Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.
NA = Not applicable. Hexavalent chromium is not absorbed via dermal contact.
NC = Not considered a carcinogen.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.
NA = Not applicable. Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
HI = Hazard Index
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.
NA = Not applicable. Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
HI = Hazard Index
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.
NA = Not applicable. Hexavalent chromium is not absorbed via dermal contact.
NC = Not considered a carcinogen.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.
NA = Not applicable. Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

PbB _t	Target PbB level of concern (e.g., 10 ug/dL)	ug/dL	1.0	1.0	1.0	1.0
P(PbB _{fetal} > PbB _t)	Probability that fetal PbB > PbB _t , assuming lognormal distribution	%	0%	0%	0%	0%

PRG90

3977

Notes:

Highlighted values are site-specific: soil ingestion rate (100 mg/day) consistent with United States Environmental Protection Agency (USEPA) recommendations for evaluating construction (i.e., soil contact-intensive) scenarios (USEPA 2016). Exposure frequency (10 days/year) is a site-specific value for long-term maintenance workers, based on 4 work hours per 8 hour work day, 20 days per year as shown in Table 5.1 of the main report.

Notes:

	HQ greater than 1
	HQ greater than 10
	HQ greater than 100

Abbreviations:

AOC = area of concern
 COPEC = constituent of potential ecological concern
 EPC = exposure point concentration
 HQ = hazard quotient
 LOAEL = lowest observed adverse effect level
 mg/kg = milligrams per kilogram
 ND = not detected in the applicable depth interval
 ng/kg = nanograms per kilogram
 no SL = no screening level available
 NOAEL = no-observed adverse effect level
 PAH = polycyclic aromatic hydrocarbon
 PCB = polychlorinated biphenyl

Notes:

	HQ greater than or equal to 1
	HQ greater than or equal to 10
	HQ greater than or equal to 100

Abbreviations:

AOC = area of concern
 COPEC = constituent of potential ecological concern
 EPC = exposure point concentration
 HQ = hazard quotient
 LOAEL = lowest observed adverse effect level
 mg/kg = milligrams per kilogram
 ND = not detected in the applicable depth interval
 ng/kg = nanograms per kilogram
 no SL = no screening level available
 NOAEL = no-observed adverse effect level
 PAH = polycyclic aromatic hydrocarbon
 PCB = polychlorinated biphenyl

Notes:

^a Dioxin presented in ng/kg.

^b Total dose equation is presented below:

$$\text{Total Dose (mg/kg-day)} = [(EPC_{\text{soil}} \times SIR) + (C_{\text{plants}} \times FIR \times F_{\text{plants}}) + (C_{\text{insects}} \times FIR \times F_{\text{insects}}) + (C_{\text{mammals}} \times FIR \times F_{\text{mammals}})] \times \text{SUF}$$

^c HQ = Total Dose / TRV

Abbreviations:

AOC = area of concern

BTAG = Biological Technical Assistance Group

COPEC = constituent of potential ecological concern

dw = dry weight

EPC_{soil} = exposure point concentration in soil (mg/kg dw)

EPC_{plants} = exposure point concentration in plants (mg/kg dw)

EPC_{insects} = exposure point concentration in insects (mg/kg dw)

EPC_{mammals} = exposure point concentration in mammals (mg/kg dw)

F_{plants} = fraction of plants in diet

F_{insects} = fraction of insects in diet

F_{mammals} = fraction of mammals in diet

FIR = food ingestion rate (kg dw/kg bw-day)

HQ = hazard quotient (unitless)

kg = kilogram

kg dw/kg bw-day = kilograms per kilogram of body weight per day

LOAEL = lowest observed adverse effect level (mg/kg-day)

m = maximum detected concentration

mg/kg = milligrams per kilogram

mg/kg-day = milligrams per kilogram per day

ND = not detected

ng/kg = nanograms per kilogram

NOAEL = no observed adverse effect level (mg/kg-day)

PAH = polycyclic aromatic hydrocarbon

PCB = polychlorinated biphenyl

SIR = soil ingestion rate (kg dw/kg bw-day)

SUF = site use factor (fraction)

TRV = toxicity reference value (mg/kg-day)

Notes:

a. Calculated using selected soil EPC and uptake model. See Section 6 of the main report.

b. Biota EPCs presented as 0.0 indicate no bioaccumulation from soil.

Bold indicates EPC selected to estimate plant uptake from soil (maximum of surface, shallow, and subsurface I soil).

Abbreviations:

-- = soil EPC or uptake model not available, biota EPCs could not be estimated.

AOC = area of concern

COPEC = constituent of potential ecological concern

EPC = exposure point concentration

ft bgs = feet below ground surface

m = maximum depth-weighted concentration

mg/kg = milligrams per kilogram

nd = not detected in this depth interval

ng/kg = nanograms per kilogram

PAH = polycyclic aromatic hydrocarbon

PCB = polychlorinated biphenyl

1 INTRODUCTION

This appendix presents the human health and ecological risk assessment (HHERA) for the Area of Concern (AOC) 27 potential soil exposure area located outside the Topock Compressor Station (TCS) in Needles, California. The AOC 27 potential exposure area, shown on Figure AOC27-1.1, is approximately 3.8 acres in total and includes sample locations shown in Table AOC27-1.1 of this appendix. Available soil data from the AOC 27 potential exposure area were used to conduct a quantitative HHERA as presented herein. A summary of the human health risk assessment (HHRA) and the ecological risk assessment (ERA) results are presented in the main report (Sections 5 and 6, respectively) of the Soil Human Health and Ecological Risk Assessment Report (the “main report”). This appendix refers to “HHRA” when discussing specific information for assessing risks to human health, “ERA” when discussing specific information for assessing risks to potential ecological receptors, and “HHERA” when discussing topics that are common to both the HHRA and the ERA.

Descriptions of the physical location and characteristics of the AOC 27 potential exposure area and the HHERA methodologies are provided in the main report and the Human Health and Ecological Risk Assessment Work Plan (RAWP) documents (Arcadis U.S., Inc. [Arcadis] 2008, 2009, 2015) and are not repeated in this appendix. Detailed discussions of the historical uses and sampling and analysis are presented in the main report as well.

This appendix summarizes site use, data evaluation, potential receptors, potential exposure pathways and the results of the HHERA risk characterization for soil in the AOC 27 potential exposure area. Tables and figures specific to the AOC 27 potential exposure area HHERA are also presented in this appendix.

1.1 Summary of Site Use

AOC 27, also referred to as the MW-24 Bench Exposure Area, is located outside the fence line north of the lower yard of the TCS and south of Interstate 40 (Figure AOC27-1.1) on property owned by Pacific Gas and Electric Company (PG&E) and Havasu National Wildlife Refuge. The primary source of contamination at AOC 27 is disposal of debris. As summarized in the Final Soil Remedial Facility Investigation/Remedial Investigation Work Plan (CH2M 2013), during interviews conducted by PG&E in late 2009 and early 2010, a former PG&E employee indicated this area was used as a potential waste disposal area. Before construction of Interstate 40, this area was contiguous with AOC 14 – Railroad Debris Site. Miscellaneous construction debris is present in AOC 27.

In January 2008, during trenching activities in AOC 27 associated with installation of a control panel related to the upland in situ pilot test, debris consisting mostly of treated wood, concrete, and scrap steel/tin (including a possible fragment of a storage tank) was encountered at a depth of approximately 3 feet (ft) below ground surface (bgs). The California Environmental Protection Agency, Department of Toxic Substances Control (DTSC) and the United States Department of the Interior were notified of this discovery in an e-mail dated January 12, 2008.

During the 2011 site walk DTSC and United States Department of the Interior noted discolored soil in the embankment of an unpaved access road leading from the MW-24 Bench to Bat Cave Wash (BCW). In 2011, DTSC identified potential burn waste in the eastern edge of the road cut on the road from AOC 27 to BCW. Potential sources of dioxins and furans in the vicinity of the TCS may include historical industrial activities as

APPENDIX AOC27
SOIL HHERA FOR AOC 27 EXPOSURE AREA

well as other sources unrelated to TCS activities (i.e., unauthorized dumping and burning; regional wildfires; combustion of diesel and leaded gas; and exhaust from cars, trucks, and trains) (CH2M 2017a).

Subsequently, PG&E collected samples of the waste material and defined the lateral and vertical extent of waste and any associated contamination observed in the in situ pilot study trench.

Constituents present in these debris materials could have been deposited on surface soil as particulates or could have entered surface soil as dissolved constituents through infiltration of rainfall. Because some material is buried, constituents could also have affected shallow and subsurface soils in the immediate vicinity of the debris. Therefore, primary source media consist of surface, shallow, and subsurface soils.

2 DATA EVALUATION AND COPC/COPEC SELECTION

This section summarizes the data considered for the AOC 27 HHERA and presents the constituents of potential concern (COPCs) for human health and constituents of potential ecological concern (COPECs) selected for the AOC 27 potential exposure area.

All soil sampling locations at the AOC 27 potential exposure area are presented on Figure AOC27-1.1 and in Table AOC27-1.1. The data were evaluated based on methodology described in the RAWP documents (Arcadis 2008, 2009, 2015). Details of the soil sampling and analysis will be presented in the forthcoming Resource Conservation and Recovery Act Facility Investigation/Remedial Investigation Report (currently being prepared by Jacobs).

Following the steps outlined in Section 3 of the main report, soil data considered usable for the risk assessment were identified and used in the quantitative HHERA. For the AOC 27 potential exposure area, soil data available from 63 samples from 0 to 10 ft bgs were all considered for use in the HHERA and the data are presented in Attachment AOC27-A1. Data processed for the HHERA (e.g., calculation of total concentrations for low molecular weight [LMW] and high molecular weight [HMW] polycyclic aromatic hydrocarbons [PAHs], benzo(a)pyrene equivalent [B(a)PEQ], polychlorinated biphenyls [PCBs], and dioxin/furan toxicity equivalents [TEQs]) are described in detail in Section 3 of the main report.

The process for identifying COPCs and COPECs included in the HHERA is detailed in Section 3.4 of the main report. COPCs and COPECs were selected for the AOC 27 potential exposure area using soil data encompassing all relevant exposure depths for the HHERA (i.e., 0 to 10 ft bgs for the AOC 27 potential exposure area), as presented in Attachment AOC27-A1. Inorganic compounds, LMW PAHs, HMW PAHs, B(a)PEQ, and dioxin TEQ were above the background levels in AOC 27 potential exposure area soil (i.e., 0 to 10 ft bgs), and therefore, are included as COPCs and/or COPECs in the baseline exposure depths evaluated in the HHERA. When detected above background levels, carcinogenic PAHs (i.e., benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, dibenzo[a,h]anthracene, chrysene, and indeno[1,2,3-cd]pyrene) associated with B(a)PEQ are also selected as COPCs in the HHERA for the evaluation of the noncancer endpoint for each PAH. All other detected organic constituents in AOC 27 potential exposure area soil in the baseline exposure depths are included as COPCs and/or COPECs in the HHERA. COPCs and/or COPECs selected for exposure depths and scenarios evaluated in the HHERA for the AOC 27 potential exposure area are summarized in Tables AOC27-2.1a through AOC27-2.1d. The selected COPCs and COPECs are discussed further in Sections 4 and 5, respectively, of this appendix.

3 EXPOSURE POINT CONCENTRATIONS

Depth-weighted and area-weighted exposure point concentrations (EPCs) for COPCs/COPECs in soil at the AOC 27 potential exposure area were calculated as described in Section 4.2 of the main report. For the AOC 27 potential exposure area, one scenario was evaluated: Baseline (no scouring).

The following exposure depths were evaluated:

1. Surface soil (0 to 0.5 ft bgs)
2. Shallow soil (0 to 3 ft bgs)
3. Subsurface I soil (0 to 6 ft bgs)
4. Subsurface II soil (0 to 10 ft bgs).

The depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment AOC27-A2. The summary statistics for these AOC 27 potential exposure area soil depth-weighted datasets and depth-weighted EPCs were calculated consistent with the RAWP documents (Arcadis 2008, 2009, 2015). Per the RAWP documents, area-weighted EPCs for the HHRA are evaluated only if depth-weighted EPCs suggest that cumulative cancer risks and/or noncancer hazards may be significant for any given HHRA exposure scenario (i.e., cumulative cancer risks exceed a 10^{-6} cancer risk level, and/or the noncancer hazard index [HI] exceeds 1). Similarly, for the ERA, area-weighted EPCs are evaluated only if depth-weighted EPCs suggest potential risk to potential ecological receptors (i.e., hazard quotient [HQ] exceeds 1 for any COPEC). For the AOC 27 potential exposure area, area-weighted EPCs were deemed necessary for either the HHRA or the ERA and, therefore, were evaluated. The area-weighted data used in the calculation of area-weighted EPCs are presented in Attachment AOC27-A3.

Soil summary statistics for constituents measured at the AOC 27 potential exposure area¹ and depth- and area-weighted EPCs for COPCs/COPECs calculated using depth-weighted data from the exposure depths listed above for the AOC 27 potential exposure area for the baseline scenario are presented in Table AOC27-3.1. If the soil dataset had fewer than four detected values (i.e., concentrations reported above the detection limit) or fewer than eight total observations, the EPC defaulted to the maximum depth-weighted concentration in that dataset. Table AOC27-3.1 also presents the basis of the calculated depth- and area-weighted EPCs, including whether the EPC is based on the maximum detected concentration.

¹ The list of constituents shown in the main report Section 3 tables is based on analytes that were detected at least once at the site (including all potential exposure areas inside or outside the TCS) and measured at AOC 27.

4 HUMAN HEALTH RISK ASSESSMENT

This section briefly summarizes the HHRA approach; presents the COPC, EPC, risk, and hazard summary tables; and discusses the results of the risk characterization and uncertainties in the risk assessment for the AOC 27 potential exposure area. Details of the overall HHRA approach are presented in Section 5 of the main report. Dose, exposure concentration (EC), risk, and hazard calculation tables for potential human health receptors at the AOC 27 potential exposure area are presented in Attachment AOC27-B.

Risks/hazards estimated for an individual AOC/solid waste management unit (SWMU)/undesignated area (UA) potential exposure area like AOC 27 are not considered representative of the realistic or likely potential exposures for the human populations that could be present in the areas outside the TCS (such as maintenance workers, recreational users, and tribal users). Risks/hazards calculated separately for individual AOCs are conservative and likely overestimate site risks/hazards. As described in the RAWP documents (Arcadis 2008, 2009, 2015), these human populations would more likely be exposed randomly, over the course of a lifetime, to soil present in all individual AOC/SWMU/UA potential exposure areas located outside the TCS, rather than have a lifetime of contact limited to the area of a single potential exposure area. Therefore, estimated risks/hazards presented for individual AOC/SWMU/UA potential exposure areas are not believed to be representative of the potential health risks to humans potentially contacting the soil outside the TCS. Rather, the HHRA results presented in Appendix OCS for all AOC/SWMU/UA potential exposure areas located outside the TCS combined will help to inform risk management decisions for the site. The estimated risks/hazards associated with a lifetime of contact with soil only in the AOC 27 potential exposure area are presented at the request of the agencies and are not suitable to provide the sole basis of risk management decisions to protect human health.

4.1 Human Health Conceptual Site Model

Following the steps outlined in Section 5.5 of the main report, risks were estimated for potentially complete and significant exposure pathways identified in the human health conceptual site model (CSM) for receptors potentially exposed to COPCs in soil present at the AOC 27 potential exposure area. The potential receptors and exposure pathways evaluated for the AOC 27 potential exposure area included:

- **Short- and Long-Term Maintenance Workers** – Incidental ingestion of soil, dermal contact with soil, inhalation of particulates and volatile organic compound (VOC) vapors in ambient outdoor air from soil
- **Recreational Users (child and/or adult camper, hiker, hunter, and off-highway vehicle [OHV] rider)** – Incidental ingestion of soil, dermal contact with soil, and inhalation of particulates and VOC vapors in ambient outdoor air from soil
- **Tribal Users** – Inhalation of particulates and VOC vapors in ambient outdoor air from soil.

Potential exposure pathways considered incomplete or insignificant were not quantitatively evaluated and are discussed in Section 5.3.1 of the main report.

4.2 Constituents of Potential Concern

COPCs for the AOC 27 potential exposure area were selected in accordance with the RAWP (Arcadis 2008) and as described in Section 3.4 of the main report. The COPC selection process using soil data encompassing all relevant exposure depths for the HHRA (i.e., 0 to 10 ft bgs for the AOC 27 potential exposure area) are presented in Attachment AOC27-A. COPCs for the four exposure depths and one scenario (baseline) evaluated for the AOC 27 potential exposure area HHRA are summarized in Table AOC27-4.1 (details are presented in Tables AOC27-2.1a through AOC27-2.1d).

COPCs included metals (antimony, cadmium, hexavalent chromium, copper, lead, mercury, and zinc), VOCs (bromomethane and chloromethane), PAHs, PCBs, total petroleum hydrocarbon (TPH) as diesel, TPH as motor oil, and dioxin TEQ in surface, shallow, subsurface I, and/or subsurface II soil.

4.3 Exposure Point Concentration Summary

For the potentially complete and significant exposure pathways identified in the CSM, EPCs were calculated as described in Section 4.2 of the main report and presented in Section 3 of this appendix. Depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment AOC27-A. Depth- and area-weighted EPCs for COPCs in soil and estimated outdoor air concentrations associated with dust and vapors and used to estimate risk in the HHRA are summarized in Tables AOC27-4.2a through AOC27-4.2h and Tables AOC27-4.3a through AOC27-4.3f, respectively, for the four exposure depths in the baseline scenario.

As described in detail in Section 5.3.3 of the main report, the following exposure depths and corresponding EPC datasets were used to evaluate potential exposure to COPCs in soil for potential human receptors:

- **Short- and Long-Term Maintenance Workers**— surface, shallow, subsurface I, and subsurface II soil
- **Recreational Users (child and/or adult camper, hiker, hunter, and off-highway vehicle [OHV] rider)** – surface and shallow soil
- **Tribal Users** – surface and shallow soil.

4.4 Estimation of Dose

The EC and chronic daily intake (CDI) for potential carcinogenic and noncarcinogenic effects were calculated, as described in Section 5.5.1 of the main report, for COPCs in soil for potentially complete exposure pathways. The calculated EC and CDI values using depth-weighted EPCs are presented in Tables AOC27-B1.1a through AOC27-B1.1g (carcinogenic effects) and Tables AOC27-B1.2a through AOC27-B1.2g (noncarcinogenic effects) in Attachment AOC27-B1 for the potential receptors evaluated. The calculated EC and CDI values using area-weighted EPCs are presented in Tables AOC27-B2.1a through AOC27-B2.1c (carcinogenic effects) and Tables AOC27-B2.2a through AOC27-B2.2c (noncarcinogenic effects) in Attachment AOC27-B2 for the potential receptors evaluated. Exposure parameters used in the dose calculations are presented in Table 5-1 of the main report.

4.5 Toxicity Assessment

The toxicity assessment characterizes the relationship between the magnitude of exposure to a constituent and the potential for adverse health effects. More specifically, the toxicity assessment identifies agency-promulgated or derived toxicity values that can be used to estimate the likelihood of adverse health effects occurring in humans at different exposure levels. The approach for the toxicity assessment was provided in Section 4.5 of the RAWP (Arcadis 2008) and in Section 4.2 of the RAWP Addendum 2 (Arcadis 2015). Consistent with regulatory risk assessment policy, adverse health effects resulting from potential chemical exposures are evaluated in two categories: carcinogenic effects and noncarcinogenic effects. The hierarchy of sources for the toxicity criteria to be used for the HHRA generally corresponds to DTSC's guidance (DTSC 2015). Toxicity values for carcinogenic and noncarcinogenic effects for COPCs selected and used for the HHRA are described in Section 5.4 of the main report and were used to estimate potential cancer risks and noncancer hazards.

4.6 Human Health Risk Characterization

For potential human receptors, assuming lifetime soil exposure is limited to the AOC 27 potential exposure area, the incremental lifetime cancer risks (ILCRs) and/or noncancer HQs were calculated for each COPC and potentially complete exposure pathway. Estimated cumulative ILCRs (i.e., sum of chemical-specific ILCRs for each exposure depth for a scenario) were calculated and compared to the DTSC's point of departure for risk management decision of 1×10^{-6} . Risk management decisions may raise this criterion depending on site-specific conditions. As indicated in the National Oil and Hazardous Substances Pollution Contingency Plan (40 Code of Federal Regulations 300), cancer risks with between one in a million and one hundred in a million probability of occurrence (1×10^{-6} and 1×10^{-4}) fall within a risk management range. This is generally referred to as the acceptable risk range. Within this estimated cancer risk range, there is flexibility for risk managers in deciding what action, if any, is necessary and appropriate for the protection of human health. Estimated cumulative noncancer hazards (i.e., HIs) are calculated and compared to an HI of 1 (DTSC 2015). Chemical exposures that yield HIs of less than or equal to 1 are not expected to result in adverse noncancer health effects (United States Environmental Protection Agency [USEPA] 1989).

4.6.1 Risk Characterization for Exposure to Soil (Baseline Scenario and Depth-Weighted EPCs)

Table AOC27-4.4 summarizes cumulative ILCRs and HIs estimated using depth-weighted EPCs for potential exposure to soil for each potential human receptor at the AOC 27 potential exposure area in the baseline scenario. The dose, EC, ILCR, and HI equations are presented in detail in Section 5.5.1 of the main report. The detailed cancer risk estimates (Tables AOC27-B1.3a through AOC27-B1.3g) and noncancer hazard calculations (Tables AOC27-B1.4a through AOC27-B1.4g) are presented in Attachment AOC27-B1.

Risk and hazard estimates for the AOC 27 potential exposure area are summarized in the tables and discussed below. Assuming that lifetime soil contact is limited to the AOC 27 potential exposure area, the depth-weighted estimated cumulative ILCRs and HIs for each receptor potentially exposed to COPCs in the AOC 27 potential exposure area soil at all exposure depths are at or below the *de minimis* levels of 1×10^{-6} and 1, respectively, for the short-term maintenance worker, camper, hunter and tribal user. Estimates for potential soil contact limited to the AOC 27 potential exposure area for lifetime exposure are above *de minimis*

APPENDIX AOC27
SOIL HHERA FOR AOC 27 EXPOSURE AREA

levels, but within the acceptable risk management range, for the long-term maintenance worker and certain recreational users (hiker and OHV rider).

Maintenance Workers

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 27 Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Short-Term Maintenance Worker	Surface	3E-07	NA	0.07	NA
	Shallow	2E-07	NA	0.08	NA
	Subsurface I	2E-07	NA	0.08	NA
	Subsurface II	1E-07	NA	0.06	NA
Long-Term Maintenance Worker	Surface	3E-06	CrVI (7E-07) B(a)PEQ (6E-07) TEQ human (1E-06)	0.09	NA
	Shallow	2E-06	CrVI (5E-07) B(a)PEQ (4E-07) TEQ human (1E-06)	0.05	NA
	Subsurface I	2E-06	CrVI (7E-07) B(a)PEQ (2E-07) TEQ human (8E-07)	0.05	NA
	Subsurface II	9E-07	NA	0.03	NA

Notes:

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

CrVI = hexavalent chromium

NA = not applicable

TEQ human = dioxin toxicity equivalent for humans

Assuming lifetime soil contact is limited to the AOC 27 potential exposure area, the depth-weighted estimated cumulative ILCRs for the short-term maintenance worker potentially exposed to COPCs in the AOC 27 potential exposure area surface, shallow, subsurface I, and subsurface II soil are below the *de minimis* level of 1×10^{-6} , the point of departure for risk management decisions (Table AOC27-B1.3a).

Assuming lifetime soil contact is limited to the AOC 27 potential exposure area, the depth-weighted estimated cumulative ILCRs for the long-term maintenance worker potentially exposed to COPCs in surface, shallow, subsurface I, and subsurface II soil are above the point of departure for risk management decisions of 1×10^{-6} , but well within the risk management range of 1×10^{-6} and 1×10^{-4} . For this potential receptor, risk estimates above *de minimis* levels were primarily attributed to B(a)PEQ and dioxin TEQ in soil via the dermal contact and soil ingestion pathways and to hexavalent chromium in soil via the inhalation of particulates pathway (Table AOC27-B1.3b).

Elevated concentrations of hexavalent chromium, B(a)PEQ, and dioxin TEQ appear to be localized in the area around sampling locations AOC27-6 and AOC27-7 (i.e., the locations with the highest concentrations of hexavalent chromium, B(a)PEQ, and dioxin TEQ detected in the AOC 27 potential exposure area soil). Accordingly, the depth-weighted EPCs and corresponding estimated ILCRs for hexavalent chromium, B(a)PEQ, and dioxin TEQ may be biased high. To reduce the uncertainty associated with this potential bias, area-weighted cumulative ILCRs for the long-term maintenance worker were estimated, as discussed below in

APPENDIX AOC27
SOIL HHERA FOR AOC 27 EXPOSURE AREA

Section 4.6.2, and are approximately 2.9 to 3 times lower than the depth-weighted cumulative ILCRs for certain exposure depths.

Assuming lifetime soil contact is limited to the AOC 27 potential exposure area, the depth-weighted estimated cumulative HIs for the short- and long-term maintenance workers (Tables AOC27-B1.4a and AOC27-B1.4b, respectively) potentially exposed to COPCs in surface, shallow, subsurface I, and subsurface II soil are below an HI of 1. The depth-weighted EPCs for lead in AOC 27 potential exposure area soil at surface shallow, subsurface I, and subsurface II exposure depths are not expected to result in an increase in blood lead levels above the California Office of Environmental Health Hazard Assessment's (OEHHA's) benchmark value of 1 microgram per deciliter (µg/dL) in the fetus of a short- or long-term maintenance worker (Tables AOC27-B1.5a and AOC27-B1.5b, respectively).

Recreational Users

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 27 Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Camper	Surface	1E-06	NA	0.06	NA
	Shallow	8E-07	NA	0.05	NA
Hiker	Surface	2E-06	CrVI (2E-07) B(a)PEQ (1E-06) TEQ human (1E-06)	0.1	NA
	Shallow	2E-06	CrVI (1E-07) B(a)PEQ (7E-07) TEQ human (8E-07)	0.1	NA
Hunter	Surface	2E-07	NA	0.02	NA
	Shallow	2E-07	NA	0.01	NA
OHV Rider	Surface	2E-06	CrVI (4E-07) B(a)PEQ (7E-07) TEQ human (6E-07)	0.03	NA
	Shallow	1E-06	NA	0.02	NA

Note:

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

The depth-weighted estimated cumulative ILCRs for the camper and hunter potentially exposed to COPCs in AOC 27 potential exposure area surface and shallow soil are at or below the *de minimis* level of 1×10^{-6} , the point of departure for risk management decisions. However, assuming lifetime soil contact is limited to the AOC 27 potential exposure area, the depth-weighted estimated cumulative ILCRs for the hiker and OHV rider potentially exposed to COPCs in surface and/or shallow soil are above the point of departure for risk management decisions of 1×10^{-6} , but well within the risk management range of 1×10^{-6} and 1×10^{-4} . For these potential receptors, risk estimates above *de minimis* levels were primarily attributed to B(a)PEQ, hexavalent chromium, and dioxin TEQ in soil via the soil ingestion pathway (Tables AOC27-B1.3c thru AOC27-B1.3f).

As previously discussed, elevated concentrations of hexavalent chromium, B(a)PEQ, and dioxin TEQ appear to be localized in the area around sampling locations AOC27-6 and AOC27-7. Accordingly, the depth-weighted EPCs and corresponding estimated ILCRs for hexavalent chromium, B(a)PEQ, and dioxin TEQ may be biased high. To reduce the uncertainty associated with this potential bias, area-weighted estimated cumulative ILCRs for the hiker and OHV rider were estimated, as discussed below in Section 4.6.2, and are approximately 3 to 3.6 times lower than the depth-weighted cumulative ILCRs for certain exposure depths.

Assuming lifetime soil contact is limited to the AOC 27 potential exposure area, the depth-weighted estimated cumulative HIs for the camper, hiker, hunter, and OHV rider (Tables AOC27-B1.4c through AOC27-B1.4f) potentially exposed to COPCs in AOC 27 potential exposure area soil at surface and shallow exposure depths are below an HI of 1. The depth-weighted EPCs for lead in AOC 27 potential exposure area soil at surface and shallow exposure depths are not expected to result in an increase in blood lead levels above OEHHHA's benchmark value of 1 µg/dL for the child recreational user and the fetus of a hunter (Tables AOC27-B1.5c through AOC27-B1.5i).

Tribal User

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 27 Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Tribal User	Surface	1E-09	NA	0.0002	NA
	Shallow	1E-09	NA	0.0002	NA

Note:

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

Assuming lifetime soil contact is limited to the AOC 27 potential exposure area, the depth-weighted estimated cumulative ILCRs and HIs for the tribal user potentially exposed to COPCs in surface and shallow soil (Tables AOC27-B1.3g and AOC27-B1.4g) are below the *de minimis* levels of 1×10^{-6} , the point of departure for risk management decisions and HI of 1, respectively. Based on the results of the HHRA, potential exposures to COPCs in soil at the AOC 27 potential exposure area are not expected to pose unacceptable risk to the tribal user, and no further evaluation is considered necessary.

4.6.2 Risk Characterization for Exposure to Soil (Baseline Scenario and Area-Weighted EPCs)

Table AOC27-4.5 summarizes cumulative ILCRs and HIs estimated for exposure to soil for each potential human receptor at the AOC 27 potential exposure area in the baseline scenario, calculated using area-weighted EPCs, for receptors where the depth-weighted estimated cumulative ILCRs and HIs were above 1×10^{-6} and 1, respectively. Therefore, area-weighted ILCRs and HIs were provided for the long-term maintenance worker and certain recreational users (hiker and OHV rider). The dose, EC, ILCR, and HI equations are presented in detail in Section 5.5.1 of the main report. The detailed cancer risk estimates (Tables AOC27-B2.3a through AOC27-B2.3c) and noncancer hazard calculations (Tables AOC27-B2.4a through AOC27-B2.4c) are presented in Attachment AOC27-B2.

The baseline scenario area-weighted estimated cumulative ILCRs and HIs for each potential receptor selected for evaluation are summarized in the tables below. The area-weighted estimated cumulative ILCRs and HIs

APPENDIX AOC27
SOIL HHERA FOR AOC 27 EXPOSURE AREA

for the long-term maintenance worker, hiker, and OVH rider potentially exposed to COPCs in AOC 27 potential exposure area soil at all exposure depths are below the *de minimis* levels of 1×10^{-6} and 1, respectively, assuming lifetime soil contact is limited to the AOC 27 potential exposure area.

In general, the area-weighted approach resulted in a reduction in the risk or hazard estimates ranging from 2.9 to 3.6 times lower than the depth-weighted estimates. Furthermore, the area-weighted EPCs for lead in surface, shallow, subsurface I, and subsurface II soil are not expected to result in an increase in blood lead levels above OEHHA's benchmark value of 1 ($\mu\text{g}/\text{dL}$) in the fetus of a long-term maintenance worker or in a child camper or OHV rider (Tables AOC27-B2.5a through AOC27-B2.5e).

Maintenance Workers

OHV Rider	Surface	5E-07	NA	0.01	NA
	Shallow	4E-07	NA	0.009	NA

Note:

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

4.6.3 Uncertainties in the Risk Assessment

The risk assessment includes several uncertainties that warrant discussion. Many of the assumptions used in this risk assessment, regarding the representativeness of the sampling data, potential human exposures, fate and transport modeling, and chemical toxicity are conservative. As agreed in the RAWP (Arcadis 2008), the values follow agency guidance, and reflect a 90th or 95th percentile value, rather than a typical or average value. The use of several conservative exposure assumptions and toxicity estimates can introduce considerable uncertainty into the risk assessment. By using conservative exposure assumptions or toxicity estimates, the assessment can develop a significant conservative bias that may result in the calculation of

APPENDIX AOC27
SOIL HHRA FOR AOC 27 EXPOSURE AREA

significantly higher estimates for cancer risks or noncancer hazards than are actually posed by the chemicals present in soil. These uncertainties are discussed in detail in Section 5.6 of the main report. Uncertainties applicable only to the risk assessment for the AOC 27 potential exposure area are discussed in detail below.

Uncertainties for the AOC 27 potential exposure area include the use of the maximum depth-weighted soil concentration as the EPC. The maximum depth-weighted soil concentration was used for COPCs when the soil dataset had fewer than four detected values (i.e., concentrations reported above the detection limit) or fewer than eight total observations as shown in Table AOC27-3.1.

For the AOC 27 potential exposure area, the maximum depth-weighted concentration was used as the EPC for the following COPCs:

- Surface soil: one metal (cadmium) and PAHs (acenaphthene, dibenzo[a,h]anthracene, fluorene, and naphthalene)
- Shallow soil: one metal (antimony), VOCs (bromomethane and chloromethane), and PAHs (acenaphthene, acenaphthylene, dibenzo[a,h]anthracene, fluorene, and naphthalene)
- Subsurface I soil: one metal (antimony), VOCs (bromomethane and chloromethane), and PAHs (acenaphthene, acenaphthylene, dibenzo[a,h]anthracene, fluorene, and naphthalene)
- Subsurface II soil: one metal (antimony), VOCs (bromomethane and chloromethane), and PAHs (acenaphthene, acenaphthylene, dibenzo[a,h]anthracene, fluorene, and naphthalene).

The use of the maximum depth-weighted soil concentration as the EPC for the COPCs listed above may not appropriately represent exposures and resulting risks/hazards. This approach to estimating EPCs does not materially impact the results of the HHRA because the AOC 27 potential exposure area COPCs with low frequency of detection and/or fewer than eight observations are not risk drivers at the site.

5 ECOLOGICAL RISK ASSESSMENT

This section summarizes the ERA approach; presents the COPECs, EPCs, dose, and risk tables for the AOC 27 potential exposure area ERA; and characterizes potential risk to potential ecological receptors exposed to COPECs in soil at the AOC 27 potential exposure area. Details of the overall ERA approach are presented in Section 6 of the main report. Supporting tables for the AOC 27 potential exposure area ERA based on risk calculations conducted using depth-weighted EPCs and area-weighted EPCs are presented in Attachment AOC27-C and described below.

Per the RAWP (Arcadis 2008) and DTSC guidance (DTSC 1996), ecological risks were also calculated using maximum depth-weighted concentrations and are presented in Attachment AOC27-D. Risks estimated using maximum depth-weighted concentrations are considered overly conservative and generally are used for screening-level purposes. Use of maximum concentrations is not recommended for use in the risk management decisions at the AOC 27 potential exposure area, where the area has been adequately characterized and data are available to estimate upper confidence limits (UCLs). Therefore, the risk results based on maximum depth-weighted concentrations are presented (Attachment AOC27-D), but are not discussed in this section.

