B1.5b, respectively).

Sensitivity Analysis and Alternate Depth-Weighted EPC/ILCR Evaluation for Maintenance Workers

A sensitivity analysis was performed to provide the risk managers with perspective on the areas/locations for the COPCs that are contributing most significantly to estimates of excess risk/hazard. An alternate depth-weighted EPC for the OCS potential exposure area for hexavalent chromium and dioxin TEQ (summarized in Table OCS-3.2 was calculated excluding analytical data from SMWU 1 and TCS-4 potential exposure area (as described in Appendix SWMU1) and from location AOC10-20. This alternate EPC was used to estimate risks for short- and long-term maintenance workers. HIs were not evaluated in the sensitivity analysis because short- and long-term maintenance workers had HIs <1 for all exposure depths in the original depth-weighted evaluation.

Using the alternate depth-weighted EPCs for hexavalent chromium and dioxin TEQ, and the original depth-weighted EPCs for all other compounds, the alternate depth-weighted cumulative ILCRs estimated for the short-term maintenance worker for all exposure soil depths are below 1×10^{-6}, the point of departure for risk management decisions. The alternate depth-weighted cumulative ILCRs estimated for the long-term maintenance worker for all exposure soil depths are above the point of departure for risk management decisions of 1×10^{-6}, but below 5×10^{-6}, which is well within the risk management range of 1×10^{-6} and 1×10^{-4}. The alternate depth-weighted cumulative ILCRs estimated for short- and long-term maintenance workers are summarized in the following table:

Maintenance Workers

Alternate[1] Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk			
Potential Receptor and Exposure Depth		OCS Potential Exposure Area	
		Cumulative ILCR	ILCR Drivers
Short-Term Maintenance Worker	Surface	3E-07	NA
	Shallow	5E-07	NA
	Subsurface I	5E-07	NA
	Subsurface II	4E-07	NA
Long-Term Maintenance Worker	Surface	**3E-06**	CrVI (2E-06) TEQ human (1E-06)
	Shallow	**4E-06**	CrVI (3E-06) TEQ human (1E-06)
	Subsurface I	**4E-06**	CrVI (3E-06) TEQ human (1E-06)
	Subsurface II	**4E-06**	CrVI (2E-06) TEQ human (9E-07)

Notes:
ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6}.
[1] 'Alternate' refers to the exclusion of analytical data from SMWU 1 and TCS-4 potential exposure area (as described in Appendix SWMU1) and from location AOC10-20 in the EPC calculation.

Recreational Users

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		OCS Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Camper	Surface	**3E-06**	CrVI (3E-06) TEQ human (5E-07)	0.1	NA
	Shallow	**2E-06**	CrVI (2E-06) TEQ human (5E-07)	0.09	NA
Hiker	Surface	**6E-06**	CrVI (5E-06) TEQ human (1E-06)	0.3	NA
	Shallow	**5E-06**	CrVI (3E-06) TEQ human (1E-06)	0.2	NA
Hunter	Surface	4E-07	NA	0.02	NA
	Shallow	3E-07	NA	0.01	NA
OHV Rider	Surface	**1E-05**	CrVI (1E-05) TEQ human (5E-07)	0.06	NA
	Shallow	**8E-06**	CrVI (7E-06) TEQ human (6E-07)	0.04	NA

Note:
ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

Assuming lifetime soil contact occurs randomly over the entire OCS potential exposure area, the depth-weighted estimated cumulative ILCRs for the hunter potentially exposed to COPCs in surface and shallow soil (Table OCS-B1.3e) are below 1×10^{-6}, the point of departure for risk management decisions. However, the depth-weighted estimated cumulative ILCRs for the camper, hiker, and OHV rider potentially exposed to COPCs in surface and shallow soil are above the point of departure for risk management decisions of 1×10^{-6}, but within the lower end of the risk management range of 1×10^{-6} and 1×10^{-4}. Risk estimates above *de minimis* levels were primarily attributed to hexavalent chromium and dioxin TEQ in soil via the soil ingestion pathway for the camper and hiker (Tables OCS-B1.3d and OCS-B1.3e) and to the dioxin TEQ via the soil ingestion pathway and hexavalent chromium via the inhalation of particulates pathway for the OHV rider (Table SWMU1-B1.3f).

As previously discussed, concentrations of hexavalent chromium and dioxin TEQ appear to be localized in the SWMU 1, around location TCS-4, and location AOC10-20 areas; the highest concentrations of hexavalent chromium and dioxin TEQ in OCS potential exposure area soil were measured in these areas. Accordingly, the depth-weighted EPCs and corresponding estimated ILCRs for hexavalent chromium and dioxin TEQ may be biased high. To reduce the uncertainty associated with this potential bias, area-weighted cumulative ILCRs for the camper, hiker, and OHV rider were estimated, as discussed below in Section 4.6.2.

Assuming lifetime soil contact occurs randomly over the entire OCS potential exposure area, the depth-weighted estimated HIs for the camper, hiker, hunter, and OHV rider (Tables OCS-B1.4c through OCS-B1.4f, respectively) potentially exposed to COPCs in surface and shallow soil are below an HI of 1. The depth-weighted EPCs for lead in surface and shallow soil at the OCS potential exposure area are not expected to result in an increase in blood lead levels above the OEHHA benchmark value of 1 µg/dL for child recreational users and the fetus of a hunter (Tables OCS-B1.5c through OCS-B1.5i).

Sensitivity Analysis and Alternate Depth-Weighted EPC/ILCR Evaluation for Camper, Hiker, and OHV Rider

Similar to the worker scenarios above, a sensitivity analysis was performed to provide the risk managers with perspective on the areas/locations for the COPCs that are contributing most significantly to estimates of excess risk for the camper, hiker, and OHV rider. Using the alternate depth-weighted EPCs for hexavalent chromium and dioxin TEQ, as described above, the alternate depth-weighted cumulative ILCRs estimated for the camper for surface and shallow soil and the hiker and OHV rider for surface soil are at or below 1×10^{-6}, the point of departure for risk management decisions. The alternate depth-weighted cumulative ILCRs estimated for the hiker and OHV rider for shallow soil are slightly above 1×10^{-6}, the point of departure for risk management decisions. HIs were not evaluated in the sensitivity analysis because the camper, hiker, and OHV rider had HIs <1 for all exposure depths in the original depth-weighted evaluation. The alternate modified depth-weighted cumulative ILCRs estimated for the camper, hiker, and OHV rider are summarized in the following table:

Recreational Users

Alternate[1] Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk			
Potential Receptor and Exposure Depth		OCS Potential Exposure Area	
		Cumulative ILCR	ILCR Drivers
Camper	Surface	7E-07	NA
	Shallow	8E-07	NA
Hiker	Surface	1E-06	NA
	Shallow	**2E-06**	CrVI (7E-07) TEQ human (8E-07)
OHV Rider	Surface	1E-06	NA
	Shallow	**2E-06**	CrVI (1E-06) TEQ human (5E-07)

Notes:
ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} .
[1] 'Alternate' refers to the exclusion of analytical data from SMWU 1 and TCS-4 exposure area (as described in Appendix SWMU1) and from location AOC10-20 in the EPC calculation.

Tribal User

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		OCS Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Tribal User	Surface	1E-08	NA	0.0003	NA
	Shallow	9E-09	NA	0.0003	NA

Note:
ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

Assuming lifetime soil contact occurs randomly over the entire OCS potential exposure area, the depth-weighted estimated cumulative ILCRs and HIs for the tribal user potentially exposed to COPCs in surface and shallow soil (Tables OCS-B1.3g and OCS-B1.4g, respectively) are below the *de minimis* levels of 1×10^{-6}, the point of departure for risk management decisions and HI of 1, respectively.

4.6.2 Risk Characterization for Exposure to Soil (Baseline Scenario and Area-Weighted EPCs)

Table OCS-4.5 summarizes cumulative ILCRs and HIs estimated for exposure to soil for each potential human receptor at the OCS potential exposure area in the baseline scenario, calculated using area-weighted EPCs, for receptors where the depth-weighted estimated cumulative ILCRs were above 1×10^{-6}. Accordingly, area-weighted ILCRs and HIs were estimated for short- and long-term maintenance workers and certain recreational users (camper, hiker, and OHV rider). The dose, EC, ILCR, and HI equations are presented in detail in Section 5.5.1 of the main report. The detailed cancer risk estimates (Tables OCS-B2.3a through

OCS-B2.3e) and noncancer hazard calculations (Tables OCS-B2.4a through OCS-B2.4e) are presented in Attachment OCS-B2.

The baseline scenario area-weighted estimated cumulative ILCRs and HIs for each potential receptor selected for evaluation are summarized in the tables and discussed below. In general, depending on the depth interval, the area-weighted approach resulted in risks or hazard estimates ranging from 1.3 to 1.8 times lower than the depth-weighted estimates.

Maintenance Workers

Baseline Area-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		OCS Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Short-Term Maintenance Worker	Surface	**2E-06**	CrVI (2E-06)	0.2	NA
	Shallow	1E-06	NA	0.1	NA
	Subsurface I	7E-07	NA	0.1	NA
	Subsurface II	5E-07	NA	0.1	NA
Long-Term Maintenance Worker	Surface	**1E-05**	CrVI (1E-05) TEQ human (3E-06)	0.1	NA
	Shallow	**9E-06**	CrVI (8E-06) TEQ human (2E-06)	0.07	NA
	Subsurface I	**5E-06**	CrVI (4E-06) TEQ human (1E-06)	0.06	NA
	Subsurface II	**4E-06**	CrVI (3E-06) TEQ human (9E-07)	0.05	NA

Note:
ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

Assuming lifetime soil contact occurs randomly over the entire OCS potential exposure area, the area-weighted estimated cumulative ILCRs for the short-term maintenance worker potentially exposed to COPCs in shallow, subsurface I, and subsurface II soil are at or below 1×10^{-6}, the point of departure for risk management decisions (Table OCS-B2.3a). However, the area-weighted estimated cumulative ILCR for the short-term maintenance worker potentially exposed to COPCs in surface soil is slightly above the point of departure for risk management decisions of 1×10^{-6}, but well within the risk management range of 1×10^{-6} and 1×10^{-4}. For this potential receptor, the risk estimate above the *de minimis* level was primarily attributed to hexavalent chromium in soil via the soil ingestion and inhalation of particulates pathways (Table OCS-B2.3a).

Assuming lifetime soil contact occurs randomly over the entire OCS potential exposure area, the area-weighted estimated cumulative ILCRs for the long-term maintenance worker potentially exposed to COPCs in surface, shallow, subsurface I, and subsurface II soil are above the point of departure for risk management decisions of 1×10^{-6}, but well within the risk management range of 1×10^{-6} and 1×10^{-4}. For this potential receptor, risk estimates above *de minimis* levels were primarily attributed to dioxin TEQ in soil via the dermal

contact and soil ingestion pathways and to hexavalent chromium in soil via the inhalation of particulates pathway (Table OCS-B2.3b).

The area-weighted estimated cumulative ILCRs for short- and long-term maintenance workers under the baseline scenario, depending on the depth interval, are approximately 1.6 to 1.8 times lower than the depth-weighted cumulative ILCRs for certain exposure depths. Therefore, assuming lifetime contact with soil in the OCS potential exposure area, estimated cumulative ILCRs for the long-term maintenance worker are at or below 1×10^{-5} for all soil depths evaluated, when accounting for spatial bias in the EPCs. These values are well within the risk management range of 1×10^{-6} and 1×10^{-4}.

The area-weighted estimated cumulative HIs for short- and long-term maintenance workers (Tables OCS-B2.4a and OCS-B2.4b, respectively) potentially exposed to COPCs in surface, shallow, subsurface I, and subsurface II soil at the OCS potential exposure area under the baseline scenario are below an HI of 1. The area-weighted EPCs for lead in surface, shallow, subsurface I, and subsurface II soil at the OCS potential exposure area are not expected to result in an increase in blood lead levels above the OEHHA benchmark value of 1 µg/dL in the fetus of a short- or long-term maintenance worker (Tables OCS-B2.5a and OCS-B2.5b).

Sensitivity Analysis and Alternate Area-Weighted EPC/ILCR Evaluation for Maintenance Workers

A sensitivity analysis was performed to provide the risk managers with perspective on the areas/locations for the COPCs that are contributing most significantly to estimates of excess risk. HIs were not evaluated in the sensitivity analysis because short- and long-term maintenance workers had HIs ≤ 1 for all exposure depths in the original area-weighted evaluations. An alternate area-weighted EPC for the OCS potential exposure area for hexavalent chromium and dioxin TEQ (summarized in Table OCS-3.2) was calculated excluding analytical data from SMWU 1 and TCS-4 potential exposure area (as described in Appendix SWMU1) and from location AOC10-20; this alternate EPC was used to estimate risks for short- and long-term maintenance workers. Using the alternate area-weighted EPCs for hexavalent chromium and dioxin TEQ, the alternate area-weighted cumulative ILCRs estimated for the short-term maintenance worker for all exposure soil depths and for the long-term maintenance worker for surface soil are below 1×10^{-6}, the point of departure for risk management decisions. The alternate area-weighted cumulative ILCRs estimated for the long-term maintenance worker for shallow, subsurface I, and subsurface II soil are slightly above the point of departure for risk management decisions of 1×10^{-6}, but below 5×10^{-6}, which is well within the risk management range of 1×10^{-6} and 1×10^{-4}. The alternate area-weighted cumulative ILCRs estimated for short- and long-term maintenance workers are summarized in the following table:

Maintenance Workers

Alternate[1] Baseline Area-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk			
Potential Receptor and Exposure Depth		OCS Potential Exposure Area	
		Cumulative ILCR	ILCR Drivers
Short-Term Maintenance Worker	Surface	1E-07	NA
	Shallow	2E-07	NA
	Subsurface I	2E-07	NA
	Subsurface II	2E-07	NA
Long-Term Maintenance Worker	Surface	1E-06	NA
	Shallow	**2E-06**	CrVI (1E-06) TEQ human (7E-07)
	Subsurface I	**2E-06**	CrVI (1E-06) TEQ human (7E-07)
	Subsurface II	**2E-06**	CrVI (1E-06) TEQ human (6E-07)

Notes:
ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6}.
[1] 'Alternate' refers to the exclusion of analytical data from SMWU 1 and TCS-4 potential exposure area (as described in Appendix SWMU1) and from location AOC10-20 in the EPC calculation.

