Appendix C
Design Criteria

APPENDIX C

Design Criteria

In conformance with requirements from the 1996 Corrective Action Consent Agreement (CACA) (California Department of Toxic Substances Control 1996) and the 2013 Remedial Action/Remedial Design (RD/RA) Consent Decree (U.S. Department of the Interior [DOI] 2013), this appendix describes the design criteria for the groundwater remedy at the Topock Compressor Station (TCS). The design criteria are the technical parameters upon which the design is based, and are based on the translation of the identified applicable or relevant and appropriate requirements (ARARs) and the Environmental Impact Report (EIR; California Department of Toxic Substances Control [DTSC] 2011) mitigation measures (where applicable) into site-specific engineering parameters.

The design criteria are grouped into engineering disciplines (Civil [Section C.2], Structural [Section C.3], Geotechnical [Section C.4], Mechanical [including lighting] [Section C.5], Electrical [Section C.6], Instrumentation and Control [Section C.7], and Architectural [Section C.8]). In addition, this appendix describes PG&E Personnel Requirements (Section C.9) and design criteria for Health and Safety (Section C.10) and Noise (Section C.11). Content of the former Construction Requirements section (Section C.11 in the previous version of this appendix from the 30% design submittal) has been removed and will be merged with the forthcoming Construction/ Remedial Action Work Plan, where construction provisions will be discussed in detail.

This appendix includes five Attachments that contain a large amount of data; these Attachments are presented in PDF format on the CD-ROM version of the 60% Basis of Design Report (enclosed within the report binders).

- Attachment A contains a detailed description of the in situ remediation design basis including carbon substrate selection and discussion of chemical reactions.
- Attachment B provides calculations in the following order:
  - Remedy-produced water pump calculations – recirculation; filter feed; conditioned water transfer
  - Remedy-produced water influent tank eductor sizing
  - Remedy-produced water caustic usage
  - Remedy project structural calculations – Remedy-produced Water Conditioning Building; Conditioned Water Tank; Injection Well and Valve and Meter Vaults; Pipe bridge deflection
  - Freshwater injection/remedy-produced water collection/conditioned remedy water distribution and disposal hydraulic network modeling calculations from EPANET software[1]
  - Hydraulic calculations for National Trails Highway In-situ Remediation Zone (NTH IRZ), Inner Recirculation Loop, and TCS Recirculation Loop wells
  - Structural design calculations for the MW-20 Bench Carbon Amendment Building
- The new Attachment C summarizes information on existing site geology and geotechnical data in support of the groundwater remedy design and to propose areas where supplemental geotechnical investigation is needed to verify design parameters.
- The new Attachment D includes a bulletin on remediation well design and field approach.
- The new Attachment E includes a summary of the hydraulic analysis of the firewater system.

C.1 Codes and Standards

The Groundwater Remedy Project is being designed in accordance with the applicable standards, codes, ordinances and regulations, including but not limited to:

[1] Developed by the U.S. Environmental Protection Agency for hydraulic network modeling and drinking water quality analysis. For details, see http://www.epa.gov/nrmrl/wswrd/dw/epanet.html.

- American Concrete Institute (ACI)
- American National Standards Institute (ANSI)
- American Society for Testing and Materials (ASTM)
- American Water Works Association Standard (AWWA)
- Arizona Department of Transportation Policy for Accommodating Utilities on Highway Rights of Way
- Burlington Northern Santa Fe Railway (BNSF) Utility Accommodation Policy
- California Building Code (2010) as amended by San Bernardino County
- California Fire Code (2010)
- California Mechanical Code (2010)
- California Plumbing Code (2010)
- California Division of Occupational Safety and Health (Cal/OSHA)
- County of San Bernardino 2007 Development Code
- Illuminating Engineering Society of North America (IES) procedures
- International Energy Conservation Code (IECC)
- International Green Building Code
- Institute of Electrical and Electronic Engineers (IEEE)
- Instrument Society of America (ISA)
- Insulated Cable Engineers Association (ICEA)
- Minimum Design Loads for Building and Other Structures (American Society of Civil Engineers [ASCE] 7-10)
- Mohave County Regulations (including Drainage Design Manual for Mohave County)
- Mohave County Floodplain Administrator requirements
- National Electrical Manufacturers Association (NEMA)
- National Electrical Code (NEC)
- National Electrical Safety Code (NESC)
- National Fire Protection Association (NFPA)
- Occupational Safety and Health Administration (OSHA)
- PG&E standards
- San Bernardino Fire Department/Certified Unified Program Agencies (CUPA) requirements
- San Bernardino County Floodplain regulations
- Uniform Fire Code (UFC) (Local Fire Code)
- Underwriters Laboratory (UL)

C.2 Civil

C.2.1 Site Datum

Following completion of recent aerial photogrammetry, the topographic map has been updated to 1-foot topographic contours. The new topographic map, which has been incorporated into the design drawings, is included as Figure 2.4-2 in the Basis of Design Report. The following data were used to establish control for the project and conduct site survey work:

- All coordinates listed are 1983 State Plane Ground Coordinates, Zone 5 (NAD1983, State Plane, California, V, FIPS, 0405). Standard transverse Mercator projection, with projection, with a scale origin point of x=0.0000 y=0.0000, using a grid adjustment factor of 1.000123. These coordinates can be used as ground datum. To convert back to grid coordinates, each coordinate value would be divided by 1.000123.
- The elevations are based on North American Vertical Datum of 1988 (NAVD88) based on NGS data sheets EU1248 and EU0763 in U.S. Survey feet.
- Units = International feet: 1 foot = 0.3048 meter exactly.
- All bearing are grid bearings, distances are ground distances, and coordinates are ground coordinates.

C.2.2 Earthwork

This section describes the design criteria for the movement of soil and rock into forms and structures needed for the project.

- Grading, Paving and Access Roads

  Cut and grading will take place at the site to install new remedy facilities. Access roads may be required to access certain project locations for construction and O&M. Access roads will be designed to the following standards (barring terrain or cultural, biological or natural resource constraints):

  - Maximum grade ≤ 10%
  - One way traffic width = 14 feet
  - Two way traffic width = 20 feet
  - Cut slopes ≤ 1.5:1
  - Fill slopes ≤ 2:1 (H:V)
  - Out slope road (1/4 inch per foot) so that drainage flows perpendicular to road centerline
  - Roadside ditches (V shaped or trapezoidal) with a minimum top width of 2 feet
  - Per San Bernardino County requirements (Chapter 82.13 Section 82.13.080) compaction to 90% minimum

  Pavement replacement will be in accordance with the California Department of Transportation's (Caltrans') *Flexible Pavement Structural Section Design Guide for California Cities and Counties* (latest edition).

- Utility trenches will be excavated to a minimum 3 feet deep and 3 feet wide. Utility trenches may include pipes (freshwater, extracted groundwater, carbon-amended water, remedy-produced water, clean in place (CIP), acid, coagulant, caustic, slurry, waste sump, utility, or spare pipes), as well as electrical and instrumentation conduits. Trench cutoff walls with drain systems may be installed at locations where pipe slopes exceed 8%-10% for long runs (300 to 500 feet) to help divert any potential water flow that may undermine the trench section. These will be added in the design submittal if needed. In areas where utility crossings exist there will be a minimum of 2 feet separation between utilities unless directed otherwise by the utility owner. GPS-based locations of utilities will be recorded as part of the as-built submittals as well as size, material, and horizontal and vertical separation distance from utilities. Construction GPS mapping and surveys of other pipelines will be required as appropriate.
- Pipe and conduit bedding material will be free of rock(s), rubbish, debris, and other objectionable material, and minimum compaction will be 90% to 95% relative density, per American Society for Testing and Materials (ASTM) D-1557 in areas sensitive to settlement. The minimum pipe bedding thickness will be 6 inches and the minimum pipe/conduit backfill zone thickness will be 3 inches. Bedding will be without voids, placed and consolidated to the proper depth in 8-inch maximum lifts. The backfill will be placed to final grade to conform to the elevation of the adjoining surface elevation.
- A survey of aboveground and underground utilities will be conducted within all work areas prior to beginning intrusive site work and construction activities. This survey will include, but will not be limited to, the following activities:

  - Notify Underground Service Alert (USA) or "Dig Alert"
  - Geophysical survey to identify underground features
  - It is Topock Compressor Station policy to minimize operational and safety risks by limiting subsurface intrusion as much as possible, and thus abandoned utilities are typically left in place. Because positive identification of all active and abandoned underground utilities prior to any intrusive activity within the station fence line is impossible, Compressor Station protocol requires all intrusive work be performed by hydrovac or hand excavation methods.

    As described during the October 24, 2011 site visit with the DTSC and the DOI, PG&E policy requires all excavations in the vicinity of existing infrastructure to be hand dug to *a minimum* of 3 feet; in more open

areas, hydrovac excavation may also be used. Depending on the location, density of utilities encountered, and available information regarding a specific location, hand excavation or clearing using the hydrovac may be required as deep as 10 feet below ground surface. No power equipment is used until the excavation has been physically cleared for utilities. A station employee observes each excavation effort and determines when it is safe to proceed with more intrusive methods. PG&E does not have a written procedure for this requirement; however, it is policy and is understood and strictly followed by all station personnel.

- Piping installed in utility corridors will be placed above ground or below ground. The preferred installation is below ground for many reasons, including but not limited to the following:

  a) The National Electrical Safety Code (NESC) considers an above-ground, non-overhead, high voltage electrical supply line to be an example of non-Code compliant, therefore, medium and high voltage electrical lines will be place underground. In addition, aboveground low voltage electrical 480 volt power lines carry the risk of causing electrical injuries from contact, and long runs of exposed electrical conduit also present numerous design and O&M challenges.

     i. It is worth noting that along the Route 66 segment in the Upland Area, considerations were also given to the piping alignment (underground) to maintain usable road width in narrow stretches of the road. The California/San Bernardino County Fire Code (Chapter 5) requires 26 feet minimum width for vehicle access. Although variances are allowed if turnarounds are available every 600 feet (County Standard 503.1), additional grading and cut backs would be required to create these turnarounds in several narrow road sections or sections with steep ravine. Note that aboveground structures would also require drainage features which adds to the footprint.

  b) Placement of water lines underground (versus aboveground) will not only avoid increased visual impacts, but will also protect the health, safety, and free movement of humans and animals. Underground piping will also enhance the integrity of the remedy infrastructure (e.g., avoid being hit by vehicular traffic), and minimize remedy footprint and future O&M challenges.

  c) Aboveground piping is inherently vulnerable as members of the public have been known to shoot pipes and large rocks or other debris may strike the pipe during a storm event. In addition, aboveground pipe will need periodic re-coating therefore, would require more maintenance compared to underground piping and as such, create more disturbance to nearby habitats as a result of maintenance activities.

  d) However, in certain cases, aboveground installations will be necessary to protect sensitive resources (e.g., aerial crossings of Bat Cave Wash, crossing of the Colorado River on the Arch Bridge) or to avoid potentially difficult construction conditions in bedrock (e.g., the aboveground piping along Route 66 between the East Ravine and the Arch Bridge).

  Belowground utility corridors will be constructed with pre-cast utility trench boxes with lids or buried directly in the soil. The installation option was selected based on the following criteria subject to constraints for the particular route (e.g., width of usable terrain):

  – No directly buried water piping will be installed below any other water pipe or conduit.

  – Directly buried electrical conduits may be installed beneath other electrical conduits.

  – There must be at least 6 inches of clearance between directly buried water piping. The clearance between directly buried water piping may be increased up to 12 inches.

  – The minimum spacing between directly buried electrical conduit shall be 3 inches or half the diameter of the conduit, whichever is greater.

  – Tracer wire for locating non-metallic pipes or conduit will be installed in the trenches.

- Trenchless construction will be used underneath existing infrastructure such as the I-40 highway and BNSF railway bridges. In such locations, these will be installed using trenchless methods such as auger boring or horizontal directional drilling. The methods will be designed such that they comply with relevant guidelines prepared by the Arizona Department of Transportation (ADOT), Mohave County (for County Road 10 bore), and BNSF listed below (see also Section 5.3.2 of the Basis of Design Report for encroachment permits). Also, the methods will comply with San Bernardino County requirements for trenchless crossings in California.
  - Caltrans Manual for Encroachment Permits on California State Highways, Seventh Edition, January 2002, Section 518, and Table 5.24 - Permit Code TN
  - ADOT Policy for Accommodating Utilities on Highway Rights-of-Way, December 2009
  - BNSF Utility Accommodation Policy, May 2007

  Pipes and conduit will be installed in steel casings when required by BNSF, ADOT, or Mohave County. Casings will extend beyond the length of the crossing a minimum of 10 feet. The need for cathodic protection will be evaluated on a case-by-case basis using site conditions and utility requirements. The casing will have centralizers and end caps 10 feet from the end of the casing. Identified spare pipes and conduits will be installed during construction. Exhibit C.1-1 lists minimum depth of cover for trenchless crossings. In some cases, concerns for pavement or railroad settlement or potential for drill fluid "frac-out" may require a thicker cover. Geotechnical borings may be required by ADOT, BNSF, or Mohave County (see Section C.4). If drilling fluids are used, continuous monitoring for frac-out conditions will be performed to prevent harm to human health and the environment caused by the release of such fluids.
- Any earthwork in areas of sensitive habitat (including floodplain and riparian areas, wetlands, and waters of the US, as well as desert washes and desert riparian) will be subject to the substantive equivalents of Section 404/Section 1600 requirements under mitigation measure BIO-1 (see the Mitigation Monitoring and Reporting Program in the EIR [DTSC 2011]).

EXHIBIT C.1-1
Depth of Cover Design Criteria for Trenchless Crossings
Groundwater Remedy Basis of Design Report/Intermediate (60%) Design
PG&E Topock Compressor Station, Needles, California

Transportation Agencies	Minimum Depth Of Cover
ADOT	• 3 feet minimum • 6 feet minimum for un-sleeved crossings up to 48" diameter • 10 feet minimum for pipelines larger than 48"
BNSF	• 3 feet minimum below flow line of ditch or ground surface • 5-1/2 feet minimum below base of rail, for casing diameters greater than 26" • 10 feet minimum without geotechnical study • 5-1/2 feet if it can be verified by geotechnical study

C.2.3 Storm Drainage

Stormwater will be managed to protect new structures and facilities built as part of the remedy. This section describes the design criteria associated with stormwater drainage.

Impervious surfaces will be sloped to drain. Culverts will be used to drain roadside ditches and protect stream crossings. Roof drainage from buildings will be collected in gutters and drain towards drainage systems. Stormwater captured within secondary containment will be managed at the remedy-produced water conditioning system. All drainage features and structures will be sized to meet San Bernardino County requirements for storm frequency and intensity.

- Rainfall intensity based on period equal to time of concentration for the basin being considered and 25-year recurrence interval.
- Minimum velocity for culverts is 2.0 feet per second. Maximum velocity for culverts is 10.0 feet per second.

During construction, erosion control measures will be implemented in accordance with San Bernardino County requirements and the construction Stormwater Pollution Prevention Plan (SWPPP). The erosion control measures will be tailored to the site to prevent sediment-laden water from leaving the site. The following erosion control measures will be used onsite:

- Site development considerations with construction scheduling
- Maintenance of buffer zones
- Disturbed-soil areas with decomposed granite
- Dust control on disturbed areas and access roads
- Diversion of runoff with earthen dikes, brow ditches, and berms to protect excavations
- Energy dissipaters, riprap channel protection, or outlet protection for discharge pipes, channels, and ditches
- Silt fence at limits of clearing
- Temporary sediment basins to protect existing drainage basins and culverts
- Check dams to control velocity along ditches and long longitudinal grades
- Stabilized construction entrance to all paved surfaces
- Materials management with material delivery, storage, and waste management
- Vehicle and equipment management with construction practices, cleaning, fueling, and maintenance

C.2.4 Site Security

In general, the security for remedial facilities located inside the Compressor Station will be provided for by the Compressor Station security system. Remedial facilities located outside of the Compressor Station will be equipped with security features/systems that are consistent with PG&E's current security standards. Such features, as determined necessary and in compliance with project and landowners' requirements, could include, but are not limited to, fencing to protect the equipment and provide safety for personnel and the public; locks to prevent unauthorized access; security devices and instrumentation; security communication systems; alarms to notify PG&E's security operations; and security cameras. Where appropriate, security features like cameras and card readers are noted on the 60% engineering plans/drawings (see Appendix D of this 60% BOD Report). Examples of security features to be installed at remedy facilities located at the TW Bench, MW-20 Bench, HNWR-1 well site, the North and South Aerial Crossings (crosses Bat Cave Wash) are described below. Additional details on security design criteria will be presented at the 90% design stage, after the remedy infrastructure locations have been confirmed. In compliance with the EIR mitigation measure CUL-1a-6, any additional phone calls and alarms associated with remedial activities will not be routed through PG&E's existing alarm system at the Compressor Station.

Transwestern Bench

- A perimeter fence will be installed with a motorized main gate and a personnel gate. The main gate will have a security card reader and camera to monitor and prevent unauthorized access.
- Perimeter cameras will be installed. Security cameras will also be installed inside select buildings/structures.
- The Central Maintenance Facility will have card readers at entrances.

MW-20 Bench

- Each new gate(s) will have a security card reader and camera.
- Perimeter cameras may be needed, but will be confirmed during the 90% design stage.
- Operational cameras will be installed inside select structures.

HNWR-1 Well Site

- A motorized gate with security card reader and camera will be installed.

North and South Aerial Crossings (Bat cave wash)

- Personnel gates with locks will be installed at each end of the 2 new aerial crossings.

C.2.5 Concrete Vaults

Concrete vaults will be installed to house mechanical and electrical equipment. Vaults will be precast concrete sections. The vaults will vary in depth depending upon use and location, but to the extent possible they will be designed to be shallow enough that entry would not require a confined space entry procedure. Each vault will be equipped with a steel ladder with extension, conforming to California Division of Occupational Safety and Health (Cal/OSHA) standards. Well vaults will be designed for an H-20 loading in traffic areas and the lids will be supplied with spring assists for safe opening. Fall protection removable grating (live load 300 pounds per square foot [psf]) will be provided. For non-traffic areas, standard lids (300 psf) will be supplied. All vault lids will be equipped with security locks or other security devices (e.g., embedded locks or 5-point bolts).

C.2.6 Construction in 100-year Floodplain

The 100-year floodplain is defined in the Flood Insurance Rate Map (FIRM), Panel 5705 of 9400 for San Bernardino County, California and Unincorporated Areas, Revised August 28, 2008, and Panel 5675 of 6700 for Mohave County, Arizona and Unincorporated Areas, Revised November 18, 2009 (Map Number 04015C5675G). The base flood elevation shown on the current FIRM is 464 feet NAVD at River Mile (RM) 234 of the Colorado River. A review of the Mohave County Flood Insurance Study (FIS) shows that this elevation is specific to the California side of the river only, and is different from information found in the newer FIS for Mohave County, AZ.

The effective FIS for San Bernardino County lists a regulatory base flood elevation of 463.90 feet NAVD. This design uses the more conservative elevation of 464 feet NAVD as the base flood elevation for the project on the California side of the Colorado River. The vertical datum for all flood elevations shown on the San Bernardino County FIRM is NAVD88.

The effective FIS for Mohave County lists a regulatory base flood elevation of 465.3 feet NAVD. This is used as the base flood elevation for the project on the Arizona side of the Colorado River. The vertical datum for all flood elevations shown on the Mohave County FIRM is NAVD88.

In this 60% design, certain infrastructure (piping) cannot be located outside of the 100-year floodplain as defined by the above baseline flood elevation. PG&E will work with San Bernardino County and Mohave County Flood Administrator to ensure compliance with the county requirements for construction in the floodplain.

C.3 Structural

This section describes design criteria for physical structures made of concrete and steel.

C.3.1 Concrete

Minimum requirements are listed below for structural concrete:

- Strength of poured-in-place concrete will be a minimum of 5,000 pounds per square inch (psi) at 28 days for all structures. Lower strengths of 3,000 psi will be used for non-critical structural elements as indicated in the specifications. 2,000 psi will be used for concrete fill, pipe and conduit encasement.
- Cement will be clean, fresh, Type II/, low alkali, Portland cement conforming to ASTM C150.
- Aggregate will be non-reactive.
- Cement content for all structures will be a minimum of 7.5 sacks per cubic yard of concrete.
- Slump of concrete will be as low as practicable to produce a dense, well consolidated concrete and not exceed 4” unless otherwise authorized by PG&E Project Engineer.
- Finish of formed surfaces will be smooth and free of fins, honeycomb, and segregation.

- When the surfaces have become sufficiently hardened, they will be kept continually moist for a period of not less than seven days. Curing compound conforming to ASTM C309 may be used in-lieu of wetting surfaces only where approved by the Engineer.
- In conformance with the EIR mitigation measures AES-1d and AES-2e, integral color concrete will be used in place of standard gray concrete.

C.3.2 Reinforcing Steel (Minimum Requirements)

Minimum requirements for reinforcing steel are as follows:

- Reinforcing steel will be deformed, grade 60, conforming to ASTM A615, and be free from coating which will reduce the bond.
- Reinforcing steel will be sized in accordance with the Strength Design Method or Alternate method.
- Reinforcing steel splices will be in accordance with the requirements of ACI 318-11.

C.3.3 Dead Loads

Dead loads will consist of gravity loads induced by all structural elements, equipment, piping, and contained liquids.

C.3.4 Live Loads

Live loads for different structural elements are listed below:

- Roof live loads will be designed for a minimum live load of 20 psf.
- Stairs, walkways, and platforms will be designed for a minimum live load of 100 psf.
- Concrete floor on Grade and Grating will conform to the latest edition (2010) of the California Building Code (CBC), but will be a minimum live load of 500 psf, or Wheel Load of 16 kips.
- Elevated Concrete floor – 200 psf or Fork Lift load – 4 kips.
- Live load on aerial crossings (pipe bridges) will be minimum 500 pounds at alternate panel point of trusses.

