Soil HHERA for AOC 11 Exposure Area

Pacific Gas and Electric Company

APPENDIX AOC11 SOIL HHERA FOR AOC 11 EXPOSURE AREA

Topock Compressor Station
Needles, California

October 2019

A large, solid orange geometric shape, resembling a stylized triangle or a section of a larger triangle, is positioned in the bottom right corner of the page. It is composed of two overlapping triangular areas, creating a complex, angular form that extends from the bottom edge towards the top right corner.

1 INTRODUCTION

This appendix presents the human health and ecological risk assessment (HHERA) for the Area of Concern 11 (AOC 11) potential soil exposure area located outside the Topock Compressor Station (TCS) in Needles, California. The AOC 11 potential exposure area, shown on Figure AOC11-1.1, is approximately 5.8 acres in total and includes sample locations shown in Table AOC11-1.1 of this appendix. Available soil data from the AOC 11 potential exposure area were used to conduct a quantitative HHERA as presented herein. A summary of the human health risk assessment (HHRA) and the ecological risk assessment (ERA) results are presented in Sections 5 and 6, respectively of the Soil Human Health and Ecological Risk Assessment Report (the “main report”). This appendix refers to “HHRA” when discussing specific information for assessing risks to human health, “ERA” when discussing specific information for assessing risks to potential ecological receptors, and “HHERA” when discussing topics that are common to both the HHRA and the ERA.

Descriptions of the physical location and characteristics of the AOC 11 potential exposure area and the HHERA methodologies are provided in the main report and the Human Health and Ecological Risk Assessment Work Plan (RAWP) documents (Arcadis U.S., Inc. [Arcadis] 2008, 2009, 2015) and are not repeated in this appendix. Detailed discussions of the historical uses and sampling and analysis are presented in the main report as well.

This appendix summarizes site use, data evaluation, potential receptors, potential exposure pathways, and the results of the HHERA risk characterization for soil in the AOC 11 potential exposure area. Tables and figures specific to the HHERA for the AOC 11 potential exposure area are also presented in this appendix.

1.1 Summary of Site Use

AOC 11, also referred to as the Topographic Low Areas. Low areas 11a, 11b, 11c, and 11d are located on Havasu National Wildlife Refuge property and one low topographic area (AOC11e) is on Pacific Gas & Electric Company (PG&E) property. The primary source of contamination to AOC 11 is runoff from surrounding areas.

Multiple storm drains discharge to this area, and several former TCS storm drains are believed to have discharged to this area in the past. In addition, portions of AOC 11 receive discharge from the station access road. An employee reported that a burn area formerly existed in the southern portion of this AOC near the station access road. AOC 11 also includes the topographic low area (AOC11e) is north of the plant access road near the Old Route 66 sign. This area receives run-off from the access road. A stormwater pipe that captures runoff from Interstate 40 (I-40) and National Trails Highway also discharges into AOC 11 north of AOC 11a immediately south of the I-40 overcrossing. Stormwater runoff from I-40 could have resulted in the release of total petroleum hydrocarbons (TPHs) and metals to this area (CH2M 2013).

The primary source of contamination to AOC 11 is runoff from the TCS, the access road to the TCS, potential railroad debris below the station access road (asphalt, a metal sign, refractory bricks, ceramic plates, glass resistors, and concrete were observed during 2008 field activities), the Transwestern Meter Station area, and I-40. Additionally, stormwater runoff from the TCS could have entered the stormwater drains that discharge to AOC 11.

If released, volatile organic compounds (VOCs) in surface soils would be expected to have been degraded by heat and light and are likely not present in significant quantities. Potential sources of dioxins and furans in the

APPENDIX AOC11

SOIL HHERA FOR AOC 11 EXPOSURE AREA

vicinity of the TCS may include historical industrial activities as well as other sources unrelated to TCS activities (i.e., unauthorized dumping and burning; regional wildfires; combustion of diesel and leaded gas; and exhaust from cars, trucks, and trains) (CH2M 2017a).

As a result of employee interviews conducted in late 2009/early 2010 and subsequent additional site reconnaissance, two new topographic low areas, a potential burn area, and a small new white powder area were identified.

- Two new topographic low areas that may receive runoff from the TCS were identified. Subarea 11f consists of the drainage area beginning near the current decontamination pad and Transwestern Meter Station and extending downslope to the low area across from AOC 11b. It captures a portion of runoff originating from the TCS that flows down the TCS access road. The other topographic low area (Subarea 11g) is located between the TCS access road and the Colorado River west of the Route 66 sign. This area may have also received runoff from the access road.
- According to interviews with former PG&E employees, fire training exercises were conducted near the location of the current decontamination pad and Transwestern Meter Station and involved burning primarily scrap wood. Fire drills were also held and reportedly expanded to include extinguishing diesel fires in a 55-gallon drum. This potential burn area is located in the potential drainage area for Subarea 11f.
- A small new white powder area was identified upslope of AOC 11e following the January 2010 rain event. Located on the steep slope below the northeastern portion of the compressor station, this area is not accessible by equipment. This white powder may represent a native mineral evaporite deposit. The white powder is no longer present.

The primary source medium for AOC 11 is surface soil. From surface soil, contaminants could have migrated to shallow and deeper soils. Shallow soils may act as a secondary source medium to subsurface soil, and subsurface soil may act as a secondary source medium to groundwater.

After storm events, water pools in AOC 11a (the largest topographic low area) and does not readily infiltrate. Historically, water may have also pooled behind the two check berms in AOC 11c and AOC 11e; while these structures have been breached and no longer retain water, accumulated fine-grained soils are present behind the berm at AOC 11c. Laterally, contaminants in soil would generally be expected to be limited to the area along the topographic drainages. With the exception of subarea 11g, all of the low points within this unit are terminal low points, and flow cannot exit AOC 11. At these low points, contaminants could potentially be driven deeper and potentially could reach groundwater.

Runoff down the station access road periodically reaches Subarea 11g. It is possible some flow during extreme storm events may result in runoff over the 11g bank and down the slope toward the Colorado River. However, there would be minimal contribution from the station to run-off flow under these extreme storm conditions.

Another potential source of contamination to AOC 11 may also include contaminated windblown dust. Contaminated surface soil (either within AOC 11 or from the adjacent TCS) may have been eroded by wind and deposited at the ground surface within AOC 11.

2 DATA EVALUATION AND COPC/COPEC SELECTION

This section summarizes the data considered for the AOC 11 potential exposure area HHERA and presents the constituents of potential concern (COPCs) for human health and constituents of potential ecological concern (COPECs) selected for the AOC 11 potential exposure area.

All soil sampling locations at the AOC 11 potential exposure area are presented on Figure AOC11-1.1 and in Table AOC11-1.1. The data were evaluated based on methodology described in the RAWP documents (Arcadis 2008, 2009, 2015). Details of the soil sampling and analysis will be presented in the forthcoming Draft Resource Conservation and Recovery Act Facility Investigation/ Remedial Investigation (RFI/RI) Report Volume 3 (currently being prepared by Jacobs).

Following the steps outlined in Section 3 of the main report, soil data considered usable for the risk assessment were identified and used in the quantitative HHERA. All available soil data for the AOC 11 potential exposure area are presented in Attachment AOC11-A1. For the AOC 11 potential exposure area, soil data are available from 193 samples, of which soil data from 179 samples from 0 to 10 feet below ground surface (ft bgs) were considered for use in the HHERA. Because potential soil contact does not extend below 10 ft bgs, deeper soil data (i.e., greater than 10 ft bgs) from 14 samples were excluded from the HHERA, as noted in Table AOC11-1.1.

Within this dataset, one polycyclic aromatic hydrocarbon (PAH) sample did not meet data quality criteria; therefore, nondetect results were rejected with an “R” data qualifier (will be discussed in the forthcoming Draft RFI/RI Report [currently being prepared by Jacobs]). This occurred for all PAHs in one sample (AOC11e-6-6172). Additionally, 1,2,3,7,8-pentachlorodibenzofuran results were rejected in one sample (SD-11-02).

Data processed for the HHERA (e.g., calculation of total concentrations for low molecular weight [LMW] and high molecular weight [HMW] PAHs, benzo(a)pyrene equivalent [B(a)PEQ], polychlorinated biphenyls [PCBs], and dioxin/furan toxicity equivalents [TEQ]) are described in detail in Section 3 of the main report.

The process for identifying COPCs and COPECs included in the HHERA is detailed in Section 3.4 of the main report. COPCs and COPECs were selected for the AOC 11 potential exposure area using soil data encompassing all relevant exposure depths for the HHERA (i.e., 0 to 10 ft bgs for the AOC 11 potential exposure area) presented in Attachment AOC11-A1. Inorganic compounds, LMW PAHs, HMW PAHs, B(a)PEQ, and dioxin TEQ were above background levels in AOC 11 potential exposure area soil (0 to 10 ft bgs), and therefore, are included as COPCs and/or COPECs in the baseline exposure depths evaluated in the HHERA. When B(a)PEQ was detected above the background level, carcinogenic PAHs (i.e., benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, dibenzo(a,h)anthracene, chrysene, and indeno(1,2,3-cd)pyrene) associated with B(a)PEQ are also selected as COPCs in the HHERA for the evaluation of the noncancer endpoint for each individual PAH. All other detected organic constituents in AOC 11 potential exposure area soil in the baseline exposure depths are included as COPCs and/or COPECs in the HHERA. COPCs and/or COPECs selected for exposure depths and scenarios evaluated in the HHERA for the AOC 11 potential exposure area are summarized in Tables AOC11-2.1a through AOC11-2.1d. The selected COPCs and COPECs are discussed further in Sections 4 and 5, respectively, of this appendix.

3 EXPOSURE POINT CONCENTRATIONS

Depth-weighted and area-weighted exposure point concentrations (EPCs) for COPCs/COPECs in soil at the AOC 11 potential exposure area were calculated as described in Section 4.2 of the main report. For the AOC 11 potential exposure area, one scenario was evaluated: Baseline (no scouring).

The following exposure depths were evaluated:

1. Surface soil (0 to 0.5 ft bgs)
2. Shallow soil (0 to 3 ft bgs)
3. Subsurface I soil (0 to 6 ft bgs)
4. Subsurface II soil (0 to 10 ft bgs).

The depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment AOC11-A2. The summary statistics for these AOC 11 potential exposure area soil depth-weighted datasets and depth-weighted EPCs were calculated consistent with the RAWP documents (Arcadis 2008, 2009, 2015). Per the RAWP documents, area-weighted EPCs for the HHRA are evaluated only if depth-weighted EPCs suggest that cumulative cancer risks and/or noncancer hazards may be significant for any given HHRA exposure scenario (cumulative cancer risks exceed a 10^{-6} cancer risk level, and/or the noncancer hazard index [HI] exceeds 1). Similarly, for the ERA, area-weighted EPCs are evaluated only if depth-weighted EPCs suggest potential risk to potential ecological receptors (i.e., hazard quotient [HQ] > 1 for any COPEC). For the AOC 11 potential exposure area, area-weighted EPCs were deemed necessary for either the HHRA or the ERA, and therefore, were calculated. The area-weighted data used in the calculation of area-weighted EPCs are presented in Attachment AOC11-A3.

In some cases, the area-weighted EPCs are greater than the depth-weighted EPCs in the AOC 11 potential exposure area, such as for hexavalent chromium, total chromium, and lead in surface soil. In these cases, the depth-weighted EPCs are based on an upper confidence limit (UCL) method, Land's H-statistic UCL (Land 1975) that can produce unstable results. Depending on the underlying data distribution, Land's H-statistic UCL values can overestimate or underestimate the true expected UCL value (United States Environmental Protection Agency [USEPA] 2015). The UCL method used to calculate the area-weighted EPC (bias-corrected and accelerated (i.e., BCA) bootstrap interval is resistant to such effects and provides a more reliable estimate of the UCL. This issue is discussed in further detail in Section 5.6.3.4 of the main report.

If the soil dataset had fewer than four detected values (i.e., concentrations reported above the detection limit) or fewer than eight total observations, the EPC defaulted to the maximum depth-weighted concentration in that dataset.

Soil summary statistics for constituents measured at the AOC 11¹ potential exposure area and depth- and area-weighted EPCs for COPCs/COPECs calculated using depth-weighted data from the four exposure depths listed above are presented in Table AOC11-3.1. These tables also present the basis of the calculated depth- and area-weighted EPCs, including if the EPC is based on the maximum detected concentration.

¹ The list of constituents shown in the main report Section 3 tables is based on analytes that were detected at least once at the site (including all potential exposure areas inside or outside the TCS) and measured at AOC 11.

4 HUMAN HEALTH RISK ASSESSMENT

This section briefly summarizes the HHRA approach; presents the COPC, EPC, risk, and hazard summary tables; and discusses the results of the risk characterization and uncertainties in the risk assessment for the AOC 11 potential exposure area. Details of the overall HHRA approach are presented in Section 5 of the main report. Dose, exposure concentration (EC), risk, and hazard calculation tables for potential human health receptors at the AOC 11 potential exposure area are presented in Attachment AOC11-B.

Risks/hazards estimated for an individual AOC/Solid Waste Management Unit (SWMU)/Undesignated Area (UA) potential exposure area like AOC 11 are not considered representative of the realistic or likely potential exposures for the human populations that could be present in the areas outside the TCS (such as maintenance workers, recreational users, and tribal users). Risks/hazards calculated separately for individual AOCs are conservative and likely overestimate site risks/hazards. As described in the RAWP documents (Arcadis 2008, 2009, 2015), these human populations would more likely be exposed randomly, over the course of a lifetime, to soil present in all individual AOC/SWMU/UA potential exposure areas located outside the TCS, rather than have a lifetime of contact limited to the area of a single potential exposure area. Therefore, estimated risk/hazards presented for individual AOC/SWMU/UA potential exposure areas are not believed to be representative of the potential health risks to humans potentially contacting the soil outside the TCS. Rather, the HHRA results presented in Appendix OCS for all AOC/SWMU/UA potential exposure areas located outside the TCS combined will help to inform risk management decisions for the site. The estimated risks and hazards associated with a lifetime of contact with soil only in AOC 11 potential exposure area are presented at the request of the agencies and are not suitable to provide the sole basis of risk management decisions to protect human health.

4.1 Human Health Conceptual Site Model

Following the steps outlined in Section 5.5 of the main report, risks were estimated for potentially complete and significant exposure pathways identified in the human health conceptual site model (CSM) for receptors potentially exposed to COPCs in soil present at the AOC 11 potential exposure area. The potential receptors and exposure pathways evaluated for the AOC 11 potential exposure area included:

- **Short- and Long-Term Maintenance Worker** – Incidental ingestion of soil, dermal contact with soil, inhalation of particulates and VOC vapors in ambient outdoor air from soil
- **Recreational User (child and/or adult campers, hikers, hunters, and off-highway vehicle [OHV] riders)** – Incidental ingestion of soil, dermal contact with soil, and inhalation of particulates and VOC vapors in ambient outdoor air from soil
- **Tribal User** – Inhalation of particulates and VOC vapors in ambient outdoor air from soil.

Potential exposure pathways considered incomplete or insignificant were not quantitatively evaluated and are discussed in Section 5.3.1 of the main report.

4.2 Constituents of Potential Concern

COPCs for the AOC 11 potential exposure area were selected in accordance with the RAWP documents (Arcadis 2008, 2009, 2015) and as described in Section 3.4 of the main report. The COPC selection process using soil data encompassing all relevant exposure depths for the HHRA (i.e., 0 to 10 ft bgs for the AOC 11 potential exposure area) are presented in Attachment AOC11-A. COPCs for the four exposure depths and one scenario (baseline) evaluated for the HHRA for the AOC 11 potential exposure area are summarized in Table AOC11-4.1 (details are presented in Tables AOC11-2.1a through AOC11-2.1d).

COPCs included metals (arsenic, hexavalent chromium, total chromium, copper, lead, mercury, and zinc), one VOC (methyl acetate), PAHs, pesticides (4,4-dichlorodiphenyldichloroethylene [DDE], alpha-chlordane, dieldrin, and gamma-chlordane), PCBs, TPH as diesel, TPH as motor oil, and dioxin TEQ in surface, shallow, subsurface I, and/or subsurface II soil.

4.3 Exposure Point Concentration Summary

For the potentially complete and significant exposure pathways identified in the CSM, EPCs were calculated as described in Section 4.2 of the main report and presented in Section 3 of this appendix. Depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment AOC11-A. Depth- and area-weighted EPCs for COPCs in soil and estimated outdoor air concentrations associated with dust and vapors and used to estimate risk in the HHRA are summarized in Tables AOC11-4.2a through AOC11-4.2h and Tables AOC11-4.3a through AOC11-4.3f, respectively, for the four exposure depths evaluated.

As described in detail in Section 5.3.3 of the main report, the following exposure depths and corresponding EPC datasets were used to evaluate potential exposure to COPCs in soil for potential human receptors:

- **Short- and Long-Term Maintenance Worker** – surface, shallow, subsurface I, and subsurface II soil
- **Recreational User (child and/or adult campers, hikers, hunters, and OHV riders)** – surface and shallow soil
- **Tribal User** – surface and shallow soil.

4.4 Estimation of Dose

The EC and chronic daily intake (CDI) for potential carcinogenic and noncarcinogenic effects were calculated, as described in Section 5.5.1 of the main report, for COPCs in soil for potentially complete exposure pathways. The calculated EC and CDI values using depth-weighted EPCs are presented in Tables AOC11-B1.1a through AOC11-B1.1g (carcinogenic effects) and Tables AOC11-B1.2a through AOC11-B1.2g (noncarcinogenic effects) in Attachment AOC11-B1 for the potential receptors evaluated. The calculated EC and CDI values using area-weighted EPCs are presented in Tables AOC11-B2.1a through AOC11-B2.1d (carcinogenic effects) and Tables AOC11-B2.2a through AOC11-B2.2d (noncarcinogenic effects) in Attachment AOC11-B2 for the potential receptors evaluated. Exposure parameters used in the dose calculations are presented in Table 5-1 of the main report.

4.5 Toxicity Assessment

The toxicity assessment characterizes the relationship between the magnitude of exposure to a constituent and the potential for adverse health effects. More specifically, the toxicity assessment identifies agency-promulgated or derived toxicity values that can be used to estimate the likelihood of adverse health effects occurring in humans at different exposure levels. The approach for the toxicity assessment was provided in Section 4.5 of the RAWP (Arcadis 2008) and in Section 4.2 of the RAWP Addendum 2 (Arcadis 2015). Consistent with regulatory risk assessment policy, adverse health effects resulting from potential chemical exposures are evaluated in two categories: carcinogenic effects and noncarcinogenic effects. The hierarchy of sources for the toxicity criteria to be used for the HHRA generally corresponds to the California Department of Substance Control (DTSC) 2015 guidance. Toxicity values for carcinogenic and noncarcinogenic effects for COPCs selected and used for the HHRA are described in Section 5.4 of the main report and were used to estimate potential cancer risks and noncancer hazards.

4.6 Human Health Risk Characterization

For potential human receptors, assuming lifetime soil exposure is limited to the AOC 11 potential exposure area, the estimated incremental lifetime cancer risks (ILCRs) and/or noncancer HQs were calculated for each COPC and potentially complete exposure pathway. Estimated cumulative ILCRs (i.e., sum of chemical-specific ILCRs for each exposure depth for a scenario) were calculated and compared to the DTSC's point of departure for risk management decision of 1×10^{-6} . Risk management decisions may raise this criterion depending on site-specific conditions. As indicated in the National Oil and Hazardous Substances Pollution Contingency Plan (40 Code of Federal Regulations 300), cancer risks between one in a million and one hundred in a million probability of occurrence (1×10^{-6} and 1×10^{-4}) fall within a risk management range. This is generally referred to as the acceptable risk range. Within this estimated cancer risk range, there is flexibility for risk managers in deciding what action, if any, is necessary and appropriate for the protection of human health. Estimated cumulative noncancer hazards (i.e., HIs) are calculated and compared to an HI of 1 (DTSC 2015). Chemical exposures that yield HIs of less than or equal to 1 are not expected to result in adverse noncancer health effects (USEPA 1989).

4.6.1 Risk Characterization for Exposure to Soil (Baseline Scenario and Depth-Weighted EPCs)

Table AOC11-4.4 summarizes cumulative ILCRs and HIs estimated for exposure to soil for each potential human receptor at the AOC 11 potential exposure area, calculated using depth-weighted EPCs. The dose, EC, ILCR, and HI equations are presented in detail in Section 5.5.1 of the main report. The detailed cancer risk estimates (Tables AOC11-B1.3a through AOC11-B1.3g) and noncancer hazard calculations (Tables AOC11-B1.4a through AOC11-B1.4g) are presented in Attachment AOC11-B1.

Risk and hazard estimates for the AOC 11 potential exposure area are summarized in the tables and discussed below. Assuming lifetime soil contact is limited to the AOC 11 potential exposure area, the depth-weighted estimated cumulative ILCRs and/or HIs for each receptor potentially exposed to COPCs in soil at all exposure depths are below the *de minimis* levels of 1×10^{-6} and 1, respectively, for the short-term maintenance worker, hunter, and tribal user. Risk estimates for potential soil contact limited to the AOC 11 potential exposure area for lifetime exposure are above *de minimis* levels but within the acceptable risk

APPENDIX AOC11
SOIL HHERA FOR AOC 11 EXPOSURE AREA

management range for the long-term maintenance worker and certain recreational users (campers, hikers, and OHV riders).

Maintenance Workers

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 11 Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Short-Term Maintenance Worker	Surface	8E-07	NA	0.1	NA
	Shallow	8E-07	NA	0.1	NA
	Subsurface I	1E-06	NA	0.1	NA
	Subsurface II	8E-07	NA	0.1	NA
Long-Term Maintenance Worker	Surface	8E-06	As (5E-06) CrVI (5E-07) TEQ human (2E-06)	0.4	NA
	Shallow	8E-06	As (5E-06) CrVI (5E-07) TEQ human (2E-06)	0.4	NA
	Subsurface I	9E-06	As (5E-06) CrVI (1E-06) TEQ human (3E-06)	0.4	NA
	Subsurface II	8E-06	As (5E-06) CrVI (6E-07) TEQ human (3E-06)	0.4	NA

Notes:

As = arsenic

CrVI = hexavalent chromium

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

NA = not applicable

TEQ human = dioxin toxicity equivalents for humans

Assuming lifetime soil contact is limited to the AOC 11 potential exposure area, the depth-weighted estimated cumulative ILCRs for the short-term maintenance worker potentially exposed to COPCs in surface, shallow, subsurface I, and subsurface II soil are at or below the *de minimis* level of 1×10^{-6} , the point of departure for risk management decisions (Table AOC11-B1.3a).

For the long-term maintenance worker potentially exposed to COPCs in surface, shallow, subsurface I, and subsurface II soil, the depth-weighted estimated cumulative ILCRs are above the point of departure for risk management decisions of 1×10^{-6} , but within the risk management range of 1×10^{-6} and 1×10^{-4} . For this potential receptor, risk estimates above *de minimis* levels were primarily attributed to arsenic and dioxin TEQ in soil via the dermal contact and soil ingestion pathways and to hexavalent chromium in soil via the inhalation of particulates pathway (Table AOC11-B1.3b). The majority (i.e., approximately 80%) of the ILCRs for arsenic

APPENDIX AOC11
SOIL HHERA FOR AOC 11 EXPOSURE AREA

for the long-term maintenance worker (5×10^{-6}) is attributed to background concentrations of arsenic in soil (i.e., background cancer risk of 4×10^{-6} based on a background UCL of the mean of 4.5 milligrams per kilogram [mg/kg]).

Elevated concentrations of hexavalent chromium and dioxin TEQ appear in a few samples (in AOC11E-6-6172 and AOC11c-SS-2-6073 for hexavalent chromium; and AOC11e-4-6160, AOC11e-4-6161, and PA-12-01 for dioxin TEQ) in few areas of the AOC 11 potential exposure area. Accordingly, the depth-weighted EPCs and corresponding estimated ILCRs for hexavalent chromium and dioxin TEQ may be biased high. To reduce the uncertainty associated with this potential bias, area-weighted estimated cumulative ILCRs for the long-term maintenance workers were estimated, as discussed below in Section 4.6.2.

Assuming lifetime soil contact is limited to the AOC 11 potential exposure area, the depth-weighted estimated cumulative HIs for the short- and long-term maintenance workers (Tables AOC11-B1.4a and AOC11-B1.4b, respectively) potentially exposed to COPCs in surface, shallow, subsurface I, and subsurface II soil are below an HI of 1. The depth-weighted EPCs for lead in surface, shallow, subsurface I, and subsurface II soil at the AOC 11 potential exposure area are not expected to result in an increase in blood lead levels above the California Office of Environmental Health Hazard Assessment's (OEHHA's) benchmark value of 1 microgram per deciliter ($\mu\text{g}/\text{dL}$) in the fetus of a short- or long-term maintenance worker (Tables AOC11-B1.5a and AOC11-B1.5b, respectively).

Recreational Users

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 11 Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Camper	Surface	3E-06	As (2E-06) TEQ human (8E-07)	0.6	NA
	Shallow	3E-06	As (2E-06) TEQ human (1E-06)	0.6	NA
Hiker	Surface	6E-06	As (4E-06) TEQ human (2E-06)	1	NA
	Shallow	6E-06	As (4E-06) TEQ human (2E-06)	1	NA
Hunter	Surface	9E-07	NA	0.06	NA
	Shallow	9E-07	NA	0.06	NA
OHV Rider	Surface	3E-06	As (2E-06) TEQ human (9E-07)	0.2	NA
	Shallow	3E-06	As (2E-06) TEQ human (1E-06)	0.3	NA

Note:

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

APPENDIX AOC11

SOIL HHERA FOR AOC 11 EXPOSURE AREA

The depth-weighted estimated cumulative ILCRs for the hunter potentially exposed to COPCs in surface and shallow soil in the AOC 11 potential exposure area are below the *de minimis* level of 1×10^{-6} , the point of departure for risk management decisions. However, assuming lifetime soil contact is limited to the AOC 11 potential exposure area, the depth-weighted estimated cumulative ILCRs for the camper, hiker, and OHV rider potentially exposed to COPCs in surface and/or shallow soil are above the point of departure for risk management decisions of 1×10^{-6} , but within the risk management range of 1×10^{-6} and 1×10^{-4} . For these potential receptors, risk estimates above *de minimis* levels were primarily attributed to arsenic and dioxin TEQ in soil via the soil ingestion pathway (Tables AOC11-B1.3c thru AOC11-B1.3f).

Assuming lifetime soil contact is limited to the AOC 11 potential exposure area, the depth-weighted estimated HIs for the camper, hiker, and hunter, OHV rider (Tables AOC11-B1.4c through AOC11-B1.4f, respectively) potentially exposed to COPCs in surface and shallow soil under the baseline scenario are at or below an HI of 1.

A substantial proportion of the estimated risks above *de minimis* levels are attributable to background concentrations of arsenic in soil. Specifically, the majority of the ILCRs for arsenic for the camper (1.6×10^{-6} of 2×10^{-6} or approximately 80%), hiker (3.1×10^{-6} of 4×10^{-6} or approximately 78%), and OHV rider (1.7×10^{-6} of 2×10^{-6} or approximately 85%) is attributed to background concentrations of arsenic in soil. Considering the substantial contribution of background arsenic in soil to the estimated cumulative ILCRs for the camper, hiker, and OHV rider potentially exposed to surface and shallow soil, it is likely that incremental risks for site-related COPCs in soil are at or slightly above the lower end of the risk management range of 1×10^{-6} and 1×10^{-4} .

As previously discussed, elevated concentrations of dioxin TEQ appear in a few samples in a few areas of the AOC 11 potential exposure area. Accordingly, the depth-weighted EPCs and corresponding estimated ILCRs for dioxin TEQ may be biased high. To reduce the uncertainty associated with this potential bias, area-weighted estimated cumulative ILCRs for the camper, hiker, and OHV rider were estimated, as discussed below in Section 4.6.2.

The depth-weighted EPCs for lead in surface and shallow soil at the AOC 11 potential exposure area are not expected to result in an increase in blood lead levels above OEHHA's benchmark value of $1 \mu\text{g/dL}$ for child recreational users or the fetus of a hunter (Tables AOC11-B1.5c through AOC11-B1.5i).

Tribal User

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 11 Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Tribal User	Surface	6E-09	NA	0.0006	NA
	Shallow	6E-09	NA	0.0006	NA

Note:

ILCR and HI drivers are presented only for ILCRs above 1×10^{-6} and HIs above 1.

Assuming lifetime soil contact is limited to the AOC 11 potential exposure area, the depth-weighted estimated cumulative ILCRs and HIs for the tribal user potentially exposed to COPCs in surface and shallow soil (Tables

AOC11-B1.3g and AOC11-B1.4g, respectively) are below the *de minimis* level of 1×10^{-6} , the point of departure for risk management decisions and HI of 1, respectively.

4.6.2 Risk Characterization for Exposure to Soil (Baseline Scenario and Area-Weighted EPCs)

Table AOC11-4.5 summarizes cumulative ILCRs and HIs estimated for exposure to soil for each potential human receptor at the AOC 11 potential exposure area in the baseline scenario, calculated using area-weighted EPCs, for receptors where the depth-weighted estimated cumulative ILCRs and/or HIs were above 1×10^{-6} and 1, respectively. Therefore, area-weighted ILCRs and HIs were provided for the long-term maintenance worker and recreational users (campers, hikers, and OHV riders). The dose, EC, ILCR, and HI equations are presented in detail in Section 5.5.1 of the main report. The detailed cancer risk estimates (Tables AOC11-B2.3a through AOC11-B2.3d) and noncancer hazard calculations (Tables AOC11-B2.4a through AOC11-B2.4d) are presented in Attachment AOC11-B2.

The baseline scenario area-weighted estimated cumulative ILCRs and HIs for each potential receptor selected for evaluation are summarized in the tables and discussed below. In general, the area-weighted approach resulted in a small difference in the risk or hazard estimates compared to the depth-weighted estimates.

Maintenance Workers

Baseline Area-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 11 Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Long-Term Maintenance Worker	Surface	7E-06	As (5E-06) CrVI (1E-06) TEQ human (9E-07)	0.4	NA
	Shallow	8E-06	As (5E-06) CrVI (1E-06) TEQ human (1E-06)	0.4	NA
	Subsurface I	8E-06	As (5E-06) CrVI (1E-06) TEQ human (2E-06)	0.4	NA
	Subsurface II	8E-06	As (5E-06) CrVI (1E-06) TEQ human (1E-06)	0.4	NA

Note:

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

Assuming lifetime soil contact is limited to the AOC 11 potential exposure area, the area-weighted estimated cumulative ILCRs for the long-term maintenance worker potentially exposed to COPCs in surface, shallow, subsurface I, and subsurface II soil are above the point of departure for risk management decisions of

APPENDIX AOC11
SOIL HHERA FOR AOC 11 EXPOSURE AREA

1×10^{-6} , but within the risk management range of 1×10^{-6} and 1×10^{-4} . For this potential receptor, risk estimates above *de minimis* levels were primarily attributed to arsenic and dioxin TEQ in soil via the dermal contact and soil ingestion pathways, and to hexavalent chromium in soil via the inhalation of particulates pathway (Table AOC11-B2.3a). As discussed earlier, approximately 80% of the ILCRs for arsenic is attributed to background concentrations of arsenic in soil.

As stated earlier, the area-weighted estimated cumulative ILCRs for the long-term maintenance worker are not materially different than the depth-weighted cumulative ILCRs for all exposure depths.

The area-weighted estimated cumulative HIs for the long-term maintenance worker (Table AOC11-B2.4a) potentially exposed to COPCs in surface, shallow, subsurface I, and subsurface II soil at the AOC 11 potential exposure area are below an HI of 1. The area-weighted EPCs for lead in surface, shallow, subsurface I, and subsurface II soil at the AOC 11 potential exposure area are not expected to result in an increase in blood lead levels above OEHHHA's benchmark value of 1 µg/dL in the fetus of a long-term maintenance worker (Table AOC11-B2.5a).

Recreational Users

Baseline Area-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 11 Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Camper	Surface	3E-06	As (2E-06) TEQ human (4E-07)	0.6	NA
	Shallow	3E-06	As (2E-06) TEQ human (5E-07)	0.6	NA
Hiker	Surface	5E-06	As (4E-06) TEQ human (7E-07)	1	NA
	Shallow	5E-06	As (4E-06) TEQ human (1E-06)	1	NA
OHV Rider	Surface	3E-06	As (2E-06) CrVI (6E-07) TEQ human (4E-07)	0.2	NA
	Shallow	3E-06	As (2E-06) CrVI (6E-07) TEQ human (5E-07)	0.2	NA

Note:

ILCR and HI drivers are presented only for ILCRs above 1×10^{-6} and HIs above 1.

Assuming lifetime soil contact is limited to the AOC 11 potential exposure area, the area-weighted estimated cumulative ILCRs for the camper, hiker, and OHV rider potentially exposed to COPCs in surface and shallow soil (Tables AOC11-B2.3b through AOC11-B2.3d) are above the point of departure for risk management decisions of 1×10^{-6} , but within the risk management range of 1×10^{-6} and 1×10^{-4} . For the camper and hiker,

estimated risks above *de minimis* levels were primarily attributed to arsenic, hexavalent chromium and/or dioxin TEQ in soil via the soil ingestion pathway. For the OHV rider, estimated risks above *de minimis* levels were primarily attributed to arsenic and dioxin TEQ, via dermal contact with soil, and to hexavalent chromium via inhalation of soil particulates. As previously noted, approximately 80%, 78%, and 85% of the ILCRs for arsenic for the camper, hiker, and OHV rider, respectively are attributed to background concentrations of arsenic in soil.

As demonstrated by comparing the values, the area-weighted estimated cumulative ILCRs for the camper, hiker, and OHV rider are not materially different than the depth-weighted estimated cumulative ILCRs for all exposure depths. Considering the substantial contribution of background arsenic in soil to the estimated cumulative ILCRs for the camper, hiker, and OHV rider potentially exposed to surface and shallow soil, it is likely that incremental risks for site related COPCs in soil are at or only slightly above the lower end of the risk management range of 1×10^{-6} and 1×10^{-4} .

The area-weighted estimated cumulative HIs for the camper, hiker, and OHV rider (Tables AOC11-B2.4b through AOC11-B2.4d) potentially exposed to COPCs in surface and shallow soil at the AOC 11 potential exposure area are at or below an HI of 1. The area-weighted EPCs for lead in surface and shallow soil at the AOC 11 potential exposure area are not expected to result in an increase in blood lead levels above OEHHHA's benchmark value of 1 µg/dL for recreational users (Tables AOC11-B2.5b through AOC11-B2.5g).

4.6.3 Uncertainties in the Risk Assessment

The risk assessment includes several uncertainties that warrant discussion. Many of the assumptions used in this risk assessment, regarding the representativeness of the sampling data, potential human exposures, fate and transport modeling, and chemical toxicity are conservative, follow agency guidance and reflect a 90th or 95th percentile value rather than a typical or average value. The use of several conservative exposure assumptions and toxicity estimates can introduce considerable uncertainty into the risk assessment. By using conservative exposure assumptions or toxicity estimates, the assessment can develop a significant conservative bias that may result in the calculation of significantly higher estimates for cancer risks or noncancer hazards than are actually posed by the chemicals present in soil. These uncertainties are discussed in detail in Section 5.6 of the main report. Uncertainties applicable only to the risk assessment for the AOC 11 potential exposure area are discussed in detail below.

Additional uncertainties for the AOC 11 potential exposure area include the use of the maximum depth-weighted soil concentration as the EPC. The maximum depth-weighted soil concentration was used for COPCs when the soil dataset had fewer than four detected values (i.e., concentrations reported above the detection limit) or fewer than eight total observations as shown in Table AOC11-3.1.

For the AOC 11 potential exposure area, the maximum depth-weighted concentration was used as the EPC for the following COPCs:

- Surface soil: one metal (mercury), PAHs (acenaphthene, acenaphthylene, fluorene, and naphthalene), and pesticides (4,4-DDE, alpha-chlordane, dieldrin, and gamma-chlordane)
- Shallow soil: one metal (mercury), one VOC (methyl acetate), PAHs (1-methylnaphthalene, acenaphthene, acenaphthylene, fluorene, and naphthalene), and pesticides (4,4-DDE, alpha-chlordane, dieldrin, and gamma-chlordane)

APPENDIX AOC11
SOIL HHRA FOR AOC 11 EXPOSURE AREA

- Subsurface I soil: one metal (mercury), one VOC (methyl acetate), PAHs (1-methylnaphthalene, acenaphthene, acenaphthylene, fluorene, and naphthalene), and pesticides (4,4-DDE, alpha-chlordane, dieldrin, and gamma-chlordane)
- Subsurface II soil: one metal (mercury), one VOC (methyl acetate), PAHs (1-methylnaphthalene, acenaphthene, acenaphthylene, fluorene, and naphthalene), and pesticides (4,4-DDE, alpha-chlordane, dieldrin, and gamma-chlordane).

The use of the maximum depth-weighted soil concentration as the EPC for the COPCs listed above may not appropriately represent exposures and resulting risks/hazards. This approach to estimating EPCs does not materially impact the results of the HHRA because the AOC 11 potential exposure area COPCs with low frequency of detection (FOD) and/or fewer than eight observations are not risk drivers at the site.

5 ECOLOGICAL RISK ASSESSMENT

This section briefly summarizes the ERA approach; presents the COPECs, EPCs, dose, and risk tables for the ERA for the AOC 11 potential exposure area; and characterizes potential risk to potential ecological receptors exposed to COPECs in soil at the AOC 11 potential exposure area. Details of the overall ERA approach are presented in Section 6 of the main report. Supporting tables for the ERA for the AOC 11 potential exposure area based on risk calculations conducted using depth-weighted and area-weighted EPCs are presented in Attachment AOC11-C and described below.

Per the RAWP (Arcadis 2008) and DTSC guidance (DTSC 1996), ecological risks were also calculated using maximum depth-weighted concentrations and are presented in Attachment AOC11-D. Risks estimated using maximum depth-weighted concentrations are considered overly conservative and generally are used for screening-level purposes. The use of maximum concentrations is not recommended for making risk management decisions at the AOC 11 potential exposure area, where the area has been adequately characterized and data are available to estimate UCLs. Therefore, the risk results based on maximum depth-weighted concentrations are presented (Attachment AOC11-D), but are not discussed in this section.

5.1 Ecological Conceptual Site Model

Following the steps outlined in Section 6.6 and Figures 2-7 and 6-1 of the main report, risks were estimated for potentially complete and significant exposure pathways identified for the following potential receptors exposed to COPECs in soil at the AOC 11 potential exposure area. These potential receptors included plants, invertebrates, and small home-range receptors:

- **Plants** – may be exposed to COPECs via root uptake from surface, shallow, and/or subsurface I soil, depending on the root depth of plants of concern.
- **Soil Invertebrates** – may be exposed to COPECs via direct contact/uptake from surface soil.
- **Mammals** – may be exposed to COPECs via incidental ingestion of surface, shallow, and/or subsurface I soil (for burrowing animals) and/or ingestion of biota tissue (i.e., food items). The small home-range mammalian indicator receptors evaluated in this ERA for the AOC 11 potential exposure area were:
 - **Merriam's Kangaroo Rat** – representative of granivorous small mammal populations exposed to surface, shallow and/or subsurface I soil (incidental and through biota uptake)
 - **Desert Shrew** – representative of invertivorous small mammal populations exposed only to surface soil (incidental and through biota uptake).
- **Birds** – may be exposed to COPECs via incidental ingestion of surface, shallow, and/or subsurface I soil and/or ingestion of biota tissue (i.e., food items). The small home-range bird indicator receptors evaluated in this ERA for the AOC 11 potential exposure area were:
 - **Cactus Wren** – representative of insectivorous bird populations, exposed only to surface soil (incidental and through biota uptake)
 - **Gambel's Quail** – representative of granivorous bird populations, exposed incidentally only to surface soil and exposed to surface, shallow, or subsurface I soil (incidental and through biota uptake).

Potential exposure pathways considered incomplete or insignificant were not quantitatively evaluated; these potential exposure pathways are described in Section 6.3 of the main report.

Potential large home-range receptors (i.e., desert kit fox, red-tailed hawk, and Nelson's desert bighorn sheep) were evaluated for larger exposure areas (combined AOCs/investigation areas) and are discussed in those specific appendices. Potential risks to desert kit fox, red-tailed hawk, and Nelson's desert bighorn sheep associated with the AOC 11 potential exposure area were estimated and characterized as part of the evaluation of all AOCs/investigation areas outside the compressor station (OCS) and AOCs outside the compressor station excluding BCW and AOC4 (OCSxBCW+AOC4); please see Appendix OCS and Appendix OCSxBCW+AOC4 for risk estimates for these large home-range potential receptors.

5.1.1 Evaluation of Special-Status Species

The biological setting for the site and the adjacent areas are described in detail in various reports (see Section 2.4 of the main report). Although potential habitat exists for special-status² species at or near the site, none have been recorded as observed at the AOC 11 potential exposure area. The primary vegetation present at the AOC 11 potential exposure area is sparse creosote bush (*Larrea tridentate*). No federal or state-listed threatened and endangered (T&E) or candidates for listing were found at the site, including the AOC 11 potential exposure area.

Several species of mammals and birds have been observed at or near the site (Tables 2-2 and 2-4 of the main report). However, no federal or state-listed T&E wildlife species or candidates for listing were observed at the AOC 11 potential exposure area.

The risk estimates presented here are considered to be protective of special-status species due to the conservative nature of the ERA where conservative parameters (e.g., small exposure areas, selected indicator species for each functional group considered on the high end of potential exposures for typical potential receptors at the site within that group, use of no-effects-based toxicity values) were used to assess risks to a wide range of potential receptors at various trophic levels. Therefore, further evaluation of special-status species was not considered necessary.

5.2 Constituents of Potential Ecological Concern

COPECs for the AOC 11 potential exposure area were selected in accordance with the RAWP (Arcadis 2008) and as described in Section 3.4 of the main report. Soil data encompassing all relevant exposure depths for the HHERA (i.e., 0 to 10 ft bgs for the AOC 11 potential exposure area) and used in the COPEC selection process are presented in Attachment AOC11-A1.

Because a potential ecological receptor could be exposed to COPECs at various exposure depths either directly and/or through their diet for a given scenario, a single comprehensive COPEC list was selected based on the range of soil depths encountered by potential ecological receptors in the baseline scenario. Additionally, essential nutrients (e.g., calcium, potassium) and analytes typically measured to evaluate geochemical conditions (e.g., chloride, nitrate, sulfate), are not typically evaluated in ERAs and were not

² Special-status species include both state- and federal-listed fully protected T&E species, state/federal species of concern, and traditional culturally significant plants. Protection at the no-observed adverse effects level (NOAEL) is warranted only for fully protected species.

selected as COPECs. COPECs for the three exposure depths evaluated for the baseline scenario for this ERA are summarized in Table AOC11-5.1.

COPECs included metals (arsenic, hexavalent chromium, total chromium, copper, lead, mercury, and zinc), one VOC (methyl acetate), LMW PAHs, HMW PAHs, pesticides (4,4-DDE, alpha-chlordane, dieldrin, and gamma-chlordane), PCBs, dioxin TEQ (for potential wildlife receptors only), and 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) (for ecological communities only). TPHs were also identified as COPECs; however, due to lack of appropriate toxicity values to evaluate TPHs for potential ecological receptors, indicator chemicals (e.g., benzene, toluene, ethylbenzene, and xylene [BTEX] and PAHs), when detected, were used to characterize TPH risks. COPECs lacking toxicity values and their impact to the ERA are discussed in Section 6.7.5 of the main report.

5.3 Exposure Point Concentration Summary

For the potentially complete and significant exposure pathways identified in the ecological CSM, soil EPCs were calculated as described in Section 4.2 of the main report and presented in Section 3 of this appendix. For the AOC 11 potential exposure area, risks to potential ecological receptors were estimated using depth-weighted EPCs and area-weighted EPCs. Depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment AOC11-A2, while area-weighted data used in the calculation of area-weighted EPCs are presented in Attachment AOC11-A3.

Biota tissue EPCs were calculated from the soil EPCs using soil-to-biota uptake relationships for plants, invertebrates, and small mammals, as described in Section 6.4.3 of the main report. As described in Section 6.4 and shown on Figure 6-1 of the main report, the depth intervals selected to represent exposure to soil and biota tissue for the risk calculations for each potential receptor are presented in Table AOC11-5.2.

To summarize for the baseline scenario:

- Soil invertebrates, invertivorous small mammals, and insectivorous birds could potentially be exposed to COPECs in soil and/or biota only at the surface (0 to 0.5 ft bgs).
- Plants and granivorous small mammals could potentially be exposed to COPECs in soil and or/biota down to 6 ft bgs. Therefore, the maximum of the depth-weighted EPCs from 0 to 0.5 ft bgs, 0 to 3 ft bgs, and 0 to 6 ft bgs was selected as the representative soil and/or biota EPC for a COPEC for estimating risks to these potential receptors.
- Granivorous birds could potentially be exposed to COPECs in soil (not biota) only at the surface (0 to 0.5 ft bgs) and biota down to 6 ft bgs. Therefore, exposures to granivorous birds included the depth-weighted soil EPC from 0 to 0.5 ft bgs (for incidental soil ingestion) and the maximum of the depth-weighted biota EPC from 0 to 0.5 ft bgs, 0 to 3 ft bgs, and 0 to 6 ft bgs for each COPEC.

Depth-weighted soil EPCs and biota tissue EPCs calculated from depth-weighted soil EPCs are presented in Table AOC11-5.3 and the representative soil and/or biota EPCs identified for the risk calculations are bolded in this table. Of the COPECs identified at the AOC 11 potential exposure area, methyl acetate was not detected in surface soil, and therefore, exposure to this COPEC by potential receptors only exposed to surface soil was not estimated. These potential receptors include soil invertebrates, invertivorous small mammals (desert shrew), and insectivorous birds (cactus wren). Although methyl acetate was detected in shallow and subsurface I soil, uptake into biota is considered negligible for VOCs (assumed to be zero for the

risk calculations³), and therefore, exposure through diet is considered incomplete for granivorous birds. For plants, only direct exposure to soil was considered a complete pathway for VOCs.

Similarly, area-weighted soil EPCs and biota tissue EPCs calculated from area-weighted soil EPCs are presented in Table AOC11-5.4. The representative soil and/or biota EPCs identified for the risk calculations are bolded in this table.