Recreational Users

Baseline Area-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		OCS Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Camper	Surface	**2E-06**	CrVI (1E-06) TEQ human (1E-06)	0.2	NA
	Shallow	**2E-06**	CrVI (1E-06) TEQ human (7E-07)	0.1	NA
Hiker	Surface	**5E-06**	CrVI (3E-06) TEQ human (2E-06)	0.4	NA
	Shallow	**3E-06**	CrVI (2E-06) TEQ human (1E-06)	0.2	NA
OHV Rider	Surface	**7E-06**	CrVI (6E-06) TEQ human (1E-06)	0.06	NA
	Shallow	**5E-06**	CrVI (4E-06) TEQ human (8E-07)	0.04	NA

Note:
ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

Assuming lifetime soil contact occurs randomly over the entire OCS potential exposure area, the area-weighted estimated cumulative ILCRs for the camper, hiker, and OHV rider potentially exposed to COPCs in surface and shallow soil (Tables OCS-B2.3c through OCS-B2.3e) are above the point of departure for risk

management decisions of 1×10^{-6}, but well within the risk management range of 1×10^{-6} and 1×10^{-4}. Risk estimates above *de minimis* levels were primarily attributed to hexavalent chromium and dioxin TEQ in soil via the soil ingestion pathway for the camper and hiker (Tables OCS-B2.3c and OCS-B2.3d) and to dioxin TEQ via the soil ingestion pathway and hexavalent chromium via the inhalation of particulates pathway for the OHV rider (Table SWMU1-B2.3e).

As demonstrated by comparing the values, the area-weighted estimated cumulative ILCRs for the camper, hiker, and OHV rider, depending on the depth interval, are approximately 1.3 to 1.7 times lower than the depth-weighted cumulative ILCRs. Therefore, assuming lifetime soil contact to the OCS potential exposure area, cumulative ILCRs for the camper, hiker, and OHV rider are at or below 5×10^{-6}, at all soil depths evaluated except for the OHV rider exposed to COPCs in surface soil, when accounting for spatial bias in the EPCs. The cumulative ILCR for the OHV rider exposed to COPCs in surface soil is slightly above 5×10^{-6}. These values are well within the risk management range of 1×10^{-6} and 1×10^{-4}.

The area-weighted estimated cumulative HIs for the camper, hiker, and OHV rider (Tables OCS-B2.4c through OCS-B2.4e) potentially exposed to COPCs in surface and shallow soil at the OCS exposure area are below an HI of 1. The area-weighted EPCs for lead in surface and shallow soil at the OCS exposure area are not expected to result in an increase in blood lead levels above the OEHHA benchmark value of 1 µg/dL for child recreational users (Tables OCS-B2.5c through OCS-B2.5h).

Sensitivity Analysis and Alternate Area-Weighted EPC/ILCR Evaluation for Camper, Hiker, and OHV Rider

A sensitivity analysis was performed to provide the risk managers with perspective on the areas/locations for the COPCs that are contributing most significantly to estimates of excess risk. HIs were not evaluated in the sensitivity analysis because the camper, hiker, and OHV rider had HIs <1 for all exposure depths in the original area-weighted evaluations. Using the alternate area-weighted EPCs for hexavalent chromium and dioxin TEQ, the alternate area-weighted cumulative ILCRs for the camper, hiker, and OHV rider for surface and shallow soil are below 1×10^{-6}, the point of departure for risk management decisions. The alternate area-weighted cumulative ILCRs for the camper, hiker, and OHV rider are summarized in the following table:

Recreational Users

Alternate[1] Baseline Area-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk			
Potential Receptor and Exposure Depth		OCS Potential Exposure Area	
		Cumulative ILCR	ILCR Drivers
Camper	Surface	3E-07	NA
	Shallow	4E-07	NA
Hiker	Surface	7E-07	NA
	Shallow	9E-07	NA
OHV Rider	Surface	6E-07	NA
	Shallow	9E-07	NA

Notes:
ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6}.
[1] 'Modified' refers to the exclusion of analytical data from SMWU 1 and TCS-4 potential exposure area (as described in Appendix SWMU1) and from location AOC10-20 in the EPC calculation.

4.6.3 Uncertainties in the Risk Assessment

The risk assessment includes several uncertainties that warrant discussion. Many of the assumptions used in this risk assessment, regarding the representativeness of the sampling data, potential human exposures, fate and transport modeling, and chemical toxicity are conservative, follow agency guidance and reflect a 90th or 95th percentile value rather than a typical or average value. The use of several conservative exposure assumptions and toxicity estimates can introduce considerable uncertainty into the risk assessment. By using conservative exposure assumptions or toxicity estimates, the assessment can develop a significant conservative bias that may result in the calculation of significantly higher estimates for cancer risks or noncancer hazards than are actually posed by the chemicals present in soil. These uncertainties are discussed in detail in Section 5.6 of the main report. Uncertainties applicable only to the risk assessment for the OCS potential exposure area are discussed below.

Additional uncertainties for the OCS potential exposure area include the use of the maximum depth-weighted soil concentration as the EPC. The maximum depth-weighted soil concentration was used for COPCs when the soil dataset contained fewer than four detected values (i.e., concentrations reported above the detection limit) or fewer than eight total observations as shown in Table OCS -3.1.

For the OCS potential exposure area, the maximum depth-weighted concentration was used as the EPC for the following COPCs:

- Surface soil: one metal (thallium), SVOCs (bis[2-ethylhexyl] phthalate, isophorone, and 4-methylphenol), pesticides (alpha-chlordane, gamma-chlordane, 4,4-DDE, 4,4-DDT, and dieldrin), and inorganic compounds (chloride, cyanide, nitrate, and phosphate)
- Shallow soil: VOCs (bromomethane, chloroform, chloromethane, and methyl acetate), SVOCs (isophorone and 4-methylphenol), pesticides (alpha-chlordane, gamma-chlordane, 4,4-DDT, and dieldrin), and inorganics (chloride, cyanide, nitrate, and phosphate)
- Subsurface I soil: VOCs (bromomethane, chloroform, chloromethane, and methyl acetate), SVOCs (isophorone and 4-methylphenol), pesticides (alpha-chlordane, gamma-chlordane, 4,4-DDT, and dieldrin) and inorganic compounds (chloride, cyanide, nitrate, and phosphate)
- Subsurface II soil: VOCs (bromomethane, chloroform, chloromethane, and methyl acetate), SVOCs (butylbenzylphthalate, isophorone and 4-methylphenol), pesticides (alpha-chlordane, gamma-chlordane, 4,4-DDT, and dieldrin), and inorganics compounds (chloride, cyanide, nitrate, and phosphate).

The use of the maximum depth-weighted soil concentration as the EPC for the COPCs listed above may not appropriately represent exposures and resulting risks/hazards. This approach to estimating EPCs does not materially impact the results of the HHRA because the OCS potential exposure area COPCs are not risk drivers at the site due to their low frequency of detection and/or fewer than eight observations.

5 ECOLOGICAL RISK ASSESSMENT

This section briefly summarizes the ERA approach; presents the COPECs, EPCs, and dose and risk tables for the OCS ERA; and characterizes potential risk to ecological receptors exposed to COPECs in soil at the OCS potential exposure area. Details of the overall ERA approach are presented in Section 6 of the main report. Supporting tables for the OCS ERA, based on risk calculations conducted using depth-weighted EPCs, are presented in Attachment OCS-C and described below.

Per the RAWP and DTSC guidance (DTSC 1996), ecological risks were also calculated using maximum depth-weighted concentrations and presented in Attachment OCS-D. Risks estimated using maximum depth-weighted concentrations are considered overly conservative and are generally used for screening level purposes. Use of maximum concentrations is not recommended for supporting risk management decisions at the OCS potential exposure area, where the area has been adequately characterized and data are available to estimated upper confidence limits (UCLs). Therefore, the risk results, based on maximum depth-weighted concentrations, are presented (Attachment OCS-D) but are not discussed in this section.

5.1 Ecological Conceptual Site Model

Following the steps outlined in Section 6.6 and Figures 2-7 and 6-1 of the main report, risks were estimated for potentially complete and significant exposure pathways identified for receptors exposed to COPECs in soil at the OCS potential exposure area. These included the following large home-range receptors:

- **Mammals –** may be exposed to COPECs via incidental ingestion of surface, shallow, or subsurface I soil (for burrowing animals) and/or ingestion of biota tissue (i.e., food items). The potential large home-range mammalian indicator receptors evaluated in this ERA for the OCS potential exposure area were:
    - **Desert Kit Fox** – representative of carnivorous large home-range mammal populations exposed to surface, shallow, and/or subsurface I soil (incidental) and exposed to only surface soil (through biota uptake). Threatened and endangered (T&E) carnivorous/omnivorous large home-range mammals (i.e., the ring-tailed cat [*Bassariscus astutus]*, a California fully protected species) have been observed only in the BCW area. The desert kit fox is the most representative potential surrogate receptor for the ring-tailed cat and was used to qualitatively evaluate potential risk to the ring-tailed cat in this ERA (see Section 5.6.1.1.3).
    - **Nelson's Desert Bighorn Sheep –** representative of herbivorous large home-range mammal populations exposed to surface, shallow, and/or subsurface I soil (incidental ingestion and through biota uptake).
- **Birds –** may be exposed to COPECs via incidental ingestion of surface, shallow, or subsurface I soil and/or ingestion of biota tissue (i.e., food items). The potential large home-range bird indicator receptor evaluated in this ERA for the OCS exposure area was:
    - **Red-Tailed Hawk** – representative of carnivorous bird populations, exposed only to surface soil (incidental ingestion and through biota uptake).

Potential exposure pathways considered incomplete or insignificant were not quantitatively evaluated; these potential exposure pathways are identified and described in Section 6.3 of the main report.

Potential plants, invertebrates, and small home-range receptors (Merriam's kangaroo rat, desert shrew, Gambel's quail, and cactus wren) were evaluated for smaller potential exposure areas (individual AOCs/potential exposure areas) and are discussed in those exposure area-specific appendices.

5.1.1 Evaluation of Special-Status Species

The biological settings for the Topock site and the adjacent areas are described in detail in various reports (see Section 2.4 of the main report). Potential habitat exists for special-status species at or near the site, and some, as discussed below, have been observed at BCW within the OCS potential exposure area. Special-status species include state and federally listed fully protected T&E species, state and federal species of concern, and traditionally culturally significant plants; however, protection at the no-observed adverse effects level (NOAEL) is warranted only for fully protected species.

Based on the discussions presented in the 2017 Floristic Survey Report (CH2M 2017) and the Final Programmatic Biological Assessment (PBA; CH2M HILL 2014), the primary terrestrial vegetation at the OCS potential exposure area includes creosote bush scrub (*Larrea tridentata*), tamarisk thickets characterized by open to dense stands of the non-native and invasive tamarisk or salt cedar (*Tamarisk ramosissima*) and/or athel tamarisk (*Tamarix aphylla*), arroweed thickets, blue palo verde woodlands (*Parkinsonia florida*), catclaw acacia thorn scrub (*Senegalia greggii*.), hillside palo verde scrub (*Parkinsonia microphylla*), allscale scrub – also known as cattle saltbush (*Atriplex polycarpa*), quailbush scrub (*Atriplex lentiformis*), western honey mesquite bosque (*Prosopis glandulosa var. torreyana*), mousetail suncup (*Chylismia arenaria*), and screwbean mesquite bosque (*Prosopis pubescens*). Creosote bush scrub is the dominant upland plant community in the upland areas (CH2M 2014, 2017). Other species of terrestrial plants are present but limited to smaller areas and are discussed in the individual exposure area appendices and are not repeated here. Many plant species have the potential to be present at the site, and several species of plants have been observed during surveys (CH2M 2014, 2017). Plant species observed in the Action Area and/or within the Topock site during the March 2017 pre-construction survey and reported in the 2017 Floristic Survey Report (CH2M 2017) are presented in Tables 2-1 and 2-3 of the main report.

No federal- or state-listed T&E plants or candidates for listing were found at the Topock site, including BCW (CH2M 2014, 2017). Of the plants listed above, several are culturally sensitive species (ethnobotanical) under the California Desert Native Plant Act as reported in the 2017 Floristic Survey Report (CH2M 2017) and presented in Table 2-1 of the main report. The hillside palo verde and the mousetail suncup are California Rare Plants and present in the OCS. Mousetail suncup was located on a vertical conglomerate rock wall above BCW (CH2M 2017). Several of the mousetail suncup plants that had been previously identified at this location, as well as the single plant that had previously been observed on a granitic rock face at the south end of the wash, had died, likely due to natural causes, as reported in the 2017 Floristic Survey Report, but a number of small seedlings were observed at the northernmost occurrence (CH2M 2017). Two other mouse-tail suncup locations were observed along BCW to the south of Interstate 40 and along the rock walls near the southern end of the Action Area. These populations represent a significant range extension for the species, as they are more than 90 miles northeast of previously recorded populations in California. Hillside palo verde was found in areas to the south of Interstate 40 on the rocky north-facing slopes of the Chemehuevi Mountains. The number of individuals in this population is approximately 150 trees.

Several species of mammals and birds have been observed at or near the site (Tables 2-2 and 2-4 of the main report). T&E species observed at the site (assuming at BCW; CH2M 2015a,b; DTSC 2018) included the

ring-tailed cat, primarily a carnivorous mammal. Bat surveys indicated presence of cave myotis (*Myotis velifer* and pallid bat (*Antrozous pallidus*), both state species of concern, at BCW, BCW culverts, and railroad culverts (Harvey 2015). Yuma myotis (Myotis yumanensis), although not formally listed, was also observed at BCW. These potential receptors are all large home-range receptors. The Tamarisk Thicket in the north end of BCW is considered a potential habitat for the southwestern willow flycatcher (*Empidonax traillii extimus*), which is listed as a federal and state T&E species. In the Tamarisk Thicket potential exposure area, a southwestern willow flycatcher was observed in 2009 but not observed in subsequent surveys (Garcia and Associates [GANDA] 2017). To date, no active nests of any migratory birds have been documented during these surveys or by protocol-level surveys conducted up to 2017. In the 2014 survey, five southwestern willow flycatchers were observed, but none in the OCS potential exposure area. Based on the single detection for each observation, it was concluded that they were most likely transient rather than nesting birds (GANDA 2014, 2017). The most recent survey was conducted in 2017 and no southwestern willow flycatchers were observed (GANDA 2017).