C.3.5 Seismic Loads

The design will meet CBC (2010) and as amended by San Bernardino County and/or ASCE 7-10 “Minimum Design Loads for Buildings and Other Structures”. Specifically:

- CBC 2010, Site Class D
- Ss = 0.434 (Needles, CA)
- S1 = 0.135 (Needles, CA)

C.3.6 Wind Loads

The design will meet CBC (2010) and as amended by San Bernardino County and/or ASCE 7-10 “Minimum Design Loads for Buildings and Other Structures”. Minimum Wind Load = 20 psf. Detailed structural design criteria are shown in Exhibit C.3-1.

EXHIBIT C.3-1

Structural Design Criteria

Groundwater Remedy Basis of Design Report/Intermediate (60%) Design
PG&E Topock Compressor Station, Needles, California

Category	Criteria
General	
Governing Code	CBC (2010) as amended by San Bernardino County, IBC 2009, ASCE 7-10
Concrete: CODE and SPECIFICATION	ACI 318-11, Building Code Requirements for Reinforced Concrete ACI 350-06, Environmental Engineering Concrete Structures
Concrete Masonry Units: SPECIFICATIONS	CBC (2010)
Structural Steel: SPECIFICATIONS	AISC Allowable Stress Design Specification for Structural Steel Buildings, 13th Edition
Aluminum: SPECIFICATIONS	CBC (2010)
Concrete	
Strength	F'c = 5,000 psi for all structures (pipe bridge foundation and precast concrete containment trench), 3,000 psi for general structural concrete(pump pads, thrust blocks, valve vaults) and 2,000 psi for concrete fill, pipe/conduit encasement.
Reinforcing	ASTM A615, Grade 60, Type S
Prestressing Strand	ASTM A416
Welded Steel Wire Fabric	ASTM A185 or ASTM A497
Design	Strength Design or Alternate Method
Detailing	ACI SP-66(00) Manual of Standard Practice for Detailing Concrete Structures
Color	Integral color concrete in place of standard gray color concrete (EIR mitigation measures AES-1d and AES-2e)
Reinforced Masonry	
Concrete Masonry Units	ASTM C90, Grade N, Type I (Unit Compressive Strength f'm = 1,900 psi at 28 days
Mortar for Unit Masonry	ASTM C270, Type M, Minimum Compressive Strength at 28 days = 2,500 psi.
Reinforcing	ASTM A615, Grade 60, Type S
Cold-Drawn Steel Wire	ASTM A 482
Grout	ASTM C476, Minimum Compressive Strength at 28 days = 3,000 psi.
Structural Steel	
Structural "W" Shapes	ASTM A992 (Fy = 50 ksi)
Structural channels. plates, angles, etc.	ASTM A36 (Fy = 36 ksi)
Structural Tubing	ASTM A500, Grade B (Fy = 46 ksi)
Steel Pipes	ASTM A53, Grade B
Stainless Steel	Alloy Types conforming to ASTM A-167 and ASTM A-276.
Plates and Shapes	Type 316 unless otherwise noted
Bolts, Nuts and Washers	Type 316
Welding	AWS E70 Electrodes
High Strength Bolts	ASTM A325F, Min 3/4" Diameter
Other Bolts	ASTM A307, Grade A

EXHIBIT C.3-1
Structural Design Criteria
Groundwater Remedy Basis of Design Report/Intermediate (60%) Design
PG&E Topock Compressor Station, Needles, California

Category	Criteria
Anchor Bolts	ASTM A36
Chemical Anchor Bolts	SS Type 316, Hilti HVA Adhesive Type or Equal
Expansion Anchors	Hilti SS Quick Bolts, Type 316 or Equal Bolts, Nuts and Washers
Timber	
TBD	CBC (2010)
TBD	National Design Specification for Wood Construction

C.4 Geotechnical

A geotechnical data summary is included in Attachment C of this Appendix. The purpose of this geotechnical summary is to provide information on existing site geology and geotechnical data in support of the groundwater remedy design and to propose areas where supplemental geotechnical investigation is needed to verify design parameters. Coordination with the Soil RFI/RI investigation program was conducted in planning of the supplemental geotechnical investigation to minimize the number of boreholes, thereby minimizing ground disturbance. It is important to note that as PG&E continues to engage in discussions with transportation agencies, counties, and other property owners/land managers to obtain institutional controls, access agreements, and permits, additional geotechnical data may be required to meet specific requirements of agencies and/or property owners/land managers.

The geotechnical design criteria presented in Exhibit C.4-1 are based on existing site-specific geologic information and geotechnical data, to support foundation and trenching designs, as well as trenchless crossings (I-40 and BNSF crossings).

EXHIBIT C.4-1
Geotechnical Design Criteria
Groundwater Remedy Basis of Design Report/Intermediate (60%) Design
PG&E Topock Compressor Station, Needles, California

Parameter	Criteria
Moist soil unit weight	120 pounds per cubic foot (pcf)
Shear strength parameters	<u>Cohesionless Soils</u> Friction angle: from 32 to 35 degrees for compacted fill Friction angle: from 28 to 30 degrees for native soils <u>Cohesive Soils</u> Undrained shear strength: from 800 to 1,000 pounds per square foot (psf)
Controlling earthquake magnitudes	Mean earthquake magnitude is 6.6 Modal earthquake magnitude is 7.9
Peak ground acceleration	For structure design is 0.10 g (design value for Site Class D) For liquefaction assessment is 0.15 g (for Site Class D)
Allowable bearing capacity	4,000 psf
Allowable long-term settlement	1 inch

EXHIBIT C.4-1
Geotechnical Design Criteria
Groundwater Remedy Basis of Design Report/Intermediate (60%) Design
PG&E Topock Compressor Station, Needles, California

Parameter	Criteria
Sliding coefficient of friction	0.45
Lateral soil pressure equivalent fluid unit weight	Active pressure: 45 pcf Pressure at rest : 60 pcf. Passive resistance = 175 pcf
Temporary cut and fill slopes	2 Horizontal:1Vertical
Frost depth	8-10 inches
Additional Geotechnical Criteria	

- Soil is corrosive to concrete structures and steel (resistivity > 1,000 ohm-centimeters, sulfate > 2,000 parts per million (ppm) and chloride > 500 ppm).
- Soil profile is classified as Site Class D (stiff soil site), as defined in the CBC (2010).
- Shallow foundations for buildings with support extending a minimum of 2 feet below lowest adjacent grade. Slabs and footings set on a minimum of 6" layer of granular base leveling course.
- Pipe design based on depth of fill, weight of fill, compaction of fill and modulus of soil reaction (E' = 1,000 psi).
- Native onsite materials may be considered for backfill if they have an expansion index (EI) less than 50 and contain less than 8 percent fines, as determined by ASTM D4829 and D422.

C.5 Mechanical

This section describes the design criteria associated with key mechanical elements of the project. Mechanical design will follow the California Mechanical Code (2010) unless noted, and fire requirements per the California Fire Code (2010).

C.5.1 Piping

Based on experience with operation and maintenance of the IM facilities, the groundwater in the floodplain has high levels of total dissolved solids, chlorides, sulfate, and other minerals that have caused significant corrosion to iron-based piping material from mild carbon steel to Type 316 stainless steel. Therefore, piping will be designed and installed in accordance with best practices and past site experience for operation and maintenance, including use of flanged or union joints for serviceability and isolation valves for systems requiring routine maintenance.

In general, piping materials will be compatible with the characteristic of the conveying fluids and will be single-walled unless the pipe is used to convey: (1) groundwater or remedy-produced water that exhibits the hazardous waste characteristic; or (2) concentrated carbon substrate. In these cases, double-walled piping will be used. Double-walled pipe segments conveying either of the fluids described above will include appropriately designed leak detection systems. Low point sumps/traps with level switches and alarms will be the primary method of detecting leaks. Continuous leak detection systems may be used as an alternative to low point switches if switches are deemed impractical or incompatible with the installation. Pipeline segments installed in belowground concrete trenches (e.g., Pipeline A) will be designed with leak detection at low points (level switch with alarm).

In the case of Pipeline H which connects to well IRL-4 located at the bottom of a wash, double walled pipe segments will be used to convey remedy produced water from the wellhead to a valve vault located on the plateau. As access to this well is difficult and via a steep slope, this containment design is to provide for safe operations during well rehabilitation where acids and chemicals are used. In the event of a leak, the secondary

containment will drain to a concrete sump located at the wellhead. The concrete sump will be equipment with a level switch and alarm, as well as a sump pump.

Corrosion Control

For corrosion control, above ground and belowground steel pipe will be coated. Any steel pipe near the point where it emerges from the ground will be coated. Air-to-soil transition piping is any steel piping located 18" below ground or 6" above ground. Cathodic protection equipment will be applied as follows: 1) steel piping and structures will be cathodically protected underground; 2) plastic pipe (e.g., HDPE or CPVC or PVC) will be preferentially used when appropriate for corrosion resistance; and 3) steel pipe will be cement mortar-lined to prevent internal corrosion. Piping cathodic protection will conform to National Association of Corrosion Engineers SP0177-2007 Standard Recommended Practice - Mitigation of Alternating Current and Lightning Effects on Metallic Structures and Corrosion Control Systems. Exceptions to coating and cathodic protection requirements are steel casing pipes used for trenchless crossings.

In compliance with the EIR mitigation measures AES-1d and AES-2e, the external coatings used for wells, pipelines, storage tanks, structures, and utilities will consist of muted, earth tone colors that are consistent with the surrounding natural color palette, and matte finishes. Coating materials will be corrosion-resistant to protect the underlying surfaces.

Pressure Loss

For the freshwater and the remedy-produced water piping network, a hydraulic model built using the EPANET water supply program was used to simulate and optimize the piping design. Attachment B of this Appendix contains more details about the hydraulic modeling.

For the design of the in-situ remediation piping system, to ensure adequate distribution, the pressure loss in the branch distribution piping to each of the injection wells (including frictional losses and wellhead pressures from drop pipe frictional losses and pressure drop across the foot valve) will be designed to be 10 times higher than the pressure drop in the distribution header. The CIP loop conveyance piping will be designed to operate at a velocity of 3 to 5 feet per second (fps) and will have cleanouts at least every 400 feet.

C.5.2 Process Equipment

Primary process equipment (substrate dosing pumps, compliance related sensors, safety switches, etc.) will be designed for parallel operation or provide stand-by equipment to provide sufficient redundant capacity.

To the extent practical, all valving, instrumentation, manways, and access ladders for tanks will be located on the northern face (including northeastern face) of the remedial facilities to allow O&M personnel to work on the shady side during O&M activities.

C.5.3 Valves

Valves installed for throttling and flow control will include globe, needle, and diaphragm valves. Isolation valves will include; gate, ball, and butterfly valves. Other valves expected to be included in the remedy system include spring and swing check valves, pressure relief, air relief, variable orifice, foot, and vacuum relief valves. Carbon substrate storage tanks may include additional safety valves, including emergency ventilation and combination pressure/vacuum relief valves in accordance with applicable standards. Valves will meet PG&E and industry standards appropriate to the application and process conditions.

Exhibit C.5-1 lists potential valve types associated with the major equipment. Valves will meet industry standards appropriate to the application and process conditions. More details will be provided in the Intermediate design submittal.

EXHIBIT C.5-1
Potential Valve Type with Associated Device
Groundwater Remedy Basis of Design Report/Intermediate (60%) Design
PG&E Topock Compressor Station, Needles, California

Equipment	Potential Valve Type
Fresh Water Injection Pumps	Pressure reducing, ball, ~~gate~~, swing check
Riverbank Extraction Pumps	Swing check, globe, butterfly, ball
Transwestern Bench Extraction Pumps	Swing check, globe, ball
IRZ Pumps	Swing check, globe, ball, pressure reducing, pressure relief
East Ravine Pumps	Swing check, globe, ball
IRZ Backflush Pumps	Swing check, gate, ball
Freshwater Backflush Pumps	Swing check, butterfly, flow control, ~~multiport gate~~
Carbon Substrate Pumps	Pressure and vacuum relief, solenoid, swing check, motor operate valve, ball
Pipelines	Butterfly, motor-operated valve, combination air release, ball,
Well Maintenance Reagent Pumps	Ball, Swing check, solenoid, multi-port, motor-operated valve
Ethanol Storage and Transfer	Pressure and vacuum relief, swing check, solenoid, ball, emergency vent
Process Pumps (Submersible Sump Pumps, Air-operated Diaphragm Pumps, Metering Pumps, Centrifugal Pumps)	Butterfly, swing check, motor-operated valve, ball, solenoid

C.5.4 Water Storage Tanks

Fixed steel tanks used for storing conditioned remedy-produced water will be designed in accordance with American Water Works Association Standard D-100 (2011). Foundations will be designed in accordance with the structural criteria described in Section C.3 above. Frac tanks used for storing remedy-produced water will be fabricated of welded steel and equipped with axles and wheels to enable them to be moved. Corrosion prevention measures will be applied to all tanks, including internal coatings. Permanent metal tank(s) will also have internal and external cathodic protection except for ethanol tanks mounted on saddle-type supports.

C.5.5 Secondary Containment

Secondary containment systems will be sized and designed in conformance with NFPA standards and California Fire Code (2010). In general, key design criteria are:

- Containment Volume
  - Secondary containment for a single container (tank) will be 110 percent of the primary container. Secondary containment for multiple containers will be 100 percent of the largest container's volume or 10 percent of the aggregate volumes of all containers, whichever is greater. In addition to the aforementioned, secondary containment systems open to rainfall will also be sized to accommodate spillage from the largest single tank at a minimum plus a 24-hr rainfall, as determined by a 25-yr storm. All secondary containment systems open to fire sprinkler discharge will also be sized to accommodate the discharge from all sprinkler heads over the secondary containment system for 20 minutes. Sprinkler system requirements to be determined.

- Containment Construction and Drainage
  - Secondary containment will be constructed using materials capable of containing a spill or leak for at least as long as the period between monitoring inspections. Drainage can be accomplished through the use of one of the following methods:
    - Liquid-tight sloped or recessed floors in indoor locations or similar areas in outdoor locations
    - Liquid-tight floors in indoor locations or similar areas in outdoor locations provided with liquid- tight raised or recessed sills or dikes
    - Sumps and collection systems (e.g., collection sump)
    - Drainage systems leading to an approved location
    - Other approved engineered systems
  - Collection systems will be equipped with a monitoring system to monitor level in containment sumps. Upon detection of fluids in the sump an alarm will be initiated to alert the operators of a potential release.
- Overfill Protection
  - A means of providing overfill protection for primary container will be required. This may be an overfill prevention device and/or an attention getting high level alarm.
- Separation of Materials
  - Materials that in combination may cause a fire or explosion, or the production of a flammable, toxic, or poisonous gas, or the deterioration of a primary or secondary container will be separated in both the primary and secondary containment so as to avoid intermixing.

C.5.5.1 Remedy-produced Water Conditioning Plant and Associated Tank Farm Areas

The Remedy-produced Water Conditioning Plant will contain hazardous materials (caustic, acids, etc.) and the B-side Remedy portion of the plant will process water streams with known or suspected contamination. The conditioned water tank farm area will be equipped with the capability for local neutralization using caustic or acids. Therefore, these areas will be designed with the following secondary containment and monitoring systems:

- Area 1 – The influent storage tank farm area will have secondary containment constructed with concrete, coated with epoxy, and equipped with a collection sump and a sump pump that pumps to either the Influent Storage Tanks or the Compressor Station Clean Water Tank.[2] The destination will be selected manually. A level switch mounted in the sump will issue an alarm when liquids are detected.
- Area 2 – The remedy-produced water conditioning system will have secondary containment constructed with concrete, coated with epoxy, and equipped with a sump and a sump pump that pumps to the Influent Storage Tanks or the TCS Cooling Tower Blowdown line. Sump monitoring will be accomplished via a level switch and alarm.
- Area 3 – The conditioned water tank farm area will have secondary containment constructed with concrete, coated with epoxy, and equipped with a sump and a sump pump that pumps to the Clean Water Tank or the Influent Storage Tanks. Sump monitoring will be accomplished via a level switch and alarm.

C.5.5.2 Truck Loading/Unloading Areas

There will be three truck loading/unloading stations with one at the MW-20 Bench, one at the Transwestern Bench, and one at the Compressor Station. Each truck loading/unloading area will be equipped with a secondary

[2] The Clean Water Tank receives clean water from the Oil/Water Separator and other sources of non-oily wastewater streams such as the cooling tower blowdown. Water from the Clean Water Tank is pumped directly to the TCS evaporation ponds.

containment system constructed of epoxy-coated concrete, transfer pumps, pipes or hoses for connecting to the trucks, and sumps and sump pumps. The sumps will have level switches that will alarm in the event of a spill.

C.5.5.3 Decontamination Pad

Consistent with the EIR mitigation measure CUL-1a-9, the existing decontamination pad at the Transwestern Bench will be reused during remedy implementation. This pad will be repaired and equipped with a collection sump and a sump pump that pumps to the remedy-produced water conditioning plant at the Compressor Station. It will be used to store soil cuttings, water from groundwater sampling, and to clean/store equipment used in well installation, maintenance, and sampling.

C.5.6 Septic and Plumbing System

The bathrooms and showers in the Central Maintenance Facility at the Transwestern Bench will be connected to a new leach field. The work will follow PG&E standards and County codes (adopted California Plumbing Code 2010). Fresh water will be supplied for use in the onsite laboratories and sample preparation areas in the Maintenance Facility, Remedy-produced Water Conditioning Plant building, and the MW-20 bench. Washbasins or sinks in laboratories will be drained to tanks or containers specifically for storing the fluids. The contained fluids will be managed in accordance with applicable permits, and state and federal regulations.

Remedial buildings will include rain water downspouts with spill out fittings to outside splash blocks for surface runoff, potable water emergency eyewash and shower stations, and plant water piping with wash-down hose bibs and connections for flushing of the chemical feed systems. The emergency eyewash and shower stations will be located near the chemical storage/feed areas, unless existing stations are nearby, and will be provided with drains.

C.5.7 Fire Protection Equipment

The Remedy-produced Water Conditioning Plant at the Compressor Station and the Central Maintenance Facility at the Transwestern Bench are unclassified, as described by NFPA 820; hence, only fire hydrants for fire protection are required. No fire and explosion hazard, materials of construction and ventilation requirements are listed in NFPA 820 for these facilities. However, PG&E is evaluating the installation of a sprinkler system for the Maintenance Facility.

Portable fire extinguishers will be mounted in buildings in accordance with PG&E requirements and County Fire codes. Portable fire extinguishers will be ABC multipurpose dry chemical type UL-rated 20A:120B:C.

All electrical equipment will have Underwriters Laboratory approval where applicable. Areas of the electrical installation will be classified in accordance by Class, Division, and Group. Specifically, for the IRZ facilities at the MW-20 Bench and the Transwestern Bench, the following will apply:

- Class I, Division I within a 5-ft radius of the carbon storage tank vents.
- Class I, Division II within a 10-ft radius of the carbon storage tank vents (from vent elevation to ground).
- Class I, Division II from ground surface to 18-inches above grade within a 10-ft radius of the tank footprint.
- Class I, Division II within the carbon amendment building where there are pipes with >10% ethanol.

C.5.8 Heating, Ventilation, and Air Conditioning

The new heating, ventilation, and air conditioning (HVAC) systems in planned remedy facilities are independent of the existing Compressor Station HVAC system. The design criteria for makeup air and temperature control for the laboratory/office and motor control center (MCC) rooms are as follows:

- Office/laboratory: Summer temperature <86 degrees F with no control for humidity. Makeup ventilation rate at 0.15 cubic feet per minute (cfm) per square foot or 15 cfm/person by code requirements.
- MCC Room: Summer temperature <90 degrees F with no control for humidity.

Wall-mounted ductless mini-split heat pumps will serve the rooms. A second, 100 percent capacity redundant unit will be installed for the Office/laboratory space. Wall mounted ductless mini-split heat pumps have two main components: an outdoor compressor/condenser and an indoor air-handling unit. Each unit will be capable of both cooling and heating the space. A conduit that houses the power cable, refrigerant tubing, suction tubing, and a condensate drain links the outdoor and indoor units. The indoor units will be mounted on the upper part of the room wall. Each unit will be sized per the heating and cooling requirements of each room.

For ventilation air in the Office/laboratory space, a 60 cfm exhaust fan will be installed with either inlet door louvers or by undercutting the door to transfer outside air from the filter room.

Outside of the office/lab and MCC room, the first and second floors of the remedy-produced water conditioning system will be naturally ventilated by constructing the building with no walls on three sides of the first floor (north, east and west), a wall on the north side with louvers, and a steel grating on the second floor adjacent to the filters and outside the MCC room and laboratory/office.

C.5.9 Air Pollution Control

Temporary and permanent mobile and fixed equipment emissions will comply with Clean Air Act - USC §§ 7401, et seq. (National Emission Standards for Hazardous Air Pollutants [NESHAP]); 40 Code of Federal Register (CFR) 61; 40 CFR 63 and local air district requirements (e.g., Mojave Desert Air Quality Control District).

C.5.10 Hazardous Materials Storage

The Hazardous Materials Division of the San Bernardino County Fire Department is the Administering Agency and the CUPA for San Bernardino County with responsibility for regulating hazardous materials handlers, hazardous waste generators, underground storage tank facilities, aboveground storage tanks, and stationary sources handling regulated substances. The handling and management of hazardous materials within the remedy facilities (e.g., the remedy-produced water conditioning facility) located within the Compressor Station will be incorporated into the existing Compressor Station Hazardous Materials Business Plan (HMBP). A separate HMBP will cover the handling and management of hazardous materials at remedy facilities located outside of the Compressor Station (e.g., MW-20 Bench, Transwestern Bench). A table of contents for the HMBP is provided in Volume 1 of the O&M Manual; complete plans will be provided at the 90% design stage. PG&E is in discussion with San Bernardino County regarding the HMBP; additional details will be provided at 90% stage.