Per the RAWP (Arcadis 2008) and DTSC guidance (DTSC 1996), risk calculations based on both the maximum depth-weighted concentration and the UCL for each COPEC are required. As mentioned earlier in this section, using the maximum depth-weighted concentrations result in overly conservative risks and is not recommended for risk management decisions. The estimated risks based on maximum depth-weighted concentrations are presented in Attachment AOC11-D, but results are not discussed in this appendix or the main report.

5.4 Estimation of Exposure Concentration or Dose

Exposures for ecological communities (plants and soil invertebrates) are quantified as ECs (e.g., in mg/kg). Exposures for wildlife (mammals and birds) are quantified as doses (e.g., in mg/kg body weight per day [mg/kg bw-day]). ECs and doses for COPECs in soil and potentially complete pathways were calculated as described, including equations, in Section 6.4 of the main report. The exposure parameters selected to evaluate wildlife in this ERA include upper bound values from literature (e.g., ingestion rates) or assumed (e.g. 100% of one type of diet), which may result in conservative estimates of exposure dose and potential overestimation of actual exposure at the site.

For ecological communities, ECs are equal to the depth-weighted soil EPCs for COPECs at the AOC 11 potential exposure area for the baseline scenario and are presented in Table AOC11-5.3. Area-weighted EPCs for the baseline scenario are presented in Table AOC11-5.4.

For wildlife, doses were calculated using the exposure parameters and equations presented in Section 6.4 of the main report and depth-weighted soil and biota tissue EPCs for COPECs at the AOC 11 potential exposure area, as presented in Table AOC11-5.3 for the depth-weighted risk evaluations, and area-weighted soil and biota tissue EPCs as presented in Table AOC11-5.4 for the area-weighted risk evaluations. Dose calculations using depth-weighted EPCs for wildlife potentially exposed to COPECs via ingestion of soil and biota tissue for the baseline scenario are presented in Attachment AOC11-C. Dose calculations using area-weighted EPCs for wildlife potentially exposed to COPECs via ingestion of soil and biota tissue for the baseline scenario are also presented in Attachment AOC11-C. Dose calculations using maximum depth-weighted concentrations for wildlife potentially exposed to COPECs via ingestion of soil and biota tissue for the baseline scenario are presented in Attachment AOC11-D.

5.5 Effects Assessment

Concentration-based screening values (i.e., toxicity values) for plants and soil invertebrates and the dose-based toxicity reference values (TRVs) for wildlife for COPECs were used to estimate risks to potential

³ VOCs have low bioaccumulation potential (octanol-water partition coefficient is low [$\log K_{ow} < 2$]) and uptake into biota is considered negligible for these constituents.

ecological receptors potentially exposed to COPECs in soil and biota tissue at the AOC 11 potential exposure area.

For plants and soil invertebrates, screening values are discussed in Section 6.3 and presented in Table 6-6 of the main report.

A range of risks to wildlife were estimated using the NOAEL)-based TRVs and lowest-observed-adverse-effects-level (LOAEL)-based TRVs presented in the RAWP documents (Arcadis 2008, 2009, 2015). These selected TRVs were primarily based on the TRVs used to develop USEPA's Ecological Soil Screening Levels (EcoSSLs; USEPA 2008); other sources included the Toxicological Benchmarks for Wildlife from Oak Ridge National Laboratory (ORNL; Sample et al. 1996) and USEPA Region 6 ERA Guidance (USEPA 1999). In addition, for estimating potential risk to wildlife, a second set of NOAEL- and LOAEL-TRVs⁴ based on the Navy/Biological Technical Assistance Group (BTAG) TRVs (DTSC 2002, 2009) were also used for COPECs, where available. Wildlife TRVs based on selected TRVs and BTAG TRVs are presented in Tables 6-7 and 6-8 of the main report, respectively.

Plant screening values are not available for 2,3,7,8-TCDD, total chromium, and methyl acetate. Soil invertebrate screening values are not available for methyl acetate. Avian TRVs are not available for methyl acetate. Therefore, risks to these potential receptors from exposure to these specific COPECs could not be estimated. In addition, appropriate screening values and TRVs are not available for TPHs; therefore, BTEX and PAHs were used as indicator chemicals to characterize TPH risks at the AOC 11 potential exposure area. The lack of screening values and TRVs and the impact to the ERA are discussed in Section 6.7.5 of the main report.

5.6 Ecological Risk Characterization

The risk characterization integrates the results of the exposure assessment and effects assessment and is subject to uncertainties in both those efforts. Risk characterization includes two major components: risk estimation and risk description. As presented in tables and discussed below, risk estimation (HQs) involved integrating exposure profiles with the exposure-effects information. For each potential receptor and COPEC, risk descriptions including various lines of evidence (LOEs) and uncertainties, including HQs, supporting statistical and site use information, and the direction of uncertainty in the risk estimates, are discussed below for interpreting the risk results and identifying potential unacceptable risk to potential ecological receptors. Uncertainties specific to the AOC 11 potential exposure area are discussed in context with the risk characterization results presented below. Generic uncertainties in the ERA are discussed in detail in Section 6 of the main report.

For plants and soil invertebrates, HQs were calculated by comparing the depth-weighted EPCs for each COPEC with respective screening values and these HQs were compared to the target HQ of 1. Following USEPA (1998) guidance, in such cases, a semi-quantitative weight-of-evidence (WOE) approach using multiple LOEs was used in reducing uncertainty and drawing risk conclusions.

Risk conclusions for ecological communities used the following criteria:

⁴ Although these are referred to as LOAEL-based BTAG TRVs, they are based on a midpoint of a variety of adverse effects and are not necessarily the LOELs. However, for simplicity, these BTAG TRVs are referred to as LOAEL-based TRVs.

- COPECs with HQs less than or equal to 1 are considered to have *de minimis* risk (i.e., negligible risk) to plants and invertebrates.
- COPECs with HQs greater than 1 indicate that unacceptable risk to plants and invertebrates is possible. However, exceedances of the screening values (which are conservative and are generally uncertain) do not always clearly indicate that unacceptable risk to ecological communities is occurring. In such cases, a WOE approach, using HQs as a single LOE along with supporting information such as FOD, site use history, and confidence in the screening values was used to reduce uncertainty for characterizing potential risk to ecological communities.

Ultimately, three risk outcomes are possible for plants and soil invertebrates based on HQs greater than 1 and the WOE: 1) unacceptable risk to ecological communities is possible (i.e., indicated by sufficient and strong supporting LOEs); 2) unacceptable risk to ecological communities is unlikely (i.e., indicated by sufficient and strong LOEs to support a conclusion of no unacceptable risk); or 3) unacceptable risk to ecological communities is uncertain (i.e., indicated by insufficient LOEs).

For wildlife, a range of HQs was calculated using NOAEL- and LOAEL-based TRVs previously identified in the RAWP documents (Arcadis 2008, 2009, 2015). HQs based on LOAEL-based TRVs selected in the RAWP documents are referred to as “LOAEL-based HQs.” HQs based on NOAEL-based TRVs selected in the RAWP documents are referred to as “NOAEL-based HQs.” Additionally, NOAEL-based and LOAEL-based HQs were calculated using a second set of TRVs (i.e., NOAEL- and LOAEL-based BTAG TRVs), as described in Section 6.5 of the main report. The NOAEL-based BTAG TRVs are considered very conservative, resulting in a wide range of risk estimates for wildlife. For this ERA, the selected TRVs are considered more robust than the BTAG TRVs, as discussed in Section 6.7.5 of the main report. Results associated with the selected TRVs are recommended for risk management decisions at the AOC 11 potential exposure area.

Risk conclusions for wildlife used the following criteria:

- COPECs with NOAEL-based HQs less than or equal to 1 pose *de minimis* risk to individuals and populations of potential wildlife receptors.
- COPECs with a NOAEL-based HQ greater than 1, but LOAEL-based HQ less than or equal to 1, pose no unacceptable risks to wildlife populations. However, as described in the RAWP (Arcadis 2008), unacceptable risk to individuals is uncertain because the NOAEL-based TRVs are thresholds with an interval that is an artifact of the dosing study and the nature and magnitude of the effects, if any, that may occur at exposures between these values is unknown. In such cases, a WOE approach, including multiple LOEs, were used to reduce uncertainty for characterizing potential risk to individual potential wildlife receptors.
- COPECs with LOAEL-based HQs greater than 1 indicate unacceptable risk is possible for populations of potential wildlife receptors. However, these LOAEL-based HQs are based on individual-level effects thresholds and only account for a single LOE. In such cases, a WOE approach (including an alternate

target HQ of 10 for dioxin TEQ)⁵ was used to reduce uncertainty for characterizing potential risk to wildlife populations at the AOC 11 potential exposure area, as described in the preceding bullet.

- NOAEL-based HQs greater than 1 are considered one LOE in assessing potential risk to sensitive species, if present in the AOC 11 potential exposure area. Evaluation of T&E species for the AOC 11 potential exposure area is characterized in Section 5.1.1 of this appendix.

Ultimately, three risk outcomes are possible for wildlife based on the HQs greater than 1 and WOE:

- 1) unacceptable risk to wildlife is possible (i.e., indicated by sufficient and strong supporting LOEs);
- 2) unacceptable risk to wildlife is unlikely (i.e., indicated by sufficient and strong LOEs supporting a conclusion of no unacceptable risk); or 3) unacceptable risk to wildlife is uncertain (i.e., indicated by insufficient LOEs).

For this ERA, the results of individual LOE evaluations were evaluated collectively to derive an overall WOE conclusion for each potential receptor. Key uncertainties were considered along with the strength, relevance, and other qualities of the LOE in reaching the WOE conclusions.

For the AOC 11 potential exposure area, evaluations were completed for the following scenarios and are discussed in this section:

- Baseline scenario using depth-weighted EPCs
- Baseline scenario using area-weighted EPCs.

In these evaluations, risk calculations were completed for all COPECs, as presented in Tables AOC11-5.5a through AOC11-5.6b; however, risk results for only a subset of the COPECs are discussed in the evaluations using area-weighted EPCs. For plants and soil invertebrates, COPECs with HQs greater than 1 based on the depth-weighted EPC are discussed in the evaluations using area-weighted EPCs. For wildlife (i.e., mammals and birds), COPECs with NOAEL-based HQs greater than 1 based on the depth-weighted EPC and species- and site-specific site use factor (SUF) are discussed in the area-weighted EPC evaluations. At the conclusion of the baseline scenario evaluation, risk drivers were identified based on those COPECs for which unacceptable community-/population-level risk was predicted using the most refined exposure and effects assumptions (i.e., site-specific SUF, area-weighted EPCs, and selected TRVs).

5.6.1 Risk Characterization (Baseline Scenario and Depth-Weighted EPCs)

Risk estimates for ecological communities (plants and soil invertebrates) and wildlife (mammals and birds) for the baseline scenario using depth-weighted EPCs are summarized in this section. As mentioned earlier in Section 5.4, ECs and doses for COPECs in soil and potentially complete pathways were calculated as described, including equations, in Section 6.4 of the main report. Detailed risk calculations for plants and soil invertebrates (Table AOC11-C.1) and detailed dose and risk calculations for wildlife (Tables AOC11-C.2 through AOC11-C.5) are presented in Attachment AOC11-C. COPECs identified at the AOC 11 potential

⁵ For dioxin TEQ, the selected bioaccumulation factors (BAFs) and TRVs result in significant overestimation of risk for key wildlife receptors, primarily for invertivorous small mammals and insectivorous birds. Due to the compounded conservatism in the risk estimates for dioxin TEQ, HQs greater than 10 were considered to pose unacceptable risk. Alternate congener-specific BAFs and alternate TRVs demonstrating the magnitude of the risk overestimation are presented in Sections 6.4.3 and 6.5.2 of the main report, respectively. These alternate BAFs and TRVs are based on current understanding of uptake and toxicity of TEQ mixtures and represent an additional LOE considered for dioxin TEQ. As a result, a target LOAEL-based HQ of 10 for dioxin TEQ was used. Uncertainty in the risk estimates for dioxin TEQ is discussed in detail in Section 6.7.6.

exposure area for the baseline scenario include seven metals, LMW and HMW PAHs, one VOC (methyl acetate), TPHs, pesticides (4,4-DDE, alpha-chlordane, dieldrin, and gamma-chlordane), PCBs, dioxin TEQ (for potential wildlife receptors only), and 2,3,7,8-TCDD (for ecological communities only) (Table AOC11-5.1). Potential risk to potential receptors exposed to these COPECs is described below.

5.6.1.1 Plants and Soil Invertebrates

Table AOC11-5.5a summarizes HQs estimated for soil exposure for ecological communities (plants and soil invertebrates) at the AOC 11 potential exposure area for the baseline scenario using depth-weighted EPCs. Plants can potentially be exposed to COPECs in soil up to 6 ft bgs. Plant HQs are greater than 1 for hexavalent chromium and HMW PAHs based on the highest EPC value from the shallow, surface, and subsurface I depth intervals. HQs for remaining COPECs are less than 1 for plants, indicating *de minimis risk* to plants from exposure to these COPECs.

Soil invertebrates can potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs). For soil invertebrates, HQs are greater than 1 for hexavalent chromium, mercury, zinc, alpha-chlordane, and gamma-chlordane based on exposure to surface soil only. HQs for remaining COPECs are less than 1 for soil invertebrates, indicating *de minimis risk* to soil invertebrates from exposure to these COPECs. As mentioned earlier in Section 5.3 of this appendix, methyl acetate was not detected in surface soil, and therefore, risks to soil invertebrates, which are only exposed to surface soil, were not estimated.

For hexavalent chromium, the HQ for plants and soil invertebrates was greater than 1. The depth-weighted EPC from surface soil (0 to 0.5 ft bgs) was used to evaluate potential risk to soil invertebrates and the depth-weighted EPC from subsurface I soil (0 to 6 ft bgs) was used to evaluate potential risk to plants from exposure to hexavalent chromium in soil. Hexavalent chromium was frequently detected at the AOC 11 potential exposure area (at 26 of 52 surface soil locations, and 36 of 53 subsurface I soil locations). Depth-weighted concentrations were greater than background concentrations (background threshold value [BTV] = 0.83 mg/kg) in nine of the 52 total surface soil (0 to 0.5 ft bgs) locations and 13 of the 53 total subsurface I soil (0 to 6 ft bgs) locations. Depth-weighted concentrations were less than 10 times the BTV at surface soil locations and greater than 10 times the BTV in one subsurface I soil location. The depth-weighted EPC for hexavalent chromium in surface soil (0.81 mg/kg) is just below the BTV and the depth-weighted EPC for hexavalent chromium in subsurface I soil (2.18 mg/kg) is above the BTV (i.e., the depth-weighted EPC exceeded the BTV by approximately 2.5 times in subsurface I soil). The screening values for plants and soil invertebrates are based on a limited number of studies, most of which were conducted in artificial test systems with species unlikely to be present in the AOC 11 potential exposure area. Efroymson et al. (1997a, b) indicates that there is low confidence in these screening values and their ability to predict toxicity to plants and soil invertebrates. In addition, the invertebrate screening value for hexavalent chromium (0.4 mg/kg) is less than the BTV (0.83 mg/kg), indicating uncertainty associated with the risk estimates for this COPEC at the AOC 11 potential exposure area. Based on the risk results and discussion above, unacceptable risk to plants and soil invertebrate communities from exposure to hexavalent chromium is considered uncertain.

For HMW PAHs, the HQ for plants was greater than 1. The depth-weighted EPC from surface soil (4.83 mg/kg) was used to evaluate potential risk to plants from exposure to HMW PAHs in soil, but EPCs decreased in the lower depth intervals (e.g., the depth-weighted EPC for subsurface I soil [0 to 6 ft bgs] was less than half the concentration of surface soil [0 to 0.5 ft bgs]). HMW PAHs were detected in most of the locations in surface soil (FOD = 98%). Depth-weighted concentrations for HMW PAHs were greater than the

APPENDIX AOC11

SOIL HHERA FOR AOC 11 EXPOSURE AREA

BTV (BTV = 0.038 mg/kg) in 51 of 52 total surface soil locations, but exceeded the plant screening level (1.2 mg/kg) at only nine locations. The plant screening level (1.2 mg/kg) cited in USEPA (1999) for benzo(a)pyrene and benzo(b)fluoranthene is based on a reported chronic no-effects concentration (Sims and Overcash 1983). Reduced stem growth was observed in summer wheat at 6.254 mg/kg, but no effects were seen on rye plants at this concentration. The plant toxicity data cited in Sims and Overcash (1983) were not included in the plant EcoSSL; no sufficient studies were identified by USEPA to calculate a plant EcoSSL for HMW PAHs (USEPA 2007a). As such, there is low confidence in the selected plant screening value to predict toxicity to plants exposure to mixtures of HMW PAHs at the site. Additionally, the most important source of PAHs for plants is the atmosphere where they enter via the gaseous phase or deposit bound to particles on the plant surface (Sims and Overcash 1983; USEPA 2007a). Thus, the relevance of the soil exposure pathway for plants at the AOC 11 potential exposure area is uncertain. Based on the risk results and discussion above, unacceptable risk to plant communities from exposure to HMW PAHs is considered uncertain.

For mercury, the HQ for soil invertebrates was greater than 1. Mercury was detected in only one of 52 locations in surface soil (FOD = 2% in 0 to 0.5 ft bgs), and the maximum depth-weighted concentration (0.18 mg/kg) was used as the depth-weighted EPC. In addition, the magnitude of the HQ is low. For areas where a constituent is largely not detected, use of a maximum concentration as the EPC may not appropriately characterize risk. Mercury was not detected in the background dataset, and therefore, a background value could not be developed for comparison. The screening value for soil invertebrates (0.1 mg/kg) is based on a limited number of studies and is based on different forms of mercury. Based on the two studies available, which use different systems and earthworm species, it was not possible to evaluate the relative toxicity of forms of mercury. Efroymsen et al. (1997b) indicates that there is low confidence in the screening value and the ability to predict toxicity to soil invertebrates. Based on the risk results and uncertainty discussed above, unacceptable risk to soil invertebrate communities from exposure to mercury is considered unlikely.

For zinc, the HQ for soil invertebrates was greater than 1. Zinc was detected in 100% of surface soil samples (0 to 0.5 ft bgs) and depth-weighted concentrations for zinc were greater than the BTV (BTV = 58 mg/kg) in 23 of the 52 total surface soil locations, but exceeded the soil invertebrate screening value (120 mg/kg) at only eight locations. The depth-weighted EPC for zinc is considered elevated compared with background concentrations (i.e., the depth-weighted EPC exceeded the BTV by approximately 3 times in surface soil). The soil invertebrate screening level (120 mg/kg) is based on multiple studies and test species representing various soil exposure conditions (USEPA 2007b5). The screening value is also greater than the BTV. There is, therefore, confidence in the ability of the screening level to predict risk to soil invertebrate communities. Based on the risk results and discussion above, unacceptable risk to soil invertebrate communities from exposure to zinc is considered uncertain.

For alpha-chlordane and gamma-chlordane, the HQs for soil invertebrates were greater than 1. These pesticides were detected in only one of 10 surface oil sample locations (FOD = 10%), and the maximum depth-weighted concentrations for alpha-chlordane (12 micrograms per kilogram [$\mu\text{g/kg}$]) and gamma-chlordane (13 $\mu\text{g/kg}$) were used as the depth-weighted EPCs. Because UCLs could not be estimated due to the low FOD, comparison of the depth-weighted mean concentrations for surface soil (1.65 $\mu\text{g/kg}$ for alpha-chlordane and 1.75 $\mu\text{g/kg}$ for gamma-chlordane based on the Kaplan-Meier [KM] mean) to screening levels would result in HQs less than 1. The screening value for soil invertebrates (4.3 $\mu\text{g/kg}$) is based on total chlordane and was used to evaluate potential risk of soil invertebrates exposed to alpha- and gamma-

chlordane. As stated in Van de Plassche et al. (1994), the method used to derive the maximum permissible concentration for soil based on direct effects leads to relatively low values. The screening value is based on studies with insects and collembola, which belong to relatively sensitive taxonomic groups. As such, there is moderate confidence in the screening level based on the potential for overestimation of risk to soil invertebrates. Based on the risk results and uncertainty discussed above, unacceptable risk to soil invertebrate communities from exposure to alpha- or gamma-chlordane is considered unlikely.

For TPH mixtures, individual constituents were used to characterize potential risks to plants and invertebrates. BTEX were not detected in any samples (Attachment AOC11-A1) and HQs for PAHs for soil invertebrates are less than 1, indicating no unacceptable risk for soil invertebrates from TPHs. For plants, the LMW PAH HQ is less than 1, but the HQ for plants exposed to HMW PAHs is greater than 1. As discussed above for HMW PAHs, unacceptable risk to plants due to exposure to PAHs is considered uncertain, some of which are likely associated with TPH mixtures. Therefore, unacceptable risk is not expected for communities of soil invertebrates, but unacceptable risk to plants from exposure to TPHs at the AOC 11 potential exposure area is uncertain.

Based on the risk results and WOE, unacceptable risk to plant communities from exposure to hexavalent chromium, HMW PAHs, and TPH mixtures are uncertain. For soil invertebrate communities, hexavalent chromium, mercury, zinc, alpha-chlordane, and gamma-chlordane in soil at the AOC 11 potential exposure area have HQs greater than 1, although unacceptable risk from mercury, alpha-chlordane and gamma-chlordane is unlikely based on the low FOD. Unacceptable risk to soil invertebrate communities from exposure to hexavalent chromium is considered uncertain based on the discussion above, and no unacceptable risk based on exposure to TPHs is expected.

No unacceptable risks to plant and invertebrate communities are expected from remaining inorganic COPECs (arsenic, total chromium, copper, and lead) and organic COPECs (LMW PAHs, 4,4,-DDE, dieldrin, PCBs, and 2,3,7,8-TCDD). Based on the risk estimates and potential uncertainties associated with the baseline risk using depth-weighted EPCs, hexavalent chromium and HMW PAHs for plants, and hexavalent chromium, mercury, zinc, alpha-chlordane, and gamma-chlordane for soil invertebrates were further evaluated using area-weighted EPCs, as discussed below in Section 5.6.2.

5.6.1.2 Small Mammals

For the AOC 11 potential exposure area, baseline risks were estimated for small mammals using depth-weighted EPCs for the following evaluations and are discussed in this section:

- Using the selected TRVs and a SUF equal to 1
- Using the BTAG TRVs and a SUF equal to 1
- Using the selected TRVs and a species- and site-specific SUF
- Using the BTAG TRVs and a species- and site-specific SUF.

5.6.1.2.1 Risks Evaluated Using a SUF equal to 1

Risks Evaluated Using the Selected TRVs

Table AOC11-5.5a summarizes HQs estimated for small mammals at the AOC 11 potential exposure area using the selected TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below. TRVs are not available for TPHs; however, risks to these potential receptors are characterized below based on indicator chemicals as described previously.

- **Merriam's kangaroo rat (granivorous small mammal)** – This potential receptor could potentially be exposed to COPECs in subsurface I soil (0 to 6 ft bgs) directly and through its diet. HQs for this potential receptor are less than 1 for all individual COPECs, indicating *de minimis* risk to individuals and populations of granivorous mammals.
 - For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples and NOAEL- and LOAEL-based HQs for PAHs are less than 1, indicating that no unacceptable risk to granivorous small mammals from exposure to TPHs is expected.
- **Desert shrew (invertivorous small mammal)** – This potential receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. HQs for this potential receptor are less than 1 for all COPECs, except for HMW PAHs and dioxin TEQ. The potential risks from COPECs with HQs greater than 1 are characterized below.
 - For HMW PAHs, the NOAEL-based HQ is greater than 1, and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of invertivorous small mammals; however, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ. HMW PAHs were frequently detected in surface soil (FOD = 96% in 0 to 0.5 ft bgs) with 51 of the 53 locations having depth-weighted concentrations exceeding the BTV (BTV = 0.038 mg/kg); however, the magnitude of the NOAEL-based HQ was low. In addition, a wide range of toxicity information is available for PAHs. For the selected TRVs for HMW PAHs, there is moderate confidence in ability to predict toxicity to small mammals. While the selected TRVs are based on EcoSSL data from multiple studies representing at least three small mammal species and five individual HMW PAHs (USEPA 2007a), the data were derived for individual PAHs (not mixtures) and the geometric mean NOAEL TRV is nearly 20 times greater than the selected NOAEL TRV value. For HMW PAHs, the NOAEL-based BTAG TRV (1.31 mg/kg bw-day) is twice the EcoSSL-based TRV (0.65 mg/kg bw-day). Alternate HMW PAH TRVs, as discussed in Section 6.5 of the main report, also suggest that adverse effects would not be observed until concentrations greater than the selected EcoSSL NOAEL-based TRV. Based on the low HQs and variability of the toxicity information, unacceptable risk to the shrew from exposure to HMW PAHs is considered to be uncertain in this scenario.
 - For dioxin TEQ for mammals, the NOAEL- and LOAEL-based HQs are greater than 1, indicating potential unacceptable risk to individuals and populations of invertivorous small mammals. As described in Section 6.7.6 of the main report, the mammal TRVs and uptake factors selected for dioxins at this site likely overestimate exposure and risk for this COPEC. Conservative assumptions were used to estimate the HQs, including use of bioaccumulation factors based on uptake of a single congener (2,3,7,8-TCDD) to earthworms, and a diet assumed to consist entirely of earthworms. As a

result, the HQs are considered to be overestimated. Confidence in the ability of the mammalian dioxin TEQ TRV to predict risk is moderate. Dioxin TEQ was detected at all 26 locations in surface soil (FOD = 100% in 0 to 0.5 ft bgs), with 13 of 26 surface soil locations having depth-weighted concentrations above the BTV (BTV = 5.58 nanograms per kilogram). Concentrations exceeding 10 times the BTV are limited to four locations along the TCS fenceline (PA-10, PA-11, PA-12, and SD-11A). Unacceptable risk to the shrew from exposure to dioxins is considered uncertain in this scenario.

- For TPH mixtures, individual constituents were used to characterize potential risks to plants and invertebrates. BTEX were not detected in any samples (Attachment AOC11-A1) and HQs for LMW PAHs are less than 1. The NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is less than 1 for HMW PAHs, indicating that no unacceptable risk to populations of invertivorous small mammals is expected; however, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ LOE. As discussed above, unacceptable risk from HMW PAH concentrations is uncertain based on the supporting LOEs, and unacceptable risk from TPHs is also considered to be uncertain.
- NOAEL- and LOAEL-based HQs for other COPECs in soil are less than 1 for the remaining COPECs indicating *de minimis* risk to individual and populations of invertivorous small mammals for the remaining COPECs.

Based on the risk estimates and potential uncertainties associated with the baseline risk from HMW PAHs and dioxin TEQ for invertivorous mammals, these COPECs were further evaluated using site-specific SUFs and area-weighted EPCs, as discussed below in Section 5.6.2.

Risks Evaluated Using the BTAG TRVs

Table AOC11-5.5a also summarizes HQs estimated for small mammals at the AOC 11 potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Merriam's kangaroo rat (granivorous small mammal)** – The NOAEL- and LOAEL-based HQs for all COPECs are less than 1, indicating *de minimis* risk to individuals and populations of granivorous small mammals.
- **Desert shrew (invertivorous small mammal)** – NOAEL-based HQs for lead, zinc, and HMW PAHs are greater than 1 and the LOAEL-based HQs are less than 1 for these COPECs, indicating no unacceptable risk to populations of invertivorous mammals; however, unacceptable risk to individual potential receptors is uncertain for these COPECs. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs indicating *de minimis* risk to individuals and populations of invertivorous small mammals from the remaining COPECs.

The table below summarizes all HQ estimates for mammals for COPECs where at least one NOAEL-based HQ value (using the selected TRV or BTAG TRV) is greater than 1.

Hazard Quotient Summary for Small Mammals (SUF = 1)								
COPEC	Merriam's Kangaroo Rat				Desert Shrew			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs

Notes:

Bold indicates HQs > 1.

-- = HQ not estimated because TRVs are unavailable.

5.6.1.2.2 Risks Evaluated Using a Site-Specific SUF

Table AOC11-5.5b presents HQs calculated using the selected TRVs and BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Based on the AOC 11 potential exposure area and home ranges for Merriam's kangaroo rat and desert shrew, the site-specific SUF was estimated as 1 for these potential receptors (i.e., their home range is less than or equal to the size of the potential exposure area). Therefore, the risk results using selected TRVs and BTAG TRVs for this scenario are the same as discussed above for the generic SUF of 1.

5.6.1.2.3 Baseline Risk Summary for Small Mammals Using Depth-Weighted EPCs

To summarize, based on the risks characterized for small mammals exposed to COPECs in soil at the AOC 11 potential exposure area using selected TRVs⁶, depth-weighted EPCs, and a species- and site-specific SUF (SUF equal to 1), the risk conclusions are as follows:

- For Merriam's kangaroo rat (granivorous small mammal), the NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, indicating *de minimis* risk to individuals and populations of granivorous mammals.
- For desert shrew (invertivorous small mammal), the LOAEL-based HQs are less than or equal to 1 for all COPECs except dioxin TEQ. For dioxin TEQ, potential unacceptable risk to invertivorous small mammal populations at the AOC 11 potential exposure area is uncertain. Although conservative assumptions, uptake factors, and toxicity values were used that likely result in overestimation of risk. In addition, locations with depth-weighted concentrations more than 10 times the BTV are limited spatially. COPECs indicative of uncertain risks based on the HQ (i.e., where NOAEL-based HQs are greater than 1 but LOAEL-based HQs are less than 1) included HMW PAHs. For the remaining COPECs at the AOC 11 potential exposure area, the NOAEL- and LOAEL-based HQs are less than 1 indicating *de minimis* risk to individuals and populations of invertivorous small mammals.

⁶ Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

Based on the risk estimates and potential uncertainties associated with the baseline risk to invertivorous small mammals from HMW PAHs and dioxin TEQ, these COPECs were further evaluated using area-weighted EPCs, as discussed below in Section 5.6.2.

5.6.1.3 Birds

For the AOC 11 potential exposure area, baseline risks were estimated for birds using depth-weighted EPCs for the following evaluations and are discussed in this section:

- Using the selected TRVs and a SUF equal to 1
- Using the BTAG TRVs and a SUF equal to 1
- Using the selected TRVs and a species- and site-specific SUF
- Using the BTAG TRVs and a species- and site-specific SUF.

5.6.1.3.1 Risks Evaluated Using a SUF equal to 1

Risks Evaluated Using the Selected TRVs

Table AOC11-5.5a summarizes HQs estimated for birds at the AOC 11 potential exposure area using the selected TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below. TRVs are not available for TPHs; however, risks to these potential receptors are characterized below based on indicator chemicals as described previously.

- **Gambel's quail (granivorous bird)** – This potential receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and to deeper soil (0 to 6 ft bgs) through its diet. NOAEL- and LOAEL-based HQs in soil are less than 1 for all individual COPECs, indicating *de minimis* risk to individuals and populations of granivorous birds.
 - For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples and NOAEL- and LOAEL-based HQs for PAHs are less than 1, indicating that no unacceptable risk to granivorous birds from exposure to TPHs is expected.
- **Cactus wren (insectivorous bird)** – This potential receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. HQs for this potential receptor are less than or equal to 1 for most COPECs except for mercury, total PCBs, and dioxin TEQ. The potential risks from COPECs with HQs greater than 1 are characterized below.
 - For mercury, the NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of insectivorous birds. However, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ LOE. Mercury was detected in only one of 52 locations in surface soil (FOD = 2% in 0 to 0.5 ft bgs), and therefore, the EPC is based on the maximum depth-weighted concentration. For areas where a constituent is largely not detected, use of a maximum concentration as the EPC may not appropriately characterize risk. Mercury was not detected in the background dataset, and therefore, a background value could not be developed for comparison. The reporting limits (0.049 to 0.065 mg/kg) for this metal also result in

NOAEL-based HQs greater than 1, indicating that the TRVs, which are based on methylmercury (DTSC 2009), likely overestimate risk for this COPEC. In this scenario, unacceptable risk to the individual cactus wren is considered unlikely.

- For total PCBs, the NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of insectivorous birds. However, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ LOE. PCBs were frequently detected in surface soil (FOD = 53% in 0 to 0.5 ft bgs). The magnitude of the NOAEL-based HQ is low. The avian TRVs for PCBs are considered conservative because they are based on data for chickens, which are known to be highly sensitive to PCBs, as discussed in Section 6.5 of the main report. Risks are likely overestimated, as most tested bird species do not have high sensitivity to PCBs (Farmahin et al. 2012; Eng et al. 2014). T&E birds have not been observed in this area. Unacceptable risk to the individual cactus wren is considered unlikely in this scenario.
- For dioxin TEQ, the NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of insectivorous birds. However, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ. Dioxin TEQ was frequently detected in surface soil (FOD = 100% in the 0 to 0.5 ft bgs interval) with 11 of the 26 total surface soil locations having depth-weighted concentrations exceeding the BTV (BTV = 5.98 mg/kg). As described in Section 6.7.5 of the main report, the avian TRVs and uptake factors selected for dioxins at this site likely overestimate exposure and risk for this COPEC. As discussed above for small mammals, elevated concentrations are limited in spatial extent and the HQs are low in magnitude. Additionally, T&E birds have not been observed in this area. Unacceptable risk to the individual cactus wren is considered unlikely in this scenario.
- For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples. The NOAEL- and LOAEL-based HQs for LMW and HMW PAHs are less than one, indicating that no unacceptable risks to individuals or populations of insectivorous birds from exposure to TPHs is expected.
- The NOAEL- and LOAEL-based HQs for all other COPECs in soil are less than 1, indicating *de minimis* risk to individuals and populations of insectivorous birds.

Based on the risk estimates and potential uncertainties associated with the baseline risk from mercury, PCBs, and dioxin TEQ for insectivorous birds, these COPECs were further evaluated using site- and species-specific SUFs, as discussed below.

Risks Evaluated Using the BTAG TRVs

Table AOC11-5.5a also summarizes HQs estimated for birds at AOC11 using the BTAG TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Gambel's quail (granivorous bird)** – NOAEL-based HQ for lead is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of granivorous birds; however, unacceptable risk to individual potential receptors is uncertain for this COPEC. The risks from lead are likely overestimated due to the conservative avian TRV. The uncertainties associated with the BTAG TRVs are discussed in Section 6.5 of the main report. NOAEL- and LOAEL-based HQs for other COPECs

in soil are less than 1 indicating *de minimis* risk to individuals and populations of granivorous birds for the remaining COPECs.

- **Cactus wren (insectivorous bird)** – NOAEL-based HQs for lead, mercury, zinc, 4,4-DDE, and PCBs are greater than 1 and the LOAEL-based HQs are less than 1, indicating no unacceptable risks to populations of insectivorous birds; however, unacceptable risk to individual potential receptors is uncertain for these COPECs. EPCs for mercury and 4,4-DDE are based on the maximum depth-weighted concentration. The uncertainties associated with the BTAG TRVs are discussed in Section 6.5 of the main report. NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs indicating *de minimis* risk to populations of insectivorous birds from these COPECs.

The table below summarizes all HQ estimates for birds for COPECs where at least one NOAEL-based HQ value (using the selected TRV or BTAG TRV) is greater than 1.

Hazard Quotient Summary for Birds (SUF = 1)								
COPEC	Gambel's Quail				Cactus Wren			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Lead	9E-02	5E-02	1E+01	2E-02	1E+00	7E-01	2E+02	3E-01
Mercury	2E-01	4E-02	2E-01	4E-02	3E+00	5E-01	3E+00	5E-01
Zinc	6E-02	2E-02	2E-01	2E-02	1E+00	5E-01	5E+00	5E-01

Notes:

Bold indicates HQs > 1.

-- = HQ not estimated because TRVs are unavailable.

5.6.1.3.2 Risks Evaluated Using a Site-Specific SUF

Risks Evaluated Using the Selected TRVs

Table AOC11-5.5b presents HQs calculated using the selected TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in text and table below.

- **Gambel's quail (granivorous bird)** – The site-specific SUF for this potential receptor is 0.2, which further reduced the NOAEL- and LOAEL-based HQs to less than 1 for all COPECs. *De minimis* risk to individuals and populations of granivorous birds is expected when accounting for site use at the AOC 11 potential exposure area.
- **Cactus wren (insectivorous bird)** – Based on the AOC 11 potential exposure area and home range for cactus wren, the SUF was estimated as 1 for this potential receptor (i.e., the home range is less than or

equal to the size of the potential exposure area). Therefore, the risk results using selected TRVs for this evaluation are the same as discussed above for the generic SUF of 1.

Based on the risk estimates and potential uncertainties associated with the baseline risk from mercury, PCBs, and dioxin TEQ for insectivorous birds (as presented above in Section 5.6.1.3.1), these COPECs were further evaluated using area-weighted EPCs, as discussed below in Section 5.6.2.

Risks Evaluated Using the BTAG TRVs

Table AOC11-5.5b also summarizes HQs estimated for birds at the AOC 11 potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Gambel's quail (granivorous bird)** – The site-specific SUF for this potential receptor is 0.2, which reduced the NOAEL-based HQ for lead, but the NOAEL-based HQ is still greater than 1, indicating no unacceptable risk to populations of granivorous birds; however, unacceptable risk to individual potential receptors is uncertain for this COPEC. The uncertainties associated with the BTAG TRVs are discussed in Section 6.5 of the main report. NOAEL- and LOAEL-based HQs for other COPECs in soil are less than 1 indicating *de minimis* risk to populations of or individual granivorous birds for the remaining COPECs.
- **Cactus wren (insectivorous bird)** – Based on the AOC 11 potential exposure area and home range for cactus wren, the SUF was estimated as 1 for this potential receptor (i.e., the home range is less than or equal to the size of the potential exposure area). Therefore, the risk results using BTAG TRVs for this scenario are the same as discussed above for the generic SUF of 1. The uncertainties associated with the BTAG TRVs are discussed in Section 6.5 of the main report.

For the COPECs with NOAEL-based HQs greater than 1 using a SUF of 1 (using the selected TRV or BTAG TRV), the table below summarizes HQ estimates using the species- and site-specific SUF for birds.

Hazard Quotient Summary for Birds (Site-Specific SUF)								
COPEC	Gambel's Quail (SUF = 0.2)				Cactus Wren (SUF = 1)			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Lead	2E-02	8E-03	2E+00	3E-03	1E+00	7E-01	2E+02	3E-01
Mercury	3E-02	7E-03	3E-02	7E-03	3E+00	5E-01	3E+00	5E-01
Zinc	1E-02	4E-03	4E-02	4E-03	1E+00	5E-01	5E+00	5E-01
4,4-DDE	7E-05	7E-06	2E-03	2E-05	1E-01	1E-02	3E+00	4E-02
Total PCBs	4E-03	2E-04	4E-03	2E-04	3E+00	2E-01	3E+00	2E-01
TEQ Avian	4E-03	4E-04	--	--	6E+00	6E-01	--	--

Notes:

Bold indicates HQs > 1.

-- = HQ not estimated because TRVs are unavailable.

5.6.1.3.3 Baseline Risk Summary for Birds Using Depth-Weighted EPCs

To summarize, based on the risks characterized for populations of birds exposed to COPECs in soil at the AOC 11 potential exposure area using selected TRVs⁷, depth-weighted EPCs, and a site-specific SUF, the risk conclusions are as follows:

- **Gambel's quail (granivorous bird)** – The NOAEL- and LOAEL-based HQs for all COPECs are less than 1, indicating *de minimis* risk to individuals and populations of granivorous birds for all COPECs.
- **Cactus wren (insectivorous bird)** – No unacceptable risk to populations was identified because the LOAEL-based HQs are less than 1 for all COPECs. COPECs indicative of uncertain risks to individual potential receptors based on the HQ (i.e., where NOAEL-based HQs are greater than 1 but LOAEL-based HQs are less than 1) included mercury, PCBs, and dioxin TEQ. For the remaining COPECs at the AOC 11 potential exposure area, the NOAEL- and LOAEL-based HQs are less than 1 indicating *de minimis* risk to individuals and populations of insectivorous birds.

Based on the risk results and potential uncertainties associated with the baseline risk to insectivorous birds from mercury, PCBs, and dioxin TEQ at the AOC 11 potential exposure area, these COPECs were further evaluated using area-weighted EPCs, as discussed below in Section 5.6.2.

5.6.2 Risk Characterization (Baseline Scenario and Area-Weighted EPCs)

Based on the risk characterization of COPECs in the baseline scenario using depth-weighted EPCs (Section 5.6.1, above), risks were characterized for all COPECs using area-weighted EPCs. For those COPECs identified for further evaluation in the depth-weighted evaluation, the results of the area-weighted risk are presented below. These included:

- Hexavalent chromium and HMW PAHs/TPHs for plants
- Hexavalent chromium, mercury, zinc, alpha- and gamma-chlordane for soil invertebrates
- HMW PAHs and dioxin TEQ for invertivorous small mammals
- Mercury, PCBs, and dioxin TEQ for insectivorous birds.

Potential risks to potential receptors from the COPECs listed above were characterized for the baseline scenario using area-weighted EPCs as discussed in this section. Detailed risk calculations for plants and soil invertebrates (Table AOC11-C.6) and detailed dose and risk calculations for wildlife for all COPECs (Tables AOC11-C.7 through AOC11-C.10) are presented in Attachment AOC11-C.

5.6.2.1 Plants and Soil Invertebrates

Table AOC11-5.6a summarizes HQs estimated for soil exposure for ecological communities (plants and soil invertebrates) at the AOC 11 potential exposure area for the baseline scenario using area-weighted EPCs for all COPECs; however, only the COPECs identified above in Section 5.6.1.1 for further evaluation using area-weighted EPCs are discussed here.

⁷ Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

APPENDIX AOC11

SOIL HHERA FOR AOC 11 EXPOSURE AREA

Plants can potentially be exposed to COPECs in soil up to 6 ft bgs. HQs were based on the highest EPC from the surface, shallow, and subsurface I depth intervals. Plant HQs using area-weighted EPCs are greater than 1 for hexavalent chromium based on the highest EPC value from the shallow, surface, and subsurface I depth intervals. For plants, the magnitude of the HQ for HMW PAHs was reduced in this evaluation and is equal to 1; therefore, unacceptable risk to plant communities is not expected for HMW PAHs.

Soil invertebrates can potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs). Soil invertebrate HQs using area-weighted EPCs are greater than 1 for hexavalent chromium, mercury, alpha-chlordane, and gamma-chlordane. For soil invertebrates, the magnitude of the HQ for zinc was reduced in this evaluation and is less than 1; therefore, unacceptable risk to soil invertebrate communities is not expected for zinc.

For hexavalent chromium, the HQs for plants and soil invertebrates based on the area-weighted EPC are also greater than 1. Similar to the depth-weighted evaluation, the area-weighted EPC from surface soil (0 to 0.5 ft bgs) was used to evaluate potential risk to soil invertebrates and the area-weighted EPC from subsurface I soil (0 to 6 ft bgs) was used to evaluate potential risk to plants from exposure to hexavalent chromium in soil. For plants, the area-weighted EPC for subsurface I soil (2.05 mg/kg) is slightly less than the depth-weighted EPC (2.18 mg/kg) because area-weighting had little effect for this dataset. Hexavalent chromium was frequently detected at the AOC 11 potential exposure area (at 26 of 52 locations in the 0 to 0.5 ft bgs interval, and 36 of 53 locations in the 0 to 6 ft bgs interval). However, for surface soil, the area-weighted EPC (1.88 mg/kg) increased relative to the depth-weighted EPC (0.81 mg/kg) due to the difference in the UCL calculation method (see Section 3, above), resulting in an HQ about two times higher than in the depth-weighted evaluation. As noted above in Section 5.6.1.1, although hexavalent chromium was frequently detected at the AOC 11 potential exposure area, exceedances of the BTV were infrequent (i.e., in nine of the 52 surface soil [0 to 0.5 ft bgs] locations and 13 of the 53 subsurface I soil [0 to 6 ft bgs] locations). High concentrations (greater than 10 times above the BTV) are limited to one location (16 mg/kg at AOC11e-6). Additionally, there are uncertainties associated with screening values for plants and soil invertebrates, as discussed above in Section 5.6.1.1, and there is low confidence in the ability of the screening levels to predict risk to plant and soil invertebrate communities. The HQs are low for both plants and soil invertebrates. Based on the risk results and discussion above, unacceptable risk to plants and soil invertebrate communities from exposure to hexavalent chromium is considered unlikely.

For mercury, the HQ for soil invertebrates is greater than 1 and is unchanged from the depth-weighted evaluation presented above in Section 5.6.1.1 because the EPC is based on the maximum depth-weighted concentration due to low FOD. Mercury was detected in only one of 52 surface soil locations (FOD = 2% in 0 to 0.5 ft bgs), and the maximum depth-weighted concentration (0.18 mg/kg) was used as the area-weighted EPC. For areas where a constituent is largely not detected, the use of a maximum concentration as the EPC may not appropriately characterize risk. Because a UCL could not be estimated due to the low FOD, comparison to the mean concentration in surface soil (0.0515 mg/kg based on the KM mean) to the screening value results in an HQ less than 1 for soil invertebrates. Mercury was not detected in the background dataset, and therefore, a background value could not be developed for comparison and the magnitude of the HQ is low. The uncertainties associated with the soil invertebrate screening values are discussed above in Section 5.6.1.1 and indicate low confidence in the ability of the screening level to predict risk to soil invertebrate communities. Based on the risk results and uncertainty discussed above, unacceptable risk to soil invertebrate communities from exposure to mercury is considered unlikely.

For alpha-chlordane and gamma-chlordane, the HQs for soil invertebrates are the same as the depth-weighted HQs and are greater than 1. These pesticides were detected in only one of 10 locations in surface soil (FOD = 10%), and the maximum depth-weighted concentrations were used as the area-weighted EPCs for alpha-chlordane (0.012 mg/kg) and gamma-chlordane (0.013 mg/kg). The magnitude of the HQ is low. For areas where a constituent is largely not detected, the use of a maximum concentration as the EPC may not appropriately characterize risk. Because UCLs could not be estimated due to the low FOD, comparison to the mean concentrations in surface soil (0.0017 mg/kg for alpha-chlordane and 0.00018 mg/kg for gamma-chlordane based on the KM mean) results in HQs less than 1 for soil invertebrates. The screening values for soil invertebrates (0.0043 mg/kg) is based on chlordane and was used to evaluate potential risk of soil invertebrates exposed to alpha- and gamma-chlordane. The uncertainties associated with the soil invertebrate screening values are discussed above in Section 5.6.1.1. Based on the risk results and uncertainty discussed above, unacceptable risk to soil invertebrate communities from exposure to alpha- or gamma-chlordane is considered unlikely.