To be consistent with the GWRA (Arcadis 2009b) and observations made by a PG&E employee at the site, Nelson's desert bighorn sheep was evaluated quantitatively. As discussed in the special-status species memo (CH2M 2015b; DTSC 2018), surveys indicate potential suitable habitat for these species are available onsite in areas within California to the south of Interstate 40 including BCW, the East Ravine, surrounding uplands, and the floodplain. Although site use by bighorn sheep cannot be excluded, it is likely limited by existing human activity at the TCS and near Interstate 40 to the north. The site has relatively poor historical floodplain habitat that is dominated by large thickets of tamarisk that are generally dense, mono-specific stands, with little herbaceous vegetation. The project area foothills, uplands, and floodplain habitats are only expected to be used for foraging or transit. However, the area east/southeast of the site and along the Colorado River offers higher quality habitat and is where desert bighorn sheep have been observed during the summer or drought months

The risk estimates presented here are considered to be protective of special-status species due to the conservative nature of the ERA, where conservative parameters (e.g., small exposure areas, selected indicator species for each functional group considered on the high end of potential exposures for typical receptors at the site within that group, use of no-effects based toxicity values) were used to assess risks to a wide range of potential receptors at various trophic levels. Although a potential large home-range receptor representative of bats was not quantitatively evaluated, no unacceptable risk to bats is expected in the OCS potential exposure area. Presence of bats roosting were observed at BCW; however, bats tend to forage near water (i.e., the river) where insects are likely to be abundant. Bats have large home ranges (e.g., 42 acres for myotis [Henry et al. 2002]) and potential exposure to COPECs from a limited area within the OCS potential exposure area (i.e., BCW soil) is expected to be minimal, and thus, unlikely to result in unacceptable risk. Therefore, further evaluation of special-status bat species was not considered necessary.

Although potential risk to the ring-tailed cat and special-status bat species were not directly or quantitatively evaluated in this ERA, potential risks were evaluated qualitatively, as described below in Section 5.6.1.1.3. As presented below, based on the risk evaluations, weight of evidence (WOE), and uncertainties, potential unacceptable risk to special-status species is unlikely.

5.2 Constituents of Potential Ecological Concern

COPECs for the OCS potential exposure area were selected in accordance with the RAWP (Arcadis 2008) and as described in Section 3.4 of the main report. Soil data encompassing all relevant exposure depths for the ERA (i.e., 0 to 6 ft bgs for OCS) and used in the COPEC selection process are presented in Attachment OCS-A1.

Because a potential ecological receptor could be exposed to COPECs at various exposure depths, either directly and/or through their diet for a given scenario, a single comprehensive COPEC list was selected based on the range of soil depths encountered by potential ecological receptors in the baseline exposure scenario. Additionally, essential nutrients (e.g., calcium, potassium) and analytes typically measured to evaluate geochemical conditions (e.g., chloride, nitrate, sulfate) are not typically evaluated in ERAs and were not selected as COPECs. COPECs for the three exposure depths evaluated for the baseline scenario for this ERA are summarized in Table OCS-5.1.

COPECs included nine inorganic compounds (antimony, hexavalent chromium, total chromium, copper, cyanide, lead, mercury, thallium, and zinc), VOCs (bromomethane, chloromethane, chloroform, and methyl acetate), SVOCs (4-methylphenol, bis[2-ethylhexyl] phthalate, and isophorone), LMW PAHs, HMW PAHs, pesticides (4,4-DDT, 4,4-DDE, alpha-chlordane, dieldrin, and gamma-chlordane), PCBs, and dioxin TEQ. TPHs were also identified as COPECs; however, due to lack of appropriate toxicity values to evaluate TPHs for potential ecological receptors, indicator chemicals (e.g., benzene, toluene, ethylbenzene, and xylene [BTEX] and PAHs) when detected, are used to characterize TPH risks. COPECs lacking toxicity values and their impact to the ERA are discussed in Section 6.7.5 of the main report.

5.3 Exposure Point Concentration Summary

For the potentially complete and significant exposure pathways identified in the ecological CSM, soil EPCs were calculated as described in Section 4.2 of the main report and presented in Section 3 of this appendix.

For the OCS potential exposure area, risks to potential ecological receptors were estimated using depth-weighted EPCs. Depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment OCS-A2.

Biota tissue EPCs were calculated from the soil EPCs using soil-to-biota uptake relationships for plants, invertebrates, and small mammals, as described in Section 6.4.3 of the main report. As described in Section 6.4 and shown on Figure 6-1 of the main report, the depth intervals selected to represent exposure to soil and biota tissue for the risk calculations for each potential receptor are presented in Table OCS-5.2.

To summarize for the baseline scenario:

- Carnivorous birds (red-tailed hawk) could potentially be exposed to COPECs in soil and/or biota only at the surface (0 to 0.5 ft bgs). Therefore, potential exposures to carnivorous birds included the depth-weighted soil EPC from 0 to 0.5 ft bgs for incidental soil ingestion and the depth-weighted biota EPC from 0 to 0.5 ft bgs for dietary exposure (estimated using the surface soil depth-weighted EPC and soil-to-mammal bioaccumulation factor/model).
- Carnivorous mammals (desert kit fox) could potentially be exposed to COPECs in soil down to 6 ft bgs and COPECs in biota only at the surface (0 to 0.5 ft bgs). Therefore, potential exposures to carnivorous

mammals included the maximum of the depth-weighted soil EPC from 0 to 0.5, 0 to 3, and 0 to 6 ft bgs for incidental soil ingestion and the depth-weighted biota EPC from 0 to 0.5 ft bgs for dietary exposure (estimated using the surface soil depth-weighted EPC and soil-to-mammal bioaccumulation factor/model).

- Herbivorous mammals (Nelson's desert bighorn sheep) could potentially be exposed to COPECs in soil and biota down to 6 ft bgs. Therefore, potential exposures to herbivorous mammals included the maximum of the depth-weighted soil and biota EPC from 0 to 0.5, 0 to 3, and 0 to 6 ft bgs for incidental soil ingestion and the maximum of the depth-weighted soil and biota EPC from 0 to 0.5, 0 to 3, and 0 to 6 ft bgs for dietary exposure (estimated using the selected soil depth-weighted EPC and soil-to-plant uptake factor/model).

Depth-weighted soil EPCs and biota tissue EPCs calculated from depth-weighted soil EPCs are presented in Table OCS-5.3, and the representative soil and/or biota EPCs identified for the baseline risk calculations are bolded in this table. Of the COPECs identified at the OCS potential exposure area for the baseline scenario, VOCs (bromomethane, chloromethane, chloroform, and methyl acetate) were not detected in surface soil; therefore, exposure to these COPECs by potential receptors only exposed to surface soil (carnivorous birds) were not estimated. Although VOCs were detected in shallow and subsurface I soil, uptake into biota is considered negligible (assumed to be zero for the risk calculations[3]); therefore, potential exposure through diet is considered incomplete. Therefore, for the carnivorous mammals (desert kit fox), risks from VOCs were estimated only from incidental soil ingestion and not from ingestion of biota.

Per the RAWP (Arcadis 2008) and DTSC guidance (1996), risk calculations based on both the maximum depth-weighted concentration and the UCL for each COPEC are required. As mentioned earlier in this section, using the maximum depth-weighted concentrations results in overly conservative risks and is not recommended for supporting risk management decisions. The estimated risks, based on maximum depth-weighted concentrations, are presented in Attachment OCS-D, but results are not discussed in this report.

5.4 Estimation of Exposure Concentration or Dose

Exposures for wildlife (mammals and birds) are quantified as doses (e.g., in units of milligrams per kilogram body weight per day [mg/kg-bw/day]). Exposure concentrations and doses for COPECs in soil and potentially complete pathways were calculated as described, including equations, in Section 6.4 of the main report. The exposure parameters selected to evaluate wildlife in this ERA include upper bound values from literature (e.g., ingestion rates) or were assumed (e.g., 100% of one type of diet), which may result in conservative estimates of exposure dose and potential overestimation of actual exposure at the site.

For wildlife, doses were calculated using the exposure parameters and equations presented in Section 6.4 of the main report. Depth-weighted soil and biota tissue EPCs for COPECs the OCS potential exposure area are presented in Table OCS-5.3 for the depth-weighted risk evaluations. Dose calculations using depth-weighted EPCs for wildlife potentially exposed to COPECs via ingestion of soil and biota tissue for the baseline scenario are presented in Attachment OCS-C. Based on the risk estimates using depth-weighted EPCs, area-weighted EPCs were not necessary for the OCS potential exposure area ERA. Dose calculations using maximum

[3] VOCs have low bioaccumulation potential (octanol-water partition coefficient is low [log Kow < 2]), and uptake into biota is considered negligible for these constituents (Arcadis 2009a).

depth-weighted concentrations for wildlife potentially exposed to COPECs via ingestion of soil and biota tissue for the baseline scenario are presented in Attachment OCS-D.

5.5 Effects Assessment

Dose-based toxicity reference values (TRVs) for wildlife were used to estimate risks to potential ecological receptors potentially exposed to COPECs in soil and biota tissue at the OCS potential exposure area. TRVs are discussed in Section 6.5 and presented in Tables 6-7 through 6-10 of the main report.

A range of risks to wildlife were estimated using the NOAEL-based TRVs and lowest-observed adverse effects level (LOAEL)-based TRVs presented in the RAWP documents (Arcadis 2008, 2009a, 2015). These selected TRVs were primarily based on those used to develop USEPA Ecological Soil Screening Levels (EcoSSLs; USEPA 2008); other sources included the Toxicological Benchmarks for Wildlife from Oak Ridge National Laboratory (Sample et al. 1996) and USEPA Region 6 ERA Guidance (USEPA 1999). In addition, for estimating potential risk to wildlife, a second set of NOAEL- and LOAEL-TRVs[4] based on the Navy/Biological Technical Assistance Group (BTAG) TRVs (DTSC 2002, 2009) were also used for COPECs, where available. Wildlife TRVs based on selected TRVs and BTAG TRVs are presented in the main report Tables 6-7 and 6-8, respectively. TRVs based on allometric conversions, when warranted, are presented in Tables 6-9 and 6-10, respectively.

TRVs are not available for antimony, bromomethane, chloromethane, chloroform, methyl acetate, 4-methylphenol, and isophorone for birds; and TRVs are not available for bromomethane, chloromethane, 4-methylphenol, and isophorone for mammals. In addition, appropriate TRVs are not available for TPHs; therefore, PAHs were used as indicator chemicals to characterize TPH risks at the OCS potential exposure area (BTEX were not detected). The lack of TRVs and the impact to the ERA are discussed in Section 6.7.5 of the main report.

5.6 Ecological Risk Characterization

The risk characterization integrates the results of the exposure assessment and effects assessment and is subject to uncertainties in both of those efforts. Risk characterization includes two major components: risk estimation and risk description. As presented in tables and discussed below, risk estimates (i.e., HQs) involved integrating exposure profiles with the exposure-effects information. For each potential receptor and COPEC, risk descriptions (including various lines of evidence [LOEs]) and uncertainties (including HQs) supporting statistical and site use information, and the direction of uncertainty in the risk estimates, are discussed below for interpreting the risk results and identifying potential unacceptable risk to ecological receptors. Uncertainties specific to the OCS potential exposure area are discussed in context with the risk characterization results presented below. Generic uncertainties in the ERA are discussed in detail in Section 6.7 of the main report.

For wildlife, a range of HQs was calculated using NOAEL- and LOAEL-based TRVs previously identified in RAWP documents (Arcadis 2008, 2009a, 2015). HQs based on LOAEL-based TRVs selected in the RAWP

[4] Although these are referred to as LOAEL-based BTAG TRVs, they are based on a midpoint of a variety of adverse effects and are not necessarily LOAELs. However, for simplicity, these BTAG TRVs are referred to as LOAEL-based TRVs.

are referred to as “LOAEL-based HQs.” HQs based on NOAEL-based TRVs selected in the RAWP are referred as “NOAEL-based HQs.” Additionally, NOAEL- and LOAEL-based HQs were calculated using a second set of TRVs (i.e., NOAEL- and LOAEL-based BTAG TRVs), as described in Section 6.5 of the main report. The BTAG NOAEL-based TRVs are considered very conservative, resulting in a wide range of risk estimates for wildlife. For this ERA, the selected TRVs are considered more robust than the BTAG TRVs, as discussed in Section 6.5 of the main report. Results associated with the selected TRVs are recommended for risk management decisions at the OCS potential exposure area.

Following USEPA guidance (1998), the estimated HQs were evaluated using a semi-quantitative WOE approach using multiple LOEs in reducing uncertainty and drawing risk conclusions. Risk conclusions for wildlife used the following criteria:

- COPECs with NOAEL-based HQs less than or equal to 1 pose *de minimis* risk (i.e., negligible risk) to individuals and populations of potential wildlife receptors.
- COPECs with a NOAEL-based HQ greater than 1 but a LOAEL-based HQ less than or equal to 1 pose no unacceptable risk to wildlife populations. However, as described in the RAWP (Arcadis 2008), unacceptable risk to individuals is uncertain because the NOAEL-based TRVs are thresholds with an interval that is an artifact of the dosing study. The nature and magnitude of the effects, if any, that may occur at exposures between these values is unknown. In such cases, a WOE approach, including multiple LOEs, were used in reducing uncertainty for characterizing potential risk to individual wildlife receptors.
- COPECs with LOAEL-based HQs greater than 1 indicate that unacceptable risk is possible for populations of potential wildlife receptors. However, these LOAEL-based HQs greater than 1 are based on individual-level effects thresholds and only account for a single LOE. In such cases, a WOE approach was used in reducing uncertainty for characterizing potential risk to wildlife populations at the OCS, as described in the previous bullet.
- The NOAEL-based HQs greater than 1 are considered one LOE in assessing potential risk to sensitive species, if present in this exposure area. Evaluation of T&E species for the OCS is presented in Section 5.1.1.