Chemicals that are anticipated to be used in remedy processes and stored on site are listed below with location (estimated quantities of chemicals will be provided in the 90% design after process parameters have been confirmed):

- Potential chemicals to be used and stored for the Remedy-produced Water Conditioning System at the Compressor Station include the following:
  - 25% sodium hydroxide (caustic)
  - 19% hydrochloric acid
  - A coagulant is under evaluation for aiding in settling solids in the Conditioning System (if determined to be needed in the process, it will be identified during the 90% design)
  - A flocculent addition is under evaluation to aid in the dewatering of the influent tank bottoms prior to pumping to the liquid phase separators (the need for this dewatering aid and flocculent type would have to be tested during operations)
- Potential chemicals to be used and stored for the freshwater pre-injection treatment at the Compressor Station include the following:
  - An oxidizer such as calcium hypochlorite
  - An acid like sulfuric acid for pH adjustment and media regeneration
  - A caustic for pH adjustment and media regeneration

- Potential chemicals to be used and stored at the carbon amendment facilities include the following:
  - Carbon substrate (95% ethanol and 5% isopropyl alcohol) – one 15,000-gallon tank located at the MW-20 Bench and one 3,000-gallon tank located at the Transwestern Bench
  - Acids, caustics, and/or dispersants for use in the Clean-In-Place (CIP) systems at the MW-20 Bench and Transwestern Bench

Potential chemicals to be used in well maintenance include hydrochloric acid, sulfamic acid, sulfuric acid, phosphoric acid, hydroxyacetic acid, acetic acid, citric acid, oxalic acid, ascorbic acid, hydrogen peroxide, sodium hypochlorite, sodium hydroxide, chlorine dioxide, potassium hydroxide, polyphosphate, Aqua Clear™ PFD, Rodine-103/Rodine 213, QC-21, CB4, NuWell 120, NuWell 130, nitrogen, and/or carbon dioxide. These materials will be brought on site during the well maintenance/rehabilitation activities, but will not be permanently stored on site.[3]

C.6 Electrical

In this section, the electrical design criteria and goals are described. Electrical systems and equipment will be designed to meet PG&E standards and the California Electrical Code (2010) unless specifically noted. The new Remedy electrical power distribution system will receive power from a single source; potential sources of power are under evaluation by PG&E. Regardless of its source, electrical power will be distributed to the project loads at the Transwestern Bench, the Remedy-produced Water Conditioning Plant at the Compressor Station, the MW-20 Bench, and three distribution locations for wells.

C.6.1 Safety, Availability, Reliability, and Efficiency

Of paramount importance is the need to minimize electrical hazards to operating personnel, including shock, arc flash, electrical fire, and combustion of explosive atmospheres. This is accomplished by applying electrical equipment within its ratings and in accordance with the electrical, fire, and life safety codes listed herein. Every 480 volt and above disconnect will have provisions for lock-out tag-out. This will provide safe working for equipment that may not be in view of the breaker handle. Where possible, the breaker handles will be in view of the connected load for additional safety.

A backup generator will be available for use by this project. The location of the generator will be determined by the 90% stage.

The power distribution system will include energy management features, such as real-time power and energy monitoring, which can be used in conjunction with process data to optimize process efficiency.

C.6.2 Distribution Voltage Selection

The project's standard distribution systems include the following:

- 12.47 kV, ungrounded delta, 3-phase, 3-wire
- 480Y/277 volts solidly grounded wye, 3-phase, 4-wire
- 240/120 volts solidly grounded wye, 1-phase, 3-wire
- 208/120 volts solidly grounded wye, 3-phase, 4-wire

The distribution voltages used throughout the project will be selected to reduce maximum load flows to levels below standard electrical equipment capacity ratings, to increase the distance that it may be transmitted, to reduce fault duty to levels standard electrical equipment withstand and interrupting ratings, and to minimize the cost of the electrical installation. Exhibit C.6-1 lists the equipment utilization voltages.

[3] For additional details, see the Operations and Maintenance Manual, Volume 1, Section 4, Exhibit 4.2-5.

EXHIBIT C.6-1
Equipment Utilization Voltages
Groundwater Remedy Basis of Design Report/Intermediate (60%) Design
PG&E Topock Compressor Station, Needles, California

Equipment	Volts	Phase
Fluorescent Lighting	120	Single, in office areas
Incandescent Lighting	120	Single
High-Intensity Discharge Lighting	120 or 240	Single
Other lighting	120	Single
Convenience Outlets	120	Single
Motor Control	120	Single
Motors, less than 1/2 horsepower (hp)	120	Single
Motors, 1/2 hp and above	480	Three

C.6.2.1 Voltage Drop

Total voltage drop from the transformer secondary to the point of utilization, including feeder, branch circuit, and transformation, will not exceed:

- Lighting - 3 percent
- Motors - 5 percent
- Receptacles - 5 percent
- Electric Heaters - 5 percent

Voltage dip calculations will be performed for motor starting whenever an individual motor exceeds 20 horsepower or if the motor is the longest or shortest distance from the transformer.

C.6.2.2 Demand Factors

The demand factors listed in Exhibit C.6-2 will be used for sizing power switchboards, MCCs, panelboards, and transformers. Connected load will be used for circuit and equipment sizing in accordance with NEC requirements. A 10 to 20 percent spare capacity will be provided at MCCs and panelboards. In accordance with the NEC, where it is unlikely that two or more coincident loads will be in use simultaneously, only the largest load(s) that will be in operation at one time will be used for calculating the total load of a feeder.

C.6.2.3 Metering

Multifunction digital meters will be provided for the MCC in the Remedy-produced Water Conditioning Plant.

C.6.2.4 Branch Circuits

- Connected load and NEC requirements will be used for sizing branch circuit breakers and conductors.
- A minimum wire size of No. 12 American wire gauge (AWG) copper will be used for lighting and receptacle branch circuits. No. 10 AWG will be used when voltage drop requires a larger conductor on lighting circuits, and when receptacle circuits are longer than 75 feet. Where electronic ballasts are specified for fluorescent or high-intensity discharge lighting, a dedicated neutral will be provided for each lighting circuit. There will be NO common neutral for multiple lighting circuits.
- In general, lighting branch circuit loads will be limited to 1,500 watts. Lighting and receptacle branch circuits will not be combined, and the number of convenience receptacles on any one branch circuit will be limited to five duplex in process areas, and six duplex in office areas.

- The electrical design will include a circuit and raceway schedule providing unique names and termination location information for each power, control, and signal circuit.

EXHIBIT C.6-2
Demand Factors
Groundwater Remedy Basis of Design Report/Intermediate (60%) Design
PG&E Topock Compressor Station, Needles, California

Service	Demand Factor
Lighting	1.0 x Connected Load
Emergency Lighting	1.0 x Connected Load
Air Conditioning Equipment	1.0 x Connected Load
Ventilation Equipment	1.0 x Connected Load
Drainage Pumps and Ejectors	1.0 x Connected Load
Convenience Receptacles	180 VA each [a]
Process Loads	1 x Full Load Amps of loads plus 25% of largest motor

Notes:
a. Apply NEC demand factor of 50% for totals over 10 kW
VA = volt-amperes

C.6.2.5 Panelboards

- Branch circuits or feeders on the drawings will identify the panelboard and device protecting the individual circuit or feeder.
- Each panelboard will be equipped with a minimum of 20 percent spare breakers with spaces, bus work, and terminations to complete the standard size panelboard.
- Panelboard schedules will be prepared indicating circuit identification, protective device trip rating, number of poles, load in volt-amps by phase, rating of main lugs or main circuit breaker, neutral bus size, ground bus size, and the integrated short circuit rating of the panelboard.

C.6.2.6 Uninterruptible Power Supply

Uninterruptible power supply (UPS) will be provided for each control panel. The UPS output will be automatically selected through an automatic bypass relay.

C.6.2.7 Motor Control and Protection

Safety interlocks, such as emergency stop pushbuttons, will be hardwired directly to motor control circuits. Process controls and interlocks will be hardwired from Supervisory Control and Data Acquisition (SCADA) system programmable logic controllers (PLCs) to motor starters. Electrical metering data will be transmitted from intelligent motor overloads and relays to the SCADA system over an Ethernet network. Elementary (ladder-type) control diagrams will be prepared for each motor showing control wiring, pilot devices, auxiliary contacts, and external connections. A single diagram will be used for more than one motor having the same control.

In addition, the following guidelines will be used:

- Adjustable overload relays will be provided for all MCC-mounted and remote mounted constant-speed motor controllers. MCC-type construction will be used.
- MCCs located in the same room with the switchboard that powers them will not have a main circuit breaker. MCCs located in areas remote from the common MCC or switchboard that powers them will have a main circuit breaker.

- MCC enclosures will be NEMA 1 gasketed. Circuit breakers 225 amps and smaller and motor starters NEMA 4 and smaller will be the cubicle type with auto disconnect of control and motor power conductors.
- MCCs will include feeder circuit breakers and motor starters. Motor starters for motors up to 25 hp will be the full-voltage, non-reversing, combination type with a magnetic-only circuit breaker. Motor starters for motors larger than 25 hp will be the solid-state, soft-start, reduced-voltage, combination type with a magnetic-only circuit breaker.
- Motor starters will include an ON/OFF/AUTO or HAND/OFF/REMOTE selector switch, GREEN motor ON light, RED motor OFF light, and AMBER abnormal condition, fault, or alarm lights, as required. Lights will be the LED push-to-test type. These devices will be mounted on the front of the motor starter control center cubical.

C.6.2.8 Equipment Identification

Process and instrumentation diagram (P&ID) tag numbers will be used for motors, instrumentation and control devices, and other process equipment shown on electrical drawings. This same numbering method will be used to create unique tags for major electrical distribution equipment.

C.6.3 Electrical Equipment

This section discusses general guidelines for the selection and configuration of electrical equipment.

C.6.3.1 Distribution System Equipment

Equipment will be selected with adequate momentary and interrupting capacity for the point in the system where it is used. Series-rated criteria will not be used, except for self-contained equipment. Where practical, phase and ground fault protective devices and device settings will be selected that will function selectively to disconnect that portion of the system that is malfunctioning, and with as little disturbance to the rest of the system as possible.

Distribution equipment criteria include the following:

- 15 kV-class metal-clad switchgear will be specified to provide power distribution selection at the front end of the Remedy system.
- The switches will be interlocked, so only one power feed will be allowed to connect to the system at any given time. There will not be any provisions or need for paralleling systems.
- 15 kV-class cable will connect the transformers together through underground conduit.
- Sectionalizing equipment will allow for individual transformers to be isolated and replaced or repaired.
- The transformers will be distribution style, similar to those used for commercial buildings. The secondary voltage will be 480/277 volt.
- 480-volt MCCs with combination motor starters of the motor circuit protector (MCP) type rated for the available fault current.
  - Starters that are NEMA size 2 (25 hp) and larger will be the solid-state, soft-start type or adjustable-speed drives.
  - MCCs will be hardwired to the PLC for motor control.
  - Field-mounted, maintained, emergency stop push buttons will be hardwired directly to the motor starter.
  - MCCs will be sized to accept future loads and either allow for space in the structures, or floor space for future sections.
- 480-volt and 240/120-volt power distribution and lighting panelboards with molded case, bolt-in, circuit breakers with integrated short-circuit rating suitable for the available fault current.

C.6.3.2 Raceway Systems

Separate ductbanks will be used for the following systems:

- 12.47-kV power distribution
- 480-volt power wiring and 120-volt control wiring
- Communications systems, including Ethernet, low-voltage signal for fire alarm, telephone and data systems, and fiber optic cabling

Special consideration will be given to separation of raceways involving low-level process control signal wiring and power system wiring to minimize the possibility of interference. General guidelines for raceway sizing, selection, and installation are as follows:

- Conduit sizing will be based on Type THW insulation.
- The following minimum sizes will be used:
  - 3/4-inch minimum diameter for conduit not in ductbanks used within buildings or connected directly to the equipment or device.
  - 1-inch minimum diameter for conduit in ductbanks for field interconnection of equipment or buildings.
- Raceways will be a combination of concealed and exposed in process areas.
- Raceways will be concealed in walls and ceilings in control rooms, offices, and areas that have finished interiors.
- PVC-coated rigid galvanized steel conduit will be used for the transition from underground direct burial and under-slab PVC conduit and concrete-encased (in-floor slab) PVC and rigid galvanized steel conduit to exposed rigid galvanized steel conduit. The transition section will extend from 1 foot below grade or top of floor slab or the last foot of conduit in the floor slab, to 6 inches out of the floor slab, concrete encasement, or above grade.
- The number of conduit bends will be limited to an equivalent of 270 degrees on long runs without pull boxes.
- PVC-coated rigid galvanized steel conduit and fittings that are resistant to direct sunlight and include an interior urethane coating will be used in exposed corrosive interior and exterior areas. This conduit will also be used for underground direct-burial. Direct buried conduit will have a 3-inch red colored concrete cap.
- PVC Schedule 40 conduit and fittings will be used for under-slab and concrete-encased ductbanks.
- Rigid galvanized steel conduit and fittings will be used when exposed in interior non-corrosive process and non-process areas, pre-cast concrete utility trenches, and in non-corrosive areas outdoors.
- Flexible, nonmetallic, liquid-tight conduit 4 inches or smaller in size will be used for connections to motors, transformers, etc., as required. Fittings will be PVC-coated in wet or corrosive areas. Length of flexible conduit will be limited to 36 inches.
- Underground conduit routes will be identified with nonmetallic warning tape and tracer wire above underground direct-burial conduits.
- Raceways will be tagged with a engraved plastic or nonferrous metal embossed tag attached to the raceway with a stainless steel wiring. Raceway tags as defined in the plans and conduit schedule will be located at each terminus, pullbox, and at minimum intervals of every 50 feet on exposed raceways (in ceiling spaces and surface-mounted).
- Cable trays will be evaluated for use where appropriate.

C.6.3.3 Wire and Cable

- Stranded copper conductors will be used for all except lighting and receptacle wiring. Solid conductors No. 10 AWG and smaller will be used for lighting and receptacle wiring.
- A minimum conductor size of No. 12 AWG will be used for power and lighting branch circuits. Type THHN/THWN-2 insulation will be used for No. 10 AWG and smaller conductors (conduit will be sized for Type THW conductors). Type XHHW-2 insulation will be used for No. 8 AWG and larger conductors (conduit will be sized for THW conductors). Conductor ampacity ratings of 75°C will be used for sizing conductors.
- A minimum conductor size of No. 14 AWG will be used for individual 120-volt control circuits.
- A minimum conductor size of No. 14 AWG will be used for 120-volt control circuits routed in a common conduit with the power conductors to the motor circuit controls. Combining individual motor power and control conductors in a common conduit will be done up to a maximum power conductor size of No. 2 AWG.
- Power and control conductors will be color-coded. Conductors No. 8 AWG and smaller will have colored insulation. Conductors No. 6 AWG and larger will be color-coded with tape at each end and at accessible intermediate points.
- Conductors and control cables will be tagged with a permanent sleeve or nylon marker plate attached with a nylon strap. Conductor tags with an approved tag number will be provided by the Contractor and will be located in accessible locations at each termination.
- Under normal conditions, the maximum wire size will be limited to 500 kcmil. Parallel conductors will be used for circuits requiring greater capacity.
- The 120-volt control circuits will be combined in control cables containing multiple No. 14 AWG stranded copper conductors with type THHN insulation and a common PVC outer jacket.
- A 600-volt multi-circuit control cable will be used where grouping control circuits is practical, and the number of individual wires exceeds six conductors. When selecting control cable size, 25 percent spare (plus or minus 10 percent) conductors will be used.
- Multi-conductor control cable color-coding will be ICEA S-61-402 Appendix K, Method 1, Table K-2.
- Low-voltage analog signal circuits will be routed in 600-volt single twisted shielded pair instrumentation control cables. The cables will consist of No. 16 AWG stranded copper conductors with combination PVC/nylon insulation, drain wire, shield, and PVC outer jacket. Signal circuits may be combined in multi-twisted shielded pair instrumentation control cables with common overall shield. The cables will consist of No. 18 AWG minimum stranded copper conductors, with a combination PVC/nylon insulation, pair and common drain wires, pair and common shields, and PVC outer jacket. Instrumentation control cables will be in accordance with ICEA S-82-552. Low-voltage analog signal circuits will not be routed in the same control cable or conduit with 120-volt control or power circuits.
- Adequate separation of power and instrumentation and control (I&C) wiring will be provided to avoid signal interference.
- Shielded power cables will be used between adjustable-frequency drives and the driven motor.

C.6.3.4 Color Coding

Conductor insulation colors will be as shown in Exhibit C.6-3.

EXHIBIT C.6-3

System Color Coding

Groundwater Remedy Basis of Design Report/Intermediate (60%) Design
PG&E Topock Compressor Station, Needles, California

System	Conductor	Color
All Systems	Ground	Green

12.47 kV	Phase A	Phase A
	Phase B	Phase B
	Phase C	Phase C

C.6.3.5 Circuit Identification

Circuit names will be assigned based on the device or equipment at the load end of the circuit. Circuits will be identified at each termination and in accessible manholes and pull boxes. Plastic sleeves for conductor No. 3 AWG or smaller and plastic marker plates for larger conductors will be used. For lighting circuits, the panel and circuit number will be identified for each fixture.

C.6.3.6 Enclosures

NEMA 1 enclosures will be used for equipment in electrical rooms and finished areas, while NEMA 12 enclosures will be used for electrical equipment in dry industrial locations. NEMA 3R enclosures will be used for outside and in wet locations, and NEMA 4X enclosures will be used for corrosive locations. NEMA 4 enclosures will be used for underground and in wet locations.

C.6.3.7 Fiber Optic Cabling

Where used, fiber optic cabling will be installed either in conduit (4-inch-diameter minimum with three 1 ¼-inch inner ducts), or in a cable tray. Routing of the raceway system will provide for large-radius turns to prevent breaking of the fiber optic cable.

C.6.3.8 Convenience Receptacles

General-service duplex receptacles will not be spaced more than 25 feet apart in process areas. Receptacles will be surface-mounted on walls or columns. Weatherproof receptacles will be installed in damp areas or areas subject to washdown.

Outlet-mounted ground-fault circuit-interrupters (GFCIs) will be provided where required by the NEC. Panelboard or feed-through-type devices will not be used.

C.6.3.9 Low Voltage AC Induction Motors

Enclosures for both horizontal and vertical motors 25 hp and smaller will be totally enclosed, fan-cooled (TEFC) severe-duty for indoor and outdoor locations. In wet and/or corrosive locations, chemical industry severe-duty (CISD-TEFC) motors will be used. Motors larger than 25 hp will be open drip-proof, unless TEFC or CISD-TEFC is required for specific conditions (evaluated on a case-by-case basis considering cost and required physical protection). Submerged motors will be totally submersible, air- or oil-sealed. Bearings will be rated for 100,000-hour Anti-Friction Bearings Manufacturers' Association (AFBMA) B-10 life.

Alternating current (AC) induction motors will be the premium efficiency type with the following:

- Motors will have a 1.15 service factor at 50 degrees Celsius ambient, except where inverter-duty rated.
- NEMA design letter to fit the application (usually NEMA design B), and locked rotor kV-amps kVA Code G or lower.
- Motor windings will be copper wire.
- Motors 15 hp and larger located in damp or wet areas will be provided with 115-volt space heaters to prevent moisture condensation.
- TEFC motors will be equipped with weep holes and drain plugs to withdraw condensed moisture.
- Motors operated by variable frequency drives (VFDs) will be specified with special provisions for inverter duty operation.

C.6.4 Electrical Systems Analysis

An analysis of the fault current will be made during the 90% design. Maximum fault current will be analyzed with sufficient accuracy to establish the required interrupting ratings of circuit protective devices specified.

During construction, a final load flow, short circuit, coordination, and arc flash hazard analysis will be performed by the Project Engineer, based on actual equipment purchased, to establish protective device settings that will result in reasonable selectivity of device operation for both three-phase and ground faults, while minimizing the arc flash hazard to workers. The following protective device characteristics will be specified:

- Protective relay model, pickup, and time delay settings
- Circuit breaker model, frame size, trip unit, trip settings, and time delay settings
- Current transformer ratios

Arc flash labels will be placed on the installed electrical equipment.

C.6.5 Grounding System

An integrated grounding system will be installed throughout the new remedial facilities and interconnected with the existing grounding system at the Compressor Station. A lightning protection system will be connected to the facility ground ring as well as to any exposed metallic surfaces.

Grounding electrode ground mats or embedded rods and cables will be designed for a maximum resistance to ground of 25 ohms. Where more than one rod is required, rods will be installed at least 20 feet apart. A minimum of No. 4/0 AWG stranded bare copper cable will be used for interconnecting to ground rods and footing rebar.

A lightning protection system will be designed with air terminals and separate grounding system on buildings or structures used for operations and maintenance and chemical storage, including shade structures. Shade structures, if isolated from electrical equipment, may not be required to have lightning protection.

Equipment Grounding

A separate ground conductor sized in accordance with NEC requirements will be installed in raceways for power feeders and branch circuit raceways for motor control, lighting, and receptacle loads.

Shields of shielded instrumentation cables will be grounded to the ground bus at the power supply for the analog or low-voltage discrete signal circuit. Shielded instrumentation cables will not be grounded at more than one point.

C.6.6 Hazardous and Corrosive Area Definition

Area classification will be shown on the drawings and will be defined at the 90% design stage.

C.6.7 Energy Efficiency and Lighting

Energy efficiency will be a factor in equipment selection. Motors will be specified to be Premium Efficient per latest NEMA MG 1 standard where possible. Lighting equipment and facilities for safe operations will be designed to be energy efficient and comply with California Title 24 and county lighting ordinances. In compliance with EIR mitigation measure CUL-1a-7, to minimize construction and operations-related lighting impacts, the lighting for the remedy will include the following features: (1) shrouding/shielding for portable lights during construction and operational activities; (2) installation of portable lights at the lowest allowable height and in the smallest number feasible to maintain adequate night lighting for safety; and (3) shielding and orientation of lights such that off-site visibility of light sources, glare, and light from construction activities are minimized to the extent feasible. In addition, no additional permanent poles will be installed for lighting.