5.1 Ecological Conceptual Site Model

Following the steps outlined in Section 6.6 and on Figures 2-7 and 6-1 of the main report, risks were estimated for potentially complete and significant exposure pathways identified for potential receptors exposed to COPECs in soil at the AOC 27 potential exposure area. These potential receptors included plants, soil invertebrates, and small home-range receptors:

- **Plants** – may be exposed to COPECs via root uptake from surface, shallow and/or subsurface I soil, depending on the root depth of plants of concern.
- **Soil Invertebrates** – may be exposed to COPECs via direct contact/uptake from surface soil.
- **Mammals** – may be exposed to COPECs via incidental ingestion of surface, shallow, or subsurface I soil (for burrowing animals) and/or ingestion of biota tissue (i.e., food items). The small home-range mammalian indicator receptors evaluated in this ERA for the AOC 27 potential exposure area were:
 - **Merriam's Kangaroo Rat** – representative of granivorous small mammal populations exposed to surface, shallow and/or subsurface I soil (incidental and through biota uptake)
 - **Desert Shrew** – representative of invertivorous small mammal populations exposed only to surface soil (incidental and through biota uptake).
- **Birds** – may be exposed to COPECs via incidental ingestion of surface, shallow, or subsurface I soil and/or ingestion of biota tissue (i.e., food items). The small home-range bird indicator receptors evaluated in this ERA for the AOC 27 potential exposure area were:
 - **Cactus Wren** – representative of insectivorous bird populations, exposed only to surface soil (incidental and through biota uptake)

- **Gambel's Quail** – representative of granivorous bird populations, exposed incidentally only to surface soil and exposed to surface, shallow, or subsurface I soil (incidental and through biota uptake).

Potential exposure pathways considered incomplete or insignificant were not quantitatively evaluated; these potential exposure pathways are identified and described in Section 6.3 of the main report.

Large home-range potential receptors (i.e., desert kit fox, red-tailed hawk, and Nelson's desert bighorn sheep) were evaluated for larger exposure areas (combined AOCs/investigation areas) and are discussed in those specific appendices. Potential risks to desert kit fox, red-tailed hawk, and Nelson's desert bighorn sheep associated with the AOC 27 potential exposure area were estimated and characterized as part of the evaluation of all AOCs/investigation areas outside the compressor station (OCS) and AOCs OCS excluding BCW and AOC 4 (OCSxBCW+AOC4); please see Appendix OCS and Appendix OCSxBCW+AOC4 for risk estimates for these large home-range potential receptors.

5.1.1 Evaluation of Special-Status Species

The biological setting for the site and the adjacent areas are described in detail in various reports (see Section 2.4 of the main report). Although potential habitat exists for special-status² species at or near the site, none have been recorded as observed at the AOC 27 potential exposure area. The primary vegetation present at the AOC 27 potential exposure area is sparse creosote bush (*Larrea tridentate*). No federal- or state-listed T&E or candidates for listing were found at the site, including the AOC 27 potential exposure area.

Several species of mammals and birds have been observed at or near the site (Tables 2-2 and 2-4 of the main report). However, no federal- or state-listed T&E wildlife species or candidates for listing were observed at the AOC 27 potential exposure area.

The risk estimates presented here are considered to be protective of special-status-species due to the conservative nature of the ERA, where conservative parameters (e.g., small exposure areas, selected indicator species for each functional group considered on the high end of potential exposures for typical potential receptors at the site within that group, use of no-effects based toxicity values) were used to assess risks to a wide range of potential receptors at various trophic levels. Therefore, further evaluation of special-status species was not considered necessary.

² Special-status species include both state- and federal-listed fully protected threatened and endangered (T&E) species, state/federal species of concern, and traditional culturally significant plants; however, protection at the no-observed adverse effects level (NOAEL) is warranted only for fully protected species.

5.2 Constituents of Potential Ecological Concern

COPECs for the AOC 27 potential exposure area were selected in accordance with the RAWP (Arcadis 2008) and as described in Section 3.4 of the main report. Soil data encompassing all relevant exposure depths for the HHERA (i.e., 0 to 10 ft bgs for the AOC 27 potential exposure area) and used in the COPEC selection process are presented in Attachment AOC27-A1.

Because a potential ecological receptor could be exposed to COPECs at various exposure depths either directly and/or through their diet for a given scenario, a single comprehensive COPEC list was selected based on the range of soil depths encountered by potential ecological receptors in the baseline scenario. Additionally, essential nutrients (e.g., calcium, potassium) and analytes typically measured to evaluate geochemical conditions (e.g., chloride, nitrate, sulfate), are not typically evaluated in ERAs and were not selected as COPECs. COPECs for the three exposure depths evaluated for the baseline scenario for this ERA are summarized in Table AOC27-5.1.

COPECs included metals (antimony, cadmium, hexavalent chromium, copper, lead, mercury, and zinc), VOCs (bromomethane and chloromethane), LMW PAHs, HMW PAHs, PCBs, dioxin TEQ (for potential wildlife receptors only), and 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD; for ecological communities only). TPHs were also identified as COPECs; however, due to lack of appropriate toxicity values to evaluate TPHs for potential ecological receptors, indicator chemicals (e.g., benzene, toluene, ethylbenzene, and xylene [BTEX] and PAHs), when detected, are used to characterize TPH risks. COPECs lacking toxicity values and their impact to the ERA are discussed in Section 6.7.5 of the main report.

5.3 Exposure Point Concentration Summary

For the potentially complete and significant exposure pathways identified in the ecological CSM, soil EPCs were calculated as described in Section 4.2 of the main report and presented in Section 3 of this appendix.

For the AOC 27 potential exposure area, risks to potential ecological receptors were estimated using depth-weighted EPCs and area-weighted EPCs. Depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment AOC27-A2. Area-weighted data used in the calculation of area-weighted EPCs are presented in Attachment AOC27-A3.

Biota tissue EPCs were calculated from the soil EPCs using soil-to-biota uptake relationships for plants, invertebrates, and small mammals, as described in Section 6.4.3 of the main report. As described in Section 6.4 and shown in Figure 6-1 of the main report, the depth intervals selected to represent exposure to soil and biota tissue for the risk calculations for each potential receptor are presented in Table AOC27-5.2.

To summarize for the baseline scenario:

- Soil invertebrates, invertivorous small mammals, and insectivorous birds could potentially be exposed to COPECs in soil and/or biota only at the surface (0 to 0.5 ft bgs).
- Plants and granivorous small mammals could potentially be exposed to COPECs in soil and or/biota down to 6 ft bgs. Therefore, the maximum of the depth-weighted EPCs from 0 to 0.5, 0 to 3, and 0 to 6 ft bgs was selected as the representative soil and/or biota EPC for a COPEC for estimating risks to these potential receptors.

- Granivorous birds could potentially be exposed to COPECs in soil (not biota) only at the surface (0 to 0.5 ft bgs) and biota down to 6 ft bgs. Therefore, exposures to granivorous birds included the depth-weighted soil EPC from 0 to 0.5 ft bgs (for incidental soil ingestion) and the maximum of the depth-weighted biota EPC from 0 to 0.5, 0 to 3, and 0 to 6 ft bgs for each COPEC.

Depth-weighted soil EPCs and biota tissue EPCs calculated from depth-weighted soil EPCs are presented in Table AOC27-5.3 and the representative soil and/or biota EPCs identified for the risk calculations are bolded in this table. Of the COPECs identified at the AOC 27 potential exposure area, antimony, bromomethane, and chloromethane were not detected in surface soil; therefore, exposure to these COPECs by potential receptors only exposed to surface soil was not estimated. These receptors include soil invertebrates, invertivorous small mammals (desert shrew), and insectivorous birds (cactus wren). For the granivorous bird (Gambel's quail), risks from antimony were estimated only from diet. Although VOCs were detected in shallow and subsurface soil, uptake into biota is considered negligible (assumed to be zero for the risk calculations³); therefore, exposure through diet is considered incomplete. For plants and granivorous wildlife, only direct exposure via direct contact/incidental ingestion of soil was considered a complete pathway for VOCs.

Similarly, area-weighted soil EPCs and biota tissue EPCs calculated from area-weighted soil EPCs are presented in Table AOC27-5.4. The representative soil and/or biota EPCs identified for the risk calculations are bolded in this table.

Per the RAWP (Arcadis 2008) and DTSC guidance (DTSC 1996), risk calculations based on both the maximum depth-weighted concentration and the UCL for each COPEC are required. As mentioned earlier in this section, using the maximum depth-weighted concentrations results in overly conservative risks and is not recommended for risk management decisions. The estimated risks based on maximum depth-weighted concentrations are presented in Attachment AOC27-D, but results are not discussed in this report.

5.4 Estimation of Exposure Concentration or Dose

Exposures for ecological communities (plants and soil invertebrates) are quantified as ECs (e.g., in units of milligrams per kilogram [mg/kg]). Exposures for wildlife (mammals and birds) are quantified as doses (e.g., in units of mg/kg body weight per day [mg/kg-bw/day]). ECs and doses for COPECs in soil and potentially complete pathways were calculated as described, including equations, in Section 6.4 of the main report. The exposure parameters selected to evaluate wildlife in this ERA include upper bound values from literature (e.g., ingestion rates) or assumed (e.g., 100% of one type of diet), which may result in conservative estimates of exposure dose and potential overestimation of actual exposure at the site.

For ecological communities, ECs are equal to the depth-weighted soil EPCs for COPECs at the AOC 27 potential exposure area for the baseline scenario and are presented in Table AOC27-5.3. Area-weighted EPCs for the baseline scenario are presented in Table AOC27-5.4.

For wildlife, doses were calculated using the exposure parameters and equations presented in Table 6-4 of the main report and depth-weighted soil and biota tissue EPCs for COPECs at the AOC 27 potential exposure area, as presented in Table AOC27-5.3 for the depth-weighted risk evaluations, and area-weighted soil and

³ VOCs have low bioaccumulation potential (octanol-water partition coefficient is low [$\log K_{ow} < 2$]) and uptake into biota is considered negligible for these constituents.

biota tissue EPCs as presented in Table AOC27-5.4 for the area-weighted risk evaluations. Dose calculations using depth-weighted EPCs for wildlife potentially exposed to COPECs via ingestion of soil and biota tissue for the baseline scenario are presented in Attachment AOC27-C. Dose calculations using area-weighted EPCs for wildlife potentially exposed to COPECs via ingestion of soil and biota tissue for the baseline scenario are also presented in Attachment AOC27-C. Dose calculations using maximum depth-weighted concentrations for wildlife potentially exposed to COPECs via ingestion of soil and biota tissue for the baseline scenario are presented in Attachment AOC27-D.

5.5 Effects Assessment

Concentration-based screening values (i.e., toxicity values) for plants and soil invertebrates and the dose-based toxicity reference values (TRVs) for wildlife for COPECs were used to estimate risks to potential ecological receptors potentially exposed to COPECs in soil and biota tissue at the AOC 27 potential exposure area.

For plants and soil invertebrates, screening values are discussed in Section 6.3 and presented in Table 6-6 of the main report.

A range of risks to wildlife were estimated using the NOAEL-based TRVs and lowest-observed-adverse-effects-level (LOAEL)-based TRVs presented in the RAWP documents (Arcadis 2008, 2009, 2015). These selected TRVs were primarily based on the TRVs used to develop USEPA's Ecological Soil Screening Levels (EcoSSLs; USEPA 2008); other sources included the Toxicological Benchmarks for Wildlife from Oak Ridge National Laboratory (Sample et al. 1996) and USEPA Region 6 ERA Guidance (USEPA 1999). In addition, for estimating potential risk to wildlife, a second set of NOAEL- and LOAEL-based TRVs⁴ based on the Navy/Biological Technical Assistance Group (BTAG) TRVs (DTSC 2002, 2009) were also used for COPECs, where available. Wildlife TRVs based on selected TRVs and BTAG TRVs are presented in Tables 6-7 and 6-8 of the main report, respectively.

Plant screening values are not available for bromomethane, chloromethane, and 2,3,7,8-TCDD. Avian TRVs are not available for antimony, bromomethane, and chloromethane. Mammal TRVs are not available for bromomethane and chloromethane. Therefore, risks to these potential receptors from exposure to these specific COPECs could not be estimated. In addition, appropriate screening values and TRVs are not available for TPHs; therefore, BTEX and PAHs were used as indicator chemicals to characterize TPH risks at the AOC 27 potential exposure area. The lack of screening values and TRVs and the impact to the ERA are discussed in Section 6.7.5 of the main report.

5.6 Ecological Risk Characterization

The risk characterization integrates the results of the exposure assessment and effects assessment and is subject to uncertainties in both those efforts. Risk characterization includes two major components: risk estimation and risk description. As presented in tables and discussed below, risk estimates (HQs) involved integrating exposure profiles with the exposure-effects information. For each potential receptor and COPEC,

⁴ Although these are referred to as LOAEL-based BTAG TRVs, they are based on a midpoint of a variety of adverse effects and are not necessarily the LOAEL. However, for simplicity, these BTAG TRVs are referred to as LOAEL-based TRVs.

risk descriptions including various lines of evidence (LOEs) and uncertainties, including HQs, supporting statistical and site use information, and the direction of uncertainty in the risk estimates, are discussed below for interpreting the risk results and identifying potential unacceptable risk to potential ecological receptors. Uncertainties specific to the AOC 27 potential exposure area are discussed in context with the risk characterization results presented below. Generic uncertainties in the ERA are discussed in detail in Section 6.5 of the main report.

For plants and soil invertebrates, HQs were calculated by comparing the depth-weighted EPCs for each COPEC with respective screening values and these HQs were compared to the target HQ of 1. Following USEPA (1998) guidance, in such cases, a semi-quantitative weight-of-evidence (WOE) approach using multiple LOEs was used in reducing uncertainty and drawing risk conclusions.

Risk conclusions for ecological communities used the following criteria:

- COPECs with HQs less than or equal to 1 pose *de minimis* risk (i.e., negligible risk) to plants and invertebrates.
- COPECs with HQs greater than 1 indicate unacceptable risk to plants and invertebrates is possible. However, exceedances of the screening values (which are conservative and are generally uncertain) do not always clearly indicate that unacceptable risk to ecological communities is occurring. In such cases, a WOE approach, using HQs as a single LOE along with supporting information such as frequency of detection (FOD), site use history, and confidence in the screening values was used in reducing uncertainty for characterizing potential risk to ecological communities.

Ultimately, three risk outcomes are possible for plants and soil invertebrates based on HQs greater than 1 and the WOE: 1) unacceptable risk to ecological communities is possible (i.e., indicated by sufficient and strong supporting LOEs); 2) unacceptable risk to ecological communities is unlikely (i.e., indicated by sufficient and strong LOEs to support a conclusion of no unacceptable risk); or 3) unacceptable risk to ecological communities is uncertain (i.e., indicated by insufficient LOEs).

For wildlife, a range of HQs was calculated using the NOAEL- and LOAEL-based TRVs previously identified in the RAWP documents (Arcadis 2008, 2009, 2015). HQs based on the LOAEL-based TRVs selected in the RAWP are referred to as “LOAEL-based HQs.” HQs based on NOAEL-based TRVs selected in the RAWP are referred as “NOAEL-based HQs.” Additionally, the NOAEL- and LOAEL-based HQs were calculated using a second set of TRVs (i.e., NOAEL- and LOAEL-based BTAG TRVs), as described in Section 6.7.5 of the main report. The BTAG NOAEL-based TRVs are considered very conservative, resulting in a wide range of risk estimates for wildlife. For this ERA, the selected TRVs are considered more robust than the BTAG TRVs, as discussed in Section 6.7.5 of the main report. Results associated with the selected TRVs are recommended for risk management decisions at the AOC 27 potential exposure area.

Risk conclusions for wildlife used the following criteria:

- COPECs with NOAEL-based HQs less than or equal to 1 pose *de minimis* risk to individuals and populations of potential wildlife receptors.
- COPECs with a NOAEL-based HQ greater than 1, but a LOAEL-based HQ less than or equal to 1, pose no unacceptable risk to wildlife populations. However, as described in the RAWP (Arcadis 2008), unacceptable risk to individuals is uncertain because the NOAEL-based TRVs are thresholds with an interval that is an artifact of the dosing study and the nature and magnitude of the effects, if any, that may occur at exposures

between these values is unknown. In such cases, a WOE approach, including multiple LOEs, was used in reducing uncertainty for characterizing potential risk to individual potential wildlife receptors.

- COPECs with LOAEL-based HQs greater than 1 indicate unacceptable risk is possible for populations of potential wildlife receptors. However, these LOAEL-based HQs are based on individual-level effects thresholds and only account for one LOE. In such cases, a WOE approach (including an alternate target HQ of 10 for dioxin TEQ)⁵ was used to reduce uncertainty for characterizing potential risk to wildlife populations at the AOC 27 potential exposure area, as described in the above bullet.
- The NOAEL-based HQs greater than 1 are considered one LOE in assessing potential risk to sensitive species, if present in the AOC 27 potential exposure area. Potential risks to T&E species for the AOC 27 potential exposure area is presented in Section 5.1.1 of this appendix.

Ultimately, three risk outcomes are possible for wildlife based on the HQs greater than 1 and WOE: 1) unacceptable risk to individual wildlife is possible (i.e., indicated by sufficient and strong supporting LOEs); 2) unacceptable risk to individual wildlife is unlikely (i.e., indicated by sufficient and strong LOEs supporting a conclusion of no unacceptable risk); or 3) unacceptable risk to individual wildlife is uncertain (i.e., indicated by insufficient LOEs).

For this ERA, the results of individual LOE evaluations were evaluated collectively to derive an overall WOE conclusion for each potential receptor. Key uncertainties were considered along with the strength, relevance, and other qualities of the LOE in reaching the WOE conclusions.

For the AOC 27 potential exposure area, evaluations were completed for the following scenarios and are discussed in this section:

- Baseline scenario using depth-weighted EPCs
- Baseline scenario using area-weighted EPCs.

In these evaluations, risk calculations were completed for all COPECs, as presented in Tables AOC27-5.5a through AOC27-5.6b; however, risk results for only a subset of the COPECs are discussed in the evaluations using area-weighted EPCs. For plants and soil invertebrates, COPECs with HQs greater than 1 based on the depth-weighted EPC are discussed in the evaluations using area-weighted EPCs. For wildlife (i.e., mammals and birds), COPECs with NOAEL-based HQs greater than 1 based on the depth-weighted EPC and species- and site-specific site use factor (SUF) are discussed in the area-weighted EPC evaluations. At the conclusion of the baseline scenario evaluation, risk drivers were identified based on those COPECs for which unacceptable community-/population-level risk was predicted using the most refined exposure and effects assumptions (i.e., site-specific SUF, area-weighted EPCs, and selected TRVs).

⁵ For dioxin TEQ, the selected bioaccumulation factors (BAFs) and TRVs result in significant overestimation of risk for key wildlife receptors, primarily for invertivorous small mammals and insectivorous birds. Due to the compounded conservatism in the risk estimates for dioxin TEQ, HQs greater than 10 were considered to pose unacceptable risk. Alternate congener-specific BAFs and alternate TRVs demonstrating the magnitude of the risk overestimation are presented in Sections 6.4.3 and 6.5.2 of the main report, respectively. These alternate BAFs and TRVs are based on current understanding of uptake and toxicity of TEQ mixtures and represent an additional LOE considered for dioxin TEQ. As a result, a target LOAEL-based HQ of 10 for dioxin TEQ was used. Uncertainty in the risk estimates for dioxin TEQ is discussed in detail in Section 6.7.6 of the main report.

5.6.1 Risk Characterization (Baseline Scenario and Depth-Weighted EPCs)

Risk estimates for ecological communities (plants and soil invertebrates) and wildlife (mammals and birds) for the baseline scenario using depth-weighted EPCs are summarized in this section. Detailed risk calculations for plants and soil invertebrates (Table AOC27-C.1) and detailed dose and risk calculations for wildlife (Tables AOC27-C.2 through AOC27-C.5) are presented in Attachment AOC27-C. COPECs identified at the AOC 27 potential exposure area for the baseline scenario include seven metals (antimony, cadmium, hexavalent chromium, copper, lead, mercury, and zinc), VOCs (bromomethane and chloromethane), LMW PAHs, HMW PAHs, TPHs, PCBs, dioxin TEQ (for potential wildlife receptors only), and 2,3,7,8-TCDD (for ecological communities only) (Table AOC27-5.1). Potential risk to potential receptors exposed to these COPECs is described below.

5.6.1.1 Plants and Soil Invertebrates

Table AOC27-5.5a summarizes HQs estimated for soil exposure for ecological communities (plants and soil invertebrates) at the AOC 27 potential exposure area for the baseline scenario using depth-weighted EPCs. Plants can potentially be exposed to COPECs in soil up to 6 ft bgs. Plant HQs are greater than 1 for copper, lead, zinc, and HMW PAHs based on the highest EPC value from the shallow, surface, and subsurface I depth intervals. HQs for remaining COPECs are less than 1 for plants, indicating *de minimis risk* to plants from exposure to these COPECs.

Soil invertebrates can potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs). For soil invertebrates, HQs are greater than 1 for hexavalent chromium, copper, mercury, and zinc based on exposure to surface soil only. HQs for remaining COPECs are less than 1 for soil invertebrates. As mentioned earlier in Section 5.3, antimony, bromomethane, and chloromethane were not detected in surface soil; therefore, risks to soil invertebrates, which are only exposed to surface soil, were not estimated.

For hexavalent chromium, the HQ for soil invertebrates was greater than 1. The screening value for soil invertebrates is based on a limited number of studies, most of which were conducted in artificial test systems with species unlikely to be present in the AOC 27 potential exposure area. Efroymson et al. (1997) indicates that there is low confidence in these screening values and their ability to predict toxicity to soil invertebrates. In addition, the invertebrate screening value for hexavalent chromium (0.4 mg/kg) is less than the background threshold value (BTV = 0.83 mg/kg), indicating uncertainty associated with the risk estimates for this COPEC at the AOC 27 potential exposure area. Hexavalent chromium was frequently detected at the AOC 27 potential exposure area (at 10 of 16 locations in the 0- to 0.5-ft bgs depth interval). However, depth-weighted concentrations were greater than the BTV in only two locations. The depth-weighted EPC for hexavalent chromium in surface soil (1.12 mg/kg) is only slightly elevated compared with background (i.e., exceeding the BTV by approximately 1.3 times [0 to 0.5 ft bgs]) and the magnitude of the HQ is low. No locations have concentrations more than 10 times the BTV. Using the depth-weighted mean concentration for surface soil (0.408 mg/kg in 0 to 0.5 ft bgs based on the Kaplan-Meier [KM] mean) results in an HQ equal to 1. Based on the risk results and discussion above, unacceptable risk to soil invertebrate communities from exposure to hexavalent chromium is considered uncertain in this scenario.

For copper, the HQs for plants and soil invertebrates were greater than 1. Copper was detected in 100 percent of samples in the surface soil (0 to 0.5 ft bgs), shallow soil (0 to 3 ft bgs), and subsurface I soil (0 to 6 ft bgs). The depth-weighted EPC for copper from surface soil (0 to 0.5 ft bgs) was used to evaluate potential

APPENDIX AOC27

SOIL HHERA FOR AOC 27 EXPOSURE AREA

risk to plants (as it was the highest EPC) and soil invertebrates from exposure to copper in soil. The depth-weighted concentrations for copper were greater than the BTV (16.8 mg/kg) in four of the 16 surface soil locations. The depth-weighted EPC for copper in surface soil (276 mg/kg) is considered elevated compared with background (i.e., exceeding the BTV by approximately 16 times). Concentrations greater than 10 times the BTV are limited to two locations (500 mg/kg at AOC27-6 and 580 mg/kg at AOC27-7). The plant screening value (70 mg/kg) and soil invertebrate screening value (80 mg/kg) are both considered relatively robust, as they are based on ample datasets representing multiple species and are above the BTV concentration. Based on the risk results and discussion above, unacceptable risk to plants and soil invertebrates from exposure to copper is considered uncertain in this scenario.

For lead, the HQ for plants was greater than 1. Lead was detected in 100 percent of samples in the surface soil (0 to 0.5 ft bgs), shallow soil (0 to 3 ft bgs), and subsurface I soil (0 to 6 ft bgs). The depth-weighted EPC from surface soil (0 to 0.5 ft bgs), the highest EPC, was used to evaluate potential risk to plants from exposure to lead in soil. The depth-weighted concentrations for lead were greater than the BTV (8.39 mg/kg) in six of 16 of the surface soil (0 to 0.5 ft bgs) locations. Depth-weighted EPCs for lead are considered elevated compared with background (i.e., exceeding the BTV by approximately 15 times [0- to 6-ft bgs depth interval]) to 28 times [0- to 0.5-ft bgs depth interval]). However, the magnitude of the HQ is low (HQ = 2). Concentrations greater than 10 times the BTV are limited to two locations (630 mg/kg at AOC27-6 and 170 mg/kg at AOC27-7). The plant screening level (120 mg/kg) is considered robust as it is based on multiple studies representing four species and various soil exposure conditions and is greater than the BTV concentration. As mentioned in Section 1.1, above, before the construction of Interstate 40, this area was contiguous with AOC 14 – Railroad Debris Site, and miscellaneous construction debris is present in the AOC 27 potential exposure area. Based on the risk results and discussion above, unacceptable risk to plant communities from exposure to lead is considered uncertain in this scenario.

For mercury, the HQ for soil invertebrates was greater than 1. Mercury was detected in only four of 16 locations in surface soil (FOD = 25% in 0- to 0.5-ft bgs depth interval) and at concentrations close to the reporting limit (0.5 mg/kg). Mercury was not detected in the background dataset; therefore, a BTV could not be developed for comparison. The screening value for soil invertebrates (0.1 mg/kg) is based on a limited number of studies and different forms of mercury. Based on the two studies available, which use different systems and earthworm species, it was not possible to evaluate the relative toxicity of forms of mercury. Efroymson et al. (1997) indicates that there is low confidence in the screening value and its ability to predict toxicity to soil invertebrates. The magnitude of the HQ is low. Using the depth-weighted mean concentration for surface soil (0.105 mg/kg in 0 to 0.5 ft bgs based on the KM mean) results in an HQ equal to 1. Based on the risk results and uncertainty discussed above, unacceptable risk to soil invertebrate communities from exposure to mercury is considered unlikely.

For zinc, the HQs for plants and soil invertebrates were greater than 1. Zinc was detected in 100 percent of samples in the surface soil (0 to 0.5 ft bgs), shallow soil (0 to 3 ft bgs), and subsurface I soil (0 to 6 ft bgs). The depth-weighted EPC from surface soil (0 to 0.5 ft bgs) was used to evaluate potential risk to plants (highest EPC) and soil invertebrates from exposure to zinc in soil. The depth-weighted concentrations for zinc were greater than the BTV (58 mg/kg) in five of 16 of the surface soil (0 to 0.5 ft bgs) locations. Depth-weighted EPCs for zinc are considered elevated compared with background (i.e., exceeding the BTV by approximately six times [0 to 6 ft bgs]) to nine times [0 to 0.5 ft bgs]); however, concentrations greater than 10 times the BTV are limited to two locations (1,200 mg/kg at AOC27-51 and 700 mg/kg at AOC27-6). The plant screening level (160 mg/kg) and soil invertebrate screening level (120 mg/kg) are based on multiple studies

APPENDIX AOC27

SOIL HHERA FOR AOC 27 EXPOSURE AREA

and test species representing various soil exposure conditions (USEPA 2007c). The screening values are also greater than the BTV. Therefore, there is confidence in the ability of the screening levels to predict risk to plant and soil invertebrate communities. Based on the risk results and discussion above, unacceptable risk to plant and soil invertebrate communities from exposure to zinc is considered uncertain in this scenario.

For HMW PAHs, the HQ for plants was greater than 1. HMW PAHs were detected in most of the locations in surface soil (88% in the 0- to 0.5-ft bgs depth interval), shallow soil (95% in the 0- to 3-ft bgs depth interval), and subsurface I soil (95% in the 0- to 6-ft bgs depth interval). The depth-weighted EPC from surface soil (22.3 mg/kg) was used to evaluate potential risk to plants (highest EPC) and soil invertebrates from exposure to HMW PAHs in soil, but EPCs were lower (approximately 50%) at deeper intervals. Depth-weighted concentrations for HMW PAHs were greater than the BTV (0.0376 mg/kg) in 10 of 16 of the surface soil (0 to 0.5 ft bgs) locations. Depth-weighted EPCs for HMW PAHs are considered elevated compared with background (i.e., exceeding the BTV by approximately 230 times [0 to 6 ft bgs] to 600 times [0 to 0.5 ft bgs]). The elevated concentrations of HMW PAHs driving risk are localized in surface and shallow soil in the eastern edge of the road cut on the road from the AOC 27 potential exposure area to BCW where potential burn waste was identified. Depth-weighted concentrations more than 10 times the BTV are limited to four locations (31.5 mg/kg at AOC27-6, 4.04 mg/kg at AOC27-50, 3.78 mg/kg at AOC27-51, and 3.39 mg/kg at AOC27-7).

The screening level (1.2 mg/kg) cited in USEPA (1999) for benzo(a)pyrene and benzo(b)fluoranthene is based on a reported chronic no-effects concentration (Sims and Overcash 1983). Reduced stem growth was observed in summer wheat at 6.254 mg/kg, but no effects were seen on rye plants at this concentration. The plant toxicity data cited in Sims and Overcash (1983) were not included in the plant EcoSSL; no sufficient studies were identified by USEPA to calculate a plant EcoSSL for HMW PAHs (USEPA 2007a). As such, there is low confidence in the selected plant screening value to predict toxicity to plants exposure to mixtures of HMW PAHs at the site. The authors also note that the most important source of PAHs for plants is the atmosphere where they enter via the gaseous phase or deposit bound to particles on the plant surface (Sims and Overcash 1983; USEPA 2007a). Thus, the relevance of the soil potential exposure pathway for plants at the AOC 27 potential exposure area is uncertain. The assumption that plants are significantly exposed to PAHs in soil is conservative. Based on the risk results and discussion above, unacceptable risk to plant communities from exposure to HMW PAHs is considered uncertain in this scenario.

For TPH mixtures, individual constituents were used to characterize potential risks to plants and invertebrates. BTEX were not detected in any samples (Attachment AOC27-A1) and HQs for PAHs for soil invertebrates were equal to 1, indicating no unacceptable risk for soil invertebrates from TPHs. For plants, the LMW PAH HQ was less than 1, but the HQ for plants exposed to HMW PAHs was greater than 1. As discussed above for HMW PAHs, unacceptable risk to plants is uncertain for PAHs. Elevated concentrations of TPHs and PAHs are likely associated with the burn waste activities in the AOC 27 potential exposure area (in the eastern edge of the road cut on the road from the AOC 27 potential exposure area to BCW). Therefore, unacceptable risk is not expected for communities of soil invertebrates, but unacceptable risk to plants from exposure to TPHs at the AOC 27 potential exposure area is uncertain.

To summarize, based on the risk results and WOE, potential risk to plants from exposure to copper, lead, zinc, HMW PAHs, and TPHs is uncertain. Unacceptable risk to soil invertebrate communities from exposure to mercury and TPHs is considered unlikely, and risk from hexavalent chromium and copper is uncertain. *De minimis* risk to plant and invertebrate communities is expected from remaining inorganic COPECs (antimony and cadmium) and organic COPECs (PCBs, dioxins, and VOCs). Based on the risk estimates and potential

uncertainties associated with the baseline risk using depth-weighted EPCs, copper, lead, zinc, and HMW PAH for plants; and hexavalent chromium, copper, mercury, and zinc for soil invertebrates were further evaluated using area-weighted EPCs, as discussed below in Section 5.6.2.

5.6.1.2 Small Mammals

For the AOC 27 potential exposure area, baseline risks were estimated for small mammals using depth-weighted EPCs for the following evaluations and are discussed in this section:

- Using the selected TRVs and a SUF equal to 1
- Using the BTAG TRVs and a SUF equal to 1
- Using the selected TRVs and a species- and site-specific SUF
- Using the BTAG TRVs and a species- and site-specific SUF.

5.6.1.2.1 Risks Evaluated Using a SUF Equal to 1

Risks Evaluated Using the Selected TRVs

Table AOC27-5.5a summarizes HQs estimated for small mammals at the AOC 27 potential exposure area using the selected TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below. TRVs are not available for TPHs; however, risks to these potential receptors are characterized below based on indicator chemicals as described previously.

- **Merriam's kangaroo rat (granivorous small mammal)** – This potential receptor could potentially be exposed to COPECs in subsurface I soil (0 to 6 ft bgs) directly and through its diet. The NOAEL- and LOAEL-based HQs in soil are less than 1 for all individual COPECs, indicating no unacceptable risk to individuals and populations of granivorous small mammals.
 - For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples and the NOAEL- and LOAEL-based HQs for PAHs are less than 1, indicating that no unacceptable risk to granivorous small mammals from exposure to TPHs is expected.
- **Desert shrew (invertivorous small mammal)** – This potential receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. HQs for this potential receptor are less than 1 for COPECs except for cadmium, copper, lead, zinc, HMW PAHs, and dioxin TEQ. The potential risks from COPECs with HQs greater than 1 are characterized below:
 - For cadmium, the NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of invertivorous mammals; however, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ. Cadmium was detected in only three of 16 locations in surface soil (FOD = 19% in 0 to 0.5 ft bgs) and the EPC was based on the maximum detected concentration (2.3 mg/kg). Each of the three depth-weighted concentrations (range from 1.5 to 2.3 mg/kg) exceed the BTV (1.1 mg/kg). However, the mean concentration in surface soil (0.75 mg/kg in 0 to 0.5 ft bgs, based on the KM mean) is less than the BTV and would reduce the NOAEL-based HQ by half. For areas where a constituent is largely not detected, use of a maximum

concentration as the EPC may not appropriately characterize risk. For copper, the NOAEL- and LOAEL-based HQs are greater than 1, indicating potential unacceptable risk for individuals and populations of invertivorous small mammals exposed to copper in soil based on the HQ. Copper was frequently detected in surface soil (FOD = 100% in 0 to 0.5 ft bgs) with four of the surface soil locations having depth-weighted concentrations exceeding the BTV (16.8 mg/kg). Concentrations greater than 10 times the BTV are limited to two locations (500 mg/kg at AOC27-6 and 580 mg/kg at AOC27-7). There is moderate confidence in the TRVs. Although the NOAEL-based TRV is the EcoSSL (USEPA 2007b), it is based on the highest bounded NOAEL (5.6 mg/kg-bw/day) below the lowest bounded LOAEL and is based on toxicity data from a study with pigs. The geometric mean of growth and reproduction NOAELs is 25 mg/kg-bw/day. Unacceptable risk to the shrew from exposure to copper is considered uncertain in this scenario.