Ultimately, three risk outcomes for wildlife are possible based on the HQs greater than 1 and WOE: (1) unacceptable risk to individual wildlife is possible (i.e., indicated by sufficient and strong supporting LOEs); (2) unacceptable risk to individual wildlife is unlikely (i.e., indicated by sufficient and strong LOEs supporting a conclusion of no unacceptable risk); or (3) unacceptable risk to individual wildlife is uncertain (i.e., indicated by insufficient LOEs).

For this ERA, the results of individual LOE evaluations were considered collectively to derive an overall WOE conclusion for each potential receptor. Key uncertainties were considered along with the strength, relevance, and other qualities of the LOEs in reaching the WOE conclusions.

For the OCS potential exposure area, evaluations were completed using depth-weighted EPCs, as discussed in this section.

In these evaluations, risk calculations were completed for all COPECs, as presented in Tables OCS-5.4a and OCS-5.4b. Based on the risks estimated using depth-weighted EPCs, evaluation of the baseline scenario using area-weighted EPCs is not necessary, and therefore, is not presented. At the conclusion of the baseline scenario evaluation, risk drivers were identified based on those COPECs for which unacceptable population-

level risk was predicted using the most refined exposure and effects assumptions (i.e., site-specific site use factor [SUF], depth-weighted EPCs, and selected TRVs).

5.6.1 Risk Characterization (Baseline Scenario and Depth-Weighted EPCs)

Risk estimates for large home-range wildlife (mammals and birds) for the baseline scenario using depth-weighted EPCs are summarized in this section. As mentioned earlier in Section 5.4 of this appendix, ECs and doses for COPECs in soil and potentially complete pathways were calculated as described, including equations, in Section 6.4 of the main report. Detailed risk calculations for wildlife (Tables OCS-C.1 through OCS-C.4) are presented in Attachment OCS-C. COPECs identified at the OCS potential exposure area for the baseline scenario include nine inorganic compounds (antimony, hexavalent chromium, total chromium, copper, cyanide, lead, mercury, thallium, and zinc), PAHs, TPHs, VOCs (bromomethane, chloromethane, chloroform, and methyl acetate), SVOCs (4-methylphenol, bis[2-ethylhexyl] phthalate, and isophorone), pesticides (4,4-DDT, 4,4-DDE, alpha-chlordane, dieldrin, and gamma-chlordane), PCBs, and dioxin TEQ (Table OCS-5.1). Potential risk to receptors exposed to these COPECs is described below.

5.6.1.1 Large Home-Range Mammals

For OCS, baseline risks were estimated for large home-range mammals using depth-weighted EPCs for the following evaluations and discussed in this section:

- Using the selected TRVs and a SUF equal to 1
- Using the BTAG TRVs and a SUF equal to 1
- Using the selected TRVs and a species and site-specific SUF
- Using the BTAG TRVs and a species and site-specific SUF.

5.6.1.1.1 Risks Evaluated Using an SUF Equal to 1

Risks Evaluated Using Selected TRVs

Table OCS-5.4a summarizes HQs estimated for large home-range mammals at the OCS potential exposure area using the selected TRVs, depth-weighted EPCs, and SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized below. TRVs are not available for TPHs; however, potential risks to these receptors are characterized below based on indicator chemicals as described previously.

- **Desert kit fox (carnivorous mammal):** This potential receptor could potentially be exposed to COPECs in subsurface I soil (0 to 6 ft bgs) directly and surface soil (0 to 0.5 ft bgs) through its diet (i.e., uptake into biota and ingestion of those biota). The NOAEL- and LOAEL-based HQs in soil are less than 1 for all individual COPECs except 4,4-DDE and dioxin TEQ. The potential risks from COPECs with HQs greater than 1 are characterized below.
    - For 4,4-DDE, the NOAEL-HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of carnivorous mammals; however, unacceptable risk to individual potential receptors are uncertain for 4,4-DDE based on the HQ. 4,4-DDE was detected at only three

of 117 locations in surface soil (frequency of detection [FOD] = 3% in 0 to 0.5 ft bgs), and the EPC was based on the maximum depth-weighted concentration (6.1 milligrams per kilogram [mg/kg]). The magnitude of the HQ is low. For areas where a constituent is largely not detected, use of a maximum concentration as the EPC may not appropriately characterize risk; therefore, potential risk to the fox from exposure to 4,4-DDE is likely overestimated. Unacceptable risk to individual carnivorous mammals from exposure to 4,4-DDE at the OCS potential exposure area is unlikely in this scenario.

  - For dioxin TEQ, the NOAEL-HQ is greater than 1, and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of carnivorous mammals; however, unacceptable risk to individual potential receptors is uncertain for dioxin TEQ based on the HQ. Dioxin TEQ was frequently detected in surface soil (FOD = 100% in the 0 to 0.5 and 0 to 6 ft bgs intervals) with 152 of 234 surface soil locations (0 to 0.5 ft bgs) and 158 of 245 subsurface I soil (0 to 6 ft bgs) locations having depth-weighted concentrations exceeding the background threshold level (BTV; 5.58 nanograms per kilogram [ng/kg]). Concentrations greater than 10 times the BTV are found at 42 locations in surface soil and 49 locations in subsurface I soil. As described in Section 6.7.6 of the main report, the mammalian TRVs (lowest available NOAEL and LOAEL) and uptake factors (bioaccumulation based on a single congener is considered overly conservative) selected for dioxins at this site likely overestimate exposure and risk for this COPEC. T&E carnivorous/omnivorous large home-range mammals (i.e., ring-tailed cat) have been observed in parts of the OCS potential exposure area (i.e., BCW, see Section 5.1.1). Unacceptable risk to individual carnivorous mammals from exposure to dioxin TEQ at the OCS potential exposure area is unlikely in this scenario.
  - For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples, and the NOAEL- and LOAEL-based HQs for PAHs are less than 1, indicating that no unacceptable risk to carnivorous mammals from exposure to TPH is expected.
  - The NOAEL- and LOAEL-based HQs for all other COPECs in soil are less than 1, indicating *de minimis* risk to individuals and populations of carnivorous mammals for these COPECs**.**

- **Nelson's Desert Bighorn Sheep (herbivorous mammal):** This potential receptor could potentially be exposed to COPECs in subsurface I soil (0 to 6 ft bgs) directly and through its diet. The NOAEL- and LOAEL-based HQs in soil are less than 1 for all individual COPECs, indicating *de minimis* risk to individuals and populations of herbivorous mammals.
  - For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples, and the NOAEL- and LOAEL-based HQs for PAHs are less than 1, indicating that no unacceptable risk to herbivorous mammals from exposure to TPH is expected.

Based on the risk estimates and potential uncertainties associated with the baseline risk for 4,4-DDE and dioxin TEQ for carnivorous mammals, these COPECs were further evaluated using site-specific SUFs as discussed below.

Risks Evaluated Using the BTAG TRVs

Table OCS-5.4a also summarizes HQs estimated for large home-range mammals at the OCS potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Desert Kit Fox (carnivorous mammal):** The NOAEL- and LOAEL-based HQs in soil are less than 1 for all COPECs, indicating *de minimis* risk to individual potential receptors and populations of carnivorous mammals.
- **Nelson's Desert Bighorn Sheep (herbivorous mammal):** The NOAEL- and LOAEL-based HQs in soil are less than 1 for all COPECs, indicating *de minimis* risk to individual potential receptors and populations of herbivorous large home-range mammals.

Summarized below are all HQ estimates for large home-range mammals for COPECs where at least one NOAEL-based HQ value (using the selected TRV or BTAG TRV) is greater than 1:

Hazard Quotient Summary for Large Home-Range Mammals (SUF = 1)								
	Desert Kit Fox				Nelson's Desert Bighorn Sheep			
COPEC	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
4,4-DDE	**3E+00**	5E-01	5E-01	2E-02	5E-04	1E-04	8E-05	4E-06
TEQ Mammals	**3E+00**	3E-01	--	--	7E-01	7E-02	--	--

Notes:
Bold indicates HQs > 1.
-- = HQ not estimated because TRVs unavailable.

5.6.1.1.2 Risks Evaluated Using a Site-Specific SUF

Risks Evaluated Using Selected TRVs

Table OCS-5.4b presents HQs calculated using the selected TRVs and BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Desert Kit Fox (carnivorous mammal):** The site-specific SUF for this potential receptor is 0.01, which reduced the NOAEL-based HQs for 4,4-DDE and dioxin TEQ to less than 1. *De minimis* risk to individual receptors and populations of carnivorous mammals is expected when accounting for site use at the OCS potential exposure area.
- **Nelson's Desert Bighorn Sheep (herbivorous mammal):** The site-specific SUF for this potential receptor is 0.03, which further reduced the NOAEL- and LOAEL-based HQs below 1. *De minimis* risk to individual receptors and populations of herbivorous mammals is expected when accounting for site use at the OCS potential exposure area.

Risks Evaluated Using the BTAG TRVs

Table OCS-5.4b also summarizes HQs estimated for large home-range mammals at the OCS potential exposure area using the BTAG TRVs, depth-weighted EPCs, and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table included below.

- **Desert Kit Fox (carnivorous mammal):** The site-specific SUF for this potential receptor further reduced the NOAEL- and LOAEL-based HQs in soil to less than 1 for all COPECs, indicating *de minimis* risk to individual receptors and populations of carnivorous large home-range mammals.
- **Nelson's Desert Bighorn Sheep (herbivorous mammal):** The site-specific SUF for this potential receptor further reduced the NOAEL- and LOAEL-based HQs in soil to less than 1 for all COPECs, indicating *de minimis* risk to individual receptors and populations of herbivorous large home-range mammals.

For the COPECs with NOAEL-based HQs greater than 1 using a SUF of 1 (using the selected TRV or BTAG TRV), HQ estimates using the species- and site-specific SUF for large home-range mammals are summarized below:

Hazard Quotient Summary for Large Home-Range Mammals (site-specific SUF)								
	Desert Kit Fox (SUF = 0.01)				Nelson's Desert Bighorn Sheep (SUF = 0.03)			
COPEC	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
4,4-DDE	3E-02	6E-03	6E-03	3E-04	2E-05	3E-06	3E-06	1E-07
TEQ Mammals	4E-02	4E-03	--	--	2E-02	2E-03	--	--

Note:

5.6.1.1.3 Qualitative Risk Evaluation for Special-Status Mammals

As discussed earlier in Section 5.1.1, the ring-tailed cat (a California fully protected species) and three special-status species of bats including Yuma myotis (a federal species of concern), cave myotis (a state and federal species of concern), and pallid bat (a state species of concern) have been observed at BCW, which is within the OCS. Although potential risks to these receptors were not directly or quantitatively evaluated in this ERA, potential risks were evaluated qualitatively, as described below:

- For the ring-tail cat (California fully protected species), the desert kit fox is the most representative surrogate receptor based on body sizes, similar dietary preferences, and large home ranges. Unlike the fox, which lives and forages primarily in the open desert, on creosote bush flats, and amongst the sand dunes (National Park Service 2015), the ring-tail cat prefers habitat associated with water (California Department of Fish and Wildlife [CDFW] 2005) and is unlikely to use upland areas in the OCS potential exposure area frequently. Risk estimates for the fox are adequate to evaluate potential risk to the ring-tail

cat. The NOAEL-based HQs greater than 1 estimated for the fox using a SUF of 1 are low in magnitude and would reduce to *de minimis* levels using a site-specific SUF for ring-tail cat based on a home range of 109 to 1,280 acres (CDFW 2005). Because the ring-tail cat is likely to forage in the riparian area, the risk characterization for the Tamarisk Thicket is considered adequate for evaluating for potential risk to the ring-tail cat as well (see Appendix TT).

- For cave myotis and pallid bats (state species of concern), the desert shrew is the most representative surrogate receptor based on prey preferences (invertebrates); however, bats have significantly larger home ranges than shrews and are less exposed to soil, as they are aerial feeders. The NOAEL-based HQs for the shrew at BCW (the only potential exposure area within OCS where these receptors were observed; see Appendix BCW) are less than 1 for all COPECs except for antimony, total chromium, and dioxin TEQ. The NOAEL-based HQs would be reduced to *de minimis* levels when using a site-specific SUF for bats (e.g., 42 acres for myotis [Henry et al. 2002] compared to the home range of 0.1 for the shrew) in addition to the LOE discussed for BCW including compounded uncertainties related to dioxin uptake and TRVs.

Based on the results of the ERA, potential exposures to COPECs in soil at OCS potential exposure area are not expected to pose unacceptable risk to potential ecological receptors including special-status species.

5.6.1.1.4 Baseline Risk Summary for Large Home-Range Mammals Using Depth-Weighted EPCs

To summarize, based on the risks characterized for large home-range mammals exposed to COPECs in soil at the OCS potential exposure area using selected TRVs[5], depth-weighted EPCs, and a site- and species-specific SUF, the risk conclusions are as follows:

- **Desert Kit Fox (carnivorous mammals):** The NOAEL-based and LOAEL-based HQs are less than 1, indicating *de minimis* risk to individuals and populations of carnivorous large home-range mammals, including T&E species, for all COPECs.
- **Nelson's Desert Bighorn Sheep (herbivorous mammals):** The NOAEL-based and LOAEL-based HQs are less than 1, indicating *de minimis* risk to individuals and populations of herbivorous mammals for all COPECs.
- Qualitative evaluation of special-status species (ring-tail cat and bats), using HQs for surrogate receptors and species-specific SUFs, indicates no unacceptable risk resulting from exposure to soil in the OCS potential exposure area for these species.

To summarize, based on the risks characterized for populations of large home-range mammals exposed to COPECs in soil at the OCS potential exposure area using selected TRVs[6], depth-weighted EPCs, and a site- and species-specific SUF, the NOAEL-based HQs and LOAEL-based HQs are less than 1 for all COPECs. This indicates no unacceptable risk to individuals or populations of large home-range mammals, including

[5] Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions, and only those results are summarized.

[6] Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions, and only those results are summarized.

T&E species, from exposure to soil at the OCS potential exposure area. No further evaluation of these potential receptors is required.