C.6.7.1 General Lighting Requirements

Since CUL-1a-7 is not meant to replace or subsume any actions required by the County or state or federal entities with regard to lighting required for minimum security and safety purposes, the following specifications will also be met:

- Construction Industry 29 CFR 1926.56 (lighting safety requirements)
- General Industry 29 CFR 1910.120 (HAZWOPER) (lighting safety requirements)
- San Bernardino County Code Title 8 Section § 83.07.040 Glare and Outdoor Lighting - Mountain and Desert Regions
- Mohave County Outdoor Light Control Ordinance 87-1
- Specific requirements from land owners, if feasible and is not in conflicting with the mitigation measures and county codes

The San Bernardino County lighting requirements are divided into two categories: residential and commercial/industrial. Remedy facilities are located both on and outside of PG&E-owned land, as follows:

- PG&E parcel (zoned industrial) – Compressor Station and Transwestern Bench
- Outside of PG&E parcel (zoned recreational) – Federally-owned land (including MW-20 Bench), the Havasu National Wildlife Refuge, and Fort Mojave Indian Tribe-owned land

PG&E will apply industrial requirements on the PG&E parcel and residential requirements outside of the PG&E parcel. The rationale for installing lights outside of the PG&E parcel is as follows:

Well Sites

- Nighttime access is not necessary; therefore no permanent lights will be installed. No new permanent light poles will be installed.
- Portable or truck-mounted lights can be brought in the event that an emergency or unforeseen condition occurs and plugged in locally.

MW-20 Bench

- Similar to the IM-3 Brine Storage Facilities located at the MW-20 bench, nighttime access is not normally required. Exterior lights will be installed but activated manually.
- No new permanent light poles will be installed.

In both Mohave and San Bernardino Counties, the lighting requirements are intended to reduce glare or other light emissions on adjacent properties. Exhibit C.6-4 lists San Bernardino County shielding requirements for different types of fixtures in residential and commercial areas.

EXHIBIT C.6-4
Shielding Requirements For Outdoor Lighting In the Mountain Region and Desert Region
Groundwater Remedy Basis of Design Report/Intermediate (60%) Design
PG&E Topock Compressor Station, Needles, California

Fixture Lamp Type	Residential Area Shielded	Commercial/Industrial Area Shielded
Low pressure sodium	Fully	Fully
High pressure sodium	Prohibited except fully shielded on streets	Fully
Metal halide	Prohibited	Fully
Fluorescent	Fully	Fully
Quartz	Prohibited	Fully
Incandescent > 60 watts	Fully	Fully
Incandescent 60 watts or less	No requirement	No requirement
Glass tubes filled with neon, argon, or krypton	No requirement	No requirement
Mercury vapor	Prohibited	Fully
Halogen	Prohibited	Fully

Laser source light or similar light intensity light for advertising purposes	Prohibited when projected above the horizontal	Prohibited when projected above the horizontal

Source: San Bernardino County Development Code, Ch. 83.07.040 Table 83-7. Note that LED lights (a low energy form) may be suitable for the Remedy. This technology is not covered in the County Code.

Fixtures prohibited by the County Code will not be used on the project. Fixtures planned for use in the remedy project are listed in Exhibit C.6-5. Fixtures used at the Compressor Station will comply with County requirements and follow PG&E standards for energy efficiency and lighting at operating facilities.

PG&E Topock Compressor Station, Needles, California

Fixture Lamp Type	Shielding Requirement	Type Used in Remedy Project?
Low pressure sodium	Fully	Indoors/Outdoors
Fluorescent	Fully	Indoors
Incandescent > 60 watts	Fully	Indoors
Incandescent 60 watts or less	No requirement	Indoors
LED	No requirement (not covered in the County Code)	Indoors

Source: San Bernardino County Development Code, Ch. 83.07.040 Table 83-7.

The amount of light or the illumination level is based on having sufficient light to do the expected tasks safely. OSHA sets standards for construction activities as shown on Exhibit C.6-6 below.

EXHIBIT C.6-6
Minimum Illumination Intensities
Groundwater Remedy Basis of Design Report/Intermediate (60%) Design
PG&E Topock Compressor Station, Needles, California

Level (foot-candles)	Area of Operation
5	General construction area lighting.
3	General construction areas, concrete placement, excavation and waste areas, access ways, active storage areas, loading platforms, refueling, and field maintenance areas.
5	Indoors: warehouses, corridors, hallways, and exit ways.
5	Tunnels, shafts, and general underground work areas. (Exception: minimum of 10 foot-candles is required at tunnel and shaft heading during drilling, mucking, and scaling. Bureau of Mines approved cap lights shall be acceptable for use in the tunnel heading.)
10	General construction plant and shops (e.g., batch plants, screening plants, mechanical and electrical equipment rooms, carpenter shops, rigging lofts and active store rooms, mess halls, and indoor toilets and workrooms.)
30	First aid stations, infirmaries, and offices.

Source: Safety Lighting Levels During Construction – OSHA 29 CFR 1926.56(a) Table D-3.

For activities and areas not included under the OSHA standard, the ANSI/IES has established recommended illumination levels under Recommended Practice RP-07-01 (see Exhibit C.6-7 below).

EXHIBIT C.6-7
Recommended Illumination Levels per ANSI/IES RP-07-01
Groundwater Remedy Basis of Design Report/Intermediate (60%) Design
PG&E Topock Compressor Station, Needles, California

Category	Description	Level
A	Public spaces	3 fc (30 lux)
B	Simple orientation for short visits	5 fc (50 lux)
C	Working space where simple visual tasks are performed	10 fc (100 lux)
D	Performance of visual tasks of high contrast and large size	30 fc (300 lux)
E	Performance of visual tasks of high contrast and small size, or tasks of low contrast and large size	50 fc (500 lux)
F	Performance of visual tasks of low contrast and small size	100 fc (1,000 lux)
G	Performance of visual tasks of critical importance	300 – 1,000 fc (3,000 – 10,000 lux)

Notes:
fc=foot-candles
1 fc ≈ 10 lux

C.6.7.2 Lighting Calculations

The recommended illumination level (foot-candles) for each space will be calculated in accordance with IES procedures. The following assumptions will be made, unless specific information is available:

Reflectances for finished rooms:

- Ceilings 80 percent reflectance
- Walls 50 percent reflectance
- Floors 20 percent reflectance

Reflectances for unfinished rooms:

- Ceilings 50 percent reflectance
- Walls 30 percent reflectance
- Floors 10 percent reflectance

Maintenance factor (light loss factor):

- Fluorescent lighting 0.80

C.6.7.3 Emergency Lighting System

- Emergency illumination will be provided in appropriate spaces, as required by code to provide life safety, property, and equipment protection.
- Adequate lighting levels will be provided to maintain safe building egress and critical process plant functions. Emergency lighting will be located near MCCs and any equipment locations that need to be monitored on a continuing basis.
- In large process areas, emergency standby lighting units with a battery pack and two lamps and lighted exit signs with a battery pack will be provided. The battery pack will power the lights for at least 90 minutes.

- In non-process and finished areas, continuous-on lights with emergency ballast and battery pack, and exit signs with a battery pack will be provided. The continuous-on light battery pack will power one fluorescent lamp and the exit sign battery pack will power the exit sign for at least 90 minutes.

C.6.7.4 Explosion-Proof Luminaires

Any room or space listed as a hazardous atmosphere area will have explosion-proof-type luminaires UL listed for installation in the hazardous area classifications, as required by Article 500 of the NEC.

C.6.7.5 Nighttime Construction Lighting

The first step will be to determine whether nighttime construction work is required. Nighttime construction-related activities will be limited to work that cannot be disrupted or suspended until the following day, such as, but not limited to, well drilling and development or decommissioning activities. If nighttime construction is required, the following principles will be applied:

- Identify the active area for construction and the applicable lighting standards. Only areas of active construction may be illuminated.
- Obtain portable lighting (including solar-powered). Lights must include shielding/shrouding (e.g., downward facing fixtures with cutoff shields to reduce light diffusion). No permanent poles will be installed for nighttime lighting.
- Install the minimum lighting feasible to maintain adequate night lighting for safety at the lowest allowable height. Orient the lights such that off-site visibility of light sources, glare, and construction activities is limited.
- Assign a responsible member of the construction crew, such as foreman or crew boss, to extinguish the lighting as soon as the nighttime construction work is completed.

C.6.8 Communications

Fiber optic cable or conventional copper wire will be used for sending signals via cable. Wireless communications devices like radio, satellite, or cellular, may be used as appropriate.

C.6.9 Existing Utilities

All existing utilities will be potholed for actual depth prior to construction following Compressor Station or utility owner methods and requirements, including maintaining a minimum 25-foot right-of-way for the L300 gas pipelines located near occupied buildings. Existing engineering drawings have been reviewed to identify areas of potential conflict, but are for planning purposes only, not solely relied upon. A utility survey was conducted in early 2012 to support the remedy design. See also Section C.2.2, Earthwork.

C.7 Instrumentation and Control

The I&C system for the project will utilize a stand-alone SCADA system and local PLCs. The SCADA system will be located at the Central Maintenance Facility (Transwestern Bench) and will provide monitoring, supervisory control, alarming, and control functions. Historian software will collect, archive and distribute project-wide raw data and provide access to historical data.

In general, emergency shutdown of equipment due to alarm conditions (low discharge flow, high discharge pressure, motor overload, pump seal water failure, high level vault alarms, etc.) will be hardwired and will occur remotely or be executed locally. These alarm conditions will require manual reset at the SCADA or the local digital controller. In conformance with the EIR mitigation measure CUL-1a-6, all additional phone calls and alarms associated with remediation activities or facilities will not be routed through PG&E's existing alarm system utilized at the Compressor Station. The notification system for remediation-related alerts and/or phone calls will not introduce additional noise to the project area, to the maximum extent feasible, provided there is ongoing compliance with applicable safety regulations or standards of the Federal Energy Regulatory Commission, Occupational Safety and Health Administration, and other agencies.

Local PLCs will have operator interface terminals. The operator interface will include sufficient access to modify system set-points, parameters, alarms limits, and indication of associated process variables and instruments. This data will also be available to the SCADA system for full remote control, alarming, trending, archiving, etc.

Each PLC switch will be connected to the Maintenance Building's gigabit capable Ethernet backbone switch. The fiber cable will be run from the Maintenance Building communication panel to remote communication panels and onto each remote PLC. The fiber cable will be multimode or single mode as applicable, consisting of 12 fibers per cable. All fiber cables will be color coded, labeled and terminated at a fiber interconnect panel.

The system has been designed to allow for isolation/removal of components that could fail from operational sequencing, thereby minimizing downtime. Full redundancy of the control system was determined to be unnecessary. System outage in individual area is expected to be repaired and put back into service within two to three days given an appropriate inventory of parts and skilled staff availability.

Power Distribution to Instrument Power Panel

All control power for each area PLC will be supplied by control panel. The control panel shall be fed from the area primary distribution transformer. All I&C power for field devices or panels will be sourced from the control.

Uninterruptible Power Supply

The UPS will be double conversion "true online" and configured with an automatic bypass switch for battery maintenance. The UPS will provide power to the PLC, 24-volt DC power supply, Digital Input/Digital Output (DI&DO) cards, and analyzer power.

Power System Monitoring/Control from SCADA

Power distribution panels, motor control centers, and communications panels will be supplied with digitally networked power metering devices for remote energy monitoring and control. Primary distribution equipment and selected secondary equipment will be supplied with electrically actuated circuit breakers or contactors which will be available for remote position monitoring and alarming as well as remote manual and automatic control via the SCADA system. Automatic sequencing for restarting of equipment after restoration of power will be provided through SCADA.

C.8 Architectural

Building and all infrastructure components will conform to the following:

- Exterior finishes: In conformance with the EIR mitigation measure AES-1d and AES-2e, the color of the wells, pipelines, reagent storage tanks, control structures, and utilities shall consist of muted, earth-tone colors that are consistent with the surrounding natural color palette. Matte finishes shall be used to prevent reflectivity along the view corridor. Integral color concrete should be used in place of standard gray concrete.
- The design, location, and physical appearance and character of new construction at the Topock Compressor Station will be consistent with existing buildings in scale, form, materials, and architectural detail.
- For new construction within the Compressor Station fenceline: In keeping with the Secretary of the Interior's Standards for the Rehabilitation of Historic Buildings, the new construction will be differentiated from existing historic architecture on the property, but will be compatible with the historic materials, features, size, scale and proportion, and massing to protect the integrity of the Topock Compressor Station and its environment.
- Floors: Floors will be reinforced cast-in-place concrete and steel grates where required for water containment. Six-inch housekeeping pads at equipment locations.
- Doors and frames: Heavy-gauge hollow metal doors and frames will be used. Doors from the exterior into the facility and the interior door into the groundwater sampling equipment room will receive a tempered glass window. Hardware to be of heavy gauge and made of stainless steel where practical.

- Overhead sectional doors: A 12-foot wide by 12-foot high heavy-gauge steel overhead sectional door with perforations to allow for air movement. Overhead door to be manually operated.
- Exterior wall assemblies: Exposed concrete and painted concrete masonry unit (CMU) on the lower floor. Insulated metal siding on the upper floor with Kynar finishes to match existing adjacent buildings.
- Interior walls and ceilings: Metal studs with Batt insulation where separating conditioned and non-conditioned spaces. Wall to be built on a concrete curb and receive moisture resistant gypsum board on both sides.
- Windows: Aluminum framed windows with a clear anodized finish. Energy efficient insulated tempered glass with a low-E coating. Extensive use of day lighting through windows.
- Louvers: Aluminum drainable louver with a clear anodized finish.
- Roof: Insulated metal roof with continuous ridge vent and Kynar light colored finishes to match existing adjacent buildings.
- Fire protection: Fire extinguishers as required per building and fire codes including NFPA 10.
- Interior finishes: Epoxy paint over gypsum board and CMU. Clear sealer at concrete. All paint to be off-white to promote a bright space where light can reach areas behind equipment.
  - Cabinetry: Wood cabinets with chemical-resistant countertops and stainless steel pulls.
  - Floors: Smooth texture and finished with a clear surface sealer to increase the durability of the concrete surface and to maintain a clean, dust-free environment.
  - Framing: Steel framing to be finished with an epoxy primer and polyurethane finish coating.
  - Interior walls: Epoxy paint over gypsum board in laboratory room and MCC room, light colored vinyl backed insulation at metal roof, painted concrete at lower floor ceiling to improve light reflectivity.
  - Pedestrian doors: Field finished with polyurethane and epoxy finish coating.

C.9 PG&E Personnel Requirements

PG&E personnel will perform the following activities during construction:

- PG&E personnel, or their designee, will lead TCS-specific safety and biological and cultural sensitivity training for contractors and employees.
- Serve as liaison and primary contact for any agency, tribal, or other third party personnel inspecting and/or monitoring construction and O&M activities.
- Serve as liaison and primary contact for community, stakeholders, agencies, Tribes, members of the press, and others requesting site tours or project-related information.
- Initiate communications with/notifications to agencies, land owners, and others, as required, in the event of emergencies or contingency triggers.
- Attend stand-up tailboard (safety) meetings before the start of work each day to review safety policies and specific hazards likely to be encountered in the day's activities.
- Sign waste manifest forms and compliance documents that require PG&E certification.
- Monitor for compliance with PG&E safety standards and requirements and contract specifications, terms, and conditions.

Additional criteria may be added for the pre-final (90%) design submittal.

C.10 Health and Safety

The project falls under federal Occupational Safety and Health Administration (OSHA) Hazardous Waste Operations and Emergency Response (HAZWOPER) requirements (29 CFR 1910.120) so these procedures must be followed in addition to California and Arizona state requirements.

These requirements will be embodied in project-specific health and safety plan(s) for construction and O&M that will be prepared and submitted to DTSC and DOI for review prior to ground disturbance activities. In addition, health and safety work plans will be prepared or amended by construction, drilling and other service contractors working on the project. Existing health and safety plans will be reviewed and amended, as needed, to suit new project requirements and/or conditions. PG&E personnel similarly work under PG&E's own health and safety requirements. These health and safety plans will describe such things as training, site control, medical surveillance, safety personnel roles and responsibilities, personnel protective equipment, exposure monitoring and air sampling programs, heat and cold stress, and site work rules and procedures.

Project-specific health and safety plans will be provided with the Pre-Final (90%) Design submittals.

C.11 Noise

- A design margin of 3 to 5 A-weighted decibels (dB[A]) will be considered in all noise design criteria.
- In conformance with the EIR mitigation measures NOISE-3 and CUL-1a-10, the operational noise design criteria for the project will be per San Bernardino County Development Code 83.01.080 for acceptable exterior noise standards for place of worship, which is 55 dB(A) Leq daytime (7 a.m.-10 p.m.) and 45 dB(A) Leq nighttime (10 p.m.-7 a.m.) (Leq is the equivalent average hourly noise level) (see page 4.9-24 of the EIR [DTSC 2011]). The noise measurement locations will be at the edge of the Maze closest to the subject facilities and at the short-term ambient noise measurement locations (ST-1, ST-2, and ST-3) in Exhibit 4.9-2 of the certified EIR (DTSC 2011).
- For remedy facilities in Arizona, the operational noise design criteria will be 60 dB daytime and 50 dB nighttime average at closest residences (per current Mohave General Plan, Exhibit V-5, Maximum Noise Levels for Various Land Use).
- For remedy facilities on the Refuge, the operational noise design criteria will be 60 dB.
- For remedy facilities located on the Compressor Station and within PG&E property, the operational noise design criteria will be consistent with the noise environment at the Station, per San Bernardino County Development Code 83.01.080 for industrial land use, 70 dB(A).
- The construction noise criteria will conform to San Bernardino Development Code and Mojave County standards, as well as the EIR mitigation measures NOISE-1, -2, and -3. Per San Bernardino County Code Division 3 Chapter 83.01.080, temporary construction, maintenance, repair, or demolition activities between 7:00 a.m. and 7:00 p.m., except Sundays and federal holidays, are exempt from noise limits.

Attachment A
Carbon Substrate Selection and Degradation Pathways Design Bulletin (*on CD-ROM only*)

ARCADIS	TOPIC: **Carbon Substrate Selection and Degradation Pathways Design Bulletin**	
Revision 2 (8/1/12)	REPORT SECTION: Appendix C	BULLETIN No.:

1. Purpose

The objective of this Design Bulletin is to detail the basis of design for the selection and usage of carbon substrates and their degradation pathways for the In-Situ Reactive Zone (IRZ) at the Pacific Gas & Electric (PG&E) Topock site. There is a wide spectrum of organic carbon substrates available for anaerobic in-situ reactive zone (IRZ) applications including fermentable soluble substrates such as molasses, lactate, and whey; alcohols such as ethanol and methanol; semi-soluble substrates such as emulsified vegetable oil; and solids such as chitin and bark mulch.

Selection of the appropriate substrate depends on the balance between the mode of delivery, the substrate properties, and the rate of carbon utilization. Substrates considered for use in the Topock Compressor Station final remedy will be discussed in this appendix, as well as general degradation pathways. Some information on carbon substrate dosing design is also provided in this appendix to supplement the thorough treatment of the dosing design in the groundwater modeling Appendix B.

$Mn(IV)$	Tetravalent manganese
$Mn(II)$	Divalent manganese
MnO_2	Manganese dioxide
NO_3^-	Nitrate
NO_2^-	Nitrite
N_2	Nitrogen
O_2	Oxygen
SO_4^{2-}	Sulfate

4. Carbon Substrate Selection

Based on the results of the preliminary evaluation, the carbon substrates that were carried forward into remedy design included ethanol (used in the Uplands In-Situ Pilot Test [ARCADIS 2009]), sodium lactate (used in the Floodplains In-Situ Pilot Test [ARCADIS, 2007]), emulsified vegetable oil, and liquid whey. Each of these carbon substrates were evaluated in the Final Environmental Impact Report (FEIR, DTSC, 2011). The selection of the appropriate substrate depended on the balance between the mode of delivery, the substrate properties, and the rate of carbon utilization.

It is anticipated that for most of the final remedy operational period, substrates that are soluble with short biodegradation half lives (i.e., 5 to 20 days), like lactate and ethanol, will be used to facilitate effective distribution and establishment of reducing conditions across the IRZ, with the highest degree of distribution control, given the utilization of the carbon substrates and by-products (discussed below) to completion (i.e. to complete degradation to carbon dioxide and methane). During the 60% design stage, ethanol was selected for use in the ongoing design and for initial use in the final remedy based on additional considerations including substrate cost and PG&E's greater experience and past successes with ethanol (e.g., at the PG&E Hinkley Compressor Station site). However, carbon substrate selection may change over the lifetime of the project as substrate costing varies. In addition, alternative substrates could be useful for certain situations that arise over the life of the project. For example, emulsified vegetable oil may be used during future operational stages of the remedy if a low dosage, slow release reservoir of carbon would be advantageous.

5. Organic Carbon Degradation Pathways

Within an active IRZ, periodic injection activities support the development of a diverse microbial community that utilizes the augmented organic carbon supply via a complex network of degradation pathways. In general, there are two types of processes by which organic carbon substrates are consumed: respiratory processes and fermentation processes. Regardless of the carbon substrate used and the complex network of degradation

pathways stimulated, the resultant end products of degradation will include carbon dioxide, methane, and biomass. Eventually, biomass will also decay into carbon dioxide and methane. The following provides an overview of the various degradation pathways that will be stimulated within the IRZs, identifies the typical intermediates that may form, and includes several balanced oxidation-reduction reactions. This list may not be inclusive, considering the complex microbial ecology that will develop within the IRZ, but is intended to provide a basic framework for understanding the carbon degradation pathways.

In respiratory processes, organic carbon substrates are oxidized to carbon dioxide, releasing electrons that in turn reduce terminal electron acceptors (oxygen, nitrate, hexavalent chromium, iron, manganese, and sulfate). In fermentation processes, the organic carbon substrates are both oxidized and reduced via the metabolic pathways. The general pathways and intermediates for organic carbon degradation are shown on Figure 1. As shown on the figure, in the respiratory pathways coupled to reduction of oxygen, nitrate, chromium, iron, manganese and sulfate, the carbon substrate is completely oxidized to carbon dioxide. Consequently, total organic carbon concentrations return to ambient concentrations following IRZ injections.

Fermentation reactions produce additional intermediates such as fatty acids, alcohols, lactate, succinate, and hydrogen from primary fermentation of more complex organic carbon substrates, and acetate and single carbon (C-1) compounds, like formate, from less complex substrates or the intermediates of primary fermentation.

