Notes:

^a Calculated using selected soil EPC and uptake model. See Section 6 of the main report.

^b EPCs equal to 0.0 indicate no bioaccumulation from soil.

Abbreviations:

-- = soil EPC or uptake model not available, biota EPCs could not be estimated.

AOC = area of concern

EPC = exposure point concentration

ft bgs = feet below ground surface

m = maximum depth-weighted concentration

mg/kg = milligrams per kilogram

nd = not detected in this depth interval

ng/kg = nanograms per kilogram

PAH = polycyclic aromatic hydrocarbons

PCB = polychlorinated biphenyls

Notes:
^a WOE Result is risk conclusion based on 1.) HQ/LOAEL HQ using depth-weighted EPCs, and 2.) supporting LOE. Area-weighted EPCs not evaluated for this exposure area.

	NOAEL HQ greater than 1
	HQ or LOAEL HQ greater than 1
	HQ or LOAEL HQ greater than 10
	HQ or LOAEL HQ greater than 100

Abbreviations:
-- = no toxicity value available, HQs could not be estimated
AOC = area of concern
HQ = hazard quotient
LOE = line of evidence
LOAEL = lowest observed adverse effect level
ND = not detected
NOAEL = no-observed adverse effect level
WOE = weight of evidence, considering multiple LOE. If HQs/LOAEL HQs > 1, WOE Result is either 1) not expected, 2) unlikely, or 3) possible.

Table AOC31-6.2
Risk Conclusions and Lines of Evidence Summary for AOC 31

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

AOC	Receptor	COPEC ^a	Depth-Weighted HQs			Additional Lines of Evidence ^c									Risk Conclusions		Risk Driver (LOAEL HQ > 1 and Supporting LOE) ^g
			Plant and Soil Invertebrates	Mammal/ Bird		Low FOD (Max = EPC) ^b	Locations > BTV	Locations > 10xBTV	Background HQs ^d		BAFs	Quality of SL or TRV	Exposure Assumptions ^e	Observation of T&E species ^f	Individuals	Populations	
				NOAEL	LOAEL				NOAEL	LOAEL

AOC 31 ^b	Plants	None	HQs ≤ 1	--	--	--	--	--	--	--	--	--	--	--	Not expected	No	
	Soil Invertebrates	None	HQs ≤ 1	--	--	--	--	--	--	--	--	--	--	--	Not expected	No	
	Merriam's Kangaroo Rat	None	--	HQs < 1	HQs < 1	--	--	--	--	--	--	--	--	--	Not expected	Not expected	No
	Desert Shrew	None	--	HQs < 1	HQs < 1	--	--	--	--	--	--	--	--	--	Not expected	Not expected	No
	Gambel's Quail	None	--	HQs < 1	HQs < 1	--	--	--	--	--	--	--	--	--	Not expected	Not expected	No
	Cactus Wren	None	--	HQs < 1	HQs < 1	--	--	--	--	--	--	--	--	--	Not expected	Not expected	No

Notes:
a COPECs are presented for HQs greater than 1 based on the depth-weighted EPC and/or area-weighted EPC and species and site-specific SUF.
b The EPC is based on the maximum depth-weighted concentration due to the small dataset size.
c The additional lines of evidence for COPECs with NOAEL and LOAEL HQs less than or equal to 1 (based on the area-weighted EPC and species and site-specific SUF) are not included in the table.
d For plants and soil invertebrates, the background HQ is based on the BTV. For mammals and birds, the NOAEL and LOAEL background HQs are based on the 95 percent upper confidence limit.
e Applicable to wildlife, unless noted.
f In areas where observations were noted, the T&E species observed have large home ranges and unlikely to forage in upland habitat. See text for details.
g For dioxin TEQ, LOAEL HQs less than 10 with supporting LOE were considered unlikely to pose an unacceptable risk to populations of wildlife receptors due to the compounded conservative assumptions included in the ecological risk assessment. See Section 6.7.6 of the main report.

--	LOAEL and NOAEL HQs ≤ 1 for the receptor
	NOAEL HQ greater than 1
	HQ/LOAEL HQ greater than 1
	HQ/LOAEL HQ greater than 10
	HQ/LOAEL HQ greater than 100

Abbreviations:
"--" = not applicable
AOC = area of concern
BAF = bioaccumulation factor
BCW = Bat Cave Wash
BG NA = background value not available
BTV = background threshold value
COPEC = constituent of potential ecological concern
EPC = exposure point concentration
FOD = frequency of detection
HQ = hazard quotient
LOAEL = lowest observed adverse effect limit

LOE = line of evidence
MDC = maximum depth-weighted concentration
NC = not calculated
NE = line of evidence not evaluated
NOAEL = no observed adverse effect limit
SL = screening level
SWMU 1 = solid waste management unit 1
T&E = threatened and endangered
TCS-4= Topock Compressor Station Well #4
TEQ = toxic equivalent
TRV = toxicity reference value

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.
NA = Not applicable. Carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated using benzo(a)pyrene equivalents.
NC = Not considered a carcinogen.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene).
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.

Notes:^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.**Abbreviations:**

-- = not calculated.

B(a)P equivalent = Benzo(a)pyrene equivalent.

bgs = below ground surface.

COPC = Constituent of Potential Concern.

ILCR = Incremental Lifetime Cancer Risk.

na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text

NA = Not applicable. Carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated using benzo(a)pyrene equivalents.

NC = Not considered a carcinogen.

ND = Not detected.

NS = Not sampled.

NV = Not volatile.

PCB = Polychlorinated biphenyls.

TPH = Total Petroleum Hydrocarbons.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
HI = Hazard Index
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene).
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.

BKSF	Biokinetic Slope Factor	ug/dL per ug/day	0.4	0.4
GSD _i	Geometric standard deviation PbB	--	1.8	1.8
PbB ₀	Baseline PbB	ug/dL	0.0	0.0
IR _s	Soil ingestion rate (including soil-derived indoor dust)	g/day	0.05	0.05
AF _{s, d}	Absorption fraction (same for soil and dust)	--	0.12	0.12
EF _{s, d}	Exposure frequency (same for soil and dust)	days/yr	8	8
AT _{s, d}	Averaging time (same for soil and dust)	days/yr	365	365
PbB _{adult}	PbB of adult worker, geometric mean	ug/dL	0.001	0.001
PbB _{fetal, 0.90}	90th percentile PbB among fetuses of adult workers	ug/dL	0.00	0.00
PbB _t	Target PbB level of concern (e.g., 10 ug/dL)	ug/dL	1.0	1.0
$P(\text{PbB}_{\text{fetal}} > \text{PbB}_t)$	Probability that fetal PbB > PbB _t , assuming lognormal distribution	%	0%	0%

PRG90

9942

Notes:

Highlighted values are site-specific: soil ingestion rate of 50 mg/day is the default incidental soil ingestion rate evaluation of exposure to lead in soil (USEPA 2003). Exposure frequency (8 days/year) based on the assumption of 8 days per month, 1 month per year as shown in Table 5.1 of the main report.

Inhalation	8.7E-9	1.7E-07	0.01%		1.7E-07	0.00%

Notes:

Highlighted values are Site-specific: days per week based on the assumption of 2 days per month, 8 months per year. Soil ingestion rate of 330 mg/day is modified by exposure time (1.5 hours riding at site per 16 awake hours, or 0.09). Default inhalation breathing rate of 6.8 m³/day is modified to account for exposure time (i.e., 1.5 hours riding at site per 24 hours, or 0.06) . See Table 5.1 of the main report for details.

1 INTRODUCTION

This appendix presents the human health and ecological risk assessment (HHERA) for the Undesignated Area 2 (UA-2) soil potential exposure area located outside the Topock Compressor Station (TCS) in Needles, California. The UA-2 potential exposure area, shown on Figure UA2-1.1, is approximately 0.10 acre and includes the sample locations identified in Table UA2-1.1. Available soil data for the UA-2 potential exposure area were used to conduct a quantitative HHERA as presented herein. The human health risk assessment (HHRA) and the ecological risk assessment (ERA) results are summarized in Sections 5 and 6, respectively, of the Soil Human Health and Ecological Risk Assessment Report (the “main report”). This appendix refers to “HHRA” when discussing specific information for assessing risks to human health, “ERA” when discussing specific information for assessing risks to potential ecological receptors, and “HHERA” when discussing topics that are common to both the HHRA and the ERA.

Descriptions of the physical location and characteristics of the UA-2 potential exposure area and the HHERA methodologies are provided in the main report and the Human Health and Ecological Risk Assessment Work Plan (RAWP) documents (Arcadis U.S., Inc. [Arcadis] 2008, 2009, 2015) and are not repeated in this appendix. Detailed discussions of the historical uses and sampling and analysis are presented in the main report as well.

This appendix summarizes site use, data evaluation, potential receptors, potential exposure pathways, and results of the HHERA risk characterization for soil in the UA-2 potential exposure area. Tables and figures specific to the UA-2 potential exposure area HHERA are also presented in this appendix.

1.1 Summary of Site Use

The UA-2 potential exposure area, also referred to as the UA or former 300B pipeline liquids tank area, is located southeast of the TCS on a shelf in the hill next to old Route 66, on Havasu National Wildlife Refuge property.

The 300B pipeline liquids tank was formerly used to collect pipeline liquids from the 300B natural gas pipeline. It was an aboveground tank located on two concrete saddle supports. The tank pad was unpaved, and oil-stained soil was observed underneath and immediately adjacent to a portion of the tank (CH2M HILL, Inc. [CH2M] 2006). The tank was removed in 1995, and cleanup according to a closure plan was implemented and soil excavation was conducted in 1996. Soil was excavated to a total depth of 5.5 feet (ft) below ground surface (bgs). Confirmation samples indicated that the closure plan target of 1,000 milligrams per kilogram (mg/kg) was met. The soil excavation and sampling results are documented in the Closure Certification Report (Trident Environmental and Engineering 1996).

The primary sources of contamination in the UA-2 potential exposure area consisted of potential historical spills while filling or emptying the 300B pipeline liquids tank, and potential historical leaks from the tank. Any constituents released would have been released in liquid form to surface soil. If released, volatile organic compounds (VOCs) in surface soil would be expected to have been degraded by heat and light and likely are no longer present. The majority of the affected soil has been removed, as documented by post-remediation confirmation sampling. Therefore, surface soil is the primary source medium.

2 DATA EVALUATION AND COPC/COPEC SELECTION

This section summarizes the data considered for the UA-2 potential exposure area HHERA and presents the constituents of potential concern (COPCs) for human health and constituents of potential ecological concern (COPECs) selected for the UA-2 potential exposure area.

All soil sampling locations at the UA-2 potential exposure area are presented on Figure UA2-1.1 and in Table UA2-1.1. The data were evaluated based on methodology described in the RAWP documents (Arcadis 2008, 2009, 2015). Details of the soil sampling and analysis will be presented in the forthcoming Draft Resource Conservation and Recovery Act Facility Investigation/Remedial Investigation (RFI/RI) Report Volume 3 (currently being prepared by Jacobs).

Following the steps outlined in Section 3 of the main report, soil data considered usable for the risk assessment were identified and used in the quantitative HHERA. All available soil data for the UA-2 potential exposure area were considered usable for the HHERA and are presented in Attachment UA2-A1. For the UA-2 potential exposure area, potential soil contact does not extend below 10 ft bgs (Table UA2-1.1); therefore, available soil data from 18 samples collected from 0 to 10 ft bgs were considered for use in the HHERA.

Data processed for the HHERA (e.g., calculation of total concentrations for low molecular weight [LMW] and high molecular weight [HMW] polycyclic aromatic hydrocarbons [PAHs], benzo[a]pyrene equivalent [B(a)PEQ], and polychlorinated biphenyls [PCBs]) are described in detail in Section 3 of the main report.

The process for identifying COPCs and COPECs included in the HHERA is detailed in Section 3.4 of the main report. COPCs and COPECs were selected for the UA-2 potential exposure area using soil data encompassing all relevant exposure depths for the HHERA (i.e., 0 to 10 ft bgs for the UA-2 potential exposure area), as presented in Attachment UA2-A1. Only a few metals are present at concentrations above background levels in UA-2 potential exposure area soil (0 to 10 ft bgs), and therefore are included as COPCs and/or COPECs in the four baseline exposure depths evaluated in the HHERA. B(a)PEQ was within the range of background, and therefore, B(a)PEQ and associated carcinogenic PAHs (i.e., benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, dibenzo[a,h]anthracene, chrysene, and indeno[1,2,3-cd]pyrene) were not selected as COPCs. HMW and LMW PAHs were within the range of background and were not selected as COPECs. All other detected organic constituents in UA-2 potential exposure area soil in the baseline exposure depths are included as COPCs and/or COPECs in the HHERA. COPCs and/or COPECs selected for exposure depths and scenarios (baseline) evaluated in the HHERA for the UA-2 potential exposure area are summarized in Tables UA2-2.1a through UA2-2.1d. The selected COPCs and COPECs are discussed further in Sections 4 and 5, respectively, of this appendix.

3 EXPOSURE POINT CONCENTRATIONS

Depth-weighted exposure point concentrations (EPCs) for COPCs/COPECs in soil at the UA-2 potential exposure area were calculated as described in Section 4.2 of the main report. For the UA-2 potential exposure area, one scenario was evaluated: Baseline (no scouring).

The following exposure depths were evaluated:

1. Surface soil (0 to 0.5 ft bgs)
2. Shallow soil (0 to 3 ft bgs)
3. Subsurface I soil (0 to 6 ft bgs)
4. Subsurface II soil (0 to 10 ft bgs).

The depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment UA2-A2. The summary statistics for these UA-2 potential exposure area soil depth-weighted datasets and depth-weighted EPCs were calculated consistent with the RAWP documents (Arcadis 2008, 2009, 2015). Although data are only available for 0 to 6 ft bgs, the depth-weighting process allows for EPCs to be calculated for the subsurface II (0 to 10 ft bgs) depth interval.

Soil summary statistics for constituents measured at the UA-2 potential exposure area¹ that were detected at least once and depth-weighted EPCs for COPCs/COPECs calculated using depth-weighted data from the exposure depths listed above for the UA-2 potential exposure area for the baseline scenario are presented in Table UA2-3.1. Due to the small sizes of the surface, shallow, subsurface I, and subsurface II soil datasets for the UA-2 potential exposure area (i.e., insufficient data to calculate upper confidence limits [UCLs] on the mean), the depth-weighted EPCs were based on maximum depth-weighted concentrations.

Per the RAWP documents (Arcadis 2008, 2009, 2015), area-weighted EPCs for the HHRA are evaluated only if depth-weighted EPCs suggest that cumulative cancer risks and/or noncancer hazards may be significant for any given HHRA exposure scenario (cumulative cancer risks exceed a 10^{-6} cancer risk level, and/or the noncancer hazard index [HI] exceeds 1). Similarly, for the ERA, area-weighted EPCs are evaluated only if depth-weighted EPCs suggest potential risk to potential ecological receptors (i.e., hazard quotient [HQ] is greater than 1 for any COPEC). For the UA-2 potential exposure area, due to the small dataset (i.e., sample size of two or five), area-weighted EPCs were not calculated since they would be equivalent to the depth-weighted EPCs (i.e., both are based on maximum depth-weighted concentrations).

¹ The list of constituents shown in the main report Section 3 tables is based on analytes that were detected at least once at the site (including all exposure areas inside or outside the TCS) and measured at UA-2.

4 HUMAN HEALTH RISK ASSESSMENT

This section summarizes the HHRA approach; presents the COPC, EPC, risk, and hazard summary tables; and discusses the results of the risk characterization and uncertainties in the risk assessment for the UA-2 potential exposure area. Details of the overall HHRA approach are presented in Section 5 of the main report. Dose, exposure concentration (EC), risk, and hazard calculation tables for potential human health receptors at the UA-2 potential exposure area are presented in Attachment UA2-B.

Risks/hazards estimated for an individual exposure area such as the UA-2 potential exposure area are not considered representative of the realistic or likely potential exposures for the human populations that could be present in the areas outside the TCS (such as maintenance workers, recreational users, and tribal users). Risks/hazards calculated separately for individual areas of concern (AOCs) are conservative and likely overestimate site risks/hazards. As described in the RAWP documents (Arcadis 2008, 2009, 2015), these human populations would more likely be exposed randomly, over the course of a lifetime, to soil present in all exposure areas located outside the TCS rather than have a lifetime of contact limited to the area of a single exposure area. Therefore, estimated risks/hazards presented for individual exposure areas are not believed to be representative of the potential health risks to humans potentially contacting the soil outside the TCS. Rather, the HHRA results presented in Appendix OCS for all exposure areas located outside the TCS combined will help to inform risk management decisions for the site. The estimated risks and hazards associated with a lifetime of contact with soil only in the UA-2 potential exposure area are presented at the request of the agencies and are not suitable to provide the sole basis of risk management decisions to protect human health.

4.1 Human Health Conceptual Site Model

Following the steps outlined in Section 5.5 of the main report, risks were estimated for potentially complete and significant exposure pathways identified in the human health conceptual site model (CSM) for receptors potentially exposed to COPCs in soil present at the UA-2 potential exposure area. The potential receptors and potential exposure pathways evaluated for the UA-2 potential exposure area included:

- **Short- and Long-Term Maintenance Workers** – Incidental ingestion of soil, dermal contact with soil, and inhalation of particulates and VOC vapors in ambient outdoor air from soil
- **Recreational Users (child and/or adult campers, hikers, hunters, and off-highway vehicle [OHV] riders)** – Incidental ingestion of soil, dermal contact with soil, and inhalation of particulates and VOC vapors in ambient outdoor air from soil
- **Tribal Users** – Inhalation of particulates and VOC vapors in ambient outdoor air from soil.

Potential exposure pathways considered incomplete or insignificant were not quantitatively evaluated and are discussed in Section 5.3.1 of the main report.

4.2 Constituents of Potential Concern

COPCs for the UA-2 potential exposure area were selected in accordance with the RAWP documents (Arcadis 2008, 2009, 2015) and as described in Section 3.4 of the main report. Data used in the COPC

selection process are presented in Attachment UA2-A1. COPCs for the four exposure depths and one scenario (baseline) evaluated for the UA-2 potential exposure area HHRA are summarized in Table UA2-4.1 (details are presented in Tables UA2-2.1a through UA2-2.1d).

COPCs included metals (arsenic, barium, lead, manganese, and zinc), semi-volatile organic compounds (SVOCs; 4-methylphenol and bis [2-ethylhexyl] phthalate), PAHs, total petroleum hydrocarbon (TPH) as diesel, and TPH as motor oil in surface, shallow, subsurface I, and/or subsurface II soil.

4.3 Exposure Point Concentration Summary

For the potentially complete and significant exposure pathways identified in the CSM, EPCs were calculated as described in Section 4.2 of the main report and presented in Section 3 of this appendix. Depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment UA2-A2. Depth-weighted EPCs for COPCs in soil and estimated outdoor air concentrations associated with dust and vapor used to estimate risk in the HHRA are summarized in Tables UA2-4.2a through UA2-4.2h for the four exposure depths in the baseline scenario.

As described in detail in Section 5.3.3 of the main report, the following exposure depths and corresponding EPC datasets were used to evaluate potential exposure to COPCs in soil for potential human receptors:

- **Short- and Long-Term Maintenance Worker** – surface, shallow, subsurface I, and subsurface II soil
- **Recreational User (child and/or adult campers, hikers, hunters, and OHV riders)** – surface and shallow soil
- **Tribal User** – surface and shallow soil.

4.4 Estimation of Dose

The EC and chronic daily intake for potential carcinogenic and noncarcinogenic effects were calculated, as described in Section 5.5.1 of the main report, for COPCs in soil for potentially complete exposure pathways. The calculated EC and chronic daily intake values are presented in Tables UA2-B.1a through UA2-B.1h (carcinogenic effects) and Tables UA2-B.2a through UA2-B.2g (noncarcinogenic effects) in Attachment UA2-B for the potential receptors evaluated. Exposure parameters used in the dose calculations are presented in Table 5-1 of the main report.

4.5 Toxicity Assessment

The toxicity assessment characterizes the relationship between the magnitude of exposure to a constituent and the potential for adverse health effects. More specifically, the toxicity assessment identifies agency-promulgated or derived toxicity values that can be used to estimate the likelihood of adverse health effects occurring in humans at different exposure levels. The approach for the toxicity assessment is provided in Section 4.5 of the RAWP (Arcadis 2008) and in Section 4.2 of the RAWP Addendum 2 (Arcadis 2015). Consistent with regulatory risk assessment policy, adverse health effects resulting from potential chemical exposures are evaluated in two categories: carcinogenic effects and noncarcinogenic effects. The hierarchy of sources for the toxicity criteria to be used for the HHRA generally corresponds to California Department of Toxic Substances Control (DTSC) guidance (2015). Toxicity values for carcinogenic and noncarcinogenic

effects for COPCs selected and used for the HHRA are described in Section 5.4 of the main report and were used to estimate potential cancer risks and noncancer hazards.

4.6 Human Health Risk Characterization

For potential human receptors, assuming lifetime soil exposure is limited to the UA-2 potential exposure area, the incremental lifetime cancer risks (ILCRs) and/or noncancer HQs were calculated for each COPC and potentially complete exposure pathway. Cumulative ILCRs (i.e., sum of chemical-specific ILCRs for each exposure depth for a scenario) were calculated and compared to the DTSC's point of departure for risk management decision of 1×10^{-6} ; risk management decisions may raise this criterion depending on site-specific conditions. As indicated in the National Oil and Hazardous Substances Pollution Contingency Plan (40 Code of Federal Regulations 300), cancer risks with between one in a million and one hundred in a million probability of occurrence (1×10^{-6} and 1×10^{-4}) fall within a risk management range. This is generally referred to as the acceptable risk range. Within this estimated cancer risk range, there is flexibility for risk managers in deciding what action, if any, is necessary and appropriate for the protection of human health. Cumulative noncancer hazards (i.e., HIs) are calculated and compared to an HI of 1 (DTSC 2015). Chemical exposures that yield HIs of less than or equal to 1 are not expected to result in adverse noncancer health effects (United States Environmental Protection Agency [USEPA] 1989).

4.6.1 Risk Characterization for Exposure to Soil (Baseline Scenario and Depth-Weighted EPCs)

Table UA2-4.3 summarizes cumulative ILCRs and HIs estimated using depth-weighted EPCs for potential exposure to soil for each potential human receptor evaluated at the UA-2 potential exposure area in the baseline scenario. The dose, EC, ILCR, and HI equations are presented in detail in Section 5.5.1 of the main report. The detailed cancer risk estimates (Tables UA2-B.3a through UA2-B.3g) and noncancer hazard calculations (Tables UA2-B.4a through UA2-B.4g) are presented in Attachment UA2-B.

Risk and hazard estimates for the baseline scenario are summarized in the tables below. Assuming that lifetime soil contact is limited to the UA-2 potential exposure area, the depth-weighted estimated cumulative ILCRs and HIs for each receptor potentially exposed to COPCs in UA-2 potential exposure area soil at all exposure depths are below the *de minimis* levels of 1×10^{-6} and 1, respectively, for the hunter and tribal user. Estimates for potential soil contact limited to the UA-2 potential exposure area for lifetime exposure are above *de minimis* levels, but within the acceptable risk management range, for short- and long-term maintenance workers and certain recreational users (campers, hikers, hunter, and OHV riders).

Maintenance Workers

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		UA-2 Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Short-Term Maintenance Worker	Surface	1E-06	NA	0.5	NA
	Shallow	2E-06	As (2E-06)	0.5	NA
	Subsurface I	2E-06	As (2E-06)	0.5	NA
	Subsurface II	1E-06	NA	0.5	NA
Long-Term Maintenance Worker	Surface	1E-05	As (1E-05)	1	NA
	Shallow	2E-05	As (2E-05)	1	NA
	Subsurface I	2E-05	As (2E-05)	1	NA
	Subsurface II	1E-05	As (1E-05)	1	NA

Notes:

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

As = arsenic

NA = not applicable

The depth-weighted estimated cumulative ILCRs for the short-term maintenance worker potentially exposed to COPCs in UA-2 potential exposure area surface and subsurface II soil are at 1×10^{-6} , the point of departure for risk management decisions. However, assuming lifetime soil contact is limited to the UA-2 potential exposure area, the depth-weighted estimated cumulative ILCRs for the short-term maintenance worker potentially exposed to COPCs in shallow and subsurface I soil are above the point of departure for risk management decisions of 1×10^{-6} , but well within the risk management range of 1×10^{-6} and 1×10^{-4} . For this potential receptor, risk estimates above *de minimis* levels were approximately 100% attributed to arsenic (Table UA2-B.3a). Approximately 20% of the ILCRs for arsenic for the short-term maintenance worker is attributed to background concentrations of arsenic in soil (i.e., background cancer risk of 4×10^{-7} based on a background UCL of 4.5 mg/kg).

Assuming lifetime soil contact is limited to the UA-2 potential exposure area, the depth-weighted estimated cumulative ILCRs for the long-term maintenance worker potentially exposed to COPCs in surface, shallow, subsurface I, and subsurface II soil are above the point of departure for risk management decisions of 1×10^{-6} , but well within the risk management range of 1×10^{-6} and 1×10^{-4} . For this potential receptor, risk estimates above *de minimis* levels were approximately 100% attributed to arsenic (Table UA2-B.3b). Approximately 20% to 40% of the ILCRs for arsenic for the long-term maintenance worker is attributed to background concentrations of arsenic in soil (i.e., background cancer risk of 4×10^{-6}).

As indicated previously in Section 3, the depth-weighted EPC is based on the maximum depth-weighted concentration. Arsenic was detected at concentrations above the background threshold value (BTv) of 11 mg/kg in seven of 17 samples at three sampling locations (UA2-300B-1, UA2-300B-2, and UA2-300B-3) at various depths within the top 6 ft of soil. The maximum concentration of 24 mg/kg detected in a sample collected from 0.5 to 1.0 ft bgs is at sampling location UA2-300B-1. Therefore, the cumulative ILCRs for the short- and long-term maintenance workers are likely overestimated.

APPENDIX UA2

SOIL HHERA FOR UA-2 EXPOSURE AREA

Assuming lifetime soil contact is limited to the UA-2 potential exposure area, the depth-weighted estimated cumulative HIs for short- and long-term maintenance workers potentially exposed to COPCs in surface, shallow, subsurface I, and subsurface II soil (Tables UA2-B.4a and UA2-B.4b, respectively) are at or below 1. The depth-weighted EPCs for lead in surface, shallow, subsurface I, and subsurface II soil at the UA-2 potential exposure area are not expected to result in an increase in blood lead levels above the California Office of Environmental Health Hazard Assessment (OEHHA) benchmark value of 1 microgram per deciliter ($\mu\text{g/dL}$) in the fetus of a short- or long-term maintenance worker (Tables UA2-B.5a and UA2-B.5b, respectively).

Recreational Users

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		UA-2 Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Camper	Surface	5E-06	As (5E-06)	1	NA
	Shallow	7E-06	As (7E-06)	2	As
Hiker	Surface	1E-05	As (1E-05)	3	As
	Shallow	1E-05	As (1E-05)	4	As
Hunter	Surface	2E-06	As (2E-06)	0.1	NA
	Shallow	2E-06	As (2E-06)	0.2	NA
OHV Rider	Surface	5E-06	As (5E-06)	0.6	NA
	Shallow	8E-06	As (8E-06)	0.8	NA

Note:

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

Assuming lifetime soil contact is limited to the UA-2 potential exposure area, the depth-weighted estimated cumulative ILCRs for the camper, hiker, and OHV rider potentially exposed to COPCs in surface and shallow soil under the baseline scenario are above the point of departure for risk management decisions of 1×10^{-6} , but well within the risk management range of 1×10^{-6} and 1×10^{-4} . For these potential receptors, risk estimates above *de minimis* levels were approximately 100% attributed to arsenic (Tables UA2-B.3c through UA2-B.3f). Approximately 21% to 32% of the ILCRs for arsenic for the camper (1.6×10^{-6}), hiker (3.1×10^{-6}), hunter (4.9×10^{-7}), and OHV rider (1.7×10^{-6}) are attributed to background concentrations of arsenic in soil.

Assuming lifetime soil contact is limited to the UA-2 potential exposure area, the depth-weighted estimated HIs for the camper and hiker potentially exposed to COPCs in surface and/or shallow soil under the baseline scenario are above 1; approximately 100% attributed to arsenic (Tables UA2-B.4c through UA2-B.4f). Approximately 20% to 40% of the HIs for arsenic for the camper (0.4) and hiker (0.82) are attributed to background concentrations of arsenic in soil.

As indicated previously in Section 3, the depth-weighted EPC is based on the maximum depth-weighted concentration. Arsenic was detected at concentrations above the BTV of 11 mg/kg in seven of 17 samples at three sampling locations (UA2-300B-1, UA2-300B-2, and UA2-300B-3) at various depths within the top 6 ft of soil. The maximum concentration of 24 mg/kg detected in a sample collected from 0.5 to 1.0 ft bgs is at

APPENDIX UA2

SOIL HHERA FOR UA-2 EXPOSURE AREA

sampling location UA2-300B-1. Therefore, the cumulative ILCRs and HIs for the recreational user are likely overestimated.

The depth-weighted EPCs for lead in surface and shallow soil at the UA-2 potential exposure area under the baseline scenario are not expected to result in an increase in blood lead levels above the OEHHA benchmark value of 1 µg/dL for the child recreational user or the fetus of a hunter (Tables UA2-B.5c through UA2-B.5i).

Tribal Users

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		UA-2 Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Tribal User	Surface	8E-11	NA	0.0003	NA
	Shallow	1E-10	NA	0.0003	NA

Note:

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

Assuming lifetime soil contact is limited to the UA-2 potential exposure area, the depth-weighted estimated cumulative ILCRs and HIs for the tribal user potentially exposed to COPCs in surface and shallow soil (Tables UA2-B.3g and UA2-B.4g, respectively) are below the *de minimis* level of 1×10^{-6} , the point of departure for risk management decisions, and HI of 1, respectively.

Due to the small dataset (i.e., sample size of two or five), a UCL was not calculated and the maximum depth-weighted concentrations were used as the EPCs. Consequently, area-weighted EPCs and associated risk and hazard estimates are not provided for the UA-2 potential exposure area.

4.6.2 Uncertainties in the Risk Assessment

The risk assessment includes several uncertainties that warrant discussion. Many of the assumptions used in this risk assessment regarding the representativeness of the sampling data, potential human exposures, fate and transport modeling, and chemical toxicity are conservative, follow agency guidance, and reflect a 90th or 95th percentile value rather than a typical or average value. The use of several conservative exposure assumptions and toxicity estimates can introduce considerable uncertainty into the risk assessment. By using conservative exposure assumptions or toxicity estimates, the assessment can develop a significant conservative bias that may result in the calculation of significantly higher estimates for cancer risks or noncancer hazards than are actually posed by the chemicals present in soil. These uncertainties are discussed in detail in Section 5.6 of the main report. Uncertainties applicable only to the risk assessment for the UA-2 potential exposure area are discussed below.

Uncertainties for the UA-2 potential exposure area include the use of the maximum depth-weighted soil concentration as the EPC. The maximum depth-weighted soil concentration was used for COPCs when the soil dataset contained fewer than four detected values (i.e., concentrations reported above the detection limit) or fewer than eight total observations as shown in Table UA2-3.1. As stated previously in Section 3, due to the small dataset sizes for surface, shallow, subsurface I, and subsurface II soil in the UA-2 potential exposure area (i.e., insufficient data to calculate UCLs on the mean), the depth-weighted EPCs were based on maximum depth-weighted concentrations.

APPENDIX UA2
SOIL HHERA FOR UA-2 EXPOSURE AREA

The use of the maximum depth-weighted soil concentration as the EPC for the COPCs may not appropriately represent exposures and resulting risks/hazards for maintenance workers, recreational users, and tribal users evaluated in the UA-2 potential exposure area HHRA.

5 ECOLOGICAL RISK ASSESSMENT

This section summarizes the ERA approach; presents the COPECs, EPCs, dose, and risk tables for the UA-2 potential exposure area ERA; and characterizes potential risk to potential ecological receptors exposed to COPECs in soil at the UA-2 potential exposure area. Details of the overall ERA approach are presented in Section 6 of the main report. Supporting tables for the UA-2 potential exposure area ERA based on risk calculations conducted using depth-weighted EPCs are presented in Attachment UA2-C and described below.

As noted in Section 3, the depth-weighted EPCs are based on the maximum depth-weighted concentration due to the small datasets available for this exposure area. Use of the maximum concentration as the EPC may not appropriately characterize exposure and risk. Ecological risk calculations based on maximum depth-weighted EPCs, specified in the RAWP (Arcadis 2008) and DTSC guidance (1996), are the same as presented below.

5.1 Ecological Conceptual Site Model

Following the steps outlined in Section 6.6 and on Figures 2-7 and 6-1 of the main report, risks were estimated for potentially complete and significant exposure pathways identified for potential receptors exposed to COPECs in soil at the UA-2 potential exposure area. These potential receptors included plants, invertebrates, and small home-range receptors, as follows:

- **Plants** – may be exposed to COPECs via root uptake from surface, shallow, and/or subsurface I soil, depending on the root depth of plants of concern.
- **Soil Invertebrates** – may be exposed to COPECs via direct contact/uptake from surface soil.
- **Mammals** – may be exposed to COPECs via incidental ingestion of surface, shallow, or subsurface I soil (for burrowing animals) and/or ingestion of biota tissue (i.e., food items). The small home-range mammal indicator receptors evaluated in this ERA for the UA-2 potential exposure area were:
 - **Merriam's Kangaroo Rat** – representative of granivorous small mammal populations, exposed to surface, shallow, and/or subsurface I soil (incidental and through biota uptake).
 - **Desert Shrew** – representative of invertivorous small mammal populations, exposed only to surface soil (incidental and through biota uptake).
- **Birds** – may be exposed to COPECs via incidental ingestion of surface, shallow, or subsurface I soil and/or ingestion of biota tissue (i.e., food items). The small home-range bird indicator receptors evaluated in this ERA for the UA-2 potential exposure area were:
 - **Cactus Wren** – representative of insectivorous bird populations, exposed only to surface soil (incidental and through biota uptake).
 - **Gambel's Quail** – representative of granivorous bird populations, exposed incidentally only to surface soil and exposed to surface, shallow, or subsurface I soil (incidental and through biota uptake).

Potential exposure pathways considered incomplete or insignificant were not quantitatively evaluated; these potential exposure pathways are identified and described in Section 6.3 of the main report.

Large home-range potential receptors (i.e., desert kit fox, red-tailed hawk, and Nelson's desert bighorn sheep) were evaluated for larger exposure areas (combined AOCs/investigation areas) and are discussed in those specific appendices. Potential risks to desert kit fox, red-tailed hawk, and Nelson's desert bighorn sheep associated with the UA-2 potential exposure area were estimated and characterized as part of the evaluation of all AOCs/investigation areas outside the compressor station (OCS) and all AOCs outside the compressor station excluding Bat Cave Wash (BCW) and AOC 4 (OCSxBCW+AOC4); see Appendix OCS and Appendix OCSxBCW+AOC4 for risk characterization for these large home-range potential receptors.

5.1.1 Evaluation of Special-Status Species

The biological setting for the site and the adjacent areas is described in detail in various reports (see Section 2.4 of the main report). Although potential habitat exists for special-status² species at or near the site, none have been recorded as observed at the UA-2 potential exposure area. The primary vegetation present at the UA-2 potential exposure area is sparse creosote bush (*Larrea tridentate*). No federal- or state-listed threatened and endangered (T&E) plants or candidates for listing were found at the site, including the UA-2 potential exposure area.

Several species of mammals and birds have been observed at or near the site (Tables 2-2 and 2-4 of the main report). However, no federal- or state-listed T&E species or candidates for listing were observed at the UA-2 potential exposure area.

The risk estimates presented here are considered to be protective of special-status species due to the conservative nature of the ERA, where conservative parameters (e.g., small exposure areas, selected indicator species for each functional group considered on the high end of potential exposures for typical potential receptors at the site within that group, and use of no-effects-based toxicity values) were used to assess risks to a wide range of potential receptors at various trophic levels. Therefore, further evaluation of special-status species was not considered necessary.

5.2 Constituents of Potential Ecological Concern

COPECs for the UA-2 potential exposure area were selected in accordance with the RAWP (Arcadis 2008) and as described in Section 3.4 of the main report. Soil data encompassing all relevant exposure depths for the HHERA (i.e., 0 to 6 ft bgs for the UA-2 potential exposure area) and used in the COPEC selection process are presented in Attachment UA2-A1.

Because a potential ecological receptor could be exposed to COPECs at various exposure depths either directly and/or through their diet for a given scenario, a single comprehensive COPEC list was selected based on the range of soil depths encountered by potential ecological receptors in the baseline scenario.

Additionally, essential nutrients (e.g., calcium, potassium) and analytes typically measured to evaluate geochemical conditions (e.g., chloride, nitrate, sulfate) are not typically evaluated in ERAs and were not

² Special-status species include both federal- and state--listed fully protected threatened and endangered (T&E) species, state/federal species of concern, and traditional culturally significant plants. Protection at the no-observed adverse effects level (NOAEL) is warranted only for fully protected species.

selected as COPECs. COPECs for the three exposure depths evaluated for the baseline scenario for this ERA are summarized in Table UA2-5.1.

COPECs include five metals (arsenic, barium, lead, manganese, and zinc), TPH as diesel, and TPH as motor oil in all three exposure depths. Two SVOCs (4-methylphenol and bis [2-ethylhexyl] phthalate) are also included as COPECs in shallow and subsurface I soil. Due to lack of appropriate toxicity values to evaluate TPHs for potential ecological receptors, indicator chemicals (e.g., benzene, toluene, ethylbenzene, and xylene [BTEX] and PAHs), when detected, are used to characterize TPH risks. However, BTEX were not detected and PAHs were below the BTVs at the UA-2 potential exposure area. COPECs lacking toxicity values and their impact to the ERA are discussed in Section 6.7.5 of the main report.

5.3 Exposure Point Concentration Summary

For the potentially complete and significant exposure pathways identified in the ecological CSM, soil EPCs were calculated as described in Section 4.3 of the main report and presented in Section 3 of this appendix.

For the UA-2 potential exposure area, risks to potential ecological receptors were estimated using depth-weighted EPCs due to the small dataset sizes; these depth-weighted EPCs are equivalent to maximum depth-weighted concentrations. Depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment UA2-A2.

Biota tissue EPCs were calculated from the soil EPCs using soil-to-biota uptake relationships for plants, invertebrates, and small mammals, as described in Section 6.4.3 of the main report. As described in Section 6.3 and shown on Figure 6-1 of the main report, the depth intervals selected to represent exposure to soil and biota tissue for the risk calculations for each potential receptor are presented in Table UA2-5.2.

To summarize for the baseline scenario:

- Soil invertebrates, invertivorous small mammals, and insectivorous birds could potentially be exposed to COPECs in soil and/or biota only at the surface (0 to 0.5 ft bgs).
- Plants and granivorous small mammals could potentially be exposed to COPECs in soil and or/biota down to 6 ft bgs. Therefore, the maximum of the depth-weighted EPCs from 0 to 0.5 ft bgs, 0 to 3 ft bgs, and 0 to 6 ft bgs was selected as the representative soil and/or biota EPC for a COPEC for estimating risks to these potential receptors.
- Granivorous birds could potentially be exposed to COPECs in soil (not biota) only at the surface (0 to 0.5 ft bgs) and biota down to 6 ft bgs. Therefore, exposures to granivorous birds included the depth-weighted soil EPC from 0 to 0.5 ft bgs (for incidental soil ingestion) and the maximum of the depth-weighted biota EPC from 0 to 0.5 ft bgs, 0 to 3 ft bgs, and 0 to 6 ft bgs for each COPEC.

Depth-weighted soil EPCs and biota tissue EPCs calculated from depth-weighted soil EPCs are presented in Table UA2-5.3 for the baseline scenario, and the representative soil and/or biota EPCs identified for the baseline risk calculations are bolded in this table.

The SVOCs (4-methylphenol and bis [2-ethylhexyl] phthalate) were not identified as COPECs in surface soil (not detected). Therefore, risks to potential receptors only exposed to surface soil are not estimated for these COPECs. These potential receptors include soil invertebrates, invertivorous small mammals (desert shrew), and insectivorous birds (cactus wren).