Potential Risk Drivers for Large Home-Range Mammals at the OCS Exposure Area

No risk-driving COPECs for large home-range mammals were identified at the OCS potential exposure area, as no potential for unacceptable population-level risk (i.e., LOAEL-based HQs greater than 1) was predicted based on HQs calculated using the most refined exposure and effects assumptions (i.e., site-specific SUF, depth-weighted EPCs[7], and selected TRVs) and additional supporting LOEs. Additionally, no COPECs with NOAEL-based HQs greater than 1, using the most refined exposure and effects assumptions and additional LOEs supporting the conclusions of unacceptable risk, were identified at the OCS potential exposure area.

5.6.1.2 Large Home-Range Birds

For the OCS potential exposure area, baseline risks were estimated for large home-range birds using depth-weighted EPCs for the following evaluations and are discussed in this section:

- Using the selected TRVs and SUF equal to 1
- Using the BTAG TRVs and a SUF equal to 1
- Using the selected TRVs and a species and site-specific SUF
- Using the BTAG TRVs and a species and site-specific SUF.

5.6.1.2.1 Risks Evaluated Using a SUF equal to 1

Risks Evaluated Using Selected TRVs

Table OCS-5.4a summarizes HQs estimated for large home-range birds (i.e., red-tailed hawk) at the OCS potential exposure area using the selected TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for this potential receptor are summarized in the text and table below.

- **Red-Tailed Hawk (carnivorous bird):** This potential receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. The NOAEL- and LOAEL-based HQs in soil are less than 1 for all COPECs except for 4,4-DDE. The potential risks from COPECs with HQs greater than 1 are characterized below. TRVs are not available for TPHs; however, risks to this receptor are characterized below based on PAHs as indicator chemicals, as described previously.
    - For 4,4-DDE, the NOAEL-HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of carnivorous birds. However, unacceptable risk to individual receptors are uncertain for 4,4-DDE based on the HQ. 4,4-DDE was detected in only three of 117 locations in surface soil (FOD = 3% in 0 to 0.5 ft bgs), and the EPC was based on the maximum depth-weighted concentration (6.1 mg/kg). The magnitude of the HQ is low. For areas where a constituent is largely not detected, use of a maximum concentration as the EPC may not appropriately

[7] Evaluation of area-weighted EPCs is not warranted for these receptors.

characterize risk; therefore, potential risk to the hawk from exposure to 4,4-DDE is likely overestimated. T&E carnivorous large home-range birds have not been observed in this area (see Section 5.1.1). Unacceptable risk to individual carnivorous birds from exposure to 4,4-DDE at the OCS potential exposure area is unlikely in this scenario.

- For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples and the NOAEL- and LOAEL-based HQs for PAHs are less than 1, indicating that no unacceptable risk to carnivorous birds from exposure to TPH is expected.
- The NOAEL- and LOAEL-based HQs for all other COPECs in soil are less than 1, indicating *de minimi*s risk to individuals and populations of carnivorous birds for these COPECs**.**

Based on the risk estimates and potential uncertainties associated with the baseline risk for 4,4-DDE for carnivorous birds, this COPEC was further evaluated site-specific SUFs as discussed below.

Risks Evaluated Using the BTAG TRVs

Table OCS-5.4a also summarizes HQs estimated for large home-range birds at the OCS potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Red-Tailed Hawk (carnivorous bird):** The NOAEL-based HQs for lead, 4,4-DDT, and 4,4-DDE are greater than 1, and the LOAEL-based HQs are less than or equal to 1, indicating no unacceptable risk to potential populations of carnivorous birds. However, unacceptable risk to individual receptors is uncertain for these COPECs based on the HQs. The potential risks from lead are likely overestimated due to the conservative avian TRV. The potential risks from 4,4-DDT and 4,4-DDE are likely overestimated due to the depth-weighted EPCs based on the maximum depth-weighted concentration in surface soil, which may not appropriately characterize risk. Uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. The NOAEL- and LOAEL-based HQs for other COPECs in soil are less than 1, indicating *de minimis* risk to individuals and populations of carnivorous birds for the remaining COPECs.

Summarized below are all HQ estimates for potential large home-range birds for COPECs where at least one NOAEL-based HQ value (using the selected TRV or BTAG TRV) is greater than 1:

COPEC	Red-Tailed Hawk (SUF = 1)			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Lead	3E-01	1E-01	**3E+01**	5E-02
4,4-DDE	**4E+00**	4E-01	**9E+01**	1E+00
4,4-DDT	1E-01	1E-02	**3E+00**	2E-02

Note:
Bold indicates HQs > 1.

5.6.1.2.2 Risks Evaluated Using a Site-Specific SUF

Risks Evaluated Using Selected TRVs

Table OCS-5.4b presents HQs calculated using the selected TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Red-Tailed Hawk (carnivorous bird):** The site-specific SUF for this potential receptor is 0.02, which reduced the NOAEL- and LOAEL-based HQs to less than 1 for all COPECs. *De minimis* risk to individual receptors and populations of carnivorous birds is expected when accounting for site use at the OCS potential exposure area.

Risks Evaluated Using the BTAG TRVs

Table OCS-5.4b also summarizes HQs estimated for large home-range birds at the OCS potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Red-Tailed Hawk (carnivorous bird):** The site-specific SUF for this potential receptor is 0.02, which reduced the NOAEL-based HQs for lead, 4,4-DDE, and 4,4-DDT to less than or equal to 1. *De minimis* risk to individual receptors and populations of carnivorous birds is expected when accounting for site use at the OCS potential exposure area.

For the COPECs with NOAEL-based HQs greater than 1 using a SUF of 1 (using the selected TRV or BTAG TRV), HQ estimates using the species- and site-specific SUF for large home-range birds are summarized below:

COPEC	Red-Tailed Hawk (SUF = 0.02)			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Lead	4E-03	2E-03	5E-01	7E-04
4,4-DDE	6E-02	6E-03	1E+00	2E-02
4,4-DDT	2E-03	2E-04	5E-02	3E-04

5.6.1.2.3 Baseline Risk Summary for Large Home-Range Birds Using Depth-Weighted EPCs

To summarize, based on the risks characterized for populations of large home-range birds potentially exposed to COPECs in soil at the OCS potential exposure area using selected TRVs[8], depth-weighted EPCs, and a site-specific SUF, the risk conclusions are as follows:

[8] Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions, and only those results are summarized.

- For red-tailed hawk (carnivorous birds), the NOAEL- and LOAEL-based HQs for all COPECs are less than 1, indicating *de minimis* risk to individuals and populations of carnivorous birds for all COPECs.

Based on the risks characterized for populations of large home-range birds exposed to COPECs in soil at the OCS potential exposure area using selected TRVs, depth-weighted EPCs, and a site- and species-specific SUF, the NOAEL-based HQs and LOAEL-based HQs are less than 1 for all COPECs. This indicates no unacceptable risk to individuals or populations of birds due to exposure to soil at the OCS potential exposure area. No further evaluation of this potential receptor is required.

Potential Risk Drivers for Large Home-Range Birds at the OCS Exposure Area

No risk-driving COPECs for large home-range birds were identified at the OCS potential exposure area, as no unacceptable population-level risk (i.e., LOAEL-based HQs greater than 1) was predicted using HQs calculated from the most refined exposure and effects assumptions (i.e., site-specific SUF, depth-weighted EPCs[9], and selected TRVs) and additional supporting LOEs. Additionally, no COPECs with NOAEL-based HQs greater than 1 using the most refined exposure and effects assumptions and additional LOEs supporting the conclusions of unacceptable risk were identified at the OCS potential exposure area.

[9] Evaluation of area-weighted EPCs is not warranted for these receptors.

6 SUMMARY AND CONCLUSIONS FOR THE HHERA

Potential cumulative cancer risks and noncancer hazards for human receptors were estimated, as presented in Section 4 of this appendix. For ecological receptors, potential risks were estimated as presented in Section 5 of this appendix. Uncertainties related to the HHRA and ERA at the site are discussed in detail in Sections 5.6 and 6.7 of the main report, and uncertainties specific to the OCS potential exposure area are discussed in this appendix. For the OCS potential exposure area, an HHRA and ERA were conducted per the RAWP documents (Arcadis 2008, 2009a, 2015). One scenario was evaluated: Baseline (no scouring). Risks were estimated for various receptors using depth-weighted EPCs and area-weighted EPCs (HHRA only). Risks based on depth-weighted EPCs did not suggest potential risk to ecological receptors (i.e., HQs were less than or equal to 1 for all COPECs); therefore, risk estimates based on area-weighted EPCs were not necessary.

At the OCS potential exposure area, the COPCs/COPECs identified for the HHERA include eight metals (antimony, hexavalent chromium, total chromium, copper, lead, mercury, thallium, and zinc), inorganic compounds (cyanide, nitrate, orthophosphate, and phosphate), VOCs (bromomethane, chloromethane, chloroform, isophorone, and methyl acetate), SVOCs (4-methylphenol, bis[2-ethylhexyl] phthalate, butylbenzylphthalate), LMW and HMW PAHs, pesticides (4,4-DDE, 4,4-DDT, alpha-chlordane, dieldrin, and gamma-chlordane), PCBs, TPH as diesel, TPH as motor oil, and dioxins and furans. A summary of these results and conclusions regarding potential risk associated with exposure to these COPCs/COPECs in soil at the OCS potential exposure area based on the risk/hazard estimates and uncertainties inherent in the risk assessment process is presented in this section.

The conclusions reached after completing the HHRA and ERA for the OCS potential exposure area are presented below.

6.1 Summary and Conclusions for the HHRA

The cumulative ILCRs and HIs associated with potential exposure to COPCs in soil at the OCS potential exposure area using depth- and area-weighted EPCs under the baseline scenario were estimated. Assuming that lifetime soil contact occurs randomly over the entire OCS potential exposure area for the receptors evaluated, the estimated potential ILCR and HI results are summarized in the table and discussed below.

Baseline Scenario Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index

Potential Receptor and Exposure Depth		OCS Potential Exposure Area					
		Cumulative ILCR				HI	
		Depth-Wt	Alternate Depth-Wt	Area-Wt	Alternate Area-Wt	Depth-Wt	Area-Wt
Short-Term Maintenance Worker	Surface	**3×10^{-6}** (CrVI)	≤1×10^{-6}	**2×10^{-6}** (CrVI)	≤1×10^{-6}	≤1	≤1
	Shallow	**2×10^{-6}** (CrVI)	≤1×10^{-6}	≤1×10^{-6}	≤1×10^{-6}	≤1	≤1
	Subsurface I	≤1×10^{-6}	≤1×10^{-6}	≤1×10^{-6}	≤1×10^{-6}	≤1	≤1

Baseline Scenario Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index							
Potential Receptor and Exposure Depth		OCS Potential Exposure Area					
		Cumulative ILCR				HI	
		Depth-Wt	Alternate Depth-Wt	Area-Wt	Alternate Area-Wt	Depth-Wt	Area-Wt
	Subsurface II	≤1 x 10^{-6}	≤1 x 10^{-6}	≤1 x 10^{-6}	≤1 x 10^{-6}	≤1	≤1
Long-Term Maintenance Worker	Surface	**2 x 10^{-5}** (CrVI and dioxin TEQ)	**3 x 10^{-6}** (CrVI and dioxin TEQ)	**1 x 10^{-5}** (CrVI and dioxin TEQ)	≤1 x 10^{-6}	≤1	≤1

	Shallow	≤1 x 10^{-6}	--	--	--	≤1	--

Note:
-- = Area-weighted (area-wt) estimate not calculated because depth-weighted (depth-wt) estimates for the receptor were below *de minimis* levels.

Depth-Weighted

Potential exposures that are below or at *de minimis* levels include the following:

- **HI ≤ 1 for all soil depths** – All receptors evaluated including: Short-Term Maintenance Worker, Long-Term Maintenance Worker, Camper, Hiker, Hunter, OHV Rider, and Tribal User.
- **ILCR ≤ 1×10^{-6}** – Short-Term Maintenance Worker (subsurface I and subsurface II), Hunter (surface and shallow), and Tribal User (surface and shallow).

Potential exposures that are above *de minimis* levels of HI > 1 and/or within the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **HI > 1 and ≤ 3** – None.
- **HI > 3** – None.
- **ILCR > 1×10^{-6} and ≤ 5×10^{-6}** – Short-Term Maintenance Worker (surface and shallow), Camper (surface and shallow), and Hiker (shallow).
- **ILCR > 5×10^{-6} and ≤ 1×10^{-5}** – Long-Term Maintenance Worker (subsurface I and subsurface II), Hiker (surface) and OHV Rider (surface and shallow).
- **ILCR > 1×10^{-5} and ≤ 1×10^{-4}** – Long-Term Maintenance Worker (surface and shallow).

Potential exposures that are above the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **ILCR > 1×10^{-4}** – None.

Assuming that lifetime soil contact occurs randomly over the entire OCS potential exposure area, the depth-weighted estimated risks above *de minimis* levels for the short-term and long-term maintenance workers, camper, hiker, and OHV rider were due to hexavalent chromium and/or dioxin TEQ. Therefore, potential risks/hazards for these five receptors were evaluated using area-weighted EPCs and are provided below.

Area-Weighted

Potential exposures that are below or at *de minimis* levels include the following:

- **HI ≤ 1 for all soil depths** – All receptors evaluated including: Short-Term Maintenance Worker, Long-Term Maintenance Worker, Camper, Hiker, and OHV Rider.
- **ILCR ≤ 1×10^{-6}** – Short-Term Maintenance Worker (shallow, subsurface I and subsurface II), Hunter (surface and shallow), and Tribal User (surface and shallow).

Potential exposures that are above *de minimis* levels of HI > 1 and/or within the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **HI > 1 and ≤ 3** – None.
- **HI > 3** – None.
- **ILCR > 1×10^{-6} and ≤ 5×10^{-6}** – Short-Term Maintenance Worker (surface), Long-Term Maintenance Worker (subsurface I and subsurface II), Camper (surface and shallow), Hiker (surface and shallow), and OHV Rider (shallow).

- **ILCR > 5 x 10^{-6} and ≤ 1 x 10^{-5}** – Long-Term Maintenance Worker (surface and shallow) and OHV Rider (surface).
- **ILCR > 1 × 10^{-5} and ≤ 1 × 10^{-4}** – None.