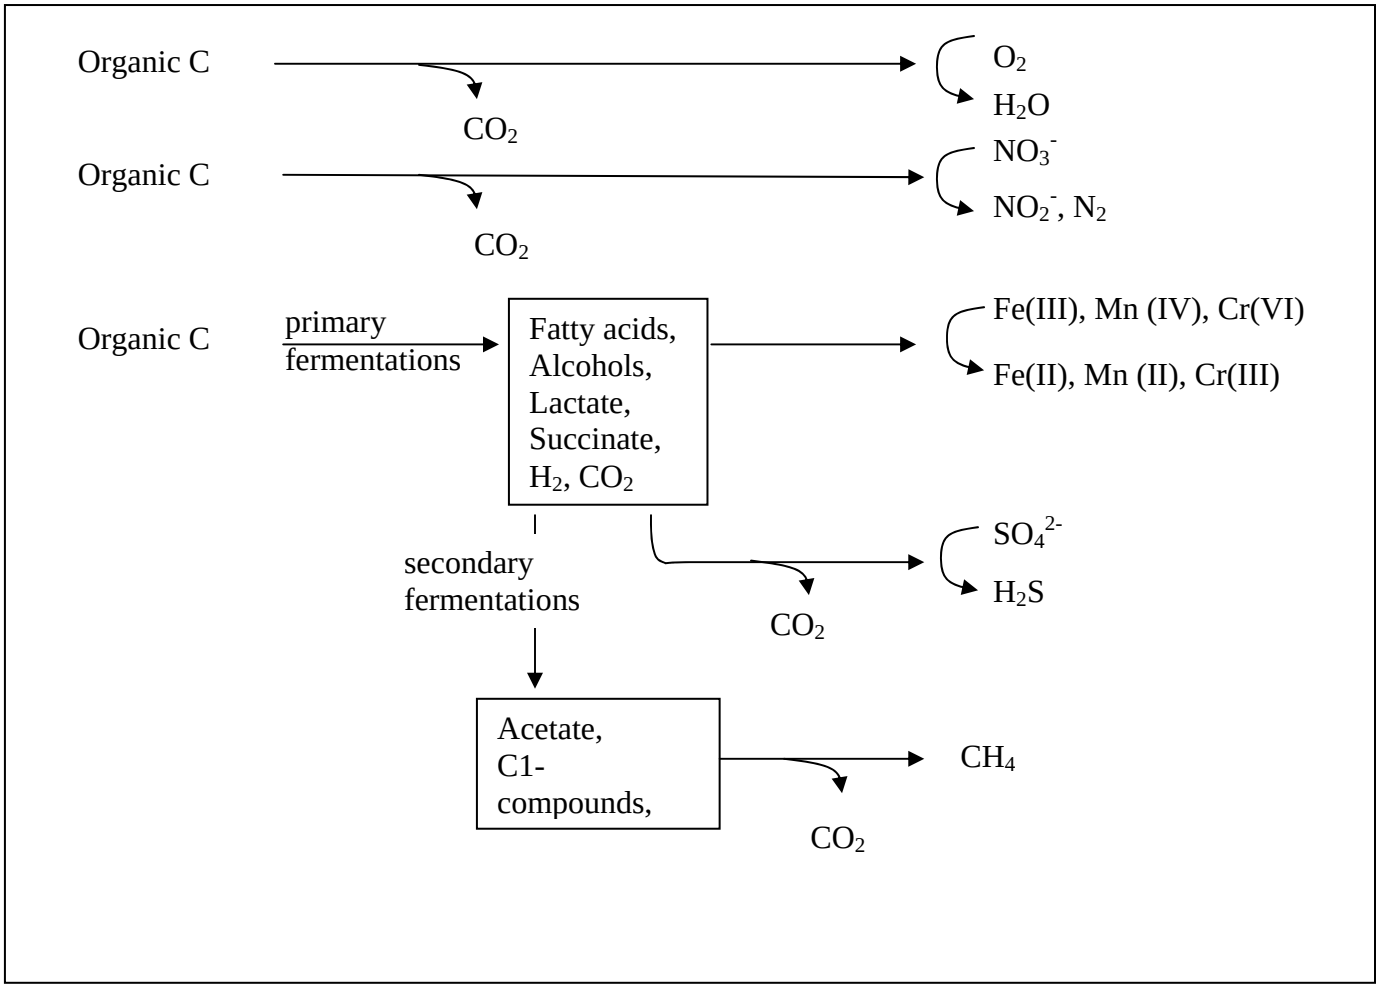

Figure 1: General Degradation Pathways for Organic Carbon Substrates (adapted from Lengeler et al., 1999)

For the IRZs that are part of the final groundwater remedy at the Topock Compressor Station, several organic carbon substrates were considered. For the purposes of this discussion, however, only the four most likely

substrates are considered, ethanol, lactate, liquid whey, and emulsified vegetable oil (EVO). For reference, liquid whey is composed primarily of the disaccharide lactose, and EVO is a triglyceride.

EVO is a slightly different substrate than the others being discussed, because it is delivered as a separate phase oil that will sorb to aquifer soils. The triglycerides are first hydrolyzed, releasing glycerol and long chain fatty acids (IES, 2006). As the long chain fatty acids are degraded by beta-oxidation, smaller molecules are generated which more easily dissolve into groundwater, such as butyric acid, and acetate (IES, 2006), as shown on Figure 2.

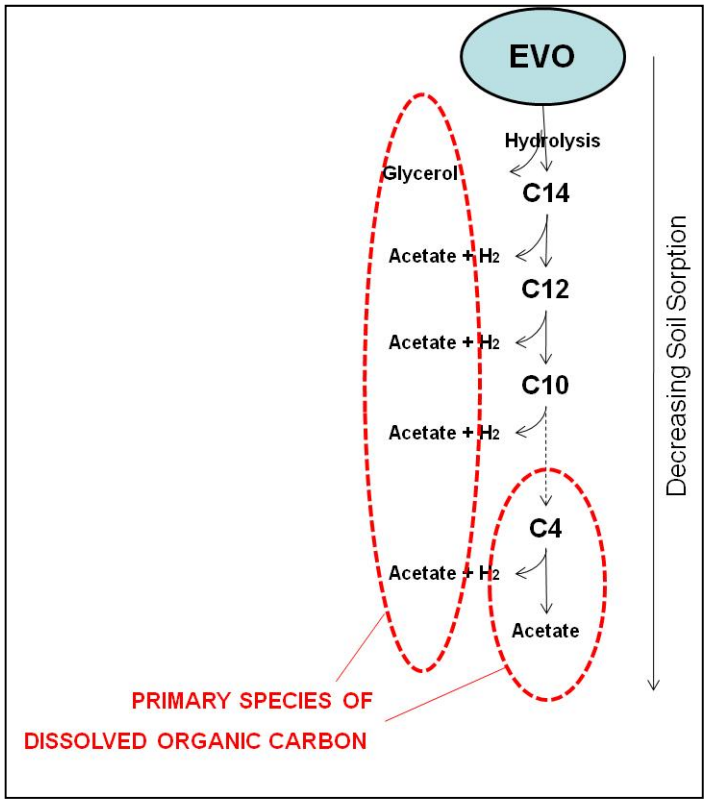

Figure 2. Degradation and Dissolution of EVO.

In the next few sections, the general breakdown pathways and balanced reactions for the respiration and fermentation of the various organic carbon substrates are presented. For the purpose of EVO, acetate will be discussed as an example of a dissolved organic compound.

a. Respiratory Processes

In respiratory processes, the oxidation of organic carbon substrates to carbon dioxide is coupled to the reduction of a terminal electron acceptor. Respiratory processes stimulated within an IRZ include aerobic respiration, denitrification, chromium reduction, iron reduction, manganese reduction, and sulfate reduction. The following discussion will provide an overview of the reactions for these respiratory processes.

The following are balanced oxidation half-reactions that release electrons for ethanol, lactate, lactose (from whey), and acetate (a degradation intermediate and one of the primary dissolved constituents released from EVO).

Ethanol	$1/12\ C_2H_6O + 1/4\ H_2O \rightarrow 1/6\ CO_2 + H^+ + e^-$	(1)
Lactate	$1/12\ C_3H_5O_3^- + 1/4\ H_2O \rightarrow 1/4\ CO_2 + 11/12\ H^+ + e^-$	(2)
Lactose	$1/48\ C_{12}H_{22}O_{11} + 13/48\ H_2O \rightarrow 1/4\ CO_2 + H^+ + e^-$	(3)
Acetate	$1/8\ C_2H_3O_2^- + 1/4\ H_2O \rightarrow 1/4\ CO_2 + 7/8\ H^+ + e^-$	(4)

The release of electrons from the oxidation of each substrate is coupled to the reduction of the various terminal electron acceptors. Below are the reduction half reactions for the various terminal electron acceptors. Note, for iron and manganese reduction (Reaction 8 and 9), various mineral phase reactants are possible and one example of each is shown. Similarly for chromium (Reaction 7), several mineral phase products are possible and one example is shown, chromium hydroxide.

Oxygen	$1/4\ O_2 + H^+ + e^- \rightarrow 1/2\ H_2O$	(5)
Nitrate	$1/5\ NO_3^- + 6/5\ H^+ + e- \rightarrow 1/10\ N_2 + 3/5\ H_2O$	(6)
Chromium	$1/3\ Cr^{6+} + H_2O + e^- \rightarrow 1/3\ Cr(OH)_3 + H^+$	(7)
Iron	$Fe(OH)_3 + 3H^+ + e^- \rightarrow Fe^{2+} + 3H_2O$	(8)
Manganese	$1/2\ MnO_2 + 2H^+ + e^- \rightarrow 1/2\ Mn^{2+} + H_2O$	(9)
Sulfate	$1/8\ SO_4^{2-} + 9/8\ H^+ + e^- \rightarrow 1/8\ HS- + 1/2\ H_2O$	(10)

For each substrate being considered, bacteria within the IRZ would couple the oxidation of the organic carbon substrate with the reduction of various electron acceptors. For example, balanced reactions for the coupling of ethanol oxidation with oxygen, iron and sulfate reduction (Reactions 11, 12 and 13, respectively) are as follows:

Ethanol/Oxygen	$1/12\ C_2H_6O + 1/4\ O_2 \rightarrow 1/6\ CO_2 + 1/4\ H_2O$	(11)
Ethanol/Iron	$1/12\ C_2H_6O + Fe(OH)_3 + 2H^+ \rightarrow Fe^{2+} + 2\ 3/4\ H_2O + 1/6\ CO_2$	(12)
Ethanol/Sulfate	$1/12\ C_2H_6O + 1/8\ SO_4^{2-} + 1/8\ H^+ \rightarrow 1/8\ HS- + 1/4\ H_2O + 1/6\ CO_2$	(13)

The utilization of electron acceptors in the system will generally be governed by the principles of thermodynamic equilibrium and redox kinetics. Dissolved oxygen and nitrate are thermodynamically more favorable electron acceptors than Cr(VI), while Cr(VI) is thermodynamically a more favorable electron acceptor than manganese oxides, iron oxides, and sulfate. However, given the relative availability of the electron acceptors and spatial heterogeneities of the subsurface aquifer environment, many of these reactions can occur simultaneously under field conditions. For example, iron and manganese reduction can proceed concurrently and sulfate reduction can begin before iron oxides are depleted, depending on the strength of the reducing environment. The strength of the reducing environment can be tuned by adjusting the concentration of organic carbon injected. To a large extent, this can help minimize the reduction of manganese, iron, and sulfate while still achieving adequate Cr(VI) reduction and removal. However, in order to create a reducing environment sufficient for the sustained removal of Cr(VI), some manganese, iron, and sulfate reduction will occur. Some iron reduction is actually desirable, as it provides stored Cr(VI) reduction capacity within the aquifer. In fact, abiotic pathways, such as reduction by Fe(II), may be faster than direct biotic mechanisms for Cr(VI) reduction (e.g., Wielinga et al., Environmental Science and Technology, 2001). Iron reduction is expected to occur under active Cr(VI) reducing conditions, producing mixed Fe/Cr precipitates that sequester Cr(VI). Thus, it is anticipated that both Cr(VI) reduction mechanisms will occur simultaneously. These principles are discussed in more detail in Appendix B of the Basis of Design (BOD)/60% Design Report.

The oxidation-reduction (redox) reactions fostered in the IRZ may temporarily mobilize certain naturally-occurring metals within the treatment zone, including manganese and arsenic. An adaptive operations approach, outlined in Volume 2 of the Operations and Maintenance Manual will be used to balance carbon dosing to treat

Cr(VI) while minimizing manganese and arsenic generation.

b. Fermentative Processes

Fermentative conditions will also develop within the IRZ, as indicated by increased methane concentrations in groundwater in IRZs at the PG&E Hinkley Site (ARCADIS 2010). As shown in Figure 1, various organic intermediates and hydrogen can be produced from the fermentation of the organic carbon substrates, but the ultimate end products of reaction are carbon dioxide and methane.

For example, fatty acids have been monitored during IRZ implementation at Hinkley. The most prominent fatty acids detected in IRZ groundwater during both lactate and ethanol applications have been acetate and propionate (ARCADIS 2010). The production of acetate and propionate from lactate and ethanol are well documented fermentation processes.

Propionibacteria produce acetate and propionate from the fermentation of lactate (Lengeler et al., 1999) as follows:

$$3\ C_3H_5O_3^- \rightarrow C_2H_3O_2^- + CO_2 + 2\ C_3H_5O_2^- + H_2O \qquad (14)$$

Ethanol ferments to produce acetate and propionate as follows (Schink et al., 1987):

$$3\ C_2H_6O + 2\ HCO_3^- \rightarrow C_2H_3O_2^- + 2\ C_3H_5O_2^- + H^+ + 3\ H_2O \qquad (15)$$

Finally, the products of fermentation will be used by methanogens to make methane. Acetoclastic methanogens will produce methane from acetate (Lengeler et al., 1999):

$$C_2H_3O_2^- + H^+ \rightarrow CH_4 + CO_2 \qquad (16)$$

Hydrogenotrophic methanogens will produce methane from carbon dioxide and hydrogen (Lengeler et al., 1999):

$$CO_2 + 4\ H_2 \rightarrow CH_4 + 2\ H_2O \qquad (17)$$

6. Dosing Design

The primary design consideration for carbon substrate dosing is the adequate (lateral) distribution of the substrate in the subsurface while minimizing byproduct (reduced manganese and arsenic) production. Concentrations of total organic carbon will be highest at the injection point and will decrease with distance, and the arsenic and manganese generated is a consequence of that distribution of organic carbon, as discussed in detail in Appendix B of the BOD/60% Design Report. As such, the hydraulic, fate and transport, and geochemical models, as well as pilot test data, are being used to guide reagent dosing design, as discussed in Appendix B (BOD/60% Design Report). To optimize the tradeoff between organic carbon distribution and byproduct generation, design parameters such as well spacing, recirculation flow rates, and injection concentrations can be varied. The first step of this process was taken with the reactive transport modeling that supported the IRZ design (Appendix B, BOD/60% Design Report). This optimization process will continue during operation as monitoring data are collected, evaluated, and used to modify operations of the system.

The semi-soluble substrate, EVO is a special case and is discussed further in this section. As EVO is injected, significant portions of the oil will be retained on the soil. The amount of oil that will be retained per unit volume of aquifer varies with soil type as documented in the Protocol for Enhanced In Situ Bioremediation (IES, 2006) and is a lower bound on the amount of oil that will be required to achieve distribution within a given

target volume. However, the amount of EVO required to achieve sufficient distribution can be up to an order of magnitude greater than the amount of oil retention reported in the literature, based on field implementation at a number of sites (Schnobrich et al., 2011). In practice, the required EVO loading must be evaluated on a case-by-case basis to confirm the site-specific degree of droplet retention and to ensure sufficient organic carbon distribution for treatment within the targeted area.

— CALCULATION SHEET —

COMPUTED BY:	R. Harris		
REVISION No.:		DATE:	02-Jul-2012
REV. COMMENT			
CHECKED BY:	W.L. Ross		
LOCATION:	Needles, CA		
CLIENT:	PG&E	PROJECT NAME	Topock Groundwater Remediation
SUBJECT:	Influent Tank Eductor and Recirc Pump Sizing	PROJECT No:	435062

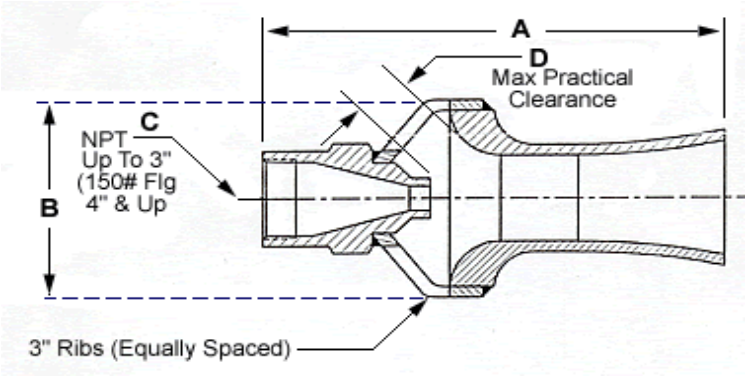
Eductor Sizing Basis:

Tank Diameter is 8'
Tank Volume: 21,000 gal
Tank Volume: 2,807 ft^3
Assume 30 minute mix and 3 tank turnovers *check of mix time =* *25.7 minutes*
Induced flow = 2100 gpm
Volume for 3 Tank Turnovers = 63,000 per 2 eductors (or 31,500 gal/eductor)

Eductor Sizing:

Scenarios: 2", 3", and 4" Eductors
20 psi, 30 psi, 40 psi, and 50 psi drop across Eductors

Eductor Size*	DP*	Max Plume*	Motive Liq. In*	Out of Eductor*	Complete Mix**
2 in	20 psi	23 ft	87.2 gpm	436 gpm	1200 gpm
3 in	20 psi	34 in	201 gpm	1003 gpm	1200 gpm
2 in	30 psi	34 in	107 gpm	534 gpm	1200 gpm
3 in	**30 psi**	**51 in**	**246 gpm**	**1228 gpm**	**1200 gpm**
4 in	30 psi	60 in	427 gpm	2136 gpm	1200 gpm
2 in	40 psi	48 in	123 gpm	616 gpm	1200 gpm
3 in	40 psi	73 in	283 gpm	1417 gpm	1200 gpm
3 in	50 psi	99 in	317 gpm	1585 gpm	1200 gpm
4 in	40 psi	95 in	493 gpm	2448 gpm	1200 gpm



* Data from www.jrgjt.com
** Complete mix assumed after 3 tank turnovers per Bill Ross.

Tank width is 8ft (96")
Using a 3" eductor
Nozzles Needed = 2
Pump to handle 492 gpm at 82 psi
Check Mix time =
Based on data above, we can use two 3" nozzles per tank.
Recirculation pump to handle 492 gpm at 82 psi (See pump Calc)

Comments:

Total usage revised to 13,840 gal/year based on increase in flow from 0.7 million gallons per year to 0.78 million gallons per year.

Information Requiring Confirmation:

Problem Statement

Calculate caustic usage to neutralize first flush well rehabilitation water to 1) calculate caustic usage

Given/Assumptions

1. 700,000 gallons per year of first flush water (Table F-1)
2. First flush water is pH 2.1 and final pH is 7.0
3. Hydrochloric acid (32%) is used for acidifying well water from ambient conditions to dissolve precipitated minerals
4. Ambient concentrations based on IW-3 backwash water chemical analysis of samples collected 10/5/11 ("Raw Data")

Method

Use Stream Analyzer by OLI Systems to perform pH adjustment (http://www.olisystems.com/new-streamanalyzer.shtml)
Uses electrolyte thermodynamic equations to calculate equilibrium concentrations.
Results shown on "Stream Analyzer Modeling" worksheet
Screenshot 1 - Starting conditions
Screenshots 2/3 - acidifying process in two different pH ranges (pH on y-axis; ratio of acid volume (L) to million liters of water)
Screenshots 4/5 - neutralizing process in two different pH ranges (pH on y-axis; ratio of NaOH volume (L) to million liters of water)

Caustic Usage

1850 L	25% caustic
to	
1e6 L	well water

700,000	gallons/year first flush water
3.7854	L/gal
2,649,788	Liters/year first flush water

Project No. WW-PEA-2124-043062		Sheet No. 12

Project Description: Lateral Loads, Topock Water Conditioning plant

Lateral Loads

Seismic: Moment frames above El. 14.0' are primarily single story frames carrying 20 PSF Dead Load from Roof

Lower portion from El. 14'-0" to El. 0'-0" shall be analysed as separate building from above using different seismic factors. All forces from above including vertical loads & horizontal shear acting at el. 14'-0"

Slope of Roof is 4:1

12.3.3.4 Design forces for all connections & collectors shall be 1.25 times the seismic forces for above frames (covered in 14'-0")

Redundancy factor ρ

ρ = 1.3 for all moment & Braced frames

Load combinations (ASCE 7-10)

For Mom. Frames & Braced frames Combinations w/ Allowable Stress Design

12.4.3.2 Comb. 5 = $(1.0 + .14 S_{DS})D + .7 \Omega_0 Q_E$ or $(1 + .057)D + 2.1 Q_E$

Mom. Fr's Comb. 8 = $(.6 - .14 S_{DS})D + .7 \Omega_0 Q_E$ or $(.6 - .057)D + 2.1 Q_E$

Ordinary Moment frames NS DIR

R = 3.5 Ω_0 = 3 C_d = 3 $\delta_x = \frac{C_d \delta_{xe}}{I} = \frac{3}{1.25} \delta_{xe} = 2.4 \delta_{xe}$

Braced Frames

R = 3.25 Ω_0 = 2 C_d = 3.25

Braced Fr's Comb. 5 $(1 + .057)D + 1.40\, Q_E = 1.057 D + 1.4 Q_E$

Comb 8: $(.6 - .057)D + 1.40\, Q_E = .543 D + 1.4 Q_E$

Using Equivalent Lateral procedure

$V = C_S W$; I = 1.25 R = 3.5 (Ordinary Mom. Fr.)

$C_S = \frac{S_{DS}}{(R/I)} = \frac{.406}{(3.5/1.25)} = .145$ $C_{S\,max} = \frac{S_{D1}}{T(R/I)}$

$T = C_t h_n^x$ (Mom. Fr) $= .028 \times (21)^{.8} = .82$ $T_{Br.Fr} = .02 \times (21)^{.75} = .196$ sec.