Per the RAWP (Arcadis 2008) and DTSC guidance (DTSC 1996), two risk calculations are required for each COPEC based on two EPC options: 1) the maximum detected concentration; and 2) the UCL. However, as the datasets were of insufficient size to estimate UCLs, depth-weighted EPCs are based on the maximum depth-weighted concentrations for depth intervals evaluated in the ERA. Therefore, only the depth-weighted EPCs (based on the maximum depth-weighted concentrations) and associated risk calculations are provided for each COPEC for the UA-2 potential exposure area.

5.4 Estimation of Exposure Concentration or Dose

Potential exposures for ecological communities (plants and soil invertebrates) are quantified as ECs (e.g., in mg/kg). Potential exposures for wildlife (mammals and birds) are quantified as doses (e.g., in mg/kg body weight per day). ECs and doses for COPECs in soil and potentially complete pathways were calculated as described, including equations, in Section 6.4 of the main report. The exposure parameters selected to evaluate wildlife in this ERA include upper bound values from literature (e.g., ingestion rates) or assumed (e.g., 100% of one type of diet), which may result in conservative estimates of exposure dose and potential overestimation of actual exposure at the site.

For ecological communities, ECs are equal to the depth-weighted soil EPCs for COPECs at the UA-2 potential exposure area for the baseline scenario and are presented in Table UA2-5.3.

For wildlife, doses were calculated using the exposure parameters and equations presented in Table 6-4 of the main report and depth-weighted soil and biota tissue EPCs at the UA-2 potential exposure area, as presented in Table UA2-5.3 for the depth-weighted risk evaluations. Dose calculations using depth-weighted EPCs for wildlife potentially exposed to COPECs via ingestion of soil and biota tissue for the baseline scenario are presented in Attachment UA2-C.

5.5 Effects Assessment

Concentration-based screening values (i.e., toxicity values) for plants and soil invertebrates and the dose-based toxicity reference values (TRVs) for wildlife for COPECs were used to estimate risks to ecological receptors potentially exposed to COPECs in soil and biota tissue at the UA-2 potential exposure area.

For plants and soil invertebrates, the screening values are discussed in Section 6.5 and presented in Table 6-6 of the main report.

A range of risks to wildlife were estimated using the no-observed adverse effects level (NOAEL)-based TRVs and lowest-observed adverse effects level (LOAEL)-based TRVs presented in the RAWP documents (Arcadis 2008, 2009, 2015). These selected TRVs were primarily based on the TRVs used to develop USEPA's Ecological Soil Screening Levels (USEPA 2008); other sources included the Toxicological Benchmarks for Wildlife from Oak Ridge National Laboratory (Sample et al. 1996) and USEPA Region 6 ERA Guidance (USEPA 1999). In addition, for estimating potential risk to wildlife, a second set of NOAEL- and LOAEL-based TRVs³, based on the Navy/Biological Technical Assistance Group (BTAG) TRVs (DTSC 2002, 2009), was

³ Although these are referred to as LOAEL-based BTAG TRVs, they are based on a midpoint of a variety of adverse effects and are not necessarily LOAELs. However, for simplicity, these BTAG TRVs are referred to as LOAEL-based TRVs.

used for COPECs, where available. Wildlife TRVs based on selected TRVs and BTAG TRVs are presented in Tables 6-7 through 6-10 of the main report.

Avian TRVs are not available for barium and 4-methylphenol, and mammalian TRVs are not available for 4-methylphenol; therefore, risks to these potential receptors from exposure to these specific COPECs could not be estimated. In addition, appropriate screening values and TRVs are not available for TPHs; therefore, BTEX and PAHs were used as indicator chemicals to characterize TPH risks at the UA-2 potential exposure area. The lack of screening values and TRVs and the impact to the ERA are discussed in Section 6.7.5 of the main report.

5.6 Ecological Risk Characterization

The risk characterization integrates the results of the exposure assessment and effects assessment and is subject to uncertainties in both those efforts. Risk characterization includes two major components: risk estimation and risk description. As presented in tables and discussed below, risk estimates (HQs) involved integrating exposure profiles with the exposure-effects information. For each potential receptor and COPEC, risk descriptions including various lines of evidence (LOEs) and uncertainties, including HQs, supporting statistical and site use information, and the direction of uncertainty in the risk estimates, are provided below for interpreting the risk results and identifying potential unacceptable risk to potential ecological receptors. Uncertainties specific to the UA-2 potential exposure area are discussed in context with the risk characterization results presented below. Generic uncertainties in the ERA are discussed in detail in Section 6.7 of the main report.

For plants and soil invertebrates, HQs were calculated by comparing the depth-weighted EPCs for each COPEC to respective screening values and these HQs were compared to the target HQ of 1. Following USEPA (1998) guidance, in such cases, a semi-quantitative weight-of-evidence (WOE) approach based on multiple LOEs was used in reducing uncertainty and drawing risk conclusions.

Risk conclusions for ecological communities used the following criteria:

- COPECs with HQs less than or equal to 1 pose *de minimis* risk (i.e., negligible risk) to plants and soil invertebrates.
- COPECs with HQs greater than 1 indicate unacceptable risk to plants and soil invertebrates is possible. However, exceedances of the screening values (which are conservative and generally uncertain) do not always clearly indicate that adverse effects to ecological communities are occurring. In such cases, a WOE approach, using HQs as a single LOE along with supporting information such as frequency of detection, site use history, and confidence in the screening values, was used in reducing uncertainty for characterizing potential risk to ecological communities.

Ultimately, three risk outcomes are possible for plants and soil invertebrates based on HQs greater than 1 and the WOE: 1) unacceptable risk to ecological communities is possible (i.e., indicated by sufficient and strong supporting LOEs); 2) unacceptable risk to ecological communities is unlikely (i.e., indicated by sufficient and strong LOEs to support a conclusion of no unacceptable risk); or 3) unacceptable risk to ecological communities is uncertain (i.e., indicated by insufficient LOEs).

For wildlife, a range of HQs were calculated using NOAEL- and LOAEL-based TRVs previously identified in RAWP documents (Arcadis 2008, 2009, 2015). HQs based on LOAEL-based TRVs selected in the RAWP are

referred to as “LOAEL-based HQs.” HQs based on NOAEL-based TRVs selected in the RAWP are referred to as “NOAEL-based HQs.” Additionally, NOAEL- and LOAEL-based HQs were calculated using a second set of TRVs (i.e., NOAEL- and LOAEL-based BTAG TRVs), as described in Section 6.5 of the main report. The BTAG NOAEL-based TRVs are considered very conservative, resulting in a wide range of risks to wildlife. For this ERA, the selected TRVs are considered more robust than the BTAG TRVs, as discussed in Section 6.7.5 of the main report. Results associated with the selected TRVs are recommended for risk management decisions at the UA-2 potential exposure area.

Risk conclusions for wildlife used the following criteria:

- COPECs with NOAEL-based HQs less than or equal to 1 pose *de minimis* risk to individuals and populations of potential wildlife receptors.
- COPECs with a NOAEL-based HQ greater than 1 but a LOAEL-based HQ less than or equal to 1 pose no unacceptable risks to wildlife populations. However, as described in the RAWP (Arcadis 2008), unacceptable risk to individuals is uncertain because the NOAEL-based TRVs are thresholds with an interval that is an artifact of the dosing study, and the nature and magnitude of the effects, if any, that may occur at exposures between these values are unknown. In such cases, a WOE approach, including multiple LOEs, was used in reducing uncertainty for characterizing potential risk to individual potential wildlife receptors.
- COPECs with LOAEL-based HQs greater than 1 indicate unacceptable risk is possible for populations of potential wildlife receptors. However, these LOAEL-based HQs are based on individual-level effects thresholds and only account for a single LOE. In such cases, a WOE approach was used in reducing uncertainty for characterizing potential risk to wildlife populations at the UA-2 potential exposure area, as described in the preceding bullet.
- NOAEL-based HQs greater than 1 are considered one LOE in assessing potential risk to sensitive species, if present in this exposure area. Evaluation of T&E species for the UA-2 potential exposure area is presented in Section 5.1.1.

Ultimately, three risk outcomes are possible for wildlife based on the HQs greater than 1 and WOE approach: 1) unacceptable risk to wildlife is possible (i.e., indicated by sufficient and strong supporting LOEs); 2) unacceptable risk to wildlife is unlikely (i.e., indicated by sufficient and strong LOEs supporting a conclusion of no unacceptable risk); or 3) unacceptable risk to wildlife is uncertain (i.e., indicated by insufficient LOEs).

For this ERA, the results of individual LOE evaluations were evaluated collectively to derive an overall WOE conclusion for each potential receptor. Key uncertainties were considered along with the strength, relevance, and other qualities of the LOE in reaching the WOE conclusions.

For the UA-2 potential exposure area, evaluations were completed for the following scenario and are discussed in this section:

- Baseline scenario using depth-weighted EPCs.

In these evaluations, risk calculations were completed for all COPECs, as presented in Tables UA2-5.4a and UA2-5.4b. At the conclusion of the baseline scenario evaluation, risk drivers were identified based on those COPECs for which unacceptable community-/population-level risk was predicted using the most refined

exposure and effects assumptions evaluated for this exposure area (i.e., site-specific site use factor [SUF], depth-weighted EPCs, and selected TRVs).

5.6.1 Risk Characterization (Baseline Scenario and Depth-Weighted EPCs)

Risk estimates for ecological communities (plants and soil invertebrates) and wildlife (mammals and birds) for the baseline scenario using depth-weighted EPCs are summarized in this section. As mentioned previously in Section 5.4, ECs and doses for COPECs in soil and potentially complete pathways were calculated as described, including equations, in Section 6.4 of the main report. Detailed risk calculations for plants and soil invertebrates (Table UA2-C.1) and detailed dose and risk calculations for wildlife (Tables UA2-C.2 through UA2-C.5) are presented in Attachment UA2-C. COPECs at the UA-2 potential exposure area include five metals (arsenic, barium, lead, manganese, and zinc), two SVOCs (4-methylphenol and bis [2-ethylhexyl] phthalate), and TPHs (TPH as diesel and TPH as motor oil) in soil. Potential risk to potential receptors exposed to these COPECs is described below.

As noted previously, the risks estimated in this scenario are based on maximum depth-weighted concentrations as the EPCs because there are too few samples available to reliably calculate UCLs. Because the samples were collected in a targeted manner near known or suspected source areas (see Section 1.1), use of the maximum concentration as the EPC likely overestimates potential soil exposure for the UA-2 potential exposure area and may not appropriately characterize risk. As such, the risk estimates presented below are likely overestimated as well.

5.6.1.1 Plants and Soil Invertebrates

Table UA2-5.4a summarizes HQs estimated for soil exposure for ecological communities (plants and soil invertebrates) at the UA-2 potential exposure area for the baseline scenario using depth-weighted EPCs. Plants can potentially be exposed to COPECs in soil up to 6 ft bgs. Plant HQs are greater than 1 only for manganese based on the highest EPC value from the shallow, surface, and subsurface I soil depth intervals. HQs for remaining COPECs are less than 1 for plants, indicating *de minimis risk* to plants from exposure to these COPECs.

Soil invertebrates can potentially be exposed only to COPECs in surface soil (0 to 0.5 ft bgs). For soil invertebrates, HQs are greater than 1 for manganese based on exposure to surface soil only. HQs for remaining COPECs are less than 1 for soil invertebrates, indicating *de minimis risk* to soil invertebrates from exposure to these COPECs. As mentioned in Section 5.3, 4-methylphenol and bis (2-ethylhexyl) phthalate were not detected in surface soil; therefore, risks for these COPECs to soil invertebrates, which are only exposed to surface soil, were not estimated.

For manganese, the plant and soil invertebrate HQs are greater than 1, based on a maximum depth-weighted EPC of 840 mg/kg. Samples were collected only in surface soil, where manganese was detected at both (N = 2) locations. Depth-weighted concentrations were greater than the BTV (402 mg/kg) at both locations. The plant HQ is based on a plant screening value (220 mg/kg) that is considered to be conservative and less than the BTV. Similarly, for soil invertebrates, the magnitude of the HQ is low and is based on an invertebrate screening value (450 mg/kg) that is similar to the BTV (402 mg/kg). Potential risk to plants and soil invertebrates may not be appropriately characterized because the depth-weighted EPC is the maximum depth-weighted concentration for manganese, and there is low confidence in the screening values to predict

site risk. Unacceptable risk to plant and soil invertebrate communities from exposure to manganese at the UA-2 potential exposure area is unlikely.

For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk to plants and soil invertebrates at the UA-2 potential exposure area. BTEX were not detected in any samples (Attachment UA2-A1) and PAHs were not selected as COPECs, as they are below the BTVs. No unacceptable risk to plant and soil invertebrate communities from exposure to TPHs at the UA-2 potential exposure area is expected.

Vegetation communities observed at the site during floristic surveys conducted in 2013 (GANDA and CH2M 2013) and in 2017 (CH2M 2017) are typical of Mojave Desert plant communities (summarized in Section 2.4.2 of the main report). More than 100 vascular plant species were observed within the survey area, which included the UA-2 potential exposure area, documented as Segment H in these survey reports (GANDA and CH2M 2013; CH2M 2017). The floristic surveys identified a diverse assemblage of plant species found in typical abundance, density, cover, and vigor of plant communities in undisturbed desert habitat. These observations are not consistent with impairment of the plant community at the site. The floristic survey documentation provides site-specific observations that support the health of plant communities at the site and is considered a stronger LOE than the exceedances of low-confidence generic plant screening values, which are widely acknowledged to have low ability to predict toxicity in plants.

Risk Summary and Risk Drivers for Ecological Communities

No risk drivers were identified for potential unacceptable ecological community-level risk based on HQs using the most refined exposure and effects assumptions evaluated for this exposure area (i.e., depth-weighted EPCs based on maximum depth-weighted concentrations) and supporting WOE. Based on the risk results, WOE, and supporting LOEs, unacceptable risk to plant and soil invertebrate communities is considered unlikely for manganese. No unacceptable risks are expected for the remaining COPECs in soil at the UA-2 potential exposure area.

5.6.1.2 Small Mammals

For the UA-2 potential exposure area, baseline risks were estimated for small mammals using depth-weighted EPCs for the following evaluations and discussed in this section:

- Using the selected TRVs and a SUF equal to 1
- Using the BTAG TRVs and a SUF equal to 1
- Using the selected TRVs and a species- and site-specific SUF
- Using the BTAG TRVs and a species- and site-specific SUF.

5.6.1.2.1 Risks Evaluated Using a SUF Equal to 1

Risks Evaluated Using Selected TRVs

Table UA2-5.4a summarizes HQs estimated for mammals at the UA-2 potential exposure area using the selected TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below. TRVs are not available for TPHs; however, risks to these potential receptors are characterized below based on indicator chemicals as described previously.

APPENDIX UA2
SOIL HHERA FOR UA-2 EXPOSURE AREA

- **Merriam's kangaroo rat (granivorous small mammal)** – This potential receptor could potentially be exposed to COPECs in subsurface I soil (0 to 6 ft bgs) directly and through its diet. The NOAEL- and LOAEL-based HQs in soil are less than 1 for all COPECs, indicating *de minimis* risk to individuals and populations of granivorous small mammals at the UA-2 potential exposure area.
 - For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples and PAHs were less than the BTVs, indicating that no unacceptable risk to granivorous small mammals from exposure to TPHs is expected.
- **Desert shrew (invertivorous small mammal)** – This potential receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. The NOAEL- and LOAEL-based HQs in soil are less than 1 for all COPECs, indicating *de minimis* risk to individuals and populations of invertivorous small mammals at the UA-2 potential exposure area.
 - For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples and PAHs were less than the BTVs, indicating that no unacceptable risk to invertivorous small mammals from exposure to TPHs is expected.

Based on the risk estimates for the UA-2 potential exposure area using the selected TRVs and a SUF of 1, *de minimis* risk is expected for small mammals in this evaluation.

Risks Evaluated Using the BTAG TRVs

Table UA2-5.4a also summarizes HQs estimated for mammals at the UA-2 potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized below.

- **Merriam's kangaroo rat (granivorous small mammal)** – NOAEL- and LOAEL-based HQs in soil are less than 1 for all COPECs, indicating *de minimis* risk to individuals and populations of granivorous small mammals.
- **Desert shrew (invertivorous small mammal)** – The NOAEL-based HQ for zinc is greater than 1 and the LOAEL-based HQ for zinc is less than 1, indicating no unacceptable risk to populations of invertivorous mammals; however, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ. The risk from zinc may not be appropriately characterized, as it was based on the maximum depth-weighted concentration of 62 mg/kg, which is slightly above the BTV (58 mg/kg). NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs, indicating no unacceptable risk to populations of invertivorous small mammals from these COPECs.

Summarized below are all HQ estimates for mammals for COPECs where at least one NOAEL-based HQ value (using the selected TRV or BTAG TRV) is greater than 1:

Hazard Quotient Summary for Mammals (SUF = 1)								
COPEC	Merriam's Kangaroo Rat				Desert Shrew			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Zinc	5E-02	1E-02	4E-01	1E-02	9E-01	2E-01	7E+00	2E-01

Note:

Bold indicates an HQ greater than 1.

5.6.1.2.2 Risks Evaluated Using a Site-Specific SUF

Table UA2-5.4b presents HQs calculated using the selected TRVs and BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Based on the UA-2 site exposure area and home ranges for Merriam's kangaroo rat and desert shrew, the site-specific SUFs were estimated as 0.7 and 1, respectively, for these potential receptors (i.e., the home range for desert shrew is less than or equal to the size of the exposure area). Therefore, the risk results for desert shrew for this scenario are the same as discussed above for the generic SUF of 1. The NOAEL- and LOAEL-based HQs are less than 1 for all COPECs for Merriam's kangaroo rat using the selected TRVs and BTAG TRVs and the site-specific SUF, similar to the results discussed above using a generic SUF of 1.

5.6.1.2.3 Baseline Risk Summary for Mammals Using Depth-Weighted EPCs

To summarize, based on the risks characterized for populations of small mammals exposed to COPECs in soil at the UA-2 potential exposure area using selected TRVs, depth-weighted EPCs (based on maximum depth-weighted concentrations due to small dataset sizes), and a site- and species-specific SUF, the risk conclusions are as follows:

- For Merriam's kangaroo rat (granivorous small mammals), the NOAEL- and LOAEL-based HQs are less than 1, indicating *de minimis* risk to individuals and populations of granivorous small mammals for all COPECs.
- For desert shrew (invertivorous small mammals), the NOAEL- and LOAEL-based HQs are less than 1, indicating *de minimis* risk to individuals and populations of invertivorous small mammals for all COPECs.

NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, indicating *de minimis* risk to populations or individual small mammals from exposure to soil at the UA-2 potential exposure area. Further evaluation of these potential receptors using area-weighted EPCs is not warranted.

Potential Risk Drivers for Small Mammals at UA-2 Exposure Area

No risk-driving COPECs for small mammals were identified at the UA-2 potential exposure area, as no potential for unacceptable population-level risk (i.e., LOAEL-based HQs greater than 1) was predicted based on HQs calculated using the most refined exposure and effects assumptions evaluated in this scenario (i.e., site-specific SUF, depth-weighted EPCs,⁴ and selected TRVs) and additional supporting WOE. Additionally,

⁴ Evaluation of area-weighted EPCs is not warranted for these receptors.

no COPECs with NOAEL-based HQs greater than 1, using the most refined exposure and effects assumptions and additional LOEs supporting the conclusions of unacceptable risk, were identified at the UA-2 potential exposure area.

5.6.1.3 Birds

For the UA-2 potential exposure area, baseline risks were estimated for birds using depth-weighted EPCs for the following evaluations and discussed in this section:

- Using the selected TRVs and SUF equal to 1
- Using the BTAG TRVs and a SUF equal to 1
- Using the selected TRVs and a species- and site-specific SUF
- Using the BTAG TRVs and a species- and site-specific SUF.

5.6.1.3.1 Risks Evaluated Using a SUF Equal to 1

Risks Evaluated Using Selected TRVs

Table UA2-5.4a summarizes HQs estimated for birds at the UA-2 potential exposure area using the selected TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below. TRVs are not available for TPHs; however, risks to these potential receptors are characterized below based on indicator chemicals.

- **Gambel's quail (granivorous bird):** This potential receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and to subsurface I soil (0 to 6 ft bgs) through its diet. NOAEL- and LOAEL-based HQs in soil are less than 1 for all COPECs, indicating *de minimis* risk to individuals and populations of granivorous birds.
 - For TPH mixtures, individual constituents were used to evaluate the potential for unacceptable risk. BTEX were not detected in any samples and PAHs were less than the BTVs, indicating that unacceptable risk to granivorous birds from exposure to TPHs is not expected.
- **Cactus wren (insectivorous bird):** This potential receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. NOAEL- and LOAEL-based HQs for COPECs in soil are less than 1, indicating *de minimis* risk to populations or individual insectivorous birds.
 - For TPH mixtures, individual constituents were used to evaluate the potential for unacceptable risk. BTEX were not detected in any samples and PAHs were less than the BTVs, indicating that unacceptable risk to insectivorous birds from exposure to TPHs is not expected.

Based on the risk estimates for the UA-2 potential exposure area, *de minimis* risk is expected for birds in this scenario.

Risks Evaluated Using the BTAG TRVs

Table UA2-5.4a also summarizes HQs estimated for birds at the UA-2 potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized below.

- **Gambel's quail (granivorous bird)** – The NOAEL-based HQ for lead is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of granivorous birds; however, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ. The risks from lead are likely overestimated due to the conservative avian TRV and the EPC based on the maximum depth-weighted concentration. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. NOAEL- and LOAEL-based HQs for other COPECs in soil are less than 1, indicating *de minimis* risk to populations of granivorous birds for the remaining COPECs.
- **Cactus wren (insectivorous bird)** – NOAEL-based HQs for lead and zinc are greater than 1 and the LOAEL-based HQs are less than 1, indicating no unacceptable risk to populations of insectivorous birds; however, unacceptable risk to individual potential receptors is uncertain for these COPECs based on the HQ. The risks from lead and zinc are likely overestimated due to the conservative avian TRVs and the EPCs based on the maximum depth-weighted concentrations, which may not appropriately characterize risk. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs, indicating *de minimis* risk to populations of insectivorous birds from these COPECs.

Summarized below are all HQ estimates for birds for COPECs where at least one NOAEL-based HQ value (using the selected TRV or BTAG TRV) is greater than 1:

Hazard Quotient Summary for Birds (SUF = 1)								
COPEC	Gambel's Quail				Cactus Wren			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Lead	6E-02	3E-02	7E+00	1E-02	9E-01	4E-01	1E+02	2E-01
Zinc	3E-02	1E-02	1E-01	1E-02	9E-01	4E-01	4E+00	4E-01

Note:

Bold indicates an HQ less than 1.

5.6.1.3.2 Risks Evaluated Using a Site-Specific SUF

Risks Evaluated Using Selected TRVs

Table UA2-5.4b presents HQs calculated using the selected TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Gambel's quail (granivorous bird):** The site-specific SUF for this potential receptor is 0.003, which further reduced the NOAEL- and LOAEL-based HQs to less than 1 for all COPECs, indicating *de minimis* risk to individuals and populations of granivorous birds at the UA-2 potential exposure area when accounting for site use.
- **Cactus wren (insectivorous bird):** The site-specific SUF for this potential receptor is 0.02, which further reduced the NOAEL- and LOAEL-based HQs to less than 1 for all COPECs, indicating *de minimis* risk to individuals and populations of insectivorous birds at the UA-2 potential exposure area when accounting for site use.

Based on the risk estimates for the UA-2 potential exposure area, *de minimis* risk is expected for birds in this scenario.

Risks Evaluated Using the BTAG TRVs

Table UA2-5.4b also summarizes HQs calculated using the BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Gambel's quail (granivorous bird):** The site-specific SUF for this potential receptor is 0.003, which reduced the NOAEL- and LOAEL-based HQs to less than 1 for all COPECs, including lead. Thus, *de minimis* risk to populations and individual granivorous birds is expected when accounting for site use at the UA-2 potential exposure area.
- **Cactus wren (insectivorous bird):** The site-specific SUF for this potential receptor is 0.02. The NOAEL-based HQ was reduced to less than 1 for zinc. The NOAEL-based HQ was reduced for lead in this evaluation, but is still greater than 1. LOAEL-based HQs are less than 1 for all COPECs, indicating no unacceptable risk to populations of insectivorous birds; however, unacceptable risk to individual potential receptors is uncertain for exposure to lead in soil based on the HQ. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs, indicating *de minimis* risk to individuals and populations of insectivorous birds from these COPECs.

For the COPECs with NOAEL-based HQs greater than 1 using a SUF of 1 (using the selected TRV or BTAG TRV), HQ estimates using the species- and site-specific SUF for birds are summarized below.

Hazard Quotient Summary for Birds (Site-Specific SUF)								
COPEC	Gambel's Quail (SUF = 0.003)				Cactus Wren (SUF = 0.02)			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Lead	2E-04	8E-05	2E-02	3E-05	2E-02	8E-03	2E+00	3E-03
Zinc	8E-05	3E-05	3E-04	3E-05	2E-02	7E-03	7E-02	7E-03

Note:

Bold indicates a HQ greater than 1.

5.6.1.3.3 Baseline Risks Summary for Birds Using Depth-Weighted EPCs

To summarize, based on the risks characterized for populations of birds exposed to COPECs in soil at the UA-2 potential exposure area using selected TRVs,⁵ depth-weighted EPCs (based on maximum depth-weighted concentrations due to small dataset sizes), and a site-specific SUF (or SUF of 1), the risk conclusions are as follows:

⁵ Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

APPENDIX UA2

SOIL HHERA FOR UA-2 EXPOSURE AREA

- For Gambel's quail (granivorous birds), the NOAEL- and LOAEL-based HQs for all COPECs are less than 1, indicating *de minimis* risk to individuals and populations of granivorous birds for all COPECs.
- For the cactus wren (insectivorous birds), the NOAEL- and LOAEL-based HQs for all COPECs are less than 1, indicating *de minimis* risk to individuals and populations of insectivorous birds for all COPECs.

Potential Risk Drivers for Birds at UA-2 Exposure Area

No risk-driving COPECs for birds were identified at the UA-2 potential exposure area, as no potential for unacceptable population-level risk (i.e., LOAEL-based HQs greater than 1) was predicted based on HQs calculated using the most refined exposure and effects assumptions evaluated in this scenario (i.e., site-specific SUF, depth-weighted EPCs,⁶ and selected TRVs) and additional supporting WOE. Additionally, no COPECs with NOAEL-based HQs greater than 1, using the most refined exposure and effects assumptions and additional LOEs supporting the conclusions of unacceptable risk, were identified at the UA-2 potential exposure area.

⁶ Evaluation of area-weighted EPCs is not warranted for these receptors.

6 SUMMARY AND CONCLUSIONS FOR THE HHRA

Estimated potential cumulative cancer risks and noncancer hazards for potential human receptors are presented in Section 4, and estimated potential risks for potential ecological receptors are presented in Section 5. Uncertainties related to the HHRA and ERAs at the site are discussed in detail in Section 5.6 and 6.7 of the main report, and uncertainties specific to the UA-2 potential exposure area are discussed in this appendix. For the UA-2 potential exposure area, the HHRA and ERA were conducted in accordance with the RAWP documents (Arcadis 2008, 2009, 2015). One scenario (baseline [no scouring]) was evaluated. Risks were estimated for various potential receptors using depth-weighted EPCs, which were based on the maximum depth-weighted concentrations due to small sample sizes for this exposure area.

At the UA-2 potential exposure area, the COPCs/COPECs identified for the HHRA include metals (arsenic, barium, lead, manganese, and zinc), SVOCs (4-methylphenol and bis [2-ethylhexyl] phthalate), TPH as diesel, and TPH as motor oil. The results and conclusions regarding potential risk associated with exposure to these COPCs/COPECs in soil at the UA-2 potential exposure area based on the risk/hazard estimates and uncertainties inherent in the risk assessment process are summarized in this section.

6.1 Summary and Conclusions for the HHRA

The cumulative ILCRs and HIs associated with potential exposure to COPCs in soil at the UA-2 potential exposure area using depth-weighted EPCs were estimated. Assuming lifetime soil contact is limited to the UA-2 potential exposure area for the potential receptors evaluated, the estimated potential ILCR and HI results are summarized in the table and discussed below.

Baseline Scenario Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index			
Potential Receptor and Exposure Depth		UA-2 Potential Exposure Area	
		Cumulative ILCR	HI
		Depth-Wt	Depth-Wt
Short-Term Maintenance Worker	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	2×10^{-6} (As)	≤ 1
	Subsurface I	2×10^{-6} (As)	≤ 1
	Subsurface II	$\leq 1 \times 10^{-6}$	≤ 1
Long-Term Maintenance Worker	Surface	1×10^{-5} (As)	≤ 1
	Shallow	2×10^{-5} (As)	≤ 1
Long-Term Maintenance Worker	Subsurface I	2×10^{-5} (As)	≤ 1
	Subsurface II	1×10^{-5} (As)	≤ 1

APPENDIX UA2
SOIL HHERA FOR UA-2 EXPOSURE AREA

Baseline Scenario Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index			
Potential Receptor and Exposure Depth		UA-2 Potential Exposure Area	
		Cumulative ILCR	HI
		Depth-Wt	Depth-Wt
Camper	Surface	5×10^{-6} (As)	≤ 1
	Shallow	7×10^{-6} (As)	2 (As)
Hiker	Surface	1×10^{-5} (As)	3 (As)
	Shallow	1×10^{-5} (As)	4 (As)
Hunter	Surface	2×10^{-6} (As)	≤ 1
	Shallow	2×10^{-6} (As)	≤ 1
OHV Rider	Surface	5×10^{-6} (As)	≤ 1
	Shallow	8×10^{-6} (As)	≤ 1
Tribal User	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	≤ 1

Note:

wt = weighted

Depth-Weighted

Potential exposures that are at or below *de minimis* levels include the following:

- **HI ≤ 1** – Short-Term Maintenance Worker (all depths), Long-Term Maintenance Worker (all depths), Camper (surface), Hunter (surface and shallow), OHV Rider (surface and shallow), and Tribal User (surface and shallow)
- **ILCR $\leq 1 \times 10^{-6}$** – Short-Term Maintenance Worker (surface and subsurface II) and Tribal User (surface and shallow).

Potential exposures that are above *de minimis* levels of HI > 1 and/or within the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **HI > 1 and ≤ 3** – Camper (shallow) and Hiker (surface)
- **HI > 3** – Hiker (shallow)
- **ILCR > 1×10^{-6} and $\leq 5 \times 10^{-6}$** – Short-Term Maintenance Worker (shallow and subsurface I), Camper (surface), Hunter (surface and shallow), and OHV Rider (surface)
- **ILCR > 5×10^{-6} and $\leq 1 \times 10^{-5}$** – Long-Term Maintenance Worker (shallow and subsurface II), Camper (shallow), Hiker (surface and shallow), and OHV Rider (shallow)

APPENDIX UA2

SOIL HHRA FOR UA-2 EXPOSURE AREA

- **ILCR > 1×10^{-5} and $\leq 1 \times 10^{-4}$** – Long-Term Maintenance Worker (shallow and subsurface I).

Potential exposures above the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **ILCR > 1×10^{-4}** – None.

Due to the small dataset (i.e., sample size of two or five), a UCL was not calculated and the maximum depth-weighted concentrations were used as the EPCs. Consequently, area-weighted EPCs and associated risk and hazard estimates are not provided for the UA-2 potential exposure area.

OVERALL SUMMARY

Assuming lifetime soil contact is limited to the UA-2 potential exposure area, the cumulative ILCRs and HIs associated with potential exposure to COPCs in soil for the tribal user are at or below 1×10^{-6} and 1, respectively. The cumulative ILCRs for the camper, hiker, and OHV rider are above the point of departure for risk management decisions of 1×10^{-6} but below or at 1×10^{-5} , which is well within the risk management range of 1×10^{-6} and 1×10^{-4} . The cumulative ILCRs for the long-term maintenance worker are just above 1×10^{-5} , but well within the risk management range of 1×10^{-6} and 1×10^{-4} . The cumulative HIs associated with potential exposure to COPCs in soil at the UA-2 potential exposure area for the short- and long-term maintenance worker, hunter, and OHV rider are at or below 1. The cumulative HIs for the camper (shallow) and hiker (surface and shallow) are above 1.

The estimated cumulative ILCRs and HIs above 1×10^{-6} and 1 are due to arsenic detected in UA-2 potential exposure area soil. As noted in Section 2.2.4.1 of the main report, the arsenic concentrations detected at the UA-2 potential exposure area may represent a different background population from the sample population used to establish background comparison concentrations. The UA-2 potential exposure area is located on bedrock, whereas the majority of the samples comprising the background dataset were collected from alluvial material. The potential for the arsenic concentrations detected at this unit to represent background concentrations was evaluated statistically and visually via probability plot (included on Figure C9-4 in Appendix A, Subappendix C9 of the RFI/RI Work Plan [CH2M 2013]). The distribution of detected arsenic concentrations at UA-2 is consistent with a single population or background dataset. Therefore, considering the substantial contribution of background arsenic in soil to the cumulative ILCRs and HIs for the receptors potentially exposed to UA-2 potential exposure area soil, it is likely that incremental risks and HIs for site-related COPCs in soil are below *de minimis* levels.

Risks/hazards estimated for an individual exposure area such as the UA-2 potential exposure area are not considered representative of the realistic or likely potential exposures for the human populations that could be present in the areas outside the TCS (such as maintenance workers, recreational users, and tribal users). Risks/hazards calculated separately for individual AOCs are conservative and likely overestimate site risks/hazards. As described in the RAWP documents (Arcadis 2008, 2009, 2015), these human populations would more likely be exposed randomly, over the course of a lifetime, to soil present in all exposure areas located outside the TCS, rather than have a lifetime of contact limited to a single exposure area. Therefore, estimated risks/hazards presented for individual exposure areas are not believed to be representative of the potential health risks to humans potentially contacting the soil outside the TCS. Rather, the HHRA results presented in Appendix OCS for all exposure areas located outside the TCS combined will help to inform risk management decisions for the site. The estimated risks/hazards associated with a lifetime of contact with soil only in the UA-2 potential exposure area are presented at the request of the agencies and are not suitable to provide the sole basis of risk management decisions to protect human health.

6.2 Summary and Conclusions for the ERA

At the UA-2 potential exposure area, five metals (arsenic, barium, lead, manganese, and zinc), two SVOCs (4-methylphenol and bis [2-ethylhexyl] phthalate), and TPHs (TPH as diesel and TPH as motor oil) were identified as COPECs. Risks could not be estimated for potential receptors lacking available screening values and/or TRVs for COPECs; such cases are discussed in the uncertainty analysis of the main report. These COPECs are unlikely to be risk drivers and are assumed to have minimal impact to the conclusions of the ERA.

Risks were estimated using depth-weighted EPCs, which are based on the maximum depth-weighted concentrations due to small samples sizes for this exposure area. Risk conclusions were based on the following criteria:

- COPECs with HQs less than or equal to 1 pose *de minimis* risk to potential ecological communities (plants and soil invertebrates).
- COPECs with HQs greater than 1 could indicate potential risk to potential ecological communities. A WOE approach was used to characterize potential risk to plants and soil invertebrates.
- COPECs with NOAEL-based HQs less than or equal to 1 pose *de minimis* risk to potential wildlife receptors.
- COPECs with NOAEL-based HQs greater than 1 but LOAEL-based HQs less than or equal to 1 pose no unacceptable risk to wildlife populations; however, the potential for unacceptable risk to individuals is uncertain based on the HQ. A WOE approach was used to characterize potential risk to individual potential receptors.
- COPECs with LOAEL-based HQs greater than 1 pose possible unacceptable risk to populations of potential wildlife receptors based on the HQ.

The risk estimates (HQs) represent a single LOE in the risk characterization. A qualitative WOE approach, incorporating other LOEs and uncertainties, was used to characterize risk to wildlife populations at the UA-2 potential exposure area.

HQs for all COPECs for the baseline scenario calculated using depth-weighted EPCs, selected screening levels/selected TRVs, and site-specific SUFs are summarized in Table UA2-6.1. The HQs/LOAEL-based HQs based on depth-weighted EPCs were greater than 1 for the following COPECs:

- **Plant Community** – manganese
- **Soil Invertebrate Community** – manganese
- **Small Mammals** – none for granivorous and invertivorous small mammals
- **Birds** – none for granivorous and insectivorous birds.

Evaluation of area-weighted EPCs was not warranted based on potential risks estimated using depth-weighted EPCs. Based on the ecological risk characterization for the UA-2 potential exposure area, using depth-weighted EPCs, selected screening levels/TRVs, and site-specific SUFs, the following conclusions were made, as described in the subsections below.

6.2.1 Plant Communities

Overall, no unacceptable risk was identified for plants, including special-status species. Conclusions are as follows:

- No federal- or state-listed T&E plants or candidates for listing were found at the site, including the UA-2 potential exposure area.
- Potential risks to plants are *de minimis* for all COPECs, including TPHs (based on BTEX and PAH data) at the UA-2 potential exposure area, except for manganese.
- Unacceptable risk to plant communities from exposure to manganese is unlikely based on the following LOEs: 1) low frequency of detection; 2) EPCs based on the maximum depth-weighted EPCs; for areas where a constituent is largely not detected, use of a maximum concentration may not appropriately characterize HQs; and 3) low confidence in the screening value to predict toxicity to plants (plant screening value less than the BTV).
- Vegetation communities observed at the site during the floristic surveys conducted in 2013 (GANDA and CH2M 2013) and in 2017 (CH2M 2017) are typical of Mojave Desert plant communities (summarized in Section 2.4.2 of the main report). More than 100 vascular plant species were observed within the survey area, which included the UA-2 potential exposure area, documented as Segment H in these survey reports (GANDA and CH2M 2013; CH2M 2017). The floristic surveys identified a diverse assemblage of plant species found in typical abundance, density, cover, and vigor of plant communities in undisturbed desert habitat. These observations are not consistent with impairment of the plant community at the site. The floristic survey documentation provides site-specific observations that support the health of plant communities at the site and is considered a stronger LOE than the exceedances of low-confidence generic plant screening values, which are widely acknowledged to have low ability to predict toxicity in plants.

6.2.2 Soil Invertebrate Communities

Overall, no unacceptable risk to soil invertebrates is expected. Conclusions are as follows:

- Potential risks to soil invertebrates are *de minimis* for all COPECs, including TPHs (based on BTEX and PAH data) at the UA-2 potential exposure area, except for manganese.
- Unacceptable risk to soil invertebrate communities from exposure to manganese is unlikely based on the same WOE as discussed above for plants.

6.2.3 Small Mammals

Potential risk to small mammals (granivorous and invertivorous) is *de minimis* for all COPECs in soil at the UA-2 potential exposure area (i.e., the NOAEL- and LOAEL-based HQs are less than 1).

6.2.4 Birds

Potential risk to birds (granivorous and insectivorous) is *de minimis* for all COPECs in soil at the UA-2 potential exposure area (i.e., the NOAEL- and LOAEL-based HQs are less than 1).

6.2.5 Potential Risk Drivers for UA-2 Exposure Area

As presented in Table UA2-6.2 and summarized in the table below, no risk drivers were identified for the UA-2 potential exposure area, based on unacceptable community-/population-level risk (i.e., HQ greater than 1 for plants and soil invertebrates and LOAEL-based HQs greater than 1 for mammals and birds) predicted from HQs calculated using the most refined exposure and effects assumptions evaluated in this exposure area (i.e., site-specific SUF, depth-weighted EPCs, and selected TRVs) and additional LOEs supporting the conclusion of unacceptable risk.

Scenario	Potential Receptors and Risk Drivers at the UA-2 Exposure Area					
	Plants	Soil Invertebrates	Granivorous Mammals (Merriam's Kangaroo Rat)	Invertivorous Mammals (Desert Shrew)	Granivorous Birds (Gambel's Quail)	Insectivorous Birds (Cactus Wren)
Baseline	None	None	None	None	None	None

Notes:

- ^a Applicable to both human health and ecological risk assessment (HHRA/ERA), unless otherwise noted.
- ^b Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA and ERA. Human health toxicity values are available for iron and manganese and ecological toxicity values are available for manganese, thus these chemicals are evaluated in the HHRA and ERA, if above background levels and have available toxicity values.
- ^c Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).
- ^d Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).
- ^e Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

mg/kg = milligrams per kilogram.

ug/kg = micrograms per kilogram.

COPC = Constituent of Potential Concern.

COPEC = Constituent of Potential Ecological Concern.

ND = Not detected.

TPH = Total Petroleum Hydrocarbons.