- For lead, the NOAEL- and LOAEL-based HQs are greater than 1, indicating potential unacceptable risk for individuals and populations of invertivorous small mammals exposed to lead in soil. Lead was frequently detected in surface soil (FOD = 100% in 0 to 0.5 ft bgs) with six of the surface soil locations having depth-weighted concentrations exceeding the BTV (8.39 mg/kg). Concentrations greater than 10 times the BTV are limited to two locations (630 mg/kg at AOC27-6 and 170 mg/kg at AOC27-7). There is low confidence in the TRVs. Although the NOAEL-based TRV is the EcoSSL (USEPA 2005b), it is based on the highest bounded NOAEL (4.7 mg/kg-bw/day) below the lowest bounded LOAEL and is based on a study showing reduced growth in rats exposed to lead acetate in drinking water. The geometric mean of growth and reproduction NOAELs is 40.7 mg/kg-bw/day. Unacceptable risk to the shrew from exposure to lead is considered uncertain in this scenario.
- For zinc, the NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of invertivorous mammals; however, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ. The NOAEL-based HQ for zinc is low. Zinc was frequently detected in surface soil (FOD = 100% in 0 to 0.5 ft bgs) with five of the 16 surface soil locations having depth-weighted concentrations exceeding the BTV (58 mg/kg). Concentrations greater than 10 times the BTV are limited to two locations (1,200 mg/kg at AOC27-51 and 700 mg/kg at AOC27-6). The TRVs are considered robust, as the NOAEL-based TRV is the EcoSSL (USEPA 2007c) and is based on the geometric mean of growth and reproduction NOAELs from a dataset representing multiple species. Unacceptable risk to the shrew from exposure to lead is considered uncertain in this scenario.
- For HMW PAHs, the NOAEL- and LOAEL-based HQs are greater than 1, indicating potential unacceptable risk for individuals and populations of invertivorous small mammals exposed to HMW PAHs in soil based on the HQ. HMW PAHs were frequently detected in surface soil (FOD = 88% in 0 to 0.5 ft bgs) with 10 of the 16 locations having depth-weighted concentrations exceeding the BTV (0.0376 mg/kg). The elevated concentrations of HMW PAHs driving risk are localized in surface and shallow soil likely associated with the burn waste activities in the AOC 27 potential exposure area (in the eastern edge of the road cut on the road from the AOC 27 potential exposure area to BCW). HMW PAH concentrations more than 10 times the BTV are limited to four locations (31.5 mg/kg at AOC27-6, 4.04 mg/kg at AOC27-50, 3.78 mg/kg at AOC27-51, and 3.39 mg/kg at AOC27-7).

There is a wide range of toxicity information available for PAHs. For the selected TRVs for HMW PAHs, there is moderate confidence in ability to predict toxicity to small mammals. While the selected TRVs are

based on EcoSSL data from multiple studies representing at least three small mammal species and five individual HMW PAHs (USEPA 2007a), the data were derived for individual PAHs (not mixtures) and the geometric mean NOAEL-based TRV is nearly 20 times greater than the selected NOAEL-based TRV value. For HMW PAHs, the NOAEL-based BTAG TRV (1.31 mg/kg-bw/day) is twice the EcoSSL-based TRV (0.65 mg/kg-bw/day).

In a toxicity study conducted by MacKenzie and Angevine (1981), where mice were administered oral doses of benzo(a)pyrene during 7 to 16 days of gestation, the chronic LOAEL was calculated as 10 mg/kg-bw/day based on reduced pregnancy rates and decreased percentage of viable mice litter. Using an uncertainty factor of 10 would result in a NOAEL of 1 mg/kg-bw/day. There is limited information available on the bioaccumulation potential of PAHs in terrestrial ecosystems. Vertebrates possess efficient metabolic and excretion mechanisms and studies have shown that PAHs do not accumulate in tissues (USEPA 2007a). Based on the variability of the toxicity information, unacceptable risk to the shrew from exposure to HMW PAH is considered to be uncertain.

- For dioxin TEQ for mammals, the NOAEL- and LOAEL-based HQs are greater than 1, indicating unacceptable risk for individuals and populations of invertivorous small mammals exposed to dioxins in soil based on the HQ. As described in Section 6.7.6 of the main report, the mammalian TRVs and uptake factors selected for dioxins at this site likely overestimate exposure and risk for this COPEC. Conservative assumptions were used to estimate the HQs, including use of BAFs based on uptake of a single congener (2,3,7,8-TCDD) to earthworms, and a diet assumed to consist entirely of earthworms. As a result, the HQs are considered to be overestimated. Confidence in the ability of the mammalian dioxin TEQ TRV to predict risk is moderate. Dioxin TEQ was detected at all nine locations in surface soil (FOD = 100% in 0 to 0.5 ft bgs), with seven of the surface soil locations having depth-weighted concentrations above the BTV (5.58 nanograms per kilogram [ng/kg]). Similar to HMW PAHs, the elevated concentrations of dioxin TEQ driving risk are localized in surface and shallow soil likely associated with the burn waste activities in the AOC 27 potential exposure area (in the eastern edge of the road cut on the road from the AOC 27 potential exposure area to BCW). Concentrations greater than 10 times the BTV are limited to two locations (120 ng/kg at AOC27-6 and 110 ng/kg at AOC27-7). Unacceptable risks to the shrew from exposure to dioxins is considered uncertain in this scenario.
- For TPH mixtures, individual constituents were used to characterize potential risks for invertivorous small mammals. BTEX were not detected in any samples (Attachment AOC27-A1) and HQs for LMW PAHs are less than 1. The NOAEL- and LOAEL-based HQs for HMW PAHs are greater than 1, indicating that unacceptable risk is possible for individuals and populations of invertivorous small mammals. Elevated concentrations of TPHs are likely associated with the burn waste activities in the AOC 27 potential exposure area (in the eastern edge of the road cut on the road from the AOC 27 potential exposure area to BCW). However, as discussed above for the desert shrew, unacceptable risk from HMW PAH concentrations is uncertain, and unacceptable risk from TPHs is also considered to be uncertain.
- The NOAEL- and LOAEL-based HQs for remaining COPECs in soil are less than 1, indicating *de minimis* risk to individuals and populations of invertivorous small mammals for the remaining COPECs.

Based on the risk estimates and potential uncertainties associated with the baseline risk from cadmium, copper, lead, zinc, HMW PAHs, and dioxin TEQ for mammals, these COPECs were further evaluated using site-specific SUFs and area-weighted EPCs, as discussed below and in Section 5.6.2.

Risks Evaluated Using the BTAG TRVs

Table AOC27-5.5a also summarizes HQs estimated for small mammals at the AOC 27 potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Merriam's kangaroo rat (granivorous small mammal)** – The NOAEL- and LOAEL-based HQs in soil are less than 1 for all COPECs, indicating no unacceptable risk to individuals and populations of granivorous small mammals.
- **Desert shrew (invertivorous small mammal)** – The NOAEL-based HQs for cadmium, copper, lead, zinc, and HMW PAHs are greater than 1 and the LOAEL-based HQs are less than 1 for these COPECs, indicating no unacceptable risk to populations of invertivorous mammals; however, unacceptable risk to individual potential receptors is uncertain for these COPECs based on the HQ. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. The NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs indicating no unacceptable risk to individuals and populations of invertivorous small mammals from the remaining COPECs.

The table below summarizes all HQ estimates for mammals for COPECs where at least one NOAEL-based HQ value (using the selected TRV or BTAG TRV) is greater than 1.

Hazard Quotient Summary for Small Mammals (SUF = 1)								
COPEC	Merriam's Kangaroo Rat				Desert Shrew			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Cadmium	1E-01	1E-02	1E+00	3E-02	4E+00	4E-01	5E+01	1E+00
Copper	2E-01	1E-01	8E-01	3E-03	3E+00	2E+00	1E+01	5E-02
Lead	2E-01	1E-01	9E-01	4E-03	3E+00	2E+00	1E+01	6E-02
Zinc	2E-01	5E-02	1E+00	3E-02	2E+00	5E-01	1E+01	3E-01
HMW PAHs	5E-01	1E-01	2E-01	1E-02	2E+01	4E+00	9E+00	4E-01
TEQ Mammals	3E-01	3E-02	--	--	1E+02	1E+01	--	--

Notes:

Bold indicates HQs > 1.

-- = HQ not estimated because TRVs are unavailable.

5.6.1.2.2 Risks Evaluated Using a Site-Specific SUF

Table AOC27-5.5b presents HQs calculated using the selected TRVs and BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Based on the AOC 27 potential exposure area and home ranges for Merriam's kangaroo rat and desert shrew, the site-specific SUF was estimated as 1 for these potential receptors (i.e., their home range is less than or equal to the size of the exposure area). Therefore, the risk results using selected TRVs and BTAG TRVs for this scenario are the same as discussed above for the generic SUF of 1.

5.6.1.2.3 Baseline Risk Summary for Small Mammals Using Depth-Weighted EPCs

To summarize, based on the risks characterized for small mammals exposed to COPECs in soil at the AOC 27 potential exposure area using selected TRVs⁶, depth-weighted EPCs, and a species- and site-specific SUF (SUF equal to 1), the risk conclusions are as follows:

- **For Merriam's kangaroo rat (granivorous small mammal)**, the NOAEL-based and LOAEL-based HQs are less than 1, indicating no unacceptable risk to individuals and populations of granivorous small mammals for all COPECs.
- **For desert shrew (invertivorous small mammal)**, the LOAEL-based HQs are less than 1 for all COPECs except copper, lead, HMW PAHs, and dioxin TEQ indicating potential unacceptable risk to invertivorous small mammal populations at the AOC 27 potential exposure area from these COPECs; however, the LOEs indicate potential risks are uncertain in this scenario. Additional COPECs indicative of uncertain risks (i.e., where the NOAEL-based HQs are greater than 1 but the LOAEL-based HQs are less than 1) included cadmium and zinc. For the remaining COPECs at the AOC 27 potential exposure area, the NOAEL- and LOAEL-based HQs are less than 1 indicating no unacceptable risk to individuals and populations of invertivorous small mammals.

Based on the risk estimates and potential uncertainties associated with the baseline risk to invertivorous small mammals from cadmium, copper, lead, zinc, HMW PAHs, and dioxin TEQ, these COPECs were further evaluated using area-weighted EPCs, as discussed below in Section 5.6.2.

5.6.1.3 Birds

For the AOC 27 potential exposure area, baseline risks were estimated for birds using depth-weighted EPCs for the following evaluations and are discussed in this section:

- Using the selected TRVs and SUF equal to 1
- Using the BTAG TRVs and a SUF equal to 1
- Using the selected TRVs and a species- and site-specific SUF
- Using the BTAG TRVs and a species- and site-specific SUF.

5.6.1.3.1 Risks Evaluated Using a SUF Equal to 1

Risks Evaluated Using the Selected TRVs

Table AOC27-5.5a summarizes HQs estimated for birds at the AOC 27 potential exposure area using the selected TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below. TRVs are not available for TPHs; however, risks to these potential receptors are characterized below based on indicator chemicals as described previously.

⁶ Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

- **Gambel's quail (granivorous bird)** – This potential receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and to deeper soil (0 to 6 ft bgs) through its diet. The NOAEL- and LOAEL-based HQs in soil are less than 1 for all individual COPECs, indicating *de minimis* risk to individuals and populations of granivorous birds.
 - For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples and the NOAEL- and LOAEL-based HQs for PAHs are less than 1, indicating that no unacceptable risk to granivorous birds from exposure to TPHs is expected.
- **Cactus wren (insectivorous bird)** – This potential receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. HQs for this potential receptor are less than 1 for most COPECs except for cadmium, copper, lead, mercury, zinc, and dioxin TEQ. The potential risks from COPECs with HQs greater than 1 are characterized below.
 - For cadmium, the NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of insectivorous birds; however, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ. Cadmium was detected in only three of 16 locations in surface soil (FOD = 19% in the 0- to 0.5-ft bgs depth interval) and the EPC was based on the maximum detected concentration (2.3 mg/kg), which is slightly greater than the BTV (1.1 mg/kg). The magnitude of the HQ is low; and the mean in surface soil (0.75 mg/kg for the 0- to 0.5-ft bgs depth interval, based on the KM mean) is less than the BTV and would reduce the NOAEL-based HQ to less than 1. For areas where a constituent is largely not detected, use of a maximum concentration as the EPC may not appropriately characterize risk. All sample locations have concentrations less than 10 times the BTV. The TRVs are considered robust, as the NOAEL-based TRV is the EcoSSL (USEPA 2005a) and is based on the geometric mean of growth and reproduction NOAELs from a dataset representing multiple species. In this scenario, unacceptable risk to the individual cactus wren is considered unlikely.
 - For copper, the NOAEL- and LOAEL-based HQs are greater than 1, indicating unacceptable risk is possible for individuals and populations of insectivorous birds exposed to copper in soil based on the HQ. Copper was frequently detected in surface soil (FOD = 100% in the 0- to 0.5-ft bgs depth interval) with four of the locations having depth-weighted concentrations exceeding the BTV (16.8 mg/kg). Concentrations greater than 10 times the BTV are limited to two locations (500 mg/kg at AOC27-6 and 580 mg/kg at AOC27-7). There is moderate confidence in the TRVs. Although the NOAEL-based TRV is the EcoSSL (USEPA 2007b), it is based on the highest bounded NOAEL (4.05 mg/kg-bw/day) below the lowest bounded LOAEL and is based on reproductive effects in chickens. The geometric mean of growth and reproduction NOAELs is 18.5 mg/kg-bw/day. In this scenario, unacceptable risk to cactus wren is considered uncertain.
 - For lead, the NOAEL- and LOAEL-based HQs are greater than 1, indicating unacceptable risk is possible for individuals and populations of insectivorous birds exposed to lead in soil based on the HQ. Lead was frequently detected in surface soil (FOD = 100% in the 0- to 0.5-ft bgs depth interval) with six of the 16 locations having depth-weighted concentrations exceeding the BTV (8.39 mg/kg). Concentrations greater than 10 times the BTV are limited to two locations (630 mg/kg at AOC27-6 and 170 mg/kg at AOC27-7). There is moderate confidence in the TRVs. Although the NOAEL-based TRV is the EcoSSL (USEPA 2005b), it is based on the highest bounded NOAEL (1.63 mg/kg-bw/day) below the lowest bounded LOAEL and is based on reproductive effects in chickens. The geometric mean of

growth and reproduction NOAELs is 10.9 mg/kg-bw/day. In this scenario, unacceptable risk to cactus wren is considered uncertain.

- For mercury, the NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of insectivorous birds; however, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ. Mercury was infrequently detected (four out of 16 locations in surface soil; FOD = 25% in the 0- to 0.5-ft bgs depth interval) and the magnitude of the HQ is low. Detected concentrations ranged from 0.12 to 0.51 mg/kg. Mercury was not detected in the background dataset, and a BTV could not be estimated. Reporting limits (0.0495 to 0.07 mg/kg) for this metal also result in NOAEL-based HQs greater than 1, indicating uncertainty in the TRVs, which are based on methylmercury, as derived by DTSC (2009).
- For zinc, the NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of insectivorous birds; however, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ. Zinc was frequently detected in surface soil (FOD = 100% in the 0 to 0.5 ft bgs interval) with five of the 16 locations having depth-weighted concentrations exceeding the BTV (58 mg/kg). Concentrations greater than 10 times the BTV are limited to two locations (1,200 mg/kg at AOC27-51 and 700 mg/kg at AOC27-6). The TRVs are considered robust, as the NOAEL-based TRV is the EcoSSL (USEPA 2007c) and is based on the geometric mean of growth and reproduction NOAELs from a dataset representing multiple species. The magnitude of the HQ is low. In this scenario, unacceptable risk to individual cactus wren is considered unlikely.
- For dioxin TEQ for birds, the NOAEL-HQ is greater than 1 and the LOAEL-based HQ is equal to 1, indicating no unacceptable risk to populations of insectivorous birds; however, unacceptable risk to individual potential receptors is uncertain for dioxin TEQ in soil based on the HQ. Dioxin TEQ was frequently detected in surface soil (FOD = 100% in the 0- to 0.5-ft bgs depth interval) with seven of the locations having depth-weighted concentrations exceeding the BTV (5.98 ng/kg). Concentrations greater than 10 times the BTV are limited to two locations (120 ng/kg at AOC27-6 and 110 ng/kg at AOC27-7). There is uncertainty associated with the conservative avian TRVs and uptake factors selected for dioxins at this site. As described in Section 6.7.6 of the main report, avian TRVs and uptake factors selected for dioxins at this site likely overestimate exposure and risk for this COPEC. As discussed above for small mammals, elevated concentrations are limited in spatial extent and the HQs are low in magnitude. Additionally, T&E birds have not been observed in this area. Unacceptable risk to the individual cactus wren is considered unlikely in this scenario.
- For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples. The LOAEL-based HQs for PAHs are less than 1, and the NOAEL-based HQs for PAHs is equal to 1, indicating that no unacceptable risk to insectivorous birds from exposure to TPHs is expected.
- The NOAEL- and LOAEL-based HQs for all other COPECs in soil are less than 1 indicating *de minimis* risk to individuals and populations of insectivorous birds.

Based on the risk estimates for birds and potential uncertainties associated with the baseline risk from cadmium, copper, lead, mercury, zinc, and dioxin TEQ, these COPECs were further evaluated using site- and species-specific SUFs as discussed below.

Risks Evaluated Using the BTAG TRVs

Table AOC27-5.5a also summarizes HQs estimated for birds at the AOC 27 potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Gambel's quail (granivorous bird)** – The NOAEL-based HQ for lead is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of granivorous birds; however, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ. The risks from lead are likely overestimated due to the conservative avian TRV. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. The NOAEL- and LOAEL-based HQs for other COPECs in soil are less than 1, indicating no unacceptable risk to individuals and populations of granivorous birds for the remaining COPECs.
- **Cactus wren (insectivorous bird)** – The NOAEL-based HQs for cadmium, copper, mercury, and zinc are greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of insectivorous birds; however, unacceptable risk to individual potential receptors is uncertain for these COPECs based on the HQ. The NOAEL- and LOAEL-based HQs for lead are greater than 1, indicating unacceptable risk is possible for individuals and populations of insectivorous birds exposed to lead in soil. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. The NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs, indicating no unacceptable risk to individuals and populations of insectivorous birds from these COPECs.

The table below summarizes all HQ estimates for birds for COPECs where at least one NOAEL-based HQ value (using the selected TRV or BTAG TRV) is greater than 1.

Hazard Quotient Summary for Birds (SUF = 1)								
COPEC	Gambel's Quail				Cactus Wren			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Cadmium	3E-02	7E-03	7E-02	4E-03	2E+00	5E-01	4E+00	3E-01
Copper	4E-01	1E-01	8E-01	3E-02	8E+00	3E+00	1E+01	6E-01
Lead	7E-01	4E-01	8E+01	1E-01	1E+01	5E+00	1E+03	2E+00
Mercury	2E-01	3E-02	2E-01	3E-02	2E+00	5E-01	2E+00	5E-01
Zinc	1E-01	5E-02	5E-01	5E-02	2E+00	8E-01	8E+00	8E-01
TEQ Avian	4E-02	4E-03	--	--	1E+01	1E+00	--	--

Notes:

Bold indicates HQs > 1.

-- = HQ not estimated because TRVs are unavailable.

5.6.1.3.2 Risks Evaluated Using a Site-Specific SUF

Risks Evaluated Using the Selected TRVs

Table AOC27-5.5b presents HQs calculated using the selected TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Gambel's quail (granivorous bird)** – The site-specific SUF for this receptor is 0.1, which further reduced the NOAEL- and LOAEL-based HQs to less than 1 for all COPECs. No unacceptable risk (*de minimis* risk) to individuals and populations of granivorous birds is expected when accounting for site use at the AOC 27 potential exposure area.
- **Cactus wren (insectivorous bird)** – The site-specific SUF for this receptor is 0.8, which reduced the NOAEL- and LOAEL- based HQs slightly compared to the evaluation using a SUF of 1; however, the same COPECs had NOAEL- and/or LOAEL-based HQs greater than 1 (including cadmium, copper, lead, mercury, zinc, and dioxin TEQ) and the supporting LOEs are the same as described above in the SUF = 1 evaluation. The NOAEL- and LOAEL-based HQs for all other COPECs in soil are less than 1, indicating no unacceptable risk to individuals and populations of insectivorous birds.

Based on the risk estimates and potential uncertainties associated with the baseline risk from cadmium, copper, lead, mercury, zinc, and dioxin TEQ for insectivorous birds, these COPECs were further evaluated using area-weighted EPCs, as discussed below in Section 5.6.2.

Risks Evaluated Using the BTAG TRVs

Table AOC27-5.5b also summarizes HQs estimated for birds at AOC27 using the BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Gambel's quail (granivorous bird)** – The site-specific SUF for this potential receptor is 0.1, which reduced the HQs for lead. The NOAEL-based HQ for lead is still greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of granivorous birds; however, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ. The risks from lead are likely overestimated due to the conservative avian BTAG TRV. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. The NOAEL- and LOAEL-based HQs for other COPECs in soil are less than 1, indicating no unacceptable risk to individuals and populations of granivorous birds for the remaining COPECs.
- **Cactus wren (insectivorous bird)** – The site-specific SUF for this potential receptor is 0.8. Although the magnitude of the NOAEL-based HQs was reduced for cadmium, copper, lead, mercury, and zinc in this evaluation, they are still greater than 1. The LOAEL-based HQ for lead was reduced to 1. The LOAEL-based HQs are less than or equal to 1 for all remaining COPECs, indicating no unacceptable risk to populations of insectivorous birds; however, unacceptable risk to individual potential receptors is uncertain for these COPECs based on the HQ. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. The NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs indicating no unacceptable risk to individuals and populations of insectivorous birds from these COPECs.

For the COPECs with NOAEL-based HQs greater than 1 using a site-specific and species-specific SUF (using the selected TRV or BTAG TRV), the table below summarizes HQ estimates using the species- and site-specific SUF for birds.

APPENDIX AOC27
SOIL HHERA FOR AOC 27 EXPOSURE AREA

Hazard Quotient Summary for Birds (site-specific SUF)								
COPEC	Gambel's Quail (SUF = 0.1)				Cactus Wren (SUF = 0.8)			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs

Notes:

Bold indicates HQs > 1.

-- = HQ not estimated because TRVs are unavailable.

5.6.1.3.3 Baseline Risk Summary for Birds Using Depth-Weighted EPCs

To summarize, based on the risks characterized for populations of birds exposed to COPECs in soil at the AOC 27 potential exposure area using selected TRVs⁷, depth-weighted EPCs, and a site-specific SUF, the risk conclusions are as follows:

- **For Gambel's quail (granivorous bird)**, the NOAEL- and LOAEL-based HQs for all COPECs are less than 1, indicating no unacceptable risk to individuals and populations of granivorous birds for all COPECs.
- **For the cactus wren (insectivorous bird)**, the LOAEL-based HQs are less than 1 for all COPECs, except for copper and lead. For these COPECs, potential unacceptable risk to insectivorous bird populations at the AOC 27 potential exposure area is possible because of the following LOEs: 1) frequently detected; and 2) at concentrations frequently above the BTV. COPECs indicative of uncertain risks (i.e., where the NOAEL-based HQs are greater than 1 but the LOAEL-based HQs are less than 1) included cadmium, mercury, zinc, and dioxin TEQ. For the remaining COPECs at the AOC 27 potential exposure area, the NOAEL- and LOAEL-based HQs are less than 1, indicating no unacceptable risk to individuals and populations of insectivorous birds.

Based on the baseline risk results for insectivorous birds, and potential uncertainties associated with exposures to cadmium, copper, lead, mercury, zinc, and dioxin TEQ at the AOC 27 potential exposure area, these COPECs were further evaluated using area-weighted EPCs, as discussed below in Section 5.6.2.

⁷ Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

5.6.2 Risk Characterization (Baseline Scenario and Area-Weighted EPCs)

Based on the risk characterization of COPECs in the baseline scenario using depth-weighted EPCs (Section 5.6.1, above), risks were characterized for all COPECs using area-weighted EPCs. For those COPECs identified for further evaluation in the depth-weighted evaluation, the results of the area-weighted risk characterization are presented below. These included:

- Copper, lead, zinc, HMW PAHs, and TPHs for plants
- Hexavalent chromium, copper, mercury, and zinc for soil invertebrates
- Cadmium, copper, lead, zinc, HMW PAHs, and dioxin TEQ for invertivorous small mammals
- Cadmium, copper, lead, mercury, zinc, and dioxin TEQ for insectivorous birds only.

Potential risks to potential receptors from the COPECs listed above were characterized for the baseline scenario using area-weighted EPCs as discussed in this section. Detailed risk calculations for plants and soil invertebrates (Table AOC27-C.6) and detailed dose and risk calculations for wildlife for all COPECs (Tables AOC27-C.7 through AOC27-C.10) are presented in Attachment AOC27-C.

5.6.2.1 Plants and Soil Invertebrates

Table AOC27-5.6a summarizes HQs estimated for soil exposure for ecological communities (plants and soil invertebrates) at the AOC 27 potential exposure area for the baseline scenario using area-weighted EPCs for all COPECs; however, only the COPECs identified above in Section 5.6.1.1 for further evaluation using area-weighted EPCs are discussed here.

Plants can potentially be exposed to COPECs in soil up to 6 ft bgs. HQs were based on the highest EPC from the surface, shallow, and subsurface I depth intervals. For plants, the magnitude of HQs for lead and zinc was reduced in this area-weighted evaluation and are equal to 1; therefore, unacceptable risk to plant communities is not expected for lead and zinc.

For copper, the magnitude of the HQ was reduced, but is still greater than 1. As discussed above in Section 5.6.1.1, copper was frequently detected at the AOC 27 potential exposure area and at concentrations (area-weighted EPC = 113 mg/kg in the 0- to 0.5-ft bgs depth interval) above the BTV (16.8 mg/kg). Although the HQ is low, there is confidence in the plant screening value for predicting of toxicity to plants. Based on the risk results and discussion above, unacceptable risk to plants from exposure to copper is considered unlikely.

For HMW PAHs (and TPHs), the HQ is reduced using area-weighted EPCs, but is still greater than 1. The uncertainty associated with concentrations of HMW PAHs is discussed in Section 6.7.2.1.2 of the main report and summarized above in Section 5.6.1. The HQ is low and driven by a few samples collected from the burn waste area of the AOC 27 potential exposure area. There is low confidence in the screening value for plants and its ability to predict risk to plant communities. The elevated concentrations of HMW PAHs are localized in a small area within the AOC 27 potential exposure area and in surface and shallow soil. Based on the risk results and discussion above, unacceptable risk to plant communities from exposure to HMW PAHs is unlikely.

Soil invertebrates can potentially be exposed only to COPECs in surface soil (0 to 0.5 ft bgs). For soil invertebrates, the magnitude of HQs for hexavalent chromium, copper, and mercury were reduced in this evaluation and are equal to 1; therefore, unacceptable risk to soil invertebrate communities is not expected for

these COPECs. For zinc, the magnitude of the HQ was reduced by more than half, but is still greater than 1. As discussed above in Section 5.6.1.1., zinc was frequently detected at the AOC 27 potential exposure area. Concentrations of zinc (area-weighted EPC is 194 mg/kg) are above the BTV (58 mg/kg) in five of 16 of the surface soil (0 to 0.5 ft bgs) locations. There is confidence in the screening level for predicting risk to soil invertebrates, as it is based on multiple studies representing multiple species and soil conditions. Based on the risk results and discussion above, unacceptable risk to soil invertebrates from exposure to zinc is considered unlikely.

Vegetation communities observed at the site during the floristic surveys conducted in 2013 (Garcia and Associates, Inc. [GANDA] and CH2M 2013) and in 2017 (CH2M 2017b) is typical of Mojave Desert plant communities (summarized in Section 2.4.2 of the main report). More than a hundred different vascular plant species have been observed within the survey area that includes the AOC 27 potential exposure area; documented as Segment H in these survey reports (GANDA and CH2M 2013; CH2M 2017b). The floristic surveys report a diverse assemblage of plants species found in typical abundance, density, cover, and vigor of plant communities in undisturbed desert habitat. These observations are not consistent with impairment of the plant community at the site. The floristic surveys provide site-specific observations that support the health of plant communities at the site and is considered a stronger LOE than the exceedances of low-confidence generic plant screening values, which are widely acknowledged to have low ability to predict toxicity in plants.

Risk Summary and Risk Drivers for Ecological Communities

No risk drivers were identified for unacceptable ecological community-level risk predicted using the most refined exposure and effects assumptions (i.e., area-weighted EPCs) and additional LOEs supporting the conclusion of unacceptable risk. For plants, no risk-driving COPECs were identified at the AOC 27 potential exposure area for the baseline scenario using area-weighted EPCs based on an HQ greater than 1 and additional LOEs supporting the conclusion of potential unacceptable risk. For soil invertebrates, no risk-driving COPECs were identified at the AOC 27 potential exposure area for the baseline scenario using area-weighted EPCs based on an HQ greater than 1 and additional LOEs supporting the conclusion of potential unacceptable risk.

No unacceptable risk to plant and soil invertebrate communities is expected from COPECs at the AOC 27 potential exposure area.

5.6.2.2 Small Mammals

For the AOC 27 potential exposure area, baseline risks were estimated for small mammals using area-weighted EPCs for the following evaluations and are discussed in this section:

- Using the selected TRVs and a species- and site-specific SUF
- Using the BTAG TRVs and a species- and site-specific SUF.

5.6.2.2.1 Risks Evaluated Using a Site-Specific SUF

Risks Evaluated Using the Selected TRVs

Table AOC27-5.6a summarizes HQs estimated for small mammals at the AOC 27 potential exposure area using the selected TRVs, area-weighted EPCs, and an SUF equal to 1. However, this section discusses only the area-weighted HQs using the selected TRVs and site-specific SUF. Table AOC27-5.6b summarizes HQs

estimated for small mammals at the AOC 27 potential exposure area using the selected TRVs, area-weighted EPCs, and a site-specific SUF (SUF = 1 as the home range for small mammals is less than or equal to the size of the AOC 27 potential exposure area) for all COPECs. However, only the COPECs identified above in Section 5.6.1.2 for further evaluation using area-weighted EPCs are discussed here. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Merriam's kangaroo rat (granivorous small mammal)** – This potential receptor could potentially be exposed to COPECs in subsurface I soil (0 to 6 ft bgs) directly and through its diet. No unacceptable risk to individuals and populations of granivorous small mammals were identified using depth-weighted EPCs, Using area-weighted EPCs, the NOAEL- and LOAEL-based HQs are also less than 1. Therefore, no unacceptable risk to individuals and populations of granivorous small mammals were identified.
- **Desert shrew (invertivorous small mammal)** – This potential receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. The COPECs identified for further evaluation using area-weighted EPCs were cadmium, copper, lead, zinc, HMW PAHs, and dioxin TEQ.
 - For cadmium, the area-weighted NOAEL- and LOAEL-based HQs remained the same as using depth-weighted EPCs because the EPCs for both evaluations were based on the maximum depth-weighted concentration due to a limited dataset. The NOAEL-based HQ is greater than 1, and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of invertivorous small mammals; however, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ. Cadmium was detected in only three out of 16 locations in surface soil (FOD = 19% in 0 to 0.5 ft bgs) and the EPC was based on the maximum depth-weighted concentration (2.3 mg/kg). Use of the maximum concentration as the EPC may not appropriately characterize risk. Potential risk to the desert shrew from exposure to cadmium is likely overestimated. Therefore, unacceptable risk to invertivorous small mammals from exposure to cadmium at the AOC 27 potential exposure area is unlikely.
 - For copper, the magnitude of the area-weighted NOAEL- and LOAEL-based HQs was reduced from the depth-weighted EPC analysis. The NOAEL-based HQ is equal to 1, and the LOAEL-based HQ is less than 1, indicating unacceptable risk to individuals and populations of invertivorous small mammals is not expected.
 - For lead, the magnitude of the area-weighted NOAEL- and LOAEL-based HQs was reduced from the depth-weighted EPC analysis, but the NOAEL-based HQ is still greater than 1. The LOAEL-based HQ is equal to 1, indicating no unacceptable risk to populations of invertivorous small mammals. Unacceptable risk to individual potential receptors is considered unlikely for lead based on the following LOEs: 1) low HQ; 2) exposure parameters assumed for this potential receptor are conservative (e.g., 100% invertebrate diet instead of a mixed diet, and invertebrate BAFs based on earthworm uptake only instead of mixed invertebrate species that are more likely encountered at the AOC 27 potential exposure area); and 3) T&E species with small home ranges have not been observed at AOC 27; therefore, protection at the individual level (i.e., NOAEL-based HQ less than or equal to 1) is not warranted (see Section 5.1.1, above). Therefore, unacceptable risk to invertivorous small mammals from exposure to lead at the AOC 27 potential exposure area is unlikely.
 - For zinc, the magnitude of the area-weighted NOAEL- and LOAEL-based HQs was reduced from the depth-weighted EPC analysis. The LOAEL-based HQ is less than 1, and the NOAEL-based HQ is equal

to 1, indicating unacceptable risk to individuals and populations of invertivorous small mammals is not expected.

- For HMW PAHs, the magnitude of the area-weighted NOAEL- and LOAEL-based HQs was reduced from the depth-weighted EPC analysis. The NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of invertivorous small mammals. Unacceptable risk to individual potential receptors is uncertain for HMW PAHs based on the HQ. However, additional LOEs supporting a conclusion that unacceptable risk to individuals is unlikely include 1) low magnitude HQ, likely associated with the burn waste activities in the AOC 27 potential exposure area (in the eastern edge of the road cut on the road from the AOC 27 potential exposure area to BCW); 2) the NOAEL-based TRV is conservative compared to other studies; 3) conservative assumptions used in the ERA (e.g., 100% invertebrate diet instead of a mixed diet, and invertebrate BAFs based on earthworm uptake only instead of mixed invertebrate species that are more likely encountered at the AOC 27 potential exposure area); and 4) T&E species with small home ranges have not been observed at the AOC 27 potential exposure area; therefore, protection at the individual level (i.e., NOAEL-based HQ less than or equal to 1) is not warranted. Unacceptable risk to invertivorous small mammals from exposure to HMW PAHs at the AOC 27 potential exposure area is unlikely.
- For dioxin TEQ, the magnitude of the area-weighted NOAEL- and LOAEL-based HQs was reduced from the depth-weighted EPC analysis, but are still greater than 1 indicating potential unacceptable risks are possible for individuals and populations of invertivorous small mammals based on the HQ. Conservative assumptions were used to estimate the HQs, including use of BAFs based on uptake of a single congener (2,3,7,8-TCDD) to earthworms, and a diet assumed to consist entirely of earthworms. The magnitude of the HQs is low (less than 10) and the spatial extent of concentrations exceeding 10 times the BTV is limited to a few. As a result, the HQs are considered to be overestimated and the LOAEL-based HQ would likely be reduced to less than 1 when adjusted for compounded conservatism in the risk estimates for this COPEC (see Section 6.7.6 of the main report). T&E species with small home ranges have not been observed at the AOC 27 potential exposure area. Based on the LOEs, unacceptable risk to individuals and populations of invertivorous small mammals is considered to be unlikely.
- The NOAEL- and LOAEL-based HQs for other COPECs in soil are less than 1 indicating no unacceptable risk (*de minimis* risk) to individuals and populations of invertivorous small mammals for the remaining COPECs.

Risks Evaluated Using the BTAG TRVs

Table AOC27-5.6b also summarizes HQs estimated for small mammals at the AOC 27 potential exposure area using the BTAG TRVs, area-weighted EPCs, and a site-specific SUF (SUF = 1). Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Merriam's kangaroo rat (granivorous small mammal)** – No unacceptable risk to granivorous small mammals was identified using depth-weighted EPCs, and the conclusions are the same using area-weighted EPCs (i.e., the NOAEL- and LOAEL-based HQs are less than 1).