$C_{S\,max} = \frac{.5 \times .271}{.32 (2.8)} = .152$ (Mom. Fr's) crane $C_{S\,max}$ (For Braces) $= \frac{.5 \times .271}{.196 (3.25/1.25)} = .265$

NS DIR $W = .02 \times 25 \times 35 + .75 \times 4.0 + .01 \times 10.5 \times 25 = 23.12^K$

$V_{NS} = .152 \times 23.12 \times 1.3 = 4.6^K$ USE 4.6^K / Mom. Fr. Say 5^K

E W DIR $V_{EW} = .265 \times 23.12 \times 1.3 = 9.1^K$ USE 9.1^K / Br. Fr.

Wind See pg. 16 for wind pressure calc. $V_{NS} = .024 \left(\frac{21}{2} + 5.4\right) \times 25 = 9.5^K = P_W$ $V_{EW} = .024 \times 23.7 \left(\frac{84}{2}\right) = 4.83^K = P_W$

Design for Seismic in both directions. Check w/ Wind loads applied in separate load cases See pg. 14

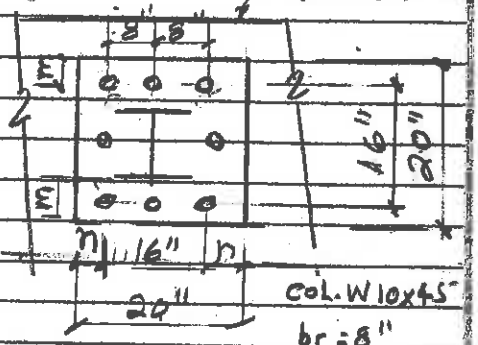
Project No. WW-PEG-2174-043062		Sheet No. 17

Project Description: Topock Steel Mom. Fr. Base pl. & Anchor Bolts

Loads from pg. ~26 Computer output for Stl. Mom. frame
Also see Braced frame line-B



Load comb (5)

$P_{max} = 22.55^{k}$ $M_{max} = 70.46^{'k}$ $V_{max} = 8.32^{k}$

Base pl. (20" x 20" x 1" tk trial size)

$\frac{P}{A} = \frac{22.6}{20\times20} = .0565^{ksi}$ $\frac{M}{S} = \frac{70.46\times12}{\frac{1}{6}\times20\times20^2} = .634^{ksi}$

$f_p = .0565 + .634 = .69^{ksi}$

$n = \frac{B - .8\,b_f}{2} = \frac{20 - .8\times8}{2} = 6.8"$

$m = \frac{N - .95\,d}{2} = \frac{20 - .95\times10}{2} = 5.25"$

$t_{min.} = 2\,m\sqrt{\frac{f_p}{F_y}}$ $F_y = 36^{ksi}$

↓ is used since this comp'n occurs in that direction.

$= 2\times5.25\sqrt{\frac{.69}{36}} = 1.45"$ (See calc.'s below for 24"x24" pl.)

$f'_c = 5^{ksi}$
$f_y = 60^{ksi}$

Anchor Bolts

Steel Mom. Frame

Max. Ten./Bolt = $T = \frac{70.46\times12}{16\times3} = 17.62^{k}$

Max Shear/Bolt = $V = \frac{8.32}{8} = 1.04^{k}$

Try $1\frac{1}{4}"\phi$ x 9" A-36 Anchor Bolts [Table 3,5,6 Attached)

Allow $T_a = 19.6^{k}$ for $E_d = 8.4"$ & $S_{dc} = 19.8$ c/c bolts
$V_a = 10.2^{k}$ $m_t = 4.3$ = Edge dist. for tension

Due to overlapping cones. Since $S_d = 8" < 19.8"$ (Arbitrary)
Increase embedment to 18" & Reduce cone area to 80%

$\frac{V}{V_a} + \frac{T}{T_a} = \frac{1.04}{10.2\times.8} + \frac{17.62}{19.8\times.8} = 1.23 \approx 1.2$ (20% increase for seismic or wind loads OK)

USE 24" x 24" x $1\frac{1}{2}$" Base pl. w/ 8 - $1\frac{1}{4}"\phi$ x 18" A.B.'s or

$f_p = \frac{22.6}{24\times24} + \frac{70.46\times12}{\frac{1}{6}\times24\times24^2} = .406^{ksi}$ $t_{min.} = 2\times7.25\sqrt{\frac{.406}{36}} = 1.54"$

$1\frac{1}{2}"$ Tk pl. OK

E2 Consulting Engineers, Inc. 1900 Powell Street, Suite 250 Emeryville, CA 94608	Designed By: K.D.	Date: 7/31/12
	Checked By:	Date:
	Revised By:	Date:
Project No. WW-PEG-2124-043062		Sheet No. 18

Project Description Lateral Analysis, Topock W.C. plant, Shear Walls

Lateral Analysis (Lower Building)

Assume portion bet'n ③ & ④ is built now - Referred to as current Bldg

N-S Dir. Distribute Shears

Diaph. @ 2nd Flr. is rigid diaph.

Assume C.G. at Floor in the center of floor in both directions

See charts for values of Δ_F

See attachments

Compute V_d and V_t (Torsional Shears)

R_x & R_y are stiffness in X & Y dir.'s

Wall line	Ht.	d (Length)	h/d	Δ_F	R	ΣR
3	14'	8	1.75	1.061	.943	
3	14'	10	1.40	0.694	1.44	
5	14'	34.5	.405	.128	7.81	
4	12.75	—	—	1.86	.54	10.733 (ΣR_y)
A	14	6	2.33	1.964	.509	
A	14	6	2.33	1.964	.509	
B	14	53.5	.262	.08	12.5	
						13.518 (ΣR_x)

Locate C.R. of Floor W.r.t. front wall & Left wall (line ③)

$$\bar{X} = \frac{7.81 \times 50.33}{10.733} = 36.62' \text{ (From Y axis)} \qquad e_x = 36.62 - \frac{50.34}{2} = 11.45'$$

$$\bar{Y} = \frac{2 \times .509 \times 33.0}{13.518} = 2.485' \text{ (From X axis)} \qquad e_y = \frac{33.0}{2} - 2.48 = 14.02'$$

Torsional Moments

$T_{NS} = V_3 \times e_x = 190 \times 11.45 = 2176^{IK}$ (pg. 13) $\qquad \frac{T_{NS}}{J} = \frac{2176}{5811} = .374$

$T_{EW} = 190 \times 14.02 = 2664^{IK}$ $\qquad \frac{T_{EW}}{J} = \frac{2664}{5811} = .453$

Torsional Shears

$$J = X_R^2 Y_R + Y_R^2 X_R = .509(30.5)^2 \times 2 + 12.5 \times (2.48)^2 + .942(36.62)^2 + 1.44(36.62)^2 + 7.81(13.71)^2 + .54(15.12)^2 = 5811$$

Wall ③ $V_{T3B} = .374 \times .942 \times 36.62 = 12.90^K$ $\quad V_{T3D} = .374 \times 1.44 \times 38.51 = 20.77^K$

Wall ⑤ $V_{T5} = .374 \times 7.81 \times 13.71 = 40.05^K$ $\quad V_{T4} = .374 \times .54 \times 15.12 = 3.05^K$

Wall Ⓐ $V_{TA} = .453 \times .509 \times 30.52 = 7.04^K$ $\quad V_{TB} = .453 \times 12.5 \times 2.48 = 14.07^K$

For Shears: N-S Dir $V_T = \frac{T_{NS}}{J} \times R_y \times X_R$ $\quad$ E-W Dir $V_T = \frac{T_{EW}}{J} \times R_x \times Y_R$ $\quad$ X_R & Y_R are distances from wall to C.R.

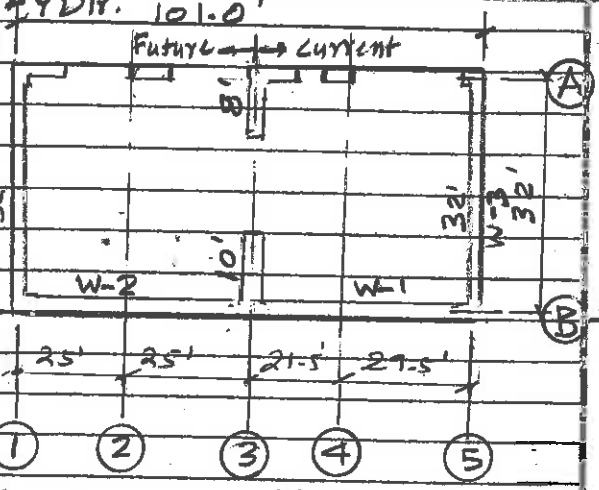
Project No. WW-PEG-2124-04362		Sheet No. 21



Project Description

Lateral Analysis (Lower Bldg. Assuming future part is Build new)

Assume 2nd flr. Diaph. is Rigid

Col. lines ② & ④ Are concrete Mom. frame for which stiffness obtained from Computer output (load comb. 2)

For simplicity (Due to symmetry) Assume torsional shears to be only 5% of direct shears

Calculations of Direct Shears + Torsional Shears

Total V = 2 x 190^k = 380^k

WALL	h/d	Δ_F	R_x OR R_y	ΣR	$\frac{R_x R_y}{\Sigma R_x \Sigma R_y}$	V_d Direct Sh	V_t Tor. Sh.	Total Shear

	Revised By:	Date:
Project No. WW-PSA-2174-435062 - 01.02.02		Sheet No. 1

Project Description Topock Groundwater Remediation Project Ref.'s & Data

Design References

1. AWWA Standard D-100-11 (Rev. of ANSI/AWAA D100.05)
2. IBC 2009 / CBC 2010
3. ACI 318-11
4. Nuclear Reactors & Earthquakes (TID 7024) chap.-6

Design Data

Concrete $f_c' = 4.0^{ksi}$ $f_y = 60^{ksi}$

Anchor Bolts - A-307

Tank Data

Total Height = 16' Height of water = H = 12.5'

Dia. of Tank = 25' = D

Min t for shell = $\frac{2.6\, h_p D G}{s_t} = \frac{2.6 \times 12.5 \times 25 \times 1}{15000 \times .66} = .05''$ use .25" (Table 15)

Seismic Data (See attachment-1)

Site Class - D (Assumed w/o any Soil Info.)

Seismic coefficients based on general area in needles, CA.

$S_s = .434$ $S_1 = .135$ $F_a = 1.4$ $F_v = 2.3$

$S_{MS} = F_a \times S_s = 1.4 \times .434 = .608$

$S_{M1} = F_v \times S_1 = 2.3 \times .135 = .311$

$S_{DS} = .667 \times .608 = .406$ $S_{D1} = .667 \times .311 = .207$

Soil Data (NO Soil Report)

Allow. Soil press. = $1 \times 1.2 = 1200^{PSF}$

Wind Data - Code AWWA D100-11

Assume G = Gust factor = 1.0 V = wind vel. = $100^{M/hr.}$

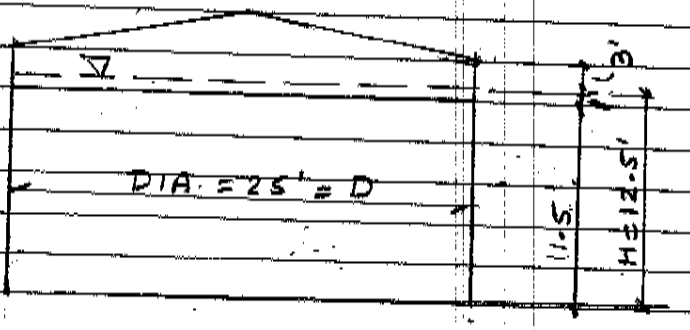
$P_W = q_z G C_f$ | $q_z = .00256 K_z I V^2$

$= 32 \times 1.0 \times .6$ | $= .00256 \times 1.09 \times 1.15 \times 100^2 = 32^{PSF}$

$= 19.2^{PSF} > 30^{PSF}$

However use $25^{PSF} = P_W$

Total wind $P_W = 25 \times 25 \times 16 = 10000^{\#} = 10^{K}$



$V_{max} = 10^{K}$ $M_{max} = 10 \times 8 = 80^{IK}$ (overturning)

Project Description Topock Groundwater Remediation Proj.

Design of 25' Dia Water Tank (Ref. #1 pg. 1)

Impulsive Components

$A_i = \frac{S_{ai} I_E}{1.4 R_I}$ (Table 24 (Group II)) $I_E = 1.25$ $R_I = 3.0$ (Table-28) (Impulsive) $R_I = 1.5$ (convective)

$= \frac{.406 \times 1.25}{1.40 \times 3.0}$ $S_{ai} = S_{DS}$ (For $T_i \le T_s$)

$= .121\ g$ $T_i = C_t h_n^{x} = .02 \times 16^{.75} = .16$ sec. $< .51$ sec.

Min. $A_i = \frac{.36 S_1 \times I_E}{R_i} = \frac{.36 \times .311 \times 1.25}{3.0}$ $T_L = 12$ sec. $T_s = \frac{S_{D1}}{S_{DS}} = \frac{.207}{.406} = .51$ sec.

$= .047$ USE $A_i = .121\ g$

Eq. 13-20 $V_i = A_i (W_s + W_r + W_f + W_i)$

$M_i = A_i (W_s x_s + W_r \times H_t + W_i x_i)$

Weights

W_T = wt. of contents $= .49 HD^2 = .49 \times 12.5 \times 25^2 \times 10^{-3} = 382.8^k$

$\frac{D}{H} = \frac{25}{12.5} = 2 < 3.33$ $\frac{W_1}{W_T} = .55$ $\frac{x_1}{H} = .35$

$\frac{W_2}{W_T} = .43$ $\frac{x_2}{H} = .62$

$x_1 = .35 H = .35 \times 12.5 = 4.38'$

$W_1 = .55 \times W_T = .55 \times 382.8 = 210.5^k$ (Effective Weight)

$x_2 = .62 H = .62 \times 12.5 = 7.75'$

$W_2 = .43 W_T = .43 \times 382.8 = 164.6^k$

$W_r = \frac{\pi}{4} (25)^2 \times .01 = 4.91^k$ = Wt. of Roof

$W_s = \frac{\pi}{4} (25.042^2 - 25^2) \times 16 \times .49 = 12.84$ = Wt. of shell

Total Wt. $W = W_1 + W_r + W_s = 210.5 + 4.91 + 12.84 = 228.25^k$ Say 229^k

E2 Consulting Engineers, Inc.
1900 Powell Street, Suite 250
Eneryville, CA 94608

Checked By:	Date:		
Revised By:	Date:		
Project No. WWW-PEA-2174-43052	Sheet No. 3		

Project Description Topock Groundwater Remediation Press.

(25' Dia. Water Tank Contd.)

Total W = 229^k

Note: Floor Weight not included since it is at ground level.

Shear V_i (due to impulsive forces)

Eq. 13-20 $= A_i (W_i + W_y + W_s) = .121 \times 229 = 27.7^k$

Moment M_i (due to impulsive forces

partial Eq. 13-23 $= A_i (W_s \times X_s + W_r \times H_t + W_i \times X_i)$

$= .121 (12.84 \times 8 + 4.91 \times 16 + 210.5 \times 4.38)$

$= .121 (102.72 + 78.56 + 922) = 133.5^{ik}$

Adjust & Calculate effective impulsive weight to include varying hor. press. if supported on pile fdn. (Sect. A-13.5.3)

Eq. 13-29 $X_i = .375 H = .375 \times 12.5 = 4.69'$

$$X_{imf} = .375 \left[1 + 1.333 \left\{ \frac{.866 \frac{D}{H}}{\tanh(1.866 \times \frac{D}{H})} - 1 \right\} \right] H$$

$$= .375 \left[1 + 1.333 \left\{ \frac{.866 \times 2}{\tanh(1.732)} - 1 \right\} \right] 12.5$$

$.939$

$= .375 [26.572] = 9.96'$

Eq. 13-32 Moment $M_{imf} = .121 (102.72 + 78.56 + 210.5 \times 9.96)$

$= 264.77^{ik}$

? To be used if supported on pile fdn. or MAT FDN See sect. A-13.5.3

Project Description Tapock Groundwater Remediation Proj.-

(25' DIA. TANK CONTD.)

Convective Forces (Sloshing Effect)

$A_c = \frac{S_{ac} I_E}{1.4 R_I}$ $I_E = 1.25$ $R_I = 1.5$

$S_{ac} = \frac{K S_{D1}}{T_c} \leq S_{DS}$ (Eq. 13-12) $T_c \leq T_L$

First mode of sloshing effect given by

$$T_c = 2\pi \sqrt{\frac{D}{3.68 g \tanh\left(\frac{3.68H}{D}\right)}}$$

$\tanh\left(\frac{3.68 \times 12.5}{25}\right) = \tanh(1.84) = .9508$

$T_c = 2\pi \sqrt{\frac{25}{3.68 \times 32.2 \times .9508}} = 2.96$ sec. < 12 sec.

Eq. 13-12 $S_{ac} = \frac{1.5 \times .207}{2.96} = .1049$

$A_c = \frac{.1049 \times 1.25}{1.4 \times 1.5} = .0625$

Eq. 13-30 $$x_c = \left[1 - \frac{\cosh\left[\frac{3.67H}{D}\right] - 1}{\frac{3.67H}{D} \sinh\left[\frac{3.67H}{D}\right]}\right] H$$

Substitute $H = 12.5$, $D = 25$

$$= \left[1 - \frac{\cosh(1.835) - 1}{1.835 \sinh(1.835)}\right] 12.5$$

$$= \left[1 - \frac{3.2129 - 1}{1.835 \times 3.0528}\right] \times 12.5 = 7.5634'$$

$$W_c = .230 \frac{D}{H} \tanh\left[\frac{3.67 \times H}{D}\right] W_T$$

$H = 12.5$ $D = 25$

$W_T = 49 \gamma H D^2 = 382.8^k$

$= .230 \times 2 \tanh\left[1.835\right] \times 382.8$

$= .230 \times 2 \times .9503 \times 382.8 = 167.34^k$

Project Description Topock Groundwater Remediation Project

Eq. 13-35 Height from bot. of shell to the c.G. of effective convective weight W_c adjusted for varying hot. press.

$$X_{cmf} = \left[1 - \frac{\cosh\left[\frac{3.67H}{D}\right] - 1.937}{\frac{3.67H}{D}\sinh\left[\frac{3.67H}{D}\right]}\right] H \qquad H = 12.5 \quad D = 25$$

$$= \left[1 - \frac{\cosh(1.835) - 1.937}{1.835 \sinh(1.835)}\right] 12.5$$

$$= \left[1 - \frac{3.2124 - 1.937}{1.835 \times 3.0525}\right] \times 12.5 = 9.654'$$

Eq. 13-32 $$M_{cmf} = \sqrt{A_i\left(W_s X_s + W_r H_r + W_i X_{imf}\right)^2 + \left[A_c W_c X_{cmf}\right]^2}$$

Moment due to convective (sloshing)

$$= A_c W_c X_{cmf}$$
$$= .0625 \times 167.34 \times 9.654$$
$$= 100.97$$

$A_c = .0625$ (Pg. 4)
$X_{cmf} = 9.654'$
$W_c = 167.34$ (Pg. 4)

$$M_{cmf} = \sqrt{(264.77)^2 + (100.97)^2}$$
$$= 283.37^{1k}$$

↳ Moment to be used if supported on pile or Mat Fdn. (Sect. 13.5.3.2.2)

Eq. 13-23 $$M_s = \sqrt{\left[A_i\left(W_s X_s + W_r H_r + W_i X_i\right)\right]^2 + \left[A_c W_c X_c\right]^2}$$

$$= \sqrt{(133.5)^2 + (.0625 \times 167.34 \times 7.563)^2}$$
$$= \sqrt{17822.25 + 6257.4} = 155.18^{1k}$$

USE 160^{1k}

M_s is Design overturning moment @ bot. of shell (w/o bot varying press effect) for Ring Fdn.

Eq. 13-31 V_f = Design shear @ top of Ring Fdn

$$= \sqrt{\left[A_i(W_s + W_r + W_i + W_i)\right]^2 + (A_c W_c)^2}$$
$$= \sqrt{[.121(229)]^2 + [.0625 \times 167.34]^2} = 29.62^k$$ USE 30^k

Freshwater Injection/ Remedy-Produced Water Collection/ Conditioned Remedy Water Distribution and Disposal Hydraulic Network Modeling Calculations from EPANET Software

Topock Remediation Design

Hydraulic analysis of Freshwater Injection System

The piping for the freshwater injection system on the Topock Remediation project was sized from simulations of a hydraulic network model of the system. The hydraulic network model of the freshwater injection system proposed for Topock remediation was constructed using EPANET. EPANET is software that models water distribution piping systems. EPANET tracks the flow of water at each pipe, the pressure at each node, pumping heads and levels of water in tanks and reservoirs. Chemical species can be tracked, although that was not needed for the freshwater system at Topock.

Pipe junctions, reservoirs and tanks are represented as nodes. A listing of nodes is contained on the following pages. Pipes, pumps and valves are represented as links. A listing of links is contained on the pages following the node listing. A map showing the location of all nodes and links is shown on the sheet following the links listing.

The piping routes and corridors have been approved by the client, Pacific Gas & Electric; however, they are subject to change pending stakeholder and regulatory review. The following summary describes the development of the hydraulic model:

Junction nodes, tanks and wells (modeled as pumps attached to an underground reservoir) have been located on the plan and profile sheets for the 60% submittal. Some liberties were taken with underground reservoir (well) locations to make the node and link map more legible, however, this did not affect the accuracy of the analysis as exact coordinates were used in model simulations. A summary of the model development is as follows:

Ground elevations for pipe junctions, reservoirs, wells and tanks are taken from the 60% plan and profile sheets, which were based on the Toponex aerial survey.

Pipe lengths have been taken off from plan and profile drawings.