Potential exposures that are above the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **ILCR > 1 × 10^{-4}** – None.

OVERALL SUMMARY

The estimated cumulative ILCRs and HIs associated with potential exposure to COPCs in soil at the OCS potential exposure area using depth-weighted EPCs for the hunter and tribal user are below 1×10^{-6} and 1, respectively. The estimated cumulative HIs for all other receptors are below an HI of 1. However, the cumulative ILCRs estimated using the depth- and area-weighted EPCs for the short- and long-term maintenance workers, camper, hiker, and OHV rider were above the point of departure for risk management decisions of 1×10^{-6}, but within the risk management range of 1×10^{-6} and 1×10^{-4}.

For the OCS potential exposure area, the depth- and area-weighted risk estimates are not substantially different, with area-weighted estimated cumulative ILCRs being approximately 1.3 to 1.8 times lower than depth-weighted estimates for the same receptor and exposure depth. As shown in the table above, this difference reduced the risk category for the short-term maintenance worker (shallow), long-term maintenance worker (surface, shallow, subsurface I, and subsurface II), hiker (surface), and OHV rider (surface and shallow), but does not substantially change the overall outcome for the risk estimates for this exposure area. The hazards are not noticeably impacted since all the estimated cumulative HIs were < 1 with both depth- and area-weighted evaluations. Furthermore, the depth- and area-weighted EPCs for lead in all soil at the OCS potential exposure area are not expected to result in an increase in blood lead levels above the OEHHA benchmark value of 1 µg/dL for the child recreational user and the fetus of a short-term maintenance worker, long-term maintenance worker, or hunter.

Risks/hazards estimated for the combination of all individual potential exposure areas evaluated as the OCS potential exposure area are considered more representative of the realistic or likely potential exposures for the human populations that could be present in the areas outside the TCS (such as the short- and long-term maintenance workers, recreational users, and tribal user) than the risks/hazards estimated for individual potential exposure areas. Risks/hazards calculated separately for individual AOCs are conservative and likely overestimate site risks/hazards. As described in the RAWP (Arcadis 2008), these human populations would more likely be exposed randomly over the course of a lifetime to soil present in all OCS potential exposure areas rather than have a lifetime of contact limited to the area of a single potential exposure area. Therefore, risks/hazards presented for the OCS potential exposure area, rather than individual potential exposure areas, are believed to be most representative of the potential health risks to humans potentially contacting the soil in all exposure areas outside the TCS.

Sensitivity Analysis and Alternate EPC/ILCR Evaluation

As described in the RAWP (Arcadis 2008), the human populations that could be present in the areas outside the TCS (i.e., the short- and long-term maintenance workers, recreational users, and tribal user) would more likely be exposed randomly over the course of a lifetime to soil present in all potential exposure areas outside the TCS rather than have a lifetime of contact limited to the area of a single potential exposure area.

Therefore, the combination of all potential exposure areas outside the TCS, evaluated as the OCS potential exposure area, is the scenario in this HHRA considered to most appropriately represent both current and potential future exposures for the short- and long-term maintenance workers, recreational users, and tribal user.

To more clearly understand the locations of the risk drivers, a sensitivity analysis was performed to provide the risk managers with perspective on the areas/locations for the COPCs that are driving risk estimates and contributing most significantly to estimates of excess risk. Estimated HIs were not evaluated in the sensitivity analysis because all receptors had HIs <1 for all exposure depths in the original depth- and area-weighted evaluations. The sensitivity analysis did not evaluate the hunter and tribal user because their cumulative ILCRs for all exposure depths in the original depth- and area-weighted evaluations were below 1×10^{-6}.

As shown in the table above and discussed in Section 4 of this appendix, the risk drivers for the OCS potential exposure area are hexavalent chromium and dioxin TEQ. The highest concentrations of hexavalent chromium and dioxin TEQ appear to be localized in the SWMU 1 and TCS-4 areas within BCW and at location AOC10-20 (see Figure OCS-1.1a for locations within SWMU 1, locations around location TCS-4, and location AOC10-20). Alternate depth- and area-weighted EPCs for the OCS potential exposure area for hexavalent chromium and dioxin TEQ were calculated excluding analytical data from SMWU 1 and TCS-4 potential exposure area (as described in Appendix SWMU1) and from location AOC10-20. The alternate depth- and area-weighted EPCs for these two compounds were then used, along with the original depth- and area-weighted EPCs for all other COPCs evaluated, to estimate alternate cumulative risks for the short- and long-term maintenance workers, camper, hiker, and OHV rider.

Alternate Depth-Weighted

Using alternate depth-weighted EPCs for hexavalent chromium and dioxin TEQ as described for the sensitivity analysis, alternate depth-weighted cumulative ILCRs were estimated for the short- and long-term maintenance workers, camper, hiker, and OHV rider. The alternate depth-weighted estimated cumulative ILCRs for these receptors are shown on the table above, and are described below:

Potential exposures that are below or at the *de minimis* level of 1×10^{-6} include the following:

- **ILCR $\leq 1\times10^{-6}$** – Short-Term Maintenance Worker (all soil depths), Camper (surface and shallow), Hiker (surface), and OHV Rider (surface).

Potential exposures that are above the *de minimis* levels of 1×10^{-6} and within the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **ILCR > 1×10^{-6} and $\leq 5\times10^{-6}$** – Long-Term Maintenance Worker (all soil depths), Hiker (shallow), and OHV Rider (shallow).
- **ILCR > 5×10^{-6} and $\leq 1 \times 10^{-5}$** – None.
- **ILCR > 1×10^{-5} and $\leq 1\times10^{-4}$** – None.

Potential exposures that are above the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **ILCR > 1×10^{-4}** – None.

Assuming that lifetime soil contact occurs randomly over the entire OCS potential exposure area (with the removal of selected hexavalent chromium and dioxin TEQ data as described for the sensitivity analysis), the

alternate depth-weighted cumulative ILCRs estimated for the short-term maintenance worker, camper, hiker (surface), and OHV rider (surface) were below 1 x 10^{-6}. The alternate depth-weighted cumulative ILCRs estimated for the long-term maintenance worker, hiker (shallow), and OHV rider (shallow) were above 1 x 10^{-6}, the point of departure for risk management decisions, and below 5 x 10^{-6}. These values are well within the risk management range of 1 x 10^{-6} and 1 x 10^{-4}.

Alternate Area-Weighted

Using alternate area-weighted EPCs for hexavalent chromium and dioxin TEQ as described for the sensitivity analysis, alternate area-weighted cumulative ILCRs were estimated for the short- and long-term maintenance workers, camper, hiker, and OHV rider. The alternate area-weighted estimated cumulative ILCRs for these receptors are shown on the table above, and are described below:

Potential exposures that are below or at the *de minimis* level of 1 x 10^{-6} include the following:

- **ILCR $\leq 1\times10^{-6}$** – Short-Term Maintenance Worker (all soil depths), Long-Term Maintenance Worker (surface), Camper (surface and shallow), Hiker (surface and shallow), and OHV Rider (surface and shallow).

Potential exposures that are above the *de minimis* levels of 1 x 10^{-6} and within the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **ILCR > 1×10^{-6} and $\leq 5\times10^{-6}$** – Long- Term Maintenance Worker (shallow, subsurface I, and subsurface II).
- **ILCR > 5 x 10^{-6} and $\leq$ 1 x 10^{-5}** – None.
- **ILCR > 1×10^{-5} and $\leq 1\times10^{-4}$** – None.

Potential exposures that are above the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **ILCR > 1×10^{-4}** – None.

Assuming that lifetime soil contact is limited to the OCS potential exposure area (with the removal of selected hexavalent chromium and dioxin TEQ data as described for the sensitivity analysis), the alternate area-weighted cumulative ILCRs estimated for the long-term maintenance worker (shallow), short-term maintenance worker (all depths), camper (all depths), hiker (all depths), and OHV rider (all depths) were below 1 x 10^{-6}. The alternate area-weighted cumulative ILCRs estimated for the long-term maintenance worker for shallow, subsurface I, and subsurface II soil were slightly above 1 x 10^{-6} (i.e., at 2 x 10^{-6}). These values are well within the risk management range of 1 x 10^{-6} and 1 x 10^{-4}.

SENSITIVITY ANALYSIS SUMMARY

Assuming that lifetime soil contact is limited to the OCS potential exposure area, the sensitivity analysis demonstrates that there are some specific locations in this exposure area that drive the excess estimates of human health risk due to the presence of hexavalent chromium and dioxin TEQ in soil. Removing the data representing those elevated concentration locations, and estimating the alternate ILCR values, shows for both the depth- and area-weighted evaluations that some type of targeted remedial actions is likely to reduce residual risk levels to at or just above 1 x 10^{-6}, the point of departure for risk management decisions. The depth- and area-weighted risk estimates are not substantially different. As shown in the table above, using the

area-weighted EPCs reduced the risk category for the long-term maintenance worker (surface), hiker (shallow), and OHV rider (shallow) from just above 1 x 10^{-6} to at or just below 1 x 10^{-6}, but does not substantially change the overall outcome for the risk estimates for this exposure area. Additional details regarding specific locations contributing to excess risk are provided in Section 8 of the main report.

6.2 Summary and Conclusions for the ERA

At the OCS potential exposure area, nine inorganic compounds (antimony, hexavalent chromium, total chromium, copper, cyanide, lead, mercury, thallium, and zinc), four VOCs (bromomethane, chloromethane, chloroform, and methyl acetate), three SVOCs (4-methylphenol, bis[2-ethylhexyl] phthalate, and isophorone), LMW PAHs, HMW PAHs, pesticides (4,4-DDT, 4,4-DDE, alpha-chlordane, dieldrin, and gamma-chlordane), PCBs, dioxin TEQ, and TPHs were identified as COPECs. Risks could not be estimated for receptors lacking available TRVs for COPECs; such cases are discussed in the uncertainty analysis of the main report. These COPECs are unlikely to be risk drivers and are assumed to have minimal impact to the conclusions of the ERA.

Potential risks were estimated using depth-weighted EPCs. Evaluation of area-weighted EPCs was not necessary based on the results of the depth-weighted EPC evaluation. Risk conclusions were based on the following criteria:

- COPECs with NOAEL-based HQs less than or equal to 1 pose *de minimis* risk to wildlife receptors.
- COPECs with NOAEL-based HQs greater than 1 but LOAEL-based HQs less than or equal to 1 pose no unacceptable risk to wildlife populations. However, potential for unacceptable risk to individuals is uncertain based on the HQ. A WOE approach was used to characterize potential risk to individual receptors.
- COPECs with LOAEL-based HQs greater than 1 pose possible unacceptable risk to populations of wildlife receptors.

The risk estimates (i.e., HQs) represent a single LOE in the risk characterization. A qualitative WOE approach, incorporating other LOEs and uncertainties, was used to characterize risk to wildlife populations at the OCS exposure area. HQs for COPECs for the baseline scenario calculated using depth-weighted EPCs, selected TRVs, and site- and species-specific SUFs are summarized in Table OCS-6.1. The LOAEL-based HQs based on depth-weighted EPCs were less than 1 for desert kit fox, Nelson's desert bighorn sheep, and red-tailed hawk. The various LOEs considered in the WOE assessment and risk conclusions are presented in Table OCS-6.2.

Based on the ecological risk characterization for OCS, using depth-weighted EPCs, selected TRVs, and site- and species-specific SUFs, the following conclusions were made.

6.2.1 Mammals

Overall, no unacceptable risk to populations of large home-range mammals potentially exposed to COPECs in soil is expected. The NOAEL- and LOAEL-based HQs are less than 1 for all the COPECs in soil at OCS potential exposure area, indicating d*e minimis* risk to carnivorous mammals (represented by the desert kit fox) and herbivorous mammals (represented by Nelson's desert bighorn sheep).

Large home-range T&E species have been observed in BCW within the OCS potential exposure area, including the ring-tail cat (California fully protected species; primarily a carnivorous mammal). Bat surveys indicated presence of cave myotis and pallid bat, both state species of concern, at BCW (Harvey 2015). Yuma myotis (*Myotis yumanensis*), although not formally listed, was also observed at BCW. Based on the qualitative evaluation of special-status species and the results of the ERA (i.e., NOAEL-based HQs are less than 1 for all the COPECs), potential exposures to COPECs in soil at OCS potential exposure area are not expected to pose unacceptable risk to special-status species.

6.2.2 Birds

Overall, no unacceptable risk to populations of large home-range birds exposed to COPECs in soil is expected. The NOAEL- and LOAEL-based HQs are less than 1 for all the COPECs in soil at OCS potential exposure area, indicating d*e minimis* risk to carnivorous birds (represented by the red-tailed hawk).

T&E birds with large home ranges have not been observed in the OCS potential exposure area. No unacceptable risk to individual receptors exposed to COPECs in soil at the OCS exposure area is expected.

6.2.3 Potential Risk Drivers for OCS Exposure Area

As presented in Table OCS-6.2 and summarized in the table below, no risk drivers were identified for the OCS potential exposure area based on unacceptable population-level risk (i.e., LOAEL-based HQs greater than 1 for mammals and birds) predicted from HQs calculated using the most refined exposure and effects assumptions (i.e., site-specific SUF, depth-weighted EPCs, and selected TRVs) and additional LOE supporting the conclusion of unacceptable risk.

Scenario	Potential Receptors and Risk Drivers at the OCS Exposure Area		
	Carnivorous Mammals (Desert Kit Fox)	Herbivorous Mammals (Nelson's Desert Bighorn Sheep)	Carnivorous Birds (Red-tailed Hawk)
Baseline	None	None	None

Notes:
[1]Scouring scenarios only evaluated for the human health risk assessment.
10 samples from 7 locations without depth informatuion were excluded from the HHERA: Bank – b, Bank – WP, P-1, P-2, T-1, T-2 and, WP-Floor.