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

Notes:

- ^a Applicable to both human health and ecological risk assessment (HHRA/ERA), unless otherwise noted.
- ^b Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA and ERA. Human health toxicity values are available for iron and manganese and ecological toxicity values are available for manganese, thus these chemicals are evaluated in the HHRA and ERA, if above background levels and have available toxicity values.
- ^c Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).
- ^d Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).
- ^e Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

mg/kg = milligrams per kilogram.

ug/kg = micrograms per kilogram.

COPC = Constituent of Potential Concern.

COPEC = Constituent of Potential Ecological Concern.

ND = Not detected.

TPH = Total Petroleum Hydrocarbons.

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

Notes:

- ^a Applicable to both human health and ecological risk assessment (HHRA/ERA), unless otherwise noted.
- ^b Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA and ERA. Human health toxicity values are available for iron and manganese and ecological toxicity values are available for manganese, thus these chemicals are evaluated in the HHRA and ERA, if above background levels and have available toxicity values.
- ^c Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).
- ^d Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).
- ^e Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

mg/kg = milligrams per kilogram.

ug/kg = micrograms per kilogram.

COPC = Constituent of Potential Concern.

COPEC = Constituent of Potential Ecological Concern.

ND = Not detected.

TPH = Total Petroleum Hydrocarbons.

Heptachlor	0 / 2	ND	ug/kg	No	Not Detected
Heptachlor epoxide	0 / 2	ND	ug/kg	No	Not Detected
Methoxy chlor	0 / 2	ND	ug/kg	No	Not Detected
Pentachlorophenol	0 / 17	ND	ug/kg	No	Not Detected

Table UA2-2.1d

Chemicals Included in the Risk Assessment: UA-2 Subsurface II Soil (0 to 10 feet bgs) for Baseline Scenario

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

Chemical	Detection Frequency (Detections/ Samples Analyzed)	Range of Detected Site Concentrations	Units	Included in Risk Assessment ^a	Basis for selection as COPC in Risk Assessment
Toxaphene	0 / 2	ND	ug/kg	No	Not Detected
Polychlorinated Biphenyls					
Total PCBs ^e	0 / 17	ND	ug/kg	No	Not Detected
Total Petroleum Hydrocarbons					
TPH as diesel	2 / 17	11 - 140	mg/kg	Yes	Detected
TPH as gasoline	0 / 7	ND	mg/kg	No	Not Detected
TPH as motor oil	10 / 17	11 - 902	mg/kg	Yes	Detected

Table UA2-2.1d

Chemicals Included in the Risk Assessment: UA-2 Subsurface II Soil (0 to 10 feet bgs) for Baseline Scenario

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

Notes:

- ^a Applicable to human health risk assessment (HHRA) only.
- ^b Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA. Human health toxicity values are available for iron and manganese, thus these chemicals are evaluated in the HHRA, if above background levels and have available toxicity values.
- ^c Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).
- ^d Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).
- ^e Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

mg/kg = milligrams per kilogram.

ug/kg = micrograms per kilogram.

COPC = Constituent of Potential Concern.

ND = Not detected.

TPH = Total Petroleum Hydrocarbons.

Notes:

^a The constituent consists of analytes detected at least once at the Topock Compressor Station site and measured in soil in this exposure area.

^b If fewer than eight total locations and four total detected concentrations, the maximum depth-weighted concentration was selected as the EPC. Otherwise, the UCL was selected as the EPC.

^c EPCs and summary statistics were not calculated for some constituents (i.e., dioxin congeners and essential nutrients). Those data, if available, are presented in Attachment A1 of each exposure area-specific appendix.

Abbreviations:

"--" = not applicable

B(a)P equivalent = benzo(a)pyrene equivalent

COPC = constituent of potential concern

COPEC = constituent of potential ecological concern

DDE = Dichlorodiphenyldichloroethylene

DDT = Dichlorodiphenyltrichloroethane

EPC = exposure point concentration

FOD = frequency of detection

ft bgs = feet below ground surface

KM = Kaplan-Meier

µg/kg = micrograms per kilogram

mg/kg = milligrams per kilogram

NA = not applicable

ND = not detected

ng/kg = nanograms per kilogram

PAH = polycyclic aromatic hydrocarbons

PCB = polychlorinated biphenyls

PG&E = Pacific Gas and Electric Company

TCDD = Tetrachlorodibenzo-p-dioxin

TEQ = toxic equivalent

TPH = total petroleum hydrocarbons

UCL = upper confidence limit

X = COPC/COPEC in the exposure depth interval

Table UA2-4.1a
Summary of COPCs Evaluated in the HHRA for UA-2: Baseline Scenario

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

COPC	COPCs in Surface Soil (0 to 0.5 feet bgs)	COPCs in Shallow Soil (0 to 3 feet bgs)	COPCs in Subsurface I Soil (0 to 6 feet bgs)	COPCs in Subsurface II Soil (0 to 10 feet bgs)
Inorganics				
Arsenic	x	x	x	x
Barium	x	x	x	x
Lead	x	x	x	x
Manganese	x	x	x	x
Zinc	x	x	x	x
Semi-Volatile Organic Compounds				
4-Methylphenol	--	x	x	x
bis (2-ethylhexyl) phthalate	--	x	x	x
Polycyclic Aromatic Hydrocarbons				
Benzo (ghi) perylene	--	--	x	x
Phenanthrene	--	x	x	x
Total Petroleum Hydrocarbons				
TPH as diesel	x	x	x	x
TPH as motor oil	x	x	x	x

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

bgs = below ground surface.

COPC = Constituent of Potential Concern.

-- = not detected or not analyzed.

x = Chemical included as COPC in human health risk assessment.

PCB = Polychlorinated biphenyls.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

TPH as motor oil	6.0E+01	3.1E+02	6.0E-05	NV	6.0E-05	NV

Notes:

- ^a Exposure point concentrations (EPCs) for surface soil (0 to 0.5 feet bgs) are used to evaluate inhalation of particulates in outdoor air.
- ^b EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.
- ^c Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.0×10⁶ m³/kg was used for maintenance workers (short-term and long-term) as recommended by Department of Toxic Substances Control (2014).
- ^d Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.

Abbreviations:

bgs = below ground surface.
COPC = Constituent of Potential Concern.
mg/kg = milligrams per kilogram.
mg/m³ = milligrams per cubic meter.
NA = not applicable.
ND = Not detected.
NV = Not volatile.
TPH = Total Petroleum Hydrocarbons.

Abbreviations:

ILCR = Incremental Lifetime Cancer Risk

HI = Hazard Index

Table UA2-5.1
Summary of COPECs Evaluated in the ERA for UA-2

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

COPEC ^a	Baseline (0-6 ft bgs)
Inorganics	
Arsenic	X
Barium	X
Lead	X
Manganese	X
Zinc	X
Semi-Volatile Organic Compounds	
4-Methylphenol	X
Bis (2-ethylhexyl) phthalate	X
Total Petroleum Hydrocarbons	
TPH as diesel	X
TPH as motor oil	X

Note:

^a COPECs selected over the entire soil depth interval (0-6 ft bgs) potentially contacted by ecological receptors. COPECs based on background screening for metals, polycyclic aromatic hydrocarbons, and dioxins (if sampled). All detected organic compounds were selected as COPECs. See Section 2 of Appendix UA2 for details.

Abbreviations:

COPEC = constituent of potential ecological concern

ERA = ecological risk assessment

ft bgs = feet below ground surface

TPH = total petroleum hydrocarbon

UA-2 = Undesignated Area-2

X = COPEC in that exposure depth interval

Table UA2-5.2
Soil Exposure Point Concentration Matrix for Terrestrial Ecological Receptors

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

Ecological Receptor	Exposure Depth Intervals for Calculation of EPCs				
	Soil EPCs ^a		Biota Tissue EPCs (modeled from soil EPCs)		
	0-0.5 ft bgs	Maximum EPC (0-0.5, 0-3, 0-6 ft bgs)	Plants - Maximum EPC (0-0.5, 0-3, 0-6 ft bgs)	Insects (0-0.5 ft bgs)	Insectivorous Mammals (0-0.5 ft bgs)
Terrestrial Receptors					
Plants		X			
Invertebrates	X				
Gambel's Quail	X		X		
Cactus Wren	X			X	
Desert Shrew	X			X	
Merriam's Kangaroo Rat		X	X		

Note:

^a EPCs for ecological receptors will be represented by the maximum detected concentration, depth-weighted 95% UCL, and spatially-weighted 95% UCL, as relevant for this exposure area. See Section 5 of Appendix UA2 for details.

Abbreviations:

95% UCL = 95% upper confidence limit

EPC = exposure point concentration

ft bgs = feet below ground surface

X = representative EPC for the pathway/receptor

Semi-Volatile Organic Compounds																
4-Methylphenol	3E-02	HQ ≤ 1	ND	--	--	--	--	--	--	--	--	--	--	--	--	--
Bis (2-ethylhexyl) phthalate	4E-03	HQ ≤ 1	ND	--	--	--	--	--	--	--	--	--	--	6E-05	6E-06	HQ ≤ 1

Notes:
^a For UA-2, due to the small dataset (i.e., sample size of 2 or 5), area-weighted HQs are not estimated.
^b WOE Result is risk conclusion based on 1.) HQ/LOAEL HQ using depth-weighted EPCs, and 2.) supporting LOE

	NOAEL HQ greater than 1
	HQ or LOAEL HQ greater than 1
	HQ or LOAEL HQ greater than 10
	HQ or LOAEL HQ greater than 100

Abbreviations:
-- = no toxicity value available, HQs could not be estimated
AOC = area of concern
COPEC = constituent of potential ecological concern
HQ = hazard quotient
LOE = line of evidence
LOAEL = lowest observed adverse effect level
ND = not detected
NOAEL = no-observed adverse effect level
UA-2 = Undesignated Area-2
WOE = weight of evidence, considering multiple LOE. If HQs/LOAEL HQs > 1, WOE Result is either 1) not expected, 2) unlikely, or 3) possible.

Table UA2-6.2
Risk Conclusions and Lines of Evidence Summary for UA-2/300B

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

AOC	Receptor	COPEC ^a	Depth-Weighted HQs			Additional Lines of Evidence ^c								Risk Conclusions		Risk Driver (LOAEL HQ > 1 and Supporting LOE) ^g	
			Plant and Soil Invertebrates	Mammal/ Bird		Low FOD (Max = EPC) ^b	Locations > BTV	Locations > 10xBTV	Background HQs ^d		BAFs	Quality of SL or TRV	Exposure Assumptions ^e	Observation of T&E species ^f	Individuals		Populations
				NOAEL	LOAEL				NOAEL	LOAEL							
Small Home Range Receptors																	
UA-2 ^e	Plants	Manganese	4E+00	--	--	Yes	2/2	0	2E+00		--	Low	--	No	Unlikely		No
	Soil Invertebrates	Manganese	2E+00	--	--	Yes	2/2	0	9E-01		--	Low	--	No	Unlikely		No
	Merriam's Kangaroo Rat	None	--	HQs < 1	HQs < 1	--	--	--	--	--	--	--	--	Not expected	Not expected	No	
	Desert Shrew	None	--	HQs < 1	HQs < 1	--	--	--	--	--	--	--	--	Not expected	Not expected	No	
	Gambel's Quail	None	--	HQs < 1	HQs < 1	--	--	--	--	--	--	--	--	Not expected	Not expected	No	
	Cactus Wren	None	--	HQs < 1	HQs < 1	--	--	--	--	--	--	--	--	Not expected	Not expected	No	

Notes:
a COPECs are presented for HQs greater than 1 based on the depth-weighted EPC and/or area-weighted EPC and species and site-specific SUF.
b The EPC is based on the maximum depth-weighted concentration due to the small dataset size.
c The additional lines of evidence for COPECs with NOAEL and LOAEL HQs less than or equal to 1 (based on the area-weighted EPC and species and site-specific SUF) are not included in the table.
d For plants and soil invertebrates, the background HQ is based on the BTV. For mammals and birds, the NOAEL and LOAEL background HQs are based on the 95 percent upper confidence limit.
e Applicable to wildlife, unless noted.
f In areas where observations were noted, the T&E species observed have large home ranges and unlikely to forage in upland habitat. See text for details.
g For dioxin TEQ, LOAEL HQs less than 10 with supporting LOE were considered unlikely to pose an unacceptable risk to populations of wildlife receptors due to the compounded conservative assumptions included in the ecological risk assessment. See Section 6.7.6 of the main report.

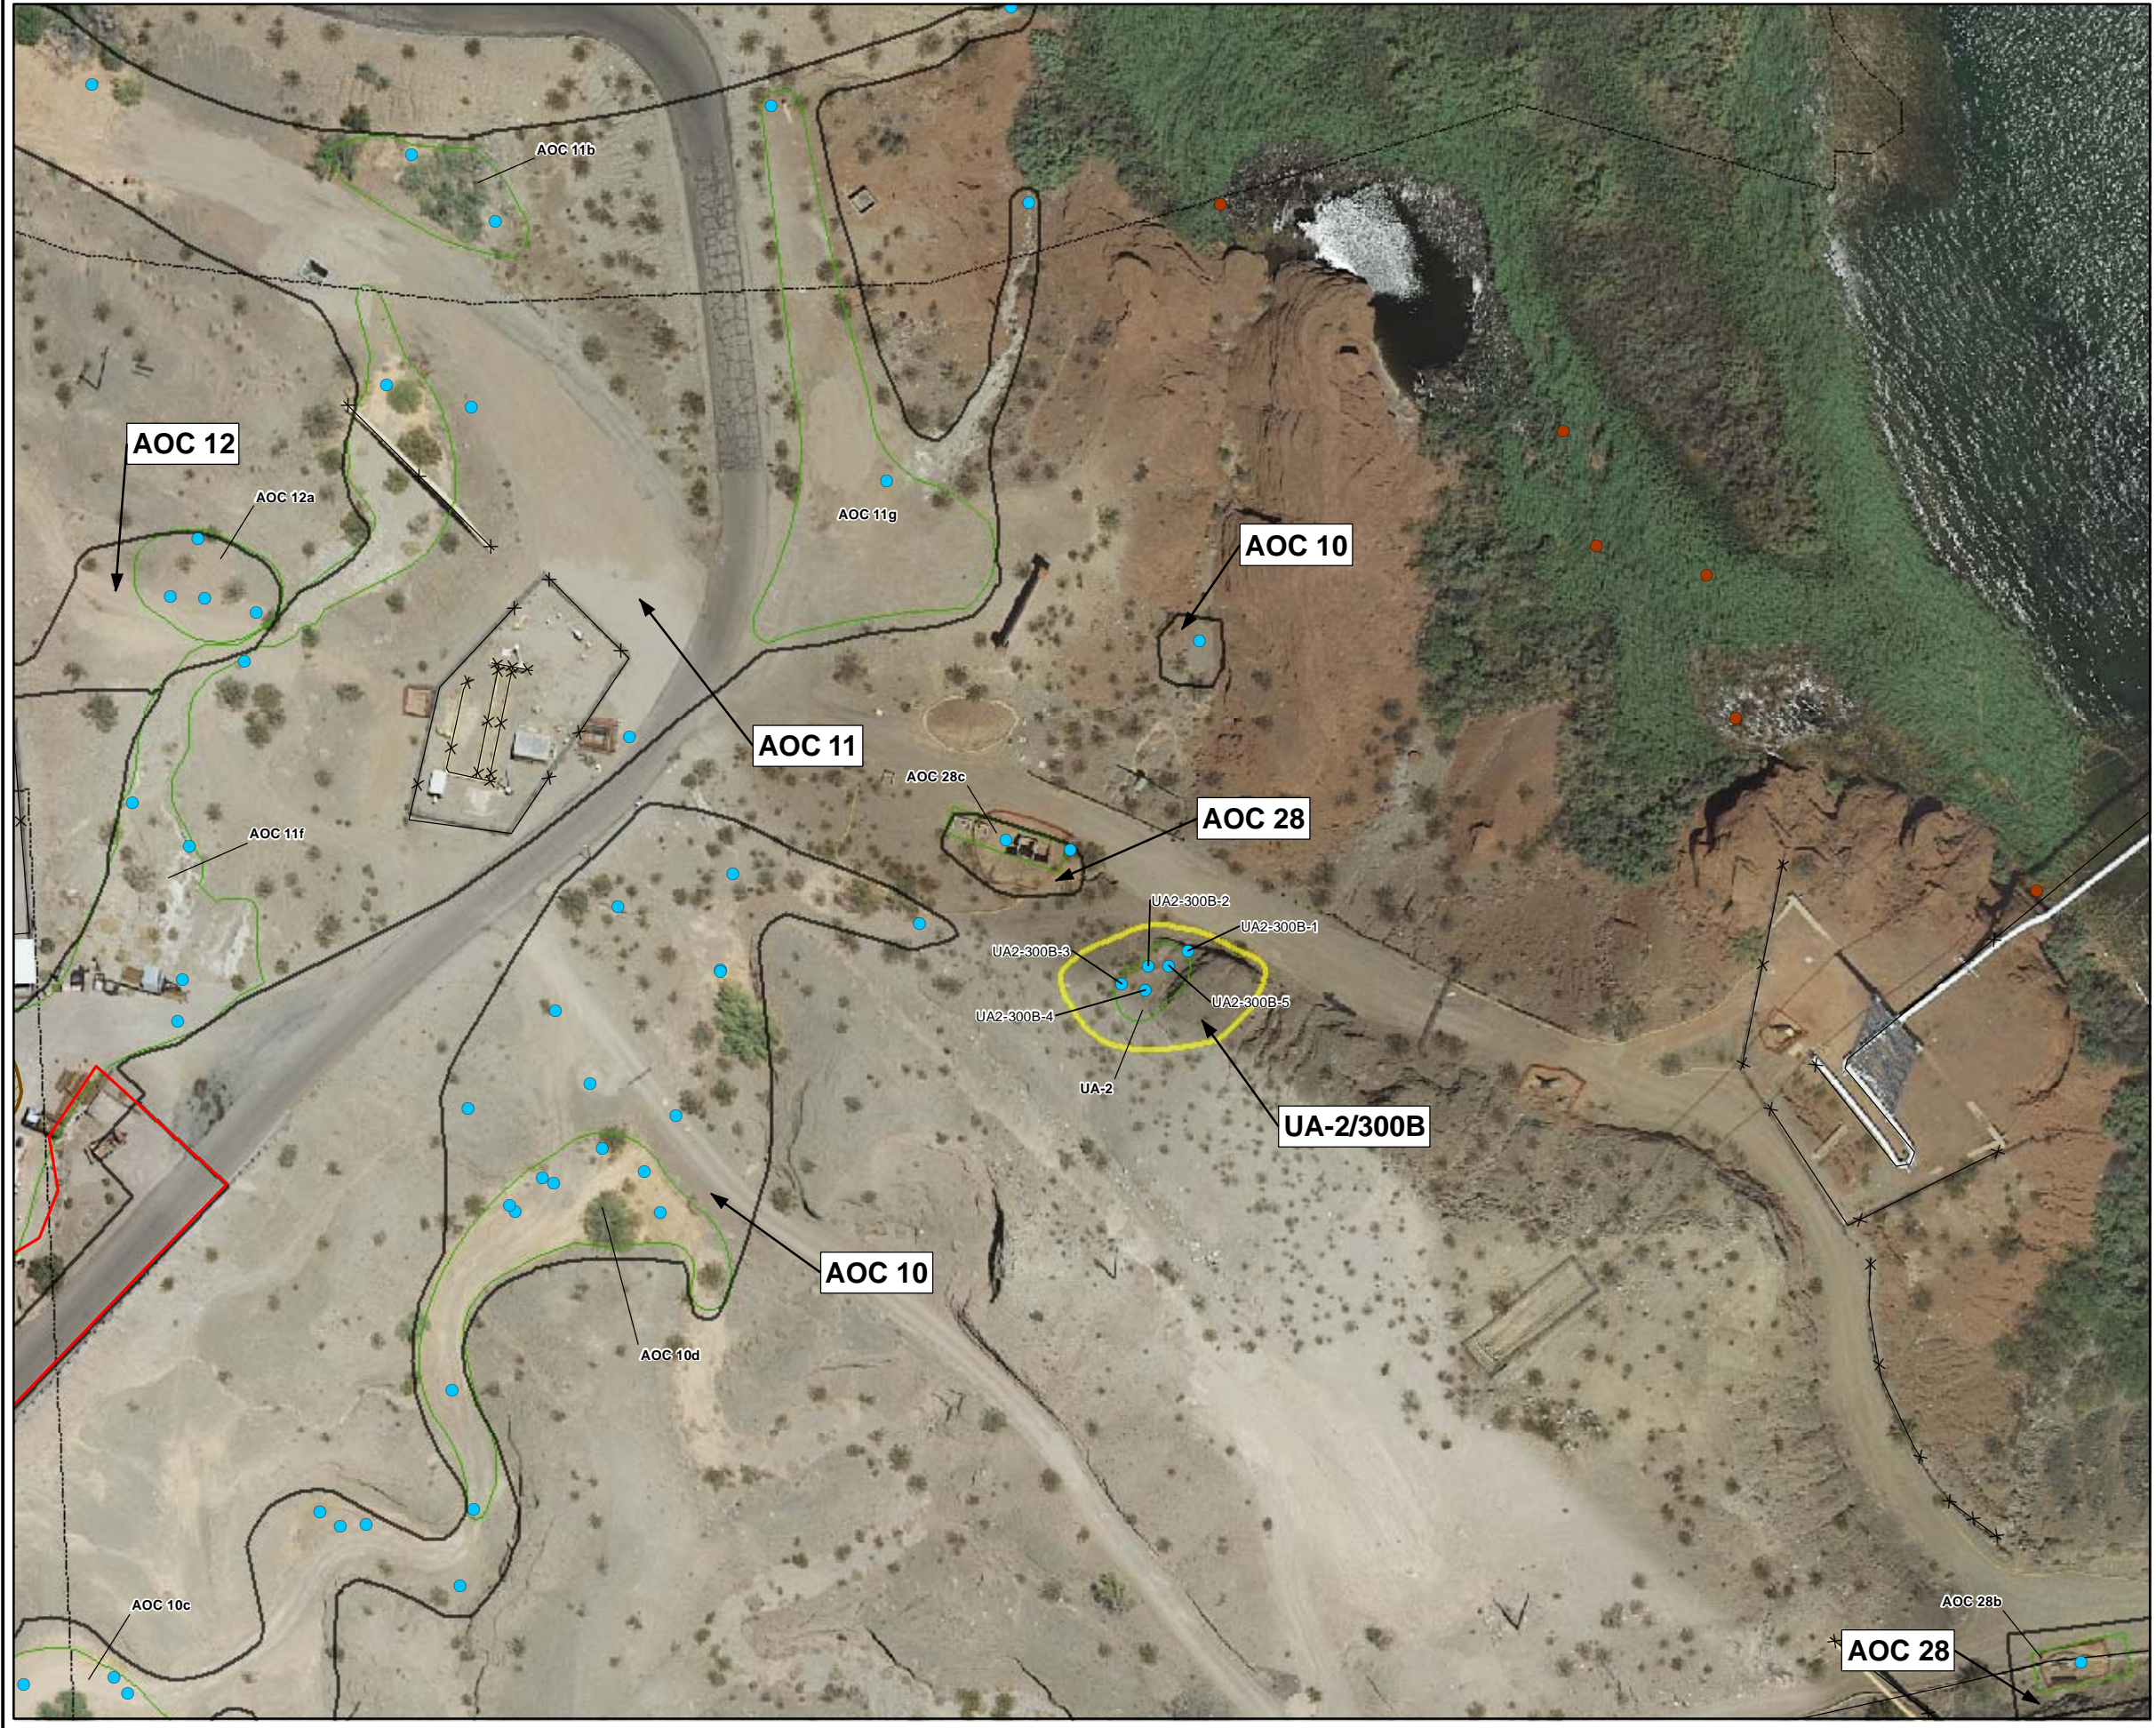

--	LOAEL and NOAEL HQs ≤ 1 for the receptor
	NOAEL HQ greater than 1
	HQ/LOAEL HQ greater than 1
	HQ/LOAEL HQ greater than 10
	HQ/LOAEL HQ greater than 100

Abbreviations:
"--" = not applicable
AOC = area of concern
BAF = bioaccumulation factor
BCW = Bat Cave Wash
BG NA = background value not available
BTV = background threshold value
COPEC = constituent of potential ecological concern
EPC = exposure point concentration
FOD = frequency of detection
HQ = hazard quotient
LOAEL = lowest observed adverse effect limit

LOE = line of evidence
MDC = maximum depth-weighted concentration
NC = not calculated
NE = line of evidence not evaluated
NOAEL = no observed adverse effect limit
SL = screening level
SWMU 1 = solid waste management unit 1
T&E = threatened and endangered
TCS-4= Topock Compressor Station Well #4
TEQ = toxic equivalent
TRV = toxicity reference value

Notes:

^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:

bgs = below ground surface.

CDI = Chronic Daily Intake.

COPC = Constituent of Potential Concern.

EC = Exposure Concentration.

mg/m³ = milligrams per cubic meter.

na = Not applicable. Potential exposure to lead is not complete for the tribal user. Please see text for discussion.

ND = Not detected.

NV = Not volatile.

TPH = Total Petroleum Hydrocarbons.

Notes:

^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:

-- = not calculated.

bgs = below ground surface.

COPC = Constituent of Potential Concern.

HI = Hazard Index

na = Not applicable. Potential exposure to lead is not complete for the tribal user. Please see text for discussion.

ND = Not detected.

NV = Not volatile.

TPH = Total Petroleum Hydrocarbons.

A large, solid orange geometric shape, resembling a stylized triangle or a section of a larger triangle, is positioned in the bottom right corner of the page. It is composed of two overlapping triangles, creating a complex, angular form. A thin white line runs diagonally through the shape, and a thin white horizontal line intersects it near the bottom.

1 INTRODUCTION

This appendix presents the ecological risk assessment (ERA) for the Tamarisk Thicket potential soil exposure area located outside the Topock Compressor Station (TCS) in Needles, California. The ERA for this potential exposure area was requested by the California Department of Toxic Substances Control (DTSC) in its November 17, 2018 directive letter to the Pacific Gas and Electric Company (DTSC 2017). The Tamarisk Thicket potential exposure area (TT), shown on Figure TT-1.1, is approximately 5.1 acres in total and includes sample locations shown in Table TT-1.1 of this appendix. Available soil data from the Tamarisk Thicket potential exposure area were used to conduct a quantitative ERA as presented herein. A human health risk assessment was not conducted for the Tamarisk Thicket potential exposure area; however, this area was evaluated for potential risk to human receptors as part of the North of Railroad (NORR) potential exposure area (see Appendix NORR). The Tamarisk Thicket potential exposure area is also part of the Bat Cave Wash (BCW) potential exposure area, for which a separate human health and ecological risk assessment (HHERA) has been conducted (see Appendix BCW).

Descriptions of the physical location and characteristics of the Tamarisk Thicket potential exposure area and the ERA methodologies are provided in the Soil Human Health and Ecological Risk Assessment Report (the “main report”), and the final Human Health and Ecological Risk Assessment Work Plan (RAWP) documents (Arcadis 2008, 2009, 2015) and are not repeated in this appendix. Detailed discussions of the historical uses and sampling and analysis are presented in the main report as well.

This appendix summarizes site use, data evaluation, potential receptors, exposure pathways and the results of the ERA risk characterization for soil in the Tamarisk Thicket potential exposure area. Tables and figures specific to the Tamarisk Thicket ERA are also presented in this appendix.

1.1 Summary of Site Use

The Tamarisk Thicket potential exposure area is a subarea of BCW as shown on Figure TT-1.1. The thick vegetation, widening of the channel near the end of BCW, and blockage of flow by National Trails Highway greatly reduces the energy of flow during runoff events, resulting in deposition of entrained soil within the vegetated area at the lower end of BCW. This area is heavily vegetated, predominately with salt cedar (also known as tamarisk), which is an invasive, exotic plant species. This heavily vegetated portion of BCW is a long-term depositional area that existed before the compressor station was built. Depositional history and patterns within this area are not known with certainty. As requested by the United States Department of the Interior grid-based sampling was conducted near the mouth of BCW in the Tamarisk Thicket exposure area to assess the potential for historical deposition (i.e., a sediment sink) of potentially contaminated fine-grained materials that may have been transported down BCW during rain events and may have received historical releases from the TCS.

Per the RAWP (Arcadis 2008), the potential for surface soil entrained in runoff to reach the Tamarisk Thicket potential exposure area (and eventually the river) was evaluated using a gradient analysis approach. This is described in detail in Section 2.5 of the main report. The gradient analysis indicates deposition of constituents within the Tamarisk Thicket potential exposure area is not occurring (i.e., concentrations in soil in the Tamarisk Thicket potential exposure area are similar to or less than those observed in the background soil from upland locations). Therefore, evaluating the Tamarisk Thicket potential exposure area as part of the

APPENDIX TT
SOIL HHERA FOR TAMARISK THICKET EXPOSURE AREA

larger area of concern (AOC) 1 potential exposure area is considered appropriate. However, per DTSC's request (DTSC 2017), the Tamarisk Thicket potential exposure area was evaluated separately for small home-range potential receptors.

2 DATA EVALUATION AND COPEC SELECTION

This section summarizes the data considered for the Tamarisk Thicket ERA and presents the constituents of potential ecological concern (COPECs) selected for the Tamarisk Thicket potential exposure area.

All soil sampling locations in the Tamarisk Thicket potential exposure area are presented on Figure TT-1.1 and in Table TT-1.1. The data were evaluated based on methodology described in the RAWP documents (Arcadis 2008, 2009, 2015). Details of the soil sampling and analysis will be presented in the forthcoming Draft Resource Conservation and Recovery Act Facility Investigation/Remedial Investigation (RFI/RI) Volume 3 (currently being prepared by Jacobs). Only soil data from 0 to 6 feet (ft) below ground surface (bgs) were included in the baseline scenario evaluated in this ERA. Because potential soil contact does not extend below 6 ft bgs for potential ecological receptors, deeper soil data (i.e., deeper than 6 ft bgs) were excluded from the risk evaluation for this potential exposure area, as noted in Table TT-1.1.

Following the steps outlined in Section 3 of the main report, soil data considered usable for the risk assessment were identified and used in the quantitative ERA. For the Tamarisk Thicket potential exposure area, all available soil data are presented in Attachment TT-A1. In addition to the soil data from the Tamarisk Thicket potential exposure area, samples classified as soils transitioning to sediment from two locations (AOC1-BCW6 and SS-1) were included as part of the Tamarisk Thicket potential exposure area soil evaluation (Figure TT-1.1). Sediment sampling data collected at the mouth of BCW along the bank of Colorado River were not evaluated as part of this ERA.

For the Tamarisk Thicket potential exposure area, soil data and soil transitioning to sediment data are available from 116 samples (Table TT-1.1), of which data from 54 samples collected from 0 to 6 ft bgs were considered for use in the ERA (i.e., data from 62 samples collected at depths greater than 6 ft bgs were excluded from this evaluation). Within this dataset, some polycyclic aromatic hydrocarbon (PAH) samples did not meet data quality criteria, and non-detected results were qualified as rejected with an “R” data qualifier (will be discussed the forthcoming Draft RFI/RI Volume 3 being (currently being prepared by Jacobs). This occurred for all PAHs in two samples (AOC1-BCW24-245 and AOC1-BCW26-253) and a subset of PAHs in two additional samples (AOC1-BCW24-244 and AOC1-BCW26-252). These “R” qualified PAH data were not included in the ERA for the Tamarisk Thicket potential exposure area.

Data processed for the ERA (e.g., calculation of total concentrations for low molecular weight [LMW] and high molecular weight [HMW] PAHs, polychlorinated biphenyls [PCBs], and dioxin/furan toxicity equivalents [TEQ]) are described in detail in Section 3 of the main report.

The process for identifying COPECs included in the ERA is detailed in Section 3.4 of the main report. COPECs were selected for the Tamarisk Thicket potential exposure area using soil data encompassing all relevant exposure depths for the ERA (i.e., 0 to 6 ft bgs for Tamarisk Thicket) as presented in Attachment TT-A1. Inorganics, LMW PAHs, HMW PAHs, and dioxin TEQ were above background levels in the Tamarisk Thicket potential exposure area soil (0 to 6 ft bgs) and therefore, are included as COPECs in the baseline exposure depths evaluated in the ERA. All other detected organic constituents in the Tamarisk Thicket potential exposure area soils in the baseline exposure depths are included as COPECs in the ERA. COPECs selected for exposure depths and scenarios evaluated in the ERA for the Tamarisk Thicket potential exposure area are summarized in Tables TT-2.1a through TT-2.1c for the depth intervals evaluated in the baseline evaluation. The selected COPECs are discussed further in Section 5.

3 EXPOSURE POINT CONCENTRATIONS

Depth-weighted and area-weighted exposure point concentrations (EPCs) for COPECs in soil at the Tamarisk Thicket potential exposure area were calculated as described in Section 4.2 of the main report. For the Tamarisk Thicket potential exposure area, one scenario was evaluated: baseline (no scouring).

The following exposure depths were evaluated:

1. Surface soil (0 to 0.5 ft bgs)
2. Shallow soil (0 to 3 ft bgs)
3. Subsurface I soil (0 to 6 ft bgs).

The depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment TT-A2. The summary statistics for these Tamarisk Thicket potential exposure area soil depth-weighted datasets and depth-weighted EPCs were calculated consistent with the RAWP documents (Arcadis 2008, 2009, 2015). Per the RAWP, area-weighted EPCs are calculated for the ERA only if depth-weighted EPCs suggest potential risk to ecological receptors (i.e., hazard quotient [HQ] > 1 for any COPEC). For the Tamarisk Thicket exposure area, area-weighted EPCs were deemed necessary for the ERA and therefore, calculated. The area-weighted data used in the calculation of area-weighted EPCs are presented in Attachment TT-A3.

Soil summary statistics for constituents measured at the Tamarisk Thicket potential exposure area¹ and depth- and area-weighted EPCs for COPECs calculated using depth-weighted data from the exposure depths listed above for Tamarisk Thicket for the baseline scenario are presented in Table TT-3.1.

¹ The list of constituents shown in the Section 3 tables is based on analytes that were detected at least once at the site (including all exposure areas inside or outside the TCS) and measured at the Tamarisk Thicket.

4 HUMAN HEALTH RISK ASSESSMENT

For the Tamarisk Thicket potential exposure area, a human health risk assessment was not conducted. As noted above, the Tamarisk Thicket potential exposure area is evaluated for human exposures as part of the BCW and NORR exposure areas. Risk estimates for potential human receptors exposed to soils in the Tamarisk Thicket potential exposure area can be found in Appendix BCW and Appendix NORR.

5 ECOLOGICAL RISK ASSESSMENT

This section briefly summarizes the ERA approach; presents the COPECs, EPCs, and dose and risk tables for the Tamarisk Thicket ERA; and characterizes potential risk to ecological receptors exposed to COPECs in soil at the Tamarisk Thicket potential exposure area. This potential exposure area was evaluated at the request of DTSC (2017) to due to its distinct habitat, which is characterized by dense vegetation unlikely most of the upland areas of the site. Details of the overall ERA approach are presented in Section 6 of the main report. Supporting tables for the Tamarisk Thicket ERA based on risk calculations conducted using depth-weighted and area-weighted EPCs are presented in Attachment TT-B and described below.

Per the RAWP documents (Arcadis 2008, 2009, 2015) and DTSC guidance (DTSC 1996), ecological risks were also calculated using maximum depth-weighted concentrations and presented in Attachment TT-C. Risks estimated using maximum depth-weighted concentrations are considered overly conservative and generally used for screening level purposes. Use of maximum concentrations are not recommended for making risk management decisions for the Tamarisk Thicket potential exposure area, where the area has been adequately characterized and data are available to estimated upper confidence limits (UCLs). Therefore, the risk results based on maximum depth-weighted concentrations are presented (Attachment TT-C) but are not discussed in this section.

5.1 Ecological Conceptual Site Model

Following the steps outlined in Section 6.6 and Figures 2-7 and 6-1 of the main report, risks were estimated for potentially complete and significant exposure pathways identified for potential receptors exposed to COPECs in soil in the Tamarisk Thicket potential exposure area. These potential receptors included plants, invertebrates, and small home-range receptors:

- **Plants** may be exposed to COPECs via root uptake from surface, shallow, and/or subsurface I soil, depending on the root depth of plants of concern.
- **Soil Invertebrates** may be exposed to COPECs via direct contact/uptake from surface soils.
- **Mammals** may be exposed to COPECs via incidental ingestion of surface, shallow, or subsurface I soil (for burrowing animals) and/or ingestion of biota tissue (i.e., food items). The small home-range mammalian indicator receptors evaluated in this ERA for the Tamarisk Thicket potential exposure area included:
 - Merriam's Kangaroo Rat – representative of granivorous small mammal populations, exposed to surface, shallow and/or subsurface I soil (incidental and through biota uptake)
 - Desert Shrew – representative of invertivorous small mammal populations exposed only to surface soil (incidental and through biota uptake).
- **Birds** may be exposed to COPECs via incidental ingestion of surface, shallow, or subsurface I soil and/or ingestion of biota tissue (i.e., food items). The small home-range bird indicator receptors evaluated in this ERA for Tamarisk Thicket included:

- Cactus Wren – representative of insectivorous bird populations, exposed only to surface soil (incidental and through biota uptake). The Tamarisk Thicket potential exposure area is considered a potential habitat for the southwestern willow flycatcher (*Empidonax traillii extimus*), listed as federally and state endangered (CH2M Hill [CH2M] 2014). The cactus wren is considered representative of the southwestern willow flycatcher (Arcadis 2008).
- Gambel's Quail – representative of granivorous bird populations, exposed incidentally only to surface soil and exposed to surface, shallow, or subsurface I soil (incidental and through biota uptake).

Exposure pathways considered incomplete or insignificant were not quantitatively evaluated; these potential exposure pathways are identified and described in Section 6.3 of the main report.

Large home-range potential receptors (desert kit fox, red-tailed hawk, and Nelson's desert bighorn sheep) were evaluated for larger exposure areas (combined AOCs) and are discussed in those specific appendices. Potential risks to desert kit fox, red-tailed hawk, and Nelson's desert bighorn sheep associated with the Tamarisk Thicket potential exposure area were estimated and characterized as part of the evaluation of all AOCs outside the compressor station (OCS) and BCW and AOC 4 (BCW+AOC4) for all large home-range potential receptors.

5.1.1 Evaluation of Special-Status Species

The biological setting for the site and the adjacent areas are described in detail in various reports (see Section 2.4 of the main report). Potential habitat exists for special-status species at or near the site and some have been observed in BCW near the Tamarisk Thicket. Special-status species include both State and Federally listed fully protected threatened and endangered (T&E) species, state/federal species of concern, and traditional culturally significant plants; however, protection at the no-observed adverse effects level (NOAEL) level is warranted only for fully protected species.

Based on the discussions presented in the Final Programmatic Biological Assessment (CH2M 2014), the vegetation in the Tamarisk Thicket potential exposure area is characterized by open to dense stands of the nonnative and invasive tamarisk or salt cedar and/or athel tamarisk (*Tamarix aphylla*). In many locations tamarisk or athel tamarisk occur as monospecific stands; in other areas associated trees and shrubs include western honey mesquite (*Prosopis glandulosa* var. *torreyana*), screwbean mesquite (*Prosopis pubescens*), blue palo verde (*Parkinsonia florida*), and arrowweed (*Pluchea sericea*). Herbaceous vegetation is absent within dense thickets of tamarisk and athel tamarisk, but scattered herbaceous species such as fanleaf crinklemat (*Tiquilia plicata*), Spanish needle (*Palafoxia arida*), and *Cryptantha* spp. are often present in the openings between the trees in some areas. Many plant species have the potential to be present at the site and several species of plants have been incidentally observed during surveys and these are presented in Tables 2-1 and 2-3 of the main report.

No federal or state listed T&E plants or candidates for listing were found at the site, including the Tamarisk Thicket exposure area (CH2M 2014). Of the plants listed above, the western honey mesquite is a special-status species under the California Desert Native Plant Act.