Probable maximum flows are used for demands. The following demands are used:

- Freshwater Injection Well no. 1 (FW-1, node 73) = 200 gpm
- Freshwater Injection Well no. 2 (FW-2, node 20) = 100 gpm
- Inner Recirculation Loop Well no. 1 (IRL-1, node 50) = 0 gpm during the maximum condition
- Inner Recirculation Loop Well no. 2 (IRL-2, node 56) =200 gpm during the maximum condition
- Inner Recirculation Loop Well no. 3 (IRL-3, node 62) = 200 gpm during the maximum condition
- Inner Recirculation Loop Well no. 4 (IRL-4, node 68) = 200 gpm during the maximum condition
- Topock Compressor Station (node 11) = 110 gpm
- Transwestern bench service (node 29) = 0 gpm – flows are too trivial and sporadic to consider as part of the maximum case

- MW-20 bench service (node 35) = 0 gpm – flows are too trivial and sporadic to consider as part of the maximum case
- TCS Loop Injection Well no. 1 (TCS-1, node 24) = 20 gpm
- TCS Loop Injection Well no. 2 (TCS-2, node 26) = 20 gpm
- Topock residential customers (node 103) = 5 gpm

Inner Loop injection wells no 3 and 4 and TCS loop injection wells no. 1 and 2 are normally fed with carbon amended water from the floodplain extracted wells, but will be designed to accept freshwater as a backup measure.

Injection wells will be fed from a pressure reducing valve (PRV). Minimum pressure upstream of the PRV is to be 5 psi.

There are three sources of supply. All are existing wells located in Arizona (where water quality is more suitable for freshwater injection). Two of the wells currently discharge to PG & E's water system.

- Havasu National Wildlife Refuge well (node HNWR and pump 201) currently supplies a revegetation project in Topock marsh. A new 14 inch diameter transmission main is proposed to connect this well to the existing PG & E potable water tanks. A manufacturer's pump curve was used to model this pump. The pumping well level has been observed to be about 410 feet (above sea level) and this was used for the analysis.
- Topock 2 and 3 currently supply PG & E's Topock Compressor Station with a 6 inch diameter pipe to the existing potable water tanks. A manufacturer's pump curve was used to model this pump. The pumping well levels are not known for these wells. A level of 400 feet was assumed based on observations from similar wells.

There are two existing fresh water tanks located above TCS at a base elevation of 672 feet (above sea level). Each tank is 30 feet high and contains 210,000 gallons. A minimum tank level of 2 feet and maximum tank level of 28 feet was assumed for this analysis.

Hazen-Williams C value of 130 was assumed for all existing pipes. New steel pipes were assumed to have a C value of 130 and new HDPE and PVC pipes were assumed to have a C value of 150.

Pipe sizing is an iterative process. After the initial simulation, pipe diameters for various segments of pipes are increased or decreased for subsequent simulations until an optimum size is selected for each segment. The criterion used for determining optimum size was based on unit head loss. In general, unit head losses of between 1 to 10 feet per 1,000 foot of pipe length yield the optimal combination of pipe capital cost and pumping energy costs. This was the criteria used to size most of the pipes. The only exceptions to this were for 1) short segments of pipes, such as pumping manifolds and 2) dead end pipes connected to injection wells. In the latter case, there was excess pressure which would have been dissipated in the pressure reducing valve. A larger pipe size does not serve any purpose in this case.

The freshwater system was modeled with a parallel pipe along National Trails Highway and for the IM-3 access road up to IRL-3. Low water levels (in the existing potable water storage tanks) and high water

levels were simulated for this configuration. The results from these simulations are contained in the following sections.

The combined pumping capacity of the existing well pumps at HNWR-1, Topock 2 and 3 are sufficient to meet probable maximum system demands.

INJECTION VALVE VAULT AND INJECTION VAULT PLAN

0 1' 2' 5'
1"=1'

NOTES:
1. ALL PIPING, INSTRUMENTATION, AND OTHER COMPONENTS SHALL BE INSTALLED AS PER THE MANUFACTURER'S GUIDELINES.
2. ALL PIPING AND INSTRUMENTATION SHALL BE INSTALLED PER P&IDS.
3. INSTALLATION OF ELECTRIC COMPONENTS SHALL COMPLY WITH ALL APPLICABLE NEC AND LOCAL CODES.
4. CROSS SECTIONS SHOW ONLY THOSE COMPONENTS NECESSARY TO INDICATE ELEVATIONS AND SPACE REQUIREMENTS FOR PIPING AND MAJOR COMPONENTS. INSTALL PIPING AND INSTRUMENTATION AS PER THE P&IDS.
5. ALL INSTRUMENTATION SHALL BE INSTALLED SUCH THAT IT MAY BE READ WITHOUT ENTERING THE WELL VAULT.
6. ALL VALVE HANDLES SHALL BE INSTALLED SUCH THAT THEY ARE ACCESSIBLE WITHOUT ENTERING THE WELL VAULT AND OPERABLE THROUGH ENTIRE STROKE.
7. ALL PIPING AND CONDUIT SHALL BE SECURED TO THE WALLS OF THE CONCRETE WELL VAULT WITH ANCHOR BOLTS AND UNI-STRUT. SUPPORTS SHALL BE INSTALLED WHEREVER NECESSARY TO PROPERLY SUPPORT PIPING AND CONDUIT.
8. PIPE SIZES AND MATERIALS ARE SHOWN ON THE P&IDS.
9. PIPING KNOCKOUTS AND ROUTING OF PIPING SHOWN AS PROPOSED AND APPROXIMATE. ACTUAL ROUTING TO BE FIELD DETERMINED AND IS SUBJECT TO ENGINEER'S APPROVAL.
10. ALL FLANGES SHALL BE CLASS 150 RAISED FACE FLANGES UNLESS OTHERWISE NOTED.
11. ALL TRANSITION FITTINGS FOR HDPE PIPING SHALL BE FLANGED WITH BACKING RINGS.

NOTES

1. DEPTHS OF EXISTING UTILITIES ARE UNKNOWN. ALL POTENTIAL CONFLICTS BETWEEN NEW PIPE CONSTRUCTION AND EXISTING UTILITIES WILL BE POTHOLED PRIOR TO 100% DESIGN. A DETERMINATION WILL BE MADE WHETHER TO RELOCATE EXISTING UTILITIES OR RE-ROUTE NEW PIPE TRENCHES AROUND EXISTING UTILITIES. THIS WILL BE INCORPORATED INTO 100% DESIGN.
2. THE NEW PIPELINE ALIGNMENT SHOWS CENTER OF TRENCH. THE NUMBER AND SIZES OF PIPE IN EACH TRENCH VARIES. REFER TO PIPE SECTION NUMBER ON EACH PLAN AND PROFILE SHEET AND PIPE SCHEDULE ON DRAWING C-07-03 FOR NUMBER AND SIZE OF EACH PIPE. REFER TO TRENCH DETAILS ON DRAWINGS C-07-60, C-07-61 AND C-07-62 OR ARRANGEMENT OF PIPING IN EACH TRENCH SECTION.

A DETERMINATION WILL BE MADE WHETHER TO RELOCATE EXISTING UTILITIES OR RE-ROUTE NEW PIPE TRENCHES AROUND EXISTING UTILITIES. THIS WILL BE INCORPORATED INTO 100% DESIGN.
2. THE NEW PIPELINE ALIGNMENT SHOWS CENTER OF TRENCH. THE NUMBER AND SIZES OF PIPE IN EACH TRENCH VARIES. REFER TO PIPE SECTION NUMBER ON EACH PLAN AND PROFILE SHEET AND PIPE SCHEDULE ON DRAWING C-07-03 FOR NUMBER AND SIZE OF EACH PIPE. REFER TO TRENCH DETAILS ON DRAWINGS C-07-60, C-07-61 AND C-07-62 OR ARRANGEMENT OF PIPING IN EACH TRENCH SECTION.

Topock Remediation Design

Hydraulic analysis of Remedy Wastewater System

The piping and the pumps for the remedy wastewater system on the Topock Remediation project were sized from simulations of a hydraulic network model of the system. The hydraulic network model of the remedy wastewater system proposed for Topock remediation was constructed using EPANET. EPANET is software that models water distribution piping systems. EPANET tracks the flow of water at each pipe, the pressure at each node, pumping heads and levels of water in tanks and reservoirs. Chemical species can be tracked, although that was not needed for the remedy wastewater system at Topock.

Pipe junctions, reservoirs and tanks are represented as nodes. A listing of nodes is contained on the following pages. Pipes, pumps and valves are represented as links. A listing of links is contained on the pages following the node listing. A map showing the location of all nodes and links is attached.

The piping routes and corridors have been approved by the client, Pacific Gas & Electric; however, they are subject to change pending stakeholder and regulatory review. The following summary describes the development of the hydraulic model:

Junction nodes, tanks and wells (modeled as pumps attached to an underground reservoir) have been located by coordinates from an aerial survey conducted by Toponex, a subcontractor to PG & E. The aerial survey was verified with a ground survey by PG & E staff. A summary of the model development is as follows:

Ground elevations for pipe junctions, reservoirs, wells and tanks are taken from the 60% plan drawings and the Toponex aerial survey.

Pipe lengths have been taken off from plan and profile drawings.

Maximum wastewater flows are generated during rehabilitation of injection wells. It is estimated that rehabilitation flows will be twice the amount of injection flows. It is assumed that only one well will be rehabilitated at a time. The following flow rates are used:

- Freshwater Injection Well no. 1 (FW-1, link PMP001) = 400 gpm
- Freshwater Injection Well no. 2 (FW-2, link PMP002) = 200 gpm
- Inner Recirculation Loop Well no. 1 (IRL-1, PMP641) =400 gpm
- Inner Recirculation Loop Well no. 2 (IRL-2, PMP642) =400 gpm
- Inner Recirculation Loop Well no. 3 (IRL-3, PMP643) = 400 gpm
- Inner Recirculation Loop Well no. 4 (IRL-4, PMP644) = 400 gpm
- TCS Loop Injection Well no. 1 (TCS-1, link PMP443) = 75 gpm
- TCS Loop Injection Well no. 2 (TCS-2, link PMP442) = 75 gpm

A pumping level elevation of 405 feet above sea level is assumed for all wells, except FW-2. A pumping level elevation of 420 feet is assumed at FW-2.

Wastewater will be pumped to influent storage tanks for the proposed wastewater treatment plant at Topock Compressor Station. Influent storage tanks are designed to be portable. The elevation of the tanks at the highest potential location (628 feet above sea level for base of the tank) was assumed for this analysis.

Hazen-Williams C value of 130 was assumed for all steel pipes. Hazen Williams C value of 150 was assumed for PVC and HDPE pipes.

Pipe sizing is an iterative process. After the initial simulation, pipe diameters for various segments of pipes are increased or decreased for subsequent simulations until an optimum size is selected for each segment. The criteria used for determining optimum size were unit head losses and minimum velocities. Usually, unit head losses of between 1 to 10 feet per 1,000 foot of pipe length yield the optimal combination of pipe capital cost and pumping energy costs. However, minimum velocities preclude the lower end of this range. It is desired to have at least three feet per second minimum velocity and preferably higher to flush sediments through the pipe. It was desired to keep head losses less than 35 feet per 1,000 foot of pipe length. Above this number, pumping costs become prohibitive. These criteria were used to size most of the pipes. The only exceptions to this were for short segments of pipes, such as pumping manifolds, bridge crossings and for lower flow scenarios where minimum flow velocities are not achieved. Model simulations were run separately for each individual pump since only one well will be rehabilitated at a time. For a certain sections of pipe, the flow velocities are more than adequate to flush sediment for most of the well pumps discharging to that section of pipe. However, minimum velocities might not be achieved for smaller well rehabilitation pumps. This was deemed acceptable because the larger well rehabilitation flows would be able to flush out sediments deposited by lower well rehabilitation flows.

Pump sizing is also an iterative process in conjunction with pipe sizing. A horsepower is selected for each simulation. The horsepower is increased or decreased until the optimum pipe size and desired flow rate are achieved.

NOTES

1. DEPTHS OF EXISTING UTILITIES ARE UNKNOWN. ALL POTENTIAL CONFLICTS BETWEEN NEW PIPE CONSTRUCTION AND EXISTING UTILITIES WILL BE POTHOLED PRIOR TO THE 100% DESIGN. A DETERMINATION WILL BE MADE WHETHER TO RELOCATE EXISTING UTILITIES OR RE-ROUTE NEW PIPE TRENCHES AROUND EXISTING UTILITIES. THIS WILL BE INCORPORATED INTO THE 100% DESIGN.
2. THE NEW PIPELINE ALIGNMENT SHOWS CENTER OF TRENCH. THE NUMBER AND SIZES OF PIPE IN EACH TRENCH VARIES. REFER TO PIPE SECTION NUMBER ON EACH PLAN AND PROFILE SHEET AND PIPE SCHEDULE ON DRAWING C-07-03 FOR NUMBER AND SIZE OF EACH PIPE. REFER TO TRENCH DETAILS ON DRAWINGS C-07-65, C-07-66 AND C-07-67 FOR ARRANGEMENT OF PIPING IN EACH TRENCH SECTION.

EXTRACTION WELL METER VAULT AND WELL VAULT PLAN

0 1' 2' 3'
1"=1'

NOTES:
1. ALL PIPING, INSTRUMENTATION, AND OTHER COMPONENTS SHALL BE INSTALLED AS PER THE MANUFACTURER'S GUIDELINES.
2. ALL PIPING AND INSTRUMENTATION SHALL BE INSTALLED PER P&IDS.
3. INSTALLATION OF ELECTRIC COMPONENTS SHALL COMPLY WITH ALL APPLICABLE NEC AND LOCAL CODES.
4. CROSS SECTIONS SHOW ONLY THOSE COMPONENTS NECESSARY TO INDICATE ELEVATIONS AND SPACE REQUIREMENTS FOR PIPING AND MAJOR COMPONENTS. INSTALL PIPING AND INSTRUMENTATION AS PER THE P&IDS.
5. ALL INSTRUMENTATION SHALL BE INSTALLED SUCH THAT IT MAY BE READ WITHOUT ENTERING THE WELL VAULT.
6. ALL VALVE HANDLES SHALL BE INSTALLED SUCH THAT THEY ARE ACCESSIBLE WITHOUT ENTERING THE WELL VAULT AND OPERABLE THROUGH ENTIRE STROKE.
7. ALL PIPING AND CONDUIT SHALL BE SECURED TO THE WALLS OF THE CONCRETE WELL VAULT WITH ANCHOR BOLTS AND UNI-STRUT. SUPPORTS SHALL BE INSTALLED WHEREVER NECESSARY TO PROPERLY SUPPORT PIPING AND CONDUIT.
8. PIPE SIZES AND MATERIALS ARE SHOWN ON THE P&IDS.
9. PIPING KNOCKOUTS AND ROUTING OF PIPING SHOWN AS PROPOSED AND APPROXIMATE. ACTUAL ROUTING TO BE FIELD DETERMINED AND IS SUBJECT TO ENGINEER'S APPROVAL.
10. ALL FLANGES SHALL BE CLASS 150 RAISED FACE FLANGES UNLESS OTHERWISE NOTED.
11. ALL TRANSITION FITTINGS FOR HDPE PIPING SHALL BE FLANGED WITH BACKING RINGS.

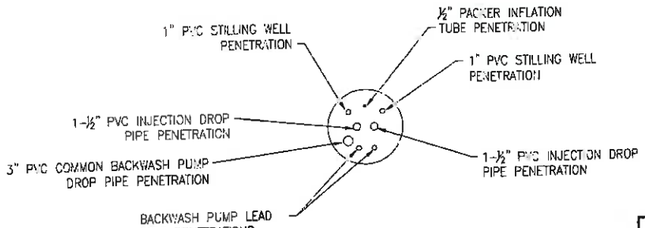
SINGLE SCREEN INJECTION WELL WITH BACKWASH PUMP DETAIL (A)
NOT TO SCALE. SEE WELL CONSTRUCTION SCHEDULE SHEET M-X-01 FOR REPRESENTATIVE DEPTHS. WELL DIAMETER EXAGGERATED TO SHOW DETAIL.

DUAL SCREEN INJECTION WELL WITH BACKWASH PUMPS DETAIL (B)
NOT TO SCALE. SEE WELL CONSTRUCTION SCHEDULE SHEET M-X-01 FOR REPRESENTATIVE DEPTHS. WELL DIAMETER EXAGGERATED TO SHOW DETAIL.



TCS-2

SINGLE SCREEN WELL FLANGE DETAIL (C)
NOT TO SCALE

INJECTION WELL PACKER DETAIL (D)
NOT TO SCALE

DUAL SCREEN INJECTION WELL FLANGE DETAIL (E)
NOT TO SCALE

KEY

1	1-½" PVC DROP PIPE (MATERIALS TBD)
2	CUSTOM TAPPED WELL FLANGE
3	¼" DIAMETER HOSE FROM PACKER TO FILL ASSEMBLY
4	PNEUMATIC WELL PACKER
5	WELL CASING (MATERIALS TBD)
6	1" PVC TUBING (STILLING WELL WITH PRESSURE TRANSDUCER)
7	ANNULAR SPACE, 100% NEAT CEMENT GROUT
8	ANNULAR SPACE, TRANSITION SAND (SIZE TBD)
9	ANNULAR SPACE, FILTER PACK (TYPE TBD)
10	WELL SCREEN (MATERIALS TBD)
11	SPRING CHECK VALVE (TYPE AND MATERIALS TBD)
12	SUMP
13	¾" PACKER PRESSURE RELIEF SAFETY VALVE
14	3" BACKWASH PIPING
15	BACKWASH PUMP

NOTES:
1. ALL DEPTH INTERVALS 'A' THRU 'K' ARE IN FEET BELOW GROUND SURFACE.
2. ALL COORDINATES BASED ON NAD83, CA ZONE V.
3. ALL WELL SEALS ARE 100% NEAT CEMENT.
4. ALL ABOVE-GRADE PIPING AND INSTRUMENTATION INSTALLED IN ACCORDANCE WITH THE P&ID AND THE WELLHEAD MECHANICAL LAYOUT

EXTRACTION WELL METER VAULT AND WELL VAULT PLAN

0 1' 2' 3'
1"=1'

NOTES:
1. ALL PIPING, INSTRUMENTATION, AND OTHER COMPONENTS SHALL BE INSTALLED AS PER THE MANUFACTURER'S GUIDELINES.
2. ALL PIPING AND INSTRUMENTATION SHALL BE INSTALLED PER P&IDS.
3. INSTALLATION OF ELECTRIC COMPONENTS SHALL COMPLY WITH ALL APPLICABLE NEC AND LOCAL CODES.
4. CROSS SECTIONS SHOW ONLY THOSE COMPONENTS NECESSARY TO INDICATE ELEVATIONS AND SPACE REQUIREMENTS FOR PIPING AND MAJOR COMPONENTS. INSTALL PIPING AND INSTRUMENTATION AS PER THE P&IDS.
5. ALL INSTRUMENTATION SHALL BE INSTALLED SUCH THAT IT MAY BE READ WITHOUT ENTERING THE WELL VAULT.
6. ALL VALVE HANDLES SHALL BE INSTALLED SUCH THAT THEY ARE ACCESSIBLE WITHOUT ENTERING THE WELL VAULT AND OPERABLE THROUGH ENTIRE STROKE.
7. ALL PIPING AND CONDUIT SHALL BE SECURED TO THE WALLS OF THE CONCRETE WELL VAULT WITH ANCHOR BOLTS AND UNI-STRUT. SUPPORTS SHALL BE INSTALLED WHEREVER NECESSARY TO PROPERLY SUPPORT PIPING AND CONDUIT.
8. PIPE SIZES AND MATERIALS ARE SHOWN ON THE P&IDS.
9. PIPING KNOCKOUTS AND ROUTING OF PIPING SHOWN AS PROPOSED AND APPROXIMATE. ACTUAL ROUTING TO BE FIELD DETERMINED AND IS SUBJECT TO ENGINEER'S APPROVAL.
10. ALL FLANGES SHALL BE CLASS 150 RAISED FACE FLANGES UNLESS OTHERWISE NOTED.
11. ALL TRANSITION FITTINGS FOR HDPE PIPING SHALL BE FLANGED WITH BACKING RINGS.

WELL VAULT SCHEDULE

NOTES

1. DEPTHS OF EXISTING UTILITIES ARE UNKNOWN. ALL POTENTIAL CONFLICTS BETWEEN NEW PIPE CONSTRUCTION AND EXISTING UTILITIES WILL BE POTHOLED PRIOR TO THE 100% DESIGN. A DETERMINATION WILL BE MADE WHETHER TO RELOCATE EXISTING UTILITIES OR RE-ROUTE NEW PIPE TRENCHES AROUND EXISTING UTILITIES. THIS WILL BE INCORPORATED INTO THE 100% DESIGN.
2. THE NEW PIPELINE ALIGNMENT SHOWS CENTER OF TRENCH. THE NUMBER AND SIZES OF PIPE IN EACH TRENCH VARIES. REFER TO PIPE SECTION NUMBER ON EACH PLAN AND PROFILE SHEET AND PIPE SCHEDULE ON DRAWING C-07-03 FOR NUMBER AND SIZE OF EACH PIPE. REFER TO TRENCH DETAILS ON DRAWINGS C-07-65, C-07-66 AND C-07-67 FOR ARRANGEMENT OF PIPING IN EACH TRENCH SECTION.

Pressure Drop (ft w.c.):											**8.28**	**(Total)**

Branch Pipe Estimated Conditions (Continued)

Location:	11	12	13	14	15	16	17	18	19	20	Summary	
Orifice Velocity (ft/s):											**7.41**	**(Avg.)**
Length of Branch Pipe (ft)[2]:											**71.12**	**(Avg.)**
Reynolds Number, Re:											**9.81E+04**	**(Avg.)**
Fanning Friction Factor, f:											**0.00462**	**(Avg.)**
Velocity Head, $v^2/2g_c$ (ft w.c.):											**0.922**	**(Avg.)**
Pressure Drop (ft w.c.)[3]:											**7.48**	**(Avg.)**
Well Head Pressure (ft w.c.)[4]:											**0.00**	**(Avg.)**

Eq. (1)
Discharge Header Pressure Drop:

$$\Delta p_p = \left(\frac{4f_{avg}L_p}{3D_p} - 2K\right)\frac{\rho V_p^2}{2g_c}$$

Eq. (2)
Return Header Pressure Drop:

$$\Delta p_p = \left(\frac{4f_{avg}L_p}{3D_p} + 2K\right)\frac{\rho V_p^2}{2g_c}$$

Eq. (3)
Branch Outlet Pressure Drop:

$$\Delta p_o = \frac{1}{C_o^2}\frac{\rho V_o^2}{2g_c}$$

Eq. (4)
Reynolds Number:

$$Re = \frac{D \cdot v \cdot \rho}{\mu} = \frac{D \cdot v}{\eta}$$

Eq. (5)
Distribution Equation:

$$\%\,Maldistribution = 100\left(1 - \sqrt{\frac{\Delta p_o - |\Delta p_p|}{\Delta p_o}}\right)$$

Eq. (6)
Fanning Friction Factor:

$$f = \frac{1}{4}\left(\frac{D}{L}\right)\left(\frac{[(p_0 - p_L) - \rho g(h_0 - h_L)]}{\frac{1}{2}\rho v^2}\right)$$

Eq. (7)
Darcy Equation:

$$h_L = \left[\left(4f\,\frac{L}{D}\right)\right]\frac{v^2}{2g}$$

Notes:

(1) K = 0.5 when viscous losses are negligible, K = 1.0 for return headers.
(2) Include the equivalent length of valves and fittings.
(3) Pressure drop due to velocity head and friction losses across the length of the branch pipe.
(4) Pressure at the well head taking into consideration frictional losses across the length of the drop pipe, static head associated with water elevation and mounding, and pressure drop required for foot valve or variable area valve.
(5) Maldistribution of 10 percent or less is recommended.
(6) If the branch piping exhibits average pressure losses (due to length, fittings, and/or well head pressures) of at least 10 times higher than the header, pressure losses maldistribution will be less than 10 percent.