Abbreviations:
AOC = area of concern
BCW = Bat Cave Wash
ft bgs = feet below ground surface
HHERA = human health and ecological risk assessment
NE = not evaluated in the HHERA
TCS = Topock Compressor Station

Table OCS-2.1a
Chemicals Included in the Risk Assessment: OCS Surface Soil (0 to 0.5 feet bgs) for Baseline Scenario

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

Chemical	Detection Frequency (Detections/ Samples Analyzed)	Range of Detected Site Concentrations	Units	Included in Risk Assessment [a]	Basis for selection as COPC/COPEC in Risk Assessment
Inorganics					
Aluminum	81 / 81	3,000 - 20,000	mg/kg	No	Within Background
Antimony	5 / 400	2.1 - 18	mg/kg	Yes	Above Background
Arsenic	327 / 400	1.1 - 14	mg/kg	No	Within Background
Barium	400 / 400	37 - 1,300	mg/kg	No	Within Background
Beryllium	0 / 400	ND	mg/kg	No	Not Detected
Cadmium	18 / 400	1.1 - 7.4	mg/kg	No	Within Background
Calcium [b]	90 / 90	9,100 - 280,000	mg/kg	No	Essential Nutrient (No Toxicity Values Available)
Chloride [c]	4 / 5	5.9 - 227	mg/kg	No	No Toxicity Values Available
Chromium, Hexavalent	175 / 456	0.060 - 2,700	mg/kg	Yes	Above Background
Chromium, total	458 / 458	4.9 - 2,800	mg/kg	Yes	Above Background
Cobalt	395 / 399	2.3 - 27	mg/kg	No	Within Background
Copper	455 / 455	2.2 - 3,100	mg/kg	Yes	Above Background
Cyanide	1 / 77	0.22	mg/kg	Yes	Detected
Iron [b]	90 / 90	4,760 - 32,000	mg/kg	No	Within Background
Lead	399 / 401	1.1 - 920	mg/kg	Yes	Above Background
Magnesium [b]	90 / 90	2,600 - 14,300	mg/kg	No	Within Background
Manganese [b]	87 / 87	67 - 1,300	mg/kg	No	Within Background
Mercury (inorganic)	27 / 400	0.10 - 35	mg/kg	Yes	Above Background
Molybdenum	43 / 400	1.0 - 20	mg/kg	No	Within Background
Nickel	452 / 455	0.28 - 75	mg/kg	No	Within Background
Nitrate	2 / 2	8.0 - 54	mg/kg	Yes	Detected
Phosphate	2 / 2	161 - 358	mg/kg	Yes	Detected
Potassium [b]	90 / 90	690 - 5,300	mg/kg	No	Within Background
Selenium	3 / 400	1.1 - 9.1	mg/kg	No	Within Background
Silver	0 / 400	ND	mg/kg	No	Not Detected
Sodium [b]	78 / 90	140 - 4,300	mg/kg	No	Within Background
Sulfate [c]	5 / 5	13 - 1,010	mg/kg	No	No Toxicity Values Available
Thallium	1 / 400	2.4	mg/kg	Yes	Above Background

TEQ Human [g]	233 / 234	0.021 - 12,000	ng/kg	Yes	Above Background (HHRA Only)
TEQ Mammals [g]	233 / 234	0.021 - 12,000	ng/kg	Yes	Above Background (ERA Only)

Table OCS-2.1a
Chemicals Included in the Risk Assessment: OCS Surface Soil (0 to 0.5 feet bgs) for Baseline Scenario

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

Notes:

[a] Applicable to both human health and ecological risk assessment (HHRA/ERA), unless otherwise noted.

[b] Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA and ERA. Human health toxicity values are available for iron and manganese and ecological toxicity values are available for manganese, thus these chemicals are evaluated in the HHRA and ERA, if above background levels and have available toxicity values.

[c] No toxicity values are available for chloride and sulfate, thus these chemicals are not evaluated in the HHRA.

[d] Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).

[e] Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).

[f] Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.

[g] Dioxins are evaluated in toxic equivalents.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.
mg/kg = milligrams per kilogram.
ng/kg = nanograms per kilogram.
ug/kg = micrograms per kilogram.
COPC = Constituent of Potential Concern.
COPEC = Constituent of Potential Ecological Concern.
ND = Not detected.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:

[a] Applicable to both human health and ecological risk assessment (HHRA/ERA), unless otherwise noted.

[b] Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA and ERA. Human health toxicity values are available for iron and manganese and ecological toxicity values are available for manganese, thus these chemicals are evaluated in the HHRA and ERA, if above background levels and have available toxicity values.

[c] No toxicity values are available for chloride and sulfate, thus these chemicals are not evaluated in the HHRA.

[d] Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).

[e] Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).

[f] Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.

[g] Dioxins are evaluated in toxic equivalents.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.
mg/kg = milligrams per kilogram.
ng/kg = nanograms per kilogram.
ug/kg = micrograms per kilogram.
COPC = Constituent of Potential Concern.
COPEC = Constituent of Potential Ecological Concern.
ND = Not detected.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

Notes:

[a] Applicable to both human health and ecological risk assessment (HHRA/ERA), unless otherwise noted.

[b] Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA and ERA. Human health toxicity values are available for iron and manganese and ecological toxicity values are available for manganese, thus these chemicals are evaluated in the HHRA and ERA, if above background levels and have available toxicity values.

[c] No toxicity values are available for chloride and sulfate, thus these chemicals are not evaluated in the HHRA.

[d] Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).

[e] Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).

[f] Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.

[g] Dioxins are evaluated in toxic equivalents.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.
mg/kg = milligrams per kilogram.
ng/kg = nanograms per kilogram.
ug/kg = micrograms per kilogram.
COPC = Constituent of Potential Concern.
COPEC = Constituent of Potential Ecological Concern.
ND = Not detected.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

Notes:

[a] Applicable to human health risk assessment (HHRA) only.

[b] Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA. Human health toxicity values are available for iron and manganese, thus these chemicals are evaluated in the HHRA, if above background levels and have available toxicity values.

[c] No toxicity values are available for chloride and sulfate, thus these chemicals are not evaluated in the HHRA.

[d] Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).

[e] Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).

[f] Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.

[g] Dioxins are evaluated in toxic equivalents.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.
mg/kg = milligrams per kilogram.
ng/kg = nanograms per kilogram.
ug/kg = micrograms per kilogram.
COPC = Constituent of Potential Concern.
ND = Not detected.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
[a] The constituent consists of analytes detected at least once at the Topock Compressor Station site and measured in soil in this exposure area.
[b] If fewer than eight total locations and four total detected concentrations, the maximum depth-weighted concentration was selected as the EPC. Otherwise, the UCL was selected as the EPC.
[c] EPCs and summary statistics were not calculated for some constituents (i.e., dioxin congeners and essential nutrients). Those data, if available, are presented in Attachment A1 of each exposure area-specific appendix.

Abbreviations:

Notes:
[a] Exposure point concentrations (EPCs) for surface soil (0 to 0.5 feet bgs) are used to evaluate inhalation of particulates in outdoor air.
[b] EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.
[c] Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.0×10^6 m^3/kg was used for maintenance workers (short-term and long-term) as recommended by Department of Toxic Substances Control (2014).
[d] Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.

Notes:

[a] Exposure point concentrations (EPCs) for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of particulates in outdoor air. Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.0×10^6 m^3/kg was used for maintenance workers (short-term and long-term) as recommended by Department of Toxic Substances Control (2014).

[b] EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatile compounds in outdoor air. Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.

Abbreviations:
bgs = below ground surface.
COPC = Constituent of Potential Concern.
mg/kg = milligrams per kilogram.
mg/m^3 = milligrams per cubic meter.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:

[a] Exposure point concentrations (EPCs) for surface soil (0 to 0.5 feet bgs) are used to evaluate inhalation of particulates in outdoor air.

[b] EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.

[c] Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.4×10^9 m^3/kg was used for recreational users (campers, hikers, and hunters) as recommended by Department of Toxic Substances Control (2014).

[d] Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.

[e] PEF of 8.5×10^5 m^3/kg was used for recreational users (off-highway vehicle rider) as calculated in United States Environmental Protection Agency (2008, 2009) and recommended in "Revised Technical Memorandum, Recreational Visitor Exposure Scenario for Federal Land, PG&E Topock Compressor Station Remediation Project, California," prepared by the Department of the Interior (DOI).

Notes:

[a] Exposure point concentrations (EPCs) for shallow soil (0 to 3 feet bgs) are used to evaluate inhalation of particulates in outdoor air.

[b] EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.

[c] Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.4×10^9 m^3/kg was used for recreational users (campers, hikers, and hunters) as recommended by Department of Toxic Substances Control (2014).

[d] Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.

[e] PEF of 8.5×10^5 m^3/kg was used for recreational users (off-highway vehicle rider) as calculated in United States Environmental Protection Agency (2008, 2009)and recommended in "Revised Technical Memorandum, Recreational Visitor Exposure Scenario for Federal Land, PG&E Topock Compressor Station Remediation Project, California," prepared by the Department of the Interior (DOI).

Notes:

[a] Exposure point concentrations (EPCs) for surface soil (0 to 0.5 feet bgs) are used to evaluate inhalation of particulates in outdoor air.

[b] EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.

[c] Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.0×10^6 m^3/kg was used for maintenance workers (short-term and long-term) as recommended by Department of Toxic Substances Control (2014).

[d] Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.

Abbreviations:
bgs = below ground surface.
COPC = Constituent of Potential Concern.
mg/kg = milligrams per kilogram.
mg/m^3 = milligrams per cubic meter.
NA = not applicable.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

	(mg/kg) [a]	(mg/m^3) [b]	(mg/m^3) [c]	(mg/m^3) [b]	(mg/m^3) [c]
Dioxins/Furans					
TEQ Human	7.9E-05	7.9E-11	1.7E-10	7.9E-11	3.0E-11

Notes:

[a] Exposure point concentrations (EPCs) for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of particulates in outdoor air. Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.0×10^6 m^3/kg was used for maintenance workers (short-term and long-term) as recommended by Department of Toxic Substances Control (2014).

[b] EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatile compounds in outdoor air. Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.

Abbreviations:
bgs = below ground surface.
COPC = Constituent of Potential Concern.
mg/kg = milligrams per kilogram.
mg/m^3 = milligrams per cubic meter.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

TPH as motor oil	X

Notes:
[a] COPECs selected over the entire soil depth interval (0-6 ft bgs) potentially contacted by ecological receptors. COPECs based on background screening for metals, PAHs, and dioxins. All detected organic compounds were selected as COPECs. See Section 2 of Appendix OCS for details.

Abbreviations:
AOC = area of concern
COPEC = constituent of potential ecological concern
ERA = ecological risk assessment
ft bgs = feet below ground surface
OCS = Outside Compressor Station
PAH = polycyclic aromatic hydrocarbons
PCB = polychlorinated biphenyl
TEQ = toxic equivalent
TPH = total petroleum hydrocarbon
X = COPEC in that exposure depth interval

Table OCS-5.2
Soil Exposure Point Concentration Matrix for Terrestrial Ecological Receptors

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

Ecological Receptor	Exposure Depth Intervals for Calculation of EPCs				
	Soil EPCs[a]		Biota Tissue EPCs		
	All AOCs		All AOCs		
	0-0.5 ft bgs	Maximum EPC (0-0.5, 0-3, 0-6 ft bgs)	Plants - Maximum EPC (0-0.5, 0-3, 0-6 ft bgs)	Insects (0-0.5 ft bgs)	Invertivorous Mammals (0-0.5 ft bgs)
Terrestrial Receptors					
Red-Tailed Hawk	X				X
Desert Kit Fox		X			X
Nelson's Desert Bighorn Sheep		X	X		

Notes:

[a] Exposure point concentrations for ecological receptors will be represented by the maximum detected concentation, depth-weighted 95% UCL, and spatially-weighted 95% UCL, as relevant for this AOC. See Section 5 of Appendix OCS for details.

Abbreviations:

95% UCL = 95 percent upper confidence limit
AOC = area of concern
EPC = exposure point concentration
ft bgs = feet below ground surface
OCS = Outside Compressor Station
X = representative EPC for the pathway/receptor

Notes:

[a] Calculated using selected soil EPC and uptake model. See Section 6 of the main report.

[b] Biota EPCs equal to 0.0 indicate no bioaccumulation from soil.

Bold indicates EPC selected to estimate plant uptake from soil (maximum of surface, shallow, and subsurface I soil).

Abbreviations:

-- = soil EPC or uptake model not available, biota EPCs could not be estimated.
AOC = area of concern
EPC = exposure point concentration
ft bgs = feet below ground surface
m = maximum depth-weighted concentration
mg/kg = milligrams per kilogram
nd = not detected in this depth interval
ng/kg = nanograms per kilogram
OCS = Outside Compressor Station

Table OCS-6.1
Ecological Risk Estimate Summary for Baseline Scenario Using Depth-Weighted Exposure Point Concentrations (Wildlife Species-Specific SUF, Selected TRVs) for Outside the Compressor Station

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

Notes:
[a] WOE Result is risk conclusion based on 1.) HQ/LOAEL HQ using depth-weighted EPCs, and 2.) supporting LOE. Area-weighted EPCs were not evalauted for this exposure area.