The Tamarisk Thicket potential exposure area is considered a potential habitat for the southwestern willow flycatcher (*Empidonax traillii extimus*), which is listed as a federal and state T&E species. Willow flycatcher nesting and foraging has been widely documented in tamarisk stands along the Colorado River so that tamarisk represents about 50% of the known breeding sites. Along the Colorado River, the southwestern

APPENDIX TT

SOIL HHERA FOR TAMARISK THICKET EXPOSURE AREA

willow flycatcher may typically nest in riparian habitat characterized by a dense stand of intermediate-sized shrubs or trees, such as willows (especially *Salix gooddingii*), *Baccharis*, or arrow weed, usually with an overstory of scattered larger trees, such as cottonwoods. Along the Lower Colorado River (downstream of the Hoover Dam), willow flycatcher nests have only been detected in tamarisk. Nesting habitat almost always contains or is adjacent to water or saturated soil. With the loss of habitats that are more dominated by native species throughout the Southwest, southwestern willow flycatchers have been observed using tamarisk thickets for nesting. Garcia and Associates (GANDA) has conducted protocol-level surveys of the suitable southwestern willow flycatcher habitats within and adjacent to the Topock Site from 2005 to 2017. In the Tamarisk Thicket potential exposure area, a southwestern willow flycatcher was last observed in 2009 but not observed in subsequent surveys (GANDA 2017).

While tamarisk occurs in and adjacent to the site, the quality of this vegetation for nesting flycatchers is not nearly as suitable compared to other locations along the Lower Colorado River. The vegetation density, habitat structure, and patch-size of thickets are sparser, smaller, and more fragmented in comparison to observed/known breeding habitat within the Topock Marsh. Additionally, southwestern willow flycatchers are very rarely nest in mesquite, palo verde, and acacia trees (Sogge et al. 1997), which are the associated tree species in this part of the Action Area including the Tamarisk Thicket potential exposure area. Furthermore, there is no known breeding habitat within the Action Area. Additionally, biological monitors have logged several hundred hours performing pre-activity surveys on the California floodplain as part of compliance with the mitigation measures associated with the Final Programmatic Biological Assessment (CH2M 2014) and with revised well sampling procedures (CH2M 2005), that require monitoring for any migratory bird nests by a qualified biologist within a 200-ft work area prior to construction-related activities that occur between March 15 and September 30. To date, no active nests of any migratory birds have been documented during these surveys or by protocol-level surveys conducted up to 2014. During the most recent survey in 2014, five southwestern willow flycatchers were observed, but none in the Tamarisk Thicket potential exposure area. Based on the single detections for each observation, it was concluded that they were most likely transient rather than nesting birds (GANDA 2014).

Several other species of mammals and birds have been observed at or near the site (Tables 2-2 and 2-4 of the main report). T&E species such as the ring-tailed cat (*Bassariscus astutus*) considered primarily a carnivorous mammal have been observed at the site (CH2M 2015a,b). This species is assumed to be observed in BCW and not specifically in the Tamarisk Thicket potential exposure area; however, it is likely that the ring-tailed cat forages near the river. Bat surveys indicated presence cave myotis and pallid bat, both state species of concern, at BCW, BCW culverts, and railroad culverts (Harvey 2015) but none in the Tamarisk Thicket exposure area, although bats tend to forage near water (i.e., the river) where insects are likely to be abundant. Yuma myotis (*Myotis yumanensis*), although not formally listed, was also observed at BCW. These potential receptors are all large home-range receptors and potential risk to these T&E species are discussed in Appendix BCW+AOC4. Resident T&E species with small home ranges were not observed at the Tamarisk Thicket potential exposure area or BCW.

The risk estimates presented in this ERA are considered to be protective of special-status species due to the conservative nature of the ERA where conservative parameters (e.g., small exposure areas, selected indicator species for each functional group considered on the high end of potential exposures for typical receptors at the site within that group, use of no-effects based toxicity values, etc.) were used to assess risks to a wide range of receptors at various trophic levels. Although a large home-range receptor representative of bats was not quantitatively evaluated, no unacceptable risk to bats are expected at the Tamarisk Thicket potential

exposure area. Presence of bats roosting were observed at the BCW potential exposure area; however, bats tend to forage near water (i.e., the river) where insects are likely to be abundant. Bats also have large home ranges (e.g., 42 acres for myotis [Henry et al. 2002]) and exposure to COPECs in the Tamarisk Thicket potential exposure area is unlikely to result in unacceptable risk. Therefore, further specific evaluation of small home-range special-status species was not considered necessary. Bats and ring-tailed cat are large home-range potential receptors and were evaluated qualitatively for exposure to the Tamarisk Thicket in combined exposure areas (see Appendix OCS and Appendix BCW+AOC4). Since these mammals likely forage along the river, a qualitative evaluation was also conservatively included for the Tamarisk Thicket potential exposure area, as presented below in Section 5.6.1.2. However, note that the Tamarisk Thicket area is not large enough to support individual or populations of bats or ring-tail cat.

5.2 Constituents of Potential Ecological Concern

COPECs for the Tamarisk Thicket potential exposure area were selected in accordance with the RAWP (Arcadis 2008) and as described in Section 3.4 of the main report. Soil data encompassing all relevant exposure depths for the ERA (i.e., 0 to 6 ft bgs for the Tamarisk Thicket potential exposure area) and used in the COPEC selection process are presented in Attachment TT-A1.

Because an ecological receptor could be exposed to COPECs at various exposure depths either directly and/or through their diet for a given scenario, a single comprehensive COPEC list was selected based on the range of soil depths encountered by ecological receptors in the baseline exposure scenario. Additionally, essential nutrients (such as calcium and potassium) and analytes typically measured to evaluate geochemical conditions (such as chloride, nitrate, and sulfate), are not typically evaluated in ERAs and were not selected as COPECs. COPECs for the three exposure depths evaluated for the baseline scenario for this ERA are summarized in Table TT-5.1.

COPECs included six metals (hexavalent chromium, total chromium, copper, lead, manganese, and zinc), PCBs, dioxin TEQ (for wildlife receptors only), and 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) (for ecological communities only). Total petroleum hydrocarbons (TPHs) were also identified as COPECs; however, due to lack of appropriate toxicity values to evaluate TPHs for ecological receptors, indicator chemicals (e.g., benzene, toluene, ethylbenzene, and xylene [BTEX] and PAHs) when detected, are used to characterize TPH risks. COPECs lacking toxicity values and their impact to the ERA are discussed in Section 6.7.5 of the main report.

5.3 Exposure Point Concentration Summary

For the potentially complete and significant exposure pathways identified in the ecological conceptual site model, soil EPCs were calculated as described in Section 4.2 of the main report and presented in Section 3 of this appendix.

For the Tamarisk Thicket potential exposure area, risks to potential ecological receptors were estimated using depth-weighted EPCs and area-weighted EPCs. Depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment TT-A2. Area-weighted data used in the calculation of area-weighted EPCs are presented in Attachment TT-A3.

Biota tissue EPCs were calculated from the soil EPCs using soil-to-biota uptake relationships for plants, invertebrates, and small mammals, as described in Section 6.4.3 of the main report. As described in

APPENDIX TT

SOIL HHERA FOR TAMARISK THICKET EXPOSURE AREA

Section 6.4 and shown in Figure 6-1 of the main report, the depth intervals selected to represent exposure to soil and biota tissue for the risk calculations for each receptor are presented in Table TT-5.2.

To summarize for the baseline scenario:

- Soil invertebrates, invertivorous small mammals, and insectivorous birds could potentially be exposed to COPECs in soil and/or biota only at the surface (0 to 0.5 ft bgs).
- Plants and granivorous small mammals could potentially be exposed to COPECs in soil and or/biota down to 6 ft bgs. Therefore, the maximum of the depth-weighted EPCs from 0 to 0.5 ft bgs, 0 to 3 ft bgs, and 0 to 6 ft bgs was selected as the representative soil and/or biota EPC for a COPEC for estimating risks to these receptors.
- Granivorous birds could potentially be exposed to COPECs in soil (not biota) only at the surface (0 to 0.5 ft bgs) and biota down to 6 ft bgs. Therefore, exposures to granivorous birds included the depth-weighted soil EPC from 0 to 0.5 ft bgs (for incidental soil ingestion) and the maximum of the depth-weighted biota EPC from 0 to 0.5 ft bgs, 0 to 3 ft bgs, and 0 to 6 ft bgs for each COPEC.

Depth-weighted soil EPCs and biota tissue EPCs calculated from depth-weighted soil EPCs are presented in Table TT-5.3 for the baseline scenario and the representative soil and/or biota EPCs identified for the baseline risk calculations are bolded in this table.

Similarly, area-weighted soil EPCs and biota tissue EPCs calculated from area-weighted soil EPCs are presented in Table TT-5.4. The representative soil and/or biota EPCs identified for the risk calculations are bolded in this table.

Per the RAWP (Arcadis 2008) and DTSC guidance (DTSC 1996), risk calculations based on both the maximum depth-weighted concentration and the UCL for each COPEC are required. As mentioned earlier (Section 5.0), use of the maximum depth-weighted concentrations results in overly conservative risks and are not recommended for risk management decisions. The estimated risks based on maximum depth-weighted concentrations are presented in Attachment TT-C but results are not discussed in this report.

5.4 Estimation of Exposure Concentration or Dose

Exposures for ecological communities (plants and soil invertebrates) are quantified as exposure concentrations (e.g., in units of milligrams per kilogram [mg/kg]). Exposures for wildlife (mammals and birds) are quantified as doses (e.g., in units of mg/kg body weight per day). Exposure concentrations and doses for COPECs in soil and potentially complete pathways were calculated as described, including equations, in Section 6.4 of the main report. The exposure parameters selected to evaluate wildlife in this ERA include upper bound values from literature (e.g., ingestion rates) or assumed (e.g., 100% of one type of diet), which may result in conservative estimates of exposure dose and potential overestimation of actual exposure at the site.

For ecological communities, exposure concentrations are equal to the depth-weighted soil EPCs for COPECs at the Tamarisk Thicket potential exposure area for the baseline scenario and are presented in Table TT-5.3. Area-weighted EPCs for the baseline scenario are presented in Table TT-5.4.

For wildlife, doses were calculated using the exposure parameters and equations presented in Section 6.4 of the main report and depth-weighted soil and biota tissue EPCs for COPECs at the Tamarisk Thicket, potential

exposure area as presented in Table TT-5.3 for the depth-weighted risk evaluations, and area-weighted soil and biota tissue EPCs as presented in Table TT-5.4 for the area-weighted risk evaluations. Dose calculations using depth-weighted EPCs for wildlife potentially exposed to COPECs via ingestion of soil and biota tissue for the baseline scenario are presented in Attachment TT-B. Dose calculations using area-weighted EPCs for wildlife potentially exposed to COPECs via ingestion of soil and biota tissue for the baseline scenario are also presented in Attachment TT-B. Dose calculations using maximum depth-weighted concentrations for wildlife potentially exposed to COPECs via ingestion of soil and biota tissue for the baseline scenario are presented in Attachment TT-C.

5.5 Effects Assessment

Concentration-based screening values (i.e., toxicity values) for plants and soil invertebrates and dose-based toxicity reference values (TRVs) for wildlife for COPECs were used to estimate risks to ecological receptors potentially exposed to COPECs in soil and biota tissue at the Tamarisk Thicket potential exposure area.

For plants and soil invertebrates, screening values discussed in Section 6.5 and are presented in Table 6-6 of the main report.

A range of risks to wildlife were estimated using the NOAEL-based TRVs and lowest-observed adverse effects level (LOAEL)-based TRVs presented in the RAWP documents (Arcadis 2008, 2009, 2015). These selected TRVs were primarily based on the TRVs used to develop the United States Environmental Protection Agency (USEPA) ecological soil screening levels (USEPA 2008); other sources included the Toxicological Benchmarks for Wildlife from Oak Ridge National Laboratory (Sample et al. 1996) and USEPA Region 6 ERA Guidance (USEPA 1999). In addition, for estimating potential risk to wildlife, a second set of NOAEL- and LOAEL-TRVs² based on the Navy/Biological Technical Assistance Group (BTAG) TRVs (DTSC 2002, 2009) were also used for COPECs, where available. Wildlife TRVs based on selected TRVs and BTAG TRVs are presented in the main report Tables 6-7 through 6-10.

Plant screening values are not available for total chromium and 2,3,7,8-TCDD. Therefore, risks to this receptor from exposure to these specific COPECs could not be estimated. In addition, appropriate screening values and TRVs are not available for TPH and therefore, PAHs were used as indicator chemicals to characterize TPH risks at Tamarisk Thicket (BTEX were not detected). The lack of screening values and TRVs and the impact to the ERA are discussed in Section 6.7.5 of the main report.

5.6 Ecological Risk Characterization

The risk characterization integrates the results of the exposure assessment and effects assessment and is subject to uncertainties in both of those efforts. Risk characterization includes two major components: risk estimation and risk description. Risk estimates (HQs) are presented in tables and discussed below and involved integrating exposure profiles with the exposure-effects information. For each receptor and COPEC, risk descriptions including various lines of evidence (LOEs) and uncertainties, including HQs, supporting statistical and site use information, and the direction of uncertainty in the risk estimates, are discussed below for interpreting the risk results and identifying potential unacceptable risk to ecological receptors. Uncertainties

² Although these are referred to as LOAEL-based BTAG TRVs, they are based on a midpoint of a variety of adverse effects and are not necessarily lowest observed adverse effect levels. However, for simplicity, these BTAG TRVs are referred to as LOAEL-based TRVs.

APPENDIX TT

SOIL HHERA FOR TAMARISK THICKET EXPOSURE AREA

specific to the Tamarisk Thicket are discussed in context with the risk characterization results presented below. Generic uncertainties in the ERA are discussed in detail in Section 6.7 of the main report.

For plants and soil invertebrates, HQs were calculated by comparing the depth-weighted EPCs for each COPEC with respective screening values and these HQs were compared to the target HQ of 1. Following USEPA guidance (1998) guidance, in such cases, a semi-quantitative weight-of-evidence (WOE) approach using multiple LOEs was used in reducing uncertainty and drawing risk conclusions.

Risk conclusions for ecological communities used the following criteria:

- COPECs with HQs less than or equal to 1 pose *de minimis* risk (i.e., no unacceptable risk or negligible risk) to plants and invertebrates.
- COPECs with HQs greater than 1 indicate unacceptable risk to plants and invertebrates is possible. However, exceedances of the screening values (which are conservative and are generally uncertain) do not always clearly indicate that unacceptable risk to ecological communities is occurring. In such cases, a WOE approach, using HQs as a single LOE along with supporting information such as frequency of detection (FOD), site use history, and confidence in the screening values was used in reducing uncertainty for characterizing potential risk to ecological communities.

Ultimately, three risk outcomes are possible for plants and soil invertebrates based on HQs greater than 1 and the WOE: (1) unacceptable risk to ecological communities is possible (i.e., indicated by sufficient and strong supporting LOE); (2) unacceptable risk to ecological communities is unlikely (i.e., indicated by sufficient and strong LOE to support a conclusion of no unacceptable risk); or (3) unacceptable risk to ecological communities is uncertain (i.e., indicated by insufficient LOE).

For wildlife, a range of HQs was calculated using NOAEL- and LOAEL-based TRVs previously identified in RAWP documents (Arcadis 2008, 2009, 2015). HQs based on LOAEL-based TRVs selected in the RAWP are referred to as "LOAEL-based HQs." HQs based on NOAEL-based TRVs selected in the RAWP are referred to as "NOAEL-based HQs." Additionally, NOAEL- and LOAEL-based HQs were calculated using a second set of TRVs (i.e., NOAEL- and LOAEL-based BTAG TRVs), as described in Section 6.5 of the main report. The BTAG NOAEL-based TRVs are considered very conservative, resulting in a wide range of risks to wildlife. For this ERA, the selected TRVs are considered more robust than the BTAG TRVs, as discussed in Section 6.5 of the main report. Results associated with the selected TRVs are recommended for risk management decisions at Tamarisk Thicket.

Risk conclusions for wildlife used the following criteria:

- COPECs with NOAEL-based HQs less than or equal to 1 pose *de minimis* risk (i.e., negligible risk) to individual and populations of wildlife receptors.
- COPECs with a NOAEL-based HQ greater than 1 but LOAEL-based HQ less than or equal to 1 pose no unacceptable risk to wildlife populations. However, as described in the RAWP (Arcadis 2008), unacceptable risk to individuals is uncertain because the NOAEL-based TRVs are thresholds with an interval that is an artifact of the dosing study and the nature and magnitude of the effects, if any, that may occur at exposures between these values is unknown. In such cases, a WOE approach, including multiple LOEs, were used in reducing uncertainty for characterizing potential risk to individual wildlife receptors.

APPENDIX TT

SOIL HHERA FOR TAMARISK THICKET EXPOSURE AREA

- COPECs with LOAEL-based HQs greater than 1 indicate unacceptable risk is possible for populations of wildlife receptors. However, these LOAEL-based HQs are based on individual-level effects thresholds and only account for a single LOE. In such cases, a WOE approach, (including an alternate target HQ of 10 for dioxin TEQ)³, was used in reducing uncertainty for characterizing potential risk to wildlife populations at the Tamarisk Thicket, as described in the preceding bullet.
- NOAEL-based HQs greater than 1 is considered one LOE in assessing potential risk to sensitive species, if present in this exposure area. The potential presence of T&E species in the Tamarisk Thicket potential exposure area is discussed in Section 5.1.1.

Ultimately, three risk outcomes are possible for wildlife based on the HQs greater than 1 and WOE:

(1) unacceptable risk to individual wildlife is possible (i.e., indicated by sufficient and strong supporting LOE); (2) unacceptable risk to individual wildlife is unlikely (i.e., indicated by sufficient and strong LOE supporting a conclusion of no unacceptable risk); or (3) unacceptable risk to individual wildlife is uncertain (i.e., indicated by insufficient LOE).

For this ERA, the results of individual LOE evaluations were evaluated collectively to derive an overall WOE conclusion for each potential receptor. Key uncertainties were considered along with the strength, relevance, and other qualities of the LOE in reaching the WOE conclusions.

For the Tamarisk Thicket potential exposure area, evaluations were completed for the following scenarios and discussed in this section:

- Baseline scenario using depth-weighted EPCs
- Baseline scenario using area-weighted EPCs.

In these evaluations, risk calculations were completed for all COPECs, as presented in Tables TT-5.5a through TT-5.6b; however, risk results for only a subset of the COPECs were discussed in the evaluations using area-weighted EPCs. For plants and soil invertebrates, COPECs with HQs greater than 1 based on the depth-weighted EPC were discussed in the evaluations using area-weighted EPCs. For wildlife (i.e., birds and mammals), COPECs with NOAEL-based HQs greater than 1 based on the depth-weighted EPC and species- and site-specific site use factor (SUF) were discussed in the area-weighted EPC evaluations. At the conclusion of the baseline scenario evaluation, risk drivers were identified based on those COPECs for which unacceptable community/population-level risk was predicted using the most refined exposure and effects assumptions (i.e., site-specific SUF, area-weighted EPCs, and selected TRVs).

³ For dioxin TEQ, the selected BAFs and TRVs result in significant overestimation of risk for key wildlife receptors, primarily for invertivorous small mammals and insectivorous birds. Due to the compounded conservatism in the risk estimates for dioxin TEQ, HQs greater than 10 were considered to pose unacceptable risk. Alternate congener-specific BAFs and alternate TRVs demonstrating the magnitude of the risk overestimation are presented in Sections 6.4.3 and 6.5.2 of the main report, respectively. These alternate BAFs and TRVs are based on current understanding of uptake and toxicity of TEQ mixtures and represent an additional LOE considered for dioxin TEQ. As a result, a target LOAEL-based HQ of 10 for dioxin TEQ was used. Uncertainty in the risk estimates for dioxin TEQ is discussed in detail in Section 6.7.6.

5.6.1 Risk Characterization (Baseline Scenario and Depth-weighted EPCs)

Risk estimates for ecological communities (plants and soil invertebrates) and wildlife (mammals and birds) for the baseline scenario using depth-weighted EPCs are summarized in this section. As mentioned earlier in Section 5.4, exposure concentrations and doses for COPECs in soil and potentially complete pathways were calculated as described, including equations, in Section 6.4 of the main report. Detailed risk calculations for plants and soil invertebrates (Table TT-B.1) and detailed dose and risk calculations for wildlife (Tables TT-B.2 through TT-B.5) are presented in Attachment TT-B. COPECs identified at the Tamarisk Thicket potential exposure area for the baseline scenario include six metals, TPH, PCBs, dioxin TEQ in soil (for wildlife receptors only), and 2,3,7,8-TCDD (for ecological communities only) (Table TT-5.1). Potential risk to receptors exposed to these COPECs is described below.

5.6.1.1 Plants and Soil Invertebrates

Table TT-5.5a summarizes HQs estimated for soil exposure for ecological communities (plants and soil invertebrates) in the Tamarisk Thicket exposure area for the baseline scenario using depth-weighted EPCs. Plants can potentially be exposed to COPECs in soil up to 6 ft bgs. Plant HQs are greater than 1 for manganese based on the highest EPC value from the shallow, surface, and subsurface I depth intervals. HQs for the remaining COPECs are less than 1 for plants, indicating *de minimis* risk to plants from exposure to these COPECs.

For manganese, the HQ for plants was greater than 1. Manganese was analyzed in two locations in surface soil (0 to 0.5 ft bgs). The maximum depth-weighted concentration (420 mg/kg) was used as the depth-weighted EPC to evaluate potential risk to plants from exposure to manganese in soil. For areas where a constituent is largely not detected, use of a maximum concentration as the EPC may not appropriately characterize risk. Only one of the locations has manganese concentrations slightly greater than the background threshold value (BTv = 402 mg/kg); the other location concentration (300 mg/kg) is below the BTv. In addition, the plant screening value for manganese (220 mg/kg) is less than the BTv and the 95UCL background concentration results in an HQ of 1, indicating low confidence in the plant screening level and its ability to predict risk to plant communities. Unacceptable risk to plant communities from exposure to manganese is considered unlikely based on the risk results and discussion above.

Soil invertebrates can potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs). For soil invertebrates, HQs for all COPECs are less than or equal to 1, indicating *de minimis* risk to invertebrates from exposure to these COPECs.

For TPH mixtures, individual constituents were used to characterize potential risks to plants and invertebrates. BTEX were not detected in any samples (Attachment TT-A1) and PAHs were within the range of background concentrations, indicating no unacceptable risk for plants and soil invertebrates from TPHs is expected in the Tamarisk Thicket potential exposure area.

To summarize, based on the risk results and WOE, unacceptable risk to plant communities from exposure to manganese in soil at the Tamarisk Thicket potential exposure area is unlikely and is not expected for TPH. For soil invertebrate communities, no unacceptable risk to invertebrate communities from exposure to TPH in soil is expected. No unacceptable risk (*de minimis* risk) to plant and invertebrate communities is expected from remaining inorganic COPECs (hexavalent chromium, total chromium, copper, lead, and zinc) and organic COPECs (PCBs and 2,3,7,8-TCDD). Based on the risk estimates and potential uncertainties associated with

the baseline risk using depth-weighted EPCs, manganese (plant communities only) was further evaluated using area-weighted EPCs as discussed in Section 5.6.2.

5.6.1.2 Small Mammals

For the Tamarisk Thicket potential exposure area, baseline risks were estimated for small mammals using depth-weighted EPCs for the following evaluations and discussed in this section:

- Using the selected TRVs and a SUF equal to 1
- Using the BTAG TRVs and a SUF equal to 1
- Using the selected TRVs and a species and site-specific SUF
- Using the BTAG TRVs and a species and site-specific SUF.

5.6.1.2.1 Risks Evaluated Using a SUF Equal to 1

Risks Evaluated Using Selected TRVs

Table TT-5.5a summarizes HQs estimated for small mammals at the Tamarisk Thicket potential exposure area using the selected TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized in the text and table below. TRVs are not available for TPHs; however, risks to these receptors are characterized below based on indicator chemicals as described previously.

- **Merriam's kangaroo rat (granivorous small mammal):** This receptor could potentially be exposed to COPECs in subsurface I soil (0 to 6 ft bgs) directly and through its diet. NOAEL- and LOAEL-based HQs in soil are less than 1 for all individual COPECs, indicating *de minimis* risk to individual and populations of granivorous small mammals.
 - For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples and PAHs are within the range of background (not COPECs), indicating that no unacceptable risk to granivorous small mammals from exposure to TPH is expected.
- **Desert shrew (invertivorous small mammal):** This receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. HQs for this receptor are less than or equal to 1 for COPECs except for dioxin TEQ. The potential risks from COPECs with HQs greater than 1 are characterized below.
 - For dioxin TEQ for mammals, the NOAEL- and LOAEL-based HQs are greater than 1, indicating unacceptable risk is possible for individual and populations of invertivorous small mammals exposed to dioxins in soil based on the HQ. Dioxin TEQ was detected at all 21 locations in surface soil (FOD = 100% in 0 to 0.5 ft bgs), with 19 of the 21 surface soil locations having depth-weighted concentrations above background (BTV = 5.58 nanograms per kilogram [ng/kg]). Concentrations are greater than 10 times the BTV are present at seven locations (64 ng/kg at AOC1-BCW6, 110 ng/kg at AOC1-BCW10, 58 ng/kg at AOC1-BCW25, 100 ng/kg at AOC1-BCW26, 180 ng/kg at AOC1-BCW28, 84 ng/kg at AOC1-BCW29, and 140 ng/kg at AOC1-BCW29). As described in Section 6.7.6 of the main report,

the mammalian TRVs and uptake factors selected for dioxins at this site likely overestimate exposure and risk for this COPEC. Conservative assumptions were used to estimate the HQs, including use of BAFs based on uptake of a single congener (2,3,7,8-TCDD) to earthworms, and a diet assumed to consist entirely of earthworms. Confidence in the ability of the mammalian dioxin TEQ TRV to predict risk is moderate. As noted in Section 5.1.1, T&E invertivorous small mammals have not been observed in the Tamarisk Thicket potential exposure area. Based on the high magnitude HQs and detections elevated concentrations (i.e., more than 10 times above BTV) potentially associated with unacceptable risk, unacceptable risk to individual and populations of shrew is considered possible in this scenario.

- For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples and PAHs are within the range of background (not COPECs), indicating that no unacceptable risk to invertivorous small mammals from exposure to TPHs is expected.
- NOAEL- and LOAEL-based HQs for other COPECs in soil are less than 1 for the remaining COPECs, indicating *de minimis* risk to individual and populations of invertivorous small mammals for the remaining COPECs.

Based on the risk estimates and potential uncertainties associated with the baseline risk from dioxin TEQ for insectivorous small mammals, this COPEC was further evaluated site-specific SUFs and using area-weighted EPCs as discussed below and in Section 5.6.2.

Risks Evaluated Using the BTAG TRVs

Table TT-5.5a also summarizes HQs estimated for small mammals at the Tamarisk Thicket potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized in the text and table below.

- **Merriam's kangaroo rat (granivorous small mammal):** NOAEL- and LOAEL-based HQs in soil are less than 1 for all COPECs, indicating *de minimis* risk to individual receptors and populations of granivorous small mammals.
- **Desert shrew (invertivorous small mammal):** The NOAEL-based HQ for zinc is greater than 1 and the LOAEL-based HQs is less than 1 for this COPECs, indicating no unacceptable risk to populations of invertivorous mammals; however, unacceptable risk to individual receptors is uncertain for this COPEC based on the HQ. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs, indicating *de minimis* risk to individual receptors and populations of invertivorous small mammals from the remaining COPECs.

Summarized below are all HQ estimates for mammals for COPECs where at least one NOAEL-based HQ value (using the selected TRV or BTAG TRV) is greater than 1:

APPENDIX TT
SOIL HHERA FOR TAMARISK THICKET EXPOSURE AREA

Hazard Quotient Summary for Small Mammals (SUF = 1)								
COPEC	Merriam's Kangaroo Rat				Desert Shrew			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Zinc	5E-02	1E-02	4E-01	1E-02	9E-01	2E-01	7E+00	2E-01
TEQ Mammals	2E-01	2E-02	--	--	1E+02	1E+01	--	--

Notes:

Bold indicates HQs > 1.

-- = HQ not estimated because TRVs are unavailable.

5.6.1.2.2 Risks Evaluated Using a Site-Specific SUF

Table TT-5.5b presents HQs calculated using the selected TRVs and BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Based on the Tamarisk Thicket potential exposure area and home ranges for Merriam's kangaroo rat and desert shrew, the site-specific SUF was estimated as 1 for these receptors (i.e., their home range is less than or equal to the size of the exposure area). Therefore, the risk results using selected TRVs and BTAG TRVs for this scenario are the same as discussed above for the generic SUF of 1.

5.6.1.2.3 Qualitative Risk Evaluation for Special-Status Mammals

For ring-tail cat and bats, potential risks were evaluated qualitatively, as described below.

- For the ring-tail cat (California fully protected species), the desert kit fox is the most representative surrogate receptor based on body sizes, similar dietary preferences, and large home ranges. Unlike the fox, which lives and forages primarily in the open desert, on creosote bush flats, and amongst the sand dunes (National Park Service 2015), the ring-tail cat prefers habitat associated with water (California Department of Fish and Wildlife [CDFW] 2005) and is unlikely to use upland areas in the OCS frequently. Risk estimates for the fox, presented in Appendices OCS and BCW+AOC4, are adequate to evaluate potential risk to the ring-tail cat. The NOAEL-based HQs greater than 1 estimated for the fox using a SUF of 1 are low in magnitude and would reduce to *de minimis* levels using a site-specific SUF for ring-tail cat based on a home range of 109 to 1,280 acres (CDFW 2005). Because the ring-tail cat is likely to forage in the riparian area, risk characterization for the Tamarisk Thicket was also considered for evaluating potential risk to the ring-tail cat. However, a carnivorous mammal, representative of the ring-tail cat was not evaluated for the Tamarisk Thicket potential exposure area. The desert shrew is considered an adequate surrogate because it is a sensitive receptor assumed to be more highly exposed to soils than the ring-tail cat based on foraging habits, body size, and home range. The NOAEL-based HQs for the shrew in the Tamarisk Thicket potential exposure area are less than 1 for all the COPECs except for dioxin TEQ. The NOAEL-based HQ for dioxin TEQ would be reduced to *de minimis* levels when using a site-specific SUF for ring-tail cat based on a home range of 109 to 1280 acres (CDFW 2005) in addition to accounting for the compounded uncertainties related to dioxin uptake and TRVs.

- For cave myotis and pallid bats (state species of concern), the desert shrew is the most representative surrogate receptor based on prey preferences (invertebrates); however, bats have significantly larger home ranges than shrews and are less exposed to soils, as they are aerial feeders. The NOAEL-based HQs for the shrew at the Tamarisk Thicket potential exposure area are less than 1 for all COPECs except for dioxin TEQ, as described above for ring-tail cat. The NOAEL-based HQs would be reduced to *de minimis* levels when using a site-specific SUF for bats (e.g., 42 acres for myotis [Henry et al. 2002] compared to the home range of 0.1 for the shrew) in addition to including compounded uncertainties related to dioxin uptake and TRVs.

Based on the results of the ERA, potential exposures to COPECs in soil in the Tamarisk Thicket potential exposure area are not expected to pose unacceptable risk to ecological receptors including special-status species.

5.6.1.2.4 Baseline Risk Summary for Small Mammals Using Depth-Weighted EPCs

To summarize, based on the risks characterized for small mammals exposed to COPECs in soil at the Tamarisk Thicket potential exposure area using selected TRVs⁴, depth-weighted EPCs, and a site and species-specific SUF (SUF equal to 1), the risk conclusions are as follows:

- For Merriam's kangaroo rat (granivorous small mammals), the NOAEL-based and LOAEL-based HQs are less than 1, indicating *de minimis* risk to individual and populations of granivorous small mammals for all COPECs.
- For desert shrew (invertivorous small mammals), the NOAEL- and LOAEL-based HQs are less than 1 for all COPECs except dioxin TEQ. For dioxin TEQ, potential unacceptable risk to invertivorous small mammal populations at the Tamarisk Thicket exposure area is possible because HQs are high in magnitude and dioxin TEQ was detected at a few locations at elevated concentrations that may be associated with risk. For the remaining COPECs at the Tamarisk Thicket exposure area, the NOAEL- and LOAEL-based HQs are less than 1, indicating *de minimis* risk to individual and populations of invertivorous small mammals.
- Qualitative evaluation of special-status species (ring-tail cat and bats), using HQs for indicator receptors and species-specific SUFs, indicates no unacceptable risk resulting from exposure to soil in the Tamarisk Thicket potential exposure area for these species.

Based on the risk estimates and potential uncertainties associated with the baseline risk to invertivorous small mammals from dioxin TEQ, this COPEC was further evaluated using area-weighted EPCs as discussed in Section 5.6.2.

5.6.1.3 Birds

For the Tamarisk Thicket potential exposure area, baseline risks were estimated for birds using depth-weighted EPCs for the following evaluations and are discussed in this section:

⁴ Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

- Using the selected TRVs and a SUF equal to 1
- Using the BTAG TRVs and a SUF equal to 1
- Using the selected TRVs and a species- and site-specific SUF
- Using the BTAG TRVs and a species- and site-specific SUF.

5.6.1.3.1 Risks Evaluated Using a SUF equal to 1

Risks Evaluated Using Selected TRVs

Table TT-5.5a summarizes HQs estimated for birds at the Tamarisk Thicket potential exposure area using the selected TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below. TRVs are not available for TPH; however, risks to these potential receptors are characterized below based on indicator chemicals as described previously.

- **Gambel's quail (granivorous bird):** This receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and to deeper soils (0 to 6 ft bgs) through its diet. NOAEL- and LOAEL-based HQs in soil are less than 1 for all individual COPECs, indicating *de minimis* risk to individual and populations of granivorous birds.
 - For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples and PAHs are within the range of background concentrations (not COPECs), indicating that no unacceptable risk to granivorous birds from exposure to TPHs is expected.
- **Cactus wren (insectivorous bird):** This receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. HQs for this receptor are less than 1 for most COPECs except for dioxin TEQ. The potential risks from COPECs with HQs greater than 1 are characterized below.
 - For dioxin TEQ for birds, the NOAEL-HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of insectivorous birds; however, unacceptable risk to individual receptors is uncertain for dioxin TEQ in soil based on the HQ. Dioxin TEQ was frequently detected in surface soil (FOD = 100% in the 0- to 0.5-ft bgs interval) with 17 of the 21 locations having depth-weighted concentrations exceeding background (5.98 ng/kg). Concentrations are greater than 10 times the BTV are limited to two locations (110 ng/kg at AOC1-BCW28 and 100 ng/kg at AOC1-BCW30). As described in Section 6.7.6 of the main report, the avian TRVs and uptake factors selected for dioxins at this site likely overestimate exposure and risk for this COPEC. Uncertainties associated with the conservative assumptions include diet (dietary composition assumes 100% of a single-item diet), uptake into dietary items (bioaccumulation based on a single congener likely overestimates HQs by about 10 times), and conservative TRVs (based on lowest available NOAEL and LOAEL). Additionally, the NOAEL-based HQ is low in magnitude and would likely reduce to less than one using alternate exposure and uptake assumptions (see Section 6.7.6 of the main report). Elevated concentrations are limited in spatial extent. Although, the Tamarisk Thicket potential exposure area is potential habitat for the southwestern willow flycatcher, based on the most recent survey in 2017, none have been observed in this area; the last and only detection with the Tamarisk

APPENDIX TT

SOIL HHERA FOR TAMARISK THICKET EXPOSURE AREA

Thicket potential exposure area was in 2009 (GANDA 2017; Section 5.1.1). Unacceptable risk to individual insectivorous birds is considered unlikely in this scenario.

- For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples and PAHs are within the range of background (not COPECs), indicating that no unacceptable risk to insectivorous birds from exposure to TPHs is expected.
- The NOAEL- and LOAEL-based HQs for all other COPECs in soil are less than 1, indicating *de minimis* risk to individual and populations of insectivorous birds.

Based on the risk estimates and potential uncertainties associated with the baseline risk from dioxin TEQ for insectivorous birds, this COPEC was further evaluated using species- and site-specific SUFs as discussed below.

Risks Evaluated Using the BTAG TRVs

Table TT-5.5a also summarizes HQs estimated for birds in the Tamarisk Thicket potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Gambel's quail (granivorous bird):** NOAEL-based HQ for lead is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of granivorous birds; however, unacceptable risk to individual receptors is uncertain for this COPEC based on the HQ. The risks from lead are likely overestimated due to the conservative avian TRV. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. NOAEL- and LOAEL-based HQs for other COPECs in soil are less than 1, indicating *de minimis* risk to individuals and populations of granivorous birds for the remaining COPECs.
- **Cactus wren (insectivorous bird):** NOAEL-based HQs for lead and zinc are greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of insectivorous birds; however, unacceptable risk to individual receptors is uncertain for these COPECs based on the HQs. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs, indicating *de minimis* risk to individual potential receptors and populations of insectivorous birds from these COPECs.

Summarized below are all HQ estimates for birds for COPECs where at least one NOAEL-based HQ value (using the selected TRV or BTAG TRV) is greater than 1:

Hazard Quotient Summary for Birds (SUF = 1)								
COPEC	Gambel's Quail				Cactus Wren			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Lead	5E-02	3E-02	6E+00	1E-02	8E-01	4E-01	9E+01	1E-01
Zinc	3E-02	1E-02	1E-01	1E-02	9E-01	4E-01	4E+00	4E-01
TEQ Avian	1E-02	1E-03	--	--	4E+00	4E-01	--	--

Notes:

Bold indicates HQs > 1.

-- = HQ not estimated because TRVs are unavailable.

5.6.1.3.2 Risks Evaluated Using a Site-Specific SUF

Risks Evaluated Using Selected TRVs

Table TT-5.5b presents HQs calculated using the selected TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Gambel's quail (granivorous bird):** The site-specific SUF for this receptor is 0.1, which further reduced the NOAEL- and LOAEL-based HQs to less than 1 for all COPECs. *De minimis* risk to populations and individual granivorous birds is expected when accounting for site use at the Tamarisk Thicket potential exposure area.
- **Cactus wren (insectivorous bird):** The site-specific SUF was estimated as 1 for cactus wren (i.e., the home range is less than or equal to the size of the exposure area). Therefore, the risk results using selected TRVs for this scenario are the same as discussed above for the generic SUF of 1.

Based on the risk estimates and potential uncertainties associated with the baseline risk from dioxin TEQ for insectivorous birds, this COPEC was further evaluated using area-weighted EPCs as discussed below in Section 5.6.2.

Risks Evaluated Using the BTAG TRVs

Table TT-5.5b also summarizes HQs estimated for birds in the Tamarisk Thicket exposure area using the BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized in the text and table below.

- **Gambel's quail (granivorous bird):** The site-specific SUF for this receptor is 0.1, which reduced the NOAEL- and LOAEL-based HQs for lead to less than 1. NOAEL- and LOAEL-based HQs for all COPECs in soil are less than 1, indicating *de minimis* risk to individuals and populations of granivorous birds at the Tamarisk Thicket.
- **Cactus wren (insectivorous bird):** The site-specific SUF was estimated as 1 for cactus wren (i.e., the home range is less than or equal to the size of the exposure area). Therefore, the risk results using BTAG TRVs for this scenario are the same as discussed above for the generic SUF of 1.

APPENDIX TT
SOIL HHERA FOR TAMARISK THICKET EXPOSURE AREA

For the COPECs with NOAEL-based HQs greater than 1 using a SUF of 1 (using the selected TRV or BTAG TRV), HQ estimates using the species- and site-specific SUF for birds are summarized below:

Hazard Quotient Summary for Birds (Site-Specific SUF)								
COPEC	Gambel's Quail (SUF = 0.1)				Cactus Wren (SUF = 1)			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs

Zinc	4E-03	2E-03	2E-02	2E-03	9E-01	4E-01	4E+00	4E-01
TEQ Avian	2E-03	2E-04	--	--	4E+00	4E-01	--	--

Notes:

Bold indicates HQs > 1.

-- = HQ not estimated because TRVs are unavailable.

5.6.1.3.3 Baseline Risk Summary for Birds Using Depth-Weighted EPCs

To summarize, based on the risks characterized for populations of birds exposed to COPECs in soil at the Tamarisk Thicket potential exposure area using selected TRVs⁵, depth-weighted EPCs, and a site-specific SUF, the risk conclusions are as follows:

- For Gambel's quail (granivorous birds), the NOAEL- and LOAEL-based HQs for all COPECs are less than 1, indicating *de minimis* risk to individual and populations of granivorous birds for all COPECs.
- For the cactus wren (insectivorous birds), LOAEL-based HQs are less than 1 for all COPECs, indicating no unacceptable risk to populations of insectivorous birds. COPECs with HQs indicative of uncertain risks (i.e., where NOAEL-based HQs are greater than 1 but LOAEL-based HQs are less than 1) include dioxin TEQ. For dioxin TEQ, unacceptable risk to individual receptors is considered unlikely because of the conservative assumptions included for this COPEC, low magnitude of the HQ, which would likely reduce to less than 1 when accounting for compounded conservative assumptions for this COPEC (see main report Section 6.7.6), and because T&E birds, are not resident in the Tamarisk Thicket potential exposure area. A single observation of the federally listed southwestern willow flycatcher was made in the Tamarisk Thicket exposure area in 2009 (CH2M 2014); however, this species is not expected to nest or reside in the Tamarisk Thicket potential exposure area (see Section 5.1.1). For the remaining COPECs at the Tamarisk Thicket potential exposure area, the NOAEL- and LOAEL-based HQs are less than 1, indicating *de minimis* risk to individual and populations of insectivorous birds.