Vegetation communities observed at the site during the floristic surveys conducted in 2013 (GANDA and CH2M 2013) and in 2017 (CH2M 2017b) is typical of Mojave Desert plant communities (summarized in Section 2.4.2). Over a hundred different vascular plant species have been observed within the survey area that includes AOC 11 potential exposure area; documented as Segment H in these survey reports (GANDA and CH2M 2013, CH2M 2017b). The floristic surveys report a diverse assemblage of plants species found in typical abundance, density, cover, and vigor of plant communities in undisturbed desert habitat. These observations are not consistent with impairment of the plant community at the site. The floristic surveys provide site-specific observations that support the health of plant communities at the site and is considered a stronger LOE than the exceedances of low-confidence generic plant screening values, which are widely acknowledged to have low ability to predict toxicity in plants.

Risk Summary and Potential Drivers for Ecological Communities

Risk drivers were identified for unacceptable ecological community-level risk predicted using the most refined exposure and effects assumptions (i.e., area-weighted EPCs) and additional LOEs supporting the conclusion of no unacceptable risk.

For plants, no unacceptable risk was identified for HMW PAHs and TPHs and unacceptable risk was considered unlikely for hexavalent chromium. No risk-driving COPECs were identified at the AOC 11 potential exposure area using area-weighted EPCs based on an HQ greater than 1 and supporting WOE.

For soil invertebrates, unacceptable risk was considered unlikely for mercury, hexavalent chromium, alpha-chlordane, and gamma-chlordane. No risk-driving COPECs were identified at the AOC 11 potential exposure area for the baseline scenario using area-weighted EPCs and supporting WOE.

No unacceptable risk to plant and soil invertebrate communities is expected from any COPECs at the AOC 11 potential exposure area.

5.6.2.2 Small Mammals

For the AOC 11 potential exposure area, baseline risks were estimated for small mammals using area-weighted EPCs for the following evaluations and are discussed in this section:

- Using the selected TRVs and a species- and site-specific SUF

- Using the BTAG TRVs and a species- and site-specific SUF.

5.6.2.2.1 Risks Evaluated Using a Site-Specific SUF

Risks Evaluated Using the Selected TRVs

Table AOC11-5.6a summarizes HQs estimated for small mammals at the AOC 11 potential exposure area using the selected TRVs, area-weighted EPCs, and a SUF equal to 1. Table AOC11-5.6b summarizes HQs estimated for small mammals at the AOC 11 potential exposure area using the selected TRVs, area-weighted EPCs, and a site-specific SUF (SUF = 1 as the home range for small mammals is less than or equal to the size of the AOC 11 potential exposure area) for all COPECs. However, only the COPECs identified above in Section 5.6.1.2 for further evaluation using area-weighted EPCs are discussed here. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Merriam's kangaroo rat (granivorous small mammal)** – This potential receptor could potentially be exposed to COPECs in subsurface I soil (0 to 6 ft bgs) directly and through its diet. *De minimis* risk to individuals and populations of granivorous small mammals was identified using depth-weighted EPCs, and the conclusions are the same using area-weighted EPCs (i.e., the NOAEL- and LOAEL-based HQs are less than 1).
- **Desert shrew (invertivorous small mammal)** – This potential receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. The COPECs identified above in Section 5.6.1.2 for further evaluation using area-weighted EPCs were HMW PAHs and dioxin TEQ.
 - For HMW PAHs, the magnitude of the NOAEL- and LOAEL-based HQs were reduced from the depth-weighted EPC analysis, and the NOAEL-based HQ is equal to 1 using an area-weighted EPC. The LOAEL-based HQ is also less than 1, indicating *de minimis* risk to individuals and populations of invertivorous small mammals exposed to HMW PAHs in soil.
 - For dioxin TEQ, the magnitude of NOAEL- and LOAEL-based HQs were reduced from the depth-weighted EPC analysis but are still greater than 1 indicating potential unacceptable risks are possible for individuals and populations of invertivorous small mammals based on the HQ. Conservative assumptions were used to estimate the HQs, including use of bioaccumulation factors based on uptake of a single congener (2,3,7,8-TCDD) to earthworms, and a diet assumed to consist entirely of earthworms. The magnitude of the HQs is low (less than 10) and the spatial extent of concentrations exceeding ten times the BTV is limited to four locations along the TCS fenceline (PA-10, PA-11, PA-12, and SD-11A). As a result, the HQs are considered to be overestimated and the LOAEL-based HQ would likely be reduced to less than 1 when adjusted for compounded conservatism in the risk estimates for this COPEC (see Section 6.7.6 of the main report. T&E species with small home ranges have not been observed at the AOC 11 potential exposure area. Based on the LOEs, unacceptable risk to individuals and populations of invertivorous small mammals is considered to be unlikely.
 - NOAEL- and LOAEL-based HQs for other COPECs in soil are less than 1 indicating *de minimis* risk to individuals and populations of invertivorous small mammals for the remaining COPECs.

Risks Evaluated Using the BTAG TRVs

Table AOC11-5.6b also summarizes HQs estimated for mammals at the AOC 11 potential exposure area using the BTAG TRVs, area-weighted EPCs, and a site-specific SUF (SUF = 1). Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in text and table below.

- **Merriam's kangaroo rat (granivorous small mammal)** – The NOAEL- and LOAEL-based HQs using area-weighted EPCs also resulted in HQs less than 1 for all COPECs, indicating *de minimis* risk to individuals and populations of granivorous small mammals.
- **Desert shrew (invertivorous small mammal)** – The NOAEL-based HQ for HMW PAHs was reduced to less than 1, indicating *de minimis* risk to individuals or populations of invertivorous small mammals for this COPEC. NOAEL-based HQs for lead and zinc using the area-weighted EPCs are similar to the HQs in the depth-weighted evaluation and are greater than 1. The LOAEL-based HQs are less than 1 for lead and zinc, indicating no unacceptable risk to populations of invertivorous mammals; however, unacceptable risk to individual potential receptors is uncertain for these COPECs. The uncertainties associated with the BTAG TRVs are discussed in Section 6.5 of the main report. NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs indicating *de minimis* risk to individuals and populations of invertivorous small mammals from the remaining COPECs.

The table below summarizes the NOAEL- and LOAEL-based HQs for mammals for COPECs identified above in Section 5.6.1.2 that were further evaluated using area-weighted EPCs in this section. The HQs below are based on the area-weighted EPCs and species- and site-specific SUF (if applicable for a potential receptor):

Hazard Quotient Summary for Mammals (Site-Specific SUF = 1)								
COPEC	Merriam's Kangaroo Rat				Desert Shrew			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Lead	5E-02	3E-02	2E-01	1E-03	7E-01	4E-01	3E+00	1E-02
Zinc	7E-02	2E-02	6E-01	1E-02	1E+00	3E-01	9E+00	2E-01
HMW PAHs	4E-02	8E-03	2E-02	8E-04	1E+00	3E-01	6E-01	3E-02
TEQ Mammals	3E-01	3E-02	--	--	9E+01	9E+00	--	--

Notes:

Bold indicates HQs > 1.

-- = HQ not estimated because TRVs are unavailable.

5.6.2.2.2 Baseline Risk Summary for Small Mammals Using Area-Weighted EPCs

To summarize, based on the risks characterized for populations of small mammals exposed to COPECs in soil at the AOC 11 potential exposure area using selected TRVs⁸, area-weighted EPCs, and a site-specific

⁸ Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

SUF (SUF equal to 1 because the home ranges are less than or equal to the size of the potential exposure area), the risk conclusions are as follows:

- For Merriam's kangaroo rat (granivorous small mammal), the area-weighted NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, indicating *de minimis* risk to individuals and populations of granivorous small mammals. As potential risk is *de minimis* from all COPECs at the AOC 11 potential exposure area for granivorous small mammals, no further evaluation is necessary.
- For the desert shrew (invertivorous small mammal), the area-weighted NOAEL- and LOAEL-based HQs are greater than 1 for dioxin TEQ. Unacceptable risk to invertivorous small mammals from exposure to dioxin TEQ is unlikely based on the following LOE: 1) low magnitude of the HQs (LOAEL-based HQ is less than 10), and likely reduced to 1 or less if adjusted for compounding uncertainties associated with the conservative assumptions; these include diet (dietary composition assumes 100% of a single item diet, uptake into dietary items (bioaccumulation based on a single congener likely overestimates HQs by 10 times), and conservative TRVs (based on the lowest available NOAEL and LOAEL doses; 2) spatial extent of elevated concentrations were limited to four locations along the TCS fenceline (PA-10, PA-11, PA-12, and SD-11A); and 3) T&E species with small home ranges have not been observed in AOC 11 potential exposure area.
- For the remaining COPECs, the NOAEL- and LOAEL-based HQs are less than or equal to 1, indicating *de minimis* risk to individuals and populations of invertivorous small mammals.

Potential Risk Drivers for Small Mammals at AOC 11 Potential Exposure Area

No risk-driving COPECs for small mammals were identified at AOC 11 as no unacceptable population-level risk (i.e., LOAEL-based HQs greater than 1 [or LOAEL-based HQs greater than 10 for dioxin TEQ]) was predicted from HQs calculated using the most refined exposure and effects assumptions (i.e., site-specific SUF, area-weighted EPCs, and selected TRVs) and additional supporting WOE.

COPECs with NOAEL-based HQs greater than 1 using the most refined exposure and effects assumptions were identified at AOC 11 (dioxin TEQ). However, the additional LOEs support the conclusions that unacceptable risk to individual receptors from exposure to this COPEC is unlikely.

5.6.2.3 Birds

For the AOC 11 potential exposure area, baseline risks were estimated using area-weighted EPCs for the following evaluations and are discussed in this section:

- Using the selected TRVs and a species- and site-specific SUF
- Using the BTAG TRVs and a species- and site-specific SUF.

5.6.2.3.1 Risks Evaluated Using Site-Specific SUF

Risks Evaluated Using the Selected TRVs

Table AOC11-5.6a summarizes HQs estimated for birds at the AOC 11 potential exposure area using the selected TRVs, area-weighted EPCs, and a SUF equal to 1. However, this section only discusses the area-weighted HQs using the selected TRVs and site-specific SUF. Table AOC11-5.6b summarizes HQs estimated for birds at the AOC 11 potential exposure area using the selected TRVs, area-weighted EPCs, and a site-

specific SUF (SUF = 0.2 for Gambel's quail and 1 for cactus wren) for all COPECs. Only the COPECs identified above in Section 5.6.1.3 for further evaluation using area-weighted EPCs are discussed here. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized in the text and table below.

- **Gambel's quail (granivorous bird)** – This potential receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and to deeper soil (0 to 6 ft bgs) through its diet. *De minimis* risk to granivorous birds was identified using depth-weighted EPCs, and the results are the same using area-weighted EPCs (i.e., the NOAEL- and LOAEL-based HQs are less than 1).
- **Cactus wren (insectivorous bird)** – This potential receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. The COPECs identified above in Section 5.6.1.3 for further evaluation using area-weighted EPCs were mercury, PCBs, and dioxin TEQ. Additionally, lead is also discussed below, as the area-weighted EPCs is higher than the depth-weighted EPC and results in an HQ greater than 1.
 - For lead, the NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is equal to 1, indicating no unacceptable risk to populations of insectivorous birds; however, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ LOE. Lead was frequently detected in surface soil (FOD = 100% from 0 to 0.5 ft bgs) with 29 of the 52 total surface soil locations having depth-weighted concentrations exceeding the BTV (8.39 mg/kg). The elevated EPC is due primarily to two locations with concentrations more than 10 times greater than the BTV (220 mg/kg at AOC11-7 and 150 mg/kg at PA-09). There is moderate confidence in the TRVs. The NOAEL TRV is considered conservative, as the EcoSSL is based data for lead acetate, a highly bioavailable form of lead unlikely to be present in soil (see Section 6.5 of the main report). The EcoSSL is based on the highest bounded NOAEL below the lowest bounded LOAEL, is below the geometric mean NOAEL value for reproduction and growth endpoints, and was calculated from a dataset representing at least six bird species. The magnitude of the HQ is low, even when using conservative assumptions for this potential receptor in the ERA (such as 100% invertebrate diet and uptake factors based on earthworms). In addition, site-specific bioavailability of lead is not accounted for in the EPC estimates and conservatively is assumed to be 100%. Further, T&E species with small home ranges have not been observed at the AOC 11 potential exposure area, and therefore, protection at the individual level (i.e., NOAEL-based HQ less than or equal to 1) is not warranted. Although the NOAEL-based HQ is greater than 1, based on the HQ and supporting LOEs, unacceptable risk is considered unlikely for individual insectivorous birds exposed to lead in soil at the AOC 11 potential exposure area and is not expected for populations of insectivorous birds.
 - For mercury, the magnitude of the NOAEL- and LOAEL-based HQ remained the same as using the depth-weighted EPC because the area-weighted EPC is based on the maximum depth-weighted concentration due to the low FOD and the SUF is equal to 1. The NOAEL-based HQ is greater than 1 and the LOAEL-based AOC is less than 1, indicating no unacceptable risk to populations of insectivorous birds. Unacceptable risks to individual potential receptors is uncertain based on the HQ; however, additional LOEs (i.e., low FOD, low HQ, and conservative assumptions, as discussed above for invertivorous mammals) support the conclusion that unacceptable risk is not expected for individual potential receptors and unlikely for populations of insectivorous birds.

- For PCBs, the magnitude of the NOAEL- and LOAEL-based HQ was reduced from the depth-weighted EPC analysis, and the NOAEL-based HQ is equal to 1 using an area-weighted EPC. *De minimis* risk to individuals and populations of insectivorous birds is expected.
- For dioxin TEQ, the magnitude of NOAEL- and LOAEL-based HQs were reduced from the depth-weighted EPC analysis. Using an area-weighted EPC, the LOAEL-based HQ is still less than 1 and the NOAEL-based HQ is still greater than 1. The results indicate no unacceptable risk to populations of insectivorous birds; however, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ. The magnitude of the NOAEL-based HQ is low. Conservative assumptions were used to estimate the HQs, including the use of bioaccumulation factors based on the uptake of a single congener (2,3,7,8-TCDD) to earthworms, and a diet assumed to consist entirely of earthworms. As a result, the HQs are considered to be overestimated. Additionally, T&E species have not been observed at the AOC 11 potential exposure area, as described above in Section 5.1.1. Therefore, unacceptable risk to individual insectivorous birds is considered to be unlikely and is not expected for populations of insectivorous birds.

Risks Evaluated Using the BTAG TRVs

Table AOC11-5.6b also summarizes HQs estimated for birds at AOC11 using the BTAG TRVs, area-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each potential receptor are summarized below.

- **Gambel's quail (granivorous bird)** – The site-specific SUF for this potential receptor is 0.2. The NOAEL-based HQ for lead increased slightly from the depth-weighted EPC analysis and is greater than 1, indicating no unacceptable risk to populations of insectivorous birds; however, unacceptable risk to individual potential receptors is uncertain. NOAEL- and LOAEL-based HQs for other COPECs in soil are less than 1 indicating *de minimis* risk to individuals and populations of granivorous birds for the remaining COPECs.
- **Cactus wren (insectivorous bird)** – The site-specific SUF for this potential receptor is 1. NOAEL-based HQs using depth-weighted EPCs were greater than 1 for lead, mercury, zinc, 4,4,-DDE, and total PCBs. Using area-weighted EPCs, the NOAEL-based HQ for PCBs was reduced from the depth-weighted analysis and is equal to 1, indicating *de minimis* risk to individuals and populations of insectivorous birds exposed to PCBs. The NOAEL-based HQ for zinc was reduced from the depth-weighted EPC analysis, but the NOAEL-based HQ was still greater than 1. NOAEL-based HQs for mercury and 4,4,-DDE remained the same because mercury and 4,4,-DDE were based on the maximum detected concentration in surface soil (0 to 0.5 ft bgs). The NOAEL-based HQ for lead increased. LOAEL-based HQs are less than 1 for all COPECs, indicating no unacceptable risk to populations of insectivorous birds; however, unacceptable risk to individual potential receptors is uncertain for lead, mercury, zinc, and 4,4-DDE. The uncertainties associated with the BTAG TRVs are discussed in Section 6.5 of the main report.

NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs indicating *de minimis* risk to individuals and populations of insectivorous birds from these COPECs.

The table below summarizes NOAEL- and LOAEL-based HQs for birds for COPECs identified above in Section 5.6.1.3 that were further evaluated using area-weighted EPCs in this section. The HQs below are based on the area-weighted EPCs and species- and site-specific SUF.

5.6.2.3.2 Risk Summary for Birds Using Area-Weighted EPCs

To summarize, based on the risks characterized for populations of birds exposed to COPECs in soil at the AOC 11 potential exposure area using selected TRVs⁹, area-weighted EPCs, and a site-specific SUF, the risk conclusions are as follows:

- Gambel's quail (granivorous bird) – The NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, indicating de minimis risk to individuals and populations of granivorous birds. Potential risk is de minimis from all COPECs at the AOC 11 potential exposure area for granivorous birds and no further evaluation is necessary.
- Cactus wren (insectivorous bird)** – LOAEL-based HQs are less than 1 for all COPECs, indicating no unacceptable risk to insectivorous bird populations. COPECs indicative of uncertain risks to individual potential receptors based on the HQs (i.e., where the NOAEL-based HQs are greater than 1 but LOAEL-based HQs are less than 1) include lead, mercury, and dioxin TEQ. For these COPECs, unacceptable risk to individual potential receptors is considered unlikely based on supporting LOEs, including the low magnitude of the HQs, conservative assumptions used in the risk estimates, no observations of T&E species at the AOC 11 potential exposure area, and low FOD (for mercury). For the remaining COPECs, the NOAEL- and LOAEL-based HQs are less than 1 indicating de minimis risk to individuals and populations of insectivorous birds.

⁹ Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

Potential Risk Drivers for Birds at AOC 11 Potential Exposure Area

No risk-driving COPECs were identified at AOC 11 for the baseline scenario using area-weighted EPCs as no unacceptable population-level risk (i.e., LOAEL-based HQs greater than 1) were predicted using the most refined exposure and effects assumptions (i.e., site-specific SUF, area-weighted EPCs, and selected TRVs) and additional supporting LOEs.

COPECs with NOAEL-based HQs greater than 1 using the most refined exposure and effects assumptions were identified for the AOC 11 potential exposure area (i.e., lead, mercury, and dioxin TEQ); however, the WOE supports the conclusion that unacceptable risk to individual potential receptors from exposure to these COPECs is unlikely.

6 SUMMARY AND CONCLUSIONS FOR THE HHRA

Potential cumulative cancer risks and noncancer hazards for potential human receptors were estimated, as presented above in Section 4. For potential ecological receptors, potential risks were estimated as presented in Section 5, above. Uncertainties related to the HHRA and ERAs at the site are discussed in detail in Sections 5.6 and 6.5 of the main report, and uncertainties specific to the AOC 11 potential exposure area are discussed in this appendix. For the AOC 11 potential exposure area, the HHRA and ERA were conducted per the RAWP documents (Arcadis 2008, 2009, 2015). One scenario was evaluated (baseline [no scouring]). For this evaluation, risks were estimated for various potential receptors using depth-weighted EPCs and area-weighted EPCs.

At the AOC 11 potential exposure area, the COPCs/COPECs identified for the HHRA include metals (arsenic, hexavalent chromium, total chromium, copper, lead, mercury, and zinc), one VOC (methyl acetate), HMW PAHs, LMW PAHs, PAHs, pesticides (4,4-DDE, alpha-chlordane, dieldrin, and gamma-chlordane), PCBs, TPH as diesel, TPH as motor oil, and dioxins and furans. A summary of these results and conclusions regarding potential risk associated with exposure to these COPCs/COPECs in soil at the AOC 11 potential exposure area based on the risk/hazard estimates and uncertainties inherent in the risk assessment process are presented in this section.

6.1 Summary and Conclusions for the HHRA

The cumulative ILCRs and HIs associated with potential exposure to COPCs in soil at the AOC 11 potential exposure area using depth- and area-weighted EPCs under the baseline scenario were estimated. Assuming lifetime soil contact is limited to the AOC 11 potential exposure area for the potential receptors evaluated, the estimated potential ILCR and HI results are summarized in the table and discussed below.

Baseline Scenario Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 11 Potential Exposure Area			
		Cumulative ILCR		HI	
		Depth-Wt	Area-Wt	Depth-Wt	Area-Wt
Short-Term Maintenance Worker	Surface	$\leq 1 \times 10^{-6}$	---	≤ 1	---
	Shallow	$\leq 1 \times 10^{-6}$	---	≤ 1	---
	Subsurface I	$\leq 1 \times 10^{-6}$	---	≤ 1	---
	Subsurface II	$\leq 1 \times 10^{-6}$	---	≤ 1	---
Long-Term Maintenance Worker	Surface	7×10^{-6} (As, CrVI, and dioxin TEQ)	7×10^{-6} (As, CrVI, and dioxin TEQ)	≤ 1	≤ 1
	Shallow	8×10^{-6} (As, CrVI, and dioxin TEQ)	8×10^{-6} (As, CrVI, and dioxin TEQ)	≤ 1	≤ 1

APPENDIX AOC11
SOIL HHERA FOR AOC 11 EXPOSURE AREA

Baseline Scenario Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 11 Potential Exposure Area			
		Cumulative ILCR		HI	
		Depth-Wt	Area-Wt	Depth-Wt	Area-Wt
Long-Term Maintenance Worker	Subsurface I	9×10^{-6} (As, CrVI, and dioxin TEQ)	8×10^{-6} (As, CrVI, and dioxin TEQ)	≤ 1	≤ 1
	Subsurface II	8×10^{-6} (As, CrVI, and dioxin TEQ)	8×10^{-6} (As, CrVI, and dioxin TEQ)	≤ 1	≤ 1
Camper	Surface	3×10^{-6} (As and dioxin TEQ)	3×10^{-6} (As and dioxin TEQ)	≤ 1	---
	Shallow	3×10^{-6} (As and dioxin TEQ)	3×10^{-6} (As and dioxin TEQ)	≤ 1	---

	Shallow	6×10^{-6} (As and dioxin TEQ)	5×10^{-6} (As and dioxin TEQ)	≤ 1	---
Hunter	Surface	$\leq 1 \times 10^{-6}$	---	≤ 1	---
	Shallow	$\leq 1 \times 10^{-6}$	---	≤ 1	---
OHV Rider	Surface	3×10^{-6} (As and dioxin TEQ)	3×10^{-6} (As, CrVI, and dioxin TEQ)	≤ 1	≤ 1
	Shallow	3×10^{-6} (As, CrVI, and dioxin TEQ)	3×10^{-6} (As, CrVI, and dioxin TEQ)	≤ 1	≤ 1
Tribal User	Surface	$\leq 1 \times 10^{-6}$	---	≤ 1	---
	Shallow	$\leq 1 \times 10^{-6}$	---	≤ 1	---

Note:

--- = area-weighted (area-wt) estimate not calculated because depth-weighted (depth-wt) estimates for the potential receptor was below *de minimis* levels

Depth-Weighted

Potential exposures that are at or below *de minimis* levels include the following:

- **HI ≤ 1 for all soil depths** – All potential receptors evaluated including: Short- and Long-Term Maintenance Worker, Camper, Hiker, Hunter, and OHV Rider
- **ILCR $\leq 1 \times 10^{-6}$** – Short-Term Maintenance Worker (all soil depths), Hunter (surface and shallow soil), and Tribal User (surface and shallow soil).

Potential exposures that are above the *de minimis* levels of an HI > 1 and within the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **HI > 1 and ≤ 3** – None
- **HI > 3** – None
- **ILCR > 1×10^{-6} and $\leq 5 \times 10^{-6}$** – Camper (surface and shallow soil) and OHV Rider (surface and shallow soil)
- **ILCR > 5×10^{-6} and $\leq 1 \times 10^{-5}$** – Long-Term Maintenance Worker (all soil depths) and Hiker (surface and shallow soil)
- **ILCR > 1×10^{-5} and $\leq 1 \times 10^{-4}$** – None.

Potential exposures that are above the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **ILCR > 1×10^{-4}** – None.

Assuming lifetime soil contact is limited to the AOC 11 potential exposure area, the depth-weighted estimated risks and hazards above *de minimis* levels for the long-term maintenance worker, camper, hiker, and OHV rider were due to arsenic, hexavalent chromium, and/or dioxin TEQ. Therefore, potential risks and hazards for these four potential receptors were evaluated using area-weighted EPCs and are provided below.

Area-Weighted

Potential exposures that are at or below the *de minimis* levels include the following:

- **HI ≤ 1 for all soil depths** – Long-Term Maintenance Worker, Camper, Hiker, and OHV Rider
- **ILCR $\leq 1 \times 10^{-6}$ for all soil depths** – None.

Potential exposures that are above the *de minimis* level of an HI > 1 and within the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **HI > 1 and ≤ 3** – None
- **HI > 3** – None
- **ILCR > 1×10^{-6} and $\leq 5 \times 10^{-6}$** – Camper (surface and shallow soil), Hiker (surface and shallow soil), and OHV Rider (surface and shallow soil)
- **ILCR > 5×10^{-6} and $\leq 1 \times 10^{-5}$** – Long-Term Maintenance Worker (all soil depths)
- **ILCR > 1×10^{-5} and $\leq 1 \times 10^{-4}$** – None.

Potential exposures that are above the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **ILCR $> 1 \times 10^{-4}$ – None.**

OVERALL SUMMARY

Assuming lifetime soil contact is limited to the AOC 11 potential exposure area, the estimated cumulative ILCRs and HIs associated with potential exposure to COPCs in soil using depth-weighted EPCs for the short-term maintenance worker, hunter, and tribal user are below 1×10^{-6} and 1, respectively. The cumulative ILCRs estimated using the depth- and area-weighted EPCs for the camper and OHV rider were above the point of departure for risk management decisions of 1×10^{-6} , but below 5×10^{-6} . The cumulative ILCRs estimated using the depth- and/or area-weighted EPCs for the long-term maintenance worker and hiker were above 5×10^{-6} , but below 1×10^{-5} . These values are within the risk management range of 1×10^{-6} and 1×10^{-4} . The cumulative HIs estimated using the depth- and area-weighted EPCs for the long-term maintenance workers, campers, hikers, and OHV riders were at or below HI of 1.

As demonstrated by comparing the values, the area-weighted estimated cumulative ILCRs for the camper, hiker, and OHV rider are not materially different than the depth-weighted cumulative ILCRs for all exposure depths. Approximately 78 to 85% of the estimated ILCRs for arsenic are attributed to background concentrations of arsenic in soil. Considering the substantial contribution of background arsenic in soil to the estimated cumulative ILCRs for all the receptors potentially exposed to AOC 11 potential exposure area soil, it is likely that incremental risks for site-related COPCs in soil are at or only slightly above 1×10^{-6} , but below 5×10^{-6} , which is well within the risk management range of 1×10^{-6} and 1×10^{-4} .

The depth- and area-weighted EPCs for lead in the AOC 11 potential exposure area soil at all exposure depths are not expected to result in an increase in blood lead levels above OEHHA's benchmark value of $1 \mu\text{g/dL}$ in the fetus of a short- or long-term maintenance worker, fetus of a hunter, or child recreational user.

Risks/hazards estimated for an individual AOC/SWMU/UA potential exposure area like AOC 11 are not considered representative of the realistic or likely potential exposures for the human populations that could be present in the areas outside the TCS (such as maintenance workers, recreational users, and tribal users). Risks/hazards calculated separately for individual AOCs are conservative and likely overestimate site risks/hazards. As described in the RAWP documents (Arcadis 2008, 2009, 2015), these human populations would more likely be exposed randomly, over the course of a lifetime, to soil present in all individual AOC/SWMU/UA potential exposure areas located outside the TCS, rather than have a lifetime of contact limited to the area of a single potential exposure area. Therefore, estimated risk/hazards presented for individual AOC/SWMU/UA potential exposure areas are not believed to be representative of the potential health risks to humans potentially contacting the soil outside the TCS. Rather, the HHRA results presented in Appendix OCS for all AOC/SWMU/UA potential exposure areas located outside the TCS combined will help to inform risk management decisions for the site. The estimated risks and hazards associated with a lifetime of contact with soil only in AOC 11 potential exposure area are presented at the request of the agencies and are not suitable to provide the sole basis of risk management decisions to protect human health.

6.2 Summary and Conclusions for the ERA

At the AOC 11 potential exposure area, seven metals (arsenic, hexavalent chromium, total chromium, copper, lead, mercury, and zinc), VOCs (methyl acetate), LMW PAHs, HMW PAHs, pesticides (4,4-DDE, alpha-

APPENDIX AOC11

SOIL HHERA FOR AOC 11 EXPOSURE AREA

chlordane, gamma- chlordane, and dieldrin), PCBs, dioxin TEQ (for potential wildlife receptors only), and 2,3,7,8-TCDD (for ecological communities only) were identified as COPECs. TPHs (as diesel and as motor oil) were also identified as COPECs. Risks could not be estimated for potential receptors lacking available screening values and/or TRVs for COPECs; such cases are discussed in the uncertainty analysis of the main report. These COPECs are unlikely to be risk drivers and are assumed to have minimal impact to the conclusions of the ERA.

Risks were estimated using depth-weighted and area-weighted EPCs. Risk conclusions were based on the following criteria:

- COPECs with HQs less than or equal to 1 pose *de minimis* risk to ecological communities (plants and invertebrates).
- COPECs with HQs greater than 1 could indicate unacceptable risk to ecological communities. A WOE approach was used to characterize potential risk to plants and soil invertebrates.
- COPECs with NOAEL-based HQs less than or equal to 1 pose *de minimis* risk to potential wildlife receptors.
- COPECs with NOAEL-based HQs greater than 1 but LOAEL-based HQs less than or equal to 1 pose no unacceptable risks to wildlife populations; however, the potential for unacceptable risk to individuals is uncertain based on the HQ. A WOE approach was used to characterize potential risk to individual potential receptors.
- COPECs with LOAEL-based HQs greater than 1 pose possible unacceptable risk to populations of potential wildlife receptors based on the HQ.

The risk estimates (HQs) represent only one LOE for risk characterization. A qualitative WOE approach, incorporating other LOE and uncertainties, was used to characterize possible risk to wildlife populations at the AOC 11 potential exposure area.

HQs for all the COPECs for the baseline scenario calculated using depth-weighted EPCs, selected screening levels/selected TRVs, and site-specific SUFs are summarized in Table AOC11-6.1. The HQs/LOAEL-based HQs based on depth-weighted EPCs were greater than 1 for the following COPECs:

- Plant Communities – Hexavalent chromium and HMW PAHs/TPHs
- Soil Invertebrate Communities – Hexavalent chromium, mercury, zinc, and alpha- and gamma-chlordane
- Small Mammals – None for granivorous small mammals; HMW PAHs and dioxin TEQ for invertivorous small mammals
- Birds – None for granivorous birds; mercury, total PCBs, and dioxin TEQ for insectivorous birds.

HQs were also calculated for all the COPECs using area-weighted EPCs, selected screening levels/selected TRVs, and site-specific SUFs and are presented in Table AOC11-6.1. For COPECs with HQs/LOAEL-based HQs greater than 1 using the most refined exposure and effects assumptions (i.e., area-weighted EPCs, selected screening levels/TRVs, and site-specific SUFs), a WOE assessment was used to draw risk conclusions and identify potential risk drivers for the AOC 11 potential exposure area. The various LOEs considered in the WOE assessment and risk conclusions are presented in Table AOC11-6.2.

Based on the ecological risk characterization for the AOC 11 potential exposure area, using area-weighted EPCs, selected screening levels/TRVs, and site-specific SUFs, the following conclusions were made:

6.2.1 Plant Communities

Overall, no unacceptable risk was identified for plants, including special-status species. Conclusions for the baseline scenario evaluations are as follows:

- No federal or state-listed T&E plants or candidates for listing were found at the site, including the AOC 11 potential exposure area.
- Potential risks to plants are *de minimis* from exposure to all COPECs except hexavalent chromium. The HQ for HMW PAHs was reduced to 1 in the area-weighted evaluation, indicating *de minimis* to plant communities from HMW PAHs (and TPHs) at the AOC 11 potential exposure area.
- The HQ for hexavalent chromium remained the same as in the depth-weighting evaluation and still greater than 1. Unacceptable risk to plants from exposure to hexavalent chromium is unlikely based on the following LOEs: 1) low magnitude of the HQ; 2) although frequently detected, concentrations were below the BTV in many of the locations; 3) low confidence in the plant screening value in predicting toxicity (screening level is less than the BTV); and 4) elevated concentrations (greater than 10 times the BTV) were limited to a single location (AOC11e-6).
- Vegetation communities observed at the site during the floristic surveys conducted in 2013 (GANDA and CH2M 2013) and in 2017 (CH2M 2017b) is typical of Mojave Desert plant communities (summarized in Section 2.4.2). Over a hundred different vascular plant species have been observed within the survey area that includes AOC 11 potential exposure area; documented as Segment H in these survey reports (GANDA and CH2M 2013, CH2M 2017b). The floristic surveys report a diverse assemblage of plants species found in typical abundance, density, cover, and vigor of plant communities in undisturbed desert habitat. These observations are not consistent with impairment of the plant community at the site. The floristic surveys provide site-specific observations that support the health of plant communities at the site and is considered a stronger LOE than the exceedances of low-confidence generic plant screening values, which are widely acknowledged to have low ability to predict toxicity in plants.

6.2.2 Soil Invertebrate Communities

Overall, no unacceptable risks to soil invertebrates are expected. Conclusions for the baseline scenario evaluations are as follows:

- Potential risks to soil invertebrates are *de minimis* from exposure to arsenic, total chromium, copper, lead, zinc, PAHs, TPHs, 4,4-DDE, dieldrin, PCBs, and 2,3,7,8-TCDD at the AOC 11 potential exposure area. The HQ for zinc was reduced to less than 1 from the depth-weighting evaluation, indicating *de minimis* to soil invertebrate communities from zinc as well at the AOC 11 potential exposure area.
- The HQs for mercury, alpha- and gamma-chlordane remained the same as in the depth-weighted evaluation. Unacceptable risks to soil invertebrates from exposure to these COPECs are unlikely because of the following LOEs: 1) low FOD; 2) EPCs based on the maximum depth-weighted concentrations; 3) for areas where a constituent is largely not detected, use of a maximum concentrations as the EPC may not

appropriately characterize HQs; 4) low magnitude of HQs; and 5) low confidence in the screening values to predict toxicity to soil invertebrate communities.

- The area-weighted HQ for hexavalent chromium increased from the depth-weighting evaluation and is greater than 1. The impact of area-weighting on these COPECs is discussed in Section 5.6.3 of the main report and in Section 4 of this appendix. Unacceptable risk to soil invertebrate communities is considered unlikely for hexavalent chromium based on these supporting LOEs: 1) low magnitude of the HQ; 2) very conservative screening level (less than the BTVs); and 3) low confidence in the invertebrate screening value and its ability to predict risk.

6.2.3 Small Mammals

Overall, no unacceptable risks to populations of granivorous and invertivorous small mammals exposed to COPECs in soil are expected except for dioxin TEQ for invertivorous small mammals. Conclusions for the baseline scenario evaluations are as follows:

- Several species of mammals have been observed at or near the site (Tables 2-2 and 2-4 of the main report); however, no T&E species with small home ranges were observed at the AOC 11 potential exposure area. Therefore, protection at the individual level (i.e., NOAEL-based HQ less than or equal to 1) is not warranted.
- For Merriam's kangaroo rat (granivorous small mammal) – NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, which is the same as in the depth-weighted evaluation, indicating *de minimis* risk to individuals and populations of granivorous small mammals at the AOC 11 potential exposure area.
- For the desert shrew (invertivorous small mammal) – Potential risk is *de minimis* from exposure to all COPECs, except dioxin TEQ. The NOAEL-based HQ for HMW PAHs was reduced to 1 in the area-weighted evaluation, indicating *de minimis* risk to invertivorous small mammals from HMW PAHs (and TPHs) at the AOC 11 potential exposure area.

NOAEL- and LOAEL-based HQs for dioxin TEQ were reduced from the depth-weighted evaluation but are still greater than 1. Unacceptable risk to invertivorous small mammals from exposure to dioxin TEQ is unlikely based on the following LOE: 1) low magnitude of the HQs (LOAEL-based HQ is less than 10), and likely reduced to 1 or less if adjusted for compounding uncertainties associated with the conservative assumptions (see Section 6.7.6 of the main report); these include diet (dietary composition assumes 100% of a single item diet; see Section 6.7.3 of the main report), uptake into dietary items (bioaccumulation based on a single congener likely overestimates HQs by 10 times; see Section 6.7.4 of the main report), and conservative TRVs (based on the lowest available NOAEL and LOAEL doses; see Section 6.7.5 of the main report); 2) spatial extent of elevated concentrations were limited to four locations along the TCS fenceline (PA-10, PA-11, PA-12, and SD-11A); and 3) T&E species with small home ranges have not been observed in AOC 11 potential exposure area.

6.2.4 Birds

Overall, no unacceptable risks to bird populations (granivorous and insectivorous) exposed to COPECs in soil are expected. Conclusions for the baseline scenario evaluations are as follows:

- Several species of birds have been observed at or near the site (Tables 2-2 and 2-4); however, no T&E species with small home ranges were observed at the AOC 11 potential exposure area. Therefore, protection at the individual level (i.e., NOAEL-based HQ less than or equal to 1) is not warranted.
- For Gambel's quail (granivorous bird) – NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, which is the same as in the depth-weighted evaluation, indicating *de minimis* risk to individuals and populations of granivorous birds at the AOC 11 potential exposure area.
- For the cactus wren (insectivorous bird) – Potential risk is *de minimis* from exposure to all the COPECs except for lead, mercury, and dioxin TEQ. The NOAEL-based HQ for PCBs was reduced to 1 from the depth-weighting evaluation, indicating *de minimis* risk to insectivorous birds from PCBs at the AOC 11 potential exposure area.

The area-weighted NOAEL-based HQ for lead increased from the depth-weighting evaluation and is greater than 1. The impact of area-weighting on this COPECs is discussed above in Section 5.6.2.3. The area-weighted NOAEL-based HQ for mercury remained the same as in the depth-weighted evaluation and is greater than 1. The area-weighted NOAEL-based HQ for dioxin TEQ was reduced from the depth-weighting evaluation and is still greater than 1.

COPECs with HQs indicative of uncertain risk to individual potential receptors include lead, mercury, and dioxin TEQ. Unacceptable risk to individual potential receptors is unlikely for these COPECs based on the following LOEs: 1) low magnitude of the HQs; 2) low FOD for mercury; 2) for areas where a constituent is largely not detected, use of a maximum concentration as the EPC may not appropriately characterize risk; 3) conservative assumptions in the risk estimates (not accounting for site-specific bioavailability of lead, assuming 100% of invertebrate diet; see Section 6.7 of the main report); 4) low confidence in the TRVs for mercury as they are unlikely to reflect the species of mercury present at the AOC 11 potential exposure area; and 5) no observations of T&E species with small home ranges at the AOC 11 potential exposure area.

No COPECs had LOAEL-based HQs greater than 1, indicating unacceptable risk to populations of insectivorous birds is not expected at the AOC 11 potential exposure area.

6.2.5 Potential Risk Drivers for the AOC 11 Potential Exposure Area

As presented in Table AOC11-6.2, risk drivers were identified for the AOC 11 potential exposure area based on unacceptable community-/population-level risk (i.e., HQ greater than 1 for plants and soil invertebrates and LOAEL-based HQs greater than 1 for mammals and birds [or LOAEL-based HQs greater than 10 for dioxin TEQ]) predicted using the most refined exposure and effects assumptions (i.e., site-specific SUF, area-weighted EPCs, and selected TRVs) and additional LOEs supporting the conclusion of unacceptable risk. The risk drivers for potential ecological receptors in the AOC 11 potential exposure area are also summarized in the table below.

APPENDIX AOC11
SOIL HHERA FOR AOC 11 EXPOSURE AREA

Scenario	Potential Receptors and Risk Drivers at the AOC 11 Potential Exposure Area					
	Plants	Soil Invertebrates	Granivorous Mammals (Merriam's kangaroo rat)	Insectivorous Mammals (desert shrew)	Granivorous Birds (Gambel's quail)	Insectivorous Birds (cactus wren)
Baseline	None	None	None	None	None	None

Table AOC11-2.1c**Chemicals Included in the Risk Assessment: AOC 11 Subsurface I Soil (0 to 6 feet bgs) for Baseline Scenario****Soil Human Health and Ecological Risk Assessment****PG&E Topock Compressor Station****Needles, California****Notes:**

- ^a Applicable to both human health and ecological risk assessment (HHRA/ERA), unless otherwise noted.
- ^b Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA and ERA. Human health toxicity values are available for iron and manganese and ecological toxicity values are available for manganese, thus these chemicals are evaluated in the HHRA and ERA, if above background levels and have available toxicity values.
- ^c Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).
- ^d Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).
- ^e Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.
- ^f Dioxins are evaluated in toxic equivalents.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

mg/kg = milligrams per kilogram.

ng/kg = nanograms per kilogram.

ug/kg = micrograms per kilogram.

COPC = Constituent of Potential Concern.

COPEC = Constituent of Potential Ecological Concern.

ND = Not detected.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

Notes:

- ^a Applicable to both human health risk assessment (HHRA) only.
- ^b Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA and ERA. Human health toxicity values are available for iron and manganese and ecological toxicity values are available for manganese, thus these chemicals are evaluated in the HHRA and ERA, if above background levels and have available toxicity values.
- ^c Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).
- ^d Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).
- ^e Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.
- ^f Dioxins are evaluated in toxic equivalents.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

mg/kg = milligrams per kilogram.

ng/kg = nanograms per kilogram.

ug/kg = micrograms per kilogram.

COPC = Constituent of Potential Concern.

ND = Not detected.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Notes:

^a The constituent consists of analytes detected at least once at the Topock Compressor Station site and measured in soil in this exposure area.

^b If fewer than eight total locations and four total detected concentrations, the maximum depth-weighted concentration was selected as the EPC. Otherwise, the UCL was selected as the EPC.

^c EPCs and summary statistics were not calculated for some constituents (i.e., dioxin congeners and essential nutrients). Those data, if available, are presented in Attachment A1 of each exposure area-specific appendix.

Abbreviations:	
"--" = not applicable	mg/kg = milligrams per kilogram
µg/kg = micrograms per kilogram	NA = not applicable
AOC = area of concern	ND = not detected
B(a)P equivalent = benzo(a)pyrene equivalent	ng/kg = nanograms per kilogram
BCA = Bias-corrected accelerated bootstrap method	PAH = polycyclic aromatic hydrocarbons
COPC = constituent of potential concern	PCB = polychlorinated biphenyls
COPEC = constituent of potential ecological concern	PG&E = Pacific Gas and Electric Company
DDE = Dichlorodiphenyldichloroethylene	TCDD = Tetrachlorodibenzo-p-dioxin
DDT = Dichlorodiphenyltrichloroethane	TEQ = toxic equivalent
EPC = exposure point concentration	TPH = total petroleum hydrocarbons
FOD = frequency of detection	UCL = upper confidence limit
ft bgs = feet below ground surface	X = COPC/COPEC in the exposure depth interval
KM = Kaplan-Meier

Notes:

- ^a Exposure point concentrations (EPCs) for surface soil (0 to 0.5 feet bgs) are used to evaluate inhalation of particulates in outdoor air.
- ^b EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.
- ^c Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.0×10^6 m³/kg was used for maintenance workers (short-term and long-term) as recommended by Department of Toxic Substances Control (2014).
- ^d Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.

Abbreviations:

Notes:

- ^a Exposure point concentrations (EPCs) for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of particulates in outdoor air. Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of $1.0 \times 10^6 \text{ m}^3/\text{kg}$ was used for maintenance workers (short-term and long-term) as recommended by Department of Toxic Substances Control (2014).
- ^b EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatile compounds in outdoor air. Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

- Notes:**
- ^a Exposure point concentrations (EPCs) for surface soil (0 to 0.5 feet bgs) are used to evaluate inhalation of particulates in outdoor air.
 - ^b EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.
 - ^c Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.4×10⁹ m³/kg was used for recreational users (campers, hikers, and hunters) as recommended by Department of Toxic Substances Control (2014).
 - ^d Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.
 - ^e PEF of 8.5×10⁵ m³/kg was used for recreational users (off-highway vehicle rider) as calculated in United States Environmental Protection Agency (2008, 2009) and recommended in "Revised Technical Memorandum, Recreational Visitor Exposure Scenario for Federal Land, PG&E Topock Compressor Station Remediation Project, California," prepared by the Department of the Interior (DOI).

Abbreviations:
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
mg/kg = milligrams per kilogram.
mg/m³ = milligrams per cubic meter.
NA = not applicable.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:

- ^a Exposure point concentrations (EPCs) for surface soil (0 to 0.5 feet bgs) are used to evaluate inhalation of particulates in outdoor air.
- ^b EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.
- ^c Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.4×10^9 m³/kg was used for tribal users as recommended by Department of Toxic Substances Control (2014).
- ^d Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.

Notes:

- ^a Exposure point concentrations (EPCs) for subsurface I soil (0 to 6 feet bgs) are used to evaluate inhalation of particulates in outdoor air.
- ^b EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.
- ^c Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.0x10⁶ m³/kg was used for long-term maintenance workers as recommended by Department of Toxic Substances Control (2014).
- ^d Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
mg/kg = milligrams per kilogram.
mg/m³ = milligrams per cubic meter.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

- Notes:**
- ^a Exposure point concentrations (EPCs) for shallow soil (0 to 3 feet bgs) are used to evaluate inhalation of particulates in outdoor air.
 - ^b EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.
 - ^c Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.4×10⁹ m³/kg was used for recreational users (campers and hikers) as recommended by Department of Toxic Substances Control (2014).
 - ^d Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.
 - ^e PEF of 8.5×10⁵ m³/kg was used for recreational users (off-highway vehicle rider) as calculated in United States Environmental Protection Agency (2008, 2009) and recommended in "Revised Technical Memorandum, Recreational Visitor Exposure Scenario for Federal Land, PG&E Topock Compressor Station Remediation Project, California," prepared by the Department of the Interior (DOI).

Abbreviations:
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
mg/kg = milligrams per kilogram.
mg/m³ = milligrams per cubic meter.
NA = not applicable.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Note:

^a COPECs selected over the entire soil depth interval (0-6 ft bgs) potentially contacted by ecological receptors. COPECs based on background screening for metals, polycyclic aromatic hydrocarbons, and dioxins. All detected organic compounds were selected as COPECs. See Section 2 of Appendix AOC 11 for details.