- **Desert shrew (invertivorous small mammal)** – The area-weighted NOAEL-based HQs for cadmium, copper, lead, zinc, and HMW PAHs are greater than 1 and the LOAEL-based HQs are less than 1, indicating no unacceptable risk to invertivorous small mammal populations; however, potential risk to individual potential receptors is uncertain for these COPECs based on the HQ. The NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs indicating no unacceptable risk to individuals and populations of invertivorous small mammals from the remaining COPECs.

The table below summarizes the NOAEL- and LOAEL-based HQs for mammals for COPECs identified above in Section 5.6.1.2 that were further evaluated using area-weighted EPCs in this section. The HQs below are based on the area-weighted EPCs and species- and site-specific SUF (if applicable for a potential receptor).

Hazard Quotient Summary for Mammals (site-specific SUF = 1)								
COPEC	Merriam's Kangaroo Rat				Desert Shrew			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Cadmium	1E-01	1E-02	1E+00	3E-02	4E+00	4E-01	5E+01	1E+00
Copper	1E-01	8E-02	5E-01	2E-03	1E+00	8E-01	5E+00	2E-02
Lead	1E-01	6E-02	6E-01	2E-03	2E+00	1E+00	9E+00	4E-02
Zinc	1E-01	3E-02	8E-01	2E-02	1E+00	3E-01	1E+01	2E-01
HMW PAHs	1E-01	2E-02	5E-02	2E-03	4E+00	8E-01	2E+00	7E-02
TEQ Mammals	8E-02	8E-03	--	--	4E+01	4E+00	--	--

Notes:

Bold indicates HQs > 1.

-- = HQ not estimated because TRVs are unavailable.

5.6.2.2.2 Baseline Risk Summary for Small Mammals Using Area-Weighted EPCs

To summarize, based on the risks characterized for small mammals exposed to COPECs in soil at the AOC 27 potential exposure area using selected TRVs⁸, area-weighted EPCs, and a site-specific SUF (SUF equal to 1 because the home ranges are less than or equal to the size of the exposure area), the risk conclusions are as follows:

- **For Merriam's kangaroo rat (granivorous small mammal)**, the area-weighted NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, indicating no unacceptable risk to individuals and populations of granivorous small mammals. Potential risk is *de minimis* from all COPECs at the AOC 27 potential exposure area for granivorous small mammals and no further evaluation is necessary.
- **For the desert shrew (invertivorous small mammal)**, the area-weighted NOAEL- and LOAEL-based HQs are greater than 1 for dioxin TEQ. Unacceptable risk to invertivorous small mammals from exposure to

⁸ Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

dioxin TEQ is unlikely based on the following LOEs: 1) low magnitude of the HQs (LOAEL-based HQ is less than 10) and likely reduced to 1 or less if adjusted for compounding uncertainties associated with the conservative assumptions; these include diet (dietary composition assumes 100% of a single-item diet, uptake into dietary items (bioaccumulation based on a single congener likely overestimates HQs by 10 times), and conservative TRVs (based on the lowest available NOAEL and LOAEL doses; 2) spatial extent of elevated concentrations were limited; and 3) T&E species with small home ranges have not been observed in the AOC 27 potential exposure area. COPECs indicative of uncertain risks to potential individual receptors (i.e., where the NOAEL-based HQs are greater than 1 but the LOAEL-based HQs are less than 1) included cadmium, lead, and HMW PAHs. For cadmium, lead, and HMW PAHs, unacceptable risk to individual potential receptors is considered unlikely based on supporting LOEs, including the low magnitude of the HQs, conservative assumptions used in the risk estimates, and no observations of T&E species at the AOC 27 potential exposure area. For the remaining COPECs, the NOAEL- and LOAEL-based HQs are less than 1 indicating no unacceptable risk to individuals and populations of invertivorous small mammals.

Potential Risk Drivers for Small Mammals at AOC 27 Potential Exposure Area

No risk-driving COPECs for small mammals were identified at AOC 27 as no unacceptable population-level risk (i.e., LOAEL-based HQs greater than 1 [or LOAEL-based HQs greater than 10 for dioxin TEQ]) was predicted from HQs calculated using the most refined exposure and effects assumptions (i.e., site-specific SUF, area-weighted EPCs, and selected TRVs) and additional supporting WOE. COPECs with NOAEL-based HQs greater than 1 using the most refined exposure and effects assumptions were identified for the AOC 27 potential exposure area. However, the additional LOEs support the conclusions that unacceptable risk to individual invertivorous small mammals is unlikely from exposure to cadmium, lead, HMW PAHs, and dioxin TEQ.

5.6.2.3 Birds

For the AOC 27 potential exposure area, baseline risks were estimated using area-weighted EPCs for the following evaluations and are discussed in this section:

- Using the selected TRVs and a species- and site-specific SUF
- Using the BTAG TRVs and a species- and site-specific SUF.

5.6.2.3.1 Risks Evaluated Using a Site-Specific SUF

Risks Evaluated Using the Selected TRVs

Table AOC27-5.6a summarizes HQs estimated for birds at the AOC 27 potential exposure area using the selected TRVs, area-weighted EPCs, and an SUF equal to 1 for all COPECs. However, this section will only discuss the area-weighted HQs using the selected TRVs and site-specific SUF. Table AOC27-5.6b summarizes HQs estimated for birds at the AOC 27 potential exposure area using the selected TRVs, area-weighted EPCs, and a site-specific SUF (SUF = 0.1 for Gambel's quail and 0.8 for cactus wren) for all COPECs. However, only the COPECs identified above in Section 5.6.1.3 for further evaluation using area-weighted EPCs are discussed here. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Gambel's quail (granivorous bird)** – No unacceptable risk to granivorous birds were identified using depth-weighted EPCs. Using area-weighted EPCs, the NOAEL- and LOAEL-based HQs are also less than 1. Therefore, no unacceptable risk to granivorous birds were identified.
- **Cactus wren (insectivorous bird)** – The area-weighted EPCs reduced the HQs estimated using depth-weighted EPCs (Section 5.6.1.3, above), as described below.
 - For cadmium, the area-weighted NOAEL- and LOAEL-based HQs remained the same as using depth-weighted EPCs because the EPCs for both evaluations were based on the maximum depth-weighted concentration. The NOAEL-based HQ is greater than 1, and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of insectivorous birds. Although unacceptable risk to individual potential receptors is uncertain for cadmium based on the HQ, additional LOEs (i.e., low FOD, low HQ, and conservative assumptions), as discussed for the depth-weighted evaluation (Section 5.6.1.3, above), support the conclusion that unacceptable risk to individual potential receptors is unlikely.
 - For copper, the magnitude of the area-weighted NOAEL- and LOAEL-based HQs was reduced from the depth-weighted EPC analysis, but the NOAEL-based HQ is still greater than 1. The LOAEL-based HQ is less than one, indicating no unacceptable risk to populations of insectivorous birds. Unacceptable risk to individual potential receptors is uncertain for copper based on the HQ. Additional LOEs, including low HQ, conservative assumptions (as discussed above in Section 5.6.1.3), and lack of T&E species at the AOC 27 potential exposure area (Section 5.1.1), support the conclusion that unacceptable risk to individual potential receptors is unlikely.
 - For lead, the magnitude of the area-weighted NOAEL- and LOAEL-based HQs was reduced from the depth-weighted EPC analysis but are still greater than 1. Based on the HQ and supporting LOEs (as discussed above in Section 5.6.1), unacceptable risk is considered unlikely for individuals and populations of insectivorous birds exposed to lead in soil.
 - For mercury, the area-weighted NOAEL- and LOAEL-based HQs remained the same as using depth-weighted EPCs because area-weighting had little effect on the EPC. The NOAEL-based HQ is greater than 1, and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of insectivorous birds. Although unacceptable risk to individual potential receptors is uncertain based on the HQ, additional LOEs, including low FOD, low magnitude of the HQ, low confidence in the TRVs (as discussed above in Section 5.6.1.3), conservative assumptions, and lack of T&E species at the AOC 27 potential exposure area (Section 5.1.1.) support the conclusion that unacceptable risk to individual insectivorous birds is unlikely.
 - For zinc, the magnitude of the area-weighted NOAEL- and LOAEL-based HQs was reduced from the depth-weighted EPC analysis. The LOAEL-based HQ is less than 1, and the NOAEL-based HQ is equal to 1 using an area-weighted EPC, indicating unacceptable risk to individuals and populations of insectivorous birds is not expected.
 - For dioxin TEQ, the magnitude of the area-weighted NOAEL- and LOAEL-based HQs was reduced from the depth-weighted EPC analysis. Using an area-weighted EPC, the LOAEL-based HQ is less than 1, but the NOAEL-based HQ is still greater than 1. The results indicate no unacceptable risk to populations of insectivorous birds; however, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ. The magnitude of the NOAEL-based HQ is low. Conservative assumptions

were used to estimate the HQs, including use of BAFs based on uptake of a single congener (2,3,7,8-TCDD) to earthworms and a diet assumed to consist entirely of earthworms. As a result, the HQs are considered to be overestimated. Additionally, T&E species have not been observed at the AOC 27 potential exposure area, as described above in Section 5.1.1. Therefore, unacceptable risk to individual insectivorous birds is considered to be unlikely.

Risks Evaluated Using the BTAG TRVs

Table AOC27-5.6b also summarizes HQs estimated for birds at AOC27 using the BTAG TRVs, area-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Gambel's quail (granivorous bird)** – The site-specific SUF for this potential receptor is 0.1. The area-weighted NOAEL-based HQ for lead was reduced from the depth-weighted EPC analysis but is still greater than 1, and the LOAEL-based HQ is less than 1. This indicates no unacceptable risk from lead to populations of granivorous birds; however, unacceptable risk to individual potential receptors is uncertain based on the HQ. The risks from lead are likely overestimated due to the conservative avian TRV. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. The NOAEL- and LOAEL-based HQs for other COPECs in soil are less than 1, indicating no unacceptable risk to individuals and populations of granivorous birds for the remaining COPECs.
- **Cactus wren (insectivorous bird)** – The site-specific SUF for this potential receptor is 0.8. Although the magnitude of the area-weighted NOAEL-based HQs was reduced for copper, lead, and zinc in this evaluation, the NOAEL-based HQs for these COPECs are greater than 1. The area-weighted NOAEL-based HQs for cadmium and mercury are also greater than 1 and remained the same as the depth-weighted EPC analysis. In both cases the cadmium EPC was based on the maximum depth-weighted concentration in surface soil (0 to 0.5 ft bgs). Mercury was detected infrequently and resulted in depth-weighted and area-weighted EPCs that were similar. As discussed above, due to the infrequent detections of cadmium and mercury, risk from these COPECs is likely overestimated. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report.

The NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs, indicating no unacceptable risk to individuals and populations of insectivorous birds from these COPECs.

The table below summarizes the NOAEL- and LOAEL-based HQs for birds for COPECs identified above in Section 5.6.1.3 that were further evaluated using area-weighted EPCs in this section. The HQs below are based on the area-weighted EPCs and species- and site-specific SUF.

Hazard Quotient Summary for Birds (Site-Specific SUF)								
COPEC	Gambel's Quail (SUF = 0.1)				Cactus Wren (SUF = 0.8)			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Cadmium	3E-03	8E-04	7E-03	5E-04	2E+00	4E-01	3E+00	2E-01
Copper	2E-02	8E-03	4E-02	2E-03	2E+00	8E-01	4E+00	2E-01
Lead	4E-02	2E-02	5E+00	8E-03	5E+00	2E+00	5E+02	8E-01
Mercury	1E-02	3E-03	1E-02	3E-03	2E+00	4E-01	2E+00	4E-01
Zinc	7E-03	3E-03	3E-02	3E-03	1E+00	4E-01	4E+00	4E-01
TEQ Avian	1E-03	1E-04	--	--	2E+00	2E-01	--	--

Notes:

Bold indicates HQs > 1.

-- = HQ not estimated because TRVs are unavailable.

5.6.2.3.2 Baseline Risk Summary for Birds Using Area-Weighted EPCs

To summarize, based on the risks characterized for populations of birds exposed to COPECs in soil at the AOC 27 potential exposure area using selected TRVs⁹, area-weighted EPCs, and a site-specific SUF, the risk conclusions are as follows:

- **For Gambel's quail (granivorous small bird)**, the NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, indicating no unacceptable risk to individuals and populations of granivorous birds. Potential risk is *de minimis* from all COPECs at the AOC 27 potential exposure area for these granivorous birds and no further evaluation is necessary.
- **For the cactus wren (insectivorous bird)**, the NOAEL- and LOAEL-based HQs are greater than 1 only for lead. However, based on the LOE, unacceptable risk to individuals and populations of insectivorous birds is unlikely. COPECs indicative of uncertain risks to individual potential receptors (i.e., where the NOAEL-based HQs are greater than 1 but the LOAEL-based HQs are less than 1) included cadmium, copper, mercury, and dioxin TEQ. For these COPECs, unacceptable risk to individual potential receptors is considered unlikely based on supporting LOEs, including the low magnitude of the HQs, conservative assumptions used in the risk estimates, no observations of T&E species at the AOC 27 potential exposure area (see Section 5.1.1), and low FOD (for cadmium and mercury). For the remaining COPECs, the NOAEL- and LOAEL-based HQs are less than 1, indicating no unacceptable risk to individuals and populations of insectivorous birds.

Potential Risk Drivers for Birds at AOC 27 Potential Exposure Area

⁹ Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

APPENDIX AOC27
SOIL HHERA FOR AOC 27 EXPOSURE AREA

No risk drivers were identified for unacceptable population-level risk (i.e., LOAEL-based HQs greater than 1) predicted using the most refined exposure and effects assumptions (i.e., site-specific SUF, area-weighted EPCs, and selected TRVs) and additional LOEs.

COPECs with NOAEL-based HQs greater than 1 using the most refined exposure and effects assumptions were identified for the AOC 27 potential exposure area (cadmium, copper, mercury, and dioxin TEQ); however, the additional LOEs support the conclusions that unacceptable risk to individual potential receptors from exposure to these COPECs is unlikely.

6 SUMMARY AND CONCLUSIONS FOR THE HHRA

Potential cumulative cancer risks and noncancer hazards for potential human receptors were estimated, as presented above in Section 4. For potential ecological receptors, potential risks were estimated as presented above in Section 5. Uncertainties related to the HHRA and ERAs at the site are discussed in detail in Sections 5.6 and 6.7 of the main report, and uncertainties specific to the AOC 27 potential exposure area are discussed in this appendix. For the AOC 27 potential exposure area, the HHRA and ERA were conducted per the RAWP documents (Arcadis 2008, 2009, 2015). One scenario (baseline [no scouring]) was evaluated, and risks were estimated for various potential receptors using depth-weighted EPCs and area-weighted EPCs.

At the AOC 27 potential exposure area, the COPCs/COPECs identified for the HHRA include metals (antimony, cadmium, hexavalent chromium, copper, lead, mercury, and zinc), VOCs (bromomethane and chloromethane), LMW PAHs, HMW PAHs, PAHs, PCBs, TPH as diesel, TPH as motor oil, and dioxins and furans. A summary of these results and conclusions regarding potential risk associated with exposure to these COPCs/COPECs in soil at the AOC 27 potential exposure area based on the risk/hazard estimates and uncertainties inherent in the risk assessment process are presented in this section.

The conclusions reached after completing the HHRA and ERA for the AOC 27 potential exposure area are presented below.

6.1 Summary and Conclusions for the HHRA

The cumulative ILCRs and HIs associated with potential exposure to COPCs in soil at the AOC 27 potential exposure area using depth- and area-weighted EPCs under the baseline scenario were estimated. Assuming lifetime soil contact is limited to the AOC 27 potential exposure area for the potential receptors evaluated, the estimated potential ILCR and HI results are summarized in the table and discussed below.

Baseline Scenario Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 27 Potential Exposure Area			
		Cumulative ILCR		HI	
		Depth-Wt	Area-Wt	Depth-Wt	Area-Wt
Short-Term Maintenance Worker	Surface	$\leq 1 \times 10^{-6}$	---	≤ 1	---
	Shallow	$\leq 1 \times 10^{-6}$	---	≤ 1	---
	Subsurface I	$\leq 1 \times 10^{-6}$	---	≤ 1	---
	Subsurface II	$\leq 1 \times 10^{-6}$	---	≤ 1	---
Long-Term Maintenance Worker	Surface	3×10^{-6} (CrVI, B(a)PEQ, and dioxin TEQ)	$\leq 1 \times 10^{-6}$	≤ 1	≤ 1
Long-Term Maintenance Worker	Shallow	2×10^{-6} (CrVI, B(a)PEQ, and dioxin TEQ)	$\leq 1 \times 10^{-6}$	≤ 1	≤ 1

APPENDIX AOC27
SOIL HHERA FOR AOC 27 EXPOSURE AREA

Baseline Scenario Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 27 Potential Exposure Area			
		Cumulative ILCR		HI	
		Depth-Wt	Area-Wt	Depth-Wt	Area-Wt
	Subsurface I	2×10^{-6} CrVI, B(a)PEQ, and dioxin TEQ)	$\leq 1 \times 10^{-6}$	≤ 1	≤ 1
	Subsurface II	$\leq 1 \times 10^{-6}$	$\leq 1 \times 10^{-6}$	≤ 1	≤ 1
Camper	Surface	$\leq 1 \times 10^{-6}$	--	≤ 1	--
	Shallow	$\leq 1 \times 10^{-6}$	--	≤ 1	--
Hiker	Surface	2×10^{-6} (CrVI, B(a)PEQ, and dioxin TEQ)	$\leq 1 \times 10^{-6}$	≤ 1	≤ 1
	Shallow	2×10^{-6} (CrVI, B(a)PEQ, and dioxin TEQ)	$\leq 1 \times 10^{-6}$	≤ 1	≤ 1
Hunter	Surface	$\leq 1 \times 10^{-6}$	--	≤ 1	--
	Shallow	$\leq 1 \times 10^{-6}$	--	≤ 1	--
OHV Rider	Surface	2×10^{-6} CrVI, B(a)P EQ, and dioxin TEQ)	$\leq 1 \times 10^{-6}$	≤ 1	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	$\leq 1 \times 10^{-6}$	≤ 1	≤ 1
Tribal User	Surface	$\leq 1 \times 10^{-6}$	--	≤ 1	--
	Shallow	$\leq 1 \times 10^{-6}$	--	≤ 1	--

Note:

--- = Area-weighted (area-wt) estimate not calculated because depth-weighted (depth-wt) estimates for the receptor was below *de minimis* levels.

Depth-Weighted

Potential exposures that are below *de minimis* levels include the following:

- **HI ≤ 1 for all soil depths** – All potential receptors evaluated including: Short-Term Maintenance Worker, Long-Term Maintenance Worker, Camper, Hiker, Hunter, OHV Rider, and Tribal User
- **ILCR $\leq 1 \times 10^{-6}$** – Short-Term Maintenance Worker (all depths), Long Term Maintenance Worker (subsurface II), Camper (surface and shallow), Hunter (surface and shallow), OHV Rider (shallow), and Tribal User (surface and shallow).

Potential exposures that are above *de minimis* levels of HI > 1 and/or within the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **HI > 1 and ≤ 3** – None
- **HI > 3** – None

APPENDIX AOC27
SOIL HHERA FOR AOC 27 EXPOSURE AREA

- **ILCR > 1×10^{-6} and $\leq 5 \times 10^{-6}$** – Long-Term Maintenance Worker (surface, shallow, and subsurface I), Hiker (surface and shallow), and OHV Rider (surface)
- **ILCR > 5×10^{-6} and $\leq 1 \times 10^{-5}$** – None
- **ILCR > 1×10^{-5} and $\leq 1 \times 10^{-4}$** – None.

Potential exposures that are above the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **ILCR > 1×10^{-4}** – None.

Assuming lifetime soil contact is limited to the AOC 27 potential exposure area, the estimated risks and hazards above *de minimis* levels for the long-term maintenance worker, hiker, and OHV rider were due to hexavalent chromium, B(a)PEQ, and dioxin TEQ. Therefore, potential risks and hazards for these three potential receptors were estimated using area-weighted EPCs and are as follows:

Area-Weighted

Potential exposures that are below *de minimis* levels include the following:

- **HI ≤ 1 for all soil depths** – All potential receptors evaluated including: Long-Term Maintenance Worker, Hiker, and, OHV Rider
- **ILCR $\leq 1 \times 10^{-6}$ for all soil depths** – All potential receptors evaluated including: Long-Term Maintenance Worker, Hiker, and, OHV Rider.

Potential exposures that are above *de minimis* levels of HI > 1 and/or within the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **HI > 1 and ≤ 3** – None
- **HI > 3** – None
- **ILCR > 1×10^{-6} and $\leq 5 \times 10^{-6}$** – None
- **ILCR > 5×10^{-6} and $\leq 1 \times 10^{-5}$** – None
- **ILCR > 1×10^{-5} and $\leq 1 \times 10^{-4}$** – None.

Potential exposures that are above the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **ILCR > 1×10^{-4}** – None.

OVERALL SUMMARY

Assuming lifetime soil contact is limited to the AOC 27 potential exposure area, the estimated cumulative ILCRs and HIs associated with potential exposure to COPCs in soil at the AOC 27 potential exposure area using depth-weighted EPCs for the short-term maintenance worker, camper, hunter, and tribal user are below 1×10^{-6} and 1, respectively. The estimated cumulative HI for the long-term maintenance worker, hiker, and OHV rider are below an HI of 1. The depth-weighted estimated cumulative ILCRs for the long-term maintenance worker, hiker, and OHV rider were slightly above the point of departure for risk management decisions of 1×10^{-6} , but below 5×10^{-6} , which is well within the risk management range of 1×10^{-6} and 1×10^{-4} . Therefore, these potential receptors were carried forward to the area-weighted evaluation. The area-weighted approach resulted in a reduction in the risk or hazard estimates ranging from 2.9 to 3.6 times lower than the depth-weighted estimates. This reduction in the cumulative ILCR estimates for the long-term maintenance worker, hiker, and OHV rider brings estimated ILCR values to the point of departure for risk management decisions of 1×10^{-6} for the area-weighted evaluation.

The depth-and area-weighted EPCs for lead in the AOC 27 potential exposure area soil at all exposure depths are not expected to result in an increase in blood lead levels above OEHHA's benchmark value of 1 µg/dL in the fetus of a short- or long-term maintenance worker, fetus of a hunter, or child recreational user.

Risks/hazards estimated for an individual AOC/SWMU/UA potential exposure area like AOC 27 are not considered representative of the realistic or likely potential exposures for the human populations that could be present in the areas outside the TCS (such as maintenance workers, recreational users, and tribal users). Risks/hazards calculated separately for individual AOCs are conservative and likely overestimate site risks/hazards. As described in the RAWP documents (Arcadis 2008, 2009, 2015), these human populations would more likely be exposed randomly, over the course of a lifetime, to soil present in all individual AOC/SWMU/UA potential exposure areas located outside the TCS, rather than have a lifetime of contact limited to the area of a single potential exposure area. Therefore, estimated risks/hazards presented for individual AOC/SWMU/UA potential exposure areas are not believed to be representative of the potential health risks to humans potentially contacting the soil outside the TCS. Rather, the HHRA results presented in Appendix OCS for all AOC/SWMU/UA potential exposure areas located outside the TCS combined will help to inform risk management decisions for the site. The estimated risks and hazards associated with a lifetime of contact with soil only in AOC 27 potential exposure area are presented at the request of the agencies and are not suitable to provide the sole basis of risk management decisions to protect human health.

6.2 Summary and Conclusions for the ERA

At the AOC 27 potential exposure area, seven metals, PAHs, VOCs (bromomethane and chloromethane), PCBs, dioxin TEQ (for potential wildlife receptors only), 2,3,7,8-TCDD (for ecological communities only), and TPHs were identified as COPECs. Risks could not be estimated for potential receptors lacking available screening values and/or TRVs for COPECs; such cases are discussed in the uncertainty analysis of the main report. These COPECs are unlikely to be risk drivers and are assumed to have minimal impact to the conclusions of the ERA.

Risks were estimated using depth-weighted and area-weighted EPCs. Risk conclusions were based on the following criteria:

- COPECs with HQs less than or equal to 1 pose *de minimis* risk to ecological communities (plants and invertebrates).
- COPECs with NOAEL-based HQs less than or equal to 1 pose *de minimis* risk to potential wildlife receptors.
- COPECs with NOAEL-based HQs greater than 1 but LOAEL-based HQs less than or equal to 1 pose no unacceptable risk to wildlife populations; however, potential for unacceptable risk to individuals is uncertain based on the HQ. A WOE approach was used to characterize potential risk to potential individual receptors.
- COPECs with LOAEL-based HQs greater than 1 pose possible unacceptable risk to populations of potential wildlife receptors.

The risk estimates (HQs) represent only a single LOE for risk characterization. A qualitative WOE approach, incorporating other LOEs and uncertainties, was used to characterize risk to wildlife populations at the AOC 27 potential exposure area.

Table AOC27-6.1 presents the HQs for all the COPECs for the baseline scenario calculated using depth-weighted EPCs, selected screening levels/selected TRVs, and site-specific SUFs. The HQs/LOAEL-based HQs based on depth-weighted EPCs were greater than 1 for the following COPECs:

- **Plant Communities** – copper, lead, zinc, and HMW PAHs/TPHs
- **Soil Invertebrate Communities** – hexavalent chromium, copper, mercury, and zinc
- **Small Mammals** – none for granivorous small mammals; copper, lead, HMW PAHs/TPHs, and dioxin TEQ for invertivorous small mammals
- **Birds** – none for granivorous birds; copper and lead for insectivorous birds.

HQs were also calculated for all the COPECs using area-weighted EPCs, selected screening levels/selected TRVs, and site-specific SUFs and are presented in Table AOC27-6.1. For COPECs with HQs/LOAEL-based HQs greater than 1 using the most refined exposure and effects assumptions (i.e., area-weighted EPCs, selected screening levels/TRVs, and site-specific SUFs), a WOE assessment was used to draw risk conclusions and identify potential risk drivers for the AOC 27 potential exposure area. The various LOEs considered in the WOE assessment and risk conclusions are presented in Table AOC27-6.2.

Based on the ecological risk characterization for the AOC 27 potential exposure area, using area-weighted EPCs, selected screening levels/TRVs, and site-specific SUFs, the following conclusions were made:

6.2.1 Plant Communities

Overall, no unacceptable risk was identified for plants at the AOC 27 potential exposure area, including special-status species. Conclusions are as follows:

- No federal- or state-listed T&E or rare plants or candidates for listing were found at the site, including the AOC 27 potential exposure area.
- Potential risk to plants is *de minimis* from exposure to antimony, cadmium, hexavalent chromium, mercury, LMW PAHs, and PCBs at the AOC 27 potential exposure area. The HQs for lead and zinc were reduced to less than 1 using area-weighted EPCs, indicating *de minimis* risk to plant communities from these COPECs at the AOC 27 potential exposure area.

- The HQ for HMW PAHs was reduced from the depth-weighted evaluation, but is still greater than 1. Unacceptable risk to plants from exposure to HMW PAHs is unlikely based on the following LOEs: 1) low magnitude of the HQ; 2) low confidence in screening values to predict risk; and 3) limited spatial extent of elevated concentrations; the elevated concentrations of HMW PAHs driving risk are localized in surface and shallow soil in the eastern edge of the road from the AOC 27 potential exposure area to BCW where potential burn waste was identified. Depth-weighted concentrations more than 10 times the BTV are limited to four locations (31.5 mg/kg at AOC27-6, 4.04 mg/kg at AOC27-50, 3.78 mg/kg at AOC27-51, and 3.39 mg/kg at AOC27-7).
- The HQ for copper was reduced from the depth-weighted evaluation, but is still greater than 1. Although copper was frequently detected at the AOC 27 potential exposure area, unacceptable risk to plants from exposure to copper is unlikely based on the following LOEs: 1) magnitude of the HQ is low; and 2) the spatial extent of elevated concentrations is limited to two locations (580 mg/kg at AOC27-7 and 500 mg/kg at AOC27-6).
- Vegetation communities observed at the site during the floristic surveys conducted in 2013 (GANDA and CH2M 2013) and in 2017 (CH2M 2017b) is typical of Mojave Desert plant communities (summarized in Section 2.4.2 of the main report). More a hundred different vascular plant species have been observed within the survey area that includes the AOC 27 potential exposure area; documented as Segment H in these survey reports (GANDA and CH2M 2013; CH2M 2017b). The floristic surveys report a diverse assemblage of plants species found in typical abundance, density, cover, and vigor of plant communities in undisturbed desert habitat. These observations are not consistent with impairment of the plant community at the site. The floristic surveys provide site-specific observations that support the health of plant communities at the site and is considered a stronger LOE than the exceedances of low-confidence generic plant screening values, which are widely acknowledged to have low ability to predict toxicity in plants.

6.2.2 Soil Invertebrate Communities

Overall, no unacceptable risk to soil invertebrates is expected at the AOC 27 potential exposure area. Conclusions are as follows:

- Potential risk to soil invertebrates is *de minimis* from exposure to cadmium, lead, PAHs, PCBs, and 2,3,7,8-TCDD at the AOC 27 potential exposure area. Antimony, bromomethane, and chloromethane were not detected in surface soil, where exposure occurs for these potential receptors. The HQs for hexavalent chromium, copper, and mercury were reduced to less than 1 using area-weighted EPCs, indicating *de minimis* risk to soil invertebrate communities from these COPECs at the AOC 27 potential exposure area.
- The HQ for zinc was reduced from the depth-weighted evaluation, but is still greater than 1. Although zinc was frequently detected at the AOC 27 potential exposure area, unacceptable risk to soil invertebrates from exposure to zinc is unlikely based on the following LOEs: 1) magnitude of the HQ is low; and 2) the spatial extent of elevated concentrations is limited to two locations (1,200 mg/kg at AOC27-51 and 700 mg/kg at AOC27-6).

6.2.3 Small Mammals

Overall, no unacceptable risk to populations of small mammals (granivorous and invertivorous) exposed to COPECs in soil at the AOC 27 potential exposure area is expected. Conclusions are as follows:

APPENDIX AOC27
SOIL HHERA FOR AOC 27 EXPOSURE AREA

- Several species of mammals have been observed at or near the site (Tables 2-2 and 2-4 of the main report); however, T&E species with small home ranges were not observed at the AOC 27 potential exposure area; therefore, protection at the individual level (i.e., NOAEL-based HQ less than or equal to 1) is not warranted.
- For Merriam's kangaroo rat (granivorous small mammal):
 - The NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, which is consistent with the depth-weighted evaluation, indicating *de minimis* risk to individuals and populations of granivorous small mammals.
- For the desert shrew (invertivorous small mammal):
 - Potential risk is *de minimis* from exposure to hexavalent chromium, mercury, LMW PAHs, and PCBs. Antimony, bromomethane, and chloromethane were not detected in surface soil, where exposure occurs for this potential receptor. The NOAEL- and LOAEL-based HQs for copper were reduced to 1 or less from the depth-weighted evaluation, indicating *de minimis* risk to invertivorous small mammals from this COPEC at the AOC 27 potential exposure area.
 - COPECs indicative of uncertain risk to individual potential receptors included cadmium, lead, and HMW PAHs. For cadmium, the NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is less than 1, same as the depth-weighted evaluation. The NOAEL-based HQs for lead and HMW PAHs were reduced from the depth-weighted evaluation but are still greater than 1; the LOAEL-based HQs remained less than 1 for lead and HMW PAHs.
 - Unacceptable risk to individual potential receptors is unlikely for cadmium based on the following LOEs: 1) low magnitude of the HQ; 2) low FOD; 3) EPCs based on the maximum depth-weighted concentrations; for areas where a constituent is largely not detected, use of a maximum concentration as the EPC may not appropriately characterize risk; and 4) T&E species with small home ranges have not been observed at the AOC 27 potential exposure area.
 - Unacceptable risk to individual potential receptors is unlikely for lead based on the following LOEs: 1) low magnitude of the HQ; 2) conservative assumptions in the risk estimates (not accounting for site-specific bioavailability of lead and assuming 100% invertebrate diet; see Section 6.5 of the main report); and 3) T&E species with small home ranges have not been observed at the AOC 27 potential exposure area.
 - Unacceptable risk to individual potential receptors is unlikely for HMW PAHs based on the following LOEs: 1) low magnitude of the HQ; 2) likely associated with the burn waste activities in the AOC 27 potential exposure area (in the eastern edge of the road cut on the road from the AOC 27 potential exposure area to BCW); 3) the NOAEL-based TRV is conservative compared to other studies (see Section 6.5 of the main report); 4) conservative assumptions used in the ERA (e.g., 100% invertebrate diet, instead of a mixed diet and invertebrate BAFs based on earthworm uptake only, instead of mixed invertebrate species that are more likely encountered at the AOC 27 potential exposure area); and 5) T&E species with small home ranges have not been observed at the AOC 27 potential exposure area. Risk conclusions are the same for TPHs.
 - The NOAEL- and LOAEL-based HQs for dioxin TEQ were reduced from the depth-weighted evaluation, but are still greater than 1. Unacceptable risk to invertivorous small mammals from exposure to dioxin TEQ is unlikely based on the following LOEs: 1) low magnitude of the HQs (LOAEL-based HQ is less

than 10) and likely reduced to 1 or less if adjusted for compounding uncertainties associated with the conservative assumptions (see Section 6.5.6 of the main report); these include diet (dietary composition assumes 100% of a single-item diet; see Section 6.5.3 of the main report), uptake into dietary items (bioaccumulation based on a single congener likely overestimates HQs by 10 times; see Section 6.5.4 of the main report), and conservative TRVs (likely overestimates HQs by more than 7 times; see Section 6.5.5 of the main report); 2) the spatial extent of elevated concentrations is limited to two locations: AOC27-6 (120 ng/kg) and AOC27-7 (110 ng/kg); and 3) T&E species with small home ranges have not been observed at the AOC 27 potential exposure area.