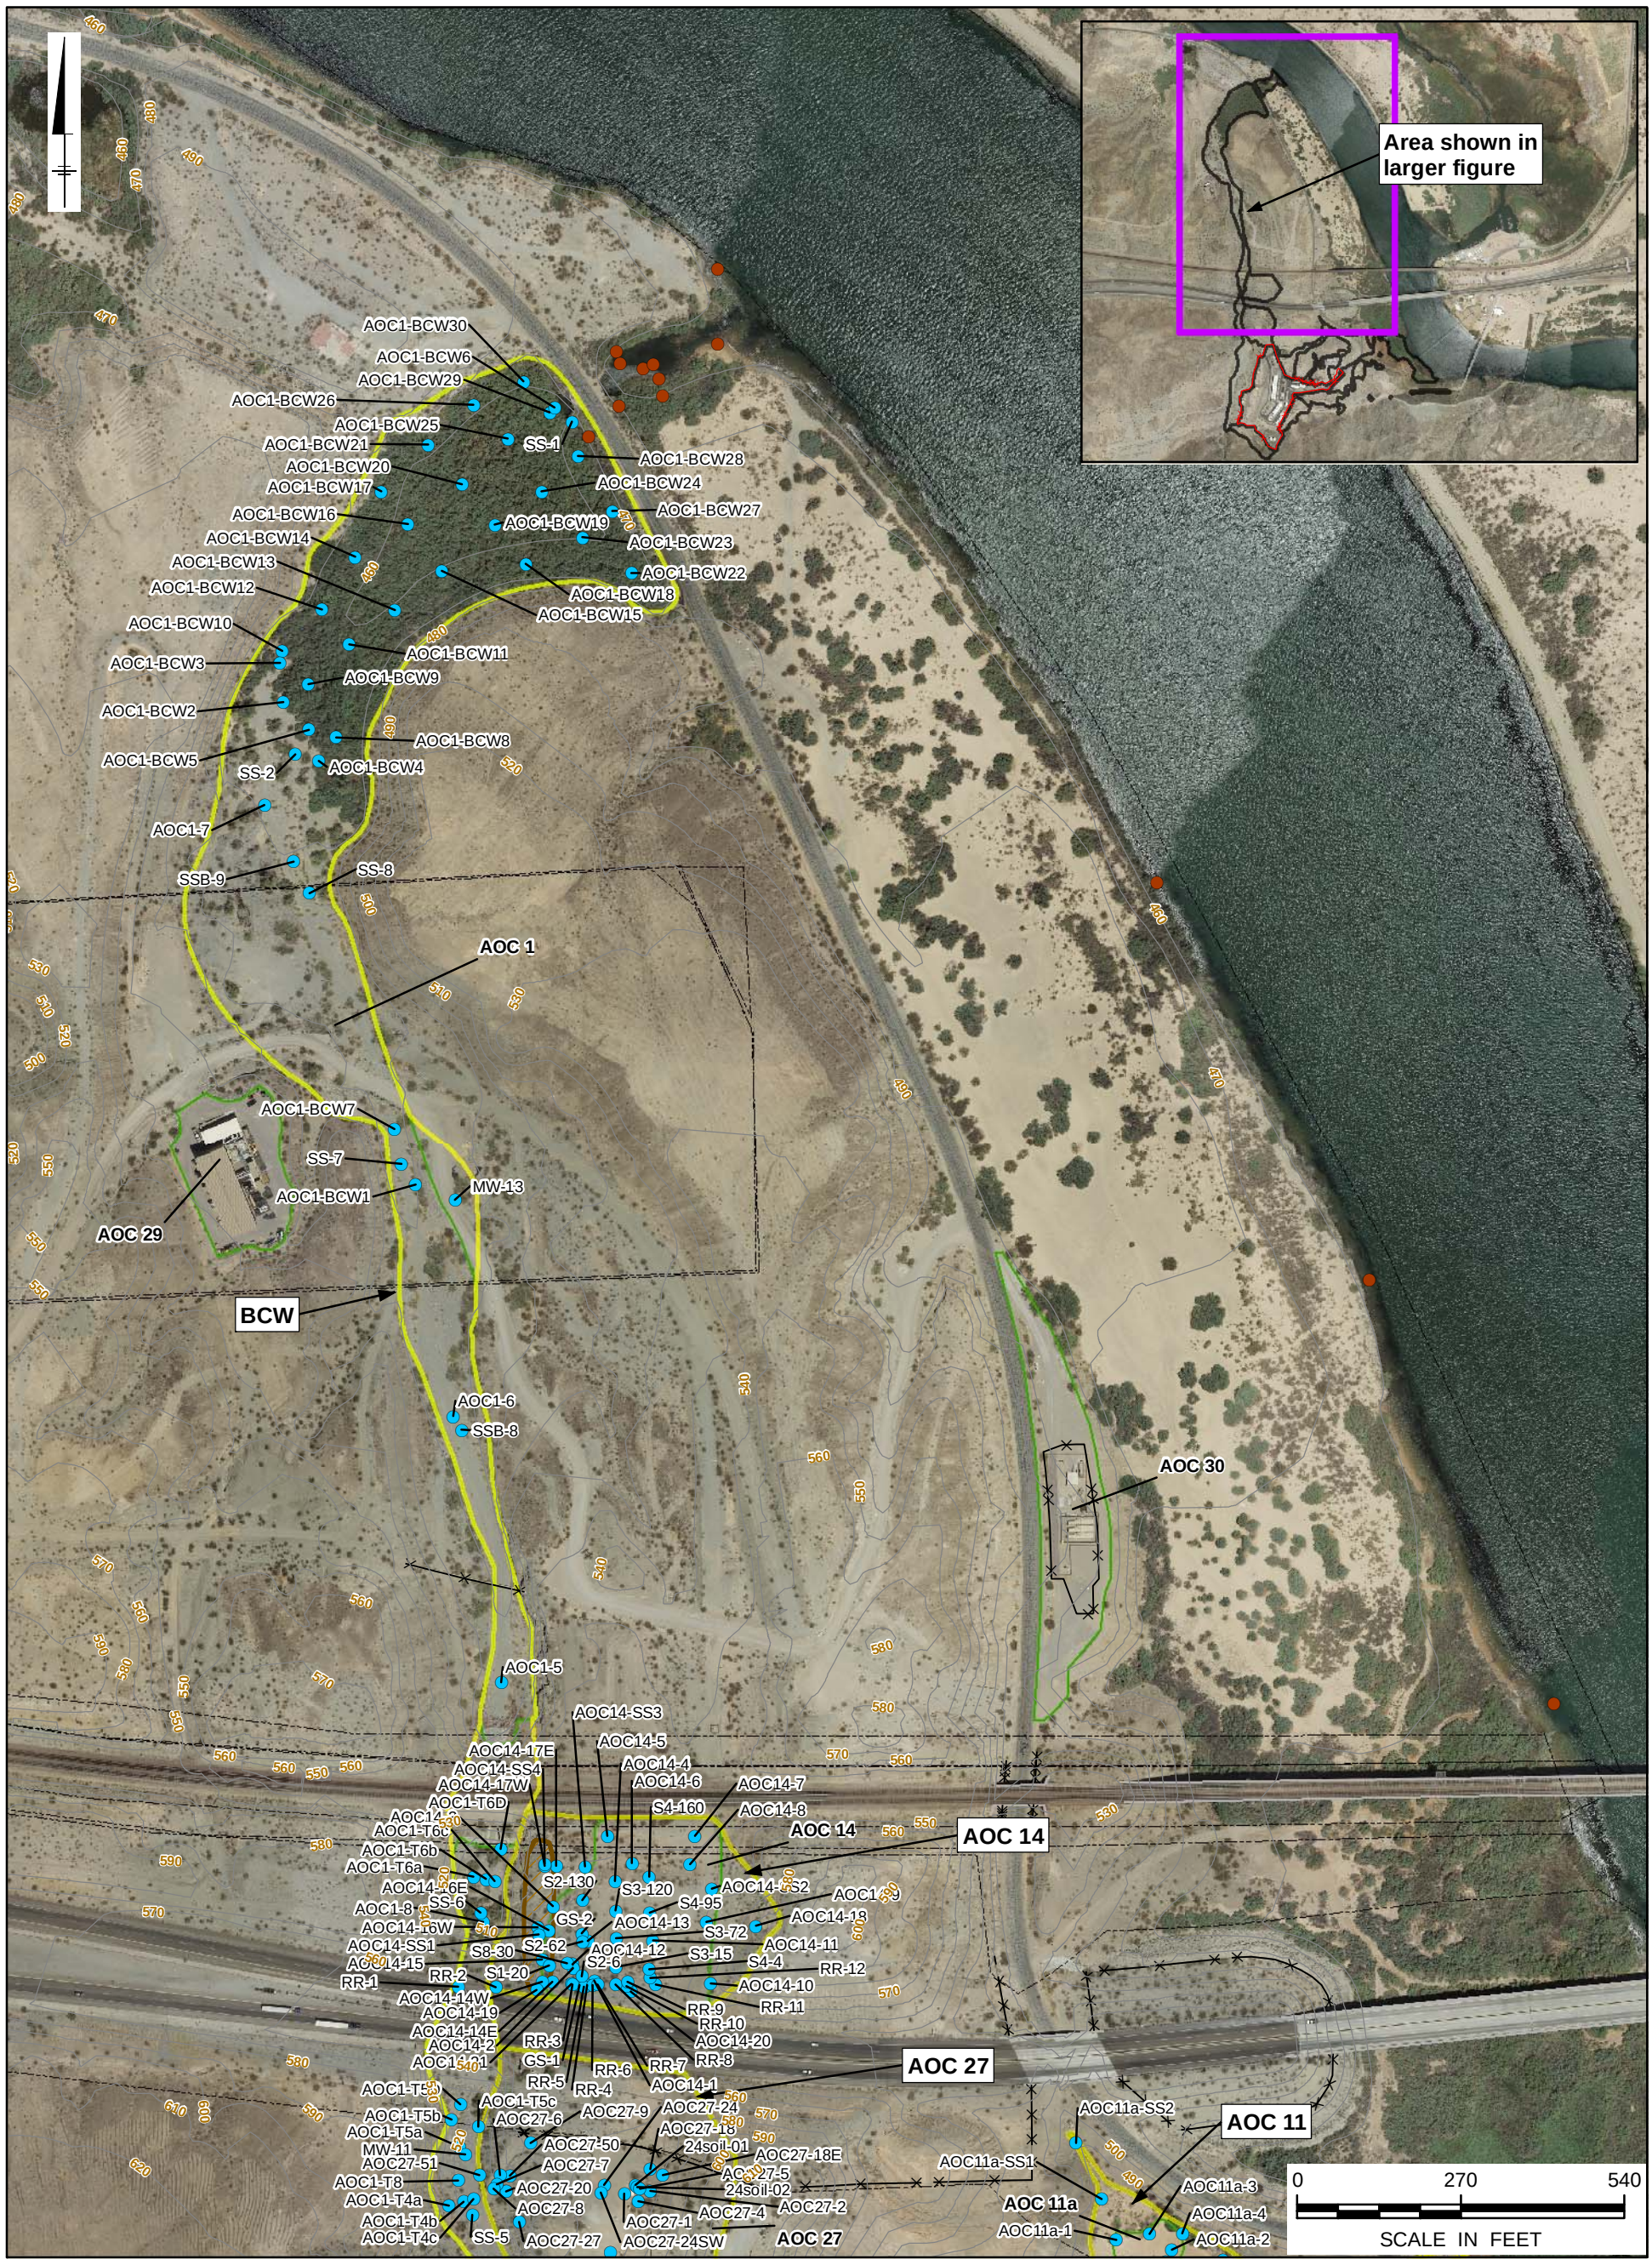
NOAEL HQ greater than 1
LOAEL HQ greater than 1
LOAEL HQ greater than 10
LOAEL HQ greater than 100

Abbreviations:
-- = no toxicity value available, HQs could not be estimated
AOC = area of concern
HQ = hazard quotient
LOE = line of evidence
LOAEL = lowest observed adverse effect level
ND = not detected
NOAEL = no-observed adverse effect level
no SL = no screening level available
TEQ = toxic equivalent
WOE = weight of evidence, considering multiple LOE. If HQs/LOAEL HQs > 1, WOE Result is either 1) not expected, 2) unlikely, or 3) possible.

Table OCS-6.2
Risk Conclusions and Lines of Evidence Summary for Outside the Compressor Station (Including BCW)

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

AOC	Receptor	COPEC[a]	Area-Weighted HQs: Mammal/ Bird NOAEL	Area-Weighted HQs: Mammal/ Bird LOAEL	Additional Lines of Evidence[c]: Low FOD (Max = EPC)[b]	Locations > BTV	Locations > 10xBTV	Background HQs[d]: NOAEL	Background HQs[d]: LOAEL	BAFs	Quality of SL or TRV	Exposure Assumptions[e]	Observation of T&E species[f]	Other LOE	Risk Conclusions: Individuals	Risk Conclusions: Populations	Risk Driver (LOAEL HQ > 1 and Supporting LOE)[g]
Large Home Range Receptors																	
Outside the Compressor Station (Including BCW)	Desert kit fox	None	HQs < 1	HQs < 1	--	--	--	--	--	--	--	--	--	--	Not expected	Not expected	No
	Nelson's Desert Bighorn Sheep	None	HQs < 1	HQs < 1	--	--	--	--	--	--	--	--	--	--	Not expected	Not expected	No
	Red-tailed hawk	None	HQs < 1	HQs < 1	--	--	--	--	--	--	--	--	--	--	Not expected	Not expected	No



Notes:
a COPECs are presented for HQs greater than 1 based on the depth-weighted EPC and/or area-weighted EPC and species and site-specific SUF.
b The EPC is based on the maximum depth-weighted concentration due to the small dataset size.
c The additional lines of evidence for COPECs with NOAEL and LOAEL HQs less than or equal to 1 (based on the area-weighted EPC and species and site-specific SUF) are not included in the table.
d For plants and soil invertebrates, the background HQ is based on the BTV. For mammals and birds, the NOAEL and LOAEL background HQs are based on the 95 percent upper confidence limit.
e Applicable to wildlife, unless noted.
f In areas where observations were noted, the T&E species observed have large home ranges and unlikely to forage in upland habitat. See text for details.
g For dioxin TEQ, LOAEL HQs less than 10 with supporting LOE were considered unlikely to pose an unacceptable risk to populations of wildlife receptors due to the compounded conservative assumptions included in the ecological risk assessment. See Section 6.7.6 of the main report.
h Depth-weighted EPC resulted in an HQ or NOAEL-based HQ less than 1, and is less than the area-weighted HQ or NOAEL-based HQ.
i Although a BTV is n LOAEL and NOAEL HQs ≤ 1 for the receptor

LOAEL and NOAEL HQs ≤ 1 for the receptor

Abbreviations:
"--" = not applicable
AOC = area of concern
BAF = bioaccumulation factor
BG NA = background value not available
BTV = background threshold value
COPEC = constituent of potential ecological concern
EPC = exposure point concentration
FOD = frequency of detection
HQ = hazard quotient
LOAEL = lowest observed adverse effect limit
LOE = line of evidence
MDC = maximum depth-weighted concentration
NC = not calculated
NOAEL = no observed adverse effect limit
SL = screening level
SWMU 1 = solid waste management unit 1
T&E = threatened and endangered
TCS-4= Topock Compressor Station Well #4
TEQ = toxic equivalent
TRV = toxicity reference value