Based on the baseline risk results for insectivorous birds and potential uncertainties associated with exposure to dioxin TEQ at the Tamarisk Thicket potential exposure area, this COPEC was further evaluated using area-weighted EPCs as discussed in Section 5.6.2.

⁵ Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

5.6.2 Risk Characterization (Baseline Scenario and Area-weighted EPCs)

Based on the risk characterization of COPECs in the baseline scenario using depth-weighted EPCs (Section 5.6.1), risks were characterized for all COPECs using area-weighted EPCs. For those COPECs identified for further evaluation in the depth-weighted evaluation, the results of the area-weighted risk characterization are discussed below. The COPECs include:

- Manganese for plants
- Dioxin TEQ for invertivorous small mammals
- Dioxin TEQ for insectivorous birds.

Potential risks to receptors from COPECs listed above were characterized for the baseline scenario using area-weighted EPCs as discussed in this section. Detailed risk calculations for plants and soil invertebrates (Table TT-B.6) and detailed dose and risk calculations for wildlife for all COPECs (Tables TT-B.7 through TT-B.10) are presented in Attachment TT-B.

5.6.2.1 Plants and Soil Invertebrates

Table TT-5.6a summarizes HQs estimated for soil exposure for ecological communities (plants and soil invertebrates) at the Tamarisk Thicket potential exposure area for the baseline scenario using area-weighted EPCs for all COPECs; however, only the COPECs identified in Section 5.6.1 for further evaluation using area-weighted EPCs are discussed here.

Plants can potentially be exposed to COPECs in soil up to 6 ft bgs. HQs were based on the highest EPC from the shallow, surface, and subsurface I soil depth intervals. For plants, the magnitude of the HQ for manganese remained the same in this evaluation, because the area-weighted EPC (420 mg/kg) is based on the maximum depth-weighted concentration. Consistent with the evaluation using depth-weighted EPCs, unacceptable risk to plant communities from exposure to manganese is considered unlikely.

Soil invertebrates can potentially be exposed only to COPECs in surface soil (0 to 0.5 ft bgs). Consistent with the evaluation using depth-weighted EPCs, HQs are less than or equal to 1 for all COPECs, indicating *de minimis* risk to invertebrates from exposure to these COPECs.

Vegetation communities observed at the site during the floristic surveys conducted in 2013 (GANDA and CH2M 2013) and in 2017 (CH2M 2017) is typical of Mojave Desert plant communities (summarized in Section 2.4.2). Over a hundred different vascular plant species have been observed within the survey area that includes Tamarisk Thicket potential exposure area; documented as Segment D in these survey reports (GANDA and CH2M 2013, CH2M 2017). The floristic surveys report a diverse assemblage of plants species found in typical abundance, density, cover, and vigor of plant communities in undisturbed desert habitat. These observations are not consistent with impairment of the plant community at the site. The floristic surveys provide site-specific observations that support the health of plant communities at the site and is considered a stronger LOE than the exceedances of low-confidence generic plant screening values, which are widely acknowledged to have low ability to predict toxicity in plants.

Risk Summary and Risk Drivers for Ecological Communities

No risk drivers were identified for ecological communities based on HQs predicted using the most refined exposure and effects assumptions (i.e., area-weighted EPCs) and additional supporting WOE.

For plants, HQs exceeded 1 only for manganese. Unacceptable risk is considered unlikely for manganese based on supporting LOE. Although T&E species have not been observed at the Tamarisk Thicket, some special-status species have been observed. Based on the risk evaluation for plant communities, no unacceptable risk to special-status plants species is expected.

For soil invertebrates, HQs were less than or equal to 1 for all COPECs.

No unacceptable risk to plant and soil invertebrate communities is expected from COPECs in soil in the Tamarisk Thicket potential exposure area.

5.6.2.2 Small Mammals

For the Tamarisk Thicket potential exposure area, baseline risks were estimated for small mammals using area-weighted EPCs for the following evaluations and discussed in this section:

- Using the selected TRVs and a species- and site-specific SUF
- Using the BTAG TRVs and a species- and site-specific SUF.

5.6.2.2.1 Risks Evaluated Using a site-specific SUF

Risks Evaluated Using Selected TRVs

Table TT-5.6a summarizes HQs estimated for small mammals at the Tamarisk Thicket potential exposure area using the selected TRVs, area-weighted EPCs, and a SUF equal to 1. Table TT-5.6b summarizes HQs estimated for small mammals at the Tamarisk Thicket potential exposure area using the selected TRVs, area-weighted EPCs, and a site-specific SUF (SUF = 1 as the home range for small mammals is less than or equal to the size of the Tamarisk Thicket potential exposure area) for all COPECs. However, only the COPECs identified in Section 5.6.1.2 for further evaluation using area-weighted EPCs are discussed here. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Merriam's kangaroo rat (granivorous small mammal):** This receptor could potentially be exposed to COPECs in subsurface I soil (0 to 6 ft bgs) directly and through its diet. *De minimis* risk to individual and populations of granivorous small mammals was identified using depth-weighted EPCs. Using area-weighted EPCs, the NOAEL- and LOAEL-based HQs are also less than 1. Therefore, no *de minimis* risk to individual receptors and populations of granivorous small mammals is expected.
- **Desert shrew (invertivorous small mammal):** This receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. Depth-weighted HQs discussed in Section 5.6.1.2 for this receptor were less than 1 except for dioxin TEQ.
 - For dioxin TEQ, the magnitude of area-weighted NOAEL- and LOAEL-based HQs were reduced from the depth-weighted EPC analysis but are still greater than 1. as discussed in Section 6.7.6 of the main report and above in Section 5.6.1.2, there is uncertainty associated with the dioxin TRVs and uptake factors for mammals, which likely overestimate HQs by at least 10 times. The LOAEL-based HQ would likely reduce to less than 1 when accounting for the compounded conservative assumptions included in the HQs for this COPEC. The spatial extent of elevated concentration more than 10 times the BTV is limited. Additionally, T&E invertivorous small mammals have not been observed in this

APPENDIX TT
SOIL HHERA FOR TAMARISK THICKET EXPOSURE AREA

area. Based on risk results and discussion, unacceptable risk to individual and populations of invertivorous small mammals is unlikely from exposure to dioxin TEQ at the Tamarisk Thicket potential exposure area.

- NOAEL- and LOAEL-based HQs for other COPECs in soil are less than 1, indicating *de minimis* risk to individuals and populations of invertivorous small mammals for the remaining COPECs.

Risks Evaluated Using the BTAG TRVs

Table TT-5.6b also summarizes HQs estimated for small mammals at the Tamarisk Thicket potential exposure area using the BTAG TRVs, area-weighted EPCs, and a site-specific SUF (SUF = 1). Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Merriam's kangaroo rat (granivorous small mammal):** No unacceptable risk to granivorous small mammals was identified using depth-weighted EPCs, and the conclusions are the same using area-weighted EPCs (i.e., the NOAEL- and LOAEL-based HQs are less than 1).
- **Desert shrew (invertivorous small mammal):** The area-weighted NOAEL-based HQ for zinc is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to invertivorous small mammal populations; however unacceptable risk to individual receptors is uncertain for this COPEC based on the HQ. The area-weighted NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs, indicating no unacceptable risk to populations of invertivorous small mammals from the remaining COPECs.

Summarized below are NOAEL- and LOAEL-based HQs for mammals for COPECs identified in Section 5.6.1.2 that were further evaluated using area-weighted EPCs in this section. The HQs below are based on the area-weighted EPCs and species and site-specific SUF (if applicable for a receptor):

Hazard Quotient Summary for Mammals (site-specific SUF = 1)								
COPEC	Merriam's Kangaroo Rat				Desert Shrew			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Zinc	5E-02	1E-02	4E-01	1E-02	9E-01	2E-01	7E+00	2E-01
TEQ Mammals	1E-01	1E-02	--	--	7E+01	7E+00	--	--

Notes:

Bold indicates HQs > 1.

-- = HQ not estimated because TRVs are unavailable.

5.6.2.2.2 Qualitative Risk Evaluation for Special-Status Mammals

For ring-tail cat and bats, potential risks were evaluated qualitatively, as described above in Section 5.6.1.2.3 using depth-weighted EPCs. Using area-weighted EPCs, potential exposures are reduced for dioxin TEQ, and therefore, the risk conclusions are unchanged. Based on the results of the ERA, potential exposures to

COPECs in soil in the Tamarisk Thicket potential exposure area are not expected to pose unacceptable risk to potential ecological receptors including special-status species.

5.6.2.2.3 *Baseline Risk Summary for Small Mammals Using Area-Weighted EPCs*

To summarize, based on the risks characterized for small mammals exposed to COPECs in soil at the Tamarisk Thicket potential exposure area using selected TRVs⁶, area-weighted EPCs, and a site-specific SUF (SUF equal to 1 because the home ranges are less than or equal to the size of the exposure area), the risk conclusions are as follows:

- For Merriam's kangaroo rat (granivorous small mammal), the NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, indicating *de minimis* risk to individual and populations of granivorous small mammals.
- For the desert shrew (invertivorous small mammals), the LOAEL-based HQ is greater than 1 for dioxin TEQ. For dioxin TEQ, unacceptable risk to individual and populations of invertivorous small mammals is unlikely because: (1) LOAEL-based HQ is less than 10 and likely to be reduced to 1 or less if adjusted for the compounding uncertainties associated with the conservative assumptions for this COPEC; (2) spatial extent of elevated concentrations is limited; and (3) T&E species with small home ranges have not been observed. For the remaining COPECs, the NOAEL- and LOAEL-based HQs are less than 1, indicating *de minimis* risk to individual and populations of invertivorous small mammals.
- Qualitative evaluation of special-status species (ring-tail cat and bats), using HQs for indicator receptors and species-specific SUFs, indicates no unacceptable risk resulting from exposure to soil in the Tamarisk Thicket potential exposure area for these species.

Potential Risk Drivers for Small Mammals in the Tamarisk Thicket Exposure Area

No risk-driving COPECs for small mammals were identified at the Tamarisk Thicket potential exposure area as no potential for unacceptable population-level risk (i.e., LOAEL-based HQs greater than 1 [or greater than 10 for dioxin TEQ]) was predicted using HQs calculated from the most refined exposure and effects assumptions (i.e., site-specific SUF, area-weighted EPCs, and selected TRVs) and additional supporting WOE.

COPECs with NOAEL-based HQs greater than 1 using the most refined exposure and effects assumptions were identified for the Tamarisk Thicket exposure area (dioxin TEQ). However, additional LOE support the conclusions that unacceptable risk to individual receptors from exposure to this COPEC is unlikely.

5.6.2.3 **Birds**

For the Tamarisk Thicket potential exposure area, baseline risks were estimated using area-weighted EPCs for the following evaluations and discussed in this section:

- Using the selected TRVs and a species- and site-specific SUF

⁶ Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

- Using the BTAG TRVs and a species- and site-specific SUF.

5.6.2.3.1 *Risks Evaluated Using a site-specific SUF*

Risks Evaluated Using the Selected TRVs

Table TT-5.6a summarizes HQs estimated for birds in the Tamarisk Thicket potential exposure area using the selected TRVs, area-weighted EPCs, and a SUF equal to 1 for all COPECs. Table TT-5.6b summarizes HQs estimated for birds in the Tamarisk Thicket exposure area using the selected TRVs, area-weighted EPCs, and a site-specific SUF (SUF = 0.1 for Gambel's quail and 1 for cactus wren) for all COPECs. However, only the COPECs identified in Section 5.6.1.3 for further evaluation using area-weighted EPCs are discussed here. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized in the text and in-text table below.

- **Gambel's quail (granivorous bird):** This receptor could potentially be exposed to COPECs in subsurface I soil (0 to 6 ft bgs) directly and through its diet. No unacceptable risk to granivorous birds was identified using depth-weighted EPCs and the results are the same using area-weighted EPCs (i.e., the NOAEL- and LOAEL-based HQs are less than 1).
- **Cactus wren (insectivorous bird):** This receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. Dioxin TEQ was identified in Section 5.6.1.3 for further evaluation using area-weighted EPCs.
 - For dioxin TEQ, the magnitude of area-weighted NOAEL- and LOAEL-based HQs were reduced from the depth-weighted EPC analysis. Using an area-weighted EPC, the LOAEL-based HQ is less than 1 but the NOAEL-based HQ is still greater than 1. The results indicate no unacceptable risk to populations of insectivorous birds; however, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ LOE. The magnitude of the NOAEL-based HQ is low. Conservative assumptions were used to estimate the HQs, including use of bioaccumulation factors based on uptake of a single congener (2,3,7,8-TCDD) to earthworms, and a diet assumed to consist entirely of earthworms. As a result, the HQs are considered to be overestimated. Additionally, T&E birds have not been observed at the Tamarisk Thicket potential exposure area since 2009 (CH2M 2014). The only observation of T&E birds in the Tamarisk Thicket potential exposure area was a single southwestern willow flycatcher, which is not expected to reside in the Tamarisk Thicket potential exposure area (Section 5.1.1).,Therefore, protection at the individual level (i.e., NOAEL-based HQ less than or equal to 1) is not warranted. Unacceptable risk to individual insectivorous birds is considered to be unlikely.

Risks Evaluated Using the BTAG TRVs

Table TT-5.6b also summarizes HQs estimated for birds at the Tamarisk Thicket potential exposure area using the BTAG TRVs, area-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Gambel's quail (granivorous bird):** The site-specific SUF for this receptor is 0.1. No unacceptable risk to granivorous birds was identified using depth-weighted EPCs and the results are the same using area-weighted EPCs (i.e., the NOAEL- and LOAEL-based HQs are also less than 1). Therefore, unacceptable risk to granivorous birds is not expected.

- **Cactus wren (insectivorous bird):** The site-specific SUF for this receptor is 1. The area-weighted NOAEL-based HQs are greater than 1 for lead and zinc, and are the same as the depth-weighted HQs because area-weighting had little effect on the EPCs. The LOAEL-based HQs for lead and zinc were less than 1, indicating no unacceptable risk to invertivorous bird populations; however, unacceptable risk to individual potential receptors is uncertain for these COPECs. The area-weighted NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs, indicating no unacceptable risk to individual potential receptors and populations of invertivorous birds from the remaining COPECs. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report.

Summarized below are NOAEL- and LOAEL-based HQs for birds for COPECs identified in Section 5.6.1.3 that were further evaluated using area-weighted EPCs in this section. The HQs below are based on the area-weighted EPCs and species- and site-specific SUF:

Hazard Quotient Summary for Birds (site-specific SUF)								
COPEC	Gambel's Quail (SUF = 0.1)				Cactus Wren (SUF = 1)			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Lead	7E-03	4E-03	8E-01	1E-03	7E-01	4E-01	9E+01	1E-01
Zinc	4E-03	2E-03	2E-02	2E-03	9E-01	4E-01	4E+00	4E-01
TEQ Avian	2E-03	2E-04	--	--	3E+00	3E-01	--	--

Notes:

Bold indicates HQs > 1.

-- = HQ not estimated because TRVs are unavailable.

5.6.2.3.2 Baseline Risk Summary for Birds Using Area-Weighted EPCs

To summarize, based on the risks characterized for populations of birds exposed to COPECs in soil in the Tamarisk Thicket potential exposure area using selected TRVs⁷, area-weighted EPCs, and a site-specific SUF, the risk conclusions are as follows:

- For Gambel's quail (granivorous bird), the NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, indicating no unacceptable risk to individual and populations of granivorous birds. Potential risk is *de minimis* from all COPECs at the Tamarisk Thicket potential exposure area for these granivorous birds and no further evaluation is necessary.
- For the cactus wren (insectivorous birds), COPECs indicative of uncertain risks to individual potential receptors (i.e., where the NOAEL-based HQs are greater than 1 but LOAEL-based HQs are less than 1) included dioxin TEQ. For this COPEC, unacceptable risk to individual potential receptors is considered unlikely based on supporting LOE, including the low magnitude of the HQ (which would likely reduce to less than 1 if adjusted for the compounding uncertainties associated with conservative assumptions for

⁷ Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

APPENDIX TT

SOIL HHRA FOR TAMARISK THICKET EXPOSURE AREA

this COPEC (see Section 6.7.6 of the main report), limited spatial extent of elevated concentrations, and resident T&E species). A single observation of the federally listed southwestern willow flycatcher was made in the Tamarisk Thicket potential exposure area in 2009 (CH2M 2014); however, this species is not expected to nest or reside in the Tamarisk Thicket potential exposure area (see Section 5.1.1). For the remaining COPECs, the NOAEL- and LOAEL-based HQs are less than 1, indicating no unacceptable risk to individual potential receptors and populations of insectivorous birds.

Potential Risk Drivers for Birds in the Tamarisk Thicket Exposure Area

No risk-driving COPECs for birds were identified at the Tamarisk Thicket potential exposure area as no potential for unacceptable population-level risk (i.e., LOAEL-based HQs greater than 1 [or greater than 10 for dioxin TEQ]) was predicted based on HQs calculated using the most refined exposure and effects assumptions (i.e., site-specific SUF, area-weighted EPCs, and selected TRVs) and supporting WOE.

COPECs with NOAEL-based HQs greater than 1 using the most refined exposure and effects assumptions were identified for Tamarisk Thicket potential exposure area (dioxin TEQ). However, the additional LOEs support the conclusion that unacceptable risk to individual potential receptors from exposure to this COPEC is unlikely.

6 SUMMARY AND CONCLUSIONS FOR THE ERA

Potential cumulative cancer risks and noncancer hazards for potential human receptors were not estimated for the Tamarisk Thicket potential exposure area, as this area is evaluated as part of the NORR potential exposure area (Appendix NORR). For potential ecological receptors, potential risks were estimated as presented above in Section 5. Uncertainties related to the ERAs at the site are discussed in detail in Section 6.7 of the main report, and uncertainties specific to the Tamarisk Thicket potential exposure area are discussed in this appendix. For the Tamarisk Thicket potential exposure area, an ERA was conducted per the RAWP documents (Arcadis 2008, 2009, 2015). One scenario (baseline, i.e., no scouring) was evaluated, and risks were estimated for various potential receptors using depth-weighted and area-weighted EPCs.

At the Tamarisk Thicket potential exposure area, the COPECs identified for the ERA include six metals, PCBs, TPHs, and dioxins/furans. A summary of these results and conclusions regarding potential risk associated with exposure to these COPECs in soil at the Tamarisk Thicket potential exposure area based on the risk/hazard estimates and uncertainties inherent in the risk assessment process are presented in this section.

The conclusions reached after completing the ERA for the Tamarisk Thicket potential exposure area are presented below.

In the Tamarisk Thicket potential exposure area, six metals (hexavalent chromium, total chromium, copper, lead, manganese, and zinc), PCBs, dioxins TEQ (for wildlife), 2,3,7,8-TCDD (for ecological communities only), and TPHs were identified as COPECs. Potential risk to plants and soil invertebrates and small home-range wildlife receptors was estimated. Risks could not be estimated for potential receptors lacking available screening values and/or TRVs for COPECs; such cases are discussed in the uncertainty analysis of the main report. These COPECs are unlikely to be risk drivers and are assumed to have minimal impact to the conclusions of the ERA.

Risks were estimated using depth-weighted and area-weighted EPCs. Risk conclusions were based on the following criteria:

- COPECs with HQs less than or equal to 1 pose *de minimis* risk to ecological communities (plants and invertebrates).
- COPECs with HQs greater than 1 could indicate potential risk to ecological communities. A WOE approach was used to characterize potential risk to plants and invertebrates.
- COPECs with NOAEL-based HQs less than or equal to 1 pose *de minimis* risk to potential wildlife receptors.
- COPECs with NOAEL-based HQs greater than 1 but LOAEL-based HQs less than or equal to 1 pose no unacceptable risk to wildlife populations; however, potential for unacceptable risk to individuals is uncertain based on the HQ. A WOE approach was used to characterize potential risk to individual potential receptors.
- COPECs with LOAEL-based HQs greater than 1 pose possible unacceptable risk to populations of potential wildlife receptors.

The risk estimates i.e., (HQs) represent a single LOE in the risk characterization. A qualitative WOE approach, incorporating other LOEs and uncertainties (including an alternate target HQ of 10 for dioxin TEQ)⁸, was used to characterize risk to wildlife populations in the Tamarisk Thicket potential; exposure area. HQs for COPECs for the baseline scenario calculated using depth-weighted EPCs, selected screening levels/selected TRVs, and site-specific SUFs are summarized in Table TT-6.1. The HQs/LOAEL-based HQs based on depth-weighted EPCs were greater than 1 for the following COPECs:

- Plant communities – manganese
- Soil invertebrate communities – none
- Small mammals – none for granivorous small mammals; dioxin TEQ for invertivorous small mammals
- Birds – none for granivorous bird; dioxin TEQ for insectivorous birds.

HQs were also calculated for all the COPECs using area-weighted EPCs, selected screening levels/selected TRVs, and site-specific SUFs and presented in Table TT-6.1. For COPECs with HQs/LOAEL-based HQs greater than 1 using the most refined exposure and effects assumptions (i.e., area-weighted EPCs, selected screening levels/TRVs, and site-specific SUFs), a WOE assessment was used to draw risk conclusions and identify potential risk drivers for the Tamarisk Thicket potential exposure area. The various LOE considered in the WOE assessment and risk conclusions are presented in Table TT-6.2.

Based on the ecological risk characterization for the Tamarisk Thicket potential exposure area, using area-weighted EPCs, selected screening levels/TRVs, and site-specific SUFs, the following conclusions were made, as described in the subsections below.

6.1.1 Plant Communities

Overall, no unacceptable risk was identified for plants, including special-status species. Conclusions are as follows:

- No federal- or state-listed T&E plants or candidates for listing were found at the site, including the Tamarisk Thicket potential exposure area.
- Potential risks to plants are *de minimis* from exposure to all the COPECs, same as the depth-weighted evaluation (i.e., HQs are less than 1) except for manganese.
- The HQ for manganese did not change from the depth-weighted evaluation and is still greater than 1. Unacceptable risk to plant communities from exposure to manganese is unlikely based on the following LOE: (1) low FOD; (2) EPCs based on the maximum depth-weighted EPCs; for areas where a constituent is largely not detected, use of a maximum concentration as the EPC may not appropriately characterize

⁸ For dioxin TEQ, the selected BAFs and TRVs result in significant overestimation of risk for key wildlife receptors, primarily for invertivorous small mammals and insectivorous birds. Due to the compounded conservatism in the risk estimates for dioxin TEQ, HQs greater than 10 were considered to pose unacceptable risk. Alternate congener-specific BAFs and alternate TRVs demonstrating the magnitude of the risk overestimation are presented in Sections 6.4.3 and 6.5.2 of the main report, respectively. These alternate BAFs and TRVs are based on current understanding of uptake and toxicity of TEQ mixtures and represent an additional LOE considered for dioxin TEQ. As a result, a target LOAEL-based HQ of 10 for dioxin TEQ was used. Uncertainty in the risk estimates for dioxin TEQ is discussed in detail in Section 6.7.6.

HQs; and (3) low confidence in the screening value to predict toxicity to plants (plant screening value less than the BTV).

- Vegetation communities observed at the site during the floristic surveys conducted in 2013 (GANDA and CH2M 2013) and in 2017 (CH2M 2017) is typical of Mojave Desert plant communities (summarized in Section 2.4.2). Over a hundred different vascular plant species have been observed within the survey area that includes Tamarisk Thicket potential exposure area; documented as Segment D in these survey reports (GANDA and CH2M 2013, CH2M 2017). The floristic surveys report a diverse assemblage of plants species found in typical abundance, density, cover, and vigor of plant communities in undisturbed desert habitat. These observations are not consistent with impairment of the plant community at the site. The floristic surveys provide site-specific observations that support the health of plant communities at the site and is considered a stronger LOE than the exceedances of low-confidence generic plant screening values, which are widely acknowledged to have low ability to predict toxicity in plants.

6.1.2 Soil Invertebrate Communities

Overall, no unacceptable risk to soil invertebrates is expected. Conclusions are as follows:

- Potential risks to soil invertebrates are *de minimis* from all the COPECs, same as the depth-weighted evaluation (i.e., HQs are less than 1).

6.1.3 Small Mammals

Overall, no unacceptable risk to populations of small mammals (granivorous and invertivorous) exposed to COPECs in soil is expected. Conclusions are as follows:

- Several species of mammals have been observed at or near the site (Tables 2-2 and 2-4 of the main report); however, T&E species with small home ranges were not observed in the Tamarisk Thicket exposure area. Based on the qualitative evaluation of special-status species and the results of the ERA, potential exposures to COPECs in soil at the Tamarisk Thicket potential exposure area are not expected to pose unacceptable risk to special-status species.
- For Merriam's kangaroo rat (granivorous small mammal):
 - NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, same as the depth-weighted evaluation, indicating *de minimis* risk to individual and populations of granivorous small mammals.
- For the desert shrew (invertivorous small mammals):
 - NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, same as the depth-weighted evaluation, indicating *de minimis* risk to individual and populations of invertivorous small mammals, except for dioxin TEQ.
 - The NOAEL- and LOAEL-based HQs were reduced from the depth-weighted evaluation but are still greater than 1. Unacceptable risk to invertivorous small mammals from exposure to dioxin TEQ is unlikely based on the following LOE:
 - (1) low magnitude of the HQs (LOAEL-based HQ is less than 10 and likely reduced to 1 or less if adjusted for compounding uncertainties associated with the conservative assumptions; see Section 6.7.6 of the main report); these include diet (dietary composition assumes 100% of a

single-item diet; see Section 6.7.3 of the main report), uptake into dietary items (bioaccumulation based on a single congener likely overestimates HQs by 10 times; see Section 6.7.4 of the main report), and conservative TRVs (based on lowest available TRVs; see Section 6.7.5 of the main report);

- (2) spatial extent of elevated concentrations were limited to seven locations: AOC1-BCW6 (64 ng/kg), AOC1-BCW10 (110 ng/kg), AOC1-BCW25 (58 ng/kg), AOC1-BCW26 (100 ng/kg), AOC1-BCW28 (180 ng/kg), AOC1-BCW29 (84 ng/kg), and AOC1-BCW29 (140 ng/kg); and
- (3) T&E species with small home ranges have not been observed in this area.

6.1.4 Birds

Overall, no unacceptable risk to bird populations (granivorous and insectivorous) exposed to COPECs in soil is expected. Conclusions are as follows:

- Several species of birds have been observed at or near the site (Tables 2-2 and 2-4 of the main report). A single observation of the federally listed southwestern willow flycatcher was made in the Tamarisk Thicket potential exposure area in 2009 (CH2M 2014, GANDA 2017); however, this species was considered transient and is not expected to nest or reside in this area (GANDA 2017). Therefore, protection at the individual level (i.e., NOAEL-based HQ less than or equal to 1) is not warranted.
- For Gambel's quail (granivorous bird), the NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, same as in the depth-weighted evaluation, indicating *de minimis* risk to individuals and populations of granivorous birds in the Tamarisk Thicket potential exposure area.
- For the cactus wren (insectivorous bird):
 - LOAEL-based HQs are less than 1 for all COPECs, same as the depth-weighted evaluation, indicating *de minimis* risk to populations of insectivorous birds.
 - COPECs with HQs indicative of uncertain risks to individual receptors included dioxin TEQ. The NOAEL- based HQ was reduced from the depth-weighted evaluation but is still greater than 1. Unacceptable risk to individual receptors is considered unlikely based on the following LOE: (1) low HQ; (2) conservative assumptions used to estimate risks (BAF and TRVs; see Section 6.7.6 of the main report); and (3) small home-range T&E wildlife are not resident in the Tamarisk Thicket potential exposure area.

6.1.5 Potential Risk Drivers for the Tamarisk Thicket Exposure Area

As presented in Table TT-6.1 and summarized in the table below, no risk drivers were identified for the Tamarisk Thicket potential exposure area based on unacceptable community/population-level risk (i.e., HQ greater than 1 for plants and soil invertebrates and LOAEL-based HQs greater than 1 for mammals and birds [or LOAEL-based HQs greater than 10 for dioxin TEQ]) predicted using HQs calculated from the most refined exposure and effects assumptions (i.e., site-specific SUF, area-weighted EPCs, and selected TRVs) and additional LOE supporting the conclusion of unacceptable risk.

Table TT-2.1c

Chemicals Included in the Risk Assessment: Tamarisk Thicket Subsurface I Soil (0 to 6 feet bgs) for Baseline Scenario

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

Notes:

- ^a Applicable to ecological risk assessment (ERA).
- ^b Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the ERA. Ecological toxicity values are available for manganese, thus this chemical is evaluated in the ERA, if above background levels.
- ^c Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.
- ^d Dioxins are evaluated in toxic equivalents.

Abbreviations:

mg/kg = milligrams per kilogram.

ng/kg = nanograms per kilogram.

ug/kg = micrograms per kilogram.

COPEC = Constituent of Potential Ecological Concern.

ND = Not detected.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Notes:

^a The constituent consists of analytes detected at least once at the Topock Compressor Station site and measured in soil in this exposure area.

^b If fewer than eight total locations and four total detected concentrations, the maximum depth-weighted concentration was selected as the EPC. Otherwise, the UCL was selected as the EPC.

^c EPCs and summary statistics were not calculated for some constituents (i.e., dioxin congeners and essential nutrients). Those data, if available, are presented in Attachment A1 of each exposure area-specific appendix.

Abbreviations:

"--" = not applicable

B(a)P equivalent = benzo(a)pyrene equivalent

BCA = Bias-corrected accelerated bootstrap method

COPEC = constituent of potential ecological concern

DDE = Dichlorodiphenyldichloroethylene

DDT = Dichlorodiphenyltrichloroethane

EPC = exposure point concentration

FOD = frequency of detection

ft bgs = feet below ground surface

KM = Kaplan-Meier

µg/kg = micrograms per kilogram

mg/kg = milligrams per kilogram

NA = not applicable

ND = not detected

ng/kg = nanograms per kilogram

PAH = polycyclic aromatic hydrocarbons

PCB = polychlorinated biphenyls

PG&E = Pacific Gas and Electric Company

TCDD = Tetrachlorodibenzo-p-dioxin

TEQ = toxic equivalent

TPH = total petroleum hydrocarbons

UCL = upper confidence limit

X = COPEC in the exposure depth interval

Table TT-5.1

Summary of COPECs Evaluated in the ERA for Tamarisk Thicket

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

COPEC ^a	Baseline (0-6 ft bgs)
Inorganics	
Chromium, hexavalent	X
Chromium, total	X
Copper	X
Lead	X
Manganese	X
Zinc	X
Polychlorinated Biphenyls	
Total PCBs	X

2,3,7,8-TCDD	X
Total Petroleum Hydrocarbons	
TPH as diesel	X
TPH as motor oil	X

Note:

^a COPECs selected over the entire soil depth interval (0-6 ft bgs) potentially contacted by ecological receptors. COPECs based on background screening for metals, polycyclic aromatic hydrocarbons, and dioxins. All detected organic compounds were selected as COPECs. See Section 2 of Appendix TT for details.

Abbreviations:

COPEC = constituent of potential ecological concern

ERA = ecological risk assessment

ft bgs = feet below ground surface

PCB = polychlorinated biphenyl

TPH = total petroleum hydrocarbon

X = COPEC in that exposure depth interval

Table TT-5.2
Soil Exposure Point Concentration Matrix for Terrestrial Ecological Receptors

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

Ecological Receptor	Exposure Depth Intervals for Calculation of EPCs				
	Soil EPCs ^a		Biota Tissue EPCs		
	0-0.5 ft bgs	Maximum EPC (0-0.5, 0-3, 0-6 ft bgs)	Plants - Maximum EPC (0-0.5, 0-3, 0-6 ft bgs)	Insects (0-0.5 ft bgs)	Insectivorous Mammals (0-0.5 ft bgs)
Terrestrial Receptors					
Plants		X			
Invertebrates	X

Notes:
^a WOE Result is risk conclusion based on 1.) HQ/LOAEL HQ using area-weighted EPCs, and 2.) supporting LOE

	NOAEL HQ greater than 1
	LOAEL HQ greater than 1
	LOAEL HQ greater than 10
	LOAEL HQ greater than 100

Abbreviations:
-- = no toxicity value available, HQs could not be estimated
AOC = area of concern
HQ = hazard quotient
LOE = line of evidence
LOAEL = lowest observed adverse effect level
ND = not detected
NOAEL = no-observed adverse effect level
no SL = no screening level available
TEQ = toxic equivalent
WOE = weight of evidence, considering multiple LOE. If HQs/LOAEL HQs > 1, WOE Result is either 1) not expected, 2) unlikely, or 3) possible.

Table TT-6.2
Risk Conclusions and Lines of Evidence Summary for Tamarisk Thicket

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

	Cactus Wren	TEQ Avian	--	3E+00	3E-01	No	17 / 21	2	3E-02	3E-03	High	Moderate	High	No	Unlikely	Not expected	No

Notes:
a COPECs are presented for HQs greater than 1 based on the depth-weighted EPC and/or area-weighted EPC and species and site-specific SUF.
b The EPC is based on the maximum depth-weighted concentration due to the small dataset size.
c The additional lines of evidence for COPECs with NOAEL and LOAEL HQs less than or equal to 1 (based on the area-weighted EPC and species and site-specific SUF) are not included in the table.
d For plants and soil invertebrates, the background HQ is based on the BTV. For mammals and birds, the NOAEL and LOAEL background HQs are based on the 95 percent upper confidence limit.
e Applicable to wildlife, unless noted.
f In areas where observations were noted, the T&E species observed have large home ranges and unlikely to forage in upland habitat. See text for details.
g For dioxin TEQ, LOAEL HQs less than 10 with supporting LOE were considered unlikely to pose an unacceptable risk to populations of wildlife receptors due to the compounded conservative assumptions included in the ecological risk assessment. See Section 6.7.6 of the main report.

--	LOAEL and NOAEL HQs ≤ 1 for the receptor
	NOAEL HQ greater than 1
	HQ/LOAEL HQ greater than 1
	HQ/LOAEL HQ greater than 10
	HQ/LOAEL HQ greater than 100

Abbreviations:
"--" = not applicable
AOC = area of concern
BAF = bioaccumulation factor
BCW = Bat Cave Wash
BG NA = background value not available
BTV = background threshold value
COPEC = constituent of potential ecological concern
EPC = exposure point concentration
FOD = frequency of detection
HQ = hazard quotient
LOAEL = lowest observed adverse effect limit
LOE = line of evidence
MDC = maximum depth-weighted concentration
NC = not calculated
NE = line of evidence not evaluated
NOAEL = no observed adverse effect limit
SL = screening level
SWMU 1 = solid waste management unit 1
T&E = threatened and endangered
TCS-4= Topock Compressor Station Well #4
TEQ = toxic equivalent

Dioxins (presented in ng/kg)						
2,3,7,8-TCDD	5.17E-01	--	No SL	5.00E-01	8800	6E-05

Notes:

	HQ greater than 1
	HQ greater than 10
	HQ greater than 100

Abbreviations:

AOC = area of concern
COPEC = constituent of potential ecological concern
EPC = exposure point concentration
HQ = hazard quotient
mg/kg = milligrams per kilogram
ng/kg = nanograms per kilogram
no SL = no screening level available
PCB = polychlorinated biphenyl

Dioxins (presented in ng/kg)						
2,3,7,8-TCDD	5.17E-01	--	No SL	5.00E-01	8800	6E-05

Notes:

	HQ greater than or equal to 1
	HQ greater than or equal to 10
	HQ greater than or equal to 100

Abbreviations:

AOC = area of concern
COPEC = constituent of potential ecological concern
EPC = exposure point concentration
HQ = hazard quotient
mg/kg = milligrams per kilogram
ng/kg = nanograms per kilogram
no SL = no screening level available
PCB = polychlorinated biphenyl

Table TT-B Table Notes

Notes for Terrestrial Wildlife Risk Calculations

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

Notes:

^a Dioxin presented in ng/kg.

^b Total dose equation is presented below:

$$\text{Total Dose (mg/kg-day)} = [(EPC_{\text{soil}} \times SIR) + (C_{\text{plants}} \times FIR \times F_{\text{plants}}) + (C_{\text{insects}} \times FIR \times F_{\text{insects}}) + (C_{\text{mammals}} \times FIR \times F_{\text{mammals}})] \times \text{SUF}$$

^c HQ = Total Dose / TRV

Abbreviations:

AOC = area of concern

BTAG = Biological Technical Assistance Group

COPEC = constituent of potential ecological concern

dw = dry weight

EPC_{soil} = exposure point concentration in soil (mg/kg dw)

EPC_{plants} = exposure point concentration in plants (mg/kg dw)

EPC_{insects} = exposure point concentration in insects (mg/kg dw)

EPC_{mammals} = exposure point concentration in mammals (mg/kg dw)

F_{plants} = fraction of plants in diet

F_{insects} = fraction of insects in diet

F_{mammals} = fraction of mammals in diet

FIR = food ingestion rate (kg dw/kg bw-day)

HQ = hazard quotient (unitless)

kg = kilogram

kg dw/kg bw-day = kilograms per kilogram of body weight per day

LOAEL = lowest observed adverse effect level (mg/kg-day)

m = maximum detected concentration

mg/kg = milligrams per kilogram

mg/kg-day = milligrams per kilogram per day

ND = not detected

ng/kg = nanograms per kilogram

NOAEL = no observed adverse effect level (mg/kg-day)

PCB = polychlorinated biphenyl

SIR = soil ingestion rate (kg dw/kg bw-day)

SUF = site use factor (fraction)

TRV = toxicity reference value (mg/kg-day)

Notes:

a. Calculated using selected soil EPC and uptake model. See Section 6 of the main report.

b. Biota EPCs presented as 0.0 indicate no bioaccumulation from soil.

Bold indicates EPC selected to estimate plant uptake from soil (maximum of surface, shallow, and subsurface I soil).**Abbreviations:**

-- = soil EPC or uptake model not available, biota EPCs could not be estimated

AOC = area of concern

COPEC = constituent of potential ecological concern

EPC = exposure point concentration

ft bgs = feet below ground surface

m = maximum depth-weighted concentration

mg/kg = milligrams per kilogram

nd = not detected in this depth interval

ng/kg = nanograms per kilogram

PCB = polychlorinated biphenyl

Notes:

	NOAEL HQ greater than 1
	HQ or LOAEL HQ greater than 1
	HQ or LOAEL HQ greater than 10
	HQ or LOAEL HQ greater than 100

Abbreviations:

-- = no toxicity value available, HQs could not be estimated
AOC = area of concern
BTAG = Biological Technical Assistance Group
COPEC = constituent of potential ecological concern
HQ = hazard quotient
LOAEL = lowest observed adverse effect level
NOAEL = no-observed adverse effect level
PCB = polychlorinated biphenyl
SUF = site use factor
TRV = toxicity reference value

1 INTRODUCTION

This appendix presents the human health and ecological risk assessment (HHERA) for soil at the North of the Railroad (NORR) potential exposure area located outside the Topock Compressor Station (TCS) in Needles, California. The NORR human health risk assessment (HHRA) evaluates potential exposures to soil under a hypothetical future residential land use scenario, as directed by the Department of Toxic Substances Control (DTSC) and U.S. Department of Interior (DOI) (DOI/DTSC 2014), even though future unrestricted use is unlikely (DOI 2014). An ecological risk assessment (ERA) was not conducted for the NORR potential exposure area, because the U.S. Bureau of Land Management (USBLM) and Fort Mojave Indian Tribe (FMIT) property boundaries are not recognized by ecological receptors. The NORR potential exposure area is defined by the USBLM land within Bat Cave Wash (BCW) and north of the Burlington Northern Santa Fe (BNSF) railroad, excluding FMIT land. Therefore, the ERA conducted for the BCW potential exposure area also applies to the NORR potential exposure area and is not repeated here.

The NORR potential exposure area, shown on Figure NORR-1.1, is approximately 6.6 acres in total and includes sample locations shown in Table NORR-1.1 of this appendix and on Figure 3-1a of the Soil HHERA Report for the TCS (the “main report”). Available soil data from NORR were used to conduct a quantitative forward HHRA as presented herein. A summary of the HHRA results are presented in Section 5 of the main report.