6.2.4 Birds

Overall, no unacceptable risk to bird populations (granivorous and insectivorous) exposed to COPECs in soil at the AOC 27 potential exposure area is expected. Conclusions are as follows:

- Several species of birds have been observed at or near the site (Tables 2-2 and 2-4 of the main report); however, T&E species with small home ranges were not observed at the AOC 27 potential exposure area; therefore, protection at the individual level (i.e., NOAEL-based HQ less than or equal to 1) is not warranted.
- For Gambel's quail (granivorous bird), the NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, which is consistent with the depth-weighted evaluation, indicating *de minimis* risk to individuals and populations of granivorous birds at the AOC 27 potential exposure area.
- For the cactus wren (insectivorous bird):
 - Potential risk is *de minimis* from exposure to hexavalent chromium, PAHs, and TPHs (based on BTEX and PAH results). The NOAEL- and LOAEL-based HQs for zinc were reduced to less than 1 from the depth-weighted evaluation, indicating *de minimis* risk to invertivorous small mammals from this COPEC at the AOC 27 potential exposure area.
 - COPECs indicative of uncertain risk to potential individual receptors included cadmium, copper, mercury, and dioxin TEQ. For cadmium and mercury, the NOAEL- based HQ is greater than 1 and the LOAEL-based HQ is less than 1, which is consistent with the depth-weighted evaluation. The NOAEL-based HQs for copper and dioxin TEQ were reduced from the depth-weighted evaluation, but are still greater than 1; the LAOEL-based HQs remained less than 1 for copper and dioxin TEQ.
 - Unacceptable risk to individual potential receptors is unlikely for cadmium based on the following LOEs: 1) low magnitude of the HQ; 2) low FOD; 3) EPCs based on the maximum depth-weighted concentrations; for areas where a constituent is largely not detected, the use of a maximum concentration as the EPC may not appropriately characterize risk; and 3) T&E species with small home ranges have not been observed at the AOC 27 potential exposure area.
 - Unacceptable risk to individual potential receptors is unlikely for copper, mercury, and dioxin TEQ based on the following LOEs: 1) low magnitude of the HQs; 2) conservative TRVs for dioxins and mercury; 3) conservative assumptions used in the risk estimates (dietary composition assumes 100% of a single-item diet, bioaccumulation based on a single congener for dioxins, and very conservative TRVs and BAFs for dioxins; see Section 6.5 of the main report); and 4) T&E species with small home ranges have not been observed at the AOC 27 potential exposure area.

- The NOAEL- and LOAEL- HQs for lead were reduced from the depth-weighted evaluation, but are still greater than 1. Unacceptable risk to insectivorous birds from exposure to lead is unlikely based on the following LOEs: 1) magnitude of the HQ is low; 2) assumes lead in soil is 100% available for uptake by prey/absorption to the target organ, which is rarely the case for lead; the average is 60% (see Section 6.5.3 of the main report); and 3) the spatial extent of elevated concentrations is limited to two locations.

6.2.5 Potential Risk Drivers for the AOC 27 Exposure Area

As presented in Table AOC27-6.1 and summarized in the table below, no risk drivers were identified for the AOC 27 potential exposure area based on unacceptable community-/population-level risk (i.e., HQs greater than 1 for plants and soil invertebrates and the LOAEL-based HQs greater than 1 for mammals and birds [or LOAEL-based HQs greater than 10 for dioxin TEQ]) predicted using the most refined exposure and effects assumptions (i.e., site-specific SUF, area-weighted EPCs, and selected TRVs) and additional LOEs supporting the conclusion of unacceptable risk.

Scenario	Potential Receptors and Risk Drivers at AOC 27 Exposure Area					
	Plants	Soil Invertebrates	Granivorous Mammals (Merriam's kangaroo rat)	Insectivorous Mammals (desert shrew)	Granivorous Birds (Gambel's quail)	Insectivorous Birds (cactus wren)
Baseline	None	None	None	None	None	None

TPH as motor oil	9 / 16	16 - 270	mg/kg	Yes	Detected
Dioxins/Furans					
2,3,7,8-TCDD	3 / 9	1.3 - 19	ng/kg	Yes	Above Background (ERA Only)
TEQ Avian ^g	9 / 9	0.87 - 120	ng/kg	Yes	Above Background (ERA Only)
TEQ Human ^g	9 / 9	0.84 - 120	ng/kg	Yes	Above Background (HHRA Only)
TEQ Mammals ^g	9 / 9	0.84 - 120	ng/kg	Yes	Above Background (ERA Only)

Table AOC27-2.1a**Chemicals Included in the Risk Assessment: AOC 27 Surface Soil (0 to 0.5 feet bgs) for Baseline Scenario****Soil Human Health and Ecological Risk Assessment****PG&E Topock Compressor Station****Needles, California****Notes:**

- ^a Applicable to both human health and ecological risk assessment (HHRA/ERA), unless otherwise noted.
- ^b Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA and ERA. Human health toxicity values are available for iron and manganese and ecological toxicity values are available for manganese, thus these chemicals are evaluated in the HHRA and ERA, if above background levels and have available toxicity values.
- ^c No toxicity values are available for chloride and sulfate, thus these chemicals are not evaluated in the HHRA and ERA.
- ^d Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).
- ^e Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).
- ^f Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.
- ^g Dioxins are evaluated in toxic equivalents.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

mg/kg = milligrams per kilogram.

ng/kg = nanograms per kilogram.

ug/kg = micrograms per kilogram.

COPC = Constituent of Potential Concern.

COPEC = Constituent of Potential Ecological Concern.

ND = Not detected.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

Notes:

- ^a Applicable to both human health and ecological risk assessment (HHRA/ERA), unless otherwise noted.
- ^b Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA and ERA. Human health toxicity values are available for iron and manganese and ecological toxicity values are available for manganese, thus these chemicals are evaluated in the HHRA and ERA, if above background levels and have available toxicity values.
- ^c No toxicity values are available for chloride and sulfate, thus these chemicals are not evaluated in the HHRA and ERA.
- ^d Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).
- ^e Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).
- ^f Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.
- ^g Dioxins are evaluated in toxic equivalents.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

mg/kg = milligrams per kilogram.

ng/kg = nanograms per kilogram.

ug/kg = micrograms per kilogram.

COPC = Constituent of Potential Concern.

COPEC = Constituent of Potential Ecological Concern.

ND = Not detected.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Notes:

- ^a Applicable to human health risk assessment (HHRA) only.
- ^b Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA. Human health toxicity values are available for iron and manganese, thus these chemicals are evaluated in the HHRA, if above background levels and have available toxicity values.
- ^c No toxicity values are available for chloride and sulfate, thus these chemicals are not evaluated in the HHRA.
- ^d Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).
- ^e Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).
- ^f Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.
- ^g Dioxins are evaluated in toxic equivalents.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

mg/kg = milligrams per kilogram.

ng/kg = nanograms per kilogram.

ug/kg = micrograms per kilogram.

COPC = Constituent of Potential Concern.

ND = Not detected.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Notes:
^a The constituent consists of analytes detected at least once at the Topock Compressor Station site and measured in soil in this exposure area.
^b If fewer than eight total locations and four total detected concentrations, the maximum depth-weighted concentration was selected as the EPC. Otherwise, the UCL was selected as the EPC.
^c EPCs and summary statistics were not calculated for some constituents (i.e., dioxin congeners and essential nutrients). Those data, if available, are presented in Attachment A1 of each exposure area-specific appendix.

Abbreviations:
"--" = not applicable
AOC = area of concern
B(a)P equivalent = benzo(a)pyrene equivalent
BCA = Bias-corrected accelerated bootstrap method
COPC = constituent of potential concern
COPEC = constituent of potential ecological concern
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
EPC = exposure point concentration
FOD = frequency of detection
ft bgs = feet below ground surface
KM = Kaplan-Meier
µg/kg = micrograms per kilogram
mg/kg = milligrams per kilogram
NA = not applicable
ND = not detected
ng/kg = nanograms per kilogram
PAH = polycyclic aromatic hydrocarbons
PCB = polychlorinated biphenyls
PG&E = Pacific Gas and Electric Company
TCDD = Tetrachlorodibenzo-p-dioxin
TEQ = toxic equivalent
TPH = total petroleum hydrocarbons
UCL = upper confidence limit
X = COPC/COPEC in the exposure depth interval

- Notes:**
- ^a Exposure point concentrations (EPCs) for surface soil (0 to 0.5 feet bgs) are used to evaluate inhalation of particulates in outdoor air.
 - ^b EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.
 - ^c Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.4×10⁹ m³/kg was used for recreational users (campers, hikers, and hunters) as recommended by Department of Toxic Substances Control (2014).
 - ^d Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.
 - ^e PEF of 8.5×10⁵ m³/kg was used for recreational users (off-highway vehicle rider) as calculated in United States Environmental Protection Agency (2008, 2009) and recommended in "Revised Technical Memorandum, Recreational Visitor Exposure Scenario for Federal Land, PG&E Topock Compressor Station Remediation Project, California," prepared by the Department of the Interior (DOI).

Abbreviations:
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.

TEQ Human	8.4E-05	4.0E-05	6.2E-14	1.1E-11

Notes:

- ^a Exposure point concentrations (EPCs) for shallow soil (0 to 3 feet bgs) are used to evaluate inhalation of particulates in outdoor air.
- ^b EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.
- ^c Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.4×10⁹ m³/kg was used for tribal users as recommended by Department of Toxic Substances Control (2014).
- ^d Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
mg/kg = milligrams per kilogram.
mg/m³ = milligrams per cubic meter.
NA = not applicable.
ND = Not detected.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

TEQ Human	3.4E-05	1.1E-05	2.5E-14	4.4E-12	4.1E-11	4.4E-12

Notes:

- ^a Exposure point concentrations (EPCs) for surface soil (0 to 0.5 feet bgs) are used to evaluate inhalation of particulates in outdoor air.
- ^b EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.
- ^c Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.4×10^9 m³/kg was used for recreational users (hikers) as recommended by Department of Toxic Substances Control (2014).
- ^d Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.
- ^e PEF of 8.5×10^5 m³/kg was used for recreational users (off-highway vehicle rider) as calculated in United States Environmental Protection Agency (2008, 2009) and recommended in "Revised Technical Memorandum, Recreational Visitor Exposure Scenario for Federal Land, PG&E Topock Compressor Station Remediation Project, California," prepared by the Department of the Interior (DOI).

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

bgs = below ground surface.

COPC = Constituent of Potential Concern.

mg/kg = milligrams per kilogram.

mg/m³ = milligrams per cubic meter.

NA = not applicable.

ND = Not detected.

NV = Not volatile.

PCB = Polychlorinated biphenyls.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Summary of COPECs Evaluated in the ERA for AOC 27

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

COPEC ^a	Baseline (0-6 ft bgs)
Inorganics	
Antimony	X
Cadmium	X
Chromium, hexavalent	X
Copper	X
Lead	X
Mercury	X
Zinc	X
Volatile Organic Compounds	
Bromomethane	X
Chloro methane	X
Polycyclic Aromatic Hydrocarbons	
PAH Low molecular weight	X
PAH High molecular weight	X
Polychlorinated Biphenyls	
Total PCBs	X
Dioxins	
TEQ Avian	X
TEQ Mammals	X
2,3,7,8-TCDD	X
Total Petroleum Hydrocarbons	
TPH as diesel	X
TPH as motor oil	X

Note:

^a COPECs selected over the entire soil depth interval (0-6 ft bgs) potentially contacted by ecological receptors. COPECs based on background screening for metals, polycyclic aromatic hydrocarbons, and dioxins. All detected organic compounds were selected as COPECs. See Section 2 of Appendix AOC 27 for details.

Abbreviations:

AOC = area of concern
COPEC = constituent of potential ecological concern
ERA = ecological risk assessment
ft bgs = feet below ground surface
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
X = COPEC in that exposure depth interval

Table AOC27-5.2

Soil Exposure Point Concentration Matrix for Terrestrial Ecological Receptors

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

Ecological Receptor	Exposure Depth Intervals for Calculation of EPCs				
	Soil EPCs ^a		Biota Tissue EPCs		
	All AOCs		All AOCs		
	0-0.5 ft bgs	Maximum EPC (0-0.5, 0-3, 0-6 ft bgs)	Plants - Maximum EPC (0-0.5, 0-3, 0-6 ft bgs)	Insects (0-0.5 ft bgs)	Insectivorous Mammals (0-0.5 ft bgs)
Terrestrial Receptors					
Plants		X			
Invertebrates	X				
Gambel's Quail	X		X		
Cactus Wren	X			X	
Desert Shrew	X			X	
Merriam's Kangaroo Rat		X	X		

Note:

^a EPCs for ecological receptors will be represented by the maximum detected concentration, depth-weighted 95% UCL, and spatially-weighted 95% UCL, as relevant for this exposure area. See Section 5 of Appendix AOC 27 for details.

Abbreviations:

95% UCL = 95% upper confidence limit

AOC = area of concern

EPC = exposure point concentration

ft bgs = feet below ground surface

X = representative EPC for the pathway/receptor

Notes:

^a Calculated using selected soil EPC and uptake model. See Section 6 of the main report.

^b Biota EPCs presented as 0.0 indicate no bioaccumulation from soil.

Bold indicates EPC selected to estimate plant uptake from soil (maximum of surface, shallow, and subsurface I soil).

Abbreviations:

-- = soil EPC or uptake model not available, biota EPCs could not be estimated

AOC = area of concern

COPEC = constituent of potential ecological concern

EPC = exposure point concentration

ft bgs = feet below ground surface

m = maximum depth-weighted concentration

mg/kg = milligrams per kilogram

nd = not detected in this depth interval

ng/kg = nanograms per kilogram

PAH = polycyclic aromatic hydrocarbon

PCB = polychlorinated biphenyl

Notes:
^a WOE Result is risk conclusion based on 1.) HQ/LOAEL HQ using area-weighted EPCs, and 2.) supporting LOE

	NOAEL HQ greater than 1
	HQ or LOAEL HQ greater than 1
	HQ or LOAEL HQ greater than 10
	HQ or LOAEL HQ greater than 100

Abbreviations:
-- = no toxicity value available, HQs could not be estimated
AOC = area of concern
HQ = hazard quotient
LOE = line of evidence
LOAEL = lowest observed adverse effect level
ND = not detected
NOAEL = no-observed adverse effect level
no SL = no screening level available
TEQ = toxic equivalent
WOE = weight of evidence, considering multiple LOE. If HQs/LOAEL HQs > 1, WOE Result is either 1) not expected, 2) unlikely, or 3) possible.

- Notes:**
- a COPECs are presented for HQs greater than 1 based on the depth-weighted EPC and/or area-weighted EPC and species and site-specific SUF.
- b The EPC is based on the maximum depth-weighted concentration due to the small dataset size.
- c The additional lines of evidence for COPECs with NOAEL and LOAEL HQs less than or equal to 1 (based on the area-weighted EPC and species and site-specific SUF) are not included in the table.
- d For plants and soil invertebrates, the background HQ is based on the BTV. For mammals and birds, the NOAEL and LOAEL background HQs are based on the 95 percent upper confidence limit.
- e Applicable to wildlife, unless noted.
- f In areas where observations were noted, the T&E species observed have large home ranges and unlikely to forage in upland habitat. See text for details.
- g For dioxin TEQ, LOAEL HQs less than 10 with supporting LOE were considered unlikely to pose an unacceptable risk to populations of wildlife receptors due to the compounded conservative assumptions included in the ecological risk assessment. See Section 6.7.6 of the main report.

--	LOAEL and NOAEL HQs ≤ 1 for the receptor
	NOAEL HQ greater than 1
	HQ/LOAEL HQ greater than 1
	HQ/LOAEL HQ greater than 10
	HQ/LOAEL HQ greater than 100

- Abbreviations:**
- "--" = not applicable

AOC = area of concern

BAF = bioaccumulation factor

BCW = Bat Cave Wash

BG NA = background value not available

BTV = background threshold value

COPEC = constituent of potential ecological concern

EPC = exposure point concentration

FOD = frequency of detection

HQ = hazard quotient

LOAEL = lowest observed adverse effect limit
- LOE = line of evidence

MDC = maximum depth-weighted concentration

NC = not calculated

NE = line of evidence not evaluated

NOAEL = no observed adverse effect limit

SL = screening level

SWMU 1 = solid waste management unit 1

T&E = threatened and endangered

TCS-4= Topock Compressor Station Well #4

TEQ = toxic equivalent

TRV = toxicity reference value

Abbreviations:
-- = not applicable
mg/kg = milligrams per kilogram
ug/kg = micrograms per kilogram
J = estimated value
U = not detected at specified reporting limit
UJ = not detected at specified reporting limit; reporting limit
AOC = area of concern
BHC = benzene hexachloride
DDD = Dichlorodiphenyldichloroethane
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
TPH = total petroleum hydrocarbon
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyls

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.
NA = Not applicable. Carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated using benzo(a)pyrene equivalents. Hexavalent chromium is not absorbed via dermal contact.
NC = Not considered a carcinogen.
ND = Not detected.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:

^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

bgs = below ground surface.

CDI = Chronic Daily Intake.

COPC = Constituent of Potential Concern.

EC = Exposure Concentration.

mg/kg-day = milligrams per kilogram per day.

mg/m³ = milligrams per cubic meter.

na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.

NA = Not applicable. Carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated using benzo(a)pyrene equivalents. Hexavalent chromium is not absorbed via dermal contact.

NC = Not considered a carcinogen.

ND = Not detected.

NV = Not volatile.

PCB = Polychlorinated biphenyls.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Notes:^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.**Abbreviations:**

B(a)P equivalent = Benzo(a)pyrene equivalent.

bgs = below ground surface.

CDI = Chronic Daily Intake.

COPC = Constituent of Potential Concern.

EC = Exposure Concentration.

mg/kg-day = milligrams per kilogram per day.

mg/m³ = milligrams per cubic meter.

na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.

NA = Not applicable. Carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated using benzo(a)pyrene equivalents. Hexavalent chromium is not absorbed via dermal contact.

NC = Not considered a carcinogen.

ND = Not detected.

NV = Not volatile.

PCB = Polychlorinated biphenyls.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene). Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene).
Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
ILCR = Incremental Lifetime Cancer Risk.
na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.
NA = Not applicable. Carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated using benzo(a)pyrene equivalents. Hexavalent chromium is not absorbed via dermal contact.
NC = Not considered a carcinogen.
ND = Not detected.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:

^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:

-- = not calculated.
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
ILCR = Incremental Lifetime Cancer Risk.
na = Not applicable. Potential exposure to lead is not complete for the tribal user. Please see text for discussion.
NA = Not applicable. Carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated using benzo(a)pyrene equivalents.
NC = Not considered a carcinogen.
ND = Not detected.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
HI = Hazard Index
na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene). Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
HI = Hazard Index
na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene). Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
HI = Hazard Index
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene). Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
HI = Hazard Index
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene). Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
HI = Hazard Index
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene). Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

MODIFIED VERSION OF USEPA ADULT LEAD MODEL

CALCULATIONS OF BLOOD LEAD CONCENTRATIONS (PbBs) AND PRELIMINARY REMEDIATION GOAL (PRG)

EDIT RED CELL

Variable	Description of Variable	Units	0-0.5 feet below ground surface	0-3 feet below ground surface
PbS	Soil lead concentration	ug/g or ppm	233.0	168.0
$R_{\text{fetal/maternal}}$	Fetal/maternal PbB ratio	--	0.9	0.9
BKSF	Biokinetic Slope Factor	ug/dL per ug/day	0.4	0.4
GSD_i	Geometric standard deviation PbB	--	1.8	1.8
PbB_0	Baseline PbB	ug/dL	0.0	0.0
IR_s	Soil ingestion rate (including soil-derived indoor dust)	g/day	0.05	0.05
$AF_{s, d}$	Absorption fraction (same for soil and dust)	--	0.12	0.12
$EF_{s, d}$	Exposure frequency (same for soil and dust)	days/yr	8	8
$AT_{s, d}$	Averaging time (same for soil and dust)	days/yr	365	365
PbB_{adult}	PbB of adult worker, geometric mean	ug/dL	0.012	0.009
$PbB_{\text{fetal, 0.90}}$	90th percentile PbB among fetuses of adult workers	ug/dL	0.02	0.02
PbB_t	Target PbB level of concern (e.g., 10 ug/dL)	ug/dL	1.0	1.0
$P(PbB_{\text{fetal}} > PbB_t)$	Probability that fetal PbB > PbB_t , assuming lognormal distribution	%	0%	0%

PRG90

9942

Notes:

Highlighted values are site-specific: soil ingestion rate of 50 mg/day is the default incidental soil ingestion rate evaluation of exposure to lead in soil (USEPA 2003). Exposure frequency (8 days/year) based on the assumption of 8 days per month, 1 month per year as shown in Table 5.1 of the main report.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.
NA = Not applicable. Carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated using benzo(a)pyrene equivalents. Hexavalent chromium is not absorbed via dermal contact.
NC = Not considered a carcinogen.
ND = Not detected.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.**Abbreviations:**

B(a)P equivalent = Benzo(a)pyrene equivalent.

bgs = below ground surface.

CDI = Chronic Daily Intake.

COPC = Constituent of Potential Concern.

EC = Exposure Concentration.

mg/kg-day = milligrams per kilogram per day.

mg/m³ = milligrams per cubic meter.

na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.

NA = Not applicable. Carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated using benzo(a)pyrene equivalents. Hexavalent chromium is not absorbed via dermal contact.

NC = Not considered a carcinogen.

ND = Not detected.

NV = Not volatile.

PCB = Polychlorinated biphenyls.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
ILCR = Incremental Lifetime Cancer Risk.
na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.
NA = Not applicable. Carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated using benzo(a)pyrene equivalents. Hexavalent chromium is not absorbed via dermal contact.
NC = Not considered a carcinogen.
ND = Not detected.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
HI = Hazard Index
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene). Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
HI = Hazard Index
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene). Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

CALCULATIONS OF BLOOD LEAD CONCENTRATIONS (PbBs) AND PRELIMINARY REMEDIATION GOAL (PRG)

EDIT RED CELL

Variable	Description of Variable	Units	0-0.5 feet below ground surface	0-3 feet below ground surface	0-6 feet below ground surface	0-10 feet below ground surface
PbS	Soil lead concentration	ug/g or ppm	125	73.2	29.4	23.9
$R_{\text{fetal/maternal}}$	Fetal/maternal PbB ratio	--	0.9	0.9	0.9	0.9
BKSF	Biokinetic Slope Factor	ug/dL per ug/day	0.4	0.4	0.4	0.4
GSD_i	Geometric standard deviation PbB	--	1.8	1.8	1.8	1.8
PbB_0	Baseline PbB	ug/dL	0.0	0.0	0.0	0.0
IR_S	Soil ingestion rate (including soil-derived indoor dust)	g/day	0.100	0.100	0.100	0.100
$AF_{S,D}$	Absorption fraction (same for soil and dust)	--	0.12	0.12	0.12	0.12
$EF_{S,D}$	Exposure frequency (same for soil and dust)	days/yr	10	10	10	10
$AT_{S,D}$	Averaging time (same for soil and dust)	days/yr	365	365	365	365
PbB_{adult}	PbB of adult worker, geometric mean	ug/dL	0.016	0.010	0.004	0.003
$PbB_{\text{fetal}, 0.90}$	90th percentile PbB among fetuses of adult workers	ug/dL	0.03	0.02	0.01	0.01
PbB_t	Target PbB level of concern (e.g., 10 ug/dL)	ug/dL	1.0	1.0	1.0	1.0
$P(PbB_{\text{fetal}} > PbB_t)$	Probability that fetal PbB > PbB_t , assuming lognormal distribution	%	0%	0%	0%	0%

PRG90

3977

Notes:

Highlighted values are site-specific: soil ingestion rate (100 mg/day) consistent with United States Environmental Protection Agency (USEPA) recommendations for evaluating construction (i.e., soil contact-intensive) scenarios (USEPA 2016). Exposure frequency (10 days/year) is a site-specific value for long-term maintenance workers, based on 4 work hours per 8 hour work day, 20 days per year as shown in Table 5.1 of the main report.

Notes:

Highlighted values are Site-specific: days per week based on the assumption of 2 days per month, 8 months per year. Soil ingestion rate of 330 mg/day is modified by exposure time (1.5 hours riding at site per 16 awake hours, or 0.09). Default inhalation breathing rate of 6.8 m³/day is modified to account for exposure time (i.e., 1.5 hours riding at site per 24 hours, or 0.06) . See Table 5.1 of the main report for details.

Notes:

	HQ greater than 1
	HQ greater than 10
	HQ greater than 100

Abbreviations:

AOC = area of concern
 COPEC = constituent of potential ecological concern
 EPC = exposure point concentration
 HQ = hazard quotient
 LOAEL = lowest observed adverse effect level
 mg/kg = milligrams per kilogram
 ND = not detected in the applicable depth interval
 ng/kg = nanograms per kilogram
 no SL = no screening level available
 NOAEL = no-observed adverse effect level
 PAH = polycyclic aromatic hydrocarbon
 PCB = polychlorinated biphenyl

Notes:

	HQ greater than or equal to 1
	HQ greater than or equal to 10
	HQ greater than or equal to 100

Abbreviations:

AOC = area of concern
 COPEC = constituent of potential ecological concern
 EPC = exposure point concentration
 HQ = hazard quotient
 LOAEL = lowest observed adverse effect level
 mg/kg = milligrams per kilogram
 ND = not detected in the applicable depth interval
 ng/kg = nanograms per kilogram
 no SL = no screening level available
 NOAEL = no-observed adverse effect level
 PAH = polycyclic aromatic hydrocarbon
 PCB = polychlorinated biphenyl

Table AOC27-C Table Notes
Notes for Terrestrial Wildlife Risk Calculations

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

Notes:

^a Dioxin presented in ng/kg.

^b Total dose equation is presented below:

$$\text{Total Dose (mg/kg-day)} = [(EPC_{\text{soil}} \times SIR) + (C_{\text{plants}} \times FIR \times F_{\text{plants}}) + (C_{\text{insects}} \times FIR \times F_{\text{insects}}) + (C_{\text{mammals}} \times FIR \times F_{\text{mammals}})] \times \text{SUF}$$

^c HQ = Total Dose / TRV

Abbreviations:

AOC = area of concern

BTAG = Biological Technical Assistance Group

COPEC = constituent of potential ecological concern

dw = dry weight

EPC_{soil} = exposure point concentration in soil (mg/kg dw)

EPC_{plants} = exposure point concentration in plants (mg/kg dw)

EPC_{insects} = exposure point concentration in insects (mg/kg dw)

EPC_{mammals} = exposure point concentration in mammals (mg/kg dw)

F_{plants} = fraction of plants in diet

F_{insects} = fraction of insects in diet

F_{mammals} = fraction of mammals in diet

FIR = food ingestion rate (kg dw/kg bw-day)

HQ = hazard quotient (unitless)

kg = kilogram

kg dw/kg bw-day = kilograms per kilogram of body weight per day

LOAEL = lowest observed adverse effect level (mg/kg-day)

m = maximum detected concentration

mg/kg = milligrams per kilogram

mg/kg-day = milligrams per kilogram per day

ND = not detected

ng/kg = nanograms per kilogram

NOAEL = no observed adverse effect level (mg/kg-day)

PAH = polycyclic aromatic hydrocarbon

PCB = polychlorinated biphenyl

SIR = soil ingestion rate (kg dw/kg bw-day)

SUF = site use factor (fraction)

TRV = toxicity reference value (mg/kg-day)

Notes:

a. Calculated using selected soil EPC and uptake model. See Section 6 of the main report.

b. Biota EPCs presented as 0.0 indicate no bioaccumulation from soil.

Bold indicates EPC selected to estimate plant uptake from soil (maximum of surface, shallow, and subsurface I soil).**Abbreviations:**

-- = soil EPC or uptake model not available, biota EPCs could not be estimated.

AOC = area of concern

COPEC = constituent of potential ecological concern

EPC = exposure point concentration

ft bgs = feet below ground surface

m = maximum depth-weighted concentration

mg/kg = milligrams per kilogram

nd = not detected in this depth interval

ng/kg = nanograms per kilogram

PAH = polycyclic aromatic hydrocarbon

PCB = polychlorinated biphenyl

2,3,7,8-TCDD	1.90E+01	--	No SL	1.90E+01	8800	2E-03

Notes:

	HQ greater than 1
	HQ greater than 10
	HQ greater than 100

Abbreviations:

AOC = area of concern
COPEC = constituent of potential ecological concern
EPC = exposure point concentration
HQ = hazard quotient
LOAEL = lowest observed adverse effect level
mg/kg = milligrams per kilogram
ND = not detected in the applicable depth interval
ng/kg = nanograms per kilogram
no SL = no screening level available
NOAEL = no-observed adverse effect level
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

Notes:

^a Dioxin presented in ng/kg.

^b Total dose equation is presented below:

$$\text{Total Dose (mg/kg-day)} = [(EPC_{\text{soil}} \times \text{SIR}) + (C_{\text{plants}} \times \text{FIR} \times F_{\text{plants}}) + (C_{\text{insects}} \times \text{FIR} \times F_{\text{insects}}) + (C_{\text{mammals}} \times \text{FIR} \times F_{\text{mammals}})] \times \text{SUF}$$

^c HQ = Total Dose / TRV

Abbreviations:

AOC = area of concern

BTAG = Biological Technical Assistance Group

COPEC = constituent of potential ecological concern

dw = dry weight

EPC_{soil} = exposure point concentration in soil (mg/kg dw)

EPC_{plants} = exposure point concentration in plants (mg/kg dw)

EPC_{insects} = exposure point concentration in insects (mg/kg dw)

EPC_{mammals} = exposure point concentration in mammals (mg/kg dw)

F_{plants} = fraction of plants in diet

F_{insects} = fraction of insects in diet

F_{mammals} = fraction of mammals in diet

FIR = food ingestion rate (kg dw/kg bw-day)

HQ = hazard quotient (unitless)

kg = kilogram

kg dw/kg bw-day = kilograms per kilogram of body weight per day

LOAEL = lowest observed adverse effect level (mg/kg-day)

m = maximum detected concentration

mg/kg = milligrams per kilogram

mg/kg-day = milligrams per kilogram per day

ND = not detected

ng/kg = nanograms per kilogram

NOAEL = no observed adverse effect level (mg/kg-day)

PAH = polycyclic aromatic hydrocarbon

PCB = polychlorinated biphenyl

SIR = soil ingestion rate (kg dw/kg bw-day)

SUF = site use factor (fraction)

TRV = toxicity reference value (mg/kg-day)

1 INTRODUCTION

This appendix presents the human health and ecological risk assessment (HHERA) for the Area of Concern 28a,b,c (AOC 28) potential soil exposure area located outside the Topock Compressor Station (TCS) in Needles, California. The AOC 28 potential exposure area, shown on Figure AOC28-1.1, is approximately 0.04 acre and includes sample locations shown in Table AOC28-1.1 of this appendix. Available soil data from the AOC 28 potential exposure area were used to conduct a quantitative HHERA as presented herein. A summary of the human health risk assessment (HHRA) and the ecological risk assessment (ERA) results are presented in Sections 5 and 6, respectively of the Soil Human Health and Ecological Risk Assessment Report (the “main report”). This appendix refers to “HHRA” when discussing specific information for assessing risks to human health, “ERA” when discussing specific information for assessing risks to potential ecological receptors, and “HHERA” when discussing topics that are common to both the HHRA and the ERA.

Descriptions of the physical location and characteristics of the AOC 28 potential exposure area and the HHERA methodologies are provided in the main report and the Human Health and Ecological Risk Assessment Work Plan (RAWP) documents (Arcadis U.S., Inc. [Arcadis] 2008, 2009, 2015) and are not repeated in this appendix. Detailed discussions of the historical uses and sampling and analysis are presented in the main report as well.

This appendix summarizes site use, data evaluation, potential receptors, potential exposure pathways and the results of the HHERA risk characterization for soil in the AOC 28 potential exposure area. Tables and figures specific to the AOC 28 potential exposure area HHERA are also presented in this appendix.

1.1 Summary of Site Use

AOC 28, also referred to as the Pipeline Drip Legs Area, consists of four drip legs associated with 300A and 300B pipelines (Figure 2-1a in main report). Three of these legs are located east of the TCS, and a drip leg for the 300B pipeline is downstream of the TCS in Bat Cave Wash (BCW). A drip leg is designed to collect pipeline liquids by gravity. Each drip leg is connected to a valve used to drain the pipeline liquids to a portable tank. AOC 28 is located on Pacific Gas and Electric Company (PG&E) and Havasu National Wildlife Refuge property.

The 300A pipeline drip legs AOC 28a and AOC 28b, were installed in the early 1950s. The drip leg associated with AOC 28c: 300B Pipeline Drip East of Compressor Station was installed the mid-1950s. The drip leg associated with AOC 28d: 300B Drip in BCW was installed in the late 1990s. The 300B dog-leg drip was formerly connected to the 300B Pipeline Liquids Tank, which was investigated separately as Undesignated Area (UA) 2.

All drip legs are currently drained to portable tanks on a monthly basis. A historical procedure for draining pipeline drips confirms this frequency (PG&E 1989) is consistent with past practices. It is possible that some spillage could occur or may have historically occurred during the transfer process. All potential releases at the drip legs would be surface releases, and the releases would be confined to a very small area in the immediate vicinity of the drip legs. If released, volatile organic compounds (VOCs) in surface soil would be expected to have been degraded by heat and light and are likely no longer present. Therefore, surface soil is the primary source medium.

APPENDIX AOC28
SOIL HHERA FOR AOC 28 EXPOSURE AREA

Since the early 1980s, PG&E has been conducting annual polychlorinated biphenyl (PCB) testing on the collected pipeline liquids from the incoming 300A and 300B transmission pipelines. No PCBs have been detected (at detection limits ranging from 0.005 to 5 milligram per kilogram [mg/kg]) coming into the compressor station through those pipelines. After PG&E discovered the presence of PCBs in some pipeline liquids from Transwestern at Topock in the late 1990s, PG&E installed protective equipment and cleaned portions of the pipeline system to remove PCB contamination. Subsequently, PG&E implemented a monthly PCB monitoring program along the entire downstream Line 300 gas pipeline system. Since the initiation of this testing protocol, only low levels of PCBs have been detected in the downstream pipelines.

2 DATA EVALUATION AND COPC/COPEC SELECTION

This section summarizes the data considered for the AOC 28 potential exposure area HHERA and presents the constituents of potential concern (COPCs) for human health and constituents of potential ecological concern (COPECs) selected for the AOC 28 potential exposure area.

All soil sampling locations at the AOC 28 potential exposure area are presented on Figure AOC28-1.1 and in Table AOC28-1.1. The data were evaluated based on the methodology described in the RAWP documents (Arcadis 2008, 2009, 2015). Details of the soil sampling and analysis will be presented in the forthcoming Resource Conservation and Recovery Act Facility Investigation/Remedial Investigation Report Volume 3 being prepared by Jacobs.

Following the steps outlined in Section 3 of the main report, soil data considered usable for the risk assessment were identified and used in the quantitative HHERA. All available soil data for the AOC 28 potential exposure area are presented in Attachment AOC28-A1. For the AOC 28 potential exposure area, soil data are available from 14 samples collected from 0 to 10 feet (ft) below ground surface (bgs) and all of them were considered for use in the HHERA as potential soil contact does not extend below 10 ft (Table AOC28-1.1). Data processed for the HHERA (e.g., calculation of total concentrations for low molecular weight [LMW] and high molecular weight [HMW] polycyclic aromatic hydrocarbons [PAHs], benzo(a)pyrene equivalent [B(a)PEQ], and PCBs) are described in detail in Section 3 of the main report.

The process for identifying COPCs and COPECs included in the HHERA is detailed in Section 3.4 of the main report. COPCs and COPECs were selected for the AOC 28 potential exposure area using soil data encompassing all relevant exposure depths for the HHERA (i.e., 0 to 10 ft bgs for the AOC 28 potential exposure area), presented in Attachment AOC28-A1. Only two metals (molybdenum and zinc) were above background levels in the AOC 28 potential exposure area soil. However, these constituents were analyzed only in deeper soil (i.e., greater than 6 ft bgs) and, therefore, are included as COPCs in the subsurface I soil baseline scenario evaluated in the HHRA, but not as COPECs for the ERA.