Abbreviations:

AOC = area of concern
COPEC = constituent of potential ecological concern
ERA = ecological risk assessment
ft bgs = feet below ground surface
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
TPH = total petroleum hydrocarbon
X = COPEC in that exposure depth interval

Table AOC11-5.2
Soil Exposure Point Concentration Matrix for Terrestrial Ecological Receptors

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

Ecological Receptor	Exposure Depth Intervals for Calculation of EPCs				
	Soil EPCs ^a		Biota Tissue EPCs		
	All AOCs		All AOCs		
	0-0.5 ft bgs	Maximum EPC (0-0.5, 0-3, 0-6 ft bgs)	Plants - Maximum EPC (0-0.5, 0-3, 0-6 ft bgs)	Insects (0-0.5 ft bgs)	Insectivorous Mammals (0-0.5 ft bgs)
Terrestrial Receptors					
Plants		X			
Invertebrates	X				
Gambel's Quail	X		X		
Cactus Wren	X			X	
Desert Shrew	X			X	
Merriam's Kangaroo Rat		X	X		

Notes:

^a EPCs for ecological receptors will be represented by the maximum detected concentration, depth-weighted 95 percent upper confidence limit on the mean (95% UCL), and spatially-weighted 95% UCL, as relevant for this AOC. See Section 5 of Appendix AOC 11 for details.

Abbreviations:

95% UCL = 95% upper confidence limit
AOC = area of concern
EPC = exposure point concentration
ft bgs = feet below ground surface
X = representative EPC for the pathway/receptor

Notes:

a. WOE Result is risk conclusion based on 1.) HQ/LOAEL HQ using area-weighted EPCs, and 2.) supporting LOE

	NOAEL HQ greater than 1
	HQ or LOAEL HQ greater than 1
	HQ or LOAEL HQ greater than 10
	HQ or LOAEL HQ greater than 100

Abbreviations:

-- = no toxicity value available, HQs could not be estimated

AOC = area of concern

HQ = hazard quotient

LOE = line of evidence.

LOAEL = lowest observed adverse effect level

ND = not detected

NOAEL = no-observed adverse effect level

no SL = no screening level available

TEQ = toxic equivalent

WOE = weight of evidence, considering multiple LOE. If HQs/LOAEL HQs > 1, WOE Result is either 1) not expected, 2) unlikely, or 3) possible.

Table AOC11-6.2
Risk Conclusions and Lines of Evidence Summary for AOC 11

Notes:
a COPECs are presented for HQs greater than 1 based on the depth-weighted EPC and/or area-weighted EPC and species and site-specific SUF.
b The EPC is based on the maximum depth-weighted concentration due to the small dataset size.
c The additional lines of evidence for COPECs with NOAEL and LOAEL HQs less than or equal to 1 (based on the area-weighted EPC and species and site-specific SUF) are not included in the table.
d For plants and soil invertebrates, the background HQ is based on the BTV. For mammals and birds, the NOAEL and LOAEL background HQs are based on the 95 percent upper confidence limit.
e Applicable to wildlife, unless noted.
f In areas where observations were noted, the T&E species observed have large home ranges and unlikely to forage in upland habitat. See text for details.
g For dioxin TEQ, LOAEL HQs less than 10 with supporting LOE were considered unlikely to pose an unacceptable risk to populations of wildlife receptors due to the compounded conservative assumptions included in the ecological risk assessment. See Section 6.7.6 of the main report.
h Depth-weighted EPC resulted in an HQ or NOAEL-based HQ less than 1, and is less than the area-weighted HQ or NOAEL-based HQ.

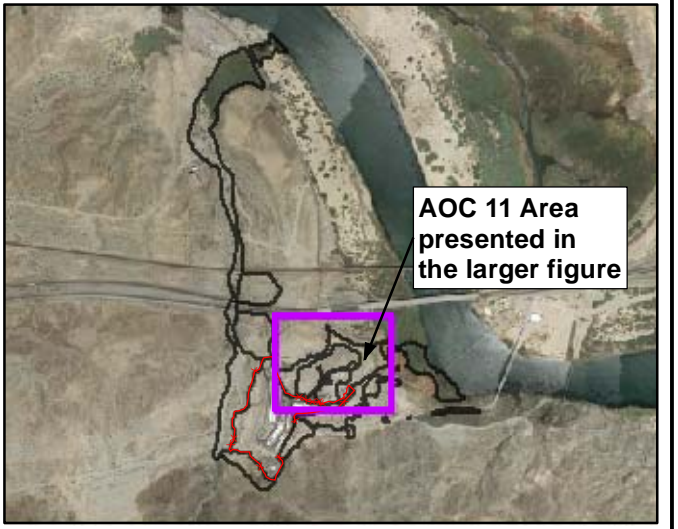

--	LOAEL and NOAEL HQs ≤ 1 for the receptor
	NOAEL HQ greater than 1
	HQ/LOAEL HQ greater than 1
	HQ/LOAEL HQ greater than 10
	HQ/LOAEL HQ greater than 100

Abbreviations:
"--" = not applicable
AOC = area of concern
BAF = bioaccumulation factor
BCW = Bat Cave Wash
BG NA = background value not available
BTV = background threshold value
COPEC = constituent of potential ecological concern
EPC = exposure point concentration
FOD = frequency of detection
HQ = hazard quotient
LOAEL = lowest observed adverse effect limit

LOE = line of evidence
MDC = maximum depth-weighted concentration
NC = not calculated
NE = line of evidence not evaluated
NOAEL = no observed adverse effect limit
SL = screening level
SWMU 1 = solid waste management unit 1
T&E = threatened and endangered
TCS-4= Topock Compressor Station Well #4
TEQ = toxic equivalent
TRV = toxicity reference value

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.
NA = Not applicable. Carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated using benzo(a)pyrene equivalents. Hexavalent chromium is not absorbed via dermal contact.
NC = Not considered a carcinogen.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.**Abbreviations:**

B(a)P equivalent = Benzo(a)pyrene equivalent.

bgs = below ground surface.

CDI = Chronic Daily Intake.

COPC = Constituent of Potential Concern.

EC = Exposure Concentration.

mg/kg-day = milligrams per kilogram per day.

mg/m³ = milligrams per cubic meter.

na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.

NA = Not applicable. Carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated using benzo(a)pyrene equivalents. Hexavalent chromium is not absorbed via dermal contact.

NC = Not considered a carcinogen.

ND = Not detected.

NS = Not sampled.

NV = Not volatile.

PCB = Polychlorinated biphenyls.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene).
Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene). Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene). Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene). Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.**Abbreviations:**

-- = not calculated.

B(a)P equivalent = Benzo(a)pyrene equivalent.

bgs = below ground surface.

COPC = Constituent of Potential Concern.

ILCR = Incremental Lifetime Cancer Risk.

na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.

NA = Not applicable. Carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated using benzo(a)pyrene equivalents. Hexavalent chromium is not absorbed via dermal contact.

NC = Not considered a carcinogen.

ND = Not detected.

NS = Not sampled.

NV = Not volatile.

PCB = Polychlorinated biphenyls.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
HI = Hazard Index
na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene). Hexavalent chromium is not absorbed via dermal contact.

ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
HI = Hazard Index
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene). Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
HI = Hazard Index
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene). Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
HI = Hazard Index
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene). Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

PRG90

994

Notes:

Highlighted values are site-specific: soil ingestion rate (100 mg/day) consistent with United States Environmental Protection Agency (USEPA) recommendations for evaluating construction (i.e., soil contact-intensive) scenarios (USEPA 2016). Exposure frequency (40 days/year) is a site-specific value for short-term maintenance workers as shown in Table 5.1 of the main report.

PRG90

3977

Notes:

Highlighted values are site-specific: soil ingestion rate (100 mg/day) consistent with United States Environmental Protection Agency (USEPA) recommendations for evaluating construction (i.e., soil contact-intensive) scenarios (USEPA 2016). Exposure frequency (10 days/year) is a site-specific value for long-term maintenance workers, based on 4 work hours per 8 hour work day, 20 days per year as shown in Table 5.1 of the main report.

PbB_0	Baseline PbB	ug/dL	0.0	0.0
IR_s	Soil ingestion rate (including soil-derived indoor dust)	g/day	0.05	0.05
$AF_{s,d}$	Absorption fraction (same for soil and dust)	--	0.12	0.12
$EF_{s,d}$	Exposure frequency (same for soil and dust)	days/yr	8	8
$AT_{s,d}$	Averaging time (same for soil and dust)	days/yr	365	365
PbB_{adult}	PbB of adult worker, geometric mean	ug/dL	0.001	0.001
$PbB_{\text{fetal}, 0.90}$	90th percentile PbB among fetuses of adult workers	ug/dL	0.002	0.002
PbB_t	Target PbB level of concern (e.g., 10 ug/dL)	ug/dL	1.0	1.0
$P(PbB_{\text{fetal}} > PbB_t)$	Probability that fetal PbB > PbB_t , assuming lognormal distribution	%	0%	0%

PRG90

9942

Notes:

Highlighted values are site-specific: soil ingestion rate of 50 mg/day is the default incidental soil ingestion rate evaluation of exposure to lead in soil (USEPA 2003). Exposure frequency (8 days/year) based on the assumption of 8 days per month, 1 month per year as shown in Table 5.1 of the main report.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.
NA = Not applicable. Carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated using benzo(a)pyrene equivalents. Hexavalent chromium is not absorbed via dermal contact.
NC = Not considered a carcinogen.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene).
Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene). Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
CDI = Chronic Daily Intake.
COPC = Constituent of Potential Concern.
EC = Exposure Concentration.
mg/kg-day = milligrams per kilogram per day.
mg/m³ = milligrams per cubic meter.
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene). Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.**Abbreviations:**

-- = not calculated.

B(a)P equivalent = Benzo(a)pyrene equivalent.

bgs = below ground surface.

COPC = Constituent of Potential Concern.

ILCR = Incremental Lifetime Cancer Risk.

na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.

NA = Not applicable. Carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated using benzo(a)pyrene equivalents. Hexavalent chromium is not absorbed via dermal contact.

NC = Not considered a carcinogen.

ND = Not detected.

NS = Not sampled.

NV = Not volatile.

PCB = Polychlorinated biphenyls.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
HI = Hazard Index
na = Not applicable. Potential exposure to lead is evaluated using the United States Environmental Protection Agency (USEPA) Adult Lead Model (ALM). Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene). Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
HI = Hazard Index
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene). Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

Notes:
^a EPCs for exposure to subsurface II soil (0 to 10 feet bgs) are used to evaluate the vapor inhalation pathway.

Abbreviations:
-- = not calculated.
B(a)P equivalent = Benzo(a)pyrene equivalent.
bgs = below ground surface.
COPC = Constituent of Potential Concern.
HI = Hazard Index
na = Not applicable. Potential exposure to lead is evaluated using California Environmental Protection Agency (Cal/EPA) Department of Toxic Substances Control's (DTSC) LeadSpread model. Please see text for discussion.
NA = Not applicable. Noncancer effects of carcinogenic polycyclic aromatic hydrocarbons (CPAHs) are evaluated separately for each chemical (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenzo[a,h]anthracene, and indeno[1,2,3-cd]pyrene). Hexavalent chromium is not absorbed via dermal contact.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

MODIFIED VERSION OF USEPA ADULT LEAD MODEL

CALCULATIONS OF BLOOD LEAD CONCENTRATIONS (PbBs) AND PRELIMINARY REMEDIATION GOAL (PRG)

EDIT RED CELL

Variable	Description of Variable	Units	0-0.5 feet below ground surface	0-3 feet below ground surface	0-6 feet below ground surface	0-10 feet below ground surface
PbS	Soil lead concentration	ug/g or ppm	38.2	29.3	21.6	17.8
$R_{\text{fetal/maternal}}$	Fetal/maternal PbB ratio	--	0.9	0.9	0.9	0.9
BKSF	Biokinetic Slope Factor	ug/dL per ug/day	0.4	0.4	0.4	0.4
GSD_i	Geometric standard deviation PbB	--	1.8	1.8	1.8	1.8
PbB_0	Baseline PbB	ug/dL	0.0	0.0	0.0	0.0
IR_s	Soil ingestion rate (including soil-derived indoor dust)	g/day	0.100	0.100	0.100	0.100
$AF_{s,d}$	Absorption fraction (same for soil and dust)	--	0.12	0.12	0.12	0.12
$EF_{s,d}$	Exposure frequency (same for soil and dust)	days/yr	10	10	10	10
$AT_{s,d}$	Averaging time (same for soil and dust)	days/yr	365	365	365	365
PbB_{adult}	PbB of adult worker, geometric mean	ug/dL	0.005	0.004	0.003	0.002
$PbB_{\text{fetal}, 0.90}$	90th percentile PbB among fetuses of adult workers	ug/dL	0.01	0.01	0.01	0.00
PbB_t	Target PbB level of concern (e.g., 10 ug/dL)	ug/dL	1.0	1.0	1.0	1.0
$P(PbB_{\text{fetal}} > PbB_t)$	Probability that fetal PbB > PbB_t , assuming lognormal distribution	%	0%	0%	0%	0%

PRG90

3977

Notes:

Highlighted values are site-specific: soil ingestion rate (100 mg/day) consistent with United States Environmental Protection Agency (USEPA) recommendations for evaluating construction (i.e., soil contact-intensive) scenarios (USEPA 2016). Exposure frequency (10 days/year) is a site-specific value for long-term maintenance workers, based on 4 work hours per 8 hour work day, 20 days per year as shown in Table 5.1 of the main report.

	PEF	ug/dl	percent	PEF	ug/dl	percent
Soil Contact	1.7E-5	6.3E-04	10%		6.3E-04	1.6%
Soil Ingestion	1.6E-4	5.9E-03	90%	1.0E-3	3.8E-02	98%
Inhalation	8.7E-9	3.3E-07	0.01%		3.3E-07	0.00%

Notes:

Highlighted values are Site-specific: days per week based on the assumption of 2 days per month, 8 months per year. Soil ingestion rate of 330 mg/day is modified by exposure time (1.5 hours riding at site per 16 awake hours, or 0.09). Default inhalation breathing rate of 6.8 m³/day is modified to account for exposure time (i.e., 1.5 hours riding at site per 24 hours, or 0.06) . See Table 5.1 of the main report for details.

Notes:

	HQ greater than or equal to 1
	HQ greater than or equal to 10
	HQ greater than or equal to 100

Abbreviations:

AOC = area of concern
 COPEC = constituent of potential ecological concern
 EPC = exposure point concentration
 HQ = hazard quotient
 mg/kg = milligrams per kilogram
 ng/kg = nanograms per kilogram
 no SL = no screening level available
 PAH = polycyclic aromatic hydrocarbon
 PCB = polychlorinated biphenyl

Table AOC11-C Table Notes

Notes for Terrestrial Wildlife Risk Calculations

Soil Human Health and Ecological Risk Assessment PG&E Topock Compressor Station Needles, California

Notes:

^a Dioxin presented in ng/kg.

^b Total dose equation is presented below:

$$\text{Total Dose (mg/kg-day)} = [(EPC_{\text{soil}} \times SIR) + (C_{\text{plants}} \times FIR \times F_{\text{plants}}) + (C_{\text{insects}} \times FIR \times F_{\text{insects}}) + (C_{\text{mammals}} \times FIR \times F_{\text{mammals}})] \times \text{SUF}$$

^c HQ = Total Dose / TRV

Abbreviations:

AOC = area of concern

BTAG = Biological Technical Assistance Group

COPEC = constituent of potential ecological concern

dw = dry weight

EPC_{soil} = exposure point concentration in soil (mg/kg dw)

EPC_{plants} = exposure point concentration in plants (mg/kg dw)

EPC_{insects} = exposure point concentration in insects (mg/kg dw)

EPC_{mammals} = exposure point concentration in mammals (mg/kg dw)

F_{plants} = fraction of plants in diet

F_{insects} = fraction of insects in diet

F_{mammals} = fraction of mammals in diet

FIR = food ingestion rate (kg dw/kg bw-day)

HQ = hazard quotient (unitless)

kg = kilogram

kg dw/kg bw-day = kilograms per kilogram of body weight per day

LOAEL = lowest observed adverse effect level (mg/kg-day)

m = maximum detected concentration

mg/kg = milligrams per kilogram

mg/kg-day = milligrams per kilogram per day

ND = not detected

ng/kg = nanograms per kilogram

NOAEL = no observed adverse effect level (mg/kg-day)

PAH = polycyclic aromatic hydrocarbon

PCB = polychlorinated biphenyl

SIR = soil ingestion rate (kg dw/kg bw-day)

SUF = site use factor (fraction)

TRV = toxicity reference value (mg/kg-day)

Notes:

a. Calculated using selected soil EPC and uptake model. See Section 6 of the main report.

b. Biota EPCs presented as 0.0 indicate no bioaccumulation from soil.

Bold indicates EPC selected to estimate plant uptake from soil (maximum of surface, shallow, and subsurface I soil).**Abbreviations:**

-- = soil EPC or uptake model not available, biota EPCs could not be estimated.

AOC = area of concern

COPEC = constituent of potential ecological concern

EPC = exposure point concentration

ft bgs = feet below ground surface

m = maximum depth-weighted concentration

mg/kg = milligrams per kilogram

ng/kg = nanograms per kilogram

PAH = polycyclic aromatic hydrocarbon

PCB = polychlorinated biphenyl

1 INTRODUCTION

This appendix presents the human health and ecological risk assessment (HHERA) for the Area of Concern 12 (AOC 12) potential soil exposure area located outside the Topock Compressor Station (TCS) in Needles, California. The AOC 12 potential exposure area, shown on Figure AOC12-1.1, is approximately 0.32 acre and includes samples and sample locations shown in Table AOC12-1.1. Available soil data from the AOC 12 potential exposure area were used to conduct a quantitative forward HHERA as presented herein. A summary of the human health risk assessment (HHRA) and the ecological risk assessment (ERA) results are presented in Sections 5 and 6, respectively, of the Soil Human Health and Ecological Risk Assessment Report for the TCS (the “main report”). This appendix refers to “HHRA” when discussing specific information for assessing risks to human health, “ERA” when discussing specific information for assessing risks to potential ecological receptors, and “HHERA” when discussing topics that are common to both the HHRA and the ERA.

Descriptions of the physical location and characteristics of the AOC 12 potential exposure area and the HHERA methodologies are provided in the main report and the final Human Health and Ecological Risk Assessment Work Plan (RAWP) documents (Arcadis U.S., Inc. [Arcadis] 2008, 2009, 2015) and are not repeated in this appendix. Detailed discussions of the historical uses and sampling and analysis are presented in the main report, as well.

This appendix summarizes site use, data evaluation, potential receptors, potential exposure pathways, and the results of the HHERA risk characterization for soil in the AOC 12 potential exposure area. Tables and figures specific to the AOC 12 potential exposure area HHERA are also presented in this appendix.

1.1 Summary of Site Use

AOC 12, also referred to as the Fill Area, is located to the east of the TCS and consists of three subareas located near the Transwestern gas pipeline meter station (Transwestern Meter Station) east of TCS. These three subareas (identified as AOC 12a, AOC 12b, and AOC 12c; CH2M HILL [CH2M] 2013) were identified through employee interviews as locations that may contain buried debris. AOCs 12a and 12b are located on property owned by Havasu National Wildlife Refuge, and AOC 12c is located on both Havasu National Wildlife Refuge and Pacific Gas and Electric (PG&E) property.

AOC 12a was reportedly a disposal area for construction-related debris. A few small pieces of concrete are visible at the surface in the area identified as AOC 12a. The exact nature of the materials placed into this area and the date(s) of placement are unknown. Initially, AOC 12a was the only disposal area initially identified in AOC 12 (CH2M 2006).

Two potential disposal locations were subsequently identified from interviews with former employees, as described in the Soil Part A Phase 1 Work Plan (CH2M 2006). There is no visible debris at these two sites, which are adjacent to the northwestern corner (AOC 12b) and southwestern corner (AOC 12c) of the Transwestern Meter Station.

Location 12b reportedly was used to bury asbestos-containing material and two drums of unused unknown chemicals. Location 12c was apparently a small ravine (about 6 feet [ft] deep) that was reportedly used to bury asbestos-containing material (ACM) and possibly other debris. Geophysical surveys and trenching in the areas did not encounter drums or ACM. Soil samples collected from AOC 12 were analyzed for inorganics and

APPENDIX AOC12
SOIL HHERA FOR AOC 12 EXPOSURE AREA

organics and several chemicals were detected as described in detail in the Resource Conservation and Recovery Act (RCRA) Facility Investigation/Remedial Investigation (RFI/RI) Work Plan (CH2M 2013; Appendix A Subappendix C6). Asbestos was not detected or not present in any of the samples.

Chemicals present in fill material and buried waste and may have affected subsurface soil underneath the debris and laterally in the immediate vicinity of the debris. Subsurface soil would, therefore, be the primary source medium.

2 DATA EVALUATION AND COPC/COPEC SELECTION

This section summarizes the data considered for the AOC 12 potential exposure area HHERA and presents the constituents of potential concern (COPCs) for human health and constituents of potential ecological concern (COPECs) selected for the AOC 12 potential exposure area.

All soil sampling locations at the AOC 12 potential exposure area are presented on Figure AOC12-1.1 and in Table AOC12-1.1. The data were evaluated based on methodology described in the RAWP documents (Arcadis 2008, 2009, 2015). Details of the soil sampling and analysis will be presented in the forthcoming Draft RFI/RI Report Volume 3 (currently being prepared by Jacobs).

Following the steps outlined in Section 3 of the main report, soil data considered usable for the risk assessment were identified and used in the quantitative HHERA. All available soil data for the AOC 12 potential exposure area are presented in Attachment AOC12-A.1. For the AOC 12 potential exposure area, soil data are available from 18 samples, of which soil data from 14 samples from 0 to 10 ft below ground surface (bgs) were considered for use in the HHERA. Because potential soil contact does not extend below 10 ft bgs, deeper soil data (i.e., greater than 10 ft bgs) from four samples collected at depths greater than 10 ft bgs were excluded from the HHERA, as noted in Table AOC12-1.1.

Data processed for the HHERA (e.g., calculation of total concentrations for low molecular weight [LMW] and high molecular weight [HMW] polycyclic aromatic hydrocarbons [PAHs], benzo(a)pyrene equivalent [B(a)PEQ], and polychlorinated biphenyls [PCBs]) are described in detail in Section 3 of the main report.

The process for identifying COPCs and COPECs included in the HHERA is detailed in Section 3.4 of the main report. COPCs and COPECs were selected for the AOC 12 potential exposure area using soil data encompassing all relevant exposure depths for the HHERA (i.e., 0 to 10 ft bgs for the AOC 12 potential exposure area). Inorganics and HMW PAHs were above background levels in AOC 12 potential exposure area soil (0 to 10 ft bgs) and, therefore, are included as COPCs and/or COPECs in the baseline exposure depths evaluated in the HHERA. All other detected organic constituents in the AOC 12 potential exposure area soil in the baseline exposure depths are included as COPCs and/or COPECs in the HHERA. COPCs and/or COPECs selected for exposure depths and scenarios evaluated in the HHERA for the AOC 12 potential exposure area are summarized in Tables AOC12-2.1a through AOC12-2.1d. The selected COPCs and COPECs are discussed further in Sections 4 and 5, respectively, of this appendix.

3 EXPOSURE POINT CONCENTRATIONS

Depth-weighted exposure point concentrations (EPCs) for COPCs/COPECs in soil at the AOC 12 potential exposure area were calculated as described in Section 4.2 of the main report. For the AOC 12 potential exposure area, one scenario was evaluated: Baseline (no scouring).

The following exposure depths were evaluated:

1. Surface soil (0 to 0.5 ft bgs)
2. Shallow soil (0 to 3 ft bgs)
3. Subsurface I soil (0 to 6 ft bgs)
4. Subsurface II soil (0 to 10 ft bgs).

The depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment AOC12-A2. The summary statistics for these AOC 12 potential exposure area soil depth-weighted datasets and depth-weighted EPCs were calculated consistent with the RAWP (Arcadis 2008, 2009, 2015). Per the RAWP, area-weighted EPCs for the HHRA are evaluated only if depth-weighted EPCs suggest that cumulative cancer risks and/or noncancer hazards may be significant for any given HHRA exposure scenario (cumulative cancer risks exceed a 10^{-6} cancer risk level, and/or the noncancer hazard index [HI] exceeds 1). Similarly, for the ERA, area-weighted EPCs are evaluated only if depth-weighted EPCs suggest potential risk to ecological receptors (i.e., hazard quotient [HQ] > 1 for any COPEC). For the AOC 12 potential exposure area, area-weighted EPCs were not deemed necessary for the HHRA or the ERA and, therefore, not calculated.

Soil summary statistics for constituents measured at the AOC 12¹ potential exposure area and detected at least once and depth-weighted EPCs for COPCs/COPECs calculated using depth-weighted data from the four exposure depths listed above for the AOC 12 potential exposure area are presented in Table AOC12-3.1. Due to the small dataset sizes for the surface, shallow, and subsurface I datasets in AOC 12 (i.e., insufficient data to calculate upper confidence limits [UCLs] on the mean), the depth-weighted EPCs were based on maximum depth-weighted concentrations for these exposure depths intervals.

¹ The list of constituents shown in the main report Section 3 tables is based on analytes that were detected at least once at the site (including all potential exposure areas inside or outside the TCS).

4 HUMAN HEALTH RISK ASSESSMENT

This section briefly summarizes the HHRA approach; presents the COPC, EPC, risk and hazard summary tables; and discusses the results of the risk characterization and uncertainties in the risk assessment for the AOC 12 potential exposure area. Details of the overall HHRA approach are presented in Section 5 of the main report. Dose, exposure concentration (EC), risk, and hazard calculation tables for potential human health receptors at the AOC 12 potential exposure area are presented in Attachment AOC12-B.

Risks/hazards estimated for an individual AOC/solid waste management unit (SWMU)/undesignated area (UA) potential exposure area like AOC 12 potential exposure area are not considered representative of the realistic or likely potential exposures for the human populations that could be present in the areas outside the TCS (such as maintenance workers, recreational users, and tribal users). Risks/hazards calculated separately for individual AOCs are conservative and likely overestimate site risks/hazards. As described in the RAWP documents (Arcadis 2008, 2009, 2015), these human populations would more likely be exposed randomly, over the course of a lifetime, to soil present in all individual AOC/SWMU/UA potential exposure areas located outside the TCS, rather than have a lifetime of contact limited to the area of a single potential exposure area. Therefore, estimated risks/hazards presented for individual AOC/SWMU/UA potential exposure areas are not believed to be representative of the potential health risks to humans potentially contacting the soil outside the TCS. Rather, the HHRA results presented in Appendix OCS for all AOC/SWMU/UA potential exposure areas located outside the TCS combined will help to inform risk management decisions for the site. The estimated risks/hazards associated with a lifetime of contact with soil only in AOC 12 potential exposure area are presented at the request of the agencies and are not suitable to provide the sole basis of risk management decisions to protect human health.

4.1 Human Health Conceptual Site Model

Following the steps outlined in Section 5.5 of the main report, risks were estimated for potentially complete and significant exposure pathways identified in the human health conceptual site model (CSM) for receptors potentially exposed to COPCs in soil present at the AOC 12 potential exposure area. The potential receptors and exposure pathways evaluated for the AOC 12 potential exposure area included:

- **Short- and Long-Term Maintenance Workers** – Incidental ingestion of soil, dermal contact with soil, inhalation of particulates and volatile organic compound (VOC) vapors in ambient outdoor air from soil
- **Recreational Users (child and/or adult campers, hikers, hunters, and off-highway vehicle [OHV] riders)** – Incidental ingestion of soil, dermal contact with soil, and inhalation of particulates and VOC vapors in ambient outdoor air from soil
- **Tribal Users** – Inhalation of particulates and VOC vapors in ambient outdoor air from soil.

Potential exposure pathways considered incomplete or insignificant were not quantitatively evaluated and are discussed in Section 5.3.1 of the main report.

4.2 Constituents of Potential Concern

COPCs for the AOC 12 potential exposure area were selected in accordance with the RAWP documents (Arcadis 2008, 2009, 2015) and as described in Section 3.4 of the main report. The COPC selection process using soil data encompassing all relevant exposure depths for the HHRA (i.e., 0 to 10 ft bgs for the AOC 12 potential exposure area) are presented in Attachment AOC12-A. COPCs for the four exposure depths and one scenario (baseline) evaluated for the AOC 12 HHRA are summarized in Table AOC12-4.1 (details are presented in Tables AOC12-2.1a through AOC12-2.1d).

COPCs included one metal (zinc), PAHs, PCBs, and total petroleum hydrocarbon (TPH) as motor oil in surface, shallow, subsurface I, and/or subsurface II soil.

4.3 Exposure Point Concentration Summary

For the potentially complete and significant exposure pathways identified in the CSM, EPCs were calculated as described in Section 4.2 of the main report and presented in Section 3 of this appendix. Depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment AOC12-A. Depth-weighted EPCs for COPCs in soil and estimated outdoor air concentrations associated with dust and vapors and used to estimate risk in the HHRA are summarized in Tables AOC12-4.2a through AOC12-4.2h for the four exposure depths in the baseline scenario.

As described in detail in Section 3.3 of the main report, the following exposure depths and corresponding EPC datasets were used to evaluate potential exposure to COPCs in soil for potential human receptors:

- **Short- and Long-Term Maintenance Workers** – surface, shallow, subsurface I and subsurface II soil
- **Recreational Users (child and/or adult campers, hikers, hunters, and OHV riders)** – surface and shallow soil
- **Tribal Users** – surface and shallow soil.

4.4 Estimation of Dose

The EC and chronic daily intake (CDI) for potential carcinogenic and noncarcinogenic effects were calculated, as described in Section 5.5.1 of the main report, for COPCs in soil for potentially complete exposure pathways. The calculated EC and CDI values are presented in Tables AOC12-B.1a through AOC12-B.1g (carcinogenic effects) and Tables AOC12-B.2a through AOC12-B.2g (noncarcinogenic effects) in Attachment AOC12-B for the potential receptors evaluated. Exposure parameters used in the dose calculations are presented in Table 5-1 of the main report.

4.5 Toxicity Assessment

The toxicity assessment characterizes the relationship between the magnitude of exposure to a constituent and the potential for adverse health effects. More specifically, the toxicity assessment identifies agency-promulgated or derived toxicity values that can be used to estimate the likelihood of adverse health effects occurring in humans at different exposure levels. The approach for the toxicity assessment was provided in Section 4.5 of the RAWP (Arcadis 2008) and in Section 4.2 of the RAWP Addendum 2 (Arcadis 2015).

Consistent with regulatory risk assessment policy, adverse health effects resulting from potential chemical exposures are evaluated in two categories: carcinogenic effects and noncarcinogenic effects. The hierarchy of sources for the toxicity criteria to be used for the HHRA generally corresponds to California Department of Toxic Substances Control (DTSC) guidance (2015). Toxicity values for carcinogenic and noncarcinogenic effects for COPCs selected and used for the HHRA are described in Section 5.4 of the main report and were used to estimate potential cancer risks and noncancer hazards.

4.6 Human Health Risk Characterization

For potential human receptors, assuming lifetime soil exposure is limited to the AOC 12 potential exposure area, the estimated incremental lifetime cancer risks (ILCRs) and/or noncancer HQs were calculated for each COPC and potentially complete exposure pathway. Estimated cumulative ILCRs (i.e., sum of chemical-specific ILCRs for each exposure depth for a scenario) were calculated and compared to the DTSC point of departure for risk management decision of 1×10^{-6} . Note that risk management decisions may raise this criterion depending on site-specific conditions. As indicated in the National Oil and Hazardous Substances Pollution Contingency Plan (40 Code of Federal Regulations 300), cancer risks between one in a million and one hundred in a million probability of occurrence (1×10^{-6} and 1×10^{-4}) fall within a risk management range. This is generally referred to as the acceptable risk range. Within this estimated cancer risk range, there is flexibility for risk managers in deciding what action, if any, is necessary and appropriate for the protection of human health. Estimated cumulative noncancer hazards (i.e., HIs) are calculated and compared to an HI of 1 (DTSC 2015). Chemical exposures that yield HIs of less than or equal to 1 are not expected to result in adverse noncancer health effects (U.S. Environmental Protection Agency [USEPA] 1989).

4.6.1 Risk Characterization for Exposure to Soil (Baseline Scenario and Depth-Weighted EPCs)

Table AOC12-4.3 summarizes cumulative ILCRs and HIs estimated using depth weighted EPCs for potential exposure to soil for each human receptor evaluated at the AOC 12 potential exposure area in the baseline scenario. The dose, EC, ILCR, and HI equations are presented in detail in Section 5.5.1 of the main report. The detailed cancer risk estimates (Tables AOC12-B.3a through AOC12-B.3g) and noncancer hazard calculations (Tables AOC12-B.4a through AOC12-B.4g) are presented in Attachment AOC12-B.

Risk and hazard estimates for the AOC 12 potential exposure area are summarized in the tables and discussed below. Assuming that lifetime soil contact is limited to the AOC 12 potential exposure area, the estimated cumulative ILCRs and HIs for the short- and long-term maintenance workers, recreational users (campers, hikers, hunters, and OVH riders), and tribal users potentially exposed to COPCs in AOC 12 potential exposure area soil at all exposure depths are below the *de minimis* levels of 1×10^{-6} and 1, respectively.

APPENDIX AOC12
SOIL HHERA FOR AOC 12 EXPOSURE AREA

Maintenance Workers

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 12 Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Short-Term Maintenance Worker	Surface	1E-09	NA	0.002	NA
	Shallow	1E-09	NA	0.002	NA
	Subsurface I	7E-10	NA	0.001	NA
	Subsurface II	6E-10	NA	0.001	NA
Long-Term Maintenance Worker	Surface	2E-08	NA	0.001	NA
	Shallow	1E-08	NA	0.0008	NA
	Subsurface I	8E-09	NA	0.0006	NA
	Subsurface II	7E-09	NA	0.0005	NA

Notes:

NA = not applicable

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

Recreational Users

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 12 Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Camper	Surface	3E-09	NA	0.0007	NA
	Shallow	2E-09	NA	0.0006	NA
Hiker	Surface	6E-09	NA	0.001	NA
	Shallow	5E-09	NA	0.001	NA
Hunter	Surface	1E-09	NA	0.00008	NA
	Shallow	9E-10	NA	0.00006	NA
OHV Rider	Surface	1E-08	NA	0.0008	NA
	Shallow	8E-09	NA	0.0006	NA

Note:

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

Tribal User

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 12 Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Tribal User	Surface	2E-11	NA	0.0000004	NA
	Shallow	2E-11	NA	0.0000004	NA

Note:

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

4.6.2 Uncertainties in the Risk Assessment

The risk assessment includes several uncertainties that warrant discussion. Many of the assumptions used in this risk assessment, regarding the representativeness of the sampling data, potential human exposures, fate and transport modeling, and chemical toxicity are conservative, follow agency guidance and reflect a 90th or 95th percentile value rather than a typical or average value. The use of several conservative exposure assumptions and toxicity estimates can introduce considerable uncertainty into the risk assessment. By using conservative exposure assumptions or toxicity estimates, the assessment can develop a significant conservative bias that may result in the calculation of significantly higher estimates for cancer risks or noncancer hazards than are actually posed by the chemicals present in soil. These uncertainties are discussed in detail in Section 5.6 of the main report. Uncertainties applicable only to the risk assessment for the AOC 12 potential exposure area are discussed below.

Additional uncertainties for the AOC 12 potential exposure area include the use of the maximum depth-weighted soil concentration as the EPC. The maximum depth-weighted soil concentration was used for COPCs when the soil dataset contained fewer than four detected values (i.e., concentrations reported above the detection limit) or fewer than eight total observations as shown in Table AOC12-3.1. As stated previously in Section 3, due to the small dataset sizes for the surface, shallow, and subsurface I soil datasets in the UA-2 potential exposure area (i.e., insufficient data to calculate UCLs on the mean), the depth-weighted EPCs were based on maximum depth-weighted concentrations.

The use of the maximum depth-weighted soil concentration as the EPC for the COPCs may not appropriately represent exposures and resulting risks/hazards for maintenance workers, recreational users, and tribe users evaluated in the AOC 12 potential exposure area HHRA.

5 ECOLOGICAL RISK ASSESSMENT

This section briefly summarizes the ERA approach; presents the COPECs, EPCs, dose and risk tables for the AOC 12 ERA; and characterizes potential risk to ecological receptors exposed to COPECs in soil at the AOC 12 potential exposure area. Details of the overall ERA approach are presented in Section 6 of the main report. Supporting tables for the AOC 12 ERA based on risk calculations conducted using depth-weighted EPCs are presented in Attachment AOC12-C and described below.

Per the RAWP (Arcadis 2008) and DTSC guidance (1996), ecological risk calculations based on both the maximum concentration and the UCL for each COPEC are required. However, as the depth-weighted EPCs for the AOC 12 potential exposure area are based on the maximum depth-weighted concentrations for depth intervals evaluated in the ERA, separate risk calculations based on the maximum depth-weighted concentrations were not necessary.

5.1 Ecological Conceptual Site Model

Following the steps outlined in Section 6.6 and on Figures 2-7 and 6-1 of the main report, risks were estimated for potentially complete and significant exposure pathways identified for potential receptors exposed to COPECs in soil at the AOC 12 potential exposure area. These included plants, invertebrates, and potential small home-range receptors, as follows:

- **Plants** – may be exposed to COPECs via root uptake from surface, shallow, and/or subsurface I soil, depending on the root depth of plants of concern.
- **Soil Invertebrates** – may be exposed to COPECs via direct contact/uptake from surface soil.
- **Mammals** – may be exposed to COPECs via incidental ingestion of surface, shallow, or subsurface I soil (for burrowing animals) and/or ingestion of biota tissue (i.e., food items). The potential small home range mammalian indicator receptors evaluated in this ERA for the AOC 12 potential exposure area were:
 - **Merriam's Kangaroo Rat** – representative of granivorous small mammal populations exposed to surface, shallow and/or subsurface I soil (incidental and through biota uptake)
 - **Desert Shrew** – representative of invertivorous small mammal populations exposed only to surface soil (incidental and through biota uptake).
- **Birds** – may be exposed to COPECs via incidental ingestion of surface, shallow, or subsurface I soil and/or ingestion of biota tissue (i.e., food items). The potential small home-range bird indicator receptors evaluated in this ERA for the AOC 12 potential exposure area were:
 - **Cactus Wren** – representative of insectivorous bird populations, exposed only to surface soil (incidental and through biota uptake)
 - **Gambel's Quail** – representative of granivorous bird populations, exposed incidentally only to surface soil and exposed to surface, shallow, or subsurface I soil (incidental and through biota uptake).

Exposure pathways considered incomplete or insignificant were not quantitatively evaluated; these potential exposure pathways are identified and described in Section 6.3 of the main report.

Potential large home-range receptors (desert kit fox, red-tailed hawk, and Nelson's desert bighorn sheep) were evaluated for larger potential exposure areas (combined AOCs/investigation areas) and are discussed in those specific appendices. Potential risks to desert kit fox, red-tailed hawk, and Nelson's desert bighorn sheep associated with AOC 12 potential exposure area were estimated and characterized as part of the evaluation of all AOCs/investigation outside the compressor station (OCS) and all AOCs outside the compressor station excluding BCW and AOC4 (OCSxBCW+AOC4) potential exposure areas; please see Appendix OCS and Appendix OCSxBCW+AOC4.

5.1.1 Evaluation of Special-Status Species

The biological setting for the Topock site and the adjacent areas are described in detail in various reports (see Section 2.4 of the main report). Potential habitat exists for special-status² species at or near the site but none have been observed at the AOC 12 potential exposure area. The primary vegetation present at the AOC 12 potential exposure area is sparse creosote bush (*Larrea tridentate*). No federal- or state-listed threatened and endangered (T&E) plants or candidates for listing were found at the Topock site, including AOC 12 potential exposure area.

Several species of mammals and birds have been observed at or near the site (see Tables 2-2 and 2-4 of the main report). However, no federal- or state-listed T&E species or candidates for listing were observed at the AOC 12 potential exposure area.

The risk estimates presented here are considered to be protective of special-status species due to the conservative nature of the ERA where conservative parameters (e.g., small potential exposure areas, selected indicator species for each functional group considered on the high end of potential exposures for typical receptors at the site within that group, use of no-effects based toxicity values, etc.) were used to assess risks to a wide range of potential receptors at various trophic levels. Therefore, further evaluation of special-status species was not considered necessary.

5.2 Constituents of Potential Ecological Concern

COPECs for the AOC 12 potential exposure area were selected in accordance with the RAWP (Arcadis 2008) and as described in Section 3.4 of the main report. Soil data encompassing all relevant exposure depths for the HHERA (i.e., 0 to 10 ft bgs for the AOC 12 potential exposure area) and used in the COPEC selection process are presented in Attachment AOC12-A1.

Because an ecological receptor could be exposed to COPECs at various exposure depths either directly and/or through their diet for a given scenario, a single comprehensive COPEC list was selected based on the range of soil depths encountered by potential ecological receptors in the baseline scenario. Additionally, essential nutrients (e.g., calcium, potassium) and analytes typically measured to evaluate geochemical conditions (e.g., chloride, nitrate, sulfate) are not typically evaluated in ERAs and were not selected as

² Special-status species include both state- and federal-listed fully protected T&E species, state/federal species of concern, and traditional culturally significant plants; however, protection at the no-observed adverse effects level (NOAEL) is warranted only for fully protected species.

COPECs. COPECs for the three exposure depths evaluated for the baseline scenario for this ERA are summarized in Table AOC12-5.1.

COPECs included one metal (zinc), HMW PAHs, and PCBs. TPHs were also identified as COPECs; however, due to lack of appropriate toxicity values to evaluate TPH for potential ecological receptors, indicator chemicals (e.g., benzene, toluene, ethylbenzene, and xylene [BTEX] and PAHs) were used to characterize TPH risks. COPECs lacking toxicity values and their impact to the ERA are discussed in Section 6.7.5 of the main report.

5.3 Exposure Point Concentration Summary

For the potentially complete and significant exposure pathways identified in the ecological CSM, soil EPCs were calculated as described in Section 4.2 of the main report and presented in Section 3 of this appendix. For the AOC 12 potential exposure area, risks to potential ecological receptors were estimated using depth-weighted EPCs. Depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment AOC12-A2.

Per the RAWP (Arcadis 2008) and DTSC guidance (1996), risk calculations based on both the maximum detected concentration and the UCL for each COPEC are required. However, because the depth-weighted EPCs are based on the maximum depth-weighted concentrations for depth intervals evaluated in the ERA for the AOC 12 potential exposure area, separate risk calculations based on the maximum depth-weighted concentrations were not necessary.

Biota tissue EPCs were calculated from the soil EPCs using soil-to-biota uptake relationships for plants, invertebrates, and small mammals, as described in Section 6.4 of the main report. As described in Section 6.4 and shown on Figure 6-1 of the main report, the depth intervals selected to represent exposure to soil and biota tissue for the risk calculations for each receptor are presented in Table AOC12-5.2.

To summarize for the baseline scenario:

- Soil invertebrates, invertivorous mammals, and insectivorous birds could potentially be exposed to COPECs in soil and/or biota only at the surface (0 to 0.5 ft bgs).
- Plants and granivorous small mammals could potentially be exposed to COPECs in soil and or/biota from 0 to 6 ft bgs. Therefore, the maximum of the depth-weighted EPCs from 0 to 0.5, 0 to 3, and 0 to 6 ft bgs was selected as the representative soil and/or biota EPC for a COPEC for estimating exposures and risks to these potential receptors.
- Granivorous birds could potentially be exposed to COPECs in soil (not biota) only at the surface (0 to 0.5 ft bgs) and biota from 0 to 6 ft bgs. Therefore, exposures to granivorous birds included the depth-weighted soil EPC from 0 to 0.5 ft bgs (for incidental soil ingestion) and the maximum of the depth-weighted biota EPC from 0 to 0.5, 0 to 3, and 0 to 6 ft bgs for each COPEC.

Depth-weighted soil EPCs and biota tissue EPCs calculated from depth-weighted soil EPCs are presented in Table AOC12-5.3 for the baseline scenario and the representative soil and/or biota EPCs identified for the baseline risk calculations are bolded in this table.

Per the RAWP (Arcadis 2008) and DTSC guidance (1996), risk calculations based on both the maximum depth-weighted concentration and the UCL for each COPEC are required. As mentioned earlier in this section,

depth-weighted EPCs are based on the maximum depth-weighted concentrations for depth intervals evaluated in the ERA for the AOC 12 potential exposure area, and separate risk calculations based on the maximum depth-weighted concentrations were not necessary.

5.4 Estimation of Exposure Concentration or Dose

Exposures for ecological communities (plants and soil invertebrates) are quantified as ECs (e.g., in units of milligrams per kilogram [mg/kg]). Exposures for wildlife (mammals and birds) are quantified as doses (e.g., in units of mg/kg body weight per day [mg/kg-bw/day]). ECs and doses for COPECs in soil and potentially complete pathways were calculated as described in Section 6.4 of the main report. The exposure parameters selected to evaluate wildlife in this ERA include upper bound values from literature (e.g., ingestion rates) or assumed (e.g., 100% of one type of diet), which may result in conservative estimates of exposure dose and potential overestimation of actual exposure at the site.

For ecological communities, ECs are equal to the depth-weighted soil EPCs for COPECs at the AOC 12 potential exposure area for the baseline scenario and are presented in Table AOC12-5.3.

For wildlife, doses were calculated using the exposure parameters and equations presented in Section 6-4 of the main report and depth-weighted soil and biota tissue EPCs for COPECs at the AOC 12 potential exposure area, as presented in Table AOC12-5.3 using depth-weighted EPCs. Dose calculations using depth-weighted EPCs for wildlife potentially exposed to COPECs via ingestion of soil and biota tissue for the baseline scenario are presented in Attachment AOC12-C.

5.5 Effects Assessment

Concentration-based screening values (i.e., toxicity values) for plants and soil invertebrates and the dose-based toxicity reference values (TRVs) for wildlife for COPECs were used to estimate risks to potential ecological receptors potentially exposed to COPECs in soil and biota tissue at the AOC 12 potential exposure area. For plants and soil invertebrates, screening values are discussed in Section 6.5 and presented in Table 6-6 of the main report.

A range of risks to wildlife were estimated using the NOAEL-based TRVs and lowest-observed adverse effects level (LOAEL)-based TRVs presented in the RAWP documents (Arcadis 2008, 2009, 2015). These selected TRVs were primarily based on the TRVs used to develop USEPA Ecological Soil Screening Levels (EcoSSLs; USEPA 2008). Other sources included the Toxicological Benchmarks for Wildlife from Oak Ridge National Laboratory (Sample et al. 1996) and USEPA Region 6 ERA Guidance (USEPA 1999). In addition, for estimating potential risk to wildlife, a second set of NOAEL- and LOAEL-TRVs³ based on the Navy/Biological Technical Assistance Group (BTAG) TRVs (DTSC 2002, 2009) were also used for COPECs, where available. Wildlife TRVs based on selected TRVs and BTAG TRVs are presented in the main report Tables 6-7 through 6-10.