The NORR potential exposure area is within BCW. Descriptions of the physical location and characteristics of the BCW potential exposure area and detailed discussions of the historical uses and sampling and analysis are provided in the main report and final Human Health and Ecological Risk Assessment Work Plan (RAWP) documents (Arcadis U.S., Inc. [Arcadis] 2008, 2009, 2015) and are not repeated in this appendix.

This appendix summarizes site use, data evaluation, potential receptors, potential exposure pathways, and the methodologies and results of the HHRA risk characterization for soil in the NORR potential exposure area. Tables and figures specific to the HHRA for the NORR potential exposure area are also presented in this appendix.

1.1 Summary of Site Use

The NORR potential exposure area is located outside the facility fenceline west of the TCS within BCW, as shown in Figure NORR-1.1. NORR comprises a portion of BCW north of the BNSF railroad and extends to the north toward the Colorado River. The background and summary of site use for the BCW are presented in the BCW HHRA (Appendix BCW) and are not repeated herein.

2 DATA EVALUATION AND COPC SELECTION

This section summarizes the data considered for the NORR HHRA and presents the constituents of potential concern (COPCs) for human health selected for evaluation in the NORR potential exposure area.

All soil sampling locations at the NORR potential exposure area are presented on Figure NORR-1.1 and in Table NORR-1.1. The data were evaluated based on methodology described in the RAWP documents (Arcadis 2008, 2009, 2015). Details of the soil sampling and data quality evaluation will be presented in the forthcoming Resource Conservation and Recovery Act (RCRA) Facility Investigation/ Remedial Investigation (RFI/RI) Report Volume 3 (currently being prepared by Jacobs). The NORR HHRA evaluated all constituents detected in the soil as presented in the soil investigation data packages provided to DOI (Pacific Gas & Electric Company [PG&E] 2018). For the baseline scenario, only soil data from 0 to 10 feet below ground surface (ft bgs) were included in the HHRA. Because potential soil contact does not extend below 10 ft bgs, deeper soil data (i.e., depths greater than 10 ft bgs) were excluded from the risk evaluation, as noted in Table NORR-1.1.

Following the steps outlined in Section 3 of the main report, soil data considered usable for the risk assessment were identified and used in the quantitative HHRA. All available soil data for the NORR potential exposure area are presented in Attachment NORR-A1. Soil data for the NORR potential exposure area includes soil samples collected from BCW north of the BNSF railroad property including the Tamarisk Thicket but excluding FMIT land (Figure NORR-1.1). In addition to the soil data from BCW, samples classified as soil transitioning to sediment from two locations (Area of Concern [AOC] 1-BCW6 and SS-1) were included as part of the soil evaluation for the NORR potential exposure area.

For the NORR potential exposure area, soil data are available from 142 soil samples, of which soil data from 139 samples from 0 to 10 ft bgs and considered for use in the HHRA. Because potential soil contact does not extend below 10 ft bgs, deeper soil data (i.e., greater than 10 ft bgs) from three soil samples were excluded from the HHRA as noted in Table NORR-1.1.

Within the soil dataset used in this HHRA, some polycyclic aromatic hydrocarbon (PAH) analytical data did not meet data quality criteria; therefore, nondetect results were qualified as rejected with an “R” data qualifier, (will be discussed in the forthcoming Draft RFI/RI Report Volume 3, currently being prepared by Jacobs). This occurred for all PAHs in two samples (NORR-BCW24-245 and NORR-BCW26-253) and a subset of PAHs in two additional samples (NORR-BCW24-244 and NORR-BCW26-252). These “R” qualified PAH data were not included in the HHRA.

Data processed for the HHRA (e.g., calculation of total concentrations for benzo(a)pyrene equivalent, polychlorinated biphenyls [PCBs], and dioxin/furan toxicity equivalents [TEQs]) are described in detail in Section 3 of the main report.

The process for identifying COPCs included in the HHRA is detailed in Section 3.4 of the main report. COPCs selected for the BCW potential exposure area (Appendix BCW) were selected as COPCs for the NORR potential exposure area because the NORR potential exposure area is encompassed by, and is a component of, the BCW potential exposure area. COPCs for the BCW potential exposure area were selected in accordance with the RAWP (Arcadis 2008), as described in Section 3.4 of the main report. COPCs selected

APPENDIX NORR
SOIL HHRA FOR NORTH OF RAILROAD EXPOSURE AREA

for the NORR HHRA are summarized in Tables NORR-2.1a through NORR-2.1d for the four soil exposure depths included in the baseline evaluation and discussed further in Section 4.2.

3 EXPOSURE POINT CONCENTRATIONS

Depth-weighted and area-weighted exposure point concentrations (EPCs) for COPCs in soil at the NORR potential exposure area were calculated as described in Section 4.2 of the main report. For this potential exposure area, one scenario was evaluated: 1) Baseline (no scouring).

For the HHRA baseline scenario, the following potential exposure depths were evaluated:

1. Surface soil (0 to 0.5 ft bgs)
2. Shallow soil (0 to 3 ft bgs)
3. Subsurface I soil (0 to 6 ft bgs)
4. Subsurface II soil (0 to 10 ft bgs).

The depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment NORR-A2. The summary statistics for these NORR potential exposure area soil depth-weighted datasets and depth-weighted EPCs were calculated consistent with the RAWP documents (Arcadis 2008, 2009, 2015). Per the RAWP, area-weighted EPCs for the HHRA are evaluated only if depth-weighted EPCs suggest that cumulative cancer risks and/or noncancer hazards may be significant for any given HHRA exposure scenario (cumulative cancer risks exceed a 10^{-6} cancer risk level, and/or the noncancer hazard index [HI] exceeds 1). For the NORR potential exposure area, area-weighted EPCs were deemed necessary for the HHRA and, therefore, were calculated. The area-weighted data used in the calculation of area-weighted EPCs are presented in Attachment NORR-A3.

Soil summary statistics for constituents measured at the NORR potential exposure area¹ and depth- and area-weighted EPCs for COPCs calculated using depth-weighted data from the exposure depths listed above for the HHRA baseline scenario are presented in Table NORR-3.1. . If the soil dataset had fewer than four detected values (i.e., concentrations reported above the detection limit) or fewer than eight total observations, the EPC defaulted to the maximum depth-weighted concentration in that dataset. Table NORR -3.1 also presents the basis of the calculated depth- and area-weighted EPCs, including if the EPC is based on the maximum detected concentration.

¹ The list of constituents shown in the Section 3 tables is based on analytes that were detected at least once at the site (including all exposure areas inside or outside the TCS).

4 HUMAN HEALTH RISK ASSESSMENT

This section briefly summarizes the HHRA approach, presents the COPCs, EPCs, risk/hazard summary tables, results of the risk characterization, and uncertainties in the risk assessment for the NORR potential exposure area. Details of the overall HHRA approach are presented in Section 5 of the main report. HHRA methodologies specific to the evaluation of the hypothetical future resident exposed to COPCs through ingestion of homegrown produce/animal products are detailed in Attachment NORR-C of this appendix. Dose, exposure concentration, risk, and hazard calculation tables for potential human health receptors at the NORR potential exposure area are presented in Attachments NORR-B1 and NORR-B2 for depth- and area-weighted EPCs, respectively.

Note that risks/hazards presented for the hypothetical future resident living in the NORR potential exposure area are presented at the request of DOI, for informational purposes, and are not based on current or likely potential future site use. It is highly unlikely that the site will be used for residential purposes. As stated in the DOI (2015) Land Use Memo, "DOI will not utilize a future residential scenario on Federal lands within the project area when evaluating cleanup options in the Feasibility Study phase." All future residential assumptions, including the assumptions that the resident is a rural resident, meaning a potential receptor who obtains a significant portion of his/her diet from onsite produced food including vegetables, fruits, and poultry, are unrealistic and presented at the request of DOI. Therefore, as requested, although future residential land use is a highly unlikely scenario, a future hypothetical residential land-use scenario is evaluated for USBLM property.

4.1 Human Health Conceptual Site Model

Following the steps outlined in Section 5.5 of the main report, risks were estimated for potentially complete and significant exposure pathways identified in the human health conceptual site model (CSM) for receptors potentially exposed to COPCs in soil present at the NORR potential exposure area. These included:

- **Hypothetical Future Resident** – Incidental ingestion of soil, dermal contact with soil, inhalation of particulates and volatile organic compound (VOC) vapors in ambient outdoor air from soil.
- **Hypothetical Future Resident Consumer of Home-Produced Food** – Secondary exposure to soil by ingestion of onsite home-produced food including plants and poultry (meat and eggs).

Exposure pathways considered incomplete or insignificant were not quantitatively evaluated and are discussed in Section 5.3.1 of the main report.

4.2 Constituents of Potential Concern

The process for identifying COPCs included in the HHRA is detailed in Section 3.4 of the main report and Section 2 of this appendix. COPCs for the four exposure depths and one scenario (baseline) evaluated for the NORR HHRA are summarized in Tables NORR-4.1 (details are presented in Tables NORR-2.1a through NORR-2.1d).

COPCs included metals (hexavalent chromium, total chromium, cobalt, copper, lead, and zinc), inorganics (orthophosphate), PAHs, PCBs, dioxin TEQ, TPH as diesel, and TPH as motor oil in surface, shallow, subsurface I, and/or subsurface II soil.

4.3 Exposure Point Concentration Summary

For the potentially complete and significant exposure pathways identified in the CSM, EPCs were calculated as described in Section 4.2 of the main report and presented in Section 3 of this appendix. Depth-weighted data used in the calculation of depth- and area-weighted EPCs are presented in Attachment NORR-A. Depth-weighted EPCs for COPCs in soil and estimated outdoor air concentrations associated with dust and vapors and used to estimate risk in the HHRA are summarized in Tables NORR-4.2a through NORR-4.2d for the four exposure depths evaluated.

Area-weighted EPCs for COPCs in soil and estimated outdoor air concentrations associated with dust and vapors and used to estimate risk in the HHRA are summarized in Tables NORR-4.5a through NORR-4.5d for the four exposure depths evaluated.

As described in detail in Section 5.3.3 of the main report, the following exposure depths and corresponding EPC datasets were used to evaluate potential exposure to COPCs in soil for potential human receptors:

- **Hypothetical Future Resident** – Surface, shallow, subsurface I, and subsurface II soil for incidental ingestion of soil, dermal contact with soil, and inhalation of particulates and VOC vapors in ambient outdoor air from soil.
- **Hypothetical Future Resident Consumer of Home-Produced Food** – Surface and shallow soil for secondary exposure to soil by ingestion of onsite home-produced food including plants and poultry (meat and eggs).

4.4 Estimation of Dose

The exposure concentration (EC) and chronic daily intake (CDI) for carcinogenic and noncarcinogenic effects were calculated, as described in Section 5.5.1 of the main report, for COPCs in soil for potentially complete exposure pathways other than for exposure to home-produced food. Dose for carcinogenic and noncarcinogenic effects for COPCs in home-produced food were calculated as described in Attachment NORR-C of this Appendix. The calculated EC, CDI, and dose from exposure COPCs in soil and home-produced food calculated using depth-weighted EPCs are presented Tables NORR-B1.1a through NORR-B1.1d (carcinogenic effects) and Tables NORR-B1.2a through NORR-B1.2g (noncarcinogenic effects) for the for hypothetical future residential receptor. The calculated EC, CDI, and dose from potential exposure to COPCs in soil and home-produced food using area-weighted EPCs are presented in Tables NORR-B2.1a through NORR-B2.1d (carcinogenic effects) and Tables NORR-B2.2a through NORR-B2.2g (noncarcinogenic effects) for hypothetical future residential receptor. Exposure parameters used in the EC and CDI calculations are presented in Table 5-1 of the main report. Exposure parameters specific to the dose from home-produced food calculations are presented in Attachment C.

4.5 Toxicity Assessment

The toxicity assessment characterizes the relationship between the magnitude of exposure to a constituent and the potential for adverse health effects. More specifically, the toxicity assessment identifies agency-promulgated or derived toxicity values that can be used to estimate the likelihood of adverse health effects occurring in humans at different exposure levels. The approach for the toxicity assessment was provided in Section 4.5 of the RAWP (Arcadis 2008) and in Section 4.2 of the RAWP Addendum 2 (Arcadis 2015). Consistent with regulatory risk assessment policy, adverse health effects resulting from potential chemical exposures are evaluated in two categories: carcinogenic effects and noncarcinogenic effects. The hierarchy of sources for the toxicity criteria to be used for the HHRA generally corresponds to the DTSC guidance (2015). Toxicity values for carcinogenic and noncarcinogenic effects for COPCs selected and used for the HHRA are described in Section 5.4 of the main report and were used to estimate potential cancer risks and noncancer hazards.

4.6 Human Health Risk Characterization

For potential human receptors potentially exposed to soil present in the NORR potential exposure area, the estimated incremental lifetime cancer risks (ILCRs) and/or noncancer hazard quotients (HQs) were calculated for each COPC and potentially complete exposure pathway. Cumulative ILCRs (i.e., sum of chemical-specific ILCRs for each exposure depth for a scenario) were calculated and compared to the DTSC point of departure for risk management decision of 1×10^{-6} . Note that risk management decisions may raise this criterion depending on site-specific conditions. As indicated in the National Oil and Hazardous Substances Pollution Contingency Plan (40 Code of Federal Regulations 300), cancer risks between one in a million and one hundred in a million probability of occurrence (1×10^{-6} and 1×10^{-4}) fall within a risk management range. This is generally referred to as the acceptable risk range. Within this estimated cancer risk range, there is flexibility for risk managers in deciding what action, if any, is necessary and appropriate for the protection of human health. Cumulative noncancer hazards (i.e., HIs) are calculated and compared to an HI of 1 (DTSC 2015). Chemical exposures that yield HIs of less than or equal to 1 are not expected to result in adverse noncancer health effects (U.S. Environmental Protection Agency [USEPA] 1989).

4.6.1 Risk Characterization for Exposure to Soil (Baseline Scenario and Depth-Weighted EPCs)

Table NORR-4.4 summarizes cumulative ILCRs and HIs estimated for potential exposure to soil and consumption of home-produced food for the hypothetical future resident at the NORR potential exposure area in the baseline scenario, calculated using depth-weighted EPCs. For potential exposures to soil, the dose, exposure concentration, ILCR, and HI equations are presented in detail in Section 5.5.1 of the main report. For potential exposure to COPCs through consumption of home-produced food, the dose, food concentration, ILCR, and HI equations are presented in detail in Attachment NORR-C of this appendix. The detailed cancer risk estimates (Tables NORR-B1.3a through NORR-B1.3c) and noncancer hazard estimates (Tables NORR-B1.4a through NORR-B1.4f) are presented in Attachment NORR-B1.

Risk/hazard estimates for the baseline scenario are summarized in the tables and discussed below. Assuming lifetime soil contact is limited to the NORR potential exposure area, the depth-weighted estimated cumulative ILCRs for the hypothetical future resident potentially contacting soil and home-produced food are

APPENDIX NORR
SOIL HHERA FOR NORTH OF RAILROAD EXPOSURE AREA

above the *de minimis* level of 1×10^{-6} for all exposure depths. HI estimates are also above 1 at all exposure depths except for hypothetical future resident potential exposure to subsurface I and subsurface II soil.

Hypothetical Future Resident Consumption of Home-Produced Food	Surface	1E-03	CrVI (1E-03) Total PCBs (2E-06) TEQ Human (2E-06)	6	CrVI (1) Total PCBs (0.4) TPHd (5)
	Shallow	1E-03	CrVI (1E-03) Total PCBs (2E-06) TEQ Human (2E-06)	7	CrVI (1) Total PCBs (0.4) TPHd (5)

Notes:

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

CrVI = hexavalent chromium

NA =not applicable

TEQ human = dioxin toxicity equivalents for humans

TPHd = total petroleum hydrocarbons as diesel

Assuming lifetime soil contact is limited to the NORR potential exposure area, the depth-weighted estimated cumulative ILCRs for the hypothetical future resident potentially exposed to COPCs in soil are above 1×10^{-6} , the point of departure for risk management decisions (Table NORR 4.4). However, these risks are below or slightly above 1×10^{-5} (i.e. 2×10^{-5} for surface soil), which is well within the risk management range of 1×10^{-6} to 1×10^{-4} . These risk estimates include contact with surface, shallow, subsurface I, and subsurface II soil via incidental ingestion, dermal contact, inhalation of particulates, and inhalation of VOC vapors in ambient outdoor air. Risk estimates above *de minimis* levels were primarily attributed to exposure to dioxin TEQ and hexavalent chromium in soil via the soil ingestion pathway, and total PCBs in soil via the dermal contact and soil ingestion pathways (Table NORR-B1.3a).

Risk estimates for hypothetical future resident exposure to dioxin TEQ in soil in the NORR potential exposure area are less than or equal to 1×10^{-5} for all exposure depths, the point of departure for risk management

APPENDIX NORR

SOIL HHERA FOR NORTH OF RAILROAD EXPOSURE AREA

decisions specific to dioxins under normal residential scenarios that do not include consumption of home-produced food. For this evaluation, the point of departure for risk management is 1×10^{-6} for all COPCs including dioxin TEQ because residential consumption of home-produced food is also assumed to occur in this exposure area and is evaluated below.

Assuming that lifetime exposure to soil is limited to the NORR potential exposure area, the depth-weighted estimated cumulative ILCRs for the hypothetical future resident potentially exposed to COPCs in home-produced food are above 1×10^{-6} , the point of departure for risk management decisions for all exposure depths (Table NORR 4.4), and also above the upper bound of 1×10^{-4} for the risk management range with estimates at 1×10^{-3} . Risk estimates above *de minimis* levels were primarily attributed to potential exposure to Hexavalent chromium, total PCBs, and dioxin TEQ in homegrown produce (Tables NORR-B1.3b and NORR-B1.3c).

Assuming lifetime soil contact is limited to the NORR potential exposure area, the depth-weighted estimated cumulative HIs for the hypothetical future resident potentially exposed to COPCs in soil via incidental ingestion, dermal contact, and inhalation of particulates and VOC vapors in ambient outdoor air are above an HI of 1 for surface and shallow soil exposure depths and equal to an HI of 1 for subsurface I and subsurface II soil (Table NORR 4.4). Noncancer hazard estimates above 1 were primarily attributed to exposure to dioxin TEQ in soil via the soil ingestion pathway (Tables NORR-B1.4a and NORR-B1.4b), for hypothetical future resident child and adult, respectively).

Assuming that lifetime exposure to soil is limited to in the NORR potential exposure area, the depth-weighted estimated cumulative HIs for the hypothetical future resident potentially exposed to COPCs in home-produced food are above an HI of 1 for all exposure depths (Table NORR 4.8a). Noncancer hazard estimates above 1 were primarily attributed to exposure to TPH as diesel, hexavalent chromium, and PCBs via consumption of homegrown produce (Tables NORR-B1.4c and B1.4d for hypothetical future resident child and Tables NORR-B1.4e and B1.4f for hypothetical future resident adult).

Elevated concentrations of dioxin TEQ appear to be limited in area and depth. Accordingly, the depth-weighted dioxin TEQ EPCs and corresponding estimated ILCRs and HIs may be biased high. To reduce the uncertainty associated with this potential bias, area-weighted estimated cumulative ILCRs and HIs for the hypothetical future resident exposed to soil and/or home-produced food were estimated, as discussed below in Section 4.6.2.

Substantial proportions of the estimated risks above *de minimis* levels are attributable to background concentrations of hexavalent chromium in soil. Specifically, the majority (i.e., approximately 100%) of the ILCRs for hexavalent chromium for hypothetical future residential exposure to soil (1×10^{-6}) and home-produced food (1×10^{-3}) may be attributed to background concentrations of Hexavalent chromium in soil. The hexavalent chromium background cancer risk of 1×10^{-6} for soil exposure and 1×10^{-3} for home-produced food is based on a background mean concentration of 0.42 milligram per kilogram [mg/kg] compared to the depth-weighted EPCs of 0.37 mg/kg, 0.43 mg/kg, 0.29 mg/kg, and 0.20 mg/kg for surface, shallow, subsurface I, and subsurface II soil, respectively). Further note that Hexavalent chromium was detected at concentrations greater than the background threshold value (BTV) of 0.83 mg/kg in very limited areas of the NORR potential exposure area. Hexavalent chromium exceeds the BTV in four of 134 (Table NORR 2.1d) soil samples at the NORR potential exposure area (0 to 10 ft bgs). Concentrations of hexavalent chromium were detected above the BTV in surface soil (0 to 0.5 ft bgs) at soil sample locations AOC1-BCW4 (1.4 mg/kg),

AOC1-BCW6 (2.6 mg/kg), and AOC1-BCW19 (1.4 mg/kg), and at 2 ft bgs in soil sample location AOC1-BCW9 (1.2 mg/kg).

In addition, for PCBs, the maximum depth-weighted concentration was used as the soil EPCs for all exposure depths in the NORR potential exposure area due to low frequency of detection (FOD). PCBs were detected in only two of 46 samples (0 to 10 ft bgs) at two locations (AOC1-BCW10 and AOC1-BCW-12, Table NORR 2.1d), which precluded the calculation of a depth-weighted average concentration. The use of maximum depth-weighted concentration as the EPC likely overestimates the potential cancer risks for exposure to PCBs in soil.

Finally, note that the concentrations of TPH as diesel in homegrown produce and the corresponding noncancer hazards were primarily attributed to the outdoor vapor concentrations of this COPC calculated from the maximum concentration in NORR potential exposure area soil. The maximum concentration of TPH as diesel was used to calculate EPCs for the NORR potential exposure area due to the low FOD, which precluded the calculation of an average concentration for TPH as diesel in this area.

In addition, the HHRA used a conservative approach for the calculation of outdoor vapor concentrations, which assumes an infinite source of each volatile COPC at the site. For volatile COPCs with a limited source area and depth such as TPH as diesel at the NORR potential exposure area, which was detected in a limited area down to a maximum depth of 3 ft bgs, it may be more appropriate to assume a finite source for the calculation of outdoor vapor concentrations (USEPA 1996). Outdoor vapor concentrations estimated based on maximum concentrations and the infinite source assumption for TPH as diesel likely overestimates the mass of chemical potentially available for contact and the associated noncancer hazards for exposure to TPH as diesel in home-produced food. As discussed in detail in Section 4.6.3, below, when the estimated concentration of TPH as diesel in home-produced food is adjusted to account for a limited source depth, the depth-weighted estimated HQs for hypothetical future resident potentially exposed to TPH as diesel in home-produced food from the NORR potential exposure area is reduced from 5 to 0.2 for all exposure depths.

The depth-weighted EPCs for lead in surface, shallow, subsurface I, and subsurface II soil at the NORR potential exposure area are not expected to result in an increase in blood lead levels above the Office of Environmental Health Hazard Assessment (OEHHA) benchmark value of 1 micrograms per deciliter ($\mu\text{g}/\text{dL}$) for the hypothetical future resident child receptor (Tables NORR-B1.5a through NORR-B1.5d).

The depth-weighted EPCs for lead in home-produced food from the NORR potential exposure area are expected to result in an increase in blood lead concentration at the 90th percentile for the hypothetical future resident child of 1.2 $\mu\text{g}/\text{dL}$ and 1.1 $\mu\text{g}/\text{dL}$ for surface and shallow soil, respectively, equivalent to the OEHHA benchmark value of 1 $\mu\text{g}/\text{dL}$ (Tables NORR-B1.5e through NORR-B1.5f).

4.6.2 Risk Characterization for Exposure to Soil (Baseline Scenario and Area-Weighted EPCs)

Table NORR-4.5 summarizes cumulative ILCRs and HIs estimated for potential exposure to soil and consumption of home-produced food for each potential human receptor at the NORR potential exposure area. Risks and hazards were calculated using area-weighted EPCs, for receptors where the depth-weighted estimated cumulative ILCRs were above 1×10^{-6} and/or the cumulative HIs were above 1. Therefore, area-weighted ILCRs and HIs were provided for hypothetical future residents potentially contacting soil and home-produced food. For potential exposures to soil, the dose, exposure concentration, ILCR, and HI equations are

APPENDIX NORR
SOIL HHERA FOR NORTH OF RAILROAD EXPOSURE AREA

presented in detail in Section 5.5.1 of the main report. For potential exposure through consumption of home-produced food, the dose, food concentration, ILCR, and HI equations are presented in detail in Attachment C of this appendix. The detailed cancer risk estimates (Tables NORR-B2.3a through NORR-B2.3c) and noncancer hazard estimates (Tables NORR-B2.4a through NORR-B2.4f) are presented in Attachment NORR-B2.

Area-weighted risk and hazard estimates for the baseline scenario are summarized in the tables and discussed below. Assuming lifetime soil contact is limited to the NORR potential exposure area, the area-weighted estimated cumulative ILCRs for the hypothetical future resident potentially contacting soil or home-produced food are above the *de minimis* level of 1×10^{-6} at all exposure depths. HI estimates are equivalent to 1 for hypothetical future resident potential exposure to soil at all exposure depths. HI estimates are above 1 at all exposure depths for hypothetical future resident potential exposure to home-produced food.

For the NORR potential exposure area, the baseline scenario area-weighted estimated cumulative ILCRs and HIs for the hypothetical future resident potentially contacting soil or home-produced food are summarized in the tables and discussed below. In general, the area-weighted approach resulted in a reduction in the risk or hazard estimates up to 2 times lower than the depth-weighted estimates for certain exposure depths.

Hypothetical Future Residents

Baseline Scenario Area-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		NORR Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Hypothetical Future Resident Exposure to Soil	Surface	1E-05	CrVI (1E-06), TEQ human (9E-06)	1	NA
	Shallow	1E-05	CrVI (1E-06) PCBs (1E-06) TEQ human (7E-06)	1	NA
	Subsurface I	7E-06	CrVI (8E-07) PCBs (2E-06) TEQ human (5E-06)	1	NA
	Subsurface II	6E-06	CrVI (7E-07) PCBs (1E-06) TEQ human (4E-06)	1	NA
Hypothetical Future Resident Exposure to Home-Produced Food	Surface	1E-03	CrVI (1E-03) PCBs (2E-06) TEQ Human (1E-06)	6	CrVI (1) PCBs (0.4) TPHd (5)
	Shallow	9E-04	CrVI (9E-04) PCBs (2E-06) TEQ Human (1E-06)	6	CrVI (0.9) PCBs (0.4) TPHd (5)

Note:

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

APPENDIX NORR

SOIL HHERA FOR NORTH OF RAILROAD EXPOSURE AREA

Assuming that lifetime soil contact is limited to the NORR potential exposure area, the area-weighted estimated cumulative ILCRs for the hypothetical future resident potentially exposed to COPCs in surface, shallow, subsurface I, and subsurface II soil via incidental ingestion, dermal contact, and inhalation of particulates and VOC vapors in ambient outdoor air are above 1×10^{-6} , the point of departure for risk management decisions (Table NORR 4.5). However, these estimated risks are at or below 1×10^{-5} , which is well within the risk management range of 1×10^{-6} to 1×10^{-4} . Risk estimates above *de minimis* levels were primarily attributed to potential exposure to dioxin TEQ, PCBs, and Hexavalent chromium in soil via the soil ingestion pathway (Table NORR-B2.3a).

Risk estimates for hypothetical future resident exposure to dioxin TEQ in soil in the NORR potential exposure area are less than or equal to 1×10^{-5} for all exposure depths, the point of departure for risk management decisions specific to dioxins under normal residential scenarios that do not include consumption of home-produced food. For this evaluation, the point of departure for risk management is 1×10^{-6} for all COPCs including dioxin TEQ because residential consumption of home-produced food is also assumed to occur in this exposure area and is evaluated below.

Assuming lifetime exposure to soil is limited to the NORR potential exposure area, the area-weighted estimated cumulative ILCRs for all exposure depths for the hypothetical future resident potentially exposed to COPCs in home-produced food are above 1×10^{-6} , the point of departure for risk management decisions (Table NORR 4.5), and also above the upper bound of 1×10^{-4} for the risk management range. Risk estimates above *de minimis* levels were primarily attributed to exposure to hexavalent chromium, PCBs, and dioxin TEQ in homegrown produce (Tables NORR-B2.3b and NORR-B2.3c).

Assuming lifetime soil contact is limited to the NORR potential exposure area, the area-weighted estimated cumulative HIs for the hypothetical future resident potentially exposed to COPCs in soil are equal to an HI of 1 (Table NORR 4.5). This estimate includes potential contact with surface, shallow, subsurface I, and subsurface II soil via incidental ingestion, dermal contact, inhalation of particulates, and inhalation of VOC vapors in ambient outdoor air (Tables NORR-B2.4a and NORR-B1.4b, for hypothetical future resident child and adult, respectively). As stated earlier, the area-weighted estimated cumulative HIs are up to 2 times lower than the depth-weighted estimated cumulative HIs for certain exposure depths. As stated for the depth-weighted results, concentrations of dioxin TEQ which resulted in estimated cumulative HIs above 1 using depth-weighted EPCs for the baseline scenario appear to be limited in area and depth. Accordingly, the depth-weighted dioxin TEQ EPCs and corresponding estimated HIs may be biased high.

Assuming lifetime exposure to soil is limited to the NORR potential exposure area, the area-weighted estimated cumulative HIs for the hypothetical future resident potentially exposed to COPCs in home-produced food (Tables NORR-B2.4c and B2.4d for hypothetical future resident child and Tables NORR-B2.4c and B2.4d for hypothetical future resident adult) are above an HI of 1 for all exposure depths. Noncancer hazard estimates above an HI of 1 were primarily attributed to exposure to TPH as diesel and hexavalent chromium via consumption of home-grown produce.

As stated earlier, substantial proportions of the estimated risks above *de minimis* levels are attributable to background concentrations of hexavalent chromium in soil. Specifically, the majority (i.e., approximately 100%) of the ILCRs for hexavalent chromium for hypothetical future residential exposure to soil (1×10^{-6}) and home-produced food (1×10^{-3}) may be attributed to background concentrations of hexavalent chromium in soil. The background cancer risk of 1×10^{-6} for soil exposure and 1×10^{-3} for home-produced food is based on a background mean concentration of 0.42 mg/kg compared to the area-weighted EPCs of 0.37 mg/kg, 0.31

mg/kg, 0.25 mg/kg, and 0.20 mg/kg for surface, shallow, subsurface I, and subsurface II soil, respectively). Further, hexavalent chromium was detected at concentrations greater than the BTV of 0.83 mg/kg in very limited areas of the NORR potential exposure area. Hexavalent chromium exceeds the BTV in four of 134 (Table NORR 2.1d) soil samples at the NORR potential exposure area. Hexavalent chromium concentrations were detected above the BTV in surface soil (0 to 0.5 ft bgs) at soil sample locations AOC1-BCW4 (1.4 mg/kg), AOC1-BCW6 (2.6 mg/kg), and AOC1-BCW19 (1.4 mg/kg), and at 2 ft bgs in soil sample location AOC1-BCW9 (1.2 mg/kg).

In addition, for PCBs, the maximum depth-weighted concentration was used as the soil EPCs for all exposure depths in the NORR potential exposure area due to low FOD. PCBs were detected in only two of 46 samples (0 to 10 ft bgs), at two locations (AOC1-BCW10 and AOC1-BCW12) (Table NORR 2.1d), which precluded the calculation of a depth-weighted average concentration. The use of maximum depth-weighted concentrations likely overestimates the potential cancer risks for exposure to PCBs in soil.

Finally, as discussed in detail in Section 4.6.1 above, outdoor vapor concentrations estimated based on maximum concentrations and the infinite source assumption for TPH as diesel likely overestimate the potential noncancer hazards for exposure to TPH as diesel in home-produced food. For the NORR potential exposure area, when the estimated concentration of TPH as diesel in home-produced food is adjusted to account for a limited source depth, the depth-weighted estimated HQs for hypothetical future resident potentially exposed to TPH as diesel in home-produced food is reduced from 5 to 0.2 for all exposure depths (see Section 4.6.7 for details).

The area-weighted EPCs for lead in surface, shallow, subsurface I, and subsurface II soil at the NORR potential exposure area are not expected to result in an increase in blood lead levels above the OEHHHA benchmark value of 1 µg/dL for the hypothetical future resident child receptor (Tables NORR-B2.5a through NORR-B2.5d).

The area-weighted EPCs for lead in home-produced food at NORR potential exposure area are not expected to result in an increase in blood lead levels above OEHHHA's benchmark value of 1 µg/dL for the hypothetical future resident child receptor (Tables NORR-B2.5e through NORR-B2.5f). As stated earlier, concentrations of lead that resulted in exceedance of the OEHHHA's benchmark value of 1 µg/dL using depth-weighted EPCs for the baseline scenario appear to be limited in area and depth. Accordingly, the depth-weighted lead EPCs and corresponding estimated increase in blood lead levels may be biased high.

4.6.3 Uncertainties in the Risk Assessment

The risk assessment includes several uncertainties that warrant discussion. Many of the assumptions used in this risk assessment, regarding the representativeness of the sampling data, potential human exposures, fate and transport modeling, and chemical toxicity are conservative, follow agency guidance and reflect a 90th or 95th percentile value rather than a typical or average value. The use of several conservative exposure assumptions and toxicity estimates can introduce considerable uncertainty into the risk assessment. By using conservative exposure assumptions or toxicity estimates, the assessment can develop a significant conservative bias that may result in the calculation of significantly higher estimates for cancer risks or noncancer hazards than are actually posed by the chemicals present in soil. These uncertainties are discussed in detail in Section 5.6 of the main report. Uncertainties applicable only to the risk assessment for the NORR potential exposure area are discussed in detail below.

APPENDIX NORR

SOIL HHRA FOR NORTH OF RAILROAD EXPOSURE AREA

For this potential exposure area, the hypothetical future resident potentially exposed to COPCs in soil through consumption of home-produced food, risk estimates above *de minimis* levels were primarily attributed to exposure to hexavalent chromium (Table NORR-B1.3b). The NORR HHRA uses soil to plant uptake factors recommended by OEHHHA (2012, 2015) to estimate the concentration of hexavalent chromium in edible plant parts for the evaluation of hypothetical future resident exposure to hexavalent chromium via consumption of homegrown produce. As discussed in OEHHHA guidance (2012) and Appendix E (Technical Memorandum, The Potential for Chromium Uptake by Arrowweed and Potential Exposure Pathways) of the RAWP Addendum 2 (Arcadis 2015), plant uptake studies support that plants can absorb hexavalent chromium from soil. However, there is significant uncertainty associated with the estimation of the magnitude of hexavalent chromium absorption by plants. Factors that may introduce uncertainty into the calculation of plant uptake factors for hexavalent chromium are discussed briefly here.

In summary, studies vary in their conclusions on what form of chromium is more likely to be taken up in plant roots, and the absolute quantity of hexavalent chromium that is reduced to trivalent chromium (CrIII) in plant tissue. Once absorbed by root tissues, it appears that most of the hexavalent chromium is reduced to trivalent chromium and retained by the roots in a tightly bound or insoluble form, or in a soluble complex that is not translocated to a large degree to the above-ground plant parts (OEHHHA 2012). However, studies indicate variability in hexavalent chromium absorption based on plant type, plant age, cultivation time, extraction methods, sample preparation, growth media, pH conditions, concentration of chromium sources, oxidation conditions, presence of other chemical species in growth medium, and the extrapolation of laboratory experiments to natural habitats. The growth medium (i.e., soil, solution, or agar) for a study has an important impact on potential plant uptake of hexavalent chromium and trivalent chromium, soil being the least facilitative for uptake. Additional uncertainty is introduced in the analytical methods used to measure hexavalent chromium in plant tissues as most studies only measure total chromium contents of plant parts due to the difficulty in estimating the actual speciation of chromium in biological tissues during analysis (OEHHHA 2012). As described in the OEHHHA guidance, it is currently unknown what proportion of chromium as hexavalent chromium will be found in edible crops following absorption and translocation from the roots. OEHHHA has, therefore, developed plant uptake factors under the conservative assumption that the chromium found in crop studies due to root uptake is in the form of hexavalent chromium only. Therefore, risks associated with exposure to hexavalent chromium via consumption of home-produced food are likely overestimated in the HHRA for the NORR potential exposure area.

Another significant source of uncertainty is the use of a conservative approach for the calculation of outdoor vapor concentrations of volatile COPCs detected in soil, which assumes an infinite source of each volatile COPC at the site. For highly volatile COPCs with a limited source area and depth such as TPH as diesel in the NORR potential exposure area (detected in a limited area down to a maximum depth of 3 ft bgs), it may be more appropriate to assume a finite source for the calculation of outdoor vapor concentrations (USEPA 1996). As stated earlier, for the NORR potential exposure area, the concentrations of TPH as diesel in homegrown produce and corresponding noncancer hazards were primarily attributed to the outdoor vapor concentrations of this COPC calculated from the maximum concentration in soil. Outdoor vapor concentrations estimated based on maximum concentrations and the infinite source assumption for TPH as diesel likely overestimate the potential noncancer hazards for exposure to TPH as diesel in home-produced food. Outdoor vapor concentrations are calculated by dividing the soil EPC by the volatilization factor as described in Section 4 of the main report. Assuming a limited source depth of 3 ft bgs for TPH as diesel, based on the deepest detection of TPH in the NORR potential exposure area soil, the outdoor vapor concentration and

APPENDIX NORR

SOIL HHERA FOR NORTH OF RAILROAD EXPOSURE AREA

corresponding HI are approximately 20 times lower than those estimated using the infinite source assumption. When the estimated outdoor vapor concentration of TPH as diesel is adjusted to account for a limited source depth, the depth- and area-weighted estimated HQs for the hypothetical future resident potentially exposed to TPH as diesel in home-produced food from the NORR potential exposure area is reduced from 5 to 0.2.

Additional uncertainties for the NORR potential exposure area include the use of the maximum depth-weighted soil concentration as the EPC. The maximum depth-weighted soil concentration was used for COPCs when the soil dataset had fewer than four detected values (i.e., concentrations reported above the detection limit) or fewer than eight total observations as shown in Table NORR-3.1 for the baseline scenario.

For the NORR potential exposure area in the baseline scenario, the maximum depth-weighted concentration was used as the EPC for the following COPCs:

- Surface soil: one PAH (benzo(g,h,i)perylene), total PCBs, TPH as diesel, TPH as motor oil, and dioxin TEQ
- Shallow soil: total PCBs, TPH as diesel, TPH as motor oil, and dioxin TEQ
- Subsurface I soil: two metals (cadmium and molybdenum), total PCBs, TPH and diesel, TPH as motor oil, and dioxin TEQ
- Subsurface II soil: two metals (cadmium and molybdenum), total PCBs, TPH as diesel, TPH as motor oil, and inorganics (orthophosphate).

The use of the maximum depth-weighted soil concentration as the EPC for the COPCs listed above may not appropriately represent exposures and resulting risks/hazards. As discussed previously in this section and in Section 4.6 above, this approach to estimating EPCs likely results in an overestimate of risks/hazards because maximum concentrations were used to estimate risks/hazards for several risk drivers (i.e., total PCBs, TPH as diesel, and dioxin TEQ) in the NORR potential exposure area.

5 ECOLOGICAL RISK ASSESSMENT

As stated in Section 1 and consistent with the RAWP documents (Arcadis 2008, 2009, 2015), an additional ERA was not conducted for the NORR potential exposure area. For potential small home-range receptors, exposure to environmental media in the NORR potential exposure area is evaluated as part of the BCW exposure area (Appendix BCW) and Tamarisk Thicket potential exposure area (Appendix TT). Exposure of potential large home-range receptors is evaluated as part of the BCW and AOC 4 potential exposure area (Appendix BCW+AOC4) and the Outside the Compressor Station potential exposure area (Appendix OCS).

6 SUMMARY AND CONCLUSIONS FOR THE HHRA

Potential cumulative cancer risks and noncancer hazards for human receptors were estimated, as presented above in Section 4. For ecological receptors, potential risks were not estimated for the NORR potential exposure area, per the RAWP (Arcadis 2008). Uncertainties related to the HHRA at the site are discussed in detail in Section 5.6 of the main report, and uncertainties specific to the NORR potential exposure area are discussed in this appendix. For the NORR potential exposure area, an HHRA was conducted per the RAWP documents (Arcadis 2008, 2009, 2015). One scenario (baseline) was evaluated. Risks were estimated for hypothetical future residential exposure to COPCs in soil via incidental ingestion, dermal contact, inhalation of particulates, inhalation of VOC vapors in ambient outdoor air, and consumption of home-produced food using depth-weighted EPCs and area-weighted EPCs.