B(a)PEQ was within the range of background; therefore, B(a)PEQ and associated carcinogenic PAHs (i.e., benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, dibenzo[a,h]anthracene, chrysene, and indeno[1,2,3-cd]pyrene) were not selected as COPCs for the HHRA. HMW and LMW PAHs were within the range of background concentrations and were not selected as COPECs for the ERA.

All other detected organic constituents in the AOC 28 potential exposure area soil in the baseline exposure depths (see Section 3 of the main report) are included as COPCs and/or COPECs in the HHERA. COPCs and/or COPECs selected for exposure depths and scenarios (baseline) evaluated in the HHERA for the AOC 28 potential exposure area are summarized in Table AOC28-2.1a through AOC28-2.1d. The selected COPCs and COPECs are discussed further in Sections 4 and 5, respectively, of this appendix.

3 EXPOSURE POINT CONCENTRATIONS

Depth-weighted exposure point concentrations (EPCs) for COPCs/COPECs in soil at the AOC 28 potential exposure area were calculated as described in Section 4.2 of the main report. For the AOC 28 potential exposure area, one scenario was evaluated: Baseline (no scouring).

The following exposure depths were evaluated:

1. Surface soil (0 to 0.5 ft bgs)
2. Shallow soil (0 to 3 ft bgs)
3. Subsurface I soil (0 to 6 ft bgs)
4. Subsurface II soil (0 to 10 ft bgs).

The depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment AOC28-A2. The summary statistics for these AOC 28 potential exposure area soil depth-weighted datasets and depth-weighted EPCs were calculated consistent with the RAWP documents (Arcadis 2008, 2009, 2015).

Per the RAWP documents (Arcadis 2008, 2009, 2015), area-weighted EPCs for the HHRA are evaluated only if depth-weighted EPCs suggest that cumulative cancer risks and/or noncancer hazards may be significant for any given HHRA exposure scenario (i.e., cumulative cancer risks exceed a 10^{-6} cancer risk level, and/or the noncancer hazard index [HI] exceeds 1). Similarly, for the ERA, area-weighted EPCs are evaluated only if depth-weighted EPCs suggest potential risk to potential ecological receptors (i.e., hazard quotient [HQ] exceeds 1 for any COPEC). Area-weighted EPCs were not deemed necessary for the HHRA or the ERA and, therefore, were not calculated.

Soil summary statistics for constituents measured at the AOC 28 potential exposure area¹ and detected at least once and depth-weighted EPCs for COPCs/COPECs calculated using depth-weighted data from the exposure depths listed above for the AOC 28 potential exposure area are presented in Table AOC28-3.1. Due to the small dataset sizes for the surface, shallow, subsurface I, and subsurface II soil datasets in the AOC 28 potential exposure area (i.e., insufficient data to calculate upper confidence limits on the mean), the depth-weighted EPCs were based on maximum depth-weighted concentrations.

¹ The list of constituents shown in the main report Section 3 tables is based on analytes that were detected at least once at the site (including all exposure areas inside or outside the TCS) and measured at the AOC 28 potential exposure area.

4 HUMAN HEALTH RISK ASSESSMENT

This section briefly summarizes the HHRA approach; presents the COPC, EPC, risk, and hazard summary tables; and discusses the results of the risk characterization and uncertainties in the risk assessment for the AOC 28 potential exposure area. Details of the overall HHRA approach are presented in Section 5 of the main report. Dose, exposure concentration (EC), risk, and hazard calculation tables for potential human health receptors at the AOC 28 potential exposure area are presented in Attachment AOC28-B.

Risks/hazards estimated for an individual AOC/SWMU/UA potential exposure area like AOC 28 are not considered representative of the realistic or likely potential exposures for the human populations that could be present in the areas outside the TCS (such as maintenance workers, recreational users, and tribal users). Risks/hazards calculated separately for individual AOCs are conservative and likely overestimate site risks/hazards. As described in the RAWP documents (Arcadis 2008, 2009, 2015), these human populations would more likely be exposed randomly, over the course of a lifetime, to soil present in all individual AOC/solid waste management unit (SWMU)/UA potential exposure areas located outside the TCS, rather than have a lifetime of contact limited to the area of a single potential exposure area. Therefore, estimated risks/hazards presented for individual AOC/SWMU/UA potential exposure areas are not believed to be representative of the potential health risks to humans potentially contacting the soil outside the TCS. Rather, the HHRA results presented in Appendix OCS for all AOC/SWMU/UA potential exposure areas located outside the TCS combined will help to inform risk management decisions for the site. The estimated risks and hazards associated with a lifetime of contact with soil only in the AOC 28 potential exposure area are presented at the request of the agencies and are not suitable to provide the sole basis of risk management decisions to protect human health.

4.1 Human Health Conceptual Site Model

Following the steps outlined in Section 5.5 of the main report, risks were estimated for potentially complete and significant exposure pathways identified in the human health conceptual site model (CSM) for potential receptors potentially exposed to COPCs in soil present at the AOC 28 potential exposure area. The potential receptors and exposure pathways evaluated for the AOC 28 potential exposure area included:

- **Short- and Long-Term Maintenance Workers** – Incidental ingestion of soil, dermal contact with soil, inhalation of particulates and VOC vapors in ambient outdoor air from soil
- **Recreational Users (child and/or adult camper, hiker, hunter, and off-highway vehicle [OHV] rider)** – Incidental ingestion of soil, dermal contact with soil, and inhalation of particulates and VOC vapors in ambient outdoor air from soil
- **Tribal Users** – Inhalation of particulates and VOC vapors in ambient outdoor air from soil.

Potential exposure pathways considered incomplete or insignificant were not quantitatively evaluated and are discussed in Section 5.3.1 of the main report.

4.2 Constituents of Potential Concern

COPCs for the AOC 28 potential exposure area were selected in accordance with the RAWP documents (Arcadis 2008, 2009, 2015) and as described in Section 3.4 of the main report. Data used in the COPC selection process are presented in Attachment AOC28-A1. COPCs for the four exposure depths and one scenario (baseline) evaluated for the AOC 28 potential exposure area HHRA are summarized in Table AOC28-4.1 (details are presented in Tables AOC28-2.1a through AOC28-2.1d).

COPCs included two metals (molybdenum and zinc), PAHs, total petroleum hydrocarbon (TPH) as diesel, and TPH as motor oil in surface, shallow, subsurface I, and/or subsurface II soil.

4.3 Exposure Point Concentration Summary

For the potentially complete and significant exposure pathways identified in the CSM, EPCs were calculated as described in Section 4.2 of the main report and presented in Section 3 of this appendix. Depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment AOC28-A2. Depth-weighted EPCs for COPCs in soil and predicted outdoor air concentrations used to estimate risk in the HHRA are summarized in Tables AOC28-4.2a through AOC28-4.2h for the four exposure depths in the baseline scenario. Tables are presented for each potential receptor type with the EPCs for soil depths relevant to that potential receptor.

As described in detail in Section 5.3.3 of the main report, the following exposure depths and corresponding EPC datasets were used to evaluate potential exposure to COPCs in soil for potential human receptors:

- **Short- and Long-Term Maintenance Workers** – surface, shallow, subsurface I, and subsurface II soil
- **Recreational Users (child and/or adult camper, hiker, hunter, and OHV rider)** – surface and shallow soil
- **Tribal Users** – surface and shallow soil.

4.4 Estimation of Dose

The EC and chronic daily intake (CDI) for potential carcinogenic and noncarcinogenic effects were calculated, as described in Section 5.5.1 of the main report, for COPCs in soil for potentially complete exposure pathways. The calculated EC and CDI values are presented in Tables AOC28-B.1a through AOC28-B.1h (carcinogenic effects) and Tables AOC28-B.2a through AOC28-B.2g (noncarcinogenic effects) in Attachment AOC28-B for the potential receptors evaluated. Exposure parameters used in the dose calculations are presented in Table 5-1 of the main report.

4.5 Toxicity Assessment

The toxicity assessment characterizes the relationship between the magnitude of exposure to a constituent and the potential for adverse health effects. More specifically, the toxicity assessment identifies agency-promulgated or derived toxicity values that can be used to estimate the likelihood of adverse health effects occurring in humans at different exposure levels. The approach for the toxicity assessment was provided in Section 4.5 of the RAWP (Arcadis 2008) and in Section 4.2 of the RAWP Addendum 2 (Arcadis 2015).

Consistent with regulatory risk assessment policy, adverse health effects resulting from chemical exposures are evaluated in two categories: carcinogenic effects and noncarcinogenic effects. The hierarchy of sources for the toxicity criteria to be used for the HHRA generally corresponds to the California Department of Toxic Substances (DTSC) guidance (2015). Toxicity values for carcinogenic and noncarcinogenic effects for COPCs selected and used for the HHRA are described in Section 5.4 of the main report and were used to estimate potential cancer risks and noncancer hazards.

4.6 Human Health Risk Characterization

For potential human receptors, assuming lifetime soil exposure is limited to the AOC 28 potential exposure area, the incremental lifetime cancer risks (ILCRs) and/or noncancer HQs were calculated for each COPC and potentially complete exposure pathway. Estimated cumulative ILCRs (i.e., sum of chemical-specific ILCRs for each exposure depth for a scenario) were calculated and compared to the DTSC point of departure for risk management decision of 1×10^{-6} ; risk management decisions may raise this criterion depending on site-specific conditions. As indicated in the National Oil and Hazardous Substances Pollution Contingency Plan (40 Code of Federal Regulations 300), cancer risks with between one in a million and one hundred in a million probability of occurrence (1×10^{-6} and 1×10^{-4}) fall within a risk management range. This is generally referred to as the acceptable risk range. Within this estimated cancer risk range, there is flexibility for risk managers in deciding what action, if any, is necessary and appropriate for the protection of human health. Estimated cumulative noncancer hazards (i.e., HIs) are calculated and compared to an HI of 1 (DTSC 2015). Chemical exposures that yield HIs of less than or equal to 1 are not expected to result in adverse noncancer health effects (United States Environmental Protection Agency 1989).

4.6.1 Risk Characterization for Exposure to Soil (Baseline Scenario and Depth-Weighted EPCs)

Table AOC28-4.3 summarizes cumulative ILCRs and HIs estimated using depth-weighted EPCs for potential exposure to soil for each potential human receptor evaluated at the AOC 28 potential exposure area in the baseline scenario. The dose, EC, ILCR, and HI equations are presented in detail in Section 5.5.1 of the main report. The detailed cancer risk estimates (Tables AOC28-B.3a through AOC28B.3g) and noncancer hazard calculations (Tables AOC28-B.4a through AOC28-B.4g) are presented in Attachment AOC28-B.

Risk and hazard estimates for the AOC 28 potential exposure area are summarized in the tables below. Assuming that lifetime soil contact is limited to the AOC 28 potential exposure area, the depth-weighted estimated cumulative ILCRs and HIs for each potential receptor potentially exposed to COPCs in AOC 28 potential exposure area soil at all exposure depths are below the *de minimis* levels of 1×10^{-6} and 1, respectively.

Maintenance Workers

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 28 Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
	Surface	2E-11	NA	0.03	NA
	Shallow	2E-11	NA	0.03	NA

	Shallow	4E-12	NA	0.0003	NA

Note:

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

4.6.2 Uncertainties in the Risk Assessment

The risk assessment includes several uncertainties that warrant discussion. Many of the assumptions used in this risk assessment, regarding the representativeness of the sampling data, potential human exposures, fate and transport modeling, and chemical toxicity are conservative, follow agency guidance and reflect a 90th or 95th percentile value rather than a typical or average value. The use of several conservative exposure assumptions and toxicity estimates can introduce considerable uncertainty into the risk assessment. By using conservative exposure assumptions or toxicity estimates, the assessment can develop a significant conservative bias that may result in the calculation of significantly higher estimates for cancer risks or noncancer hazards than are actually posed by the chemicals present in soil. These uncertainties are discussed in detail in Section 5.6 of the main report. Uncertainties applicable only to the risk assessment for the AOC 28 potential exposure area are discussed below.

Uncertainties for the AOC 28 potential exposure area include the use of the maximum depth-weighted soil concentration as the EPC. The maximum depth-weighted soil concentration was used for COPCs when the soil dataset contained fewer than four detected values (i.e., concentrations reported above the detection limit) or fewer than eight total observations as shown in Table AOC 28-3.1. As stated in Section 3, due to the small dataset sizes for the surface, shallow, subsurface I, and subsurface II soil datasets in the AOC 28 potential exposure area (i.e., insufficient data to calculate upper confidence limits on the mean), the depth-weighted EPCs were based on maximum depth-weighted concentrations.

The use of the maximum depth-weighted soil concentration as the EPC for the COPCs may not appropriately represent exposures and resulting risks/hazards for the short- and long-term maintenance workers, recreational users, and tribe user evaluated in the AOC 28 potential exposure area HHRA.

5 ECOLOGICAL RISK ASSESSMENT

This section briefly summarizes the ERA approach and presents the COPECs selected for the ERA. TPHs were the only COPECs selected for soil in the depth intervals contacted by potential ecological receptors (0 to 6 ft bgs). Because TPHs are evaluated using indicator compounds (as described below in Section 5.2), EPCs and dose and risk calculations for the AOC 28 potential exposure area were not necessary. Details of the overall ERA approach are presented in Section 6 of the main report.

5.1 Ecological Conceptual Site Model

Following the steps outlined in Section 6.6 and on Figures 2-7 and 6-1 of the main report, risks were estimated for potentially complete and significant exposure pathways identified for potential receptors exposed to COPECs in soil at the AOC 28 potential exposure area. These potential receptors included plants, invertebrates, and small home-range receptors:

- **Plants** – may be exposed to COPECs via root uptake from surface, shallow and/or subsurface I soil, depending on the root depth of plants of concern.
- **Soil Invertebrates** – may be exposed to COPECs via direct contact/uptake from surface soil.
- **Mammals** – may be exposed to COPECs via incidental ingestion of surface, shallow, or subsurface I soil (for burrowing animals) and/or ingestion of biota tissue (i.e., food items). The small home-range mammalian indicator receptors evaluated in this ERA for the AOC 28 potential exposure area were:
 - **Merriam's Kangaroo Rat**– representative of granivorous small mammal populations exposed to surface, shallow, and/or subsurface I soil (incidental and through biota uptake)
 - **Desert Shrew**– representative of invertivorous small mammal populations exposed only to surface soil (incidental and through biota uptake).
- **Birds** – may be exposed to COPECs via incidental ingestion of surface, shallow, or subsurface I soil and/or ingestion of biota tissue (i.e., food items). The small home-range bird indicator receptors evaluated in this ERA for the AOC 28 potential exposure area were:
 - **Cactus Wren** – representative of insectivorous bird populations exposed only to surface soil (incidental and through biota uptake)
 - **Gambel's Quail** – representative of granivorous bird populations exposed incidentally only to surface soil and exposed to surface, shallow, or subsurface I soil (incidental and through biota uptake).

Potential exposure pathways considered incomplete or insignificant were not quantitatively evaluated; these potential exposure pathways are identified and described in Section 6.3 of the main report.

Potential large home-range receptors (i.e., desert kit fox, red-tailed hawk, and Nelson's desert bighorn sheep) were evaluated for larger exposure areas (combined AOCs) and are discussed in those specific appendices. Potential risks to desert kit fox, red-tailed hawk, and Nelson's desert bighorn sheep associated with the AOC 28 potential exposure area were estimated and characterized as part of the evaluation of all AOCs outside the compressor station (OCS) and all AOCs outside the compressor station excluding BCW+AOC4

(OCSxBCW+AOC4); please see Appendix OCS and Appendix OCSxBCW+AOC4 for risk characterization for these large home-range potential receptors.

5.1.1 Evaluation of Special-Status Species

The biological setting for the site and the adjacent areas are described in detail in various reports (see Section 2.4 of the main report). Potential habitat exists for special-status² species at or near the site but none have been observed at the AOC 28 potential exposure area. The primary vegetation present at the AOC 28 potential exposure area is sparse creosote bush (*Larrea tridentate*). No federal- or state-listed T&E plants or candidates for listing were found at the site, including the AOC 28 potential exposure area.

Several species of mammals and birds have been observed at or near the site (see Tables 2-2 and 2-4 of the main report). However, no federal- or state-listed T&E species or candidates for listing were observed at the AOC 28 potential exposure area.

The risk estimates presented here are considered to be protective of special-status species due to the conservative nature of the ERA, where conservative parameters (e.g., small exposure areas, selected indicator species for each functional group considered on the high end of potential exposures for typical potential receptors at the site within that group, use of no-effects-based toxicity values) were used to assess risks to a wide range of potential receptors at various trophic levels. Therefore, further evaluation of special-status species was not considered necessary.

5.2 Constituents of Potential Ecological Concern

COPECs for the AOC 28 potential exposure area were selected in accordance with the RAWP (Arcadis 2008) and as described in Section 3.4 of the main report. Soil data encompassing all relevant exposure depths for the HHERA (i.e., 0 to 10 ft bgs for the AOC 28 potential exposure area) and used in the COPEC selection process are presented in Attachment AOC28-A1.

Because a potential ecological receptor could be exposed to COPECs at various exposure depths either directly and/or through their diet for a given scenario, a single comprehensive COPEC list was selected based on the range of soil depths encountered by potential ecological receptors in the baseline scenario. Additionally, essential nutrients (e.g., calcium, potassium) and analytes typically measured to evaluate geochemical conditions (e.g., chloride, nitrate, sulfate) are not typically evaluated in ERAs and were not selected as COPECs. COPECs for the three exposure depths evaluated for the baseline scenario for this ERA are summarized in Table AOC28-5.1.

COPECs included only TPH as diesel and TPH as motor oil, which were detected in all three exposure depths. Hexavalent chromium was the only inorganic constituent measured in soil in the 0- to 6-ft bgs depth interval, and concentrations were below background threshold values. Individual organic compounds were either not detected or were below background threshold values.

² Special-status species include both state- and federal-listed fully protected threatened and endangered (T&E) species, state/federal species of concern, and traditional culturally significant plants; however, protection at the no-observed adverse effects level is warranted only for fully protected species.

5.3 Exposure Point Concentration Summary

For the potentially complete and significant exposure pathways identified in the ecological CSM, soil EPCs were calculated as described in Section 4.2 of the main report and presented in Section 3 of this appendix.

For the AOC 28 potential exposure area, risks to potential ecological receptors were evaluated using indicator chemicals for TPHs using depth-weighted data and EPCs based on the maximum depth-weighted concentrations, as summarized in Table AOC28-3.1. Depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment AOC28-A2.

5.4 Ecological Risk Characterization for TPHs

The risk characterization typically integrates the results of the exposure assessment and effects assessment and is subject to uncertainties in both those efforts. Appropriate screening values and toxicity reference values (TRVs) are not available for TPH mixtures. Therefore, indicator chemicals (i.e., benzene, toluene, ethylbenzene, and xylenes [BTEX], and LMW and HMW PAHs), if detected, are typically used to characterize potential risk for TPHs. At the AOC 28 potential exposure area, BTEX were not detected in any samples (Attachment AOC28-A1) and LMW and HMW PAHs were detected but not selected as COPECs as they are below background. Consequently, no quantitative HQ estimates were calculated. No unacceptable risk to plant and invertebrate communities or to populations of or individual potential wildlife receptors from exposure to TPHs at the AOC 28 potential exposure area is expected.

The lack of screening values and TRVs and the impact to the uncertainties for the ERA are discussed in Section 6 of the main report.

6 SUMMARY AND CONCLUSIONS FOR THE HHRA

Potential cumulative cancer risks and noncancer hazards for potential human receptors were estimated, as presented above in Section 4. For potential ecological receptors, the absence of potential risks are discussed in Section 5. Uncertainties related to the HHRA and ERAs at the site are discussed in detail in Sections 5.6 and 6.7 of the main report, and uncertainties specific to the AOC 28 potential exposure area are discussed in this appendix. For the AOC 28 potential exposure area, the HHRA and ERA presented above were conducted per methodology presented in the RAWP documents (Arcadis 2008, 2009, 2015). One scenario (baseline [no scouring]) was evaluated. Risks were estimated for various potential receptors using depth-weighted EPCs, which were based on the maximum depth-weighted concentrations due to the small sample sizes for this exposure area.

At the AOC 28 potential exposure area, the COPCs identified for the HHRA include metals (molybdenum and zinc), PAHs, TPH as diesel, and TPH as motor oil. For the ERA, except for hexavalent chromium, metals were not analyzed in soil samples collected from depths included in the ERA (0 to 6 ft bgs). Hexavalent chromium was not detected in soil samples collected from 0 to 6 ft bgs; therefore, only TPH mixtures were selected as COPECs for the ERA.

A summary of the results and conclusions regarding potential risk associated with exposure to these COPCs/COPECs in soil at the AOC 28 potential exposure area based on the risk/hazard estimates and uncertainties inherent in the risk assessment process is presented in this section.

6.1 Summary and Conclusions for the HHRA

The cumulative ILCRs and HI associated with potential exposure to COPCs in soil at the AOC 28 potential exposure area using depth-weighted EPCs under the baseline scenario were estimated. Assuming lifetime soil contact is limited to the AOC 28 potential exposure area for the receptors evaluated, the estimated potential ILCR and HI results are summarized in the table and discussed below.

Baseline Scenario Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index			
Potential Receptor and Exposure Depth		AOC 28 Potential Exposure Area	
		Cumulative ILCR	HI
		Depth-Wt	Depth-Wt
Short-Term Maintenance Worker	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	≤ 1
	Subsurface I	$\leq 1 \times 10^{-6}$	≤ 1
	Subsurface II	$\leq 1 \times 10^{-6}$	≤ 1
Long-Term Maintenance Worker	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	≤ 1
	Subsurface I	$\leq 1 \times 10^{-6}$	≤ 1
	Subsurface II	$\leq 1 \times 10^{-6}$	≤ 1

APPENDIX AOC28
SOIL HHERA FOR AOC 28 EXPOSURE AREA

Baseline Scenario Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index			
Potential Receptor and Exposure Depth		AOC 28 Potential Exposure Area	
		Cumulative ILCR	HI
		Depth-Wt	Depth-Wt
Camper	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	≤ 1
Hiker	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	≤ 1
Hunter	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	≤ 1
OHV Rider	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	≤ 1
Tribal User	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	≤ 1

Note:

wt = weighted

Depth-Weighted

Potential exposures that are at or below *de minimis* levels include the following:

- **HI ≤ 1 for all soil depths** – All potential receptors evaluated, including Short- and Long-Term Maintenance Workers, Camper, Hiker, Hunter, OHV Rider, and Tribal User
- **ILCR $\leq 1 \times 10^{-6}$ all soil depths** – All potential receptors evaluated, including: Short- and Long-Term Maintenance Workers, Camper, Hiker, Hunter, OHV Rider, and Tribal User

OVERALL SUMMARY

Assuming lifetime soil contact is limited to the AOC 28 potential exposure area, the estimated cumulative ILCRs and HIs associated with potential exposure to COPCs in soil at the AOC 28 potential exposure area using depth-weighted EPCs for all receptors, that is the short- and long-term maintenance workers, recreational users, and tribal user are below 1×10^{-6} and 1, respectively.

Risks/hazards estimated for an individual AOC/SWMU/UA potential exposure area like AOC 28 are not considered representative of the realistic or likely potential exposures for the human populations that could be present in the areas outside the TCS (such as maintenance workers, recreational users, and tribal users). Risks/hazards calculated separately for individual AOCs are conservative and likely overestimate site risks/hazards. As described in the RAWP documents (Arcadis 2008, 2009, 2015), these human populations would more likely be exposed randomly, over the course of a lifetime, to soil present in all individual AOC/SWMU/UA potential exposure areas located outside the TCS, rather than have a lifetime of contact limited to the area of a single potential exposure area. Therefore, estimated risks/hazards presented for individual AOC/SWMU/UA potential exposure areas are not believed to be representative of the potential

health risks to humans potentially contacting the soil outside the TCS. Rather, the HHRA results presented in Appendix OCS for all AOC/SWMU/UA potential exposure areas located outside the TCS combined will help to inform risk management decisions for the site. The estimated risks and hazards associated with a lifetime of contact with soil only in AOC 28 potential exposure area are presented at the request of the agencies and are not suitable to provide the sole basis of risk management decisions to protect human health.

6.2 Summary and Conclusions for the ERA

At the AOC 28 potential exposure area, only TPH as diesel and TPH as motor oil were identified as COPECs for the ERA. Although molybdenum and zinc are also identified as COPECs for the AOC 28 potential exposure area, they were detected in soil deeper than 6 ft bgs (not in the exposure depths relevant for potential ecological receptors).

Appropriate screening values and TRVs are not available for TPHs; therefore, indicator chemicals (e.g. BTEX and PAHs if detected and above background) were used to characterize TPH risks. The lack of screening values and TRVs and the impact to the ERA are discussed in Section 6.7 of the main report.

Risks were estimated using depth-weighted EPCs for indicator chemicals. A summary of the risk results for TPHs are presented in Table AOC28-6.1. The depth-weighted EPCs are based on the maximum depth-weighted concentration due to the small samples sizes for this exposure area. Conclusions for the baseline scenario evaluations are as follows:

- Potential risk to all potential ecological receptors is expected to be *de minimis* from exposure to TPHs in soil at the AOC 28 potential exposure area. BTEX were not detected in any samples (Attachment AOC28-A1) and LMW and HMW PAHs were not selected as COPECs, as concentrations are less than the background.
- No T&E small home-range potential wildlife receptors have been observed in the AOC 28 potential exposure area. Concentrations of COPECs at the AOC 28 potential exposure area do not pose unacceptable risk to potential individual receptors.

Based on the results of the ERA, potential exposures to COPECs in soil at the AOC 28 potential exposure area are not expected to pose unacceptable risk to ecological receptors.

6.2.1 Potential Risk Drivers for the AOC 28 Exposure Area

As presented in Table AOC28-6.1 and summarized in the table below, no risk drivers were identified for the AOC 28 potential exposure area, COPECs were limited to TPHs, and indicator chemicals for TPHs were either not detected or below background levels. Therefore, potential HQs for TPHs are expected to be less than 1 for all potential receptors.

Scenario	Potential Receptors and Risk Drivers at the AOC 28 Exposure Area					
	Plants	Soil Invertebrates	Granivorous Mammals (Merriam's kangaroo rat)	Invertivorous Mammals (desert shrew)	Granivorous Birds (Gambel's quail)	Insectivorous Birds (cactus wren)
Baseline	None	None	None	None	None	None

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

Notes:

- ^a Applicable to both human health and ecological risk assessment (HHRA/ERA), unless otherwise noted.
- ^b Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).
- ^c Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).
- ^d Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

mg/kg = milligrams per kilogram.

ug/kg = micrograms per kilogram.

COPC = Constituent of Potential Concern.

COPEC = Constituent of Potential Ecological Concern.

ND = Not detected.

TPH = Total Petroleum Hydrocarbons.

Notes:

- ^a The constituent consists of analytes detected at least once at the Topock Compressor Station site and measured in soil in this exposure area.
- ^b If fewer than eight total locations and four total detected concentrations, the maximum depth-weighted concentration was selected as the EPC. Otherwise, the UCL was selected as the EPC.
- ^c EPCs and summary statistics were not calculated for some constituents (i.e., dioxin congeners and essential nutrients). Those data, if available, are presented in Attachment A1 of each exposure area-specific appendix.

Abbreviations:

"--" = not applicable	EPC = exposure point concentration	mg/kg = milligrams per kilogram	PCB = polychlorinated biphenyls	UCL = upper confidence limit
AOC = area of concern	FOD = frequency of detection	NA = not applicable	PG&E = Pacific Gas and Electric Company	X = COPC/COPEC in the exposure depth interval
B(a)P equivalent = benzo(a)pyrene equivalent	ft bgs = feet below ground surface	ND = not detected	TCDD = Tetrachlorodibenzo-p-dioxin	
COPC = constituent of potential concern	KM = Kaplan-Meier	ng/kg = nanograms per kilogram	TEQ = toxic equivalent	
COPEC = constituent of potential ecological concern	µg/kg = micrograms per kilogram	PAH = polycyclic aromatic hydrocarbons	TPH = total petroleum hydrocarbons	

Table AOC28-4.1a

Summary of COPCs Evaluated in the HHRA for AOC 28: Baseline Scenario

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

COPC	COPCs in Surface Soil (0 to 0.5 feet bgs)	COPCs in Shallow Soil (0 to 3 feet bgs)	COPCs in Subsurface I Soil (0 to 6 feet bgs)	COPCs in Subsurface II Soil (0 to 10 feet bgs)
Inorganics				
Molybdenum	--	--	--	x
Zinc	--	--	--	x
Polycyclic Aromatic Hydrocarbons				
Fluoranthene	x	x	x	x
Naphthalene	x	x	x	x
Phenanthrene	x	x	x	x
Pyrene	x	x	x	x
Total Petroleum Hydrocarbons				
TPH as diesel	x	x	x	x
TPH as motor oil	x	x	x	x

Abbreviations:

bgs = below ground surface.

COPC = Constituent of Potential Concern.

-- = not detected or not analyzed.

x = Chemical included as COPC in human health risk assessment.

TPH = Total Petroleum Hydrocarbons.

Table AOC28-4.2a

Baseline Scenario Depth-Weighted Exposure Point Concentrations and Predicted Outdoor Air Concentrations for Short- and Long-Term Maintenance Workers:
COPCs in AOC 28 Surface Soil (0 to 0.5 feet bgs)

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

COPC	Exposure Point Concentration for Surface Soil: 0 to 0.5 feet bgs	Exposure Point Concentration for Subsurface II Soil: 0 to 10 feet bgs	Short Term Maintenance Worker		Long Term Maintenance Worker	
			Outdoor Airborne Particulate Concentration	Outdoor Vapor Concentration	Outdoor Airborne Particulate Concentration	Outdoor Vapor Concentration
	(mg/kg) ^a	(mg/kg) ^b	(mg/m ³) ^c	(mg/m ³) ^d	(mg/m ³) ^c	(mg/m ³) ^d

TPH as motor oil	4.1E+02	4.1E+02	4.1E-04	NV	4.1E-04	NV

Notes:

- ^a Exposure point concentrations (EPCs) for surface soil (0 to 0.5 feet bgs) are used to evaluate inhalation of particulates in outdoor air.
- ^b EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.
- ^c Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.0x10⁶ m³/kg was used for maintenance workers (short-term and long-term) as recommended by Department of Toxic Substances Control (2014).
- ^d Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.

Abbreviations:

bgs = below ground surface.
COPC = Constituent of Potential Concern.
mg/kg = milligrams per kilogram.
mg/m³ = milligrams per cubic meter.
NA = not applicable.
NS = Not sampled.
NV = Not volatile.
TPH = Total Petroleum Hydrocarbons.

- ^a Exposure point concentrations (EPCs) for surface soil (0 to 0.5 feet bgs) are used to evaluate inhalation of particulates in outdoor air.
- ^b EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.
- ^c Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.4x10⁹ m³/kg was used for tribal users as recommended by Department of Toxic Substances Control (2014).
- ^d Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.

Abbreviations:

bgs = below ground surface.
COPC = Constituent of Potential Concern.
mg/kg = milligrams per kilogram.
mg/m³ = milligrams per cubic meter.
NA = not applicable.
NS = Not sampled.
NV = Not volatile.
TPH = Total Petroleum Hydrocarbons.

Table AOC28-5.1
Summary of COPECs Evaluated in the ERA for AOC 28

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

COPEC ^a	Baseline (0-6 ft bgs)
Total Petroleum Hydrocarbons	
TPH as diesel	X
TPH as motor oil	X

Notes:

^a COPECs selected over the entire soil depth interval (0-6 ft bgs) potentially contacted by ecological receptors. COPECs based on background screening for metals, PAHs, and dioxins (if sampled). All detected organic compounds were selected as COPECs. See Section 2 of Appendix AOC28 for details.

Abbreviations:

AOC = area of concern

COPEC = constituent of potential ecological concern

ERA = ecological risk assessment

ft bgs = feet below ground surface

NA = not analyzed in relevant exposure interval

PAH = polycyclic aromatic hydrocarbons

PG&E = Pacific Gas and Electric Company

TPH = total petroleum hydrocarbon

X = COPEC in that exposure depth interval

Table AOC28-6.1
Risk Conclusions and Lines of Evidence Summary for AOC 28

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

AOC	Receptor	COPEC ^a	Depth-Weighted HQs			Additional Lines of Evidence ^c									Risk Conclusions		Risk Driver (LOAEL HQ > 1 and Supporting LOE) ^g
			Plant and Soil Invertebrates	Mammal/ Bird		Low FOD (Max = EPC) ^b	Locations > BTV	Locations > 10xBTV	Background HQs ^d		BAFs	Quality of SL or TRV	Exposure Assumptions ^e	Observation of T&E species ^f	Individuals	Populations	
				NOAEL	LOAEL				NOAEL	LOAEL							
Small Home Range Receptors																	
AOC 28 ^b	Plants	None	HQs ≤ 1	--	--	--	--	--	--	--	--	--	--	--	Not expected		No
	Soil Invertebrates	None	HQs ≤ 1	--	--	--	--	--	--	--	--	--	--	--	Not expected		No
	Merriam's Kangaroo Rat	None	--	HQs < 1	HQs < 1	--	--	--	--	--	--	--	--	--	Not expected	Not expected	No
	Desert Shrew	None	--	HQs < 1	HQs < 1	--	--	--	--	--	--	--	--	--	Not expected	Not expected	No
	Gambel's Quail	None	--	HQs < 1	HQs < 1	--	--	--	--	--	--	--	--	--	Not expected	Not expected	No
	Cactus Wren	None	--	HQs < 1	HQs < 1	--	--	--	--	--	--	--	--	--	Not expected	Not expected	No

Notes:
a COPECs are presented for HQs greater than 1 based on the depth-weighted EPC and/or area-weighted EPC and species and site-specific SUF.
b The EPC is based on the maximum depth-weighted concentration due to the small dataset size.
c The additional lines of evidence for COPECs with NOAEL and LOAEL HQs less than or equal to 1 (based on the area-weighted EPC and species and site-specific SUF) are not included in the table.
d For plants and soil invertebrates, the background HQ is based on the BTV. For mammals and birds, the NOAEL and LOAEL background HQs are based on the 95 percent upper confidence limit.
e Applicable to wildlife, unless noted.
f In areas where observations were noted, the T&E species observed have large home ranges and unlikely to forage in upland habitat. See text for details.
g For dioxin TEQ, LOAEL HQs less than 10 with supporting LOE were considered unlikely to pose an unacceptable risk to populations of wildlife receptors due to the compounded conservative assumptions included in the ecological risk assessment. See Section 6.7.6 of the main report.