³ Although these are referred to as LOAEL-based BTAG TRVs, they are based on a midpoint of a variety of adverse effects and are not necessarily lowest observed adverse effect. However, for simplicity, these BTAG TRVs are referred to as LOAEL-based TRVs.

Appropriate screening values and TRVs are not available for TPHs; therefore, BTEX and PAHs were used as indicator chemicals to characterize TPH risks at the AOC 12 potential exposure area. The lack of screening values and TRVs and the impact to the ERA are discussed in Section 6.7.5 of the main report.

5.6 Ecological Risk Characterization

The risk characterization integrates the results of the exposure assessment and effects assessment and is subject to uncertainties in both those efforts. Risk characterization includes two major components: risk estimation and risk description. As presented in tables and discussed below, risk estimates (i.e., HQs) involved integrating exposure profiles with the exposure-effects information. For each receptor and COPEC, risk descriptions including various lines of evidence (LOEs) and uncertainties, including HQs, supporting statistical and site use information, and the direction of uncertainty in the risk estimates, are discussed below for interpreting the risk results and identifying potential unacceptable risk to potential ecological receptors. Uncertainties specific to AOC 12 potential exposure area are discussed in context with the risk characterization results presented below. Generic uncertainties in the ERA are discussed in detail in Section 6.7 of the main report.

For plants and soil invertebrates, HQs were calculated in soil by comparing the depth-weighted EPCs for each COPEC with respective screening values and these HQs were compared to the target HQ of 1. Following USEPA (1998) guidance, in such cases, a semi-quantitative weight-of-evidence (WOE) approach using multiple LOEs was used in reducing uncertainty and drawing risk conclusions.

Risk conclusions for ecological communities used the following criteria:

- COPECs with HQs less than or equal to 1 pose *de minimis* risk (i.e., negligible risk) to plants and invertebrates.
- COPECs with HQs greater than 1 indicate that unacceptable risk to plants and invertebrates is possible. However, exceedances of the screening values (which are conservative and are generally uncertain) do not always clearly indicate that unacceptable risk to ecological communities is occurring. In such cases, a WOE approach, using HQs as a single LOE along with supporting information such as frequency of detection, site use history, and confidence in the screening values was used in reducing uncertainty for characterizing potential risk to ecological communities.

Ultimately, three risk outcomes are possible for plants and soil invertebrates based on HQs greater than 1 and the WOE: (1) unacceptable risk to ecological communities is possible (i.e., indicated by sufficient and strong supporting LOEs); (2) unacceptable risk to ecological communities is unlikely (i.e., indicated by sufficient and strong LOEs to support a conclusion of no unacceptable risk); or (3) unacceptable risk to ecological communities is uncertain (i.e., indicated by insufficient LOEs).

For wildlife, a range of HQs was calculated using NOAEL- and LOAEL-based TRVs previously identified in RAWP documents (Arcadis 2008, 2009, 2015). HQs based on LOAEL-based TRVs selected in the RAWP are referred to as "LOAEL-based HQs." HQs based on NOAEL-based TRVs selected in the RAWP are referred to as "NOAEL-based HQs." Additionally, NOAEL and LOAEL HQs were calculated using a second set of TRVs (i.e., NOAEL- and LOAEL-based BTAG TRVs), as described in Section 6.5 of the main report. The NOAEL-based BTAG TRVs are considered very conservative, resulting in a wide range of risks to wildlife. For this ERA, the selected TRVs are considered more robust than the BTAG TRVs, as discussed in Section 6.7.5 of the main

report. Results associated with the selected TRVs are recommended for risk management decisions at the AOC 12 potential exposure area.

Risk conclusions for wildlife used the following criteria:

- COPECs with NOAEL-based HQs less than or equal to 1 pose *de minimis* risk to individuals and populations of potential wildlife receptors.
- COPECs with a NOAEL-based HQ greater than 1 but a LOAEL-based HQ less than or equal to 1 pose no unacceptable risks to wildlife populations. However, as described in the RAWP (Arcadis 2008), unacceptable risk to individuals is uncertain because the NOAEL-based TRVs are thresholds with an interval that is an artifact of the dosing study and the nature and magnitude of the effects, if any, that may occur at exposures between these values is unknown. In such cases, a WOE approach, including multiple LOEs, were used in reducing uncertainty for characterizing potential risk to individual wildlife receptors.
- COPECs with LOAEL-based HQs greater than 1 indicate unacceptable risk is possible for populations of potential wildlife receptors. However, these LOAEL-based HQs greater than 1 are based on individual-level effects thresholds and only account for a single LOE. In such cases, a WOE approach was used in reducing uncertainty for characterizing potential risk to wildlife populations at the AOC 12 potential exposure area, as described in the above bullet.
- NOAEL-based HQs greater than 1 is considered one LOE in assessing potential risk to sensitive species, if present in this potential exposure area. Evaluation of T&E species for the AOC 12 potential exposure area is presented in Section 5.1.1 of this appendix.

Ultimately, three risk outcomes are possible for wildlife based on the HQs greater than 1 and WOE: (1) unacceptable risk to wildlife is possible (i.e., indicated by sufficient and strong supporting LOEs); (2) unacceptable risk to wildlife is unlikely, (i.e., indicated by sufficient and strong LOEs supporting a conclusion of no unacceptable risk); or (3) unacceptable risk to wildlife is uncertain (i.e., indicated by insufficient LOEs).

For this ERA, the results of individual LOE evaluations were evaluated collectively to derive an overall WOE conclusion for each receptor. Key uncertainties were considered along with the strength, relevance, and other qualities of the LOEs in reaching the WOE conclusions. For the AOC 12 potential exposure area, evaluations were completed for the following scenarios and discussed in this section:

- Baseline scenario using depth-weighted EPCs.

In these evaluations, risk calculations were completed for all COPECs, as presented in Tables AOC12-5.4a through AOC12-5.4b. At the conclusion of the baseline scenario evaluation, risk drivers were identified based on those COPECs for which unacceptable community/population-level risk was predicted using the most refined exposure and effects assumptions (i.e., site-specific site use factor [SUF], depth-weighted EPCs, and selected TRVs).

5.6.1 Risk Characterization (Baseline Scenario and Depth-Weighted EPCs)

Risk estimates for ecological communities (plants and soil invertebrates) and wildlife (mammals and birds) estimated for the baseline scenario using depth-weighted EPCs are summarized in this section. As mentioned earlier in Section 5.4, ECs and doses for COPECs in soil and potentially complete pathways were calculated as described, including equations, in Section 6.4 of the main report. Detailed risk calculations for plants and

soil invertebrates (Table AOC12-C.1) and detailed dose and risk calculations for wildlife (Tables AOC12-C.2 through AOC12-C.4) are presented in Attachment AOC12-C. COPECs at the AOC 12 potential exposure area include one metal (zinc), HMW PAHs, TPHs, and PCBs (Table AOC12-5.1). Potential risk to receptors exposed to these COPECs is described below.

5.6.1.1 Plants and Soil Invertebrates

Table AOC12-5.4a summarizes HQs estimated for soil exposure for ecological communities (plants and soil invertebrates) at the AOC 12 potential exposure area using depth-weighted EPCs. Plants can potentially be exposed to COPECs in soil up to 6 ft bgs. HQs for all COPECs are less than 1 for plants, indicating *de minimis risk* to plants from exposure to these COPECs.

Soil invertebrates can potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs). HQs for all COPECs are less than 1 for soil invertebrates, indicating *de minimis risk* to soil invertebrates from exposure to these COPECs.

Based on the risk results and discussion above, unacceptable risk to plant and invertebrate communities from exposure to COPECs at the AOC 12 potential exposure area is not expected.

5.6.1.2 Small Mammals

For the AOC 12 potential exposure area, baseline risks were estimated for small mammals using depth-weighted EPCs for the following evaluations and discussed in this section:

- Using the selected TRVs and an SUF equal to 1
- Using the BTAG TRVs and an SUF equal to 1
- Using the selected TRVs and a species and site-specific SUF
- Using the BTAG TRVs and a species and site-specific SUF.

5.6.1.2.1 Risks Evaluated Using a SUF Equal to 1

Table AOC12-5.4a summarizes HQs estimated for mammals at the AOC 12 potential exposure area using the selected TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized in the text and table below. TRVs are not available for TPHs; however, risks to these potential receptors are characterized below based on indicator chemicals as described previously.

- **Merriam's Kangaroo Rat (granivorous small mammal):** This receptor could potentially be exposed to COPECs in subsurface I soil (0 to 6 ft bgs) directly and through its diet. NOAEL- and LOAEL-based HQs for COPECs in soil are less than or equal to 1, indicating *de minimis risk* to individuals and populations of granivorous small mammals.
 - For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not analyzed in any samples, but NOAEL- and LOAEL-based HQs for PAHs are less than 1, indicating that no unacceptable risk to granivorous mammals from exposure to TPH is expected.

- **Desert Shrew (invertivorous small mammal):** This receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. NOAEL- and LOAEL-based HQs for COPECs in soil are less than or equal to 1, indicating *de minimis* risk to individuals and populations of invertivorous small mammals.
 - For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not analyzed in any samples, but NOAEL- and LOAEL-based HQs for PAHs are less than 1, indicating that no unacceptable risk to invertivorous mammals from exposure to TPH is expected.

No unacceptable risks to small mammals are expected for the baseline scenario. No further evaluation of COPECs using selected TRVs and site-specific SUFs for small mammals was required in this scenario.

Risks Evaluated Using the BTAG TRVs

Table AOC12-5.4a also summarizes HQs estimated for small mammals at the AOC 12 potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized in the text and table below.

- **Merriam's Kangaroo Rat (granivorous small mammal):** The NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, indicating *de minimis* risk to individuals and populations of granivorous small mammals.
- **Desert Shrew (invertivorous small mammal):** The NOAEL-based HQ for zinc is greater than 1 and the LOAEL-based HQ is less than 1 for zinc, indicating no unacceptable risk to populations of invertivorous small mammals; however, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. The NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs, indicating *de minimis* risk to individuals and populations of invertivorous small mammals from the remaining COPECs.

Summarized below are all HQ estimates for small mammals for COPECs where at least one NOAEL-based HQ value (using the selected TRV or BTAG TRV) is greater than 1:

Hazard Quotient Summary for Mammals (SUF = 1)								
COPEC	Merriam's Kangaroo Rat				Desert Shrew			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Zinc	6E-02	2E-02	5E-01	1E-02	1E+00	2E-01	8E+00	2E-01

Note:

Bold indicates HQs > 1.

5.6.1.2.2 Risks Evaluated Using a Site-Specific SUF

Table AOC12-5.4b presents HQs calculated using the selected TRVs and BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Based on the AOC 12 potential exposure area and home ranges for Merriam's kangaroo rat and desert shrew, the site-specific SUF was estimated as 1 for these potential receptors (i.e., their home range is less than or equal to the size of the potential exposure area). Therefore,

the risk results using selected TRVs and BTAG TRVs for this scenario are the same as discussed above for the generic SUF of 1.

5.6.1.2.3 Baseline Risk Summary for Mammals Using Depth-Weighted EPCs

To summarize, based on the risks characterized for populations of small mammals exposed to COPECs in soil at the AOC 12 potential exposure area using selected TRVs⁴, depth-weighted EPCs, and a site- and species-specific SUF (SUF equal to 1), the risk conclusions are as follows:

- For Merriam's kangaroo rat (granivorous small mammals), the NOAEL-based and LOAEL-based HQs are less than 1, indicating de minimis risk to individuals and populations of granivorous small mammals for all COPECs.
- For desert shrew (invertivorous small mammals), the NOAEL-based and LOAEL-based HQs are less than 1, indicating de minimis risk to individuals and populations of invertivorous small mammals for all COPECs.

No unacceptable risk to individuals and populations of small mammals at the AOC 12 potential exposure area is expected. Therefore, no further evaluation of these potential receptors at the AOC 12 potential exposure area is required.

Potential Risk Drivers for Small Mammals at the AOC 12 Exposure Area in the Baseline Scenario

No risk-driving COPECs based on small mammals were identified at the AOC 12 potential exposure area as no potential for unacceptable population-level risk (i.e., LOAEL-based HQs greater than 1) was predicted using HQs calculated from exposure and effects assumptions in this scenario (i.e., SUF of 1, depth-weighted EPCs, and selected TRVs) and additional supporting LOEs.

No COPECs with NOAEL-based HQs greater than 1 using the exposure and effects assumptions in this scenario (i.e., SUF of 1, depth-weighted EPCs, and selected TRVs) were identified at the AOC 12 potential exposure area, supporting the conclusions that unacceptable risk to individual potential receptors from exposure to these COPECs is not expected.

Birds

For the AOC 12 potential exposure area, baseline risks were estimated for birds using depth-weighted EPCs for the following evaluations and discussed in this section:

- Using the selected TRVs and an SUF equal to 1
- Using the BTAG TRVs and an SUF equal to 1
- Using the selected TRVs and a species and site-specific SUF
- Using the BTAG TRVs and a species and site-specific SUF.

⁴ Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

5.6.1.2.4 Risks Evaluated Using an SUF Equal to 1

Table AOC12-5.4a summarizes HQs estimated for birds at the AOC 12 potential exposure area using the selected TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized in the text and table below. TRVs are not available for TPHs; however, risks to these potential receptors are characterized below based on indicator chemicals as described previously.

- **Gambel's Quail (granivorous bird):** This receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and to deeper soil (0 to 6 ft bgs) through its diet. The NOAEL- and LOAEL-based HQs for COPECs in soil are less than 1, indicating *de minimis* risk to individuals and populations of granivorous birds.
 - For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not analyzed in any samples, but the NOAEL- and LOAEL-based HQs for PAHs are less than 1, indicating that no unacceptable risk to granivorous birds from exposure to TPH is expected.
- **Cactus Wren (insectivorous bird):** This receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. The NOAEL- and LOAEL-based HQs for COPECs in soil are less than or equal to 1, indicating *de minimis* risk to individuals and populations of insectivorous birds.
 - For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not analyzed in any samples, but the NOAEL- and LOAEL-based HQs for PAHs are less than 1, indicating that no unacceptable risk to insectivorous birds from exposure to TPH is expected.

Risks Evaluated Using the BTAG TRVs

Table AOC12-5.4a also summarizes HQs estimated for birds at the AOC 12 potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized in the text and table below.

- **Gambel's Quail (granivorous bird):** The NOAEL- and LOAEL-based HQs for COPECs are less than 1, indicating *de minimis* risk to individuals and populations of granivorous birds.
- **Cactus Wren (insectivorous bird):** The NOAEL-based HQ for zinc is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of insectivorous birds; however, unacceptable risk to individual potential receptors is uncertain for this COPEC based on the HQ. The NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs, indicating *de minimis* risk to individuals and populations of insectivorous birds from the remaining COPECs.

Summarized below are all HQ estimates for birds for COPECs where at least one NOAEL-based HQ value (using the selected TRV or BTAG TRV) is greater than 1:

Hazard Quotient Summary for Birds (SUF = 1)								
COPEC	Gambel's Quail				Cactus Wren			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Zinc	4E-02	1E-02	1E-01	1E-02	1E+00	4E-01	4E+00	4E-01

Note:

Bold indicates HQs > 1

5.6.1.2.5 Risks Evaluated Using a Site-Specific SUF

Risks Evaluated Using Selected TRVs

Table AOC12-5.4b presents HQs calculated using the selected TRVs and BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized in the text and table below.

- **Gambel's Quail (granivorous bird):** The site-specific SUF for this receptor is 0.009, which further reduced the NOAEL- and LOAEL-based HQs to less than 1 for all COPECs, indicating *de minimis* risk to individuals and populations of granivorous birds at the AOC 12 potential exposure area.
- **Cactus Wren (insectivorous bird):** The site-specific SUF for this receptor is 0.07, which further reduced the NOAEL- and LOAEL-based HQs to less than 1 for all COPECs, indicating *de minimis* risk to individuals and populations of insectivorous birds at the AOC 12 potential exposure area.

Risks Evaluated Using the BTAG TRVs

Table AOC4-5.4b also summarizes HQs estimated for birds at the AOC 12 potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized in the text and table below.

- **Gambel's Quail (granivorous bird):** The site-specific SUF for this receptor is 0.009, which further reduced the NOAEL- and LOAEL-based HQs, indicating *de minimis* risk to individuals and populations of granivorous birds from this COPEC when accounting for site use at the AOC 12 potential exposure area.
- **Cactus Wren (insectivorous bird):** The site-specific SUF for this receptor is 0.07, which reduced the NOAEL- and LOAEL-based HQs for zinc to less than 1, indicating no unacceptable risk to individuals or populations of insectivorous birds from this COPEC when accounting for site use at the AOC 12 potential exposure area.

For the COPECs with NOAEL-based HQs greater than 1 using an SUF of 1 (using the selected TRV or BTAG TRV), HQ estimates using the species- and site-specific SUF for birds are summarized below.

Hazard Quotient Summary for Birds (Site-Specific SUF)								
COPEC	Gambel's Quail (SUF = 0.009)				Cactus Wren HQs (SUF = 0.07)			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Zinc	3E-04	1E-04	1E-03	1E-04	7E-02	3E-02	3E-01	3E-02

Note:

Bold indicates HQs > 1.

5.6.1.2.6 Baseline Risk Summary for Birds Using Depth-Weighted EPCs

To summarize, based on the risks characterized for populations of birds exposed to COPECs in soil at the AOC 12 potential exposure area using selected TRVs⁵, depth-weighted EPCs, and a site-specific SUF, the risk conclusions are as follows:

- For Gambel's quail (granivorous birds), the NOAEL- and LOAEL-based HQs for all COPECs are less than 1, indicating *de minimis* risk to individuals and populations of granivorous birds for all COPECs.
- For the cactus wren (insectivorous birds), the NOAEL- and LOAEL-based HQs for all COPECs are less than 1, indicating *de minimis* risk to individuals and populations of granivorous birds for all COPECs.

No unacceptable risk to individuals and populations of birds at the AOC 12 potential exposure area is expected. Therefore, no further evaluation of these potential receptors at the AOC 12 potential exposure area is required.

Potential Risk Drivers for Birds at the AOC 12 Exposure Area in the Baseline Scenario

No risk-driving COPECs based on birds were identified at the AOC 12 potential exposure area as no potential for unacceptable population-level risk (i.e., LOAEL-based HQs greater than 1) was predicted using HQs calculated from the exposure and effects assumptions in this scenario (i.e., site-specific SUF, depth-weighted EPCs, and selected TRVs) and additional supporting LOEs.

No COPECs with NOAEL-based HQs greater than 1 using the exposure and effects assumptions in this scenario (i.e., site-specific SUF, depth-weighted EPCs, and selected TRVs) were identified at the AOC 12 potential exposure area, supporting the conclusions that unacceptable risk to individual potential receptors from exposure to these COPECs is not expected.

⁵ Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

6 SUMMARY AND CONCLUSIONS FOR THE HHRA

Potential cumulative cancer risks and noncancer hazards for potential human receptors were estimated for the AOC 12 potential exposure area, as presented above in Section 4. For potential ecological receptors, potential risks were estimated as presented in Section 5. Uncertainties related to the HHRA and ERA at the site are discussed in detail in Sections 5.6 and 6.7 of the main report, and uncertainties specific to the AOC 12 potential exposure area are discussed herein. For the AOC 12 potential exposure area, a HHRA and ERA was conducted per the RAWP documents (Arcadis 2008, 2009, 2015). One scenario (baseline, i.e., no scouring) was evaluated, and risks were estimated for various receptors using depth-weighted EPCs. Risks based on depth-weighted EPCs did not suggest potential risk to ecological receptors (i.e., HQs were less than or equal to 1 for all COPECs); therefore, risks based on area-weighted EPCs were not necessary.

At the AOC 12 potential exposure area, COPCs/COPECs identified for the HHRA include one metal (zinc), HMW PAHs, PAHs, PCBs, and TPH as motor oil. A summary of the results and conclusions regarding estimated risk associated with potential exposure to these COPCs/COPECs in soil at the AOC 12 potential exposure area based on the risk/hazard estimates and uncertainties inherent in the risk assessment process are presented in this section.

The conclusions reached after completing the HHRA and ERA for the AOC 12 potential exposure area are presented below.

6.1 Summary and Conclusions for the HHRA

The cumulative ILCRs and HIs associated with potential exposure to COPCs in soil at the AOC 12 potential exposure area using depth-weighted EPCs under the baseline scenario were estimated. Assuming lifetime soil contact is limited to the AOC 12 potential exposure area for the potential receptors evaluated, the estimated potential ILCR and HI results are summarized in the table and discussion below.

Baseline Scenario Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index			
Potential Receptor and Exposure Depth		AOC 12 Potential Exposure Area	
		Cumulative ILCR	HI
		Depth-wt	Depth-wt
Short-Term Maintenance Worker	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	≤ 1
	Subsurface I	$\leq 1 \times 10^{-6}$	≤ 1
	Subsurface II	$\leq 1 \times 10^{-6}$	≤ 1
Long-Term Maintenance Worker	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	≤ 1
	Subsurface I	$\leq 1 \times 10^{-6}$	≤ 1
	Subsurface II	$\leq 1 \times 10^{-6}$	≤ 1

APPENDIX AOC12
SOIL HHERA FOR AOC 12 EXPOSURE AREA

Baseline Scenario Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index			
Potential Receptor and Exposure Depth		AOC 12 Potential Exposure Area	
		Cumulative ILCR	HI
		Depth-wt	Depth-wt
Camper	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	≤ 1
Hiker	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	≤ 1
Hunter	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	≤ 1
OHV Rider	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	≤ 1
Tribal User	Surface	$\leq 1 \times 10^{-6}$	≤ 1
	Shallow	$\leq 1 \times 10^{-6}$	≤ 1

Note:

wt = weighted

Depth-Weighted

Potential exposures that are at or below *de minimis* levels include the following:

- **HI ≤ 1 for all soil depths** – All potential receptors evaluated including: Short- and Long-Term Maintenance Workers, Camper, Hiker, Hunter, OHV Rider, and Tribal User.
- **ILCR $\leq 1 \times 10^{-6}$ for all soil depths** – All potential receptors evaluated including: Short- and Long-Term Maintenance Workers, Camper, Hiker, Hunter, OHV Rider, and Tribal User.

Potential exposures that are above *de minimis* levels of HI > 1 and within the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **HI > 1 and ≤ 3** – None.
- **HI > 3** – None.
- **ILCR > 1×10^{-6} and $\leq 5 \times 10^{-6}$** – None.
- **ILCR > 5×10^{-6} and $\leq 1 \times 10^{-5}$** – None.
- **ILCR > 1×10^{-5} and $\leq 1 \times 10^{-4}$** – None.

Exposures above the risk management range of 1×10^{-6} and 1×10^{-4}

- **ILCR > 1×10^{-4}** – None.

OVERALL SUMMARY

Assuming lifetime soil contact is limited to the AOC 12 potential exposure area, the estimated cumulative ILCRs and HIs associated with potential exposure to COPCs in soil using depth-weighted EPCs for all potential receptors, that is the short- and long-term maintenance workers and the recreational and tribal users are below the *de minimis* levels of 1×10^{-6} and 1, respectively.

Risks/hazards estimated for an individual AOC/SWMU/UA potential exposure area like the AOC 12 potential exposure area are not considered representative of the realistic or likely potential exposures for the human populations that could be present in the areas outside the TCS (such as maintenance workers, recreational users, and tribal users). Risks/hazards calculated separately for individual AOCs are conservative and likely overestimate site risks/hazards. As described in the RAWP documents (Arcadis 2008, 2009, 2015), these human populations would more likely be exposed randomly, over the course of a lifetime, to soil present in all individual AOC/SWMU/UA potential exposure areas located outside the TCS, rather than have a lifetime of contact limited to the area of a single potential exposure area. Therefore, estimated risks/hazards presented for individual AOC/SWMU/UA potential exposure areas are not believed to be representative of the potential health risks to humans potentially contacting the soil outside the TCS. Rather, the HHRA results presented in Appendix OCS for all AOC/SWMU/UA potential exposure areas located outside the TCS combined will help to inform risk management decisions for the site. The estimated risks/hazards associated with a lifetime of contact with soil only in the AOC 12 potential exposure area are presented at the request of the agencies and are not suitable to provide the sole basis of risk management decisions to protect human health.

6.2 Summary and Conclusions for the ERA

At the AOC 12 potential exposure area, one metal (zinc), HMW PAHs, TPHs, and PCBs were identified as COPECs. Risks could not be estimated for potential receptors lacking available screening values and/or TRVs for COPECs; such cases are discussed in the uncertainty analysis of the main report. These COPECs are unlikely to be risk drivers and are assumed to have minimal impact to the conclusions of the ERA.

Risks were estimated using depth-weighted EPCs. Evaluation of area-weighted EPCs was not necessary based on the results of the depth-weighted EPC evaluation. Risk conclusions were based on the following criteria:

- COPECs with HQs less than or equal to 1 pose *de minimis* risk to ecological communities (plants and invertebrates).
- COPECs with HQs greater than 1 could indicate potential risk to ecological communities. A WOE approach was used to characterize potential risk to plants and invertebrates.
- COPECs with NOAEL-based HQs less than or equal to 1 pose *de minimis* risk to potential wildlife receptors.
- COPECs with NOAEL-based HQs greater than 1 but LOAEL-based HQs less than or equal to 1 pose no unacceptable risks to wildlife populations; however, potential for unacceptable risk to individuals is uncertain based on the HQ. A WOE approach was used to characterize potential risk to individual receptors.

APPENDIX AOC12
SOIL HHERA FOR AOC 12 EXPOSURE AREA

- COPECs with LOAEL-based HQs greater than 1 have potential for unacceptable risk to populations of potential wildlife receptors.

The risk estimates (i.e., HQs) represent a single LOE in the risk characterization. A qualitative WOE approach, incorporating other LOEs and uncertainties, was used to characterize risk to wildlife populations at the AOC 12 potential exposure area.

The HQs for all the COPECs for the baseline scenario calculated using depth-weighted EPCs, selected screening levels/selected TRVs, and site-specific SUFs are summarized in Table AOC12-6.1. Area-weighted EPCs were not evaluated for this potential exposure area based on the risk estimates using depth-weighted EPCs. The depth-weighted EPCs are based on the maximum depth-weighted concentration due to small samples sizes for this potential exposure area.

Based on the ecological risk characterization for the AOC 12 potential exposure area using depth-weighted EPCs, selected TRVs, and site- and species-specific SUFs, the following conclusions were made.

- Potential risks to all ecological receptors are expected to be *de minimis* from exposure to all COPECs including TPH (based on PAH results) in soil at the AOC 12 potential exposure area. These COPECs were detected at concentrations less than screening values for plants and soil invertebrates and all NOAEL-based HQs for small mammals and birds were equal to or less than 1 based on depth-weighted EPCs, site-specific SUF, and selected TRVs. The various LOEs considered in the WOE assessment and risk conclusions are presented in Table AOC12-6.2.
- No T&E plants or small home range wildlife receptors have been observed in the AOC 12 potential exposure area.

6.2.1 Potential Risk Drivers for the AOC 12 Exposure Area

As presented in Table AOC12-6.2 and summarized in the table below, no potential risk drivers were identified for the AOC 12 potential exposure area based on unacceptable community/population-level risk (i.e., HQ greater than 1 for plants and soil invertebrates and LOAEL-based HQs greater than 1 for mammals and birds) predicted using the exposure and effects assumptions evaluated in this ERA (i.e., site-specific SUF, depth-weighted EPCs, and selected TRVs) and additional LOEs supporting the conclusion of unacceptable risk.

Scenario	Potential Receptors and Risk Drivers at AOC 12 Exposure Area					
	Plants	Soil Invertebrates	Granivorous Mammals (Merriam's Kangaroo Rat)	Invertivorous Mammals (Desert Shrew)	Granivorous Birds (Gambel's Quail)	Insectivorous Birds (Cactus Wren)
Baseline	None	None	None	None	None	None

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

Notes:

- ^a Applicable to both human health and ecological risk assessment (HHRA/ERA), unless otherwise noted.
- ^b Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA and ERA. Human health toxicity values are available for iron and manganese and ecological toxicity values are available for manganese, thus these chemicals are evaluated in the HHRA and ERA, if above background levels and have available toxicity values.
- ^c Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).
- ^d Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).
- ^e Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

mg/kg = milligrams per kilogram.

ng/kg = nanograms per kilogram.

ug/kg = micrograms per kilogram.

COPC = Constituent of Potential Concern.

COPEC = Constituent of Potential Ecological Concern.

ND = Not detected.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

Notes:

- ^a Applicable to both human health and ecological risk assessment (HHRA/ERA), unless otherwise noted.
- ^b Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA and ERA. Human health toxicity values are available for iron and manganese and ecological toxicity values are available for manganese, thus these chemicals are evaluated in the HHRA and ERA, if above background levels and have available toxicity values.
- ^c Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).
- ^d Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).
- ^e Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

mg/kg = milligrams per kilogram.

ng/kg = nanograms per kilogram.

ug/kg = micrograms per kilogram.

COPC = Constituent of Potential Concern.

COPEC = Constituent of Potential Ecological Concern.

ND = Not detected.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

Notes:

- ^a Applicable to both human health and ecological risk assessment (HHRA/ERA), unless otherwise noted.
- ^b Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA and ERA. Human health toxicity values are available for iron and manganese and ecological toxicity values are available for manganese, thus these chemicals are evaluated in the HHRA and ERA, if above background levels and have available toxicity values.
- ^c Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).
- ^d Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).
- ^e Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

mg/kg = milligrams per kilogram.

ng/kg = nanograms per kilogram.

ug/kg = micrograms per kilogram.

COPC = Constituent of Potential Concern.

COPEC = Constituent of Potential Ecological Concern.

ND = Not detected.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Notes:
^a The constituent consists of analytes detected at least once at the Topock Compressor Station site and measured in soil in this exposure area.
^b If fewer than eight total locations and four total detected concentrations, the maximum depth-weighted concentration was selected as the EPC. Otherwise, the UCL was selected as the EPC.
^c EPCs and summary statistics were not calculated for some constituents (i.e., dioxin congeners and essential nutrients). Those data, if available, are presented in Attachment A1 of each exposure area-specific appendix.

Abbreviations:
"--" = not applicable
AOC = area of concern
B(a)P equivalent = benzo(a)pyrene equivalent
COPC = constituent of potential concern
COPEC = constituent of potential ecological concern
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
EPC = exposure point concentration
FOD = frequency of detection
ft bgs = feet below ground surface
KM = Kaplan-Meier
µg/kg = micrograms per kilogram
mg/kg = milligrams per kilogram
NA = not applicable
ND = not detected
ng/kg = nanograms per kilogram
PAH = polycyclic aromatic hydrocarbons
PCB = polychlorinated biphenyls
PG&E = Pacific Gas and Electric Company
TCDD = Tetrachlorodibenzo-p-dioxin
TEQ = toxic equivalent
TPH = total petroleum hydrocarbons
UCL = upper confidence limit
X = COPC/COPEC in the exposure depth interval

Table AOC12-4.1

Summary of COPCs Evaluated in the HHRA for AOC 12: Baseline Scenario

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

COPC	COPCs in Surface Soil (0 to 0.5 feet bgs)	COPCs in Shallow Soil (0 to 3 feet bgs)	COPCs in Subsurface I Soil (0 to 6 feet bgs)	COPCs in Subsurface II Soil (0 to 10 feet bgs)
Inorganics				
Zinc	x	x	x	x
Polycyclic Aromatic Hydrocarbons				
Benzo (ghi) perylene	x	x	x	x
Fluoranthene	x	x	x	x
Phenanthrene	x	x	x	x
Pyrene	x	x	x	x
Polychlorinated Biphenyls				
Total PCBs	x	x	x	x
Total Petroleum Hydrocarbons				
TPH as motor oil	--	--	x	x

Abbreviations:

bgs = below ground surface.

COPC = Constituent of Potential Concern.

-- = not detected or not analyzed.

x = Chemical included as COPC in human health risk assessment.

PCB = Polychlorinated biphenyls.

TPH = Total Petroleum Hydrocarbons.

Table AOC12-4.2a

Baseline Scenario Depth-Weighted Exposure Point Concentrations and Predicted Outdoor Air Concentrations for Short- and Long-Term Maintenance Workers:
COPCs in AOC 12 Surface Soil (0 to 0.5 feet bgs)

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

COPC	Exposure Point Concentration for Surface Soil: 0 to 0.5 feet bgs	Exposure Point Concentration for Subsurface II Soil: 0 to 10 feet bgs	Short Term Maintenance Worker		Long Term Maintenance Worker	
			Outdoor Airborne Particulate Concentration	Outdoor Vapor Concentration	Outdoor Airborne Particulate Concentration	Outdoor Vapor Concentration
	(mg/kg) ^a	(mg/kg) ^b	(mg/m ³) ^c	(mg/m ³) ^d	(mg/m ³) ^c	(mg/m ³) ^d

Total Petroleum Hydrocarbons						
TPH as motor oil	ND	1.7E+01	NA	NV	NA	NV

Notes:

- ^a Exposure point concentrations (EPCs) for surface soil (0 to 0.5 feet bgs) are used to evaluate inhalation of particulates in outdoor air.
- ^b EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.
- ^c Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.0×10⁶ m³/kg was used for maintenance workers (short-term and long-term) as recommended by Department of Toxic Substances Control (2014).
- ^d Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.

Abbreviations:

bgs = below ground surface.
COPC = Constituent of Potential Concern.
mg/kg = milligrams per kilogram.
mg/m³ = milligrams per cubic meter.
NA = not applicable.
ND = Not detected.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.

Notes:

- ^a Exposure point concentrations (EPCs) for surface soil (0 to 0.5 feet bgs) are used to evaluate inhalation of particulates in outdoor air.
- ^b EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.
- ^c Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.4×10^9 m³/kg was used for tribal users as recommended by Department of Toxic Substances Control (2014).
- ^d Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.

Abbreviations:

bgs = below ground surface.
COPC = Constituent of Potential Concern.
mg/kg = milligrams per kilogram.
mg/m³ = milligrams per cubic meter.
NA = not applicable.
ND = Not detected.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.

Notes:

a. WOE Result is risk conclusion based on 1.) HQ/LOAEL HQ using depth-weighted EPCs, and 2.) supporting LOE. Area-weighted EPCs not evaluated for this exposure area.

NOAEL HQ greater than 1

HQ or LOAEL HQ greater than 1

HQ or LOAEL HQ greater than 10

HQ or LOAEL HQ greater than 100

Abbreviations:

-- = no toxicity value available, HQs could not be estimated

AOC = area of concern

HQ = hazard quotient

LOE = line of evidence

LOAEL = lowest observed adverse effect level

ND = not detected

NOAEL = no-observed adverse effect level

no SL = no screening level available

TEQ = toxic equivalent

WOE = weight of evidence, considering multiple LOE. If HQs/LOAEL HQs > 1, WOE Result is either 1) not expected, 2) unlikely, or 3) possible.

Table AOC12-6.2
Risk Conclusions and Lines of Evidence Summary for AOC 12

Soil Human Health and Ecological Risk Assessment
PG&E Topock Compressor Station
Needles, California

AOC	Receptor	COPEC ^a	Depth-Weighted HQs			Additional Lines of Evidence ^c									Risk Conclusions		Risk Driver (LOAEL HQ > 1 and Supporting LOE) ^g
			Plant and Soil Invertebrates	Mammal/ Bird		Low FOD (Max = EPC) ^b	Locations > BTV	Locations > 10xBTV	Background HQs ^d		BAFs	Quality of SL or TRV	Exposure Assumptions ^e	Observation of T&E species ^f	Individuals	Populations	
				NOAEL	LOAEL				NOAEL	LOAEL							
Small Home Range Receptors																	
AOC12	Plants	None	HQs ≤ 1	--	--	--	--	--	--	--	--	--	--	--	Not expected	No	
	Soil Invertebrates	None	HQs ≤ 1	--	--	--	--	--	--	--	--	--	--	--	Not expected	No	
	Merriam's Kangaroo Rat	None	--	HQs < 1	HQs < 1	--	--	--	--	--	--	--	--	--	Not expected	Not expected	No
	Desert Shrew	None	--	HQs < 1	HQs < 1	--	--	--	--	--	--	--	--	--	Not expected	Not expected	No
	Gambel's Quail	None	--	HQs < 1	HQs < 1	--	--	--	--	--	--	--	--	--	Not expected	Not expected	No
	Cactus Wren	None	--	HQs < 1	HQs < 1	--	--	--	--	--	--	--	--	--	Not expected	Not expected	No

- Notes:**
a COPECs are presented for HQs greater than 1 based on the depth-weighted EPC and/or area-weighted EPC and species and site-specific SUF.
b The EPC is based on the maximum depth-weighted concentration due to the small dataset size.
c The additional lines of evidence for COPECs with NOAEL and LOAEL HQs less than or equal to 1 (based on the area-weighted EPC and species and site-specific SUF) are not included in the table.
d For plants and soil invertebrates, the background HQ is based on the BTV. For mammals and birds, the NOAEL and LOAEL background HQs are based on the 95 percent upper confidence limit.
e Applicable to wildlife, unless noted.
f In areas where observations were noted, the T&E species observed have large home ranges and unlikely to forage in upland habitat. See text for details.
g For dioxin TEQ, LOAEL HQs less than 10 with supporting LOE were considered unlikely to pose an unacceptable risk to populations of wildlife receptors due to the compounded conservative assumptions included in the ecological risk assessment. See Section 6.7.6 of the main report.

--	LOAEL and NOAEL HQs ≤ 1 for the receptor
	NOAEL HQ greater than 1
	HQ/LOAEL HQ greater than 1
	HQ/LOAEL HQ greater than 10
	HQ/LOAEL HQ greater than 100

- Abbreviations:**
"--" = not applicable
AOC = area of concern
BAF = bioaccumulation factor
BCW = Bat Cave Wash
BG NA = background value not available
BTV = background threshold value
COPEC = constituent of potential ecological concern
EPC = exposure point concentration
FOD = frequency of detection
HQ = hazard quotient
LOAEL = lowest observed adverse effect limit
- LOE = line of evidence
MDC = maximum depth-weighted concentration
NC = not calculated
NE = line of evidence not evaluated
NOAEL = no observed adverse effect limit
SL = screening level
SWMU 1 = solid waste management unit 1
T&E = threatened and endangered
TCS-4= Topock Compressor Station Well #4
TEQ = toxic equivalent
TRV = toxicity reference value

See Notes and Abbreviations following Table AOC12-C.5

Table AOC12-C Table Notes

Notes for Terrestrial Wildlife Risk Calculations

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

Notes:

^a Dioxin presented in ng/kg.

^b Total dose equation is presented below:

$$\text{Total Dose (mg/kg-day)} = [(EPC_{\text{soil}} \times \text{SIR}) + (C_{\text{plants}} \times \text{FIR} \times F_{\text{plants}}) + (C_{\text{insects}} \times \text{FIR} \times F_{\text{insects}}) + (C_{\text{mammals}} \times \text{FIR} \times F_{\text{mammals}})] \times \text{SUF}$$

^c HQ = Total Dose / TRV

Abbreviations:

AOC = area of concern

BTAG = Biological Technical Assistance Group

COPEC = constituent of potential ecological concern

dw = dry weight

EPC_{soil} = exposure point concentration in soil (mg/kg dw)

EPC_{plants} = exposure point concentration in plants (mg/kg dw)

EPC_{insects} = exposure point concentration in insects (mg/kg dw)

EPC_{mammals} = exposure point concentration in mammals (mg/kg dw)

F_{plants} = fraction of plants in diet

F_{insects} = fraction of insects in diet

F_{mammals} = fraction of mammals in diet

FIR = food ingestion rate (kg dw/kg bw-day)

HQ = hazard quotient (unitless)

kg = kilogram

kg dw/kg bw-day = kilograms per kilogram of body weight per day

LOAEL = lowest observed adverse effect level (mg/kg-day)

m = maximum detected concentration

mg/kg = milligrams per kilogram

mg/kg-day = milligrams per kilogram per day

ND = not detected

ng/kg = nanograms per kilogram

NOAEL = no observed adverse effect level (mg/kg-day)

SIR = soil ingestion rate (kg dw/kg bw-day)

SUF = site use factor (fraction)

TRV = toxicity reference value (mg/kg-day)

A decorative graphic consisting of three thin orange lines. One line is horizontal, extending from the left edge of the page towards the right. Two other lines are diagonal, starting from the bottom left and extending towards the top right, intersecting the horizontal line.

Appendix AOC14

Soil HHERA for AOC 14 Exposure Area

Pacific Gas and Electric Company

APPENDIX AOC14 SOIL HHERA FOR AOC 14 EXPOSURE AREA

Topock Compressor Station
Needles, California

October 2019

A large, solid orange geometric shape, resembling a stylized triangle or a section of a larger triangle, is positioned in the bottom right corner of the page. It is composed of two overlapping triangles, creating a complex, angular form. A thin white line runs diagonally across the shape, and a thin white horizontal line intersects it near the bottom.

1 INTRODUCTION

This appendix presents the human health and ecological risk assessment (HHERA) for the Area of Concern 14 (AOC 14) soil potential exposure area located outside the Topock Compressor Station (TCS) in Needles, California. The AOC 14 potential exposure area, shown on Figure AOC14-1.1, is approximately 2.9 acres in total and includes sample locations shown in Table AOC14-1.1 of this appendix. Available soil data from the AOC 14 potential exposure area were used to conduct a quantitative HHERA as presented herein. A summary of the human health risk assessment (HHRA) and the ecological risk assessment (ERA) results are presented in Sections 5 and 6, respectively, of the Soil Human Health and Ecological Risk Assessment Report for the TCS (the “main report”). This appendix refers to “HHRA” when discussing specific information for assessing risks to human health, “ERA” when discussing specific information for assessing risks to ecological receptors, and “HHERA” when discussing topics that are common to both the HHRA and the ERA or in general.

Descriptions of the physical location and characteristics of the AOC 14 potential exposure area and the HHERA methodologies are provided in the main report and the final Human Health and Ecological Risk Assessment Work Plan (RAWP) documents (Arcadis U.S., Inc. [Arcadis] 2008, 2009, 2015) and are not repeated in this appendix. Detailed discussions of the historical uses and sampling and analysis are presented in the main report, as well.

This appendix summarizes site use, data evaluation, potential receptors, exposure pathways, and the results of the HHERA risk characterization for soil in the AOC 14 potential exposure area. Tables and figures specific to the AOC 14 HHERA are also presented in this appendix.

1.1 Summary of Site Use

AOC 14, also referred to as the Railroad Debris Site is located approximately 1,000 feet (ft) north of the TCS and is currently bounded by the Burlington Northern Santa Fe (BNSF) railroad tracks to the north, Interstate 40 (I-40) to the south, Bat Cave Wash (BCW) to the west, and a former access road to the east. The primary plateau of AOC 14 is approximately 100 ft above the bottom of BCW. AOC 14 is located on property owned by the Havasu National Wildlife Refuge (HNWR), BNSF Railroad, U.S. Bureau of Land Management (USBLM), and Caltrans.

The Railroad Debris Site first appears in an aerial photograph dated 1947, before the establishment of the TCS, showing a mound of soil apparently related to construction of the rail line. In subsequent aerial photographs dated 1955, a white patch and other materials are present on this Railroad Debris Site along with a dirt road that runs from the north end of the TCS to this area. A white patch can be seen on aerial photographs from the same period (mid 1950s) on the ground adjacent to the sludge-drying beds (Solid Waste Management Unit [SWMU] 5). The white material is probably dehydrated lime (water softening) sludge from the Permutit water-conditioning system. Former employees report that the water softening sludge was trucked to the Railroad Debris Site and sprayed on the ground (CH2M HILL [CH2M] 2006). AOC 14 currently contains miscellaneous construction debris including chunks of asphalt, railroad ties, and piping. An asbestos removal action was completed in 1999, and sampling detected no remaining asbestos.

The Department of Toxic Substances Control (DTSC) field observations in 2009 identified scattered debris and a potential burn layer (visible in the I-40 road cut) in the southwest corner of AOC 14. During additional

APPENDIX AOC14
SOIL HHERA FOR AOC 14 EXPOSURE AREA

employee interviews conducted by Pacific Gas and Electric Company (PG&E) in late 2009 and early 2010, a former PG&E TCS employee reported periodic burning of primarily office garbage on the western edge of the AOC 14 bench area, as shown on Figure AOC14-1.1 of Appendix AOC14. The employee reported that AOC 14 was used for dumping and garbage burning until the freeway was built in the 1960s (PG&E 2010). Potential sources of dioxins and furans in the vicinity of the TCS may include historical industrial activities as well as other sources unrelated to TCS activities (i.e., unauthorized dumping and burning; regional wildfires; combustion of diesel and leaded gas; and exhaust from cars, trucks, and trains) (CH2M, 2017a). This area may also have contributed run-off to BCW.

Because some material is buried, constituents could also have affected shallow and subsurface soils in the immediate vicinity of the debris, water softening sludge, and/or residual burned material. Constituents released from debris located in the higher (eastern) portion of AOC 14 could also have been transported to the lower portions of the unit through surface runoff. Primary source media therefore consist of surface, shallow, and subsurface soils.

2 DATA EVALUATION AND COPC/COPEC SELECTION

This section summarizes the data considered for the AOC 14 HHERA and presents the constituents of potential concern (COPCs) for human health and constituents of potential ecological concern (COPECs) selected for the AOC 14 potential exposure area.

All soil sampling locations at the AOC 14 potential exposure area are presented on Figure AOC14-1.1 and in Table AOC14-1.1. Note that although location RR-1 falls outside the potential exposure area boundary for AOC 14, data from this sampling location were included in the AOC 14 potential exposure area dataset because they were collected to support site characterization for this AOC (i.e., assigned to AOC 14 in the forthcoming Draft Resource Conservation and Recovery Act (RCRA) Facility Investigation/Remedial Investigation (RFI/RI) Report Volume 3, currently being prepared by Jacobs). The data were evaluated based on methodology described in the RAWP documents (Arcadis 2008, 2009, 2015). Details of the soil sampling and analysis will be presented in the forthcoming Draft RFI/RI Report Volume 3 (currently being prepared by Jacobs). For the baseline scenario, only soil data from 0 to 10 ft below ground surface (bgs) are typically included in the HHERA. Because potential soil contact does not extend below 10 ft bgs for the baseline scenario, deeper soil data (i.e., greater than 10 ft bgs) were excluded from the risk evaluation, as noted in Table AOC14-1.1.