At the NORR potential exposure area, the COPCs identified for the HHRA include metals (hexavalent chromium, total chromium, cobalt, copper, lead, and zinc), and inorganics (orthophosphate), PAHs, PCBs, dioxin TEQ, TPH as diesel, and TPH as motor oil. A summary of these results and conclusions regarding potential risk associated with exposure to these COPCs in the NORR potential exposure area soil based on the risk/hazard estimates and uncertainties inherent in the risk assessment process are presented below.

For the NORR potential exposure area, the cumulative ILCRs and HIs associated with potential exposure to COPCs in soil using depth- and area-weighted EPCs under the baseline scenario for the hypothetical future resident were estimated. Assuming lifetime soil contact is limited to the NORR potential exposure area for the hypothetical future resident, the estimated potential ILCR and HI results are summarized in the table and discussed below.

Baseline Scenario Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		NORR Potential Exposure Area			
		Cumulative ILCR		HI	
		Depth-Wt	Area-Wt	Depth-Wt	Area-Wt
Hypothetical Future Resident Exposure to Soil	Surface	2×10^{-5} (CrVI and dioxin TEQ)	1×10^{-5} (CrVI and dioxin TEQ)	2 (Dioxin TEQ)	≤ 1
	Shallow	1×10^{-5} (CrVI, total PCBs, and dioxin TEQ)	1×10^{-5} (CrVI, total PCBs, and dioxin TEQ)	2 (Dioxin TEQ)	≤ 1
	Subsurface I	9×10^{-6} (CrVI, total PCBs, and dioxin TEQ)	7×10^{-6} (CrVI, total PCBs, and dioxin TEQ)	≤ 1	≤ 1
	Subsurface II	7×10^{-6} (CrVI, total PCBs, and dioxin TEQ)	6×10^{-6} (CrVI, total PCBs, and dioxin TEQ)	≤ 1	≤ 1

APPENDIX NORR
SOIL HHERA FOR NORTH OF RAILROAD EXPOSURE AREA

Baseline Scenario Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index

	Shallow	1×10^{-3} (CrVI, total PCBs, and dioxin TEQ)	9×10^{-4} (CrVI, total PCBs, and dioxin TEQ)	7 (CrVI, total PCBs, and TPHd)	6 (CrVI, total PCBs, and TPHd)

Note:

wt = weighted

Depth-Weighted

Potential exposures that are below or at *de minimis* levels include the following:

- **HI ≤ 1 for all soil depths** – Hypothetical Future Resident Exposure to Soil (subsurface I and subsurface II)
- **ILCR $\leq 1 \times 10^{-6}$** – None.

Potential exposures that are above *de minimis* levels of HI > 1 and/or within the risk management range of 1×10^{-6} and 1×10^{-4} include the following

- **HI > 1 and ≤ 3** – Hypothetical Future Resident Exposure to Soil (surface and shallow)
- **HI > 3** – Hypothetical Future Resident Exposure to Home-Produced Food (surface and shallow)
- **ILCR > 1×10^{-6} and $\leq 5 \times 10^{-6}$** – None
- **ILCR > 5×10^{-6} and $\leq 1 \times 10^{-5}$** – Hypothetical Future Resident Exposure to Soil (shallow, subsurface I, and subsurface II)
- **ILCR > 1×10^{-5} and $\leq 1 \times 10^{-4}$** – Hypothetical Future Resident Exposure to Soil (surface).

Potential exposures that are above the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **ILCR > 1×10^{-4}** – Hypothetical Future Resident Exposure to Home-Produced Food (surface and shallow).

For the NORR potential exposure area, the depth-weighted estimated risks above *de minimis* levels for the hypothetical future resident potentially exposed to COPCs in soil and home-produced food were due to hexavalent chromium, total PCBs, and/or dioxin TEQ. Therefore, potential risks and hazards for hypothetical future resident potentially exposed to soil and home-produced food were estimated using area-weighted EPCs and are as follows:

Area-Weighted

Potential exposures that are below or at *de minimis* levels include the following:

SOIL HHERA FOR NORTH OF RAILROAD EXPOSURE AREA

- **HI ≤ 1 for all soil depths** – Hypothetical Future Resident Exposure to Soil (surface, shallow, subsurface I, and subsurface II)
- **ILCR $\leq 1 \times 10^{-6}$** - None.

Potential exposures that are above *de minimis* levels of HI > 1 and/or within the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **HI > 1 and ≤ 3** – None
- **HI > 3** – Hypothetical Future Resident Exposure to Home-Produced Food (surface and shallow)
- **ILCR > 1×10^{-6} and $\leq 5 \times 10^{-6}$** – None
- **ILCR > 5×10^{-6} and $\leq 1 \times 10^{-5}$** – Hypothetical Future Resident Exposure to Soil (surface, shallow, subsurface I, and subsurface II)
- **ILCR > 1×10^{-5} and $\leq 1 \times 10^{-4}$** – None.

Potential exposures that are above the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **ILCR > 1×10^{-4}** – Hypothetical Future Resident Exposure to Home-Produced Food (surface and shallow).

OVERALL SUMMARY

For the NORR potential exposure area, risk drivers for both depth- and area-weighted evaluations are hexavalent chromium, total PCBs, and/or dioxin TEQ. All potential receptors and exposure depths had estimated risks/hazards above *de minimis* levels with one exception. Using both depth- and area-weighted EPCs, the estimated cumulative HIs were at or below 1 for the hypothetical future resident potentially contacting COPCs in subsurface I and subsurface II soil.

The estimated cumulative ILCRs and HIs associated with potential exposure to COPCs in soil at the NORR potential exposure area, using area-weighted EPCs for the hypothetical future resident, are above the point of departure for risk management decisions of 1×10^{-6} and an HI of 1, respectively. However, the estimated cumulative ILCRs for this receptor at or below 1×10^{-5} and within the risk management range of 1×10^{-6} to 1×10^{-4} .

Using depth- and area-weighted EPCs and food consumption and uptake modeling (as described in Attachment C of this appendix), for the hypothetical future resident consuming home-produced food, the risk estimates are 1×10^{-3} and HIs are 6 to 7. These values are above the risk management ranges of 1×10^{-6} to 1×10^{-4} and HI of 1, respectively. Note that cancer risk estimates above the risk management range were primarily attributed to exposure to hexavalent chromium in home-produced food and that the area of hexavalent chromium detected above background is limited with only four of 134 samples detected above the BTV.

Noncancer hazard estimates above 1 were primarily attributed to exposure to TPH as diesel, hexavalent chromium, and PCBs in home-produced food. Significant uncertainties associated with the estimation of hypothetical future resident exposure to TPH as diesel, hexavalent chromium, and PCBs in home-produced food may result in an overestimate of potential cancer risks and noncancer hazards calculated for these exposures. These uncertainties are described in detail in Section 4.6.3 of this appendix and include the assumption of an infinite source of TPH as diesel, and the use of maximum depth-weighted concentrations to

APPENDIX NORR

SOIL HHERA FOR NORTH OF RAILROAD EXPOSURE AREA

estimate exposure to PCBs and TPH as diesel. In addition, several conservative assumptions associated with food uptake modeling were used for hexavalent chromium and TPH as diesel. When the estimated outdoor vapor concentration of TPH as diesel is adjusted to account for a limited source depth, the depth- and area-weighted estimated HQs for the hypothetical future resident potentially exposed to TPH as diesel in home-produced food from the NORR potential exposure area is reduced from 5 to 0.2.

The depth- and area-weighted EPCs for lead in all soil at the NORR potential exposure area are not expected to result in an increase in blood lead levels above OEHHA benchmark value of 1 µg/dL for a hypothetical future resident child receptor.

For the NORR potential exposure area, the depth- and area-weighted risk estimates are not substantially different, with area-weighted ILCRs being approximately 1.2 to 2 times lower than depth-weighted estimates for the same receptor and exposure depth. As shown in the table above, this difference reduced the risk category for the hypothetical future resident potentially contacting soil from 2×10^{-5} to 1×10^{-5} and the HIs from 2 down to 1. However, the overall outcome for the risk estimates for the NORR potential exposure area does not substantially change.

The risks/hazards presented for the hypothetical future resident living in the NORR potential exposure area are presented at the request of DOI for informational purposes. It is highly unlikely that the site will be used for residential purposes in the future. As stated in the DOI (2015) Land Use Memo, "DOI will not utilize a future residential scenario on Federal lands within the project area when evaluating cleanup options in the Feasibility Study phase."

Table NORR-2.1a**Chemicals Included in the Risk Assessment: NoRR Surface Soil (0 to 0.5 feet bgs) for Baseline Scenario****Soil Human Health and Ecological Risk Assessment****PG&E Topock Compressor Station****Needles, California****Notes:**

- ^a Applicable to human health risk assessment (HHRA) only.
- ^b Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA. Human health toxicity values are available for iron and manganese, thus these chemicals are evaluated in the HHRA, if above background levels and have available toxicity values.
- ^c Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).
- ^d Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).
- ^e Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.
- ^f Dioxins are evaluated in toxic equivalents.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

mg/kg = milligrams per kilogram.

ng/kg = nanograms per kilogram.

ug/kg = micrograms per kilogram.

COPC = Constituent of Potential Concern.

ND = Not detected.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Table NORR-2.1b**Chemicals Included in the Risk Assessment: NoRR Shallow Soil (0 to 3 feet bgs) for Baseline Scenario****Soil Human Health and Ecological Risk Assessment****PG&E Topock Compressor Station****Needles, California****Notes:**

- ^a Applicable to human health risk assessment (HHRA) only.
- ^b Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA. Human health toxicity values are available for iron and manganese, thus these chemicals are evaluated in the HHRA, if above background levels and have available toxicity values.
- ^c Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).
- ^d Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).
- ^e Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.
- ^f Dioxins are evaluated in toxic equivalents.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

mg/kg = milligrams per kilogram.

ng/kg = nanograms per kilogram.

ug/kg = micrograms per kilogram.

COPC = Constituent of Potential Concern.

ND = Not detected.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Notes:

^a The constituent consists of analytes detected at least once at the Topock Compressor Station site and measured in soil in this exposure area.

^b If fewer than eight total locations and four total detected concentrations, the maximum depth-weighted concentration was selected as the EPC. Otherwise, the UCL was selected as the EPC.

^c EPCs and summary statistics were not calculated for some constituents (i.e., dioxin congeners and essential nutrients). Those data, if available, are presented in Attachment A1 of each exposure area-specific appendix.

Abbreviations:

"--" = not applicable

B(a)P equivalent = benzo(a)pyrene equivalent

BCA = Bias-corrected accelerated bootstrap method

COPC = constituent of potential concern

DDE = Dichlorodiphenyldichloroethylene

DDT = Dichlorodiphenyltrichloroethane

EPC = exposure point concentration

FOD = frequency of detection

ft bgs = feet below ground surface

KM = Kaplan-Meier

µg/kg = micrograms per kilogram

mg/kg = milligrams per kilogram

NA = not applicable

ng/kg = nanograms per kilogram

PAH = polycyclic aromatic hydrocarbons

PCB = polychlorinated biphenyls

PG&E = Pacific Gas and Electric Company

TCDD = Tetrachlorodibenzo-p-dioxin

TEQ = toxic equivalent

TPH = total petroleum hydrocarbons

UCL = upper confidence limit

X = COPC in the exposure depth interval

Table NORR-4.1

Summary of COPCs Evaluated in the HHRA for NoRR: Baseline Scenario

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

COPC	COPCs in Surface Soil (0 to 0.5 feet bgs)	COPCs in Shallow Soil (0 to 3 feet bgs)	COPCs in Subsurface I Soil (0 to 6 feet bgs)	COPCs in Subsurface II Soil (0 to 10 feet bgs)
Inorganics				
Chromium, Hexavalent	x	x	x	x
Chromium, total	x	x	x	x
Cobalt	x	x	x	x
Copper	x	x	x	x
Lead	x	x	x	x
Orthophosphate	--	--	--	x
Zinc	x	x	x	x
Polycyclic Aromatic Hydrocarbons				
Benzo (ghi) perylene	x	x	x	x
Fluoranthene	x	x	x	x
Phenanthrene	x	x	x	x
Pyrene	x	x	x	x
Polychlorinated Biphenyls				
Total PCBs	x	x	x	x
Total Petroleum Hydrocarbons				
TPH as diesel	x	x	x	x
TPH as motor oil	x	x	x	x
Dioxins/Furans				
TEQ Human	x	x	x	x

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

bgs = below ground surface.

COPC = Constituent of Potential Concern.

-- = not detected or not analyzed.

x = Chemical included as COPC in human health risk assessment.

PCB = Polychlorinated biphenyls.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

for Hypothetical Future Residents: COPCs in NoRR Surface Soil (0 to 0.5 feet bgs)

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

COPC	Exposure Point Concentration for Surface Soil: 0 to 0.5 feet bgs	Exposure Point Concentration for Subsurface II Soil: 0 to 10 feet bgs	Hypothetical Future Resident	
			Outdoor Airborne Particulate Concentration	Outdoor Vapor Concentration
	(mg/kg) ^a	(mg/kg) ^b	(mg/m ³) ^c	(mg/m ³) ^d
Dioxins/Furans				
TEQ Human	7.0E-05	2.7E-05	5.1E-14	1.1E-11

Notes:

- ^a Exposure point concentrations (EPCs) for surface soil (0 to 0.5 feet bgs) are used to evaluate inhalation of particulates in outdoor air.
- ^b EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.
- ^c Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.36×10^9 m³/kg was used for hypothetical future residents as recommended by Department of Toxic Substances Control (2014).
- ^d Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.

Table NORR-4.3c

**Baseline Scenario Area-Weighted Exposure Point Concentrations and Predicted Outdoor Air Concentrations
for Hypothetical Future Residents: COPCs in NoRR Subsurface I Soil (0 to 6 feet bgs)**

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

COPC	Exposure Point Concentration for Subsurface I Soil: 0 to 6 feet bgs	Exposure Point Concentration for Subsurface II Soil: 0 to 10 feet bgs	Hypothetical Future Resident	
			Outdoor Airborne Particulate Concentration	Outdoor Vapor Concentration
	(mg/kg) ^a	(mg/kg) ^b	(mg/m ³) ^c	(mg/m ³) ^d
Dioxins/Furans				
TEQ Human	2.4E-05	2.1E-05	1.8E-14	8.6E-12

Notes:

- ^a Exposure point concentrations (EPCs) for subsurface I soil (0 to 6 feet bgs) are used to evaluate inhalation of particulates in outdoor air.
- ^b EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.
- ^c Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.36×10^9 m³/kg was used for hypothetical future residents as recommended by Department of Toxic Substances Control (2014).
- ^d Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.

Abbreviations:

bgs = below ground surface.
 COPC = Constituent of Potential Concern.
 mg/kg = milligrams per kilogram.
 mg/m³ = milligrams per cubic meter.
 NA = not applicable.
 NS = Not sampled.
 NV = Not volatile.
 PCB = Polychlorinated biphenyls.
 TPH = Total Petroleum Hydrocarbons.
 TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated using benzo(a)pyrene equivalents. Hexavalent chromium is not absorbed via dermal contact.
NC = Not considered a carcinogen.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

DOSE TO FUTURE CHILD RESIDENT								
Consumption(0<2yr)	2.9E+00	6.1E+00	1.2E+01	3.8E+00	5.9E+00	5.7E+00	g product/ kg BW-day	Point estimates for average consumption (OEHHA 2015, Table 5.15) (a)
Consumption(2-6yr)	2.2E+00	3.9E+00	7.4E+00	2.5E+00	4.7E+00	3.9E+00		
Fraction of Food Intake that is Home-Produced	1.51E-01	2.14E-01	2.35E-01	2.35E-01	2.35E-01	2.35E-01	unitless	Point estimates for households that farm (OEHHA 2015, Table 5.17)
DOSE _{fa} (0<2yr)	6.4E-08	1.8E-08	2.0E-04	7.3E-05	4.2E-05	5.4E-05	mg/kg-day	Calculated value (b)
DOSE _{fa} (2-6yr)	4.8E-08	1.1E-08	1.2E-04	4.8E-05	3.4E-05	3.7E-05	mg/kg-day	Calculated value (b)
Time-Weighted Average Dose	5.3E-08	1.3E-08	1.5E-04	5.6E-05	3.7E-05	4.3E-05	mg/kg-day	Calculated value
Daily Intake	8.0E-07	2.0E-07	2.2E-03	8.4E-04	5.5E-04	6.4E-04	mg/day	Calculated value (c)
BLOOD LEAD LEVEL								
Total Daily Intake	0.0043						mg/day	Calculated value
Ingestion Constant	0.16						µg/dl per µg/day	DTSC 2009
Average Blood Lead Level (PbB)	0.68						µg/dl	Calculated value
Blood Lead Level, Geometric Standard Deviation	1.6						µg/dl	DTSC 2009
Blood Lead Level, 90th Percentile	1.2						µg/dl	Calculated value

Notes:

- (a) Average, rather than high-end, consumption rates are used as inputs for lead risk assessment. Reasonable maximum inputs are not recommended for use with the lead model because the model considers the distribution of blood lead, which reflects variation in exposure parameters (DTSC 2011).
- (b) Dose is calculated as follows: $C_i \times L \times \text{Consumption} \times \text{Conversion Factor}$ (1×10^{-3} g/kg to mg/kg for C_i term) \times EF/365 days per year, where EF is 350 exposure days per year.
- (c) Daily intake is calculated as follows: Time-weighted average dose (mg/kg-day) \times 15 kg body weight. Body weight value corresponds to Cal/EPA default value for child receptors (DTSC 2014).

Abbreviations:

BW = body weight.
g = grams
m³ = cubic meters
mg/kg = milligrams per kilogram.
µg/dl = micrograms per deciliter.
µg/kg = micrograms per kilogram.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated using benzo(a)pyrene equivalents. Hexavalent chromium is not absorbed via dermal contact.
NC = Not considered a carcinogen.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Hexavalent chromium is not absorbed via dermal contact.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
HI = Hazard Index
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Hexavalent chromium is not absorbed via dermal contact.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Total Daily Intake	0.0035						mg/day	Calculated value
Ingestion Constant	0.16						$\mu\text{g/dl}$ per $\mu\text{g/day}$	DTSC 2009
Average Blood Lead Level (PbB)	0.56						$\mu\text{g/dl}$	Calculated value
Blood Lead Level, Geometric Standard Deviation	1.6						$\mu\text{g/dl}$	DTSC 2009
Blood Lead Level, 90th Percentile	1.0						$\mu\text{g/dl}$	Calculated value

Notes:

- (a) Average, rather than high-end, consumption rates are used as inputs for lead risk assessment. Reasonable maximum inputs are not recommended for use with the lead model because the model considers the distribution of blood lead, which reflects variation in exposure parameters (DTSC 2011).
- (b) Dose is calculated as follows: $C_i \times L \times \text{Consumption} \times \text{Conversion Factor}$ (1×10^{-3} g/kg to mg/kg for C_i term) $\times EF/365$ days per year, where EF is 350 exposure days per year.
- (c) Daily intake is calculated as follows: Time-weighted average dose (mg/kg-day) $\times 15$ kg body weight. Body weight value corresponds to Cal/EPA default value for child receptors (DTSC 2014).

Abbreviations:

BW = body weight.
g = grams
 m^3 = cubic meters
mg/kg = milligrams per kilogram.
 $\mu\text{g/dl}$ = micrograms per deciliter.
 $\mu\text{g/kg}$ = micrograms per kilogram.

ATTACHMENT C

Methodology for the Evaluation of Home-Produced Food at North of the Railroad

Pacific Gas and Electric Company

APPENDIX NORR ATTACHMENT C – METHODOLOGY USED FOR EVALUATION OF RESIDENTIAL EXPOSURE TO HOME-PRODUCED FOOD

Topock Compressor Station
Needles, California

1 INTRODUCTION

As stated in the RAWP (Arcadis 2008) and the RAWP Addendum 2 (Arcadis 2015), residential uses of Department of Interior (DOI) land managed by Bureau of Land Management (BLM) located within the north of the railroad (NORR) potential exposure area are included in the human health risk assessment (HHRA), even though future unrestricted use is unlikely (DOI 2014b). As requested, the future unrestricted land use scenario was evaluated as the hypothetical future resident as a rural resident who obtains a significant portion of his/her diet from onsite produced food including vegetables, fruits, and poultry. Chemicals in soil could partition into these foods, as described in the RAWP (Arcadis 2008). In agreement with DOI for evaluation of the BLM managed land, the uptake into home-produced food was evaluated using the uptake model from the Office of Environmental Health Hazard Assessment (OEHHA) Toxic Hot Spots Program (OEHHA 2015). This attachment summarizes the HHRA methodologies specific to the evaluation of the hypothetical future resident exposed to constituents of potential concern (COPCs) through ingestion of home-produced food. The HHRA summary of results and conclusions for hypothetical future resident ingestion of home-produced food for the NORR potential exposure area are presented in Appendix NORR and associated dose, risk, and hazard calculation tables are presented in Attachments NORR-B1 and NORR-B2 for depth- and area-weighted exposure point concentrations (EPCs), respectively.

2 METHODOLOGY

An analysis of the ingestion of plant and animal products as a pathway for potential exposure to contaminated soil was conducted based on the California Environmental Protection Agency (CalEPA) OEHHA in the Air Toxics Hot Spots Guidelines (OEHHA 2015). Section 5 of the Hot Spots Guidance provides equations for calculating the exposure of humans to COPCs through ingestion of plants and animals impacted by COPCs. First, uptake of COPCs by plants and animals is estimated using equations and COPC-specific values presented in Table NORR-C.1a through Table NORR-C.3. Second, the ingestion of these plant and animal products is calculated to estimate human exposure to COPCs using equations and food ingestion rates to calculate dose as presented in Table NORR-C.4 and Table NORR-C.5, respectively.

2.1 Exposure Concentrations

COPC concentrations in home-produced food were estimated using equations presented in Tables NORR-C.1a through NORR-C.2b. COPC-specific parameters used to calculate COPC concentrations in home-produced food are presented in Table NORR-C.3.

Plant COPC concentrations are based on the following:

- Root uptake from soil;
- Deposition of wind-blown dust onto plant parts; and
- Deposition of volatile chemicals in outdoor air onto plant parts.

Estimated COPC concentrations in plants calculated using depth-weighted soil EPCs for surface and shallow soil and volatile COPCs in subsurface II soil are summarized in Tables NORR-C.6a through NORR-C.6c.

Estimated COPC concentrations in plants calculated using area-weighted soil EPCs for surface and shallow soil and volatile COPCs in subsurface II soil are summarized in Tables NORR-C.12a through NORR-C.12c.

Animal COPC concentrations are based the following:

- Uptake from ingestion of soil;
- Uptake from inhalation of wind-blown dust;
- Uptake from inhalation of volatile chemicals in outdoor air; and
- Uptake from ingestion of plants impacted by soil.

Estimated COPC concentrations in animal products calculated using depth-weighted soil EPCs for surface and shallow soil and volatile COPCs in subsurface II soil are summarized in Tables NORR-C.7a through NORR-C.7c.

APPENDIX NORR

HHRA FOR NORTH OF RAILROAD EXPOSURE AREA

Estimated COPC concentrations in animal products calculated using area-weighted soil EPCs for surface and shallow soil and volatile COPCs in subsurface II soil are summarized in Tables NORR-C.13a through NORR-C.13c.

2.2 Estimation of Dose

Dose for carcinogenic and non-carcinogenic effects for COPCs in home-produced food were calculated using the equation presented in Table NORR-C.4. Age-specific food ingestion rates used to calculate dose are presented in Table NORR-C.5.

The calculated dose from home-produced food values using depth-weighted soil EPCs for the exposure scenarios evaluated in the HHRA are presented in Tables NORR-B1.1c through NORR-B1.1d (carcinogenic effects) and Tables NORR-B1.2c through NORR-B1.2g (noncarcinogenic effects) in Attachment NORR-B1.

The calculated dose from home-produced food values using area-weighted soil EPCs for the exposure scenarios evaluated in the HHRA are presented in Tables NORR-B2.1c through NORR-B2.1d (carcinogenic effects) and NORR-B2.2c through NORR-B2.2g (noncarcinogenic effects) in Attachment NORR-B2.

2.3 Estimation of Cancer Risk and Non-Cancer Hazard

As described in Section 4.6 of Appendix NORR and Section 5.5.1 of the main report, estimated incremental lifetime cancer risks (ILCRs) and/or non-cancer hazard quotients (HQs) were calculated for each COPC and potentially complete exposure pathway.

For hypothetical future resident ingestion of home-produced food, the equations below describe the established relationship between estimated dose, toxicity, and risk for carcinogenic health effects. For exposures occurring via ingestion of plant or animal food products, the relationship for carcinogenic effects is given by the following equation (OEHHA 2015):

$$ILCR_{(0 \text{ to } 26 \text{ years})} = CSF \times \frac{1}{AT_c} \times \left(\begin{array}{l} [DOSE_{fa(0-2 \text{ years})} \times ADAF \times ED_{(0-2 \text{ years})}] + \\ [DOSE_{fa(2-16 \text{ years})} \times ADAF \times ED_{(2-16 \text{ years})}] + \\ [DOSE_{fa(16-26 \text{ years})} \times ADAF \times ED_{(16-26 \text{ years})}] \end{array} \right)$$

Where:

ILCR	=	Incremental lifetime cancer risk; the incremental probability of an individual developing cancer as a result of exposure to a particular cumulative concentration of a potential carcinogen (unitless);
CSF	=	Cancer Slope Factor; the toxicity value which indicates the upper limit on ILCR per unit of dose of chemical (mg chemical/kg body weight-day) ⁻¹ .
ADAF	=	Age-dependent adjustment factor for carcinogens that are also considered mutagens as indicated in Section 5.4.1 of the main report. Hexavalent chromium is the only carcinogenic COPC evaluated as a

APPENDIX NORR

HHRA FOR NORTH OF RAILROAD EXPOSURE AREA

mutagen for the NORR potential exposure area. Age-dependent adjustment factors are as follows: 10 for the 0 to 2 year age group; 3 for the 2 to 16 age group and 1 for the 16 to 26 year age group. For non-mutagenic carcinogens, age dependent adjustment factors are assumed to be 1 for all age groups (i.e., there is no adjustment for toxicity by age).

$DOSE_{fa}$	=	Exposure dose through ingestion of animal product (mg chemical/kg body weight-day);
ED	=	Exposure duration for specified age group (years); and
AT_c	=	Averaging time for ILCR (70 years)

The equations below describe the established relationship between estimated intake, toxicity, and non-cancer hazard. For exposures occurring via ingestion of plant or animal food products, the relationship for noncarcinogenic effects is given by the following equation (OEHHA 2015):

$$HQ_{(child)} = \frac{1}{RfD} \times \frac{1}{AT_{nc}} \times (DOSE_{fa(0-2years)} \times ED_{(0-2years)} + DOSE_{fa(2-6years)} \times ED_{(2-6years)})$$

$$HQ_{(Adult)} = \frac{1}{RfD} \times \frac{1}{AT_{nc}} \times (DOSE_{fa(>16years)} \times ED_{(26years)})$$

Where:

Hazard Quotient	=	Hazard Quotient (HQ); an expression of the potential for a chemical to cause noncarcinogenic effects, which relates the allowable amount of a chemical (RfD) to the estimated Site-specific intake (unitless);
$DOSE_{fa}$	=	Exposure dose through ingestion of animal product (mg chemical/kg body weight-day);
ED	=	Exposure duration for specified age group (years); and
AT_{nc}	=	Averaging time for HQ (total ED for all age groups in years)
RfD	=	Reference dose; the toxicity value indicating the threshold amount of chemical contacted below which no adverse health effects are expected (mg chemical/kg body weight-day).

2.4 Lead Risk Assessment

For exposure to lead in soil, the risk characterization for the hypothetical future residential scenarios uses the latest version of the California Department of Toxic Substances Control's (DTSC) LeadSpread (DTSC 2011b, 2011c), Version 8, to evaluate blood lead levels in child receptors that would result from with regular contact with lead in soil assuming potential exposure via ingestion of home-produced food. Lead concentrations in home-produced food were estimated as for other COPCs as described in Section 2.1 above. Equations and input parameters for lead risk assessment for ingestion of home-produced food are presented in Attachment B tables as noted below.

APPENDIX NORR HHRA FOR NORTH OF RAILROAD EXPOSURE AREA

The dose calculations and corresponding blood lead levels for exposure to lead through ingestion of home-produced food using depth-weighted soil EPCs are presented in Tables NORR-B1.5e and NORR-B1.5f in Attachment NORR-B1

The dose calculations and corresponding blood lead levels for exposure to lead through ingestion of home-produced food using area-weighted soil EPCs are presented in Tables NORR-B2.5e and NORR-B2.5f in Attachment NORR-B2.

Concentration of COPC in Produce

$$C_p = C_{dep} + C_{trans}$$

$$C_{dep} = \frac{Dep \times IF}{k \times Y} \times (1 - e^{-kT})$$

$$Dep = C_{air} \times Dep\text{-}rate \times 86,400 \text{ s/day}$$

$$C_{air} = \frac{C_s}{PEF}$$

$$C_{trans} = UF \times C_s$$

Where:

C_{air} = Concentration of chemical in air. Calculated as the outdoor airborne particulate concentration (Tables 4.2a through 4.2b) [mg/m³].

C_{dep} = Concentration of COPC in plant/produce due to direct deposition; equal to zero for protected and root crops [mg/kg]

C_p = Concentration of COPC in plant/produce [mg/kg]

C_s = Concentration of COPC in surface or shallow soil [mg/kg]

C_{trans} = Concentration of COPC in plant/produce due to translocation [mg/kg]

Dep = Deposition rate on affected vegetation per day [mg/m²-day]

Dep-rate = Default value for deposition on affected vegetation from uncontrolled sources [0.05 m/s]

IF = Interception Fraction [0.2 for leafy crops, 0.1 for exposed crops, unitless]

k = Weathering Constant [0.1, days⁻¹]

PEF = Soil-to-Air Particulate Emission Factor [m³/kg]

T = Growth period [45 days for leafy crops, 90 days for exposed crops]

UF = COPC-specific root uptake factor [unitless]

Y = Yield [2 kg/m²]

<p><i>Dose to Animal Through Inhalation (D_{inh})</i></p> $D_{inh} = BR \times C_{air}$

Table NORR-C.2b**Equations used to Calculate Concentrations of Volatile COPCs in Animal Products****Soil Human Health and Ecological Risk Assessment****PG&E Topock Compressor Station****Needles, California**

Where:

BR = Breathing rate of food animal [m^3/day]

C_{air} = Concentration of COPC in air. Calculated as the outdoor air vapor concentration (Tables 4.2a through 4.2d) [mg/m^3].

C_{fa} = Concentration of COPC in food animal [mg/kg]

C_{feed} = Concentration of COPC in animal feed [mg/kg]

$C_{\text{p,vol(avg)}}$ = Concentration of COPC in plant/produce due to deposition of volatile COPCs in outdoor onto plant tissues, averaged across all plant types (i.e., exposed, leafy, protected, and root) [mg/kg]

D_{inh} = Total dose to food animal through inhalation [kg/day]

D_{feed} = Total dose to food animal through feed ingestion [kg/day]

D_{past} = Total dose to food animal through pasture grazing [kg/day]

D_{soil} = Total dose to food animal through ingestion of soil [kg/day]

D_{total} = Total Dose of COPC to food animal [kg/day]

FG = Fraction of animal diet provided by grazing [unitless]

FI = Animal daily food intake [kg/day]

IF = Interception fraction [0.7, unitless]

k = Weathering Constant [0.1, days^{-1}]

L = Fraction of feed that is grown on-Site [5% for poultry]

PEF = Soil-to-Air Particulate Emission Factor [m^3/kg]

T_{co} = COPC-specific food animal transfer coefficient [unitless]

VF = Soil-to-Air Volatilization Factor [m^3/kg]

Y = Yield [$2 \text{ kg}/\text{m}^2$]

TABLE NORR-C.3
COPC-Specific Default Values for Home-Produced Food Exposure Pathways

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

COPC	COPC-Specific Values ^a					
	Root Uptake Factor (UF)				Transfer Coefficient (T _{co})

Notes:

^a COPC-specific values are default values recommended by California Environmental Protection Agency (Cal/EPA) Office of Environmental Health Hazard Assessment (OEHHA 2015).

Abbreviations:

bgs = below ground surface.
COPC = Constituent of Potential Concern.
mg/kg = milligrams per kilogram.
NS = Not sampled at depths evaluated for homegrown produce/animal product exposure pathways.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Office of Environmental Health Hazard Assessment (OEHHA). 2015. *Air Toxics Hot Spots Program, Risk Assessment Guidelines, Guidance Manual for Preparation of Risk Assessments*. February.

Table NORR-C.4

Equation used to Calculate Dose from Ingestion of Home-Produced Food: Hypothetical Future Resident

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

Dose to Receptor via the Food Pathway

$$DOSE_{f(agegroup)} = C_f \times IR_{age\ group} \times L \times \frac{EF}{365} \times CF$$

Where:

C_f = Concentration of COPC in Food Product [mg/kg] (Equations used to calculate C_f are presented in Tables C.2a through C.3b)

CF = Conversion Factor [mg/kg to mg/g]

$DOSE_{fa(age-group)}$ = Age-specific dose via the food ingestion pathway [mg/kg-day]

EF = Exposure Frequency [days/year]

IR = Food-Specific Ingestion Rate, age-specific [g food/kg-body weight per day](Food/age-specific ingestion rates are presented in Table C.4).

L = Fraction of food type that is home-produced [0.151 for poultry, 0.214 for eggs, and 0.235 for produce, unitless]

Table NORR-C.5

Food Ingestion Rates for Home-Produced Food

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

Food Category	Hypothetical Future Resident Scenario					
	Age-Adjusted Adult			Child		Adult
	Age 0<2 (g/kg-day)	Age 2-16 (g/kg-day)	Age 16-26 (g/kg-day)	Age 0<2 (g/kg-day)	Age 2-6 (g/kg-day)	Age > 16 (g/kg-day)
Produce						
Exposed Produce	30.2	5.9	5.9	30.2	21.7	5.6
Leafy	10.8	3.2	3.2	10.8	7.9	3.4

APPENDIX ICS SOIL HHERA FOR THE INSIDE COMPRESSOR STATION EXPOSURE AREA

Topock Compressor Station
Needles, California

October 2019

A large, solid orange geometric shape, resembling a stylized triangle or a section of a larger triangle, is positioned in the bottom right corner of the page. It is composed of two overlapping triangular shapes, creating a complex, angular form. A thin white line runs diagonally across the shape, and a thin white horizontal line runs across the page, intersecting the shape.

1 INTRODUCTION

This appendix presents the human health risk assessment (HHRA) for the soil potential exposure area located inside the Topock Compressor Station (TCS) in Needles, California. This exposure area inside the compressor station is referred to as the ICS potential exposure area. An ecological risk assessment (ERA) was not conducted for the ICS potential exposure area because ecological habitat is not present inside the fenceline of the TCS. The ICS potential exposure area, shown on Figure ICS-1.1, is approximately 15 acres in total and is located inside the compressor station fenceline. Sample locations for ICS are identified in Table ICS-1.1 of this appendix (as well as on Figure 3-2 of the Soil Human Health and Ecological Risk Assessment Report [“main report”]). Available soil data for the ICS potential exposure area were used to conduct a quantitative forward HHRA as presented herein. A summary of the HHRA results is presented in Section 5 of the main report.

Descriptions of the physical location and characteristics of the ICS potential exposure area and the HHRA methodologies are provided in the main report and the final Human Health and Ecological Risk Assessment Work Plan (RAWP) documents (Arcadis U.S., Inc. [Arcadis] 2008, 2009, 2015) and are not repeated in this appendix. Detailed discussions of the historical uses and sampling and analysis are presented in the main report.

This appendix summarizes site use, data evaluation, potential receptors, potential exposure pathways, and results of the HHRA risk characterization for soil in the ICS potential exposure area. Tables and figures specific to the ICS HHRA are presented in this appendix.

1.1 Summary of Site Use

The TCS is fenced and occupies approximately 15 acres of a 65-acre parcel of Pacific Gas and Electric Company (PG&E) owned land. The investigation areas inside the TCS included in the risk assessment are presented on Figure 2-1b of the main report. The specific investigation areas inside the TCS addressed in the HHRA include:

SWMU 5 (Sludge Drying Bed)	AOC 20 (Industrial Floor Drains)
SWMU 6 (Chromate Reduction Tank)	AOC 21 (Round Depression Near Sludge Drying Bed)
SWMU 8 (Process Pump Tank)	AOC 22 (Unidentified Three-Sided Structure)
SWMU 9 (Transfer Pump)	AOC 23 (Former Water Conditioning Building)
SWMU 11 (Former Sulfuric Acid Tanks)	AOC 24 (Stained Area and Former API Oil/Water Separator)
AOC 5 (Cooling Tower A)	AOC 25 (Compressor and Generator Engine Basements)
AOC 6 (Cooling Tower B)	AOC 26 (Former Scrubber Oil Sump)
AOC 7 (Hazardous Materials Storage Area)	AOC 32 (Oil Storage Tanks and Waste Oil Sump)
AOC 8 (Paint Shed)	
AOC 13 (Unpaved Area Within the TCS)	
AOC 15 (Auxiliary Jacket Cooling Water Pumps)	

APPENDIX ICS
SOIL HHERA FOR THE INSIDE COMPRESSOR STATION EXPOSURE AREA

AOC 16 (Former Sandblast Shelter)	AOC 33 (Potential Former Burn Area Near AOC 17)
AOC 17 (Onsite Septic System)	Unit 4.3 (Oily Water Holding Tank)
AOC 18 (Combine Wastewater Transference Pipelines)	Unit 4.4 (Oil/Water Separator)
AOC 19 (Former Cooling Liquid Mixing Area and Former Hotwell)	Unit 4.5 (Portable Waste Oil Holding Tank)
	Portions of AOC 4 Inside the TCS Fenceline
	Perimeter Area

The primary sources of contamination inside the TCS are likely to be historical incidental spills during operations (CH2M HILL Inc. [CH2M] 2006, 2013). The quantity of spills released, if any, is unknown but is believed to be relatively small. Any spills or incidental leaks would have quickly been addressed due to the inherent hazards associated with chemical spills. It is unknown whether a large release occurred that could have reached the storm drain system and been discharged outside the fenceline. Large portions of the ICS exposure area are paved or covered by buildings or gravel. Until approximately 1964, cooling-water blowdown containing hazardous constituents was directly discharged to Bat Cave Wash. The primary source media inside the TCS is surface soil.

.

2 DATA EVALUATION AND COPC SELECTION

This section summarizes the data considered for the ICS HHRA and presents the constituents of potential concern (COPCs) for human health selected for the ICS potential exposure area.

Soil sampling locations at the ICS potential exposure area are presented on Figure ICS-1.1 and in Table ICS-1.1. Note that several locations along the perimeter of the TCS fenceline were included in the ICS potential exposure area, as data for these locations were collected to support site characterization of areas of concern (AOCs) within the TCS. The data from these sampling locations (AOC16-5, PA-01, PA-07, and PA-13 through PA-17) were evaluated for the ICS potential exposure area, for the potential exposure area outside the compressor station (Appendix OCS), and for individual AOC potential exposure areas along the fenceline (Appendices AOC1, AOC11, and AOC27). Soil from these locations could potentially migrate via surface water runoff to areas outside the fenceline of the TCS. The data were evaluated based on methodology described in the RAWP documents (Arcadis 2008, 2009, 2015). Details of the soil sampling and data quality evaluation will be presented in the forthcoming Remedial Facility Investigation/Remedial Investigation Volume 3 Report currently being prepared by Jacobs. The ICS HHRA evaluated all constituents detected in the soil as presented in the soil investigation data packages provided to the U.S. Department of the Interior (PG&E 2018). Only soil data for 0 to 10 feet (ft) below ground surface (bgs) were included in the ICS HHRA. Because potential soil contact does not extend below 10 ft bgs for the baseline scenario, deeper soil data (i.e., greater than 10 ft bgs) were excluded from the risk evaluation, as noted in Table ICS-1.1.

Following the steps outlined in Section 3 of the main report, soil data considered usable for the risk assessment were identified and used in the quantitative HHRA. For the ICS potential exposure area, all available soil data are presented in Attachment ICS-A1. For the ICS potential exposure area, soil data are available from 863 samples, of which soil data from 787 samples from 0 to 10 ft bgs were considered for use in the HHRA. Because potential soil contact does not extend below 10 ft bgs, data from 76 samples from deeper soil (i.e., greater than 10 ft bgs) were excluded from the HHRA, as noted in Table ICS-1.1.