--	LOAEL and NOAEL HQs ≤ 1 for the receptor
	NOAEL HQ greater than 1
	HQ/LOAEL HQ greater than 1
	HQ/LOAEL HQ greater than 10
	HQ/LOAEL HQ greater than 100

Abbreviations:
"--" = not applicable
AOC = area of concern
BAF = bioaccumulation factor
BCW = Bat Cave Wash
BG NA = background value not available
BTV = background threshold value
COPEC = constituent of potential ecological concern
EPC = exposure point concentration
FOD = frequency of detection
HQ = hazard quotient
LOAEL = lowest observed adverse effect limit

LOE = line of evidence
MDC = maximum depth-weighted concentration
NC = not calculated
NE = line of evidence not evaluated
NOAEL = no observed adverse effect limit
SL = screening level
SWMU 1 = solid waste management unit 1
T&E = threatened and endangered
TCS-4= Topock Compressor Station Well #4
TEQ = toxic equivalent
TRV = toxicity reference value

1 INTRODUCTION

This appendix presents the human health and ecological risk assessment (HHERA) for the Area of Concern 31 (AOC 31) soil potential exposure area located outside the Topock Compressor Station (TCS) in Needles, California. The AOC 31 potential exposure area, shown on Figure AOC31-1.1, is approximately 0.11 acre and includes sample locations identified in Table AOC31-1.1 of this appendix. Available soil data for the AOC 31 potential exposure area were used to conduct a quantitative HHERA as presented herein. The human health risk assessment (HHRA) and the ecological risk assessment (ERA) results are summarized in Sections 5 and 6, respectively, of the Soil Human Health and Ecological Risk Assessment Report (the “main report”). This appendix refers to “HHRA” when discussing specific information for assessing risks to human health, “ERA” when discussing specific information for assessing risks to potential ecological receptors, and “HHERA” when discussing topics that are common to both the HHRA and the ERA.

Descriptions of the physical location and characteristics of the AOC 31 potential exposure area and the HHERA methodologies are provided in the main report and the Human Health and Ecological Risk Assessment Work Plan (RAWP) documents (Arcadis U.S., Inc. [Arcadis] 2008, 2009, 2015) and are not repeated in this appendix. Detailed discussions of the historical uses and sampling and analysis are presented in the main report as well.

This appendix summarizes site use, data evaluation, potential receptors, potential exposure pathways, and results of the HHERA risk characterization for soil in the AOC 31 potential exposure area. Tables and figures specific to the AOC 31 potential exposure area HHERA are also presented in this appendix.

1.1 Summary of Site Use

The AOC 31 potential exposure area, also referred to as the Former Teapot Dome Oil Pit, is located northeast of the TCS, just outside the fenceline. The location of the AOC 31 potential exposure area overlaps with the perimeter area (PA) investigation. The AOC 31 potential exposure area is located on property owned by Pacific Gas and Electric Company (PG&E).

There are two sampling locations within the AOC 31 potential exposure area: PA-OS1 and PA08. Opportunistic soil samples were collected from PA-OS1 in 2011 and analyzed for several constituents. As part of the PA investigation, samples were collected from PA08 from an area identified as having a circular area of dark soil approximately 3 to 4 feet (ft) in diameter, and therefore, is considered the most likely potential location of the former oil pit.

The primary source of contamination in the AOC 31 potential exposure area is potential historical leaks or spills from a reported oil pit. Former employees indicated that they had been told that the Teapot Dome restaurant provided oil changes and that oil from vehicles was dumped into a pit. Potential wastes in this area pre-date the construction of the TCS. Any constituents released would have been in liquid form and released to surface soil, or leaks from the bottom of the pit to subsurface soil. Therefore, surface soil and subsurface soil are the primary source media.

2 DATA EVALUATION AND COPC/COPEC SELECTION

This section summarizes the data considered for the AOC 31 HHERA and presents the constituents of potential concern (COPCs) for human health and constituents of potential ecological concern (COPECs) selected for the AOC 31 potential exposure area.

All soil sampling locations at the AOC 31 potential exposure area are presented on Figure AOC31-1.1 and in Table AOC31-1.1. The data were evaluated based on methodology described in the RAWP documents (Arcadis 2008, 2009, 2015). Details of the soil sampling and analysis will be presented in the forthcoming Resource Conservation and Recovery Act Facility Investigation/Remedial Investigation Report Volume 3 (currently being prepared by Jacobs).

Following the steps outlined in Section 3 of the main report, soil data considered usable for the risk assessment were identified and used in the quantitative HHERA. Available soil data for the AOC 31 potential exposure area are presented in Attachment AOC31-A1. For AOC 31 potential exposure area, soil data available from 9 samples from 0 to 10 ft below ground surface (ft bgs) were considered for use in the HHERA as potential soil contact does not extend below 10 ft bgs (Table AOC31-1.1).

Data processed for the HHERA (e.g., calculation of total concentrations for low molecular weight [LMW] and high molecular weight [HMW] polycyclic aromatic hydrocarbons [PAHs], benzo[a]pyrene equivalent [B(a)PEQ], and polychlorinated biphenyls [PCBs]) are described in detail in Section 3 of the main report.

The process for identifying COPCs and COPECs included in the HHERA is detailed in Section 3.4 of the main report. COPCs and COPECs were selected for the AOC 31 potential exposure area using soil data encompassing relevant exposure depths for the HHERA (i.e., 0 to 10 ft bgs for the AOC 31 potential exposure area), as presented in Attachment AOC31-A1. Inorganic compounds (i.e., HMW PAHs, LMW PAHs, and B[a]PEQ) are above background threshold values (BTVs) in AOC 31 potential exposure area soil (0 to 10 ft bgs), and therefore are included as COPCs and/or COPECs in the four baseline exposure depths evaluated in the HHERA. When B(a)PEQ was detected above background, carcinogenic PAHs (i.e., benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, dibenzo[a,h]anthracene, chrysene, and indeno[1,2,3-cd]pyrene) associated with B(a)PEQ were also selected as COPCs in the HHERA for the evaluation of the noncancer endpoint for each PAH.

All other detected organic constituents in AOC 31 potential exposure area soil in the baseline exposure depths (see Section 3) are included as COPCs and/or COPECs in the HHERA. COPCs and/or COPECs selected for exposure depths and scenarios (baseline) evaluated in the HHERA for the AOC 31 potential exposure area are summarized in Tables AOC31-2.1a through AOC31-2.1d. The selected COPCs and COPECs are discussed further in Sections 4 and 5, respectively, of this appendix.

3 EXPOSURE POINT CONCENTRATIONS

Depth-weighted exposure point concentrations (EPCs) for COPCs/COPECs in soil at the AOC 31 potential exposure area were calculated as described in Section 4.2 of the main report. For the AOC 31 potential exposure area, one scenario was evaluated: Baseline (no scouring).

The following exposure depths were evaluated:

1. Surface soil (0 to 0.5 ft bgs)
2. Shallow soil (0 to 3 ft bgs)
3. Subsurface I soil (0 to 6 ft bgs)
4. Subsurface II soil (0 to 10 ft bgs).

The depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment AOC31-A2. The summary statistics for these AOC 31 potential exposure area soil depth-weighted datasets and depth-weighted EPCs were calculated consistent with the RAWP documents (Arcadis 2008, 2009, 2015). Per the RAWP documents, area-weighted EPCs for the HHRA are evaluated only if depth-weighted EPCs suggest that cumulative cancer risks and/or noncancer hazards may be significant for any given HHRA exposure scenario (i.e., cumulative cancer risks exceed a 10^{-6} cancer risk level, and/or the noncancer hazard index [HI] exceeds 1). Similarly, for the ERA, area-weighted EPCs are calculated only if depth-weighted EPCs suggest potential risk to potential ecological receptors (i.e., hazard quotient [HQ] exceeds 1 for any COPEC). For AOC 31, area-weighted EPCs were not deemed necessary for the HHRA or the ERA, and therefore were not evaluated.

Soil summary statistics for constituents measured at the AOC 31 potential exposure area¹ that were detected at least once and depth-weighted EPCs for COPCs/COPECs calculated using depth-weighted data from the exposure depths listed above are presented in Table AOC31-3.1. Due to the small dataset sizes for the surface, shallow, subsurface I, and subsurface II soil datasets in the AOC 31 potential exposure area (i.e., sample sizes of two or five depending on the exposure depths), insufficient data were available to calculate upper confidence limits [UCLs] on the mean. Therefore, the depth-weighted EPCs were based on maximum depth-weighted concentrations.

¹ The list of constituents shown in Table AOC31-3.1 is based on analytes that were detected at least once at the site (including all exposure areas inside or outside the TCS) and measured at the AOC 31 potential exposure area.

4 HUMAN HEALTH RISK ASSESSMENT

This section summarizes the HHRA approach; presents the COPC, EPC, risk, and hazard summary tables; and discusses the results of the risk characterization and uncertainties in the risk assessment for the AOC 31 potential exposure area. Details of the overall HHRA approach are presented in Section 5 of the main report. Dose, exposure concentration (EC), risk, and hazard calculation tables for potential human health receptors at the AOC 31 potential exposure area are presented in Attachment AOC31-B.

Risks/hazards estimated for an individual AOC/solid waste management unit (SWMU)/unidentified area (UA) potential exposure area such as the AOC 31 potential exposure area are not considered representative of the realistic or likely potential exposures for the human populations that could be present in the areas outside the TCS (such as maintenance workers, recreational users, and tribal users). Risks/hazards calculated separately for individual AOCs are conservative and likely overestimate site risks/hazards. As described in the RAWP documents (Arcadis 2008, 2009, 2015), these human populations would more likely be exposed randomly, over the course of a lifetime, to soil present in all individual AOC/SWMU/UA potential exposure areas located outside the TCS, rather than have a lifetime of contact limited to the area of a single potential exposure area. Therefore, estimated risks/hazards presented for individual AOC/SWMU/UA potential exposure areas are not believed to be representative of the potential health risks to humans potentially contacting the soil outside the TCS. Rather, the HHRA results presented in Appendix OCS for all AOC/SWMU/UA potential exposure areas located outside the TCS combined will help to inform risk management decisions for the site. The estimated risks and hazards associated with a lifetime of contact with soil only in the AOC 31 potential exposure area are presented at the request of the agencies and are not suitable to provide the sole basis of risk management decisions to protect human health.

4.1 Human Health Conceptual Site Model

Following the steps outlined in Section 5.5 of the main report, risks were estimated for potentially complete and significant exposure pathways identified in the human health conceptual site model (CSM) for receptors potentially exposed to COPCs in soil present at the AOC 31 potential exposure area. The potential receptors and exposure pathways evaluated for the AOC 31 potential exposure area included:

- **Short- and Long-Term Maintenance Workers** – Incidental ingestion of soil, dermal contact with soil, and inhalation of particulates and volatile organic compound (VOC) vapors in ambient outdoor air from soil
- **Recreational Users (child and/or adult camper, hiker, hunter, and off-highway vehicle [OHV] rider)** – Incidental ingestion of soil, dermal contact with soil, and inhalation of particulates and VOC vapors in ambient outdoor air from soil
- **Tribal Users** – Inhalation of particulates and VOC vapors in ambient outdoor air from soil.

Potential exposure pathways considered incomplete or insignificant were not quantitatively evaluated and are discussed in Section 5.3.1 of the main report.

4.2 Constituents of Potential Concern

COPCs for the AOC 31 potential exposure area were selected in accordance with the RAWP documents (Arcadis 2008, 2009, 2015) and as described in Section 3.4 of the main report. The COPC selection process using soil data encompassing relevant exposure depths for the HHRA (i.e., 0 to 10 ft bgs for the AOC 31 potential exposure area) are presented in Attachment AOC31-A. COPCs for the four exposure depths and one scenario (baseline) evaluated for the AOC 31 potential exposure area HHRA are summarized in Table AOC31-4.1 (details are presented in Tables AOC31-2.1a through AOC31-2.1d).

COPCs included three metals (copper, lead, and zinc), one VOC (chloroform), PAHs, total PCBs, total petroleum hydrocarbon (TPH) as diesel, and TPH as motor oil in surface, shallow, subsurface I, and/or subsurface II soil.

4.3 Exposure Point Concentration Summary

For the potentially complete and significant exposure pathways identified in the CSM, EPCs were calculated as described in Section 4.2 of the main report and presented in Section 3 of this appendix. Depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment AOC31-A. Depth-weighted EPCs for COPCs in soil and estimated outdoor air concentrations associated with dust and vapors and used to estimate risk in the HHRA are summarized in Tables AOC31-4.2a through AOC31-4.2h for the four exposure depths in the baseline scenario.

As described in detail in Section 5.3.3 of the main report, the following exposure depths and corresponding EPC datasets were used to evaluate potential exposure to COPCs in soil for potential human receptors:

- **Short- and Long-Term Maintenance Workers** – surface, shallow, subsurface I, and subsurface II soil
- **Recreational Users (child and/or adult camper, hiker, hunter, and OHV rider)** – surface and shallow soil
- **Tribal Users** – surface and shallow soil.

4.4 Estimation of Dose

The EC and chronic daily intake (CDI) for potential carcinogenic and noncarcinogenic effects were calculated, as described in Section 5.5.1 of the main report, for COPCs in soil for potentially complete exposure pathways. The calculated EC and CDI values are presented in Tables AOC 31-B.1a through AOC31-B.1g (carcinogenic effects) and Tables AOC31-B.2a through AOC31-B.2g (noncarcinogenic effects) in Attachment AOC31-B for the potential receptors evaluated. Exposure parameters used in the dose calculations are presented in Table 5-1 of the main report.

4.5 Toxicity Assessment

The toxicity assessment characterizes the relationship between the magnitude of exposure to a constituent and the potential for adverse health effects. More specifically, the toxicity assessment identifies agency-promulgated or derived toxicity values that can be used to estimate the likelihood of adverse health effects occurring in humans at different exposure levels. The approach for the toxicity assessment is provided in

Section 4.5 of the RAWP (Arcadis 2008) and in Section 4.2 of the RAWP Addendum 2 (Arcadis 2015). Consistent with regulatory risk assessment policy, adverse health effects resulting from potential chemical exposures are evaluated in two categories: carcinogenic effects and noncarcinogenic effects. The hierarchy of sources for the toxicity criteria to be used for the HHRA generally corresponds to California Department of Toxic Substances Control (DTSC) guidance (2015). Toxicity values for carcinogenic and noncarcinogenic effects for COPCs selected and used for the HHRA are described in Section 5.4 of the main report and were used to estimate potential cancer risks and noncancer hazards.

4.6 Human Health Risk Characterization

For potential human receptors, assuming lifetime soil exposure is limited to the AOC 31 potential exposure area, the estimated incremental lifetime cancer risks (ILCRs) and/or noncancer HQs were calculated for each COPC and potentially complete exposure pathway. Estimated cumulative ILCRs (i.e., sum of chemical-specific ILCRs for each exposure depth for a scenario) were calculated and compared to the DTSC point of departure for risk management decision of 1×10^{-6} ; risk management decisions may raise this criterion depending on site-specific conditions. As indicated in the National Oil and Hazardous Substances Pollution Contingency Plan (40 Code of Federal Regulations 300), cancer risks with between one in a million and one hundred in a million probability of occurrence (1×10^{-6} and 1×10^{-4}) fall within a risk management range. This is generally referred to as the acceptable risk range. Within this estimated cancer risk range, there is flexibility for risk managers in deciding what action, if any, is necessary and appropriate for the protection of human health. Estimated cumulative noncancer hazards (i.e., HIs) are calculated and compared to an HI of 1 (DTSC 2015). Chemical exposures that yield HIs of less than or equal to 1 are not expected to result in adverse noncancer health effects (United States Environmental Protection Agency [USEPA] 1989).

4.6.1 Risk Characterization for Exposure to Soil (Baseline Scenario and Depth-Weighted EPCs)

Table AOC31-4.3 summarizes cumulative ILCRs and HIs estimated using depth-weighted EPCs for exposure to soil for each potential human receptor evaluated for the AOC 31 potential exposure area in the baseline scenario. The dose, EC, ILCR, and HI equations are presented in detail in Section 5.5.1 of the main report. The detailed cancer risk estimates (Tables AOC31-B.3a through AOC31-B.3g) and noncancer hazard calculations (Tables AOC31-B.4a through AOC 31-B.4g) are presented in Attachment AOC31-B.

Risk and hazard estimates for the baseline scenario are summarized in the tables below. Assuming lifetime soil contact is limited to the AOC 31 potential exposure area, the depth-weighted estimated cumulative ILCRs and HIs for each human receptor potentially exposed to COPCs in AOC 31 soil at all exposure depths are below the *de minimis* levels of 1×10^{-6} and 1, respectively. Furthermore, the depth-weighted EPCs for lead in surface, shallow, subsurface I, and subsurface II soil are not expected to result in an increase in blood lead levels above the California Office of Environmental Health Hazard Assessment's (OEHHA's) benchmark value of 1 microgram per deciliter ($\mu\text{g/dL}$) in the fetus of a short-term maintenance worker, long-term maintenance worker, or hunter or in the child recreational user (Tables AOC31-B.5a through AOC31-B.5i).

APPENDIX AOC31
SOIL HHERA FOR AOC 31 EXPOSURE AREA

Maintenance Workers

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 31 Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Short-Term Maintenance Worker	Surface	6E-09	NA	0.02	NA
	Shallow	5E-09	NA	0.01	NA
	Subsurface I	3E-09	NA	0.01	NA
	Subsurface II	3E-09	NA	0.01	NA
Long-Term Maintenance Worker	Surface	7E-08	NA	0.004	NA
	Shallow	6E-08	NA	0.003	NA
	Subsurface I	4E-08	NA	0.002	NA
	Subsurface II	4E-08	NA	0.002	NA

Notes:

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.
NA = not applicable

Recreational Users

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 31 Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Camper	Surface	4E-08	NA	0.003	NA
	Shallow	3E-08	NA	0.003	NA
Hiker	Surface	8E-08	NA	0.006	NA
	Shallow	6E-08	NA	0.005	NA
Hunter	Surface	5E-09	NA	0.001	NA
	Shallow	4E-09	NA	0.0009	NA
OHV Rider	Surface	7E-08	NA	0.003	NA
	Shallow	5E-08	NA	0.002	NA

Note:

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

Tribal User

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 31 Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Tribal User	Surface	1E-10	NA	0.00006	NA
	Shallow	1E-10	NA	0.00006	NA

Note:

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

4.6.2 Uncertainties in the Risk Assessment

The risk assessment includes several uncertainties that warrant discussion. Many of the assumptions used in this risk assessment regarding the representativeness of the sampling data, potential human exposures, fate and transport modeling, and chemical toxicity are conservative, follow agency guidance, and reflect a 90th or 95th percentile value rather than a typical or average value. The use of several conservative exposure assumptions and toxicity estimates can introduce considerable uncertainty into the risk assessment. By using conservative exposure assumptions or toxicity estimates, the assessment can develop a significant conservative bias that may result in the calculation of significantly higher estimates for cancer risks or noncancer hazards than are actually posed by the chemicals present in soil. These uncertainties are discussed in detail in Section 5.6 of the main report. Uncertainties applicable only to the risk assessment for the AOC 31 potential exposure area are discussed below.

Uncertainties for the AOC 31 potential exposure area include the use of the maximum depth-weighted soil concentration as the EPC. The maximum depth-weighted soil concentration was used for COPCs when the soil dataset contained fewer than four detected values (i.e., concentrations reported above the detection limit) or fewer than eight total observations as shown in Table AOC31-3.1. As stated previously in Section 3, due to the small sizes of the surface, shallow, subsurface I, and subsurface II soil datasets for the AOC 31 potential exposure area (i.e., insufficient data to calculate UCLs on the mean), the depth-weighted EPCs were based on maximum depth-weighted concentrations.

The use of the maximum depth-weighted soil concentration as the EPC for the COPCs may not appropriately represent exposures and resulting risks/hazards for maintenance workers, recreational users, and tribal users evaluated in the AOC 31 potential exposure area HHRA.

5 ECOLOGICAL RISK ASSESSMENT

This section summarizes the ERA approach; presents the COPECs, EPCs, dose, and risk tables for the AOC 31 potential exposure area ERA; and characterizes potential risk to potential ecological receptors exposed to COPECs in soil at the AOC 31 potential exposure area. Details of the overall ERA approach are presented in Section 6 of the main report. Supporting tables for the AOC 31 potential exposure area ERA based on risk calculations conducted using depth-weighted EPCs are presented in Attachment AOC31-C and described below.

As noted previously in Section 3, the depth-weighted EPCs are based on the maximum depth-weighted concentration due to the small datasets available for the AOC 31 potential exposure area. Ecological risk calculations based on maximum depth-weighted EPCs, specified in the RAWP (Arcadis 2008) and DTSC guidance (1996), are the same as presented below.

5.1 Ecological Conceptual Site Model

Following the steps outlined in Section 6.6 and on Figures 2-7 and 6-1 of the main report, risks were estimated for potentially complete and significant exposure pathways identified for potential receptors exposed to COPECs in soil at the AOC 31 potential exposure area. These potential receptors included plants, soil invertebrates, and small home-range receptors, as follows:

- **Plants** – may be exposed to COPECs via root uptake from surface, shallow, and/or subsurface I soil, depending on the root depth of plants of concern.
- **Soil Invertebrates** – may be exposed to COPECs via direct contact/uptake from surface soil.
- **Mammals** – may be exposed to COPECs via incidental ingestion of surface, shallow, or subsurface I soil (for burrowing animals) and/or ingestion of biota tissue (i.e., food items). The small home-range mammal indicator receptors evaluated in this ERA for the AOC 31 potential exposure area were:
 - **Merriam's Kangaroo Rat** – representative of granivorous small mammal populations exposed to surface, shallow, and/or subsurface I soil (incidental and through biota uptake).
 - **Desert Shrew** – representative of invertivorous small mammal populations exposed only to surface soil (incidental and through biota uptake).
- **Birds** – may be exposed to COPECs via incidental ingestion of surface, shallow, or subsurface I soil and/or ingestion of biota tissue (i.e., food items). The small home-range bird indicator receptors evaluated in this ERA for the AOC 31 potential exposure area were:
 - **Cactus Wren** – representative of insectivorous bird populations exposed only to surface soil (incidental and through biota uptake).
 - **Gambel's Quail** – representative of granivorous bird populations exposed incidentally only to surface soil and exposed to surface, shallow, or subsurface I soil (incidental and through biota uptake).

Potential exposure pathways considered incomplete or insignificant were not quantitatively evaluated; these potential exposure pathways are identified and described in Section 6.3 of the main report.

Potential large home-range receptors (i.e., desert kit fox, red-tailed hawk, and Nelson's desert bighorn sheep) were evaluated for larger exposure areas (combined AOCs) and are discussed in those specific appendices. Potential risks to desert kit fox, red-tailed hawk, and Nelson's desert bighorn sheep associated with the AOC 31 potential exposure area were estimated and characterized as part of the evaluation of all AOCs in the OCS combined, as well as all AOCs OCS excluding Bat Cave Wash (BCW) and AOC 4 (OCSxBCW+AOC4); see Appendix OCS and Appendix OCSxBCW+AOC4 for risk characterization for these large home-range potential receptors.

5.1.1 Evaluation of Special-Status Species

The biological setting for the site and the adjacent areas is described in detail in various reports (see Section 2.4 of the main report). Although potential habitat exists for special-status² species at or near the site, none have been recorded as observed at the AOC 31 potential exposure area. The primary vegetation present at the AOC 31 potential exposure area is sparse creosote bush (*Larrea tridentate*). No federal- or state-listed threatened and endangered (T&E) plants or candidates for listing were found at the site, including the AOC 31 potential exposure area.

Several species of mammals and birds have been observed at or near the site (Tables 2-2 and 2-4 of the main report). However, no federal- or state-listed T&E species or candidates for listing were observed at the AOC 31 potential exposure area.

The risk estimates presented here are considered to be protective of special-status species due to the conservative nature of the ERA, where conservative parameters (e.g., small exposure areas, selected indicator species for each functional group considered on the high end of potential exposures for typical potential receptors at the site within that group, use of no-effects-based toxicity values) were used to assess risks to a wide range of potential receptors at various trophic levels. Therefore, further evaluation of special-status species was not considered necessary.

5.2 Constituents of Potential Ecological Concern

COPECs for the AOC 31 potential exposure area were selected in accordance with the RAWP (Arcadis 2008) and as described in Section 3.4 of the main report. Soil data encompassing relevant exposure depths for the HHERA (i.e., 0 to 10 ft bgs for the AOC 31 potential exposure area) and used in the COPEC selection process are presented in Attachment AOC31-A1.

Because a potential ecological receptor could be exposed to COPECs at various exposure depths either directly and/or through their diet for a given scenario, a single comprehensive COPEC list was selected based on the range of soil depths encountered by potential ecological receptors in the baseline scenario.

Additionally, essential nutrients (e.g., calcium, potassium) and analytes typically measured to evaluate geochemical conditions (e.g., chloride, nitrate, sulfate) are not typically evaluated in ERAs and were not

² Special-status species include both federal- and state-listed fully protected threatened and endangered (T&E) species, federal/state species of concern, and traditional culturally significant plants; however, protection at the no-observed adverse effects level (NOAEL) is warranted only for fully protected species.

selected as COPECs. COPECs for the three exposure depths evaluated for the baseline scenario for this ERA are summarized in Table AOC31-5.1.

COPECs included three metals (copper, lead, and zinc), one VOC (chloroform; VOCs were not analyzed in the 0- to 0.5-ft bgs interval), total PCBs, and HMW and LMW PAHs in all three exposure depths. TPH as diesel and TPH as motor oil were also identified as COPECs. However, due to lack of appropriate toxicity values to evaluate TPHs for potential ecological receptors, indicator chemicals (e.g., benzene, toluene, ethylbenzene, and xylene [BTEX] and PAHs), when detected, were used to characterize TPH risks. COPECs lacking toxicity values and their impact to the ERA are discussed in Section 6.7.5 of the main report.

5.3 Exposure Point Concentration Summary

For the potentially complete and significant exposure pathways identified in the ecological CSM, soil EPCs were calculated as described in Section 4.2 of the main report and presented in Section 3 of this appendix. For the AOC 31 potential exposure area, risks to potential ecological receptors were estimated using depth-weighted EPCs due to the small dataset sizes; these depth-weighted EPCs are equivalent to maximum depth-weighted concentrations. Depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment AOC31-A2.

Biota tissue EPCs were calculated from the soil EPCs using soil-to-biota uptake relationships for plants, invertebrates, and small mammals, as described in Section 6.4.3 of the main report. As described in Section 6.3 and shown on Figure 6-1 of the main report, the depth intervals selected to represent exposure to soil and biota tissue for the risk calculations for each potential receptor are presented in Table AOC31-5.2.

To summarize for the baseline scenario:

- Soil invertebrates, invertivorous small mammals, and insectivorous birds could potentially be exposed to COPECs in soil and/or biota only at the surface (0 to 0.5 ft bgs).
- Plants and granivorous small mammals could potentially be exposed to COPECs in soil and or/biota down to 6 ft bgs. Therefore, the maximum of the depth-weighted EPCs from 0 to 0.5 ft bgs, 0 to 3 ft bgs, and 0 to 6 ft bgs was selected as the representative soil and/or biota EPC for a COPEC for estimating risks to these potential receptors.
- Granivorous birds could potentially be exposed to COPECs in soil (not biota) only at the surface (0 to 0.5 ft bgs) and biota down to 6 ft bgs. Therefore, exposures to granivorous birds included the depth-weighted soil EPC from 0 to 0.5 ft bgs (for incidental soil ingestion) and the maximum of the depth-weighted biota EPC from 0 to 0.5 ft bgs, 0 to 3 ft bgs, and 0 to 6 ft bgs for each COPEC.

Depth-weighted soil EPCs and biota tissue EPCs calculated from depth-weighted soil EPCs are presented in Table AOC31-5.3 for the baseline scenario, and the representative soil and/or biota EPCs identified for the baseline risk calculations are bolded in this table.

Of the COPECs identified for the AOC 31 potential exposure area, chloroform was not analyzed in surface soil. Therefore, risks to potential receptors only exposed to surface soil do not include a risk estimate for this COPEC. These potential receptors include soil invertebrates, invertivorous mammals (desert shrew), and insectivorous birds (cactus wren). Although this COPEC was detected in shallow and subsurface I soil, uptake

into biota is considered negligible (assumed to be zero for the risk calculations³), and therefore, exposure through diet is considered incomplete. For plants and granivorous wildlife, only direct exposure was considered complete for this VOC. As noted previously, per the RAWP (Arcadis 2008) and DTSC guidance (DTSC 1996), two risk calculations are required for each COPEC based on two EPC options: 1) the maximum detected concentration, and 2) the UCL. However, because the datasets were of insufficient size to estimate UCLs, depth-weighted EPCs are based on the maximum depth-weighted concentrations for depth intervals evaluated in the ERA. Therefore, only the depth-weighted EPCs (based on the maximum depth-weighted concentrations) and associated risk calculations are provided for each COPEC for the AOC 31 potential exposure area.

5.4 Estimation of Exposure Concentration or Dose

Potential exposures for ecological communities (plants and soil invertebrates) are quantified as ECs (i.e., in milligrams per kilogram [mg/kg]). Potential exposures for wildlife (mammals and birds) are quantified as doses (i.e., in mg/kg body weight per day). ECs and doses for COPECs in soil and potentially complete pathways were calculated as described, including equations, in Section 6.4 of the main report. The exposure parameters selected to evaluate wildlife in this ERA include upper bound values from literature (e.g., ingestion rates) or assumed (e.g., 100% of one type of diet), which may result in conservative estimates of exposure dose and potential overestimation of actual exposure at the site.

For ecological communities, ECs are equal to the depth-weighted soil EPCs for COPECs at the AOC 31 potential exposure area for the baseline scenario presented in Table AOC31-5.3.

For wildlife, doses were calculated using the exposure parameters and equations presented in Table 6-4 of the main report and depth-weighted soil and biota tissue EPCs for COPECs at the AOC 31 potential exposure area, as presented in Table AOC31-5.3 for the depth-weighted risk evaluations. Dose calculations using depth-weighted EPCs for wildlife potentially exposed to COPECs via ingestion of soil and biota tissue for the baseline scenario are presented in Attachment AOC31-C.

5.5 Effects Assessment

Concentration-based screening values (i.e., toxicity values) for plants and soil invertebrates and the dose-based toxicity reference values (TRVs) for wildlife for COPECs were used to estimate risks to ecological receptors potentially exposed to COPECs in soil and biota tissue at the AOC 31 potential exposure area.

For plants and soil invertebrates, the screening values are presented in Section 6.5 and Table 6-6 of the main report.

A range of risks to wildlife were estimated using the no-observed-adverse effects-level (NOAEL)-based TRVs and lowest-observed-adverse-effects-level (LOAEL)-based TRVs presented in the RAWP documents (Arcadis 2008, 2009, 2015). These selected TRVs were primarily based on the TRVs used to develop USEPA's Ecological Soil Screening Levels (USEPA 2008); other sources included the Toxicological Benchmarks for Wildlife from Oak Ridge National Laboratory (Sample et al. 1996) and USEPA Region 6 ERA Guidance

³ VOCs have low bioaccumulation potential (octanol-water partition coefficient is low [$\log K_{ow} < 2$]) and uptake into biota is considered negligible for these constituents.

(USEPA 1999). In addition, for estimating potential risk to wildlife, a second set of NOAEL- and LOAEL-based TRVs⁴, based on the Navy/Biological Technical Assistance Group (BTAG) TRVs (DTSC 2002, 2009), was used for COPECs, where available. Wildlife TRVs based on selected TRVs and BTAG TRVs are presented in Tables 6-7 through 6-10 of the main report, respectively.

Plant screening levels and avian TRVs are not available for chloroform; therefore, direct effects to these potential receptors from exposure to this specific COPEC could not be estimated. In addition, appropriate screening values and TRVs are not available for TPHs; therefore, BTEX and PAHs were used as indicator chemicals to characterize TPH risks at the AOC 31 potential exposure area. The lack of screening values and TRVs and the impact to the ERA are discussed in Section 6.7.5 of the main report.

5.6 Ecological Risk Characterization

The risk characterization integrates the results of the exposure assessment and effects assessment and is subject to uncertainties in both of those efforts. Risk characterization includes two major components: risk estimation and risk description. As presented in tables and discussed below, risk estimates (HQs) involved integrating exposure profiles with the exposure-effects information. For each potential receptor and COPEC, risk descriptions including various lines of evidence (LOEs) and uncertainties, HQs, supporting statistical and site use information, and the direction of uncertainty in the risk estimates are discussed below for interpreting the risk results and identifying potential unacceptable risk to potential ecological receptors. Uncertainties specific to the AOC 31 potential exposure area are discussed in context with the risk characterization results presented below. Generic uncertainties in the ERA are discussed in detail in Section 6.7 of the main report.

For plants and soil invertebrates, HQs were calculated by comparing the depth-weighted EPCs for each COPEC to respective screening values, and these HQs were compared to the target HQ of 1. Following USEPA (1998) guidance, in such cases, a semi-quantitative weight-of-evidence (WOE) approach based on multiple LOEs was used in reducing uncertainty and drawing risk conclusions.

Risk conclusions for ecological communities used the following criteria:

- COPECs with HQs less than or equal to 1 pose *de minimis* risk (i.e., negligible risk) to plants and soil invertebrates.
- COPECs with HQs greater than 1 indicate unacceptable risk to plants and soil invertebrates is possible. However, exceedances of the screening values (which are conservative and generally uncertain) do not always clearly indicate that unacceptable risk to ecological communities is occurring. In such cases, a WOE approach, using HQs as a single LOE along with supporting information such as frequency of detection, site use history, and confidence in the screening values was used in reducing uncertainty for characterizing potential risk to ecological communities.

Ultimately, three risk outcomes are possible for plants and soil invertebrates based on HQs greater than 1 and the WOE: 1) unacceptable risk to ecological communities is possible (i.e., indicated by sufficient and strong supporting LOEs); 2) unacceptable risk to ecological communities is unlikely (i.e., indicated by sufficient and

⁴ Although these are referred to as LOAEL-based BTAG TRVs, they are based on a midpoint of a variety of adverse effects and are not necessarily the LOAELs. However, for simplicity, these BTAG TRVs are referred to as LOAEL-based TRVs.

strong LOEs to support a conclusion of no unacceptable risk); or 3) unacceptable risk to ecological communities is uncertain (i.e., indicated by insufficient LOEs).

For wildlife, a range of HQs was calculated using NOAEL- and LOAEL-based TRVs previously identified in RAWP documents (Arcadis 2008, 2009, 2015). HQs based on LOAEL-based TRVs selected in the RAWP are referred to as “LOAEL-based HQs.” HQs based on NOAEL-based TRVs selected in the RAWP are referred to as “NOAEL-based HQs.” Additionally, NOAEL- and LOAEL-based HQs were calculated using a second set of TRVs (i.e., NOAEL- and LOAEL-based BTAG TRVs), as described in Section 6.5 of the main report. The BTAG NOAEL-based TRVs are considered very conservative, resulting in a wide range of risks to wildlife. For this ERA, the selected TRVs are considered more robust than the BTAG TRVs, as discussed in Section 6.7.5 of the main report. Results associated with the selected TRVs are recommended for risk management decisions at the AOC 31 potential exposure area.