Following the steps outlined in Section 3 of the main report, soil data considered usable for the risk assessment were identified and used in the quantitative HHERA. For the AOC 14 potential exposure area, available soil data are presented in Attachment AOC14-A1. For the AOC 14 potential exposure area, soil data are available from 164 samples, of which soil data from 144 samples from 0 to 10 ft bgs were considered for use in the HHERA. Because potential soil contact does not extend below 10 ft bgs, deeper soil data (i.e., greater than 10 ft bgs), from 20 samples were excluded from the baseline evaluations as noted in Table AOC14-1.1.

Within this dataset, analytical results for four organic compounds (2,4-dinitrophenol, 4,6-dinitro-2-methylphenol, benzoic acid, and hexachlorocyclopentadiene) in a single sample (AOC14-20-8138) received an “R” data qualifier, therefore, these results were rejected from the HHERA. Methods used to process the data for the HHERA (e.g., calculation of total concentrations for low molecular weight [LMW] and high molecular weight [HMW] polycyclic aromatic hydrocarbons [PAHs], benzo(a)pyrene equivalent [B(a)PEQ], polychlorinated biphenyls [PCBs], and dioxin/furan toxicity equivalents [TEQ]) are described in detail in Section 3 of the main report.

The process for identifying COPCs and COPECs included in the HHERA is detailed in Section 3.4 of the main report. COPCs and COPECs were selected for the AOC 14 potential exposure area using soil data encompassing all relevant exposure depths for the HHERA (i.e., 0 to 10 ft bgs for AOC 14) as presented in Attachment AOC14-A1. Metals, LMW PAHs, HMW PAHs, and dioxin TEQ were above background levels in AOC 14 soil (0 to 10 ft bgs) and, therefore, are included as COPCs and/or COPECs in the baseline exposure depths evaluated in the HHERA. All other detected organic constituents in AOC 14 potential exposure area soil in the baseline exposure depths are included as COPCs and/or COPECs in the HHERA. COPCs and/or COPECs selected for exposure depths and scenarios evaluated in the AOC 14 HHERA are summarized in Tables AOC14-2.1a through AOC14-2.1d. The selected COPCs and COPECs are discussed further in Sections 4 and 5, respectively, of this appendix.

3 EXPOSURE POINT CONCENTRATIONS

Depth-weighted and area-weighted exposure point concentrations (EPCs) for COPCs/COPECs in soil at the AOC 14 potential exposure area were calculated as described in Section 4.2 of the main report. For the AOC 14 exposure area, one scenario was evaluated: Baseline (no scouring).

The following exposure depths were evaluated:

1. Surface soil (0 to 0.5 ft bgs)
2. Shallow soil (0 to 3 ft bgs)
3. Subsurface I soil (0 to 6 ft bgs)
4. Subsurface II soil (0 to 10 ft bgs).

The depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment AOC14-A2. The summary statistics for these AOC 14 potential exposure area soil depth-weighted datasets and depth-weighted EPCs were calculated consistent with the RAWP documents (Arcadis 2008, 2009, 2015). Per the RAWP, area-weighted EPCs for the HHRA are evaluated only if depth-weighted EPCs suggest that cumulative cancer risks and/or noncancer hazards may be significant for any given HHRA exposure scenario (cumulative cancer risks exceed a 10^{-6} cancer risk level, and/or the noncancer hazard index [HI] exceeds 1). Similarly, for the ERA, area-weighted EPCs are evaluated only if depth-weighted EPCs suggest potential risk to ecological receptors (i.e., hazard quotient [HQ] > 1 for any COPEC). For the AOC 14 potential exposure area, area-weighted EPCs were deemed necessary for either the HHRA or the ERA and, therefore, were evaluated. The area-weighted data used in the calculation of area-weighted EPCs are presented in Attachment AOC14-A3.

Soil summary statistics for constituents measured at the AOC 14 potential exposure area¹ and detected at least once and depth- and area-weighted EPCs for COPCs/COPECs calculated using depth-weighted data from the exposure depths listed above are presented in Table AOC14-3.1. If the soil dataset had fewer than four detected values (i.e., concentrations reported above the detection limit) or fewer than eight total observations, the EPC defaulted to the maximum depth-weighted concentration in that dataset. Table AOC14-3.1 also presents the basis of the calculated depth- and area-weighted EPCs, including if the EPC is based on the maximum detected concentration.

In some cases, the area-weighted EPCs are greater than the depth-weighted EPCs for some COPCs in this potential exposure area. In such cases depth-weighted EPCs are based on an upper confidence limit (UCL) method (Land's H-UCL) that can produce unstable results. Depending on the underlying data distribution, Land's H-UCL values can overestimate or underestimate the true expected UCL value (U.S. Environmental Protection Agency [USEPA] 2015). The UCL method used to calculate the area-weighted EPC (bias-corrected

¹ The list of constituents shown in the Section 3 tables is based on analytes that were detected at least once at the site (including all potential exposure areas inside or outside the TCS) and measured at AOC 14.

APPENDIX AOC14
SOIL HHERA FOR AOC 14 EXPOSURE AREA

accelerated [BCa] Bootstrap) is resistant to such effects and provides a more reliable estimate of the UCL. This issue is discussed in further detail in Section 5.6.3 of the main report.

4 HUMAN HEALTH RISK ASSESSMENT

This section briefly summarizes the HHRA approach; presents the COPCs, EPCs, risk and hazard summary tables; and discusses the results of the risk characterization and uncertainties in the risk assessment for the AOC 14 potential exposure area. Details of the overall HHRA approach are presented in Section 5 of the main report. Dose, exposure concentration (EC), risk, and hazard calculation tables for human health receptors at the AOC 14 potential exposure area are presented in Attachment AOC14-B.

Risks/hazards estimated for an individual AOC/SWMU/undesignated area (UA) potential exposure area like AOC 14 are not considered representative of the realistic or likely potential exposures for the human populations that could be present in the areas outside the TCS (such as maintenance workers, recreational users, and tribal users). Risks/hazards calculated separately for individual AOCs are conservative and likely overestimate site risks/hazards. As described in the RAWP documents (Arcadis 2008, 2009, 2015), these human populations would more likely be exposed randomly, over the course of a lifetime, to soil present in all individual AOC/SWMU/UA potential exposure areas located outside the TCS, rather than have a lifetime of contact limited to the area of a single potential exposure area. Therefore, estimated risks/hazards presented for individual AOC/SWMU/UA potential exposure areas are not believed to be representative of the potential health risks to humans potentially contacting the soil outside the TCS. Rather, the HHRA results presented in Appendix OCS for all AOC/SWMU/UA potential exposure areas located outside the TCS combined will help to inform risk management decisions for the site. The estimated risks and hazards associated with a lifetime of contact with soil only in AOC 14 potential exposure area are presented at the request of the agencies and are not suitable to provide the sole basis of risk management decisions to protect human health.

4.1 Human Health Conceptual Site Model

Following the steps outlined in Section 5.5 of the main report, risks were estimated for potentially complete and significant exposure pathways identified in the human health conceptual site model (CSM) for receptors potentially exposed to COPCs in soil present at the AOC 14 potential exposure area. The receptors and potential exposure pathways evaluated for the AOC 14 potential exposure area included:

- **Short- and Long-Term Maintenance Workers** – Incidental ingestion of soil, dermal contact with soil, inhalation of particulates and volatile organic compound (VOC) vapors in ambient outdoor air from soil
- **Recreational Users (child and/or adult campers, hikers, hunters, and off-highway vehicle [OHV] riders)** – Incidental ingestion of soil, dermal contact with soil, and inhalation of particulates and VOC vapors in ambient outdoor air from soil
- **Tribal Users** – Inhalation of particulates and VOC vapors in ambient outdoor air from soil.

Exposure pathways considered incomplete or insignificant were not quantitatively evaluated and are discussed in Section 5.3.1 of the main report.

4.2 Constituents of Potential Concern

COPCs for the AOC 14 potential exposure area were selected in accordance with the RAWP (Arcadis 2008) and as described in Section 3.4 of the main report. The COPC selection process using soil data

encompassing all relevant exposure depths for the HHRA (i.e., 0 to 10 ft bgs for the AOC 14 potential exposure area) are presented in Attachment AOC14-A. COPCs for the four exposure depths and one scenario (baseline) evaluated for the AOC 14 HHRA are summarized in Table AOC14-4.1 (details are presented in Tables AOC14-2.1a through AOC14-2.1d).

COPCs included metals (antimony, hexavalent chromium, copper, lead, mercury, and thallium), inorganics (nitrate and phosphate), semivolatile organic compounds (SVOCs) (4-methylphenol, bis [2-ethylhexyl] phthalate, and butylbenzenephthalate), PAHs, pesticides (4,4-dichlorodiphenyldichloroethylene [4,4-DDE] and 4,4-dichlorodiphenyltrichloroethane [4,4-DDT]), PCBs, total petroleum hydrocarbon (TPH) as diesel, TPH as motor oil, and dioxin TEQ in surface, shallow, subsurface I, and/or subsurface II soil.

4.3 Exposure Point Concentration Summary

For the potentially complete and significant exposure pathways identified in the CSM, EPCs were calculated as described in Section 4.2 of the main report and presented in Section 3 of this appendix. Depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment AOC14-A. Depth- and area-weighted EPCs for COPCs in soil and estimated outdoor air concentrations associated with dust and vapors and used to estimate risk in the HHRA are summarized in Tables AOC14-4.2a through AOC14-4.2h and Tables AOC14-4.3a through AOC14-4.3d, respectively, for the four exposure depths.

As described in detail in Section 5.3.3 of the main report, the following exposure depths and corresponding EPC datasets were used to evaluate potential exposure to COPCs in soil for potential human receptors:

- **Short- and Long-Term Maintenance Workers** – surface, shallow, subsurface I and subsurface II soil
- **Recreational Users (child and/or adult campers, hikers, hunters, and OHV riders)** – surface and shallow soil
- **Tribal Users** – surface and shallow soil.

4.4 Estimation of Dose

The EC and chronic daily intake (CDI) for potential carcinogenic and noncarcinogenic effects were calculated, as described in Section 5.5.1 of the main report, for COPCs in soil for potentially complete exposure pathways. The calculated EC and CDI values using depth-weighted EPCs are presented in Tables AOC14-B1.1a through AOC14-B1.1g (carcinogenic effects) and Tables AOC14-B1.2a through AOC14-B1.2g (noncarcinogenic effects) in Attachment AOC14-B1 for the receptors evaluated. The calculated EC and CDI values using area-weighted EPCs are presented in Table AOC14-B2.1a (carcinogenic effects) and Table AOC14-B2.2a (noncarcinogenic effects) in Attachment AOC14-B2 for the receptors. Exposure parameters used in the dose calculations are presented in Table 5-1 of the main report.

4.5 Toxicity Assessment

The toxicity assessment characterizes the relationship between the magnitude of exposure to a constituent and the potential for adverse health effects. More specifically, the toxicity assessment identifies agency-promulgated or derived toxicity values that can be used to estimate the likelihood of adverse health effects occurring in humans at different exposure levels. The approach for the toxicity assessment was provided in

Section 4.5 of the RAWP (Arcadis 2008) and in Section 4.2 of the RAWP Addendum 2 (Arcadis 2015). Consistent with regulatory risk assessment policy, adverse health effects resulting from potential chemical exposures are evaluated in two categories: carcinogenic effects and noncarcinogenic effects. The hierarchy of sources for the toxicity criteria to be used for the HHRA generally corresponds to DTSC guidance (2015). Toxicity values for carcinogenic and noncarcinogenic effects for COPCs selected and used for the HHRA are described in Section 5.4 of the main report and were used to estimate potential cancer risks and noncancer hazards.

4.6 Human Health Risk Characterization

For human receptors, assuming lifetime soil exposure is limited to AOC 14 potential exposure area, the estimated incremental lifetime cancer risks (ILCRs) and/or noncancer HQs were calculated for each COPC and potentially complete exposure pathway. Estimated cumulative ILCRs (i.e., sum of chemical-specific ILCRs for each exposure depth for a scenario) were calculated and compared to the DTSC point of departure for risk management decision of 1×10^{-6} . Note that risk management decisions may raise this criterion depending on site-specific conditions. As indicated in the National Oil and Hazardous Substances Pollution Contingency Plan (40 Code of Federal Regulations 300), cancer risks between one in a million and one hundred in a million probability of occurrence (1×10^{-6} and 1×10^{-4}) fall within a risk management range. This is generally referred to as the acceptable risk range. Within this estimated cancer risk range, there is flexibility for risk managers in deciding what action, if any, is necessary and appropriate for the protection of human health. Estimated cumulative noncancer hazards (i.e., HIs) are calculated and compared to an HI of 1 (DTSC 2015). Chemical exposures that yield HIs of less than or equal to 1 are not expected to result in adverse noncancer health effects (USEPA 1989).

4.6.1 Risk Characterization for Exposure to Soil (Baseline Scenario and Depth-Weighted EPCs)

Table AOC14-4.4 summarizes cumulative ILCRs and HIs estimated for exposure to soil for each potential human receptor at the AOC 14 potential exposure area, calculated using depth-weighted EPCs. The dose, EC, ILCR, and HI equations are presented in detail in Section 5.5.1 of the main report. The detailed cancer risk estimates (Tables AOC14-B1.3a through AOC14-B1.3g) and noncancer hazard calculations (Tables AOC14-B1.4a through AOC14-B1.4g) are presented in Attachment AOC14-B1.

Risk/hazard estimates for the AOC 14 potential exposure area are summarized in the tables and discussed below. Assuming lifetime soil contact is limited to AOC 14 potential exposure area, the depth-weighted estimated cumulative ILCRs and HIs for each receptor potentially exposed to COPCs in AOC 14 soil at all exposure depths are at or below the *de minimis* levels of 1×10^{-6} and 1, respectively, for the short-term maintenance worker, camper, hiker, hunter, OHV rider, and tribal user. Risk estimates for potential soil contact limited to the AOC 14 potential exposure area for lifetime exposure are above *de minimis* levels but within the acceptable risk management range for long-term maintenance workers.

Maintenance Workers

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 14 Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Short-Term Maintenance Worker	Surface	5E-08	NA	0.01	NA
	Shallow	2E-07	NA	0.6	NA
	Subsurface I	2E-07	NA	0.7	NA
	Subsurface II	1E-07	NA	0.5	NA
Long-Term Maintenance Worker	Surface	4E-07	NA	0.003	NA
	Shallow	2E-06	CrVI (6E-07) TEQ human (2E-06)	0.1	NA
	Subsurface I	2E-06	CrVI (8E-07) TEQ human (1E-06)	0.2	NA
	Subsurface II	1E-06	NA	0.1	NA

Notes:

CrVI = hexavalent chromium

NA = Not applicable. ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

TEQ human = dioxin toxicity equivalents for humans

Assuming that lifetime soil contact is limited to the AOC 14 potential exposure area, the depth-weighted estimated cumulative ILCRs for the short-term maintenance worker potentially exposed to COPCs in surface, shallow, subsurface I, and subsurface II soil are below the *de minimis* level of 1×10^{-6} , the point of departure for risk management decisions (Table AOC14-B1.3a).

Assuming that lifetime soil contact is limited to the AOC 14 potential exposure area, the depth-weighted estimated cumulative ILCRs for the long-term maintenance worker potentially exposed to COPCs in AOC 14 surface and subsurface II soil are below the *de minimis* level of 1×10^{-6} , the point of departure for risk management decisions (Table AOC14-B1.3b). However, the depth-weighted estimated cumulative ILCRs for the long-term maintenance worker potentially exposed to COPCs in shallow and subsurface I soil are two-times above the point of departure for risk management decisions of 1×10^{-6} , but well within the risk management range of 1×10^{-6} and 1×10^{-4} . For this receptor, risk estimates above *de minimis* levels were primarily attributed to dioxin TEQ in soil via the dermal contact and soil ingestion pathways and to hexavalent chromium in soil via the inhalation of particulates pathway (Table AOC14-B1.3b).

Elevated concentrations of dioxin TEQ appear to be localized in the area around sampling locations AOC14-14W and AOC14-19. These two locations have the two highest concentrations of dioxin TEQ detected in AOC 14 soil. Accordingly, the depth-weighted EPCs and corresponding estimated ILCRs for dioxin TEQ may be biased high. To reduce the uncertainty associated with this potential bias, area-weighted estimated cumulative ILCRs for the long-term maintenance worker were estimated, as discussed below in Section 4.6.2.

APPENDIX AOC14
SOIL HHERA FOR AOC 14 EXPOSURE AREA

Assuming that lifetime soil contact is limited to AOC 14 potential exposure area, the depth-weighted estimated cumulative HIs for the short- and long-term maintenance workers (Table AOC14-B1.4a and Table AOC14-B1.4b, respectively) potentially exposed to COPCs in surface, shallow, subsurface I, and subsurface II soil are below an HI of 1. The depth-weighted EPCs for lead in AOC 14 potential exposure area soil at surface shallow, subsurface I, and subsurface II exposure depths under the baseline scenario are not expected to result in an increase in blood lead levels above the California Office of Environmental Health Hazard Assessment (OEHHA) benchmark value of 1 microgram per deciliter ($\mu\text{g}/\text{dL}$) in the fetus of a short- or long-term maintenance worker (Table AOC14-B1.5a and Table AOC14-B1.5b, respectively).

Recreational Users

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 14 Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Camper	Surface	7E-08	NA	0.004	NA
	Shallow	7E-07	NA	0.2	NA
Hiker	Surface	1E-07	NA	0.009	NA
	Shallow	1E-06	NA	0.5	NA
Hunter	Surface	2E-08	NA	0.001	NA
	Shallow	2E-07	NA	0.02	NA
OHV Rider	Surface	2E-07	NA	0.002	NA
	Shallow	1E-06	NA	0.08	NA

Note:

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

Assuming that lifetime soil contact is limited to the AOC 14 potential exposure area, the depth-weighted estimated cumulative ILCRs for the camper, hiker, hunter, and OHV rider (Tables AOC14-B1.3c thru AOC14-B1.3f) potentially exposed to COPCs in surface and shallow soil are at or below the *de minimis* level of 1×10^{-6} , the point of departure for risk management decisions.

Assuming lifetime soil contact is limited to the AOC 14 potential exposure area, the depth-weighted estimated cumulative HIs for the camper, hiker, hunter, and OHV rider (Tables AOC14-B1.4c through AOC14-B1.4f) potentially exposed to COPCs in surface and shallow soil are below an HI of 1. The depth-weighted EPCs for lead in AOC 14 potential exposure area surface and shallow soil are not expected to result in an increase in blood lead levels above the OEHHA benchmark value of $1 \mu\text{g}/\text{dL}$ for child recreational users and the fetus of a hunter (Tables AOC14-B1.5c through AOC14-B1.5i).

Tribal User

Baseline Depth-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 14 Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Tribal User	Surface	1E-09	NA	0.00009	NA
	Shallow	1E-09	NA	0.0001	NA

Note:

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

Assuming that lifetime soil contact is limited to the AOC 14 potential exposure area, the depth-weighted estimated cumulative ILCRs and HIs for the tribal user potentially exposed to COPCs in surface and shallow soil (Tables AOC14-B1.3g and AOC14-B1.4g) are below the *de minimis* levels of 1×10^{-6} , the point of departure for risk management decisions and HI of 1, respectively.

4.6.2 Risk Characterization for Exposure to Soil (Baseline Scenario and Area-Weighted EPCs)

Table AOC14-4.5 summarizes cumulative ILCRs and HIs estimated for exposure to soil for each potential human receptor at the AOC 14 potential exposure area, calculated using area-weighted EPCs, for potential receptors where the depth-weighted estimated cumulative ILCRs and HIs were above 1×10^{-6} and/or 1, respectively. Therefore, area-weighted ILCRs and HIs were provided for the long-term maintenance worker. The dose, EC, ILCR, and HI equations are presented in detail in Section 5.5.1 of the main report. The detailed cancer risk estimates (Table AOC14-B2.3a) and noncancer hazard calculations (Table AOC14-B2.4a) are presented in Attachment AOC14-B2.

The area-weighted estimated cumulative ILCRs and HIs for the long-term maintenance worker are summarized in the table below. The area-weighted estimated cumulative ILCRs and HIs for the long-term maintenance worker potentially exposed to COPCs in soil at all exposure depths are at or below the *de minimis* levels of 1×10^{-6} and 1, respectively, assuming that lifetime soil contact is limited to AOC 14 potential exposure area.

In general, the area-weighted approach resulted in a reduction in the risk or hazard estimates ranging from 1.2 to 1.5 times lower than the depth-weighted estimates. Furthermore, the area-weighted EPCs for lead in surface, shallow, subsurface I, and subsurface II soil are not expected to result in an increase in blood lead levels above the OEHHa benchmark value of $1 \mu\text{g/dL}$ in the fetus of a long-term maintenance worker (Table AOC14-B2.5a).

Maintenance Workers

Baseline Area-Weighted Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 14 Potential Exposure Area			
		Cumulative ILCR	ILCR Drivers	HI	HI Drivers
Long-Term Maintenance Worker	Surface	4E-07	NA	0.003	NA
	Shallow	1E-06	NA	0.1	NA
	Subsurface I	1E-06	NA	0.2	NA
	Subsurface II	9E-07	NA	0.1	NA

Note:

ILCR and HI drivers are presented only for estimated cumulative ILCRs above 1×10^{-6} and estimated HIs above 1.

4.6.3 Uncertainties in the Risk Assessment

The risk assessment includes several uncertainties that warrant discussion. Many of the assumptions used in this risk assessment, regarding the representativeness of the sampling data, potential human exposures, fate and transport modeling, and chemical toxicity are conservative, follow agency guidance and reflect a 90th or 95th percentile value rather than a typical or average value. The use of several conservative exposure assumptions and toxicity estimates can introduce considerable uncertainty into the risk assessment. By using conservative exposure assumptions or toxicity estimates, the assessment can develop a significant conservative bias that may result in the calculation of significantly higher estimates for cancer risks or noncancer hazards than are actually posed by the chemicals present in soil. These uncertainties are discussed in detail in Section 5.6 of the main report. Uncertainties applicable only to the risk assessment for the AOC 14 potential exposure area are discussed below.

Additional uncertainties for the AOC 14 potential exposure area include the use of the maximum depth-weighted soil concentration as the EPC. The maximum depth-weighted soil concentration was used for COPCs when the soil dataset contained fewer than four detected values (i.e., concentrations reported above the detection limit) or fewer than eight total observations as shown in Table AOC14-3.1.

For the AOC 14 potential exposure area, the maximum depth-weighted concentration was used as the EPC for the following COPCs:

- Surface soil: one metal (mercury), SVOCs (bis[2-ethylhexyl] phthalate and 4-methylphenol), one PAH (phenanthrene), and pesticides (4,4-DDE and 4,4-DDT)
- Shallow soil: metals (antimony, mercury, and thallium), VOCs (bromomethane, chloroform, chloromethane, and methyl acetate), SVOCs (bis[2-ethylhexyl] phthalate and 4-methylphenol), PAHs (acenaphthylene and anthracene), pesticides (4,4-DDE and 4,4-DDT), total PCBs, and inorganics compounds (nitrate and phosphate)
- Subsurface I soil: metals (antimony, mercury, and thallium), VOCs (bromomethane, chloroform, chloromethane, and methyl acetate), SVOCs (bis[2-ethylhexyl] phthalate and 4-methylphenol), PAHs (acenaphthylene, anthracene, and dibenzo[a,h]anthracene), pesticides (4,4-DDE and 4,4-DDT), total PCBs, and inorganics compounds (nitrate and phosphate)

APPENDIX AOC14
SOIL HHRA FOR AOC 14 EXPOSURE AREA

- Subsurface II soil: metals (antimony, mercury, and thallium), VOCs (bromomethane, chloroform, chloromethane, and methyl acetate), SVOCs (bis[2-ethylhexyl] phthalate, butylbenzylphthalate, and 4-methylphenol), PAHs (acenaphthylene, anthracene, and dibenzo[a,h]anthracene), pesticides (4,4-DDE and 4,4-DDT), total PCBs, and inorganics compounds (nitrate and phosphate).

The use of the maximum depth-weighted soil concentration as the EPC for the COPCs listed above may not appropriately represent exposures and resulting risks/hazards. This approach to estimating EPCs does not materially impact the results of the HHRA because the AOC 14 potential exposure area COPCs are not risk drivers at the site due to their low frequency of detection and/or fewer than eight observations.

5 ECOLOGICAL RISK ASSESSMENT

This section briefly summarizes the ERA approach; presents the COPECs, EPCs, dose, and risk tables for the AOC 14 ERA; and characterizes potential risk to ecological receptors exposed to COPECs in soil at the AOC 14 potential exposure area. Details of the overall ERA approach are presented in Section 6 of the main report. Supporting tables for the AOC 14 ERA based on risk calculations conducted using depth-weighted EPCs and area-weighted EPCs are presented in Attachment AOC14-C and described below.

Per the RAWP (Arcadis 2008) and DTSC guidance (1996), ecological risks were also calculated using maximum depth-weighted concentrations and presented in Attachment AOC14-D. Risks estimated using maximum depth-weighted concentrations are considered overly conservative and generally used for screening level purposes. Use of maximum concentrations are not recommended for use in the risk management decisions at the AOC 14 potential exposure area, where the area has been adequately characterized and data are available to estimate UCLs. Therefore, the risk results based on maximum depth-weighted concentrations are presented (Attachment AOC14-D) but are not discussed in this section.

5.1 Ecological Conceptual Site Model

Following the steps outlined in Section 6.6 and on Figures 2-7 and 6-1 of the main report, risks were estimated for potentially complete and significant exposure pathways identified for receptors exposed to COPECs in soil at the AOC 14 potential exposure area. These included plants, invertebrates, and small home-range receptors as follows:

- **Plants** – may be exposed to COPECs via root uptake from surface, shallow and/or subsurface I soil, depending on the root depth of plants of concern.
- **Soil Invertebrates** – may be exposed to COPECs via direct contact/uptake from surface soil.
- **Mammals** – may be exposed to COPECs via incidental ingestion of surface, shallow, or subsurface I soil (for burrowing animals) and/or ingestion of biota tissue (i.e., food items). The small home-range mammalian indicator receptors evaluated in this ERA for the AOC 14 potential exposure area were:
 - **Merriam's Kangaroo Rat** – representative of granivorous small mammal populations exposed to surface, shallow and/or subsurface I soil (incidental and through biota uptake)
 - **Desert Shrew** – representative of invertivorous small mammal populations exposed only to surface soil (incidental and through biota uptake).
- **Birds** – may be exposed to COPECs via incidental ingestion of surface, shallow, or subsurface I soil and/or ingestion of biota tissue (i.e., food items). The small home-range bird indicator receptors evaluated in this ERA for the AOC 14 potential exposure area were:
 - **Cactus Wren** – representative of insectivorous bird populations, exposed only to surface soil (incidental and through biota uptake)
 - **Gambel's Quail** – representative of granivorous bird populations, exposed incidentally only to surface soil and exposed to surface, shallow, or subsurface I soil (incidental and through biota uptake).

Exposure pathways considered incomplete or insignificant were not quantitatively evaluated; these exposure pathways are identified and described in Section 6.3 of the main report.

Large home-range receptors (desert kit fox, red-tailed hawk, and Nelson's desert bighorn sheep) were evaluated for larger exposure areas (combined AOCs/investigation areas) and are discussed in those specific appendices. Potential risks to desert kit fox, red-tailed hawk, and Nelson's desert bighorn sheep associated with the AOC 14 potential exposure area were estimated and characterized as part of the evaluation of all AOCs outside the compressor station (OCS) and AOCs/investigation area outside the compressor station excluding BCW and AOC4 (OCSxBCW+AOC4); please see Appendix OCS and Appendix OCSxBCW+AOC4 for risk estimates for large home-range receptors.

5.1.1 Evaluation of Special-Status Species

The biological setting for the Topock site and the adjacent areas are described in detail in various reports (see Section 2.4 of the main report). Although potential habitat exists for special-status² species at or near the site, none have been recorded as observed at the AOC 14 potential exposure area. The primary vegetation present at the AOC 14 potential exposure area is sparse creosote bush (*Larrea tridentate*). No federal- or state-listed T&E or rare plants or candidates for listing were found at the Topock site, including the AOC 14 potential exposure area.

Several species of mammals and birds have been observed at or near the site (Tables 2-2 and 2-4 of the main report). However, no federal- or state-listed T&E species or candidates for listing were observed at the AOC 14 potential exposure area.

The risk estimates presented here are considered to be protective of special-status species due to the conservative nature of the ERA where conservative parameters (e.g., small exposure areas, selected indicator species for each functional group considered on the high end of potential exposures for typical receptors at the site within that group, use of no-effects based toxicity values, etc.) were used to assess risks to a wide range of receptors at various trophic levels. Therefore, further evaluation of special-status species was not considered necessary.

5.2 Constituents of Potential Ecological Concern

COPECs for the AOC 14 potential exposure area were selected in accordance with the RAWP (Arcadis 2008) and as described in Section 3.4 of the main report. Soil data encompassing all relevant exposure depths for the HHERA (i.e., 0 to 10 ft bgs for the AOC 14 potential exposure area) and used in the COPEC selection process are presented in Attachment AOC14-A1.

² Special-status species include both state- and federal-listed fully protected T&E species, state/federal species of concern, and traditional culturally significant plants; however, protection at the NOAEL is warranted only for fully protected species.

Because an ecological receptor could be exposed to COPECs at various exposure depths either directly and/or through their diet for a given scenario, a single comprehensive COPEC list was selected based on the range of soil depths encountered by ecological receptors in the baseline exposure scenario. Additionally, essential nutrients (e.g., calcium, potassium, etc.) and analytes typically measured to evaluate geochemical conditions (e.g., chloride, nitrate, sulfate, etc.), are not typically evaluated in ERAs and were not selected as COPECs. COPECs for the three exposure depths evaluated for the baseline scenario for this ERA are summarized in Table AOC14-5.1.

COPECs included metals (antimony, hexavalent chromium, copper, lead, mercury, and thallium), SVOCs (4-methylphenol and bis [2-ethylhexyl] phthalate), LMW PAHs, HMW PAHs, pesticides (4,4-DDT and 4,4-DDE), PCBs, dioxin TEQ (for wildlife receptors only), and 2,3,7,8-tetrachlorodibenzo-p-dioxin (2,3,7,8-TCDD; for ecological communities only). TPHs were also identified as COPECs; however, due to lack of appropriate toxicity values to evaluate TPHs for ecological receptors, indicator chemicals (e.g., benzene, toluene, ethylbenzene, and xylene [BTEX] and PAHs) if detected, were used to characterize TPH risks. COPECs lacking toxicity values and their impact to the ERA are discussed in Section 6.7.5 of the main report.

5.3 Exposure Point Concentration Summary

For the potentially complete and significant exposure pathways identified in the ecological CSM, soil EPCs were calculated as described in Section 4.2 of the main report and presented in Section 3 of this appendix.

For the AOC 14 potential exposure area, risks to ecological receptors were estimated using depth-weighted EPCs and area-weighted EPCs. Depth-weighted data used in the calculation of depth-weighted EPCs are presented in Attachment AOC14-A2. Area-weighted data used in the calculation of area-weighted EPCs are presented in Attachment AOC14-A3.

Biota tissue EPCs were calculated from the soil EPCs using soil-to-biota uptake relationships for plants, invertebrates, and small mammals, as described in Section 6.4.3 of the main report. As described in Section 6.4 and shown on Figure 6-1 of the main report, the depth intervals selected to represent exposure to soil and biota tissue for the risk calculations for each receptor are presented in Table AOC14-5.2.

To summarize for the baseline scenario:

- Soil invertebrates, invertivorous small mammals, and insectivorous birds could potentially be exposed to COPECs in soil and/or biota only at the surface (0 to 0.5 ft bgs).
- Plants and granivorous small mammals could potentially be exposed to COPECs in soil and or/biota down to 6 ft bgs. Therefore, the maximum of the depth-weighted EPCs from 0 to 0.5, 0 to 3, and 0 to 6 ft bgs was selected as the representative soil and/or biota EPC for a COPEC for estimating risks to these receptors.
- Granivorous birds could potentially be exposed to COPECs in soil (not biota) only at the surface (0 to 0.5 ft bgs) and biota down to 6 ft bgs. Therefore, exposures to granivorous birds included the depth-weighted soil EPC from 0 to 0.5 ft bgs (for incidental soil ingestion) and the maximum of the depth-weighted biota EPC from 0 to 0.5, 0 to 3, and 0 to 6 ft bgs for each COPEC.

Depth-weighted soil EPCs and biota tissue EPCs calculated from depth-weighted soil EPCs are presented in Table AOC14-5.3 for the baseline scenario and the representative soil and/or biota EPCs identified for the baseline risk calculations are bolded in this table. Of the COPECs identified at the AOC 14 potential exposure

area for the baseline scenario, antimony, thallium, and PCBs were not detected in surface soil; therefore, risks for these COPECs to receptors only exposed to surface soil were not estimated. These include soil invertebrates, invertivorous mammals (desert shrew), and insectivorous birds (cactus wren). For the granivorous bird (Gambel's quail), risks from antimony, thallium, and PCBs were estimated only from diet.

Similarly, area-weighted soil EPCs and biota tissue EPCs calculated from area-weighted soil EPCs are presented in Table AOC14-5.4 for the baseline scenario. The representative soil and/or biota EPCs identified for the risk calculations are bolded in this table.

Per the RAWP (Arcadis 2008) and DTSC guidance (1996), risk calculations based on both the maximum depth-weighted concentration and the UCL for each COPEC are required. As mentioned earlier in this section, using the maximum depth-weighted concentrations results in overly conservative risks and is not recommended for risk management decisions. The estimated risks based on maximum depth-weighted concentrations are presented in Attachment AOC14-D but results are not discussed in this report.

5.4 Estimation of Exposure Concentration or Dose

Exposures for ecological communities (plants and soil invertebrates) are quantified as ECs (e.g., in units of milligrams per kilogram [mg/kg]). Exposures for wildlife (mammals and birds) are quantified as doses (e.g., in units of mg/kg body weight per day [mg/kg-bw/day]). ECs and doses for COPECs in soil and potentially complete pathways were calculated as described, including equations, in Section 6.4 of the main report. The exposure parameters selected to evaluate wildlife in this ERA include upper bound values from literature (e.g., ingestion rates) or are assumed (e.g., 100% of one type of diet), which may result in conservative estimates of exposure dose and potential overestimation of actual exposure at the site.

For ecological communities, ECs are equal to the depth-weighted soil EPCs for COPECs at the AOC 14 potential exposure area for the baseline scenario and are presented in Table AOC14-5.3. Area-weighted EPCs for the baseline scenario are presented in Table AOC14-5.4.

For wildlife, doses were calculated using the exposure parameters and equations presented in Section 6.4 of the main report and depth-weighted soil and biota tissue EPCs for COPECs at the AOC 14 potential exposure area, as presented in Table AOC14-5.3 for the depth-weighted risk evaluations, and area-weighted soil and biota tissue EPCs as presented in Table AOC14-5.4 for the area-weighted risk evaluations. Dose calculations using depth-weighted EPCs for wildlife potentially exposed to COPECs via ingestion of soil and biota tissue for the baseline scenario are presented in Attachment AOC14-C. Dose calculations using area-weighted EPCs for wildlife potentially exposed to COPECs via ingestion of soil and biota tissue for the baseline scenario are also presented in Attachment AOC14-C. Dose calculations using maximum depth-weighted concentrations for wildlife potentially exposed to COPECs via ingestion of soil and biota tissue for the baseline scenario are presented in Attachment AOC14-D.

5.5 Effects Assessment

Concentration-based screening values (i.e., toxicity values) for plants and soil invertebrates and the dose-based toxicity reference values (TRVs) for wildlife for COPECs were used to estimate risks to ecological receptors potentially exposed to COPECs in soil and biota tissue at the AOC 14 potential exposure area. The screening values for plants and soil invertebrates are discussed in Section 6.5 of the main report and presented in Table 6-6 of the main report.

A range of risks to wildlife were estimated using the NOAEL-based TRVs and lowest-observed adverse effects level (LOAEL)-based TRVs presented in the RAWP documents (Arcadis 2008, 2009, 2015). These selected TRVs were primarily based on the TRVs used to develop the USEPA Ecological Soil Screening Levels (EcoSSLs; USEPA 2008); other sources included the Toxicological Benchmarks for Wildlife from Oak Ridge National Laboratory (ORNL; Sample et al. 1996) and USEPA Region 6 ERA Guidance (USEPA 1999). In addition, for estimating potential risk to wildlife, a second set of NOAEL- and LOAEL-TRVs³ based on the Navy/Biological Technical Assistance Group (BTAG) TRVs (DTSC 2002, 2009) were also used for COPECs, where available. Wildlife TRVs based on selected TRVs and BTAG TRVs are presented in the main report Tables 6-7 and 6-8, respectively.

Plant screening values are not available for dioxins; soil invertebrate screening values are not available for thallium; avian TRVs are not available for antimony and 4-methylphenol; and mammalian TRVs are not available for 4-methylphenol. Therefore, risks to these receptors from exposure to these specific COPECs could not be estimated. In addition, appropriate screening values and TRVs are not available for TPHs. Therefore, BTEX and PAHs were used as indicator chemicals to characterize TPH risks at the AOC 14 potential exposure area. The lack of screening values and TRVs and the impact to the ERA are discussed in Section 6.7.5 of the main report.

5.6 Ecological Risk Characterization

The risk characterization integrates the results of the exposure assessment and effects assessment and is subject to uncertainties in both of those efforts. Risk characterization includes two major components: risk estimation and risk description. As presented in tables and discussed below, risk estimates (HQs) involved integrating exposure profiles with the exposure-effects information. For each receptor and COPEC, risk descriptions including various lines of evidence (LOEs) and uncertainties, including HQs, supporting statistical and site use information, and the direction of uncertainty in the risk estimates, are discussed below for interpreting the risk results and identifying potential unacceptable risk to ecological receptors. Uncertainties specific to the AOC 14 potential exposure area are discussed in context with the risk characterization results presented below. Generic uncertainties in the ERA are discussed in detail in Section 6.7 of the main report.

For plants and soil invertebrates, HQs were calculated by comparing the depth-weighted EPCs for each COPEC with respective screening values and these HQs were compared to the target HQ of 1. Following USEPA guidance (1998) guidance, in such cases, a semi-quantitative weight-of-evidence (WOE) approach using multiple LOEs was used in reducing uncertainty and drawing risk conclusions.

Risk conclusions for ecological communities used the following criteria:

- COPECs with HQs less than or equal to 1 pose *de minimis* risk (i.e., negligible risk) to plants and invertebrates.

³ Although these are referred to as LOAEL-based BTAG TRVs, they are based on a midpoint of a variety of adverse effects and are not necessarily lowest observed adverse effect levels. However, for simplicity, these BTAG TRVs are referred to as LOAEL-based TRVs.

- COPECs with HQs greater than 1 indicate unacceptable risk to plants and invertebrates is possible. However, exceedances of the screening values (which are conservative and are generally uncertain) do not always clearly indicate that unacceptable risk to ecological communities is occurring. In such cases, a WOE approach, using HQs as a single LOE along with supporting information such as frequency of detection (FOD), site use history, and confidence in the screening values was used in reducing uncertainty for characterizing potential risk to ecological communities.

Ultimately, possible risk outcomes are possible for plants and soil invertebrates based on HQs greater than 1 and the WOE: (1) unacceptable risk to ecological communities is possible (i.e., indicated by sufficient and strong supporting LOEs); (2) unacceptable risk to ecological communities is unlikely (i.e., indicated by sufficient and strong LOEs to support a conclusion of no unacceptable risk); or (3) unacceptable risk to ecological communities is uncertain (i.e., indicated by insufficient LOEs).

For wildlife, a range of HQs was calculated using NOAEL- and LOAEL-based TRVs previously identified in the RAWP documents (Arcadis 2008, 2009, 2015). The HQs based on LOAEL-based TRVs selected in the RAWP are referred to as “LOAEL-based HQs.” HQs based on NOAEL-based TRVs selected in the RAWP are referred as “NOAEL-based HQs.” Additionally, NOAEL and LOAEL HQs were calculated using a second set of TRVs (i.e., NOAEL- and LOAEL-based BTAG TRVs), as described in Section 6.5 of the main report. The BTAG NOAEL-based TRVs are considered very conservative, resulting in a wide range of risk estimates for wildlife. For this ERA, the selected TRVs are considered more robust than the BTAG TRVs, as discussed in Section 6.7.5 of the main report. Results associated with the selected TRVs are recommended for risk management decisions at the AOC 14 potential exposure area.

Risk conclusions for wildlife used the following criteria:

- COPECs with NOAEL-based HQs less than or equal to 1 pose *de minimis* risk to individuals and populations of wildlife receptors.
- COPECs with NOAEL-based HQs greater than 1, but LOAEL-based HQs less than or equal to 1 pose no unacceptable risks to wildlife populations. However, as described in the RAWP (Arcadis 2008), unacceptable risk to individuals is uncertain because the NOAEL-based TRVs are thresholds with an interval that is an artifact of the dosing study and the nature and magnitude of the effects, if any, that may occur at exposures between these values is unknown. In such cases, a WOE approach, including multiple LOEs, were used in reducing uncertainty for characterizing potential risk to individual wildlife receptors.
- COPECs with LOAEL-based HQs greater than 1 indicate unacceptable risk is possible for populations of wildlife receptors. However, these LOAEL-based HQs are based on individual-level effects thresholds and only account for a single LOE. In such cases, a WOE approach (including an alternate target HQ of 10 for dioxin TEQ)⁴ was used in reducing uncertainty for characterizing potential risk to wildlife populations at the BCW exposure area, as described in the preceding bullet.

⁴ For dioxin TEQ, the selected bioaccumulation factors (BAFs) and TRVs result in significant overestimation of risk for key wildlife receptors, primarily for invertivorous small mammals and insectivorous birds. Due to the compounded conservatism in the risk estimates for dioxin TEQ,

- NOAEL-based HQs greater than 1 are considered one LOE in assessing potential risk to sensitive species, if present in this exposure area. Evaluation of T&E species for the AOC 14 potential exposure area is characterized in Section 5.1.1.

Ultimately three risk outcomes for wildlife are possible based on the HQs greater than 1 and WOE: (1) unacceptable risk to individual wildlife is possible (i.e., indicated by sufficient and strong supporting LOEs); (2) unacceptable risk to wildlife is unlikely (i.e., indicated by sufficient and strong LOEs supporting a conclusion of no unacceptable risk); or (3) unacceptable risk to wildlife is uncertain (i.e., indicated by insufficient LOEs).

For this ERA, the results of individual LOE evaluations were evaluated collectively to derive an overall WOE conclusion for each receptor. Key uncertainties were considered along with the strength, relevance, and other qualities of the LOEs in reaching the WOE conclusions.

For the AOC 14 potential exposure area, evaluations were completed for the following scenarios and discussed in this section:

- Baseline scenario using depth-weighted EPCs
- Baseline scenario using area-weighted EPCs.

In these evaluations, risk calculations were completed for all COPECs, as presented in Tables AOC14-5.5a through AOC14-5.6b. However, risk results for only a subset of the COPECs were discussed in the evaluations using area-weighted EPCs. For plants and soil invertebrates, COPECs with HQs greater than 1 based on the depth-weighted EPC were discussed in the evaluations using area-weighted EPCs. For wildlife (i.e., birds and mammals), COPECs with NOAEL-based HQs greater than 1 based on the depth-weighted EPC and species- and site-specific site use factor (SUF) were discussed in the area-weighted EPC evaluations. At the conclusion of the baseline scenario evaluation, risk drivers were identified based on those COPECs for which unacceptable community/population-level risk was predicted using the most refined exposure and effects assumptions (i.e., site-specific SUF, area-weighted EPCs, and selected TRVs).

5.6.1 Risk Characterization (Baseline Scenario and Depth-Weighted EPCs)

Risk estimates for ecological communities (plants and soil invertebrates) and wildlife (mammals and birds) estimated for the baseline scenario using depth-weighted EPCs are summarized in this section. Detailed risk calculations for plants and soil invertebrates (Table AOC14-C.1) and detailed dose and risk calculations for wildlife (Tables AOC14-C.2 through AOC14-C.5) are presented in Attachment AOC14-C. COPECs identified at the AOC 14 potential exposure area for the baseline scenario include six metals, two SVOCs (4-methylphenol and bis [2-ethylhexyl] phthalate), TPHs, LMW and HMW PAHs, two pesticides (4,4-DDE and

HQs greater than 10 were considered to pose unacceptable risk. Alternate congener-specific BAFs and alternate TRVs demonstrating the magnitude of the risk overestimation are presented in Sections 6.4.3 and 6.5.2 of the main report, respectively. These alternate BAFs and TRVs are based on current understanding of uptake and toxicity of TEQ mixtures and represent an additional LOEs considered for dioxin TEQ. As a result, a target LOAEL HQ of 10 for dioxin TEQ was used. Uncertainty in the risk estimates for dioxin TEQ is discussed in detail in Section 6.7.6.

4,4-DDT), PCBs, dioxin TEQ in soil (for wildlife receptors only), and 2,3,7,8-TCDD (for ecological communities only) (Table AOC14-5.1). Potential risk to receptors exposed to these COPECs is described below.

5.6.1.1 Plants and Soil Invertebrates

Table AOC14-5.5a summarizes the HQs estimated for soil exposure for ecological communities (plants and soil invertebrates) at the AOC 14 potential exposure area for the baseline scenario using depth-weighted EPCs.

Plants can potentially be exposed to COPECs in soil up to 6 ft bgs. Plant HQs are greater than 1 for antimony, copper, lead, mercury, thallium, and HMW PAHs based on the highest EPC value from the shallow, surface, and subsurface I depth intervals. HQs for remaining COPECs are less than 1 for plants, indicating *de minimis* risk to plants from exposure to these COPECs.

Soil invertebrates can potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs). Antimony, thallium, and PCBs were not detected in surface soil; therefore, risks for these COPECs to soil invertebrates were not estimated. For soil invertebrates, HQs are greater than 1 for mercury and 4-methylphenol based on exposure to surface soil only. HQs for remaining COPECs are less than 1 for soil invertebrates, indicating *de minimis* risk to soil invertebrates from exposure to these COPECs.