Within the ICS potential exposure area risk assessment dataset, analytical results for some polycyclic aromatic hydrocarbons (PAHs) and polychlorinated biphenyls (PCBs) in 27 samples received an “R” data qualifier; therefore, these results were rejected from use in the HHRA. The ICS potential exposure area samples with at least one rejected analytical result include the following sample IDs:

AOC15-1-18000	AOC4-30-3157	AOC6-7-14014
AOC15-1-18001	AOC4-32-3164	AOC6-8-14015
AOC19-10-22000	AOC5-4-13010	SWMU11-3-32004
AOC19-10-22001	AOC5-4-13011	SWMU11-3-32005
AOC19-11-22018	AOC5-5-13012	SWMU5-2-29002
AOC19-5-22003	AOC5-5-13013	SWMU5-2-29003
AOC19-6-22006	AOC6-2-14003	AOC19-7-22008
AOC6-5-14011	AOC6-2-14004	AOC19-7-22010
AOC19-8-22011	AOC6-7-14013	AOC6-5-14010

Data processed for the HHRA (e.g., calculation of total concentrations for benzo(a)pyrene equivalent [B(a)PEQ], PCBs, and dioxin/furan toxicity equivalents [TEQ]) are described in Section 3 of the main report.

APPENDIX ICS

SOIL HHRA FOR THE INSIDE COMPRESSOR STATION EXPOSURE AREA

The process for identifying COPCs included in the HHRA is detailed in Section 3.4 of the main report. COPCs were selected for the ICS potential exposure area using soil data encompassing all relevant exposure depths for the HHRA (i.e., 0 to 10 ft bgs for ICS) as presented in Attachment ICS-A1. Metals, B(a)PEQ, and dioxin TEQ were above background levels in the ICS potential exposure area soil (0 to 10 ft bgs) and therefore are included as COPCs evaluated in the HHRA. Carcinogenic PAHs (i.e., benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, dibenzo[a,h]anthracene, chrysene, and indeno[1,2,3-cd]pyrene) associated with B(a)PEQ are also selected as COPCs in the HHRA for the evaluation of the noncancer endpoint for each individual PAH. All other detected organic constituents in the ICS potential exposure area soil are included as COPCs in the HHRA. COPCs selected for the ICS HHRA are summarized in Tables ICS-2.1a through ICS-2.1d for the four soil exposure depths included in the baseline evaluations and are discussed further in Section 4.2.

For soil gas, COPCs included all volatile organic compounds (VOCs) detected in soil gas, as presented in Attachment ICS-A2 and summarized in Section 4.2 and Table ICS-2.2.

3 EXPOSURE POINT CONCENTRATIONS

Depth-weighted and area-weighted exposure point concentrations (EPCs) for COPCs in soil at the ICS potential exposure area were calculated as described in Section 4.2 of the main report. For the ICS potential exposure area, one scenario was evaluated: Baseline (no scouring).

Four exposure depths were evaluated:

1. Surface soil (0 to 0.5 ft bgs)
2. Shallow soil (0 to 3 ft bgs)
3. Subsurface I soil (0 to 6 ft bgs)
4. Subsurface II soil (0 to 10 ft bgs).

For the ICS potential exposure area, the depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment ICS-A2. The summary statistics for these soil depth-weighted datasets and depth-weighted EPCs were calculated consistent with the RAWP documents (Arcadis 2008, 2009, 2015). Per the RAWP, area-weighted EPCs for the HHRA are evaluated only if depth-weighted EPCs suggest that cumulative cancer risks and/or noncancer hazards may be significant for any given HHRA exposure scenario (i.e., cumulative cancer risks exceed a 10^{-6} cancer risk level, and/or the noncancer hazard index [HI] exceeds 1). For the ICS potential exposure area, area-weighted EPCs were deemed necessary for the HHRA and, therefore, were calculated. The area-weighted data used in the calculation of area-weighted EPCs are presented in Attachment ICS-A3.

If the soil dataset had fewer than four detected values (i.e., concentrations reported above the detection limit) or fewer than eight total observations, the EPC defaulted to the maximum depth-weighted concentration in that dataset.

Table ICS-3.1 includes soil summary statistics for constituents measured at the ICS potential exposure area¹ and detected at least once, and depth- and area-weighted EPCs for COPCs calculated using depth-weighted data from the four exposure depths listed above. Table ICS-3.1 also presents the basis of the calculated depth- and area-weighted EPCs, including whether the EPC is based on the maximum detected concentration.

For VOCs detected in at least one soil gas sample, the detected concentration at each sampled depth of each soil gas sampling location was used as the EPC. For sampling locations where a VOC was not detected (but detected elsewhere), one-half the detection limit was used as the EPC. Summary statistics for VOCs detected in soil gas are presented in Table ICS-2.2; the EPCs for VOCs detected in soil gas used in the estimate of risks and hazards are presented in Table ICS-B1.5 of Attachment ICS-B1.

¹ The list of constituents shown in Table ICS-3.1 is based on analytes that were detected at least once at the site (including all exposure areas inside or outside the TCS) and measured at the ICS potential exposure area.

4 HUMAN HEALTH RISK ASSESSMENT

This section summarizes the HHRA approach, presents the COPC, EPC, risk, and hazard summary tables; and discusses the results of the risk characterization and uncertainties in the risk assessment for the ICS potential exposure area. Details of the overall HHRA approach are presented in Section 5 of the main report. Dose, exposure concentration (EC), risk, and hazard calculation tables for potential human health receptors are presented in Attachments ICS-B1 and ICS-B2 for depth- and area-weighted EPCs, respectively.

4.1 Human Health Conceptual Site Model

Following the steps outlined in Section 5.5 of the main report, risks were estimated for potentially complete and significant exposure pathways identified in the human health conceptual site model (CSM) for receptors potentially exposed to COPCs in soil present at the ICS potential exposure area. These included:

- **Commercial Workers** – Incidental ingestion of soil, dermal contact with soil, inhalation of particulates and VOC vapors in ambient outdoor air from soil, and inhalation of VOC vapors in indoor air from soil gas.
- **Short- and Long-Term Maintenance Workers** – Incidental ingestion of soil, dermal contact with soil, and inhalation of particulates and VOC vapors in ambient outdoor air from soil.

Potential exposure pathways considered incomplete or insignificant were not quantitatively evaluated and are discussed in Section 5.3.1 of the main report.

4.2 Constituents of Potential Concern

COPCs for the ICS potential exposure area were selected in accordance with the RAWP (Arcadis 2008) and as described in Section 2 of this appendix and Section 3.4 of the main report. COPCs for the four exposure depths evaluated are summarized in Table ICS-4.1. For soil gas, COPCs included all VOCs detected in soil gas data and are presented in Table ICS-2.2.

COPCs in soil included metals (antimony, hexavalent chromium, total chromium, copper, lead, mercury, molybdenum, silver, thallium, and zinc), inorganic compounds (cyanide), VOCs (acetone, chloroform, methyl acetate, methylene chloride, toluene, and xylenes, total), semi-volatile organic compounds (SVOCs; bis [2-ethylhexyl] phthalate), PAHs, pesticides (4,4-dichlorodiphenyldichloroethylene [4,4-DDE], 4,4-dichlorodiphenyltrichloroethane [4,4-DDT], alpha-chlordane, and gamma-chlordane), PCBs, total petroleum hydrocarbon (TPH) as diesel, TPH as motor oil, and dioxin TEQ in surface, shallow, subsurface I, and/or subsurface II soil.

COPCs in soil gas included 1,1-dichloroethene, 1,3-dichlorobenzene, acetone, benzene, carbon disulfide, carbon tetrachloride, chloromethane, chloroform, ethylbenzene, m,p-xylenes, methyl ethyl ketone, methylene chloride, o-xylene, tetrachloroethene, toluene, and trichloroethene.

4.3 Exposure Point Concentration Summary

For the potentially complete and significant exposure pathways identified in the CSM, EPCs were calculated as described in Section 4.2 of the main report and presented in Section 3 of this appendix. Depth-weighted

data used in the calculation of depth- and area-weighted EPCs are presented in Attachment ICS-A. Depth-weighted EPCs for COPCs in soil and estimated outdoor air concentrations associated with dust used to estimate risk in the HHRA are summarized in Tables ICS-4.2a through ICS-4.2d for the four exposure depths evaluated. Area-weighted EPCs for COPCs in soil and estimated outdoor air concentrations associated with dust used to estimate risk in the HHRA are summarized in Tables ICS-4.3a through ICS-4.3d for the four exposure depths evaluated.

As described in detail in Section 5.3.3 of the main report, the following exposure depths and corresponding EPC datasets were used to evaluate potential exposure to COPCs in soil for potential human receptors:

- **Commercial Workers** – surface and shallow soil
- **Short- and Long-Term Maintenance Workers** – surface, shallow, subsurface I and subsurface II soil.

EPCs for COPCs in soil gas and associated estimated indoor air concentrations used to estimate risk in the HHRA are summarized in Table ICS-B1.5 of Attachment ICS-B1.

4.4 Estimation of Dose

The EC and chronic daily intake (CDI) for carcinogenic and noncarcinogenic effects were calculated, as described in Section 5.5.1 of the main report, for COPCs in soil for potentially complete exposure pathways. The calculated EC and CDI values using depth-weighted EPCs are presented in Tables ICS-B1.1a and ICS-B1.1b (carcinogenic effects) and Tables ICS-B1.2a and ICS-B1.2b (noncarcinogenic effects) in Attachment ICS-B1 for the short- and long-term maintenance workers evaluated. The calculated EC and CDI values using area-weighted EPCs are presented in Table ICS-B2.1 (carcinogenic effects) and ICS-B2.2 (noncarcinogenic effects) in Attachment ICS-B2 for the long-term maintenance workers evaluated. EC and CDI values were not calculated for the commercial worker because a screening approach was used to estimate risks and hazards for this receptor, as described in Section 5.5.2 of the main report.

Exposure parameters used in the dose calculations are presented in Table 5-1 of the main report.

4.5 Toxicity Assessment

The toxicity assessment characterizes the relationship between the magnitude of exposure to a constituent and the potential for adverse health effects. More specifically, the toxicity assessment identifies agency-promulgated or derived toxicity values that can be used to estimate the likelihood of adverse health effects occurring in humans at different exposure levels. The approach for the toxicity assessment was provided in Section 4.5 of the RAWP (Arcadis 2008) and in Section 4.2 of the RAWP Addendum 2 (Arcadis 2015). Consistent with regulatory risk assessment policy, adverse health effects resulting from potential chemical exposures are evaluated in two categories: carcinogenic effects and noncarcinogenic effects. The hierarchy of sources for the toxicity criteria to be used for the HHRA generally corresponds to the California Department of Toxic Substances Control (DTSC) guidance (2015). Toxicity values for carcinogenic and noncarcinogenic effects for COPCs selected and used for the HHRA are described in Section 5.4 of the main report and were used to estimate potential cancer risks and noncancer hazards.

4.6 Human Health Risk Characterization

For human receptors potentially exposed to soil present in the ICS potential exposure area, the estimated incremental lifetime cancer risks (ILCRs) and/or noncancer hazard quotients were calculated for each COPC and potentially complete exposure pathway. Cumulative ILCRs (i.e., sum of chemical-specific ILCRs for each exposure depth for a scenario) were calculated and compared to the DTSC point of departure for risk management decision of 1×10^{-6} . Risk management decisions may raise this criterion depending on site-specific conditions. As indicated in the National Oil and Hazardous Substances Pollution Contingency Plan (40 Code of Federal Regulations 300), cancer risks between one in a million and one hundred in a million probability of occurrence (1×10^{-6} and 1×10^{-4}) fall within a risk management range. This is generally referred to as the acceptable risk range. Within this estimated cancer risk range, there is flexibility for risk managers in deciding what action, if any, is necessary and appropriate for the protection of human health. Cumulative noncancer hazards (i.e., HIs) are calculated and compared to an HI of 1 (DTSC 2015). Chemical exposures that yield HIs of less than or equal to 1 are not expected to result in adverse noncancer health effects (United States Environmental Protection Agency [USEPA] 1989).

4.6.1 Risk Characterization for Exposure to Soil (Baseline Scenario and Depth-Weighted EPCs)

Table ICS-4.4 summarizes cumulative ILCRs and HIs estimated for exposure to soil for each potential human receptor at the ICS potential exposure area, calculated using depth-weighted EPCs. Table ICS-4.6 summarizes the maximum ILCRs and HIs estimated for exposure to soil gas for the commercial worker. The dose, EC, ILCR, and HI equations are presented in detail in Section 5.5.1 of the main report. The detailed cancer risk estimates (Tables ICS-B1.3a through ICS-B1.3c) and noncancer hazard calculations (Tables ICS-B1.4a through ICS-B1.4c) for potential exposure to COPCs in soil are presented in Attachment ICS-B1. The detailed cancer risk estimates and noncancer hazard calculations for potential exposure to COPCs in soil gas (Table ICS-B1.5) are also presented in Attachment ICS-B1.

For the ICS potential exposure area, risk and hazard estimates are summarized in the tables and discussed below. Assuming lifetime soil contact is limited to the ICS potential exposure area, and that soil contact occurs randomly over all potential areas within the fenceline, the depth-weighted estimated cumulative ILCRs for the short-term maintenance worker at all exposure depths are below the *de minimis* level of 1×10^{-6} . Additional potential exposures found to be *de minimis* include HI estimates for potential soil contact for all receptors and exposure depths evaluated (Tables ICS-B1.4a through ICS-B1.4c) and potential soil gas exposure for the commercial worker (Table ICS-B1.5). Risk estimates for potential soil contact are above *de minimis* levels but within the acceptable risk management range for commercial and long-term maintenance workers.

APPENDIX ICS
SOIL HHRA FOR THE INSIDE COMPRESSOR STATION EXPOSURE AREA

Commercial and Maintenance Workers

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		ICS Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Commercial Worker	Surface	1E-05	CrVI (1E-06) Total PCBs (9E-07) TEQ human (9E-06)	0.6	NA
	Shallow	9E-06	CrVI (8E-07) Total PCBs (8E-07) TEQ human (7E-06)	0.4	NA
	Soil Gas	7E-08 (Maximum)	NA	0.002 (Maximum)	NA
Short-Term Maintenance Worker	Surface	8E-07	NA	0.5	NA
	Shallow	7E-07	NA	0.4	NA
	Subsurface I	5E-07	NA	0.4	NA
	Subsurface II	4E-07	NA	0.4	NA
Long-Term Maintenance Worker	Surface	7E-06	CrVI (4E-06) Total PCBs (4E-07) TEQ human (2E-06)	0.1	NA
	Shallow	6E-06	CrVI (3E-06) Total PCBs (4E-07) TEQ human (2E-06)	0.1	NA
	Subsurface I	4E-06	CrVI (2E-06) Total PCBs (3E-07) TEQ human (1E-06)	0.09	NA
	Subsurface II	3E-06	CrVI (2E-06) Total PCBs (3E-07) TEQ human (1E-06)	0.09	NA

Notes:

CrVI = hexavalent chromium

NA = not applicable

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

Assuming that lifetime soil contact is limited to the ICS potential exposure area, and that potential soil contact occurs randomly over all AOCs within the fenceline, the depth-weighted estimated cumulative ILCRs for the commercial worker potentially exposed to COPCs in surface and shallow soil are above the point of departure for risk management decisions of 1×10^{-6} . However, these risk estimates are at or below 1×10^{-5} , which is well within the risk management range of 1×10^{-6} and 1×10^{-4} . For this receptor, risk estimates above *de minimis* levels were primarily attributed to hexavalent chromium, total PCBs, and dioxin TEQ in soil (Table ICS-B1.3a). The estimated cumulative ILCRs for the commercial worker potentially exposed to COPCs in soil gas via the vapor intrusion pathway are well below the point of departure for risk management decisions of 1×10^{-6} (Table ICS-B4.6; maximum sample location-specific estimated cumulative ILCR is 7×10^{-8}).

Assuming that lifetime soil contact is limited to the ICS potential exposure area, and that potential soil contact occurs randomly over all AOCs within the fenceline, the depth-weighted estimated cumulative ILCRs for the

short-term maintenance worker potentially exposed to COPCs in surface, shallow, and subsurface I, and subsurface II soil are below 1×10^{-6} , the point of departure for risk management decisions (Table ICS-B1.3b).

Assuming that lifetime soil contact is limited to the ICS potential exposure area, and that potential soil contact occurs randomly over all AOCs within the fenceline, the depth-weighted estimated cumulative ILCRs for the long-term maintenance worker potentially exposed to COPCs in surface, shallow, subsurface I, and subsurface II soil are above the point of departure for risk management decisions of 1×10^{-6} . However, these risks are below 1×10^{-5} , which is well within the risk management range of 1×10^{-6} and 1×10^{-4} . For this receptor, risk estimates above *de minimis* levels were primarily attributed to total PCBs and dioxin TEQ via the dermal contact and soil ingestion pathways and to hexavalent chromium via the inhalation of soil particulates pathway (Table ICS-B1.3c).

Elevated concentrations of hexavalent chromium (170 milligrams per kilogram [mg/kg] at AOC15-OS2), total PCBs (13.8 mg/kg at AOC4-28), and dioxin TEQ (2,000 nanograms per kilogram [ng/kg] at AOC13-33 and AOC5-4) appear to be localized at several locations within the ICS potential exposure area (see Figure ICS-1.1). Accordingly, the depth-weighted EPCs and corresponding estimated ILCRs for hexavalent chromium, total PCBs, and dioxin TEQ may be biased high. To reduce the uncertainty associated with this potential bias, area-weighted cumulative ILCRs for the commercial and long-term maintenance workers were estimated, as discussed below in Section 4.6.2.

Assuming that lifetime soil contact is limited to the ICS potential exposure area, and that potential soil contact occurs randomly over all AOCs within the fenceline, the depth-weighted estimated cumulative HIs for the commercial and short- and long-term maintenance workers (Table ICS-B1.4a and Table ICS-B1.4c, respectively) potentially exposed to COPCs in surface, shallow, subsurface I, and/or subsurface II soil are below an HI of 1. The estimated cumulative HI for the commercial worker potentially exposed to COPCs in soil gas via the vapor intrusion pathway are below an HI of 1.

The depth-weighted EPCs for lead in surface, shallow, subsurface I, and subsurface II soil at the ICS potential exposure area are not expected to result in an increase in blood lead levels above the Office of Environmental Health Hazard Assessment (OEHHA) benchmark value of 1 microgram per deciliter ($\mu\text{g/dL}$) in the fetus of a commercial worker (i.e., when compared to the commercial risk-based screening concentration of 320 mg/kg presented in Table ICS-B1.4a) or the fetus of a short- or long-term maintenance worker (i.e., calculated blood-lead level using the Adult Lead Model [ALM] as presented in Table ICS-B1.6a and Table ICS-B1.6b, respectively).

4.6.2 Risk Characterization for Exposure to Soil (Baseline Scenario and Area-Weighted EPCs)

Table ICS-4.5 summarizes cumulative ILCRs and HIs estimated for potential exposure to soil in the ICS potential exposure area for the commercial and long-term maintenance workers, calculated using area-weighted EPCs. Area-weighted ILCRs and HIs were estimated for commercial and long-term maintenance workers since depth-weighted estimated cumulative ILCRs were above 1×10^{-6} for these two potential receptors. The dose, EC, ILCR, and HI equations are presented in detail in Section 5.5 of the main report. The detailed cancer risk estimates (Tables ICS-B2.3a and ICS-B2.3b) and noncancer hazard calculations (Tables ICS-B2.4a and ICS-B2.4b) are presented in Attachment ICS-B2. The estimated cumulative ILCRs and HIs for the commercial worker potentially exposed to COPCs in soil gas via the vapor intrusion pathway are well

APPENDIX ICS
SOIL HHERA FOR THE INSIDE COMPRESSOR STATION EXPOSURE AREA

below the point of departure for risk management decisions of 1×10^{-6} and HI of 1 (Table ICS-B4.6). The results of the soil gas evaluation are discussed in Section 4.6.1 above and are not repeated in the summary of the soil area-weighted cumulative ILCRs and HIs provided below.

The area-weighted estimated cumulative ILCRs and HIs for each receptor selected for evaluation are summarized below. In general, depending on the depth interval, the area-weighted approach resulted in risk or hazard estimates ranging from 1.3 to 2.1 times lower than the depth-weighted estimates.

Commercial and Maintenance Workers

Baseline Area-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		ICS Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Commercial Worker	Surface	8E-06	CrVI (3E-07) Total PCBs (1E-06) TEQ human (7E-06)	0.5	NA
	Shallow	7E-06	CrVI (2E-07) Total PCBs (9E-07) TEQ human (6E-06)	0.4	NA
Long-Term Maintenance Worker	Surface	3E-06	CrVI (1E-06) Total PCBs (5E-07) TEQ human (2E-06)	0.1	NA
	Shallow	3E-06	CrVI (9E-07) Total PCBs (4E-07) TEQ human (2E-06)	0.09	NA
	Subsurface I	2E-06	CrVI (7E-07) Total PCBs (4E-07) TEQ human (1E-06)	0.08	NA
	Subsurface II	2E-06	CrVI (6E-07) Total PCBs (4E-07) TEQ human (1E-06)	0.08	NA

Notes:

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

Assuming that lifetime soil contact is limited to the ICS potential exposure area, and that potential soil contact occurs randomly over all AOCs within the fenceline, the area-weighted estimated cumulative ILCRs for the commercial worker potentially contacting surface and shallow soil are above the point of departure for risk management decisions of 1×10^{-6} . However, these risks are below 1×10^{-5} , which is well within the risk management range of 1×10^{-6} and 1×10^{-4} . For this receptor, risk estimates above the *de minimis* level were primarily attributed to hexavalent chromium, total PCBs, and dioxin TEQ in soil (Table ICS-B2.3a).

Assuming that lifetime soil contact is limited to the ICS potential exposure area, and that potential soil contact occurs randomly over all AOCs within the fenceline, the area-weighted estimated cumulative ILCRs for the long-term maintenance worker potentially contacting surface, shallow, subsurface I, and subsurface II soil are slightly above the point of departure for risk management decisions of 1×10^{-6} , but below 5×10^{-6} , which is well within the risk management range of 1×10^{-6} and 1×10^{-4} . For this receptor, risk estimates above the *de minimis* level were primarily attributed to total PCBs and dioxin TEQ in soil via the dermal contact and soil

ingestion pathways and to hexavalent chromium in soil via the inhalation of particulates pathway (Table ICS-B2.3b).

Assuming that lifetime soil contact is limited to the ICS potential exposure area, and that potential soil contact occurs randomly over all AOCs within the fenceline, the area-weighted estimated cumulative HIs for the commercial and long-term maintenance workers (Table ICS-B2.4a and Table ICS-B2.4b, respectively) potentially contacting surface, shallow, subsurface I, and/or subsurface II soil are less than 1.

The area-weighted EPCs for lead in surface, shallow, subsurface I, and subsurface II soil at the ICS potential exposure area are not expected to result in an increase in blood lead levels above the OEHHA benchmark value of 1 µg/dL in the fetus of a commercial worker (i.e., when compared to the commercial risk-based screening concentration of 320 mg/kg presented in Table ICS-B2.4a) or the fetus of a long-term maintenance worker (i.e., calculated blood-lead level using the ALM as presented in Table ICS-B2.5).

As stated previously, the area-weighted estimated cumulative ILCRs for the commercial and long-term maintenance workers, depending on the depth interval, are approximately 1.3 to 2.1 times lower than the depth-weighted estimated cumulative ILCRs. Therefore, assuming lifetime contact with soil in the ICS potential exposure area, estimated cumulative ILCRs are below 5×10^{-6} for the long-term maintenance workers and below 1×10^{-5} for the commercial worker, at all soil depths evaluated, when accounting for spatial bias in the EPCs. These values are well within the risk management range of 1×10^{-6} and 1×10^{-4} .

4.6.3 Uncertainties in the Risk Assessment

The risk assessment includes several uncertainties that warrant discussion. Many of the assumptions used in this risk assessment regarding the representativeness of the sampling data, human exposures, fate and transport modeling, and chemical toxicity are conservative, follow agency guidance, and reflect a 90th or 95th percentile value, rather than a typical or average value. The use of several conservative exposure assumptions and toxicity estimates can introduce considerable uncertainty into the risk assessment. By using conservative exposure assumptions or toxicity estimates, the assessment can develop a significant conservative bias that may result in the calculation of significantly higher cancer risks or noncancer hazards than are actually posed by the chemicals present in soil. These uncertainties are discussed in detail in Section 5.6 of the main report. Uncertainties applicable only to the risk assessment for the ICS potential exposure area are discussed below.

Uncertainties for the ICS potential exposure area include the use of the maximum depth-weighted soil concentration as the EPC. The maximum depth-weighted soil concentration was used for COPCs when the soil dataset contained fewer than four detected values (i.e., concentrations reported above the detection limit) or fewer than eight total observations as shown in Table ICS-3.1.

For the ICS potential exposure area, the maximum depth-weighted concentration was used as the EPC for the following COPCs:

- Surface soil: metals (antimony and thallium), VOCs (acetone, methyl acetate, toluene, and xylenes, total), one SVOC (bis [2-ethylhexyl] phthalate), one PAH (acenaphthylene), and pesticides (4,4-DDE, 4,4-DDT, alpha-chlordane, and gamma-chlordane)
- Shallow soil: VOCs (acetone, chloroform, methyl acetate, toluene, and xylenes, total), one SVOC (bis [2-ethylhexyl] phthalate), and pesticides (4,4-DDE, 4,4-DDT, alpha-chlordane, and gamma-chlordane)

APPENDIX ICS

SOIL HHRA FOR THE INSIDE COMPRESSOR STATION EXPOSURE AREA

- Subsurface I soil: VOCs (chloroform, methyl acetate, methylene chloride, toluene, and xylenes, total), one SVOC (bis [2-ethylhexyl] phthalate), and pesticides (4,4-DDE, 4,4-DDT, alpha-chlordane, and gamma-chlordane)
- Subsurface II soil: VOCs (chloroform, methyl acetate, methylene chloride, toluene, and xylenes, total), one SVOC (bis [2-ethylhexyl] phthalate), and pesticides (4,4-DDE, 4,4-DDT, alpha-chlordane, and gamma-chlordane).

The use of the maximum depth-weighted soil concentration as the EPC for the COPCs listed above may not appropriately represent exposures and resulting risks/hazards. This approach for estimating EPCs does not materially impact the results of the HHRA because the ICS potential exposure area COPCs with low frequency of detection and/or fewer than eight observations are not risk drivers at the site.

Much of the ICS potential exposure area is covered by buildings, pavement, or gravel. Therefore, the assumption that workers are exposed to all soil in the ICS potential exposure area is overly conservative. Furthermore, work practices are currently in place that limit the amount of exposure to dusts and soil and provide an added level of protection to all workers, above and beyond what is necessary to ensure full protection of the health of all PG&E workers at the TCS. Therefore, the estimated ILCRs and HIs associated with potential exposure to COPCs in soil at the ICS potential exposure area for workers are likely overestimated.

5 ECOLOGICAL RISK ASSESSMENT

As stated in Section 1 and consistent with the RAWP documents (Arcadis 2008, 2009, 2015), an ERA was not conducted for the ICS potential exposure area. Ecological habitat is not present; therefore, potential exposure pathways for ecological receptors in the ICS potential exposure area are incomplete. An ERA is not warranted for this area.

6 SUMMARY AND CONCLUSIONS FOR THE HHRA

Assuming that lifetime soil contact is limited to the ICS potential exposure area, and that potential soil contact occurs randomly over all AOCs within the fenceline, potential cumulative cancer risks and noncancer hazards for human receptors were estimated, as presented in Section 4. For ecological receptors, potential risks were not estimated because no ecological habitat is present in the ICS potential exposure area. Uncertainties related to the HHRA at the site are discussed in detail in Section 5.6 of the main report, and uncertainties specific to the ICS potential exposure area are discussed herein. For the ICS potential exposure area, a HHRA was conducted in accordance with the RAWP documents (Arcadis 2008, 2009, 2015). One scenario (baseline, i.e., no scouring) was evaluated, and risks were estimated for various potential receptors using depth-weighted EPCs and area-weighted EPCs.

At the ICS potential exposure area, the COPCs identified for the HHRA include metals (antimony, hexavalent chromium, total chromium, copper, lead, mercury, molybdenum, silver, thallium, and zinc), inorganic compounds (cyanide), VOCs (acetone, chloroform, methyl acetate, methylene chloride, toluene, and xylenes, total), SVOCs (bis [2-ethylhexyl] phthalate), PAHs, pesticides (4,4-DDE, 4,4-DDT, alpha-chlordane, and gamma-chlordane), PCBs, TPH as diesel, TPH as motor oil, and dioxins and furans in soil and VOCs in soil gas. Results regarding estimated risk associated with potential exposure to these COPCs in soil and soil gas are summarized in this section. The conclusions reached after completing the HHRA for the ICS potential exposure area are presented below.

Baseline Scenario Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		ICS Potential Exposure Area			
		Cumulative ILCR		HI	
		Depth-Wt	Area-Wt	Depth-Wt	Area-Wt
Commercial Worker	Surface	1×10^{-5} (CrVI, Total PCBs, and dioxin TEQ)	8×10^{-6} (CrVI, Total PCBs, and dioxin TEQ)	≤ 1	≤ 1
	Shallow	9×10^{-6} (CrVI, Total PCBs, and dioxin TEQ)	7×10^{-6} (CrVI, Total PCBs, and dioxin TEQ)	≤ 1	≤ 1
	Soil Gas	$\leq 1 \times 10^{-6}$	---	≤ 1	---
Short-Term Maintenance Worker	Surface	$\leq 1 \times 10^{-6}$	---	≤ 1	---
	Shallow	$\leq 1 \times 10^{-6}$	---	≤ 1	---
	Subsurface I	$\leq 1 \times 10^{-6}$	---	≤ 1	---
	Subsurface II	$\leq 1 \times 10^{-6}$	---	≤ 1	---
Long-Term Maintenance Worker	Surface	7×10^{-6} (CrVI, Total PCBs, and dioxin TEQ)	3×10^{-6} (CrVI, Total PCBs, and dioxin TEQ)	≤ 1	≤ 1
	Shallow	6×10^{-6} (CrVI, Total PCBs, and dioxin TEQ)	3×10^{-6} (CrVI, Total PCBs, and dioxin TEQ)	≤ 1	≤ 1

APPENDIX ICS
SOIL HHRA FOR THE INSIDE COMPRESSOR STATION EXPOSURE AREA

Baseline Scenario Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		ICS Potential Exposure Area			
		Cumulative ILCR		HI	
		Depth-Wt	Area-Wt	Depth-Wt	Area-Wt
	Subsurface I	4×10^{-6} (CrVI, Total PCBs, and dioxin TEQ)	2×10^{-6} (CrVI, Total PCBs, and dioxin TEQ)	≤ 1	≤ 1
	Subsurface II	3×10^{-6} (CrVI, Total PCBs, and dioxin TEQ)	2×10^{-6} (CrVI, Total PCBs, and dioxin TEQ)	≤ 1	≤ 1

Note:

--- = Area-weighted (area-wt) estimate not calculated because depth-weighted (depth-wt) estimate for the receptor was below *de minimis* level.

Depth-Weighted

Potential exposures that are below or at *de minimis* levels include the following:

- **HI ≤ 1 for all soil depths** – All potential receptors evaluated including Commercial Worker, Short-Term Maintenance Worker, and Long-Term Maintenance Worker
- **HI ≤ 1 for soil gas** – Commercial Worker
- **ILCR $\leq 1 \times 10^{-6}$ for all soil depths** – Short-term Maintenance Worker
- **ILCR $\leq 1 \times 10^{-6}$ for soil gas** – Commercial Worker.

Potential exposures that are above *de minimis* levels of HI > 1 and/or within the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **HI > 1 and ≤ 3** – None
- **HI > 3** – None
- **ILCR > 1×10^{-6} and $\leq 5 \times 10^{-6}$** – Long-Term Maintenance Worker (subsurface I and subsurface II)
- **ILCR > 5×10^{-6} and $\leq 1 \times 10^{-5}$** – Commercial Worker (surface and shallow) and Long-Term Maintenance Worker (surface and shallow)
- **ILCR > 1×10^{-5} and $\leq 1 \times 10^{-4}$** – None.

Potential exposures that are above the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **ILCR > 1×10^{-4}** – None.

Assuming lifetime soil contact is limited to the ICS potential exposure area, the depth-weighted estimated risks above *de minimis* levels for the commercial and long-term maintenance workers were due to hexavalent chromium, total PCBs, and dioxin TEQ. Accordingly, potential risks and hazards for these potential receptors were estimated using area-weighted EPCs. Note that the elevated concentrations of hexavalent chromium

APPENDIX ICS

SOIL HHRA FOR THE INSIDE COMPRESSOR STATION EXPOSURE AREA

(170 mg/kg at AOC15-OS2), total PCBs (13.8 mg/kg at AOC4-28), and dioxin TEQ (2,000 ng/kg at AOC13-33 and AOC5-4) appear to be limited to these locations within the ICS potential exposure area.

The area-weighted estimated ILCR and HI results for the commercial worker and long-term maintenance worker are provided below.

Area-Weighted

Potential exposures that are below or at *de minimis* levels include the following:

- **HI ≤ 1 for all soil depths** – All potential receptors evaluated including Commercial Worker and Long-Term Maintenance Worker
- **ILCR $\leq 1 \times 10^{-6}$ for all soil depths** – None.

Potential exposures that are above *de minimis* levels of HI > 1 and/or within the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **HI > 1 and ≤ 3** – None
- **HI > 3** – None
- **ILCR > 1×10^{-6} and $\leq 5 \times 10^{-6}$** – Long-Term Maintenance Worker (surface, shallow, subsurface I, and subsurface II)
- **ILCR > 5×10^{-6} and $\leq 1 \times 10^{-5}$** – Commercial Worker (surface and shallow)
- **ILCR > 1×10^{-5} and $\leq 1 \times 10^{-4}$** – None.

Potential exposures that are above the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **ILCR > 1×10^{-4}** – None.

OVERALL SUMMARY

The estimated cumulative ILCRs associated with potential exposure to COPCs in soil at the ICS potential exposure area using depth- and area-weighted EPCs for the short-term maintenance worker are below the *de minimis* level of 1×10^{-6} . The estimated cumulative HIs for all potential receptors and all soil depths evaluated using depth- and area-weighted EPCs are below an HI of 1. The cumulative ILCRs for the commercial and long-term maintenance workers estimated using depth- and area-weighted EPCs are above the point of departure for risk management decisions of 1×10^{-6} but at or below 1×10^{-5} , which is well within the risk management range of 1×10^{-6} and 1×10^{-4} . In general, depending on the depth interval, the area-weighted approach resulted in risk or hazard estimates ranging from 1.3 to 2.1 times lower than the depth-weighted estimates. As shown in the preceding table, this difference reduces the risk category for the long-term maintenance worker (surface and shallow) but does not substantially change the overall outcome for the risk estimates for this exposure area. The hazards are not noticeably impacted because all estimated cumulative HIs are less than 1 with both depth- and area-weighted evaluations.

The estimated cumulative ILCRs and HIs for the commercial worker potentially exposed to COPCs in soil gas via the vapor intrusion pathways are well below the point of departure for risk management decisions of 1×10^{-6} and an HI of 1, respectively. Furthermore, the depth- and area-weighted EPCs for lead in all soil at the ICS potential exposure area are not expected to result in an increase in blood lead levels above the OEHHA

APPENDIX ICS

SOIL HHRA FOR THE INSIDE COMPRESSOR STATION EXPOSURE AREA

benchmark value of 1 µg/dL for the fetus of a commercial worker, short-term maintenance worker, or long-term maintenance worker.

As indicated in Section 4.6.3, much of the ICS potential exposure area is covered by buildings, pavement, and gravel, and the assumption that workers are exposed to all soil in the ICS potential exposure area is overly conservative. Furthermore, work practices are currently in place that limit the amount of exposure to dusts and soil and provide an added level of protection to all workers, above and beyond what is necessary to ensure full protection of the health of all PG&E workers at the TCS. Therefore, the estimated ILCRs and HIs associated with potential exposure to COPCs in soil at the ICS potential exposure area for workers are overestimated and likely well below 1×10^{-5} and 1, respectively. PG&E follows all relevant and appropriate worker health and safety protocols and is in compliance with worker health and safety measures set forth by the Occupational Safety and Health Administration, as required by state and federal law. The results of the ICS HHRA are intended to provide additional information useful in identifying chemical hazards and appropriate controls, where necessary.

Table ICS-2.1c**Chemicals Included in the Risk Assessment: ICS Subsurface I Soil (0 to 6 feet bgs) for Baseline Scenario****Soil Human Health and Ecological Risk Assessment****PG&E Topock Compressor Station****Needles, California****Notes:**

- ^a Applicable to human health risk assessment (HHRA) only.
- ^b Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA. Human health toxicity values are available for iron and manganese, thus these chemicals are evaluated in the HHRA, if above background levels and have available toxicity values.
- ^c No toxicity values are available for sulfate, thus sulfate was not evaluated in the HHRA.
- ^d Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).
- ^e Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).
- ^f Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.
- ^g Dioxins are evaluated in toxic equivalents.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

mg/kg = milligrams per kilogram.

ng/kg = nanograms per kilogram.

ug/kg = micrograms per kilogram.

COPC = Constituent of Potential Concern.

ND = Not detected.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Table ICS-2.1d**Chemicals Included in the Risk Assessment: ICS Subsurface II Soil (0 to 10 feet bgs) for Baseline Scenario****Soil Human Health and Ecological Risk Assessment****PG&E Topock Compressor Station****Needles, California****Notes:**

- ^a Applicable to human health risk assessment (HHRA) only.
- ^b Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA. Human health toxicity values are available for iron and manganese, thus these chemicals are evaluated in the HHRA, if above background levels.
- ^c No toxicity values are available for sulfate, thus sulfate was not evaluated in the HHRA.
- ^d Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).
- ^e Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).
- ^f Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.
- ^g Dioxins are evaluated in toxic equivalents.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

mg/kg = milligrams per kilogram.

ng/kg = nanograms per kilogram.

ug/kg = micrograms per kilogram.

COPC = Constituent of Potential Concern.

ND = Not detected.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Table ICS-3.1
Summary Statistics and Exposure Point Concentrations for Soil Data in the Baseline (No Scouring) Scenario for
Inside Compressor Station (0-0.5 ft bgs, 0-3 ft bgs, 0-6 ft bgs, and 0-10 ft bgs)

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

			Summary Statistics for Depth-Weighted Soil Datasets												COPC?	Exposure Point Concentration ^{b,c}			
Constituent ^a	Units	Depth (ft bgs)	Detects / Total	FOD	Minimum Detect	Maximum Detect	Minimum Nondetect	Maximum Nondetect	Mean Detected	KM Mean	Median	Variance	Standard Deviation	Depth-Weighted UCL		Depth-Weighted UCL Basis	Area-Weighted UCL	Area-Weighted UCL Basis	
Miscellaneous																			
Sulfate	mg/kg	0-10	3 / 3	100	25	3690	NA	NA	1313	1313	224	4247497	2061	X	3690	Max Detect	3690	Max Detect	

Notes:

- ^a The constituent consists of analytes detected at least once at the Topock Compressor Station site and measured in soil in this exposure area.
- ^b If fewer than eight total locations and four total detected concentrations, the maximum depth-weighted concentration was selected as the EPC. Otherwise, the UCL was selected as the EPC.
- ^c EPCs and summary statistics were not calculated for some constituents (i.e., dioxin congeners and essential nutrients). Those data, if available, are presented in Attachment A1 of each exposure area-specific appendix.

Abbreviations:

- "--" = not applicable
- B(a)P equivalent = benzo(a)pyrene equivalent
- BCA = Bias-corrected accelerated bootstrap method
- COPC = constituent of potential concern
- DDE = Dichlorodiphenyldichloroethylene
- DDT = Dichlorodiphenyltrichloroethane
- EPC = exposure point concentration
- FOD = frequency of detection
- ft bgs = feet below ground surface
- KM = Kaplan-Meier
- µg/kg = micrograms per kilogram
- mg/kg = milligrams per kilogram
- NA = not applicable
- ng/kg = nanograms per kilogram
- PAH = polycyclic aromatic hydrocarbons
- PCB = polychlorinated biphenyls
- PG&E = Pacific Gas and Electric Company
- TCDD = Tetrachlorodibenzo-p-dioxin
- TEQ = toxic equivalent
- TPH = total petroleum hydrocarbons
- UCL = upper confidence limit
- X = COPC in the exposure depth interval