Risk conclusions for wildlife used the following criteria:

- COPECs with NOAEL-based HQs less than or equal to 1 pose *de minimis* risk to individuals and populations of potential wildlife receptors.
- COPECs with a NOAEL-based HQ greater than 1, but a LOAEL-based HQ less than or equal to 1, pose no unacceptable risks to wildlife populations. However, as described in the RAWP (Arcadis 2008), unacceptable risks to individuals are uncertain because the NOAEL-based TRVs are thresholds with an interval that is an artifact of the dosing study, and the nature and magnitude of the effects, if any, that may occur at exposures between these values is unknown. In such cases, a WOE approach, including multiple LOEs, was used in reducing uncertainty for characterizing potential risk to individual potential wildlife receptors.
- COPECs with LOAEL-based HQs greater than 1 indicate unacceptable risk is possible for populations of potential wildlife receptors. However, these LOAEL-based HQs are based on individual-level effects thresholds and only account for a single LOE. In such cases, a WOE approach was used in reducing uncertainty for characterizing potential risk to wildlife populations at the AOC 31 potential exposure area, as described in the preceding bullet.
- NOAEL-based HQs greater than 1 are considered one LOE in assessing potential risk to sensitive species, if present, in this exposure area. Evaluation of T&E species for the AOC 31 potential exposure area is presented in Section 5.1.1 of this appendix.

Ultimately, three risk outcomes are possible for wildlife based on the HQs greater than 1 and WOE:

1) unacceptable risk to individual wildlife is possible (i.e., indicated by sufficient and strong supporting LOEs);
2) unacceptable risk to individual wildlife is unlikely (i.e., indicated by sufficient and strong LOEs supporting a conclusion of no unacceptable risk); or 3) unacceptable risk to individual wildlife is uncertain (i.e., indicated by insufficient LOEs).

For this ERA, the results of individual LOE evaluations were evaluated collectively to derive an overall WOE conclusion for each potential receptor. Key uncertainties were considered along with the strength, relevance, and other qualities of the LOE in reaching the WOE conclusions.

For the AOC 31 potential exposure area, evaluations were completed for the following scenario and are discussed in this section:

- Baseline scenario using depth-weighted EPCs.

In these evaluations, risk calculations were completed for all COPECs, as presented in Tables AOC31-5.4a and AOC31-5.4b. At the conclusion of the baseline scenario evaluation, risk drivers were identified based on those COPECs for which unacceptable community-/population-level risk was predicted using the most refined exposure and effects assumptions evaluated for this exposure area (i.e., site-specific site use factor [SUF], depth-weighted EPCs, and selected TRVs).

5.6.1 Risk Characterization (Baseline Scenario and Depth-Weighted EPCs)

Risk estimates for ecological communities (plants and soil invertebrates) and wildlife (mammals and birds) for the baseline scenario using depth-weighted EPCs are summarized in this section. As mentioned previously in Section 5.4, ECs and doses for COPECs in soil and potentially complete pathways were calculated as described, including equations, in Section 6.4 of the main report. Detailed risk calculations for plants and soil invertebrates (Table AOC31-C.1) and detailed dose and risk calculations for wildlife (Tables AOC31-C.2 through AOC31-C.5) are presented in Attachment AOC31-C. COPECs at the AOC 31 potential exposure area include three metals (copper, lead, and zinc), one VOC (chloroform), HMW PAHs, LMW PAHs, total PCBs, and TPHs in soil.

As noted, the risks estimated in this scenario are based on maximum depth-weighted concentrations as the EPCs because there are too few samples available to reliably calculate UCLs. Because the samples were collected in a targeted manner near known or suspected source areas (see Section 1.1), use of the maximum concentrations as the EPC may not appropriately characterize potential soil exposure and risk for the AOC 31 potential exposure area. Potential risk to receptors exposed to these COPECs is described below.

5.6.1.1 Plants and Soil Invertebrates

Table AOC31-5.4a summarizes HQs estimated for soil exposure for ecological communities (plants and soil invertebrates) at the AOC 31 potential exposure area for the baseline scenario using depth-weighted EPCs. Plants can potentially be exposed to COPECs in soil up to 6 ft bgs. Plant HQs are less than 1 for all COPECs (including PAHs as indicator chemicals for TPHs) based on the highest EPC value from the shallow, surface, and subsurface I soil depth intervals, indicating *de minimis* risk to plants from exposure to these COPECs.

Soil invertebrates can potentially be exposed only to COPECs in surface soil (0 to 0.5 ft bgs). For soil invertebrates, HQs are less than 1 for all COPECs based on exposure to surface soil only, indicating *de minimis* risk to soil invertebrates from exposure to these COPECs. As mentioned in Section 5.3 of this appendix, chloroform was not analyzed for surface soil; therefore, risks for this COPEC to soil invertebrates, which are only exposed to surface soil, were not estimated.

For TPH mixtures, individual constituents were used to characterize potential risks to plants and soil invertebrates. BTEX were not detected in any samples (Attachment AOC31-A). HQs for HMW and LMW PAHs for plants and soil invertebrates are less than 1, indicating no unacceptable risk to these potential receptors. Therefore, unacceptable risk to plants and soil invertebrates from exposure to TPHs at the AOC 31 potential exposure area is considered unlikely.

To summarize, based on the risk results and WOE for the depth-weighted EPCs, unacceptable risk to plant and soil invertebrate communities from exposure to COPECs in soil at the AOC 31 potential exposure area is not expected, and therefore, risk estimates based on area-weighted EPCs are not warranted.

Risk Summary and Risk Drivers for Ecological Communities

Risk drivers were identified for potential unacceptable ecological community-level risk based on HQs using the most refined exposure and effects assumptions evaluated for this exposure area (i.e., depth-weighted EPCs based on maximum depth-weighted concentrations) and supporting WOE. Based on the risk results and WOE, no unacceptable risks to plant and soil invertebrate communities are expected for COPECs in soil at the AOC 31 potential exposure area.

5.6.1.2 Small Mammals

For the AOC 31 potential exposure area, baseline risks were estimated for small mammals using depth-weighted EPCs for the following evaluations and discussed in this section:

- Using the selected TRVs and a SUF equal to 1
- Using the BTAG TRVs and a SUF equal to 1
- Using the selected TRVs and a species- and site-specific SUF
- Using the BTAG TRVs and a species- and site-specific SUF.

5.6.1.2.1 Risks Evaluated Using a SUF Equal to 1

Risks Evaluated Using the Selected TRVs

Table AOC31-5.4a summarizes HQs estimated for small mammals at the AOC 31 potential exposure area using the selected TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below. TRVs are not available for TPHs; however, risks to these potential receptors are characterized below based on indicator chemicals as described previously.

- **Merriam's kangaroo rat (granivorous small mammal)** – This potential receptor could potentially be exposed to COPECs in subsurface I soil (0 to 6 ft bgs) directly and through its diet. The NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, indicating *de minimis* risk to individuals and populations of granivorous small mammals at the AOC 31 potential exposure area.
 - For TPH mixtures, individual constituents were used to evaluate the potential for unacceptable risk. BTEX were not detected in any samples and the NOAEL- and LOAEL-based HQs for HMW and LMW PAHs are less than 1, indicating that unacceptable risk to granivorous small mammals from exposure to TPHs is not expected.
- **Desert shrew (invertivorous small mammal)** – This potential receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. The NOAEL- and LOAEL-based HQs for this potential receptor are less than 1, indicating *de minimis* risk to individuals and populations of invertivorous small mammals at the AOC 31 potential exposure area.
 - For TPH mixtures, individual constituents were used to evaluate the potential for unacceptable risk. BTEX were not detected in any samples and NOAEL- and LOAEL-based HQs for HMW and LMW PAHs are less than 1, indicating that unacceptable risk to invertivorous small mammals from exposure to TPHs is not expected.

Based on the risk estimates for the AOC 31 potential exposure area using the selected TRVs and a SUF of 1, *de minimis* risk is expected for small mammals for COPECs in soil at the AOC 31 potential exposure area.

Risks Evaluated Using the BTAG TRVs

Table AOC31-5.4a also summarizes HQs estimated for small mammals at the AOC 31 potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Merriam's kangaroo rat (granivorous small mammal)** – NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, indicating *de minimis* risk to individuals and populations of granivorous small mammals.
- **Desert shrew (invertivorous small mammal)** – NOAEL-based HQs for copper, lead, and zinc are greater than 1, and the LOAEL-based HQs are less than 1 for these COPECs, indicating no unacceptable risk to populations of invertivorous mammals is expected. However, unacceptable risk to individual potential receptors is uncertain for these COPECs based on the HQs. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs, indicating *de minimis* risk to individuals and populations of invertivorous small mammals from the remaining COPECs.

Summarized below are all HQ estimates for small mammals for COPECs where at least one NOAEL-based HQ value (using the selected TRV or BTAG TRV) is greater than 1:

Hazard Quotient Summary for Small Mammals (SUF = 1)								
COPEC	Merriam's Kangaroo Rat				Desert Shrew			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Copper	1E-01	6E-02	4E-01	1E-03	7E-01	4E-01	3E+00	1E-02
Lead	3E-02	2E-02	2E-01	6E-04	4E-01	2E-01	2E+00	8E-03
Zinc	7E-02	2E-02	5E-01	1E-02	1E+00	3E-01	8E+00	2E-01

Note:

Bold indicates HQs > 1.

5.6.1.2.2 Risks Evaluated Using a Site-Specific SUF

Table AOC31-5.4b presents HQs calculated using the selected TRVs and BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Based on the AOC 31 potential exposure area and home ranges for Merriam's kangaroo rat and desert shrew, the site-specific SUFs were estimated as 0.9 and 1, respectively, for these potential receptors (i.e., the home range for desert shrew is less than or equal to the size of the exposure area). Therefore, the risk results for desert shrew for this evaluation are the same as discussed above for the generic SUF of 1. The NOAEL- and LOAEL-based HQs are less than 1 for all COPECs for Merriam's kangaroo rat using the selected TRVs and BTAG TRVs and the site-specific SUF, similar to the results discussed above using a generic SUF of 1.

5.6.1.2.3 Baseline Risk Summary for Small Mammals Using Depth-Weighted EPCs

Based on the risks characterized for populations of small mammals exposed to COPECs in soil at the AOC 31 potential exposure area using selected TRVs,⁵ depth-weighted EPCs (based on maximum depth-weighted concentrations due to small dataset sizes), and a site- and species-specific SUF (SUF equal to 1 for desert shrew), the risk conclusions are as follows:

- For Merriam's kangaroo rat (granivorous small mammal), the NOAEL-based and LOAEL-based HQs are less than 1 for all COPECs, indicating *de minimis* risk to individuals and populations of granivorous small mammals at the AOC 31 potential exposure area.
- For desert shrew (invertivorous small mammal), the NOAEL-based and LOAEL-based HQs are less than 1 for all COPECs, indicating *de minimis* risk to individuals and populations of invertivorous small mammals at the AOC 31 potential exposure area.

De minimis risk is expected for individuals and populations of small mammals at the AOC 31 potential exposure area based on this evaluation. Further evaluation of these potential receptors using area-weighted EPCs is not warranted.

Potential Risk Drivers for Small Mammals at the AOC 31 Potential Exposure Area

No risk-driving COPECs for small mammals were identified at the AOC 31 potential exposure area based on the following: no potential for unacceptable population-level risk (i.e., LOAEL-based HQs greater than 1) was predicted based on HQs calculated using the most refined exposure and effects assumptions evaluated in this scenario (i.e., site-specific SUF, depth-weighted EPCs,⁶ and selected TRVs) and additional supporting WOE. Additionally, no COPECs with NOAEL-based HQs greater than 1, using the most refined exposure and effects assumptions and additional LOEs supporting the conclusions of unacceptable risk, were identified at the AOC 31 potential exposure area.

5.6.1.3 Birds

For the AOC 31 potential exposure area, baseline risks were estimated for birds using depth-weighted EPCs for the following evaluations and discussed in this section:

- Using the selected TRVs and a SUF equal to 1
- Using the BTAG TRVs and a SUF equal to 1
- Using the selected TRVs and a species- and site-specific SUF
- Using the BTAG TRVs and a species- and site-specific SUF.

5.6.1.3.1 Risks Evaluated Using a SUF Equal to 1

Risks Evaluated Using the Selected TRVs

⁵ Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

⁶ Evaluation of area-weighted EPCs is not warranted for these receptors.

Table AOC31-5.4a summarizes HQs estimated for birds at the AOC 31 potential exposure area using the selected TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below. TRVs are not available for TPHs; however, risks to these potential receptors are characterized below based on indicator chemicals as described previously.

- **Gambel's quail (granivorous bird)** – This potential receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and to subsurface I soil (0 to 6 ft bgs) through its diet. The NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, indicating *de minimis* risk to individuals and populations of granivorous birds.
 - For TPH mixtures, individual constituent concentrations were used to evaluate the potential for unacceptable risk. BTEX were not detected in any samples and NOAEL- and LOAEL-based HQs for HMW and LMW PAHs are less than 1, indicating that no unacceptable risk to granivorous birds from exposure to TPHs is expected.
- **Cactus wren (insectivorous bird)** – This potential receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. NOAEL- and LOAEL-based HQs for this potential receptor are less than 1 for all COPECs, except copper. The potential risks from COPECs with HQs greater than 1 are characterized below.
 - For copper, the NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of insectivorous birds. However, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ. Copper was detected above the BTV (BTV = 16.8) in the single sample location analyzed at the AOC 31 potential exposure area. The NOAEL-based HQ is low. The HQ may not appropriately characterize risk because the depth-weighted EPC (62 mg/kg) is based on the maximum depth-weighted concentration.
 - For TPH mixtures, individual concentrations were used to evaluate the potential for unacceptable risk. BTEX were not detected in any samples and NOAEL- and LOAEL-based HQs for HMW and LMW PAHs are less than 1, indicating that no unacceptable risk to insectivorous birds from exposure to TPHs is expected.
 - NOAEL- and LOAEL-based HQs for the remaining COPECs in soil are less than or equal to 1, indicating *de minimis* risk to individuals or populations of insectivorous birds.

Based on the risk estimates and potential uncertainties associated with the baseline risk for copper, this COPEC was further evaluated using site- and species-specific SUFs as discussed below.

Risks Evaluated Using the BTAG TRVs

Table AOC31-5.4a also summarizes HQs estimated for birds at the AOC 31 potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Gambel's quail (granivorous bird)** – The NOAEL-based HQ for lead is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of granivorous birds is expected. However, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ. The risks from lead are likely overestimated due to the conservative avian TRV and the EPC based

on the maximum depth-weighted concentration. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. NOAEL- and LOAEL-based HQs for other COPECs in soil are less than 1, indicating *de minimis* risk to individuals and populations of granivorous birds for the remaining COPECs.

- **Cactus wren (insectivorous bird)** – NOAEL-based HQs for copper, lead, and zinc are greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of insectivorous birds is expected. However, unacceptable risk to individual potential receptors is uncertain for these COPECs based on the HQ. The risks from copper, lead, and zinc are likely overestimated due to the conservative avian TRVs and the EPCs based on the maximum depth-weighted concentrations. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs, indicating *de minimis* risk to individuals and populations of insectivorous birds from these COPECs.

Summarized below are all HQ estimates for birds for COPECs where at least one NOAEL-based HQ value (using the selected TRV or BTAG TRV) is greater than 1:

Hazard Quotient Summary for Birds (SUF = 1)								
COPEC	Gambel's Quail				Cactus Wren			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Copper	2E-01	5E-02	3E-01	1E-02	2E+00	6E-01	3E+00	1E-01
Lead	8E-02	4E-02	9E+00	1E-02	1E+00	6E-01	1E+02	2E-01
Zinc	4E-02	2E-02	2E-01	2E-02	1E+00	4E-01	4E+00	4E-01

Note:

Bold indicates HQs > 1.

5.6.1.3.2 Risks Evaluated Using a Site-Specific SUF

Risks Evaluated Using Selected TRVs

Table AOC31-5.4b presents HQs calculated using the selected TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Gambel's quail (granivorous bird)** – The site-specific SUF for this potential receptor is 0.003, which further reduced the NOAEL- and LOAEL-based HQs to less than 1 for all COPECs. Consistent with the evaluation using a SUF of 1, *de minimis* risk to individuals and populations of granivorous birds is expected when accounting for site use at the AOC 31 potential exposure area.
- **Cactus wren (insectivorous bird)** – The site-specific SUF for this potential receptor is 0.02, which reduced the NOAEL-based HQ for copper to less than 1, indicating *de minimis* risk to individuals and populations of insectivorous birds exposed to this COPEC in soil at the AOC 31 potential exposure area. The NOAEL- and LOAEL-based HQs for all other COPECs in soil are less than 1, indicating *de minimis* risk to populations and individual insectivorous birds from exposure to the remaining COPECs.

No unacceptable risks to birds are expected for this scenario using a species- and site-specific SUF.

Risks Evaluated Using the BTAG TRVs

Table AOC31-5.4b also summarizes HQs estimated for birds at the AOC 31 potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Gambel's quail (granivorous bird)** – The site-specific SUF for this potential receptor is 0.003, which reduced the NOAEL-based HQ for lead to less than 1. NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs. Thus, *de minimis* risk to individuals and populations of granivorous birds is expected when accounting for site use at the AOC 31 potential exposure area.
- **Cactus wren (insectivorous bird)** – The site-specific SUF for this potential receptor is 0.02, which reduced the NOAEL-based HQs for copper and zinc to less than 1. The NOAEL-based HQ was also reduced for lead in this evaluation, but is still greater than 1. LOAEL-based HQs are less than 1 for all COPECs, indicating no unacceptable risk to populations of insectivorous birds. However, unacceptable risk to individual potential receptors is uncertain for exposure to lead in soil based on the HQ. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs, indicating *de minimis* risk to individuals and populations of insectivorous birds from these COPECs.

For the COPECs with NOAEL-based HQs greater than 1 using a SUF of 1 (using the selected TRV or BTAG TRV), HQ estimates using the species- and site-specific SUF for birds are summarized below.

Hazard Quotient Summary for Birds (Site-Specific SUF)								
COPEC	Gambel's Quail (SUF = 0.003)				Cactus Wren (SUF = 0.02)			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Copper	5E-04	2E-04	9E-04	4E-05	4E-02	1E-02	7E-02	3E-03
Lead	3E-04	1E-04	3E-02	5E-05	3E-02	1E-02	3E+00	5E-03
Zinc	1E-04	5E-05	5E-04	5E-05	3E-02	1E-02	1E-01	1E-02

Note:

Bold indicates HQs > 1.

5.6.1.3.3 Baseline Risk Summary for Birds Using Depth-Weighted EPCs

To summarize, based on the risks characterized for populations of birds exposed to COPECs in soil at the AOC 31 potential exposure area using selected TRVs,⁷ depth-weighted EPCs (based on maximum depth-weighted concentrations due to small dataset sizes), and a site- and species-specific SUF, the risk conclusions are as follows:

⁷ Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

APPENDIX AOC31
SOIL HHERA FOR AOC 31 EXPOSURE AREA

- For Gambel's quail (granivorous bird), the NOAEL- and LOAEL-based HQs for all COPECs are less than 1, indicating *de minimis* risk to individuals and populations of granivorous birds for all COPECs.
- For cactus wren (insectivorous bird), the NOAEL- and LOAEL-based HQs for all COPECs are less than 1, indicating *de minimis* risk to individuals and populations of insectivorous birds for all COPECs.

Based on the above results, further evaluation of these potential receptors using area-weighted EPCs is not warranted.

Potential Risk Drivers for Birds at the AOC 31 Exposure Area

No risk-driving COPECs for birds were identified at the AOC 31 potential exposure area based on the following: no potential for unacceptable population-level risk (i.e., LOAEL-based HQs greater than 1) was predicted based on HQs calculated using the most refined exposure and effects assumptions evaluated in this scenario (i.e., site-specific SUF, depth-weighted EPCs,⁸ and selected TRVs) and additional supporting WOE. Additionally, no COPECs with NOAEL-based HQs greater than 1, using the most refined exposure and effects assumptions and additional LOEs supporting the conclusions of unacceptable risk, were identified at the AOC 31 potential exposure area.

⁸ Evaluation of area-weighted EPCs is not warranted for these receptors.

6 SUMMARY AND CONCLUSIONS FOR THE HHRA

Estimated potential cumulative cancer risks and noncancer hazards for potential human receptors are presented in Section 4 and estimated potential risks for potential ecological receptors are presented in Section 5 of this appendix. Uncertainties related to the HHRA and ERAs at the site are discussed in detail in Sections 5.6 and 6.7 of the main report, and uncertainties specific to the AOC 31 potential exposure area are discussed in this appendix. For the AOC 31 potential exposure area, the HHRA and ERA were conducted in accordance with the methodology presented in the RAWP documents (Arcadis 2008, 2009, 2015). One scenario (baseline, i.e., no scouring) was evaluated, and risks were estimated for various potential receptors using depth-weighted EPCs. Depth-weighted EPCs were based on the maximum depth-weighted concentrations due to small sample sizes for this exposure area.

At the AOC 31 potential exposure area, the COPCs/COPECs identified for the HHRA include three metals (copper, lead, and zinc), one VOC (chloroform), HMW and LMW PAHs, total PCBs, TPH as diesel, and TPH as motor oil. The results and conclusions regarding potential risk associated with exposure to these COPCs/COPECs in soil at the AOC 31 potential exposure area based on the risk/hazard estimates and uncertainties inherent in the risk assessment process are summarized in this section.

6.1 Summary and Conclusions for the HHRA

The cumulative ILCRs and HIs associated with potential exposure to COPCs in soil at the AOC 31 potential exposure area using depth-weighted EPCs under the baseline scenario were estimated. Assuming lifetime soil contact is limited to the AOC 31 potential exposure area for the potential receptors evaluated, the estimated potential ILCR and HI results are summarized in the table and discussed below.

Baseline Scenario Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index			
Potential Receptor and Exposure Depth		AOC 31 Potential Exposure Area	
		Cumulative ILCR	HI
		Depth- Wt	Depth-Wt
Short-Term Maintenance Worker	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	≤ 1
	Subsurface I	$\leq 1 \times 10^{-6}$	≤ 1
	Subsurface II	$\leq 1 \times 10^{-6}$	≤ 1
Long-Term Maintenance Worker	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	≤ 1
	Subsurface I	$\leq 1 \times 10^{-6}$	≤ 1
	Subsurface II	$\leq 1 \times 10^{-6}$	≤ 1
Camper	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	≤ 1
Hiker	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	≤ 1

APPENDIX AOC31
SOIL HHRA FOR AOC 31 EXPOSURE AREA

Baseline Scenario Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index			
Potential Receptor and Exposure Depth		AOC 31 Potential Exposure Area	
		Cumulative ILCR	HI
		Depth- Wt	Depth-Wt
Hunter	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	≤ 1
OHV Rider	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	≤ 1
Tribal User	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	≤ 1

Note:

wt = weighted

Depth-Weighted

Potential exposures that are at or below *de minimis* levels include the following:

- **HI ≤ 1 for all soil depths** – All potential receptors evaluated including Short- and Long-Term Maintenance Workers, Camper, Hiker, Hunter, OHV Rider, and Tribal User
- **ILCR $\leq 1 \times 10^{-6}$ all soil depths** – All potential receptors evaluated including Short- and Long-Term Maintenance Workers, Camper, Hiker, Hunter, OHV Rider, and Tribal User.

OVERALL SUMMARY

Assuming lifetime soil contact is limited to the AOC 31 potential exposure area, the cumulative ILCRs and HIs associated with potential exposure to COPCs in soil using depth-weighted EPCs for all receptors (i.e., short- and long-term maintenance workers, recreational users, and tribal users) are below 1×10^{-6} and 1, respectively. Furthermore, the depth-weighted EPCs for lead in surface, shallow, subsurface I, and subsurface II soil are not expected to result in an increase in blood lead levels above OEHHA's benchmark value of 1 µg/dL in the fetus of a short- or long-term maintenance worker, the fetus of a hunter, or the child recreational user.

Risks/hazards estimated for an individual AOC/SWMU/UA potential exposure area such as AOC 31 are not considered representative of the realistic or likely potential exposures for the human populations that could be present in the areas outside the TCS (such as maintenance workers, recreational users, and tribal users). Risks/hazards calculated separately for individual AOCs are conservative and likely overestimate site risks/hazards. As described in the RAWP documents (Arcadis 2008, 2009, 2015), these human populations would more likely be exposed randomly, over the course of a lifetime, to soil present in all individual AOC/SWMU/UA potential exposure areas located outside the TCS rather than have a lifetime of contact limited to the area of a single potential exposure area. Therefore, estimated risks/hazards presented for individual AOC/SWMU/UA potential exposure areas are not believed to be representative of the potential health risks to humans potentially contacting the soil outside the TCS. Rather, the HHRA results presented in Appendix OCS for all AOC/SWMU/UA potential exposure areas located outside the TCS combined will help to inform risk management decisions for the site. The estimated risks and hazards associated with a lifetime of

contact with soil only in the AOC 31 potential exposure area are presented at the request of the agencies and are not suitable to provide the sole basis of risk management decisions to protect human health.

6.2 Summary and Conclusions for the ERA

At the AOC 31 potential exposure area, three metals (copper, lead, and zinc), one VOC (chloroform), HMW PAHs, LMW PAHs, total PCBs, and TPHs were identified as COPECs. Risks could not be estimated for potential receptors lacking available screening values and/or TRVs for COPECs; such cases are discussed in the uncertainty analysis of the main report. These COPECs are unlikely to be risk drivers and are assumed to have minimal impact to the conclusions of the ERA.

Risks were estimated using depth-weighted EPCs, which were based on the maximum depth-weighted concentrations, due to small samples sizes for this exposure area. Risk conclusions are based on the following criteria:

- COPECs with HQs less than or equal to 1 pose *de minimis* risk to ecological communities (plants and soil invertebrates).
- COPECs with HQs greater than 1 could indicate potential risk to ecological communities. A WOE approach was used to characterize potential risk to plants and soil invertebrates.
- COPECs with NOAEL-based HQs less than or equal to 1 pose *de minimis* risk to potential wildlife receptors.
- COPECs with NOAEL-based HQs greater than 1 but LOAEL-based HQs less than or equal to 1 pose no unacceptable risks to wildlife populations; however, the potential for unacceptable risk to individuals is uncertain based on the HQ. A WOE approach was used to characterize potential risk to individual potential receptors.
- COPECs with LOAEL-based HQs greater than 1 pose possible unacceptable risk to populations of potential wildlife receptors based on the HQ.

The risk estimates (HQs) represent a single LOE in the risk characterization. A qualitative WOE approach, incorporating other LOEs and uncertainties, was used to characterize risk to wildlife populations at the AOC 31 potential exposure area.

HQs for COPECs for the baseline scenario calculated using depth-weighted EPCs, selected screening values/selected TRVs, and species- and site-specific SUFs are summarized in Table AOC31-6.1. Evaluation of area-weighted EPCs was not warranted based on potential risks estimated using depth-weighted EPCs. Conclusions for the baseline scenario evaluations are as follows:

- **Plant Communities** – *de minimis* risk to plant communities from exposure to all COPECs in soil.
- **Soil Invertebrates Communities** – *de minimis* risk to soil invertebrate communities from exposure to all COPECs in soil.
- **Small Mammals** – *de minimis* risk to individuals and populations of small mammals (granivorous and invertivorous) exposed to all COPECs in soil.
- **Birds** – *de minimis* risk to individuals and populations of birds (granivorous and insectivorous) exposed to all COPECs in soil.

APPENDIX AOC31
SOIL HHERA FOR AOC 31 EXPOSURE AREA

- **T&E Species** – No federal or state T&E species have been observed in the AOC 31 potential exposure area. Concentrations of COPECs at the AOC 31 potential exposure area pose no unacceptable risk to potential individual receptors.

Based on the results of the ERA for the AOC 31 potential exposure area, potential exposures to COPECs in soil at the AOC 31 potential exposure area are not expected to pose unacceptable risk to potential ecological receptors.

6.2.1 Potential Risk Drivers for the AOC 31 Potential Exposure Area

As presented in Table AOC31-6.2 and summarized in the table below, no risk drivers were identified for the AOC 31 potential exposure area based on unacceptable community-/population-level risk (i.e., HQs greater than 1 for plants and soil invertebrates and LOAEL-based HQs greater than 1 for mammals and birds) predicted from HQs calculated using the most refined exposure and effects assumptions evaluated for this potential exposure area (i.e., site-specific SUF, depth-weighted EPCs, and selected TRVs) and additional LOEs supporting the conclusion of unacceptable risk.

Scenario	Potential Receptors and Risk Drivers at the AOC 31 Exposure Area					
	Plants	Soil Invertebrates	Granivorous Mammals (Merriam's kangaroo rat)	Insectivorous Mammals (desert shrew)	Granivorous Birds (Gambel's quail)	Insectivorous Birds (cactus wren)
Baseline	None	None	None	None	None	None

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

Notes:

- ^a Applicable to both human health and ecological risk assessment (HHRA/ERA), unless otherwise noted.
- ^b Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA and ERA. Human health toxicity values are available for iron and manganese and ecological toxicity values are available for manganese, thus these chemicals are evaluated in the HHRA and ERA, if above background levels and have available toxicity values.
- ^c Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).
- ^d Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).
- ^e Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

mg/kg = milligrams per kilogram.

ug/kg = micrograms per kilogram.

COPC = Constituent of Potential Concern.

COPEC = Constituent of Potential Ecological Concern.

ND = Not detected.

TPH = Total Petroleum Hydrocarbons.

Notes:

- ^a The constituent consists of analytes detected at least once at the Topock Compressor Station site and measured in soil in this exposure area.
- ^b If fewer than eight total locations and four total detected concentrations, the maximum depth-weighted concentration was selected as the EPC. Otherwise, the UCL was selected as the EPC.
- ^c EPCs and summary statistics were not calculated for some constituents (i.e., dioxin congeners and essential nutrients). Those data, if available, are presented in Attachment A1 of each exposure area-specific appendix.

Abbreviations:

"--" = not applicable	EPC = exposure point concentration	mg/kg = milligrams per kilogram	PCB = polychlorinated biphenyls	UCL = upper confidence limit
AOC = area of concern	FOD = frequency of detection	NA = not applicable	PG&E = Pacific Gas and Electric Company	X = COPC/COPEC in the exposure depth interval
B(a)P equivalent = benzo(a)pyrene equivalent	ft bgs = feet below ground surface	ND = not detected	TCDD = Tetrachlorodibenzo-p-dioxin	
COPC = constituent of potential concern	KM = Kaplan-Meier	ng/kg = nanograms per kilogram	TEQ = toxic equivalent	
COPEC = constituent of potential ecological concern	µg/kg = micrograms per kilogram	PAH = polycyclic aromatic hydrocarbons	TPH = total petroleum hydrocarbons

- Notes:**
- ^a Exposure point concentrations (EPCs) for shallow soil (0 to 3 feet bgs) are used to evaluate inhalation of particulates in outdoor air.
 - ^b EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.
 - ^c Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.4×10⁹ m³/kg was used for recreational users (campers, hikers, and hunters) as recommended by Department of Toxic Substances Control (2014).
 - ^d Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.
 - ^e PEF of 8.5×10⁵ m³/kg was used for recreational users (off-highway vehicle rider) as calculated in United States Environmental Protection Agency (2008, 2009) and recommended in "Revised Technical Memorandum, Recreational Visitor Exposure Scenario for Federal Land, PG&E Topock Compressor Station Remediation Project, California," prepared by the Department of the Interior (DOI).

Human Health Risk and Hazard Estimate Summary at AOC 31 for the Baseline Scenario Using Depth-Weighted Exposure Point Concentrations

**Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California**

Receptor	Depth Interval	ILCR	HI
Short-Term Maintenance Worker	Surface	6E-09	2E-02
	Shallow	5E-09	1E-02
	Subsurface I	3E-09	1E-02
	Subsurface II	3E-09	1E-02
Long-Term Maintenance Worker	Surface	7E-08	4E-03
	Shallow	6E-08	3E-03
	Subsurface I	4E-08	2E-03
	Subsurface II	4E-08	2E-03
Recreational User - Camper	Surface	4E-08	3E-03
	Shallow	3E-08	3E-03
Recreational User - Hiker	Surface	8E-08	6E-03
	Shallow	6E-08	5E-03
Recreational User - Hunter	Surface	5E-09	1E-03
	Shallow	4E-09	9E-04
Recreational User - OHV Rider	Surface	7E-08	3E-03
	Shallow	5E-08	2E-03
Tribal User	Surface	1E-10	6E-05
	Shallow	1E-10	6E-05

Abbreviations:

ILCR = Incremental Lifetime Cancer Risk

HI = Hazard Index

Table AOC31-5.1
Summary of COPECs Evaluated in the ERA for AOC31

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

COPEC ^a	Baseline (0-6 ft bgs)
Inorganics	
Copper	X
Lead	X
Zinc	X
Volatile Organic Compounds	
Chloroform	X
Polycyclic Aromatic Hydrocarbons	
PAH Low molecular weight	X
PAH High molecular weight	X
Polychlorinated Biphenyls	
Total PCBs	X
Total Petroleum Hydrocarbons	
TPH as diesel	X
TPH as motor oil	X

Notes:

^a COPECs selected over the entire soil depth interval (0-6 ft bgs) potentially contacted by ecological receptors. COPECs based on background screening for metals, PAHs, and dioxins (if sampled). All detected organic compounds were selected as COPECs. See Section 2 of Appendix AOC31 for details.

Abbreviations:

AOC = area of concern
COPEC = constituent of potential ecological concern
ERA = ecological risk assessment
ft bgs = feet below ground surface
PAH = polycyclic aromatic hydrocarbons
PCB = polychlorinated biphenyls
TPH = total petroleum hydrocarbon
X = COPEC in that exposure depth interval

Table AOC31-5.2

Soil Exposure Point Concentration Matrix for Terrestrial Ecological Receptors

**Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California**

Ecological Receptor	Exposure Depth Intervals for Calculation of EPCs				
	Soil EPCs ^a		Biota Tissue EPCs (modeled from soil EPCs)		
	All AOCs		All AOCs		
	0-0.5 ft bgs	Maximum EPC (0-0.5, 0-3, 0-6 ft bgs)	Plants - Maximum EPC (0-0.5, 0-3, 0-6 ft bgs)	Insects (0-0.5 ft bgs)	Insectivorous Mammals (0-0.5 ft bgs)
Terrestrial Receptors					
Plants		X			
Invertebrates	X				
Gambel's Quail	X		X		
Cactus Wren	X			X	
Desert Shrew	X			X	
Merriam's Kangaroo Rat		X	X		

Notes:

^a Exposure point concentrations for ecological receptors will be represented by the maximum detected concentration, depth-weighted 95% UCL, and area-weighted 95% UCL, as relevant for this AOC. See Section 5 of Appendix AOC31 for details.

Abbreviations:

95% UCL = 95 percent upper confidence limit

AOC = area of concern

EPC = exposure point concentration

ft bgs = feet below ground surface

X = representative EPC for the pathway/receptor