For antimony, the plant HQ is greater than 1. Antimony was not detected in surface soil (0 to 0.5 ft bgs) and was detected at only two of 24 locations in shallow soil (FOD = 8% in 0 to 3 ft bgs) and two of 27 locations in subsurface I soil (FOD = 7% in 0 to 6 ft bgs). Due to the low FOD in the dataset for the AOC 14 potential exposure area, the depth-weighted EPC from shallow soil (0 to 3 ft bgs) is based on the maximum depth-weighted concentration of 19 mg/kg and was used as the depth-weighted EPC (the highest EPC) to evaluate potential risk to plants from exposure to antimony. However, the average shallow soil depth-weighted concentration across the AOC 14 potential exposure area of 1.782 mg/kg (Kaplan-Meier [KM] mean) results in an HQ of less than 1 for plants. A background value is not available for antimony, as antimony was not detected in the background dataset. For plants, the antimony screening level is 5 mg/kg and based on a secondary report citing unspecified toxic effects on plants (Efroymson et al. 1997a); the report notes that no primary reference data are available for antimony and assign a low confidence in the screening benchmark. For areas where a constituent is largely not detected, use of a maximum concentration as the EPC may not appropriately characterize risk. Based on the low FOD for antimony and low confidence in the screening value, unacceptable risk to plant communities is considered unlikely at the AOC 14 potential exposure area.

For copper, the plant HQ is greater than 1. Copper was detected in 100% of sample locations in the surface soil (0 to 0.5 ft bgs), shallow soil (0 to 3 ft bgs), and subsurface I soil (0 to 6 ft bgs). The depth-weighted EPC for copper from shallow soil (0 to 3 ft bgs) was used to evaluate potential risk to plants (the highest EPC) from exposure to copper in soil. The depth-weighted concentrations for copper are greater than background (16.8 mg/kg) in six of the total 48 shallow soil locations. The depth-weighted EPC for copper in shallow soil (223 mg/kg) is considered elevated compared with background (i.e., exceeding background by approximately 13 times). Background HQ for copper based on the 95% UCL on the mean (95UCL) background concentration is less than 1. The high copper EPC is due primarily to depth-weighted concentrations in two locations (438 mg/kg at AOC14-16W and 1,800 mg/kg at AOC14-19). The plant screening value (70 mg/kg) is considered relatively robust, as it is based on an ample dataset representing multiple species and is above background concentrations. Although the plant screening level for copper is considered robust for prediction of toxicity to

APPENDIX AOC14

SOIL HHERA FOR AOC 14 EXPOSURE AREA

plants, based on the low HQ and limited spatial extent of elevated concentrations, unacceptable risk to plant communities is considered unlikely.

For lead, the plant HQ is greater than 1. Lead was detected in 100% of sample locations in the surface soil (0 to 0.5 ft bgs), shallow soil (0 to 3 ft bgs), and subsurface I soil (0 to 6 ft bgs). The depth-weighted EPC for lead from shallow soil (0 to 3 ft bgs) was used to evaluate potential risk to plants (the highest EPC) from exposure to lead in soil. The depth-weighted concentrations for lead are greater than background (8.39 mg/kg) in nine of the total 24 shallow soil locations. The depth-weighted EPC for lead in shallow soil (364 mg/kg) is considered elevated compared with background (i.e., exceeding background by approximately 43 times). Background HQ for lead based on the 95UCL background concentration is less than 1. Similar to copper, the high lead EPC is due primarily to depth-weighted concentrations in one location (1,600 mg/kg at AOC14-19). The plant screening level (120 mg/kg) is considered robust as it is based on multiple studies representing four species and various soil exposure conditions and is greater than background concentrations. Although the screening level for lead is considered robust for prediction of toxicity to plants, based on the low HQ and limited spatial extent of elevated concentrations, unacceptable risk to plant communities is considered unlikely.

For mercury, the HQs for plants and soil invertebrates are greater than 1. Mercury was detected in only one of 23 locations in surface soil (FOD = 4% in 0 to 0.5 ft bgs), two of 24 locations in shallow soil (FOD = 8% in 0 to 3 ft bgs) and three of 27 locations in subsurface I soil (FOD = 11% in 0 to 6 ft bgs). Due to the low FOD in the dataset for the AOC 14 potential exposure area, the depth-weighted EPC from subsurface I soil (0 to 6 ft bgs) is based on the maximum depth-weighted concentration of 102 mg/kg and was used as the depth-weighted EPC (the highest EPC) to evaluate potential risk to plants from exposure to mercury. For the 0 to 6 ft bgs interval, the maximum concentration (102 mg/kg at AOC14-16W) is much higher than the depth-weighted concentrations at the other two locations with detected mercury (0.15 mg/kg at AOC14-SS1 and 0.078 mg/kg at AOC14-14W).

The maximum depth-weighted concentration of 0.41 mg/kg for mercury and was used as the depth-weighted EPC to evaluate potential risk to soil invertebrates. For areas where a constituent is largely not detected, use of a maximum concentration as the EPC may not appropriately characterize risk. Mercury was not detected in the background dataset; therefore, a background value could not be developed for comparison. However, aside from the maximum depth-weighted concentration, the remaining locations had depth-weighted concentrations near or below the reporting limit. The screening values for plants (0.3 mg/kg) and soil invertebrates (0.1 mg/kg) are based on a limited number of studies and the screening value for soil invertebrates is based on different forms of mercury. Based on the two studies available which use different systems and earthworm species, it was not possible to evaluate the relative toxicity of forms of mercury. Efroymson et al. (1997a, b) indicate that there is low confidence in the screening values and the ability to predict toxicity to plants and soil invertebrates. Based on the low FOD for mercury and low confidence in the screening values, unacceptable risk to plant and soil invertebrate communities is considered unlikely at the AOC 14 potential exposure area.

For thallium, the HQ for plants was greater than 1. Thallium was not detected in surface soil (0 to 0.5 ft bgs) and was detected at only two of 24 locations in shallow soil (FOD = 8% in 0 to 3 ft bgs) and two of 27 locations in subsurface I soil (FOD = 7% in 0 to 6 ft bgs). Due to the low FOD in the dataset for the AOC 14 potential exposure area, the depth-weighted EPC from subsurface I soil (0 to 6 ft bgs) based on the maximum depth-weighted concentration of 1.85 mg/kg was used as the depth-weighted EPC (the highest EPC) to evaluate potential risk to plants from exposure to thallium. For areas where a constituent is largely not

APPENDIX AOC14

SOIL HHERA FOR AOC 14 EXPOSURE AREA

detected, use of a maximum concentration as the EPC may not appropriately characterize risk. The magnitude of the HQ is low and is based on a plant screening value (1 mg/kg) considered to be uncertain, as it is based on unspecified effect in plants reported in a secondary reference, as cited in Efroymsen et al. (1997a). Thallium was not detected in the background dataset; therefore, a background value could not be developed. Based on the low FOD for thallium and low confidence in the screening value, unacceptable risk to plant communities is considered unlikely at the AOC 14 potential exposure area.

For HMW PAHs, the HQ for plants was greater than 1. HMW PAHs were frequently detected in surface soil (FOD = 48% in 0 to 0.5 ft bgs), shallow soil (FOD = 59% in 0 to 3 ft bgs), and subsurface I soil (FOD = 60% in 0 to 6 ft bgs). The depth-weighted EPC for HMW PAHs from surface soil (0 to 0.5 ft bgs) was used to evaluate potential risk to plants (the highest EPC) from exposure to HMW PAHs in soil, but EPCs were lower (approximately 2 to 3 times lower than surface soil) at deeper intervals. The depth-weighted concentrations for HMW PAHs are greater than background (0.0376 mg/kg) in six of the total 21 surface soil locations but exceeded the plant screening value (1.2 mg/kg) at only two locations. The depth-weighted EPC for HMW PAHs in surface soil (4.33 mg/kg) is considered elevated compared with background (i.e., exceeding background by approximately 117 times). The high EPC is primarily due to elevated concentrations in one location (8.07 mg/kg at AOC14-14W). The screening level (1.2 mg/kg) cited in USEPA (1999) for benzo(a)pyrene and benzo(b)fluoranthene is based on a reported chronic no-effects concentration (Sims and Overcash 1983). Reduced stem growth was observed in summer wheat at 6.254 mg/kg, but no effects were seen on rye plants at this concentration. The plant toxicity data cited in Sims and Overcash (1983) were not included in the plant EcoSSL; no sufficient studies were identified by USEPA to calculate a plant EcoSSL for HMW PAHs (USEPA 2007). As such, there is low confidence in the selected plant screening value to predict toxicity to plants exposure to mixtures of HMW PAHs at the site. The authors also note that the most important source of PAHs for plants is the atmosphere where they enter via the gaseous phase or deposit bound to particles on the plant surface (Sims and Overcash 1983; USEPA 2007). Thus, the relevance of the soil exposure pathway for plants at the AOC 14 potential exposure area is uncertain. Additionally, the HQ is low in magnitude. Based on the risk results and discussion above, unacceptable risk to plant communities from exposure to HMW PAH is considered uncertain.

For 4-methylphenol, the HQ for soil invertebrates was greater than 1. 4-methylphenol was detected in only one of 21 locations in surface soil (FOD = 5% in 0 to 0.5 ft bgs). Due to the low FOD in the dataset for the AOC 14 potential exposure area, the depth-weighted EPC from surface soil (0 to 0.5 ft bgs) is based on the maximum depth-weighted concentration of 0.43 mg/kg (at AOC14-2) and was used as the depth-weighted EPC to evaluate potential risk to soil invertebrates from exposure to 4-methylphenol. For areas where a constituent is largely not detected, use of a maximum concentration as the EPC may not appropriately characterize risk. Because a conventional screening value was not available for 4-methylphenol, the screening value for soil invertebrates (0.08 mg/kg) is based on an equilibrium partitioning model as presented in USEPA (2015). The screening level is calculated assuming equilibrium partitioning between the moisture (i.e., water) and organic carbon in soil and uses toxicity thresholds for water from published water quality benchmarks when available (as is the case for 4-methylphenol) or estimated using various quantitative structure activity relationship (QSAR) models (such as the USEPA's Ecological Structure Activity Relationships [2012]). The screening levels assume similar sensitivity of aquatic organisms and soil invertebrates. A silty clay loam texture classification for the soil type was used by USEPA (2015), which is not representative of site conditions. Based on the approach and assumptions used to calculate the screening level, there is low confidence in the ability of this screening level to predict toxicity to soil invertebrates. Based

on the low FOD and low confidence in the screening level for 4-methylphenol, unacceptable risk to soil invertebrate communities is considered unlikely at the AOC 14 potential exposure area.

For TPH mixtures, individual constituents were used to characterize potential risks to plants and invertebrates. BTEX were not detected in any samples (Attachment AOC14-A1) and HQs for LMW and HMW PAHs for soil invertebrates are less than 1, indicating no unacceptable risk for soil invertebrates from TPH. For plants, the LMW PAH HQ is less than 1, but the HQ for plants exposed to HMW PAHs is greater than 1. As discussed above for HMW PAHs, unacceptable risk to plants is uncertain for PAHs. Therefore, unacceptable risk to plants from exposure to TPHs at the AOC 14 potential exposure area is also considered uncertain.

To summarize, based on the risk results and WOE, unacceptable risk to plants from exposure to HMW PAHs/TPHs in soil at the AOC 14 potential exposure area is uncertain; and unacceptable risk to plant communities from exposure to antimony, copper, lead, mercury, and thallium is unlikely. For soil invertebrate communities, unacceptable risk from exposure to mercury and 4-methylphenol in soil at the AOC 14 potential exposure area is unlikely as well, based on the low FOD and uncertainties associated with the screening levels.

No unacceptable risk to plant and invertebrate communities is expected from remaining inorganic COPECs with available screening values (hexavalent chromium, 4-methylphenol, bis [2-ethylhexyl] phthalate, LMW PAHs, 4,4-DDT, 4,4-DDE, and PCBs for plants; and hexavalent chromium, copper, lead, bis [2-ethylhexyl] phthalate, HMW and LMW PAHs, 4,4-DDT, 4,4-DDE, PCBs, and 2,3,7,8-TCDD for soil invertebrates). Based on the risk estimates and potential uncertainties associated with the baseline risk using depth-weighted EPCs, antimony, copper, lead, mercury, thallium, and HMW PAHs were further evaluated for plants, and mercury and 4-methylphenol were further evaluated for soil invertebrates using area-weighted EPCs as discussed in Section 5.6.2.

5.6.1.2 Small Mammals

For the AOC 14 potential exposure area, baseline risks were estimated for mammals using depth-weighted EPCs for the following evaluations and are discussed in this section:

- Using the selected TRVs and a SUF equal to 1
- Using the BTAG TRVs and a SUF equal to 1
- Using the selected TRVs and a species and site-specific SUF
- Using the BTAG TRVs and a species and site-specific SUF.

5.6.1.2.1 Risks Evaluated Using a SUF Equal to 1

Risks Evaluated Using Selected TRVs

Table AOC14-5.5a summarizes HQs estimated for small mammals at the AOC 14 potential exposure area using the selected TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized below.

- **Merriam's Kangaroo Rat (granivorous small mammal):** This receptor could potentially be exposed to COPECs in subsurface I soil (0 to 6 ft bgs) directly and through its diet. The NOAEL- and LOAEL-based

HQs in soil are less than 1 for all COPECs except antimony and mercury. The potential risks from COPECs with HQs greater than 1 are characterized below and the HQs for these COPECs are summarized in a table at end of this subsection for small mammals. TRVs are not available for TPHs; however, risks to these receptors are characterized below based on PAHs as indicator chemicals as described previously.

- For antimony, the NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of granivorous small mammals is expected; however, unacceptable risk to individual receptors is uncertain for this COPEC based on the HQ. Antimony was not detected in surface soil (0 to 0.5 ft bgs) and was detected at only two of 24 locations in shallow soil (FOD = 8% in 0 to 3 ft bgs). Due to the low FOD in the dataset for the AOC 14 potential exposure area, the depth-weighted EPC from shallow soil (0 to 3 ft bgs) based on the maximum depth-weighted concentration of 19 mg/kg and was used as the depth-weighted EPC (the highest EPC from surface, shallow, and subsurface I soil) to evaluate potential risk to Merriam's kangaroo rat from exposure to antimony. The magnitude of the HQ is low; however, for areas where a constituent is largely not detected, use of a maximum concentration as the EPC may not appropriately characterize risk. Antimony was not detected in the background dataset; therefore, a background value could not be developed for comparison. Additionally, there is uncertainty in the TRVs for antimony. The selected LOAEL TRV (0.59 mg/kg-bw/day) is based on the paired value from the selected NOAEL (0.059 mg/kg-bw/day) in a study by Rossi et al. (1987) reported in the EcoSSL guidance. Other studies cited in the EcoSSL and ORNL guidance indicate the selected TRVs are the most conservative. ORNL (Sample et al. 1996) reports a LOAEL TRV of 1.25 mg/kg-bw/day. The EcoSSL guidance (USEPA 2007) reports paired LOAEL values ranging from 42 mg/kg-bw/day to 835 mg/kg-bw/day, which are orders of magnitudes greater than the selected LOAEL. Potential risk to Merriam's kangaroo rat from exposure to antimony is likely overestimated.
- For mercury, the NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of granivorous small mammals is expected. However, unacceptable risk to individual receptors is uncertain for this COPEC based on the HQ. Mercury was detected in only one of 23 locations in surface soil (FOD = 4% in 0 to 0.5 ft bgs), two of 24 locations in shallow soil (FOD = 8% in 0 to 3 ft bgs), and three of 27 locations in subsurface I soil (FOD = 11% in 0 to 6 ft bgs). Due to the low FOD in the dataset for the AOC 14 potential exposure area, the depth-weighted EPC from subsurface I soil (0 to 6 ft bgs) is based on the maximum depth-weighted concentration of 102 mg/kg and was used as the depth-weighted EPC (as it was the highest EPC) to evaluate potential risk to Merriam's kangaroo rat from exposure to mercury. The magnitude of the HQ is low; however, for areas where a constituent is largely not detected, use of a maximum concentration as the EPC may not appropriately characterize risk. Mercury was not detected in the background dataset; therefore, a background value could not be developed for comparison. However, aside from the maximum depth-weighted concentration, the remaining locations had depth-weighted concentrations near or below the reporting limit.
- The selected BTAG TRVs (DTSC 2009) are based on reproductive and developmental effects in rats exposed to organic mercury, as presented in data from the USEPA (1995) Great Lakes Initiative Documents for the Protection of Wildlife. In the Great Lakes Initiative and BTAG approach, mercury TRVs are based on exposure to methylmercury, as this is the form found predominantly in fish and consumed by fish-eating wildlife. However, exposure to methylmercury is not expected for

granivorous and invertivorous mammalian wildlife present in mercury upland areas of the site. Toxicity data for inorganic mercury indicate that unacceptable risk would only be observed at higher concentrations (see main report Section 6.7.5 for discussion). Therefore, there is only moderate confidence in the TRVs to evaluate risk to mammals at the AOC 14 potential exposure area. Potential risk to the kangaroo rat from exposure to mercury is likely overestimated.

- For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples and NOAEL- and LOAEL-based HQs for PAHs are less than 1, indicating that no unacceptable risk to granivorous small mammals from exposure to TPH is expected.

The NOAEL- and LOAEL-based HQs in soil are less than 1 for the remaining COPECs, indicating *de minimis* risk to individuals or populations of granivorous small mammals.

- **Desert Shrew (invertivorous small mammal):** This receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. HQs for this receptor are less than 1 for most COPECs except for HMW PAHs and dioxin TEQ for mammals. The potential risks from COPECs with HQs greater than 1 are characterized below and the HQs for these COPECs are summarized in a table at end of this subsection for small mammals. TRVs are not available for TPHs; however, risks to these receptors are characterized below based on indicator chemicals as described previously.
 - For HMW PAHs, the NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of invertivorous mammals is expected. However, unacceptable risk to individual receptors is uncertain for this COPEC based on the HQ. HMW PAHs were frequently detected in surface soil (FOD = 48% in 0 to 0.5 ft bgs), with six of the 21 total surface soil locations having depth-weighted concentrations exceeding background (0.038 mg/kg). Depth-weighted concentrations at only one location exceed 10 times the background threshold value (BTV) (8.070 mg/kg at AOC14-14W). In addition, there is a wide range of toxicity information available for PAHs. For the selected TRVs for HMW PAHs, there is moderate confidence in ability to predict toxicity to small mammals. While the selected TRVs are based on EcoSSL data from multiple studies representing at least three small mammal species and five individual HMW PAHs (USEPA 2007), the data were derived for individual PAHs (not mixtures) and the geometric mean NOAEL-based TRV is nearly 20 times greater than the selected NOAEL-based TRV value. Alternate TRVs available from published sources and the literature (DTSC 2009; MacKenzie and Angevine 1981) indicate that the selected TRVs overestimate risk based on exposure to HMW PAHs (see Section 6.7.5 of the main report for details). As mentioned above for plants, the high EPC for HMW PAHs is primarily due to elevated concentrations in the one location (8.07 mg/kg at AOC14-14W). Additionally, the magnitude of the HQ is low. Based on the variability of the toxicity information unacceptable risk to the desert shrew from exposure to HMW PAH is considered to be uncertain.
 - For dioxin TEQ for mammals, the NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of invertivorous mammals is expected. However, unacceptable risk to individual receptors is uncertain for this COPEC based on the HQ. As described in Section 6.7.6 of the main report, there is uncertainty associated with the mammalian TRVs and uptake factors selected for dioxins at this site. Dioxin TEQ were detected at eight of eight locations in surface soil (FOD = 100% in 0 to 0.5 ft bgs), with one of the eight total surface soil locations having depth-weighted concentrations above background (BTV = 5.58 nanograms per

kilogram [ng/kg]). High concentrations (i.e., locations with depth-weighted concentrations more than 10 times the BTV) of dioxin TEQ were not detected at the AOC 14 potential exposure area. Based on the risk results and the uncertainties discussed above, unacceptable risk to individual receptors is uncertain for dioxin TEQ.

- For TPH mixtures, individual constituents were used to characterize potential risks to small mammals. BTEX were not detected in any samples (Attachment AOC14-A1) and HQs for LMW PAHs are less than 1. As discussed above for the desert shrew, unacceptable risk from HMW PAH concentrations is uncertain, and unacceptable risk from TPH is also considered uncertain.

The NOAEL- and LOAEL-based HQs in soil are less than 1 for the remaining COPECs, indicating *de minimis* risk to individuals and populations of invertivorous small mammals.

Based on the risk estimates and potential uncertainties associated with the baseline risk from antimony and mercury for granivorous small mammals; and HMW PAHs and dioxin TEQ for invertivorous small mammals, these COPECs were further evaluated site-specific SUFs and using area-weighted EPCs as discussed below and in Section 5.6.2.

Risks Evaluated Using the BTAG TRVs

Table AOC14-5.5a also summarizes HQs estimated for small mammals at the AOC 14 potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized below. The HQs greater than 1 are summarized below.

- **Merriam's Kangaroo Rat (granivorous small mammal):** The NOAEL-based HQ for mercury is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of granivorous mammals is expected. However, unacceptable risk to individual receptors is uncertain for this COPEC based on the HQ. Mercury was infrequently detected and the depth-weighted EPC was based on the maximum depth-weighted concentration. Therefore, potential risk for Merriam's kangaroo rat from exposure to mercury may not be appropriately characterized. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs indicating no unacceptable risk to individuals or populations of granivorous small mammals from the remaining COPECs.
- **Desert Shrew (invertivorous small mammal):** The NOAEL-based HQ for HMW PAHs is greater than 1 and the LOAEL-based HQ is less than 1 for these COPECs, indicating no unacceptable risk to populations of invertivorous mammals is expected. However, unacceptable risk to individual receptors is uncertain for these COPECs based on the HQ. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. The NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs indicating no unacceptable risk to individuals or populations of invertivorous small mammals from the remaining COPECs.

Summarized below are all HQ estimates for mammals for COPECs where at least one NOAEL-based HQ value (using the selected TRV or BTAG TRV) is greater than 1:

Hazard Quotient Summary for Small Mammals (SUF = 1)

APPENDIX AOC14
SOIL HHERA FOR AOC 14 EXPOSURE AREA

COPEC	Merriam's Kangaroo Rat				Desert Shrew

Notes:

Bold indicates HQs > 1.

-- = HQ not estimated because TRVs are unavailable.

5.6.1.2.2 Risks Evaluated Using a Site-Specific SUF

Table AOC14-5.5b presents HQs calculated using the selected TRVs and BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Based on the AOC 14 potential exposure area and home ranges for Merriam's kangaroo rat and desert shrew, the SUF was estimated as 1 for these receptors (i.e., their home range is less than or equal to the size of the exposure area). Therefore, the risk results using selected TRVs and BTAG TRVs for this scenario are the same as discussed above for the generic SUF of 1.

5.6.1.2.3 Baseline Risk Summary for Small Mammals Using Depth-Weighted EPCs

To summarize, based on the risks characterized for populations of small mammals exposed to COPECs in soil at the AOC 14 potential exposure area using selected TRVs⁵, depth-weighted EPCs, and a site and species-specific SUF (SUF equal to 1), the risk conclusions are as follows:

- For Merriam's kangaroo rat (granivorous small mammals), the LOAEL-based HQs are less than 1 for all COPECs, indicating no unacceptable risk to populations of granivorous small mammals at the AOC 14 potential exposure area. COPECs indicative of uncertain risks to individual receptors (i.e., where NOAEL-based HQs are greater than 1 but LOAEL-based HQs are less than 1) included antimony and mercury. The following LOEs indicate potential risks to individual granivorous small mammals from exposure to antimony and mercury are likely overestimated: (1) low magnitude of HQs; (2) low FOD for these COPECs; (3) use of the maximum detected depth-weighted concentration as the depth-weighted EPC; and (4) low to moderate confidence in the TRVs. For the remaining COPECs at the AOC 14 potential exposure area, the NOAEL- and LOAEL-based HQs are less than 1 indicating no unacceptable risk to individuals and populations of granivorous small mammals.

⁵ Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

- For desert shrew (invertivorous small mammals), the LOAEL-based HQs are less than 1 for all COPECs, indicating no unacceptable risk to populations of invertivorous small mammals. COPECs indicative of uncertain risks to individual receptors (i.e., where NOAEL-based HQs are greater than 1 but LOAEL-based HQs are less than 1) included HMW PAHs and dioxin TEQ. The following LOEs indicate potential risks to individual insectivorous small mammals from exposure to HMW PAHs and dioxin TEQ are uncertain: (1) low magnitude HQs; (2) frequently detected at the AOC 14 potential exposure area; however, concentrations above background were infrequent; and (3) moderate to robust TRVs. For the remaining COPECs at the AOC 14 potential exposure area, the NOAEL- and LOAEL-based HQs are less than 1 indicating no unacceptable risk to individuals and populations of invertivorous small mammals.

Based on the risk estimates and potential uncertainties associated with the baseline risk to granivorous small mammals from exposure to antimony and mercury, as well as invertivorous small mammals from exposure to HMW PAHs and dioxin TEQ, these COPECs were further evaluated using area-weighted EPCs as discussed in Section 5.6.2.

5.6.1.3 Birds

For the AOC 14 potential exposure area, baseline risks were estimated for birds using depth-weighted EPCs for the following evaluations and are discussed in this section:

- Using the selected TRVs and SUF equal to 1
- Using the BTAG TRVs and a SUF equal to 1
- Using the selected TRVs and a species and site-specific SUF
- Using the BTAG TRVs and a species and site-specific SUF.

5.6.1.3.1 Risks Evaluated Using a SUF Equal to 1

Risks Evaluated Using Selected TRVs

Table AOC14-5.5a summarizes HQs estimated for birds at the AOC 14 potential exposure area using the selected TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized below.

- **Gambel's Quail (granivorous bird):** This receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and to deeper soil (0 to 6 ft bgs) through its diet. The NOAEL- and LOAEL-based HQs in soil are less than 1 for all COPECs except mercury. The potential risks from COPECs with HQs greater than 1 are characterized below and the HQs for these COPECs are summarized in a table at end of this subsection for birds. TRVs are not available for TPHs; however, risks to these receptors are characterized below based on PAHs as indicator chemicals as described previously.
 - For mercury, the NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is equal to 1, indicating no unacceptable risk to populations of granivorous birds is expected. However, unacceptable risk to individual receptors is uncertain for this COPEC based on the HQ. Mercury was detected in only one of 23 locations in surface soil (FOD = 4% in 0 to 0.5 ft bgs), two of 24 locations in shallow soil (FOD = 8% in 0 to 3 ft bgs), and three of 27 locations in subsurface I soil (FOD = 11% in 0

to 6 ft bgs). Due to the low FOD in the dataset for the AOC 14 potential exposure area, the maximum depth-weighted concentration of 102 mg/kg in subsurface I soil (0 to 6 ft bgs) was used as the depth-weighted EPC (the highest EPC) to evaluate potential risk to Gambel's quail from exposure to mercury through its diet. The maximum concentration (102 mg/kg at AOC14-16W) greatly exceeds depth-weighted concentrations at the other two locations with detected mercury (0.15 mg/kg at AOC14-SS1 and 0.078 mg/kg at AOC14-14W). The maximum depth-weighted concentration of 0.41 mg/kg in surface soil (0 to 0.5 ft bgs) was used to evaluate potential exposure through incidental ingestion of soil. For areas where a constituent is largely not detected, use of a maximum concentration as the EPC may not appropriately characterize risk. Mercury was not detected in the background dataset; therefore, a background value could not be developed for comparison. As discussed above for small mammals, the mercury TRVs are conservative because they are based on methylmercury (DTSC 2009), a form of mercury unlikely to be present at AOC14. Potential risk to Gambel's quail from exposure to mercury is likely overestimated.

- For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples and the NOAEL- and LOAEL-based HQs for PAHs are less than 1, indicating that no unacceptable risk to granivorous birds from exposure to TPH is expected.

The NOAEL- and LOAEL-based HQs in soil are less than 1 for the remaining COPECs, indicating *de minimis* risk to individuals or populations of granivorous birds is expected.

- **Cactus Wren (insectivorous bird):** This receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. The NOAEL- and LOAEL-based HQs in soil are less than 1 for all COPECs except mercury. The potential risks from COPECs with HQs greater than 1 are characterized below and the HQs for these COPECs are summarized in a table at end of this subsection for birds. TRVs are not available for TPHs; however, risks to these receptors are characterized below based on PAHs as indicator chemicals as described previously.
 - For mercury, the NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of insectivorous birds is expected. However, unacceptable risk to individual receptors is uncertain for this COPEC based on the HQ. Similar to the discussion above for mercury and Gambel's quail, potential risk to cactus wren from exposure to mercury is likely overestimated.
 - For TPH mixtures, concentrations of the individual constituents do not pose an unacceptable risk. BTEX were not detected in any samples and the NOAEL- and LOAEL-based HQs for PAHs are less than 1, indicating that no unacceptable risk to insectivorous birds from exposure to TPH is expected.

The NOAEL- and LOAEL-based HQs for all other COPECs in soil are less than 1, indicating *de minimis* risk to individuals and populations of insectivorous birds.

Based on the risk estimates and potential uncertainties associated with the baseline risk for mercury for granivorous and insectivorous birds, this COPEC was further evaluated using site- and species-specific SUFs as discussed below.

Risks Evaluated Using the BTAG TRVs

Table AOC14-5.5a also summarizes HQs estimated for birds at the AOC 14 potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a SUF equal to 1. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized below.

- **Gambel's Quail (granivorous bird):** The NOAEL-based HQs for lead and mercury are greater than 1 and the LOAEL-based HQs are less than 1, indicating no unacceptable risk to populations of granivorous birds is expected. However, unacceptable risk to individual receptors is uncertain for these COPECs based on the HQ. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. The NOAEL- and LOAEL-based HQs for other COPECs in soil are less than 1 indicating *de minimis* risk to individuals and populations of granivorous birds for the remaining COPECs.
- **Cactus Wren (insectivorous bird):** The NOAEL-based HQs for lead and mercury are greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of insectivorous birds is expected. However, unacceptable risk to individual receptors is uncertain for these COPECs based on the HQ. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. The NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs indicating *de minimis* risk to individuals and populations of insectivorous birds from these COPECs.

Summarized below are all HQ estimates for birds for COPECs where at least one NOAEL-based HQ value (using the selected TRV or BTAG TRV) is greater than 1:

Hazard Quotient Summary for Birds (SUF = 1)								
COPEC	Gambel's Quail				Cactus Wren			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Lead	2E-01	1E-01	2E+01	4E-02	7E-01	3E-01	8E+01	1E-01
Mercury	5E+00	1E+00	5E+00	1E+00	3E+00	7E-01	3E+00	7E-01

Notes:

Bold indicates HQs > 1.

-- = HQ not estimated because TRVs are unavailable.

5.6.1.3.2 Risks Evaluated Using a Site-Specific SUF

Risks Evaluated Using Selected TRVs

Table AOC14-5.5b presents HQs calculated using the selected TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized below.

- **Gambel's quail (granivorous bird):** The site-specific SUF for this receptor is 0.08 which reduced the NOAEL-based HQ for mercury to less than 1. Considering site use at the AOC 14 potential exposure area, the NOAEL- and LOAEL-based HQs for all COPECs in soil are less than 1, indicating *de minimis* risk to individuals and populations of granivorous birds.

- **Cactus wren (insectivorous bird):** The site-specific SUF for this receptor is 0.6, which reduced the NOAEL- and LOAEL-based HQs for mercury, but the NOAEL-based HQ for mercury is still greater than 1. The potential risks from COPECs with HQs greater than 1 are characterized below and the HQs are summarized in a table at end of this subsection for birds.
 - For mercury, the NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of insectivorous birds is expected. However, unacceptable risk to individual receptors is uncertain for this COPEC based on the HQ. As noted above in Section 5.6.1.3.1, the depth-weighted EPC for mercury is based on the maximum detected depth-weighted concentration and the TRVs are conservative. Therefore, potential risk to individual insectivorous birds are likely overestimated.

The NOAEL- and LOAEL-based HQs for all other COPECs in soil are less than 1, indicating *de minimis* risk to individuals and populations of insectivorous birds.

Based on the risk estimates and potential uncertainties associated with the baseline risk from mercury for insectivorous birds, this COPEC was further evaluated using area-weighted EPCs as discussed below in Section 5.6.2.

Risks Evaluated Using the BTAG TRVs

Table AOC14-5.5b also summarizes HQs estimated for birds at the AOC 14 potential exposure area using the BTAG TRVs, depth-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized below.

- **Gambel's quail (granivorous bird):** The site-specific SUF for this receptor is 0.08 which reduced the HQs for mercury to less than 1, indicating no unacceptable risk to individuals or populations of granivorous birds. Use of the site-specific SUF reduced the NOAEL- and LOAEL-based HQs for lead, but the NOAEL-based HQ for lead is still greater than 1, indicating no unacceptable risk to populations of granivorous birds is expected. However, unacceptable risk to individual receptors is uncertain for this COPEC based on the HQ. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs indicating no unacceptable risk to individuals and populations of granivorous birds from these COPECs.
- **Cactus wren (insectivorous bird):** The site-specific SUF for this receptor is 0.6. Although the magnitude of NOAEL-based HQs was reduced for lead and mercury in this evaluation, they are still greater than 1. The LOAEL-based HQs are less than one, indicating no unacceptable risk to populations of insectivorous birds is expected. However, unacceptable risk to individual receptors is uncertain for these COPECs based on the HQ. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs indicating no unacceptable risk to individuals and populations of insectivorous birds from these COPECs.

For the COPECs with NOAEL-based HQs greater than 1 using a SUF of 1 (using the selected TRV or BTAG TRV), HQ estimates using the species- and site-specific SUF for birds are summarized below:

Hazard Quotient Summary for Birds (site-specific SUF)								
COPEC	Gambel's Quail (SUF = 0.08)				Cactus Wren (SUF = 0.6)			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Lead	2E-02	8E-03	2E+00	3E-03	4E-01	2E-01	5E+01	7E-02
Mercury	4E-01	8E-02	4E-01	8E-02	2E+00	4E-01	2E+00	4E-01

Notes:

Bold indicates HQs > 1.

-- = HQ not estimated because TRVs are unavailable.

5.6.1.3.3 Baseline Risk Summary for Birds Using Depth-Weighted EPCs

To summarize, based on the risks characterized for populations of birds exposed to COPECs in soil at the AOC 14 potential exposure area using selected TRVs⁶, depth-weighted EPCs, and a site-specific SUF, the risk conclusions are as follows:

- For Gambel's quail (granivorous birds), the NOAEL- and LOAEL-based HQs for all COPECs are less than 1, indicating *de minimis* risk to individuals and populations of granivorous birds for all COPECs in this scenario.
- For the cactus wren (insectivorous birds), LOAEL-based HQs are less than 1 for all COPECs, indicating no unacceptable risk to populations of insectivorous birds at the AOC 14 potential exposure area. COPECs indicative of uncertain risks (i.e., where NOAEL-based HQs are greater than 1 but LOAEL-based HQs are less than 1) included only mercury. The following LOEs indicate potential risk to individual insectivorous birds from exposure to mercury is likely overestimated: (1) low magnitude of HQ; (2) low FOD; (3) use of the maximum detected depth-weighted concentration as the depth-weighted EPC; and (4) moderate confidence in the TRVs. For the remaining COPECs at the AOC 14 potential exposure area, the NOAEL- and LOAEL-based HQs are less than 1, indicating *de minimis* risk to individuals and populations of insectivorous birds.

Based on the risk results and potential uncertainties associated with the baseline risk to insectivorous birds from mercury at the AOC 14 potential exposure area, this COPEC was further evaluated using area-weighted EPCs as discussed in Section 5.6.2.

⁶ Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

5.6.2 Risk Characterization (Baseline Scenario and Area-Weighted EPCs)

Based on the risk characterization of COPECs in the baseline scenario using depth-weighted EPCs (Section 5.6.1), risks were characterized for all COPECs using area-weighted EPCs. For those COPECs identified for further evaluation in the depth-weighted evaluation, the results of the area-weighted risk characterization are presented below. These included:

- Antimony, copper, lead, mercury, thallium, and HMW PAHs for plants
- Mercury and 4-methylphenol for soil invertebrates
- Antimony and mercury for granivorous small mammals
- HMW PAHs and dioxin TEQ for invertivorous small mammals
- Mercury for insectivorous birds.

Potential risks to receptors from COPECs listed above were characterized for the baseline scenario using area-weighted EPCs as discussed in this section. Detailed risk calculations for plants and soil invertebrates (Table AOC14-C.6) and detailed dose and risk calculations for wildlife for all COPECs (Tables AOC14-C.7 through AOC14-C.10) are presented in Attachment AOC14-C.

5.6.2.1 Plants and Soil Invertebrates

Table AOC14-5.6a summarizes HQs estimated for soil exposure for ecological communities (plants and soil invertebrates) at the AOC 14 potential exposure area for the baseline scenario using area-weighted EPCs for all COPECs. However, only the COPECs identified for further evaluation using area-weighted EPCs are discussed here. The HQ for hexavalent chromium is greater than 1 using area-weighted EPC and is discussed below.

Plants can potentially be exposed to COPECs in soil up to 6 ft bgs. HQs were based on the highest EPC from the shallow, surface, and subsurface I depth intervals. For plants, the HQs using area-weighted EPCs are greater than 1 for antimony, hexavalent chromium, copper, lead, mercury, and thallium. The HQ increased for hexavalent chromium using the area-weighted EPC, relative to the depth-weighted EPC due to the difference in the UCL calculation method (see Section 3, above). The HQ for HMW PAHs was reduced in this evaluation and is equal to 1. Therefore, unacceptable risk to plant communities is not expected for HMW PAHs. The HQ for hexavalent chromium increased to greater than 1 from the depth-weighted evaluation, in which the HQ was equal to 1.

For antimony, mercury, and thallium, plant HQs based on the area-weighted EPCs did not change from the plant HQs based on the depth-weighted EPCs, because the depth-weighted and area-weighted EPCs are based on the maximum depth-weighted concentration. As discussed in Section 5.6.1.1, these COPECs were infrequently detected and generally based on low confidence screening values. Therefore, unacceptable risk to plant communities from exposure to antimony, mercury, and thallium is considered unlikely at the AOC 14 potential exposure area.

For copper and lead, the plant HQs based on area-weighted EPCs were reduced from the depth-weighted EPCs but the HQs are still greater than 1. Uncertainties associated with plants exposed to these COPECs in soil are discussed in Section 5.6.1.1. Copper and lead were frequently detected (100%) at the AOC 14 potential exposure area; however, exceedances of the BTV were infrequent. Plant screening values are

considered robust, therefore, unacceptable risk to plant communities and is considered possible. Although the screening levels for copper and lead is considered robust for prediction of toxicity to plants, based on the low HQs and limited spatial extent of elevated concentrations, unacceptable risk to plant communities from these COPECs is considered unlikely.

For hexavalent chromium, the plant HQ based on an area-weighted EPC is greater than 1. EPCs in surface and shallow soil are lower than in subsurface I soil (Table AOC14-5.4), indicating lower exposure and risk to shallow-rooted plants compared to deep-rooted plants at the AOC 14 potential exposure area (plant HQs based on surface and shallow soil area-weighted EPCs are less than or equal to 1). The upland terrestrial habitats at the site, including AOC 14, are typical of Mojave Desert uplands dominated by creosote bush scrub, which are shallow rooted plants with roots extending down to 8-14 inches (Marshall 1995).

No T&E species have been observed at the AOC 14 potential exposure area (see Section 5.1.1). The hexavalent chromium screening values for plants are based on a limited number of studies, most of which were conducted in artificial test systems with species unlikely to be present in the AOC 14 potential exposure area. Efroymsen et al. (1997a) indicate that there is low confidence in the screening value and its ability to predict toxicity to plants. Hexavalent chromium was detected at the AOC 14 potential exposure area at 20 of 52 locations in the 0 to 6 ft bgs interval, of which depth-weighted concentrations were greater than background in eight locations. The elevated EPC is due primarily to high hexavalent chromium concentrations (i.e., greater than 10 times background of 0.83 mg/kg) at three locations (14.2 mg/kg at S4-4, 10.5 mg/kg at AOC14-16W, and 10.3 mg/kg at S2-6). Based on the risk results and discussion above, unacceptable risk to plants from exposure to hexavalent chromium is considered unlikely.

Soil invertebrates can potentially be exposed only to COPECs in surface soil (0 to 0.5 ft bgs). For soil invertebrates, the HQ values for mercury and 4-methylphenol remained the same as discussed for the depth-weighted HQs in Section 5.6.1.1, because they are based on the maximum depth-weighted concentration due to low FOD. Based on the risk results and supporting LOEs as discussed in Section 5.6.1.1, including low FOD and uncertainty in the screening values, unacceptable risk to soil invertebrate communities from exposure to mercury and 4-methylphenol is considered unlikely.

Vegetation communities observed at the site during the floristic surveys conducted in 2013 (Garcia and Associates [GANDA] and CH2M 2013) and in 2017 (CH2M 2017b) is typical of Mojave Desert plant communities (summarized in Section 2.4.2). More than 100 different vascular plant species have been observed within the survey area that includes the AOC 14 potential exposure area; documented as Segment H in these survey reports (GANDA and CH2M 2013; CH2M 2017b). The floristic surveys report a diverse assemblage of plants species found in typical abundance, density, cover, and vigor of plant communities in undisturbed desert habitat. These observations are not consistent with impairment of the plant community at the site. The floristic surveys provide site-specific observations that support the health of plant communities at the site and is considered a stronger LOE than the exceedances of low-confidence generic plant screening values, which are widely acknowledged to have low ability to predict toxicity in plants.

Risk Summary and Potential Risk Drivers for Ecological Communities

No risk drivers were identified for unacceptable ecological community-level risk predicted using the most refined exposure and effects assumptions (i.e., area-weighted EPCs) and additional LOEs supporting the conclusion of unacceptable risk.

For plants, area-weighted HQs were greater than 1 for antimony, hexavalent chromium, copper, lead, mercury, and thallium. The WOE indicate unacceptable risk to plant communities is considered unlikely from exposure to these COPECs.

For soil invertebrates, area-weighted HQs were greater than 1 for mercury and 4-methylphenol. The WOE indicates unacceptable risk is considered unlikely from exposure to these COPECs.

No unacceptable risk to plant and soil invertebrate communities is expected from remaining COPECs.

5.6.2.2 Small Mammals

For the AOC 14 potential exposure area, baseline risks were estimated for small mammals using area-weighted EPCs for the following evaluations and discussed in this section:

- Using the selected TRVs and a species- and site-specific SUF
- Using the BTAG TRVs and a species- and site-specific SUF.

5.6.2.2.1 *Risks Evaluated Using a Site-Specific SUF*

Risks Evaluated Using Selected TRVs

Table AOC14-5.6a summarizes the HQs estimated for small mammals at the AOC 14 potential exposure area using the selected TRVs, area-weighted EPCs, and an SUF equal to 1 for all COPECs. Table AOC14-5.6b summarizes HQs estimated for mammals at the AOC 14 potential exposure area using the selected TRVs, area-weighted EPCs, and a site-specific SUF (SUF = 1 as the home range for small mammals is less than or equal to the size of the AOC 14 potential exposure area) for all COPECs. However, only the COPECs identified in Section 5.6.1.2 for further evaluation using area-weighted EPCs are discussed here. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized below.

- **Merriam's Kangaroo Rat (granivorous small mammal):** This receptor could potentially be exposed to COPECs in subsurface I soil (0 to 6 ft bgs) directly and through its diet. The COPECs identified in Section 5.6.1.2 for further evaluation using area-weighted EPCs were antimony and mercury. HQs for these COPECs are summarized in a table at end of this subsection for small mammals.
 - For antimony, the NOAEL- and LOAEL-based HQs remained the same as using depth-weighted EPCs because the maximum depth-weighted concentration was selected as the EPC in both evaluations due to low FOD. The NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of granivorous mammals is expected. However, unacceptable risk to individual receptors is uncertain for this COPEC based on the HQ. As discussed in Section 5.6.1.2, potential risk to the kangaroo rat from exposure to antimony is likely overestimated due to use of very conservative TRVs and use of the maximum depth-weighted concentration as the EPC. Furthermore, small mammal T&E species have not been observed at the AOC 14 potential exposure area. **Therefore, unacceptable risk to individual granivorous small mammals from exposure to antimony at the AOC 14 potential exposure area is unlikely.**
 - For mercury, the NOAEL- and LOAEL-based HQs remained the same as using depth-weighted EPCs because the maximum depth-weighted concentration was selected as the EPC in both evaluations due to low FOD. The NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is less than 1,

indicating no unacceptable risk to populations of granivorous mammals is expected. However, unacceptable risk to individual receptors is uncertain for this COPEC based on the HQ. As discussed in Section 5.6.1.2, potential risk to the kangaroo rat from exposure to mercury is likely overestimated due to the use of the maximum depth-weighted concentration as the EPC, which may not appropriately characterize risk. Furthermore, small mammal T&E species have not been observed at the AOC 14 potential exposure area. **Therefore, unacceptable risk to individual granivorous small mammals from exposure to mercury at the AOC 14 potential exposure area is unlikely.**

- **Desert Shrew (invertivorous small mammal):** This receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. The COPECs identified in Section 5.6.1.2 for further evaluation using area-weighted EPCs were HMW PAHs and dioxin TEQ. HQs for these COPECs are summarized in a table at end of this subsection for small mammals.
 - For HMW PAHs, the magnitude of NOAEL- and LOAEL-based HQs were reduced from the depth-weighted EPC analysis and the NOAEL-based HQ is equal to 1, **indicating no unacceptable risk is expected for individuals or populations of invertivorous small mammals exposed to HMW PAH in soil.**
 - For dioxin TEQ for mammals, the NOAEL- based HQ was reduced from the depth-weighted EPC analysis but is still greater than 1. The LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of invertivorous mammals is expected; however, unacceptable risk to individual receptors is uncertain for this COPEC based on the HQ. Conservative assumptions were used to estimate the HQs, including use of bioaccumulation factors based on uptake of a single congener (2,3,7,8-TCDD) to earthworms, and a diet assumed to consist entirely of earthworms. As a result, the HQs are considered to be overestimated. Additionally, the magnitude of the HQ is low. T&E species have not been observed at the AOC 14 potential exposure area, as described in Section 5.1.1. Therefore, unacceptable risk to individuals and populations of invertivorous small mammals is considered to be unlikely.

NOAEL- and LOAEL-based HQs for other COPECs in soil are less than 1, indicating *de minimis* risk to individuals and populations of invertivorous small mammals for the remaining COPECs.

Risks Evaluated Using the BTAG TRVs

Table AOC14-5.6b also summarizes HQs estimated for small mammals at the AOC 14 potential exposure area using the BTAG TRVs, area-weighted EPCs, and a site-specific SUF (SUF = 1). Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized below. The HQs greater than 1 are summarized below.

- **Merriam's Kangaroo Rat (granivorous small mammal):** The NOAEL-based HQ for mercury is greater than 1 and the LOAEL-based HQs is less than 1, indicating no unacceptable risk to granivorous small mammal populations is expected. However, unacceptable risk to individual receptors is uncertain for this COPEC based on the HQ. NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs, indicating no unacceptable risk to individuals and populations of granivorous small mammals from the remaining COPECs.
- **Desert Shrew (invertivorous small mammal):** The NOAEL-based HQ for HMW PAHs was reduced to less than 1 using area-weighted EPCs. Thus, all NOAEL-based and LOAEL-based HQs are less than 1,

APPENDIX AOC14
SOIL HHERA FOR AOC 14 EXPOSURE AREA

indicating no unacceptable risk to individuals and populations of invertivorous small mammals COPECs in soil at the AOC 14 potential exposure area.

Summarized below are NOAEL- and LOAEL-based HQs for mammals for COPECs identified in Section 5.6.1.2 that were further evaluated using area-weighted EPCs in this section. The HQs below are based on the area-weighted EPCs and species and site-specific SUF (if applicable for a receptor):

Hazard Quotient Summary for Small Mammals (Site-Specific SUF = 1)								
COPEC	Merriam's Kangaroo Rat				Desert Shrew			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Antimony	2E+00	2E-01	--	--	--	--	--	--
Mercury	2E+00	1E-01	2E+00	1E-01	6E-01	4E-02	6E-01	4E-02
HMW PAHs	3E-02	6E-03	2E-02	6E-04	1E+00	2E-01	5E-01	2E-02
TEQ Mammals	1E-01	1E-02	--	--	2E+00	2E-01	--	--

Notes:

Bold indicates HQs > 1.

-- = HQ not estimated because TRVs are unavailable.

5.6.2.2.2 *Baseline Risk Summary for Mammals Using Area-Weighted EPCs*

To summarize, based on the risks characterized for populations of small mammals exposed to COPECs in soil at the AOC 14 potential exposure area using selected TRVs⁷, area-weighted EPCs, and a site-specific SUF (SUF equal to 1 because the home ranges are less than or equal to the size of the exposure area), the risk conclusions are as follows:

- For Merriam's kangaroo rat (granivorous small mammal), the LOAEL-based HQs are less than 1 for all COPECs, indicating no unacceptable risk to populations of granivorous small mammals at the AOC 14 potential exposure area. COPECs indicative of uncertain risks to individual receptors (i.e., where the NOAEL-based HQs are greater than 1 but LOAEL-based HQs are less than 1) included antimony and mercury. For antimony and mercury, the WOE indicates unacceptable risk to individual receptors is considered unlikely. The supporting LOEs include: (1) low FOD; (2) low magnitude of the HQs; (3) use of the maximum detected depth-weighted concentration as the depth-weighted EPC; (4) low to moderate confidence in the TRVs; and (5) no observations of T&E species at the AOC 14 potential exposure area. For the remaining COPECs, the NOAEL- and LOAEL-based HQs are less than 1, indicating no unacceptable risk to individuals and populations of granivorous small mammals.

⁷ Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

- For the desert shrew (invertivorous small mammals), the LOAEL-based HQs are less than 1 for all COPECs, indicating no unacceptable risk to populations of invertivorous small mammals at the AOC 14 potential exposure area. COPECs indicative of uncertain risks to individual receptors (i.e., where the NOAEL-based HQs are greater than 1 but LOAEL-based HQs are less than 1) included only dioxin TEQ. For dioxin TEQ, the WOE indicates unacceptable risk to individual receptors is considered unlikely. The supporting LOEs include: (1) low magnitude of the HQs; (2) conservative assumptions used in the bioaccumulation into prey items; and (3) no observations of T&E species at the AOC 14 potential exposure area. For the remaining COPECs, the NOAEL- and LOAEL-based HQs are less than 1, indicating no unacceptable risk to individuals and populations of invertivorous small mammals.

Potential Risk Drivers for Small Mammals at AOC 14 Exposure Area

No risk-driving COPECs were identified at the AOC 14 potential exposure area for the baseline scenario using area-weighted EPCs, as no unacceptable population-level risk (i.e., LOAEL-based HQs greater than 1) was predicted using the most refined exposure and effects assumptions (i.e., site-specific SUF, area-weighted EPCs, and selected TRVs and additional LOEs supporting the conclusion of unacceptable risk).

COPECs with NOAEL-based HQs greater than 1 using the most refined exposure and effects assumptions were also identified at the AOC 14 potential exposure area. However, the additional LOEs support the conclusion that unacceptable risk from antimony and mercury to individual granivorous small mammals and dioxin TEQ to individual invertivorous small mammals is unlikely.

5.6.2.3 Birds

For the AOC 14 potential exposure area, baseline risks were estimated using area-weighted EPCs for the following evaluations and discussed in this section:

- Using the selected TRVs and a species and site-specific SUF
- Using the BTAG TRVs and a species and site-specific SUF.

5.6.2.3.1 Risks Evaluated Using a Site-Specific SUF

Risks Evaluated Using the Selected TRVs

Table AOC14-5.6a summarizes HQs estimated for birds at the AOC 14 potential exposure area using the selected TRVs, area-weighted EPCs, and a SUF equal to 1 for all COPECs. Table AOC14-5.6b summarizes HQs estimated for birds at the AOC 14 potential exposure area using the selected TRVs, area-weighted EPCs, and a site-specific SUF (SUF = 0.06 for Gambel's quail and 0.4 for cactus wren) for all COPECs. However, only the COPECs identified in Section 5.6.1.3 for further evaluation using area-weighted EPCs are discussed here. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized below.

- **Gambel's Quail (granivorous bird):** This receptor could potentially be exposed to COPECs in subsurface I soil (0 to 6 ft bgs) directly and through its diet. No unacceptable risk to individuals or population of granivorous birds were identified using depth-weighted EPCs. The results are the same using area-weighted EPCs (i.e., the NOAEL- and LOAEL-based HQs are less than 1).

- **Cactus Wren (insectivorous bird):** This receptor could potentially be exposed to COPECs in surface soil (0 to 0.5 ft bgs) directly and through its diet. Mercury was identified for further evaluation using area-weighted EPCs. The HQs for this COPEC are summarized in a table at end of this subsection for birds.
 - For mercury, the NOAEL- and LOAEL-based HQs remained the same as using depth-weighted EPCs because the maximum depth-weighted concentration was selected as the EPC in both evaluations due to low FOD. The NOAEL-based HQ is greater than 1 and the LOAEL-based HQ is less than 1, indicating no unacceptable risk to populations of insectivorous birds is expected. However, unacceptable risk to individual receptors is uncertain for this COPEC based on the HQ. As discussed in Section 5.6.1.3, potential risk to the cactus wren from exposure to mercury is likely overestimated due to conservative assumptions in the ERA, especially the use of the maximum detected depth-weighted concentration as the EPC due to low FOD, which may not appropriately characterize risk. Therefore, unacceptable risk to individual insectivorous birds from exposure to mercury at the AOC 14 potential exposure area is unlikely.

The NOAEL- and LOAEL-based HQs for other COPECs in soil are less than 1, indicating *de minimis* risk to individuals and populations of insectivorous birds for the remaining COPECs.

Risks Evaluated Using the BTAG TRVs

Table AOC14-5.6b also summarizes HQs estimated for birds at the AOC 14 potential exposure area using the BTAG TRVs, area-weighted EPCs, and a species- and site-specific SUF. Using these assumptions, the NOAEL- and LOAEL-based HQs for each receptor are summarized below.

- **Gambel's Quail (granivorous bird):** The site-specific SUF for this receptor is 0.08. The NOAEL-based HQ for lead was reduced to less than 1 using area-weighted EPCs. Thus, all NOAEL-based and LOAEL-based HQs are less than 1, indicating no unacceptable risk to individuals and populations of insectivorous birds from COPECs in soil at the AOC 14 potential exposure area. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report.
- **Cactus Wren (insectivorous bird):** The site-specific SUF for this receptor is 0.6. Although the magnitude of the NOAEL-based HQ was reduced for lead in this evaluation, it is still greater than 1. The NOAEL-based HQ for mercury remained the same as in the depth-weighted EPC analysis, because the maximum depth-weighted concentration was used as the EPC due to low FOD. The LOAEL-based HQs are less than 1 for all COPECs, indicating no unacceptable risk to populations of insectivorous birds. However, potential risk to individual receptors are uncertain for lead and mercury. The uncertainties associated with the BTAG TRVs are discussed in Section 6.7.5 of the main report. The NOAEL- and LOAEL-based HQs are less than 1 for all other COPECs, indicating no unacceptable risk to individuals and populations of insectivorous birds from these COPECs.

Summarized below are the NOAEL- and LOAEL-based HQs for birds for COPECs identified in Section 5.6.1.3 that were further evaluated using area-weighted EPCs in this section. The HQs below are based on the area-weighted EPCs and species and site-specific SUF.

Hazard Quotient Summary for Birds (Site-Specific SUF)								
COPEC	Gambel's Quail (SUF = 0.08)				Cactus Wren (SUF = 0.6)			
	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs	Selected NOAEL TRVs	Selected LOAEL TRVs	BTAG NOAEL TRVs	BTAG LOAEL TRVs
Lead	1E-02	6E-03	1E+00	2E-03	4E-01	2E-01	4E+01	7E-02
Mercury	4E-01	8E-02	4E-01	8E-02	2E+00	4E-01	2E+00	4E-01

Notes:

Bold indicates HQs > 1.

-- = HQ not estimated because TRVs are unavailable.

5.6.2.3.2 Baseline Risk Summary for Birds Using Area-Weighted EPCs

To summarize, based on the risks characterized for populations of birds exposed to COPECs in soil at the AOC 14 potential exposure area using selected TRVs⁸, area-weighted EPCs, and a site-specific SUF, the risk conclusions are as follows:

- For Gambel's Quail (granivorous small mammal), the NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, indicating no unacceptable risk to individuals and populations of granivorous birds. Potential risk is *de minimis* from all COPECs at the AOC 14 potential exposure area for these granivorous birds and no further evaluation is necessary.
- For Cactus Wren (insectivorous birds), the LOAEL-based HQs are less than 1 for all COPECs, indicating no unacceptable risk to populations of insectivorous birds at the AOC 14 potential exposure area. COPECs indicative of uncertain risks to individual receptors (i.e., where the NOAEL-based HQs are greater than 1 but LOAEL-based HQs are less than 1) included only mercury. For mercury, the WOE indicates unacceptable risk to individual receptors is considered unlikely based on supporting LOEs: (1) low magnitude of HQ; (2) low FOD; (3) use of the maximum detected depth-weighted concentration as the EPC; (4) moderate confidence in the TRVs; and (5) no observations of T&E species at the AOC 14 potential exposure area. For the remaining COPECs, the NOAEL- and LOAEL-based HQs are less than 1, indicating *de minimis* risk to individuals and populations of insectivorous birds.

Potential Risk Drivers for Birds at AOC 14 Exposure Area

No risk-driving COPECs were identified at the AOC 14 potential exposure area for the baseline scenario using area-weighted EPCs, as no unacceptable population-level risk (i.e., LOAEL-based HQs greater than 1) was predicted using the most refined exposure and effects assumptions (i.e., site-specific SUF, area-weighted EPCs, and selected TRVs) and had additional supporting LOEs.

⁸ Results associated with BTAG TRVs are presented and discussed in the ERA; however, the selected TRVs are recommended for risk management decisions and only those results are summarized.

APPENDIX AOC14
SOIL HHERA FOR AOC 14 EXPOSURE AREA

COPECs with NOAEL-based HQs greater than 1 using the most refined exposure and effects assumptions were identified for the AOC 14 potential exposure area. These included only mercury for insectivorous birds. However, the additional LOEs support the conclusions that unacceptable risk to individual receptors from exposure to mercury is unlikely.

6 SUMMARY AND CONCLUSIONS FOR THE HHRA

Potential cumulative cancer risks and noncancer hazards for human receptors were estimated, as presented above in Section 4. For ecological receptors, potential risks were estimated as presented above in Section 5. Uncertainties related to the HHRA and ERAs at the site are discussed in detail in Sections 5.6 and 6.7 of the main report, and uncertainties specific to the AOC 14 potential exposure area are discussed in this appendix. For AOC 14, a HHRA and ERA was conducted per the RAWP documents (Arcadis 2008, 2009, 2015). One scenario (baseline, i.e., no scouring) was evaluated, and risks were estimated for various receptors using depth-weighted EPCs and area-weighted EPCs.

At the AOC 14 potential exposure area, the COPCs/COPECs identified for the HHRA include metals (antimony, hexavalent chromium, copper, lead, mercury, and thallium), inorganics (nitrate and phosphate), SVOCs (4-methylphenol, bis[2-ethylhexyl] phthalate, and butylbenzylphthalate), LMW PAHs, HMW PAHs, PAHs, pesticides (4,4-DDE and 4,4-DDT), PCBs, TPH as diesel, TPH as motor oil, and dioxins and furans. A summary of these results and conclusions regarding potential risk associated with exposure to these COPCs/COPECs in soil at the AOC 14 potential exposure area based on the risk/hazard estimates and uncertainties inherent in the risk assessment process are presented in this section.

6.1 Summary and Conclusions for the HHRA

The cumulative ILCRs and HIs associated with potential exposure to COPCs in soil at the AOC 14 potential exposure area using depth- and area-weighted EPCs under the baseline scenario were estimated. Assuming that lifetime soil contact is limited to the AOC 14 potential exposure area for the receptors evaluated, the estimated potential ILCR and HI results are summarized in the table and discussed below.

Baseline Scenario Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 14 Potential Exposure Area			
		Cumulative ILCR		HI	
		Depth-Wt	Area-Wt	Depth-Wt	Area-Wt
Short-Term Maintenance Worker	Surface	$\leq 1 \times 10^{-6}$	---	≤ 1	---
	Shallow	$\leq 1 \times 10^{-6}$	---	≤ 1	---
	Subsurface I	$\leq 1 \times 10^{-6}$	---	≤ 1	---
	Subsurface II	$\leq 1 \times 10^{-6}$	---	≤ 1	---
Long-Term Maintenance Worker	Surface	$\leq 1 \times 10^{-6}$	$\leq 1 \times 10^{-6}$	≤ 1	≤ 1
	Shallow	2×10^{-6} (CrVI and dioxin TEQ)	$\leq 1 \times 10^{-6}$	≤ 1	≤ 1
	Subsurface I	2×10^{-6} (CrVI and dioxin TEQ)	$\leq 1 \times 10^{-6}$	≤ 1	≤ 1
	Subsurface II	$\leq 1 \times 10^{-6}$	$\leq 1 \times 10^{-6}$	≤ 1	≤ 1
Camper	Surface	$\leq 1 \times 10^{-6}$	---	≤ 1	---

APPENDIX AOC14
SOIL HHERA FOR AOC 14 EXPOSURE AREA

Baseline Scenario Estimated Cumulative Incremental Lifetime Cancer Risk and Hazard Index					
Potential Receptor and Exposure Depth		AOC 14 Potential Exposure Area			
		Cumulative ILCR		HI	
		Depth-Wt	Area-Wt	Depth-Wt	Area-Wt
	Shallow	$\leq 1 \times 10^{-6}$	---	≤ 1	---
Hiker	Surface	$\leq 1 \times 10^{-6}$	---	≤ 1	---
	Shallow	$\leq 1 \times 10^{-6}$	---	≤ 1	---
Hunter	Surface	$\leq 1 \times 10^{-6}$	---	≤ 1	---
	Shallow	$\leq 1 \times 10^{-6}$	---	≤ 1	---
OHV Rider	Surface	$\leq 1 \times 10^{-6}$	---	≤ 1	---
	Shallow	$\leq 1 \times 10^{-6}$	---	≤ 1	---
Tribal User	Surface	$\leq 1 \times 10^{-6}$	---	≤ 1	---
	Shallow	$\leq 1 \times 10^{-6}$	---	≤ 1	---

Note:

--- = Area-weighted (area-wt) estimate not calculated because depth-weighted (depth-wt) estimates for the receptor were below *de minimis* levels

wt = weighted

Depth-Weighted

Potential exposures that are at or below *de minimis* levels include the following:

- **HI ≤ 1 for all soil depths** – All receptors evaluated including: Short- and Long-Term Maintenance Workers, Camper, Hiker, Hunter, OHV Rider, and Tribal User
- **ILCR $\leq 1 \times 10^{-6}$** – Short-Term Maintenance Worker (all soil depths), Long-Term Maintenance Worker (surface and subsurface II), Camper (surface and shallow), Hiker (surface and shallow), Hunter (surface and shallow), OHV Rider (surface and shallow), and Tribal User (surface and shallow).

Potential exposures that are above *de minimis* levels of HI > 1 and/or within the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **HI > 1 and ≤ 3** – None
- **HI > 3** – None
- **ILCR > 1×10^{-6} and $\leq 5 \times 10^{-6}$** – Long-Term Maintenance Worker (shallow and subsurface I)
- **ILCR > 5×10^{-6} and $\leq 1 \times 10^{-5}$** – None
- **ILCR > 1×10^{-5} and $\leq 1 \times 10^{-4}$** – None.

Potential exposures that are above the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **ILCR > 1×10^{-4}** – None.

Assuming that lifetime soil contact is limited to the AOC 14 potential exposure area, the depth-weighted estimated cumulative ILCRs above *de minimis* levels for the long-term maintenance worker were due to hexavalent chromium and dioxin TEQ. Therefore, potential risks/hazards for the long-term maintenance worker were evaluated using area-weighted EPCs and are as follows:

Area-Weighted

Potential exposures that are at or below *de minimis* levels include the following:

- **HI ≤ 1 for all soil depths** – Long-Term Maintenance Worker
- **ILCR $\leq 1 \times 10^{-6}$ for all soil depths** – Long-Term Maintenance Worker.

Potential exposures that are above *de minimis* levels of HI > 1 and/or within the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **HI > 1 and ≤ 3** – None
- **HI > 3** – None
- **ILCR > 1×10^{-6} and $\leq 5 \times 10^{-6}$** – None
- **ILCR > 5×10^{-6} and $\leq 1 \times 10^{-5}$** – None
- **ILCR > 1×10^{-5} and $\leq 1 \times 10^{-4}$** – None.

Potential exposures that are above the risk management range of 1×10^{-6} and 1×10^{-4} include the following:

- **ILCR > 1×10^{-4}** – None.

OVERALL SUMMARY

Assuming that lifetime soil contact is limited to the AOC 14 potential exposure area, the estimated cumulative ILCRs and HIs associated with potential exposure to COPCs in soil at the AOC 14 potential exposure area using depth-weighted EPCs for the short-term maintenance worker, camper, hiker, hunter, OHV rider, and tribal user are at or below 1×10^{-6} and 1, respectively. However, the estimated cumulative ILCRs using the depth-weighted EPCs for the long-term maintenance worker were 2 times above the point of departure for risk management decisions of 1×10^{-6} but below 5×10^{-6} and well within the risk management range of 1×10^{-6} and 1×10^{-4} . The estimated cumulative ILCRs using the area-weighted EPCs for the long-term maintenance worker were 1.2 to 1.5 times lower than the estimated cumulative ILCRs using the depth-weighted EPCs and are at or below the point of departure for risk management decisions of 1×10^{-6} . The estimated cumulative HIs using the depth- and area-weighted EPCs for the long-term maintenance worker, were below 1.

The depth- and area-weighted EPCs for lead in AOC 14 potential exposure area soil at all exposure depths are not expected to result in an increase in blood lead levels above the OEHHA benchmark value of 1 µg/dL in the fetus of a short- or long-term maintenance worker, fetus of a hunter, or child recreational user.

Risks/hazards estimated for an individual potential exposure area like AOC 14 potential exposure area are not considered representative of the realistic or likely potential exposures for the human populations that could be present in the areas outside the TCS (such as maintenance workers, recreational users, and tribal users). Risks/hazards calculated separately for individual AOCs are conservative and likely overestimate site

risks/hazards. As described in the RAWP documents (Arcadis 2008, 2009, 2015), these human populations would more likely be exposed randomly, over the course of a lifetime, to soil present in all potential exposure areas located outside the TCS, rather than have a lifetime of contact limited to the area of a single potential exposure area. Therefore, estimated risks/hazards presented for individual potential exposure areas are not believed to be representative of the potential health risks to humans potentially contacting the soil outside the TCS. Rather, the HHRA results presented in Appendix OCS for all potential exposure areas located outside the TCS combined will help to inform risk management decisions for the site. The estimated risks and hazards associated with a lifetime of contact with soil only in the AOC 14 potential exposure area are presented at the request of the agencies and are not suitable to provide the sole basis of risk management decisions to protect human health.

6.2 Summary and Conclusions for the ERA

At the AOC 14 potential exposure area, six metals (antimony, hexavalent chromium, copper, lead, mercury, and thallium), SVOCs (4-methylphenol and bis [2-ethylhexyl] phthalate), LMW PAHs, HMW PAHs, PCBs, pesticides (4,4-DDE, 4,4-DDT), dioxin TEQ (for wildlife receptors only), and 2,3,7,8-TCDD (for ecological communities only) were identified as COPECs. Risks could not be estimated for receptors lacking available screening values and/or TRVs for COPECs; such cases are discussed in the uncertainty analysis of the main report. These COPECs are unlikely to be risk drivers and are assumed to have minimal impact to the conclusions of the ERA.

Risks were estimated using depth-weighted and area-weighted EPCs. Risk conclusions were based on the following criteria:

- COPECs with HQs less than or equal to 1 pose *de minimis* risk to ecological communities (plants and invertebrates).
- COPECs with HQs greater than 1 could indicate potential risk to ecological communities. A WOE approach was used to characterize potential risk to plants and invertebrates.
- COPECs with NOAEL-based HQs less than or equal to 1 pose *de minimis* risk to potential wildlife receptors.
- COPECs with NOAEL-based HQs greater than 1 but LOAEL-based HQs less than or equal to 1 pose no unacceptable risks to wildlife populations; however, potential for unacceptable risk to individuals is uncertain based on the HQ. A WOE approach was used to characterize potential risk to individual potential receptors.
- COPECs with LOAEL-based HQs greater than 1 pose possible unacceptable risk to populations of potential wildlife receptors based on the HQ.

The risk estimates (i.e., HQs) represent a single LOE in the risk characterization. A qualitative WOE approach incorporating other LOEs and uncertainties was used to characterize risk to wildlife populations at the AOC 14 potential exposure area.

HQs for all the COPECs for the baseline scenario calculated using depth-weighted EPCs, selected screening levels/selected TRVs, and site-specific SUFs are summarized in Table AOC14-6.1. The HQs/LOAEL HQs based on depth-weighted EPCs were greater than 1 for the following COPECs:

- **Plant Community** – antimony, hexavalent chromium, copper, lead, mercury, thallium, and HMW PAHs/TPHs
- **Soil Invertebrate Community** – mercury and 4-methylphenol
- **Small Mammals** – antimony and mercury for granivorous small mammals; HMW PAHs/TPHs and dioxin TEQ for insectivorous small mammals
- **Birds** – none for granivorous birds; mercury for insectivorous birds.

HQs were also calculated for all the COPECs using area-weighted EPCs, selected screening levels/selected TRVs, and site-specific SUFs are presented in Table AOC14-6.2.

HQs were also calculated for all the COPECs using area-weighted EPCs, selected screening levels/selected TRVs, and site-specific SUFs and are presented in Table AOC14-6.1. For COPECs with HQs / LOAEL-based HQs greater than 1 using the most refined exposure and effects assumptions (i.e., area-weighted EPCs, selected screening levels/TRVs, and site-specific SUFs), a WOE assessment was used to draw risk conclusions and identify potential risk drivers for the AOC 14 potential exposure area. The various LOEs considered in the WOE assessment and risk conclusions are presented in Table AOC14-6.2.

Based on the ecological risk characterization for the AOC 14 potential exposure area, using area-weighted EPCs, selected TRVs, and site-specific SUFs, the following conclusions were made.

6.2.1 Plant Communities

Overall, no unacceptable risk was identified for plants, including special-status species. Conclusions are as follows:

- No federal- or state-listed T&E or rare plants or candidates for listing were found at the Topock site, including the AOC 14 potential exposure area.
- Potential risks to plants are *de minimis* from exposure to 4-methylphenol and bis (2-ethylhexyl) phthalate), LMW PAHs, 4,4-DDE and 4,4-DDT, and PCBs at the AOC 14 potential exposure area. The HQ for HMW PAHs was reduced to less than 1 using an area-weighted EPC, indicating *de minimis* risk to plant communities from this COPEC as well at the AOC 14 potential exposure area.
- HQs for antimony, mercury, and thallium did not change from the depth-weighted evaluation. Unacceptable risks to plants from exposure to antimony and thallium are unlikely based on the following LOEs: (1) low magnitude of the HQs; (2) low FOD; (3) EPCs based on the maximum depth-weighted concentration; for areas where a constituent is largely not detected, use of a maximum concentration can potentially overestimate risk; and (4) low confidence in screening values to predict risk. For mercury, although the HQs were high in magnitude, unacceptable risk to plants is unlikely based on the following LOEs: (1) low FOD; (2) EPCs based on the maximum depth-weighted concentration; (3) low confidence in screening values to predict risk; and (4) limited spatial extent of elevated concentrations of mercury (102 mg/kg at AOC14-16W).
- The area-weighted HQ for hexavalent chromium increased to greater than 1 from the depth-weighting evaluation. The impact of area-weighting on these COPECs is discussed in Section 5.6.3 of the main report and in this appendix. Unacceptable risk to soil invertebrate communities is considered unlikely for hexavalent chromium based on supporting LOEs: (1) low magnitude of the HQ; (2) very conservative

screening level (less than the BTV); and (3) low confidence in the invertebrate screening value and its ability to predict risk.

- The HQs for copper and lead were reduced from the depth-weighting evaluation but are still greater than 1. Although the screening levels are considered robust for prediction of toxicity to plants and these COPECs were frequently detected at the AOC 14 potential exposure area, unacceptable risk to plant communities from exposure to copper and lead is unlikely based on the following LOEs: (1) detected concentrations infrequently exceeded the BTVs and screening levels; and (2) limited spatial extent of elevated concentrations; AOC14-16W (438 mg/kg) and AOC14-19 (1800 mg/kg) for copper, and AOC14-19 (1600 mg/kg) for lead.
- Vegetation communities observed at the site during the floristic surveys conducted in 2013 (GANDA and CH2M 2013) and in 2017 (CH2M 2017b) is typical of Mojave Desert plant communities (summarized in Section 2.4.2). Over a hundred different vascular plant species have been observed within the survey area that includes AOC 14 potential exposure area; documented as Segment H in these survey reports (GANDA and CH2M 2013, CH2M 2017b). The floristic surveys report a diverse assemblage of plants species found in typical abundance, density, cover, and vigor of plant communities in undisturbed desert habitat. These observations are not consistent with impairment of the plant community at the site. The floristic surveys provide site-specific observations that support the health of plant communities at the site and is considered a stronger LOE than the exceedances of low-confidence generic plant screening values, which are widely acknowledged to have low ability to predict toxicity in plants.

6.2.2 Soil Invertebrate Communities

Overall, no unacceptable risks to soil invertebrates are expected. Conclusions are as follows:

- Potential risks to soil invertebrates are *de minimis* from exposure to all COPECs except mercury and 4-methylphenol at the AOC 14 potential exposure area. Antimony, thallium, and PCBs were not detected in surface soil, where exposure occurs for this receptor.
- The HQs for mercury and 4-methylphenol remained the same as in the depth-weighted evaluation. Unacceptable risks to soil invertebrates from exposure to these COPECs is unlikely based of the following LOEs: (1) low magnitude of the HQs; (2) low FOD; (3) EPCs based on the maximum depth-weighted EPCs; for areas where a constituent is largely not detected, use of a maximum concentrations can potentially overestimate risks; (4) low confidence in screening values to predict risk; and (5) limited spatial extent of detected concentrations (0.41 mg/kg at AOC14-16W for mercury and 0.43 mg/kg at AOC14-2 for 4-methylphenol).

6.2.3 Small Mammals

Overall, no unacceptable risks to populations of small mammals (granivorous and invertivorous) potentially exposed to COPECs in soil are expected. Conclusions are as follows:

- Several species of mammals have been observed at or near the site (Tables 2-2 and 2-4 of the main report); however, T&E species with small home ranges were not observed at the AOC 14 potential exposure area, and therefore, protection at the individual level (i.e., NOAEL-based HQ less than or equal to 1) is not warranted.

- For Merriam's kangaroo rat (granivorous small mammal):
 - The NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, same as the depth-weighted evaluation, indicating *de minimis* risk to individuals and populations of granivorous small mammals, except for antimony and mercury.
 - COPECs indicative of uncertain risks to individual receptors included antimony and mercury. Unacceptable risk to granivorous small mammal populations from exposure to these COPECs is not expected based on LOAEL HQs less than 1. Unacceptable risk to individual granivorous small mammals from exposure to these COPECs is unlikely based on the following LOEs: (1) low magnitude of the HQs; (2) low FOD; (3) EPCs based on the maximum depth-weighted concentrations; for areas where a constituent is largely not detected, use of a maximum concentrations can potentially overestimate risks; (4) TRVs were considered overly conservative (for antimony, orders of magnitude lower than other published values; for mercury, based on methylmercury, which is unlikely to be present in upland soil; see Section 6.7 of the main report); and (5) T&E species with small home ranges have not been observed at the AOC 14 potential exposure area.
- For the desert shrew (invertivorous small mammals):
 - The NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, same as the depth-weighted evaluation, indicating *de minimis* risk to individuals and populations of insectivorous small mammals, except for HMW PAHs and dioxin TEQ. The NOAEL-based HQ for HMW PAHs was reduced to less than 1 using an area-weighted EPC, indicating *de minimis* risk to individual receptors from this COPEC as well at the AOC 14 potential exposure area.
 - COPECs indicative of uncertain risks to individual receptors included dioxin TEQ. The NAOEL-based HQ was reduced from the depth-weighted evaluation but is still greater than 1. Unacceptable risk to individual receptors for dioxin TEQ is unlikely based on the following LOEs: (1) low magnitude of the HQ; (2) conservative assumptions used in the risk estimates (dietary composition assumes 100% of a single-item diet, bioaccumulation based on a single congener, and very conservative TRVs and BAFs; see Section 6.7 of the main report); (3) limited spatial extent of concentrations above the BTV; and (4) T&E species with small home ranges have not been observed at the AOC 14 potential exposure area.

6.2.4 Birds

Overall, no unacceptable risks to bird populations (granivorous and insectivorous) exposed to COPECs in soil are expected. Conclusions are as follows:

- Several species of birds have been observed at or near the site (Tables 2-2 and 2-4 of the main report); however, T&E species with small home ranges were not observed at the AOC 14 potential exposure area, and therefore, protection at the individual level (i.e., NOAEL-based HQ less than or equal to 1) is not warranted.
- For Gambel's quail (granivorous bird), the NOAEL- and LOAEL-based HQs are less than 1 for all COPECs, same as the depth-weighted evaluation, indicating *de minimis* risk to individuals and populations of granivorous birds at the AOC 14 potential exposure area.
- For the cactus wren (insectivorous bird):

- The NOAEL and LOAEL-based HQs are less than 1 for all COPECs, same as the depth-weighted evaluation, indicating *de minimis* risk to individuals and populations of insectivorous birds at the AOC 14 potential exposure area, except for mercury.
- COPECs indicative of uncertain risks to individual receptors included mercury. For mercury, the NOAEL-based HQs remained the same as the depth-weighting evaluation. The LOAEL-based HQs for mercury are less than 1, same as the same as the depth-weighting evaluation. Unacceptable risk to insectivorous birds from exposure to mercury is unlikely based on the following LOEs: (1) low magnitude of the HQs; (2) low FOD; (3) EPCs based on the maximum depth-weighted concentrations; for areas where a constituent is largely not detected, use of a maximum concentrations can potentially overestimate risks; (4) low confidence in the TRVs for mercury as they are unlikely to reflect the species of mercury present at the AOC 14 potential exposure area; and (5) no observations of nesting T&E species with small home ranges at the AOC 14 potential exposure area.

6.2.5 Potential Risk Drivers for the AOC 14 Exposure Area

As presented in Table AOC14-6.2 and summarized in the table below, no potential risk drivers were identified for the AOC 14 potential exposure area for the baseline scenario, based on unacceptable community/population-level risk (i.e., HQ greater than 1 for plants and soil invertebrates and LOAEL-based HQs greater than 1 for mammals and birds) predicted using the most refined exposure and effects assumptions (i.e., site-specific SUF, area-weighted EPCs, and selected TRVs) and additional LOEs supporting the conclusion of unacceptable risk.

Scenario	Potential Receptors and Risk Drivers at AOC 14 Exposure Area					
	Plants	Soil Invertebrates	Granivorous Mammals (Merriam's Kangaroo Rat)	Insectivorous Mammals (Desert Shrew)	Granivorous Birds (Gambel's Quail)	Insectivorous Birds (Cactus Wren)
Baseline	None	None	None	None	None	None

Needles, California

Chemical	Detection Frequency (Detections/ Samples Analyzed)	Range of Detected Site Concentrations	Units	Included in Risk Assessment ^a	Basis for selection as COPC/COPEC in Risk Assessment
Inorganics					
Aluminum	9 / 9	3,000 - 9,000	mg/kg	No	Within Background
Antimony	0 / 23	ND	mg/kg	No	Not Detected
Arsenic	22 / 23	1.5 - 6.8	mg/kg	No	Within Background
Barium	23 / 23	66 - 300	mg/kg	No	Within Background
Beryllium	0 / 23	ND	mg/kg	No	Not Detected
Cadmium	1 / 23	1.4	mg/kg	No	Within Background
Calcium ^b	9 / 9	11,000 - 48,000	mg/kg	No	Within Background
Chromium, Hexavalent	10 / 40	0.26 - 5.8	mg/kg	Yes	Above Background
Chromium, total	40 / 40	9.0 - 75	mg/kg	No	Within Background
Cobalt	23 / 23	2.4 - 7.8	mg/kg	No	Within Background
Copper	40 / 40	2.2 - 44	mg/kg	Yes	Above Background
Cyanide	0 / 9	ND	mg/kg	No	Not Detected
Iron ^b	9 / 9	6,800 - 20,000	mg/kg	No	Within Background
Lead	23 / 23	2.2 - 18	mg/kg	Yes	Above Background
Magnesium ^b	9 / 9	2,600 - 8,500	mg/kg	No	Within Background
Manganese ^b	9 / 9	120 - 290	mg/kg	No	Within Background
Mercury (inorganic)	1 / 23	0.41	mg/kg	Yes	Above Background
Molybdenum	3 / 23	1.1 - 1.6	mg/kg	No	Within Background
Nickel	40 / 40	0.28 - 16	mg/kg	No	Within Background
Potassium ^b	9 / 9	690 - 2,800	mg/kg	No	Within Background
Selenium	0 / 23	ND	mg/kg	No	Not Detected
Silver	0 / 23	ND	mg/kg	No	Not Detected
Sodium ^b	9 / 9	190 - 850	mg/kg	No	Within Background
Thallium	0 / 23	ND	mg/kg	No	Not Detected
Vanadium	23 / 23	13 - 32	mg/kg	No	Within Background
Zinc	40 / 40	11 - 243	mg/kg	No	Within Background
Volatile Organic Compounds					
1,1,1,2-Tetrachloroethane	0 / 6	ND	ug/kg	No	Not Detected
1,1,1-Trichloroethane	0 / 6	ND	ug/kg	No	Not Detected

Table AOC14-2.1a**Chemicals Included in the Risk Assessment: AOC 14 Surface Soil (0 to 0.5 feet bgs) for Baseline Scenario****Soil Human Health and Ecological Risk Assessment****PG&E Topock Compressor Station****Needles, California****Notes:**

- ^a Applicable to both human health and ecological risk assessment (HHRA/ERA), unless otherwise noted.
- ^b Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA and ERA. Human health toxicity values are available for iron and manganese and ecological toxicity values are available for manganese, thus these chemicals are evaluated in the HHRA and ERA, if above background levels and have available toxicity values.
- ^c Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).
- ^d Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).
- ^e Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.
- ^f Dioxins are evaluated in toxic equivalents.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

mg/kg = milligrams per kilogram.

ng/kg = nanograms per kilogram.

ug/kg = micrograms per kilogram.

COPC = Constituent of Potential Concern.

COPEC = Constituent of Potential Ecological Concern.

ND = Not detected.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Table AOC14-2.1b**Chemicals Included in the Risk Assessment: AOC 14 Shallow Soil (0 to 3 feet bgs) for Baseline Scenario****Soil Human Health and Ecological Risk Assessment****PG&E Topock Compressor Station****Needles, California****Notes:**

- ^a Applicable to both human health and ecological risk assessment (HHRA/ERA), unless otherwise noted.
- ^b Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA and ERA. Human health toxicity values are available for iron and manganese and ecological toxicity values are available for manganese, thus these chemicals are evaluated in the HHRA and ERA, if above background levels and have available toxicity values.
- ^c No toxicity values are available for chloride and sulfate, thus these chemicals are not evaluated in the HHRA.
- ^d Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).
- ^e Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).
- ^f Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.
- ^g Dioxins are evaluated in toxic equivalents.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

mg/kg = milligrams per kilogram.

ng/kg = nanograms per kilogram.

ug/kg = micrograms per kilogram.

COPC = Constituent of Potential Concern.

COPEC = Constituent of Potential Ecological Concern.

ND = Not detected.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Notes:

- ^a Applicable to both human health and ecological risk assessment (HHRA/ERA), unless otherwise noted.
- ^b Essential nutrient. No toxicity values are available for calcium, magnesium, potassium, and sodium, thus these chemicals are not evaluated in the HHRA and ERA. Human health toxicity values are available for iron and manganese and ecological toxicity values are available for manganese, thus these chemicals are evaluated in the HHRA and ERA, if above background levels and have available toxicity values.
- ^c No toxicity values are available for chloride and sulfate, thus these chemicals are not evaluated in the HHRA.
- ^d Carcinogenic polycyclic aromatic hydrocarbons (CPAHs).
- ^e Benzo(a)pyrene equivalent concentrations for CPAHs calculated for each sample using Potency Equivalency Factors (PEF) developed by United States Environmental Protection Agency (USEPA 2017) and recommended in Department of Toxic Substances Control (DTSC) guidance (2015).
- ^f Polychlorinated biphenyls (PCBs) are evaluated as total PCBs in the risk assessment.
- ^g Dioxins are evaluated in toxic equivalents.

Abbreviations:

B(a)P equivalent = Benzo(a)pyrene equivalent.

mg/kg = milligrams per kilogram.

ng/kg = nanograms per kilogram.

ug/kg = micrograms per kilogram.

COPC = Constituent of Potential Concern.

COPEC = Constituent of Potential Ecological Concern.

ND = Not detected.

TPH = Total Petroleum Hydrocarbons.

TEQ = Toxic Equivalent.

Notes:
^a The constituent consists of analytes detected at least once at the Topock Compressor Station site and measured in soil in this exposure area.
^b If fewer than eight total locations and four total detected concentrations, the maximum depth-weighted concentration was selected as the EPC. Otherwise, the UCL was selected as the EPC.
^c EPCs and summary statistics were not calculated for some constituents (i.e., dioxin congeners and essential nutrients). Those data, if available, are presented in Attachment A1 of each exposure area-specific appendix.

Abbreviations:
"---" = not applicable
AOC = area of concern
B(a)P equivalent = benzo(a)pyrene equivalent
BCA = Bias-corrected accelerated bootstrap method
COPC = constituent of potential concern
COPEC = constituent of potential ecological concern
DDE = Dichlorodiphenyldichloroethylene
DDT = Dichlorodiphenyltrichloroethane
EPC = exposure point concentration
FOD = frequency of detection
ft bgs = feet below ground surface
KM = Kaplan-Meier
µg/kg = micrograms per kilogram

mg/kg = milligrams per kilogram
NA = not applicable
ND = not detected
ng/kg = nanograms per kilogram
PAH = polycyclic aromatic hydrocarbons
PCB = polychlorinated biphenyls
PG&E = Pacific Gas and Electric Company
TCDD = Tetrachlorodibenzo-p-dioxin
TEQ = toxic equivalent
TPH = total petroleum hydrocarbons
UCL = upper confidence limit
X = COPC/COPEC in the exposure depth interval

Notes:

- ^a Exposure point concentrations (EPCs) for surface soil (0 to 0.5 feet bgs) are used to evaluate inhalation of particulates in outdoor air.
- ^b EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.
- ^c Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.0×10⁶ m³/kg was used for maintenance workers (short-term and long-term) as recommended by Department of Toxic Substances Control (2014).
- ^d Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.

Abbreviations:

bgs = below ground surface.
COPC = Constituent of Potential Concern.
mg/kg = milligrams per kilogram.
mg/m³ = milligrams per cubic meter.

- ^a Exposure point concentrations (EPCs) for subsurface I soil (0 to 6 feet bgs) are used to evaluate inhalation of particulates in outdoor air.
- ^b EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.
- ^c Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.0×10⁶ m³/kg was used for maintenance workers (short-term and long-term) as recommended by Department of Toxic Substances Control (2014).
- ^d Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.

Abbreviations:

bgs = below ground surface.
COPC = Constituent of Potential Concern.
mg/kg = milligrams per kilogram.
mg/m³ = milligrams per cubic meter.
NA = not applicable.
ND = Not detected.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

TEQ Human	4.5E-06	4.9E-05	3.3E-15	1.3E-11

Notes:

- ^a Exposure point concentrations (EPCs) for surface soil (0 to 0.5 feet bgs) are used to evaluate inhalation of particulates in outdoor air.
- ^b EPCs for subsurface II soil (0 to 10 feet bgs) are used to evaluate inhalation of volatiles in outdoor air.
- ^c Outdoor airborne particulate concentration is calculated by dividing the soil EPCs by the particulate emission factor (PEF). Default PEF of 1.4×10⁹ m³/kg was used for tribal users as recommended by Department of Toxic Substances Control (2014).
- ^d Chemical-specific volatilization factors (VFs) were estimated as discussed in Section 4.0, Exposure Assessment, of the main report. Outdoor vapor concentration is calculated by dividing the soil EPC by the VF.

Abbreviations:

bgs = below ground surface.
COPC = Constituent of Potential Concern.
mg/kg = milligrams per kilogram.
mg/m³ = milligrams per cubic meter.
NA = not applicable.
ND = Not detected.
NS = Not sampled.
NV = Not volatile.
PCB = Polychlorinated biphenyls.
TPH = Total Petroleum Hydrocarbons.
TEQ = Toxic Equivalent.

TPH as diesel	X
TPH as motor oil	X

Note:

^a COPECs selected over the entire soil depth interval (0-6 ft bgs) potentially contacted by ecological receptors. COPECs based on background screening for metals, polycyclic aromatic hydrocarbons, and dioxins. All detected organic compounds were selected as COPECs. See Section 2 of Appendix AOC 14 for details.

Abbreviations:

AOC = area of concern
COPEC = constituent of potential ecological concern
ERA = ecological risk assessment
ft bgs = feet below ground surface
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
TPH = total petroleum hydrocarbon
X = COPEC in that exposure depth interval

Table AOC14-5.2

Soil Exposure Point Concentration Matrix for Terrestrial Ecological Receptors

Soil Human Health and Ecological Risk Assessment

PG&E Topock Compressor Station

Needles, California

Ecological Receptor	Exposure Depth Intervals for Calculation of EPCs				
	Soil EPCs ^a		Biota Tissue EPCs		
	All AOCs		All AOCs		
	0-0.5 ft bgs	Maximum EPC (0-0.5, 0-3, 0-6 ft bgs)	Plants - Maximum EPC (0-0.5, 0-3, 0-6 ft bgs)	Insects (0-0.5 ft bgs)	Insectivorous Mammals (0-0.5 ft bgs)
Terrestrial Receptors					
Plants		X			
Invertebrates	X				
Gambel's Quail	X		X		
Cactus Wren	X			X	
Desert Shrew	X			X	
Merriam's Kangaroo Rat		X	X		

Note:

^a EPCs for ecological receptors will be represented by the maximum detected concentration, depth-weighted 95% UCL, and spatially-weighted 95% UCL, as relevant for this exposure area. See Section 5 of Appendix AOC 14 for details.

Abbreviations:

95% UCL = 95% upper confidence limit

AOC = area of concern

EPC = exposure point concentration

ft bgs = feet below ground surface

X = representative EPC for the pathway/receptor

Notes:
^a WOE Result is risk conclusion based on 1.) HQ/LOAEL HQ using area-weighted EPCs, and 2.) supporting LOE

	NOAEL HQ greater than 1
	HQ or LOAEL HQ greater than 1
	HQ or LOAEL HQ greater than 10
	HQ or LOAEL HQ greater than 100

Abbreviations:
-- = no toxicity value available, HQs could not be estimated
AOC = area of concern
HQ = hazard quotient
LOE = line of evidence
LOAEL = lowest observed adverse effect level
ND = not detected
NOAEL = no-observed adverse effect level
no SL = no screening level available
TEQ = toxic equivalent
WOE = weight of evidence, considering multiple LOE. If HQs/LOAEL HQs > 1, WOE Result is either 1) not expected, 2) unlikely, or 3) possible.

- Notes:**
- a COPECs are presented for HQs greater than 1 based on the depth-weighted EPC and/or area-weighted EPC and species and site-specific SUF.
- b The EPC is based on the maximum depth-weighted concentration due to the small dataset size.
- c The additional lines of evidence for COPECs with NOAEL and LOAEL HQs less than or equal to 1 (based on the area-weighted EPC and species and site-specific SUF) are not included in the table.
- d For plants and soil invertebrates, the background HQ is based on the BTV. For mammals and birds, the NOAEL and LOAEL background HQs are based on the 95 percent upper confidence limit.
- e Applicable to wildlife, unless noted.
- f In areas where observations were noted, the T&E species observed have large home ranges and unlikely to forage in upland habitat. See text for details.
- g For dioxin TEQ, LOAEL HQs less than 10 with supporting LOE were considered unlikely to pose an unacceptable risk to populations of wildlife receptors due to the compounded conservative assumptions included in the ecological risk assessment. See Section 6.7.6 of the main report.
- h Depth-weighted EPC resulted in an HQ or NOAEL-based HQ less than 1, and is less than the area-weighted HQ or NOAEL-based HQ.
- i Although a BTV is not available, concentrations were at or below the reporting limit except for the number of locations noted.

--	LOAEL and NOAEL HQs ≤ 1 for the receptor
	NOAEL HQ greater than 1
	HQ/LOAEL HQ greater than 1
	HQ/LOAEL HQ greater than 10
	HQ/LOAEL HQ greater than 100

- Abbreviations:**