Well Head Pressure (ft w.c.)[4]:											**23.10**	**(Avg.)**

Eq. (1)
Discharge Header Pressure Drop:

$$\Delta p_p = \left(\frac{4f_{avg}L_p}{3D_p} - 2K\right)\frac{\rho V_p^2}{2g_c}$$

Eq. (2)
Return Header Pressure Drop:

$$\Delta p_p = \left(\frac{4f_{avg}L_p}{3D_p} + 2K\right)\frac{\rho V_p^2}{2g_c}$$

Eq. (3)
Branch Outlet Pressure Drop:

$$\Delta p_o = \frac{1}{C_o^2}\frac{\rho V_o^2}{2g_c}$$

Eq. (4)
Reynolds Number:

$$Re = \frac{D \cdot v \cdot \rho}{\mu} = \frac{D \cdot v}{\eta}$$

Eq. (5)
Distribution Equation:

$$\%\,Maldistribution = 100\left(1 - \sqrt{\frac{|\Delta p_o| - |\Delta p_p|}{\Delta p_o}}\right)$$

Eq. (6)
Fanning Friction Factor:

$$f = \frac{1}{4}\left(\frac{D}{L}\right)\left(\frac{[(p_0 - p_L) - \rho g(h_0 - h_L)]}{\frac{1}{2}\rho v^2}\right)$$

Eq. (7)
Darcy Equation:

$$h_L = \left[\left(4f\,\frac{L}{D}\right)\right]\frac{v^2}{2g}$$

Notes:

(1) K = 0.5 when viscous losses are negligible, K = 1.0 for return headers.
(2) Include the equivalent length of valves and fittings.
(3) Pressure drop due to velocity head and friction losses across the length of the branch pipe.
(4) Pressure at the well head taking into consideration frictional losses across the length of the drop pipe, static head associated with water elevation and mounding, and pressure drop required for foot valve or variable area valve.
(5) Maldistribution of 10 percent or less is recommended.
(6) If the branch piping exhibits average pressure losses (due to length, fittings, and/or well head pressures) of at least 10 times higher than the header, pressure losses maldistribution will be less than 10 percent.

Reynolds Number, Re:											**1.12E+05**	**(Avg.)**
Fanning Friction Factor, f:											**0.00452**	**(Avg.)**
Velocity Head, $v^2/2g_c$ (ft w.c.):											**0.624**	**(Avg.)**
Pressure Drop (ft w.c.)[3]:											**12.22**	**(Avg.)**
Well Head Pressure (ft w.c.)[4]:											**198.1**	**(Avg.)**

Eq. (1)
Discharge Header Pressure Drop:

$$\Delta p_p = \left(\frac{4f_{avg}L_p}{3D_p} - 2K\right)\frac{\rho V_p^2}{2g_c}$$

Eq. (2)
Return Header Pressure Drop:

$$\Delta p_p = \left(\frac{4f_{avg}L_p}{3D_p} + 2K\right)\frac{\rho V_p^2}{2g_c}$$

Eq. (3)
Branch Outlet Pressure Drop:

$$\Delta p_o = \frac{1}{C_o^2}\frac{\rho V_o^2}{2g_c}$$

Eq. (4)
Reynolds Number:

$$Re = \frac{D \cdot v \cdot \rho}{\mu} = \frac{D \cdot v}{\eta}$$

Eq. (5)
Distribution Equation:

$$\%\,Maldistribution = 100\left(1 - \sqrt{\frac{\Delta p_o - |\Delta p_p|}{\Delta p_o}}\right)$$

Eq. (6)
Fanning Friction Factor:

$$f = \frac{1}{4}\left(\frac{D}{L}\right)\left(\frac{[(p_0 - p_L) - \rho g(h_0 - h_L)]}{\frac{1}{2}\rho v^2}\right)$$

Eq. (7)
Darcy Equation:

$$h_L = \left[\left(4f\,\frac{L}{D}\right)\right]\frac{v^2}{2g}$$

Notes:

(1) K = 0.5 when viscous losses are negligible, K = 1.0 for return headers.
(2) Include the equivalent length of valves and fittings.
(3) Pressure drop due to velocity head and friction losses across the length of the branch pipe.
(4) Pressure at the well head taking into consideration frictional losses across the length of the drop pipe, static head associated with water elevation and mounding, and pressure drop required for foot valve or variable area valve.
(5) Maldistribution of 10 percent or less is recommended.
(6) If the branch piping exhibits average pressure losses (due to length, fittings, and/or well head pressures) of at least 10 times higher than the header, pressure losses maldistribution will be less than 10 percent.

Eq. (1)
Discharge Header Pressure Drop:

$$\Delta p_p = \left(\frac{4f_{avg}L_p}{3D_p} - 2K\right)\frac{\rho V_p^2}{2g_c}$$

Eq. (2)
Return Header Pressure Drop:

$$\Delta p_p = \left(\frac{4f_{avg}L_p}{3D_p} + 2K\right)\frac{\rho V_p^2}{2g_c}$$

Eq. (3)
Branch Outlet Pressure Drop:

$$\Delta p_o = \frac{1}{C_o^2}\frac{\rho V_o^2}{2g_c}$$

Eq. (4)
Reynolds Number:

$$Re = \frac{D \cdot v \cdot \rho}{\mu} = \frac{D \cdot v}{\eta}$$

Eq. (5)
Distribution Equation:

$$\%\,Maldistribution = 100\left(1 - \sqrt{\frac{\Delta p_o - |\Delta p_p|}{\Delta p_o}}\right)$$

Eq. (6)
Fanning Friction Factor:

$$f = \frac{1}{4}\left(\frac{D}{L}\right)\left(\frac{[(p_0 - p_L) - \rho g(h_0 - h_L)]}{\frac{1}{2}\rho v^2}\right)$$

Eq. (7)
Darcy Equation:

$$h_L = \left[\left(4f\,\frac{L}{D}\right)\right]\frac{v^2}{2g}$$

Notes:

(1) K = 0.5 when viscous losses are negligible, K = 1.0 for return headers.
(2) Include the equivalent length of valves and fittings.
(3) Pressure drop due to velocity head and friction losses across the length of the branch pipe.
(4) Pressure at the well head taking into consideration frictional losses across the length of the drop pipe, static head associated with water elevation and mounding, and pressure drop required for foot valve or variable area valve.
(5) Maldistribution of 10 percent or less is recommended.
(6) If the branch piping exhibits average pressure losses (due to length, fittings, and/or well head pressures) of at least 10 times higher than the header, pressure losses maldistribution will be less than 10 percent.

Well Head Pressure (ft w.c.)[4]:											0.00	(Avg.)

Eq. (1)
Discharge Header Pressure Drop:

$$\Delta p_p = \left(\frac{4f_{avg}L_p}{3D_p} - 2K\right)\frac{\rho V_p^2}{2g_c}$$

Eq. (2)
Return Header Pressure Drop:

$$\Delta p_p = \left(\frac{4f_{avg}L_p}{3D_p} + 2K\right)\frac{\rho V_p^2}{2g_c}$$

Eq. (3)
Branch Outlet Pressure Drop:

$$\Delta p_o = \frac{1}{C_o^2}\frac{\rho V_o^2}{2g_c}$$

Eq. (4)
Reynolds Number:

$$Re = \frac{D \cdot v \cdot \rho}{\mu} = \frac{D \cdot v}{\eta}$$

Eq. (5)
Distribution Equation:

$$\%\ Maldistribution = 100\left(1 - \sqrt{\frac{\Delta p_o - |\Delta p_p|}{\Delta p_o}}\right)$$

Eq. (6)
Fanning Friction Factor:

$$f = \frac{1}{4}\left(\frac{D}{L}\right)\left(\frac{[(p_0 - p_L) - \rho g(h_0 - h_L)]}{\frac{1}{2}\rho v^2}\right)$$

Eq. (7)
Darcy Equation:

$$h_L = \left[\left(4f\ \frac{L}{D}\right)\right]\frac{v^2}{2g}$$

Notes:

(1) K = 0.5 when viscous losses are negligible, K = 1.0 for return headers.
(2) Include the equivalent length of valves and fittings.
(3) Pressure drop due to velocity head and friction losses across the length of the branch pipe.
(4) Pressure at the well head taking into consideration frictional losses across the length of the drop pipe, static head associated with water elevation and mounding, and pressure drop required for foot valve or variable area valve.
(5) Maldistribution of 10 percent or less is recommended.
(6) If the branch piping exhibits average pressure losses (due to length, fittings, and/or well head pressures) of at least 10 times higher than the header, pressure losses maldistribution will be less than 10 percent.

Pressure Drop (ft w.c.)[3]:											**0.00**	**(Avg.)**
Well Head Pressure (ft w.c.)[4]:											**0.00**	**(Avg.)**

Eq. (1)
Discharge Header Pressure Drop:

$$\Delta p_p = \left(\frac{4f_{avg}L_p}{3D_p} - 2K\right)\frac{\rho V_p^2}{2g_c}$$

Eq. (2)
Return Header Pressure Drop:

$$\Delta p_p = \left(\frac{4f_{avg}L_p}{3D_p} + 2K\right)\frac{\rho V_p^2}{2g_c}$$

Eq. (3)
Branch Outlet Pressure Drop:

$$\Delta p_o = \frac{1}{C_o^2}\frac{\rho V_o^2}{2g_c}$$

Eq. (4)
Reynolds Number:

$$Re = \frac{D \cdot v \cdot \rho}{\mu} = \frac{D \cdot v}{\eta}$$

Eq. (5)
Distribution Equation:

$$\%\ Maldistribution = 100\left(1 - \sqrt{\frac{\Delta p_o - |\Delta p_p|}{\Delta p_o}}\right)$$

Eq. (6)
Fanning Friction Factor:

$$f = \frac{1}{4}\left(\frac{D}{L}\right)\left(\frac{[(p_0 - p_L) - \rho g(h_0 - h_L)]}{\frac{1}{2}\rho v^2}\right)$$

Eq. (7)
Darcy Equation:

$$h_L = \left[\left(4f\ \frac{L}{D}\right)\right]\frac{v^2}{2g}$$

Notes:

(1) K = 0.5 when viscous losses are negligible, K = 1.0 for return headers.
(2) Include the equivalent length of valves and fittings.
(3) Pressure drop due to velocity head and friction losses across the length of the branch pipe.
(4) Pressure at the well head taking into consideration frictional losses across the length of the drop pipe, static head associated with water elevation and mounding, and pressure drop required for foot valve or variable area valve.
(5) Maldistribution of 10 percent or less is recommended.
(6) If the branch piping exhibits average pressure losses (due to length, fittings, and/or well head pressures) of at least 10 times higher than the header, pressure losses maldistribution will be less than 10 percent.

Eq. (7)
Darcy Equation:

$$h_L = \left[\left(4f\ \frac{L}{D}\right)\right]\frac{v^2}{2g}$$

Notes:

(1) K = 0.5 when viscous losses are negligible, K = 1.0 for return headers.
(2) Include the equivalent length of valves and fittings.
(3) Pressure drop due to velocity head and friction losses across the length of the branch pipe.
(4) Pressure at the well head taking into consideration frictional losses across the length of the drop pipe, static head associated with water elevation and mounding, and pressure drop required for foot valve or variable area valve.
(5) Maldistribution of 10 percent or less is recommended.
(6) If the branch piping exhibits average pressure losses (due to length, fittings, and/or well head pressures) of at least 10 times higher than the header, pressure losses maldistribution will be less than 10 percent.

ASCE Table 12.2-1 Design Coefficients and Factors for Seismic Force-Resisting Systems

Select Seismic Force-Resisting System:

4. Ordinary steel concentrically braced frames

DETAILING REFERENCE SECTION	Refer to IBC
RESPONSE MODIFICATION COEFFICIENT, R[a]	3.25
SYSTEM OVER-STRENGTH FACTOR, Ω[g]	2
DEFLECTION AMPLIFICATION FACTOR, C_D[b]	3.25
BASIC SEISMIC-FORCE-RESISTING SYSTEM	B - 4

Str. System Limitions and Building Height				
Seismic Design Category				
B	C	D	E	F
NL	NL	35j	35j	NPj

Equivalent Lateral Force Procedure (ASCE 7-12.8)

$V := C_S \cdot W$ — W = effective seismic weight per ASCE 7 section 12.7.2; C_S = seismic response coefficient

$R = 3.25$ — Response Modification Coef. (ASCE 7 - Table 12.2-1)

$I_E = 1$ — Seismic Importance Factor (ASCE 7 - Table 11.5-1)

ASCE 7-12.8.1

$$C_{S\_2} := \frac{S_{DS}}{\frac{R}{I_E}}$$ $C_{S\_2} = 12.93\%$ — ASCE 7 equation 12.8-2

ASCE 7-12.8.2.1

$T_L := 6$ — ASCE 7 figure 22-15

Structure Type (ASCE 7 Table 12.8-2)	Ct	x
All other structural systems	0.02	0.75

$h_n := 12$ — height in ft above the base to the highest level of the structure

$T_a := C_T \cdot h_n^{\,x}$ $T_a = 0.129$ — ASCE 7 equation 12.8-7

$$C_{S\_3} := \frac{S_{D1}}{T_a \cdot \frac{R}{I_E}}$$ $C_{S\_3} = 48.53\%$ — ASCE 7 equation 12.8-3

$$C_{S\_4} := \frac{S_{D1} \cdot T_L}{T_a^{\,2} \cdot \frac{R}{I_E}}$$ $C_{S\_4} = 2258.33\%$ — ASCE 7 equation 12.8-4

$$C_{S\_3\_4} := \begin{cases} C_{S\_3} & \text{if } T_a \le T_L \\ C_{S\_4} & \text{if } T_a > T_L \end{cases}$$ $C_{S\_3\_4} = 48.53\%$

$C_{S\_5} := 0.01$ $C_{S\_5} = 1.00\%$ — ASCE 7 equation 12.8-5

$$C_{S\_6} := \frac{0.5 \cdot S_1}{\frac{R}{I_E}}$$ $C_{S\_6} = 2.08\%$ — ASCE 7 equation 12.8-6

Seismic Response Coefficient in accordance with ASCE 7 section 12.8.1.1

$$C_S := \begin{cases} \max\left(\min\left(C_{S\_2}, C_{S\_3\_4}\right), C_{S\_5}\right) & \text{if } S_1 < 0.06 \\ \max\left(\max\left(\min\left(C_{S\_2}, C_{S\_3\_4}\right), C_{S\_5}\right), C_{S\_6}\right) & \text{if } S_1 \ge 0.06 \end{cases}$$

$C_S = 12.93\%$

$0.7C_S = 9.05\%$

Seismic Load Effects and Combinations (ASCE 7-12.4)

$E := E_h + E_v$ - ASCE 7 equation 12.4-1

$E := E_h - E_v$ - ASCE 7 equation 12.4-2

$E_h := \rho \cdot Q_E$ - ASCE 7 equation 12.4-2

$\rho := 1.3$

$Q_E := C_s$

	Factored	Service
$E_h := \rho \cdot Q_E$	$E_h = 0.168 \cdot W$	$0.7 \cdot E_h = 0.118 \cdot W$
$E_v := \begin{cases} 0 & \text{if } S_{DS} \le 0.125 \\ (0.2 \cdot S_{DS} \cdot D) & \text{otherwise} \end{cases}$	$E_v = 0.084 \cdot D$	$0.7E_v = 0.059 \cdot D$

Group-Anchor Bolt Design

Reference:H:\MATHCAD WORKSHEETS\Units.xmcd

REFERENCE: Appendix D, ACI 318-05 & chapter 34 of PCA's Notes on ACI 318.

D.4 - GENERAL STRENGTH REQUIREMENTS FOR ANCHORS

$f'_c := 4000psi$

$n := 4$ - number of tensioned anchors in the group

$N_{ua} := 8.4kip$ - factored design load, Tension

$V_{ua} := 4.1kip$ - factored design load, Shear

$d_o := 0.75in$ - outside diameter of anchor or shaft diameter of headed stud, headed bolt ot hooked bolt.

Material := 1554 $f_y := 36ksi$ $f_{uta} := 58ksi$

typical_embedment = 9·in vert_anchor_spacing := 6in hor_anchor_spacing := 6in

top_edge := 6in bot_edge := 6in left_edge := 6in right_edge := 6in

$c_{amax} := \max(top\_edge, bot\_edge, right\_edge, left\_edge)$ $c_{amax} = 0.5\,ft$

$c_{amin} := \min(top\_edge, bot\_edge, right\_edge, left\_edge)$ $c_{amin} = 6\cdot in$

$h_{ef1} := typical\_embedment$ $h_{ef1} = 9\cdot in$ - effective embedment length

Is this an anchor group?

$answer_1 :=$ "Yes" if $\min(vert\_anchor\_spacing, hor\_anchor\_spacing) \le 3\cdot h_{ef1}$ $answer_1 = "Yes"$
"No, use single anchor factors." otherwise

a) Steel Strength of anchors in tension (D.5.1)

$\phi_{nsa} := 0.75$ - D.4.4, D.4.5 - Strength reduction factor based on anchor

$AB\_diam := d_o$ $n_t := 10$ - number of threads per inch of anchor - AISC 13th Ed.Manual pg 7-83 or AISC/ASD Manual pg 4-147. See table on the right.

$A_{se} := \frac{\pi}{4}\cdot\left(d_o - \frac{0.9743\cdot 1in}{n_t}\right)^2$ $A_{se} = 0.33\cdot in^2$ - effective cross sectional area of threaded anchor, ACI 318 pg. 399

$f_{ut} := \min(f_{uta}, 1.9f_y, 125ksi)$ $f_{uta} = 58\cdot ksi$ - specified tensile strength of anchor steel

$\phi N_{sa} := \phi_{nsa}\cdot n\cdot A_{se}\cdot f_{uta}$ $\phi N_{sa} = 58.2\cdot kips$ - Nsa, nominal strength of a single anchor or group of anchors in tension as governed by the steel strength

$A_{se\_required} := \frac{N_{ua}}{\phi_{nsa}\cdot n\cdot f_{uta}}$ $A_{se\_required} = 0.05\cdot in^2$

$check_1 :=$ "OK" if $A_{se} \ge A_{se\_required}$ $check_1 = "OK"$
"NG" otherwise

b) Concrete Breakout strength of Anchor in Tension (D.5.2)

$1.5h_{ef1} = 13.5\cdot in$ $vert\_anchor\_spacing = 6\cdot in$ $hor\_anchor\_spacing = 6\cdot in$

$top\_edge_1 := \min(top\_edge, 1.5h_{ef1})$ $right\_edge_1 := \min(right\_edge, 1.5h_{ef1})$ $bot\_edge_1 := \min(bot\_edge, 1.5h_{ef})$ $left\_edge_1 := \min(left\_edge,$

$A_{Nc} := (right\_edge_1 + hor\_anchor\_spacing + left\_edge_1)\cdot(top\_edge_1 + vert\_anchor\_spacing + bot\_edge_1)$ $A_{Nc} = 324\cdot in^2$

- A_{Nc} projected area of the failure surface approximated by a rectangle with edges bounded by 1.5hef and free edges of the concrete to the centerline of the anchors.

$\phi_{cbg} := 0.7$

- D.4.4 or D.4.5 - Strength reduction factor bas concrete breakout, Condition A or B.

$$h_{ef} := \begin{cases} \frac{c_{amax}}{1.5} & \text{if } c_{amax} \le 1.5h_{ef1} \\ h_{ef1} & \text{otherwise} \end{cases}$$ $h_{ef} = 4\cdot in$

- For the special case where there are 3 or 4 e with the largest edge distance ca max ≤1.5hef, embedment depth hef used in D-6 through D-11 limited to camax/1.5, D.5.2.3

$A_{Nco} := 9\cdot h_{ef}^2$ $A_{Nco} = 144\cdot in^2$

-Equation D-6, Ano, projected area of failure su of single anchor, away from the edges

$A_{Nc} := \min(A_{Nc}, n\cdot A_{Nco})$ $A_{Nc} = 324\cdot in^2$

-An, projected area of failure surface of anchor group of anchors, 1.5hef away from the edges

$k_c := 24$ $N_b := k_c\cdot\sqrt{f'_c\cdot\frac{1}{psi}}\cdot\left(h_{ef}\cdot\frac{1}{in}\right)^{1.5}\cdot lb$ $N_b = 12143.15lb$

- kc=24 Cast-In or kc=17 Post-Installed Anchors, D.5.2.2. See also RD.5.2.2. Equation D-7, Basic concrete breakout strength in tension of a sing anchor in cracked concrete

$e_{N'} := 0in$ $\psi_{ecN} := \begin{cases} \frac{1}{\left(1+\frac{2\cdot e_{N'}}{3\cdot h_{ef}}\right)} & \text{if } \frac{1}{\left(1+\frac{2\cdot e_{N'}}{3\cdot h_{ef}}\right)} \le 1 \\ 1.0 & \text{otherwise} \end{cases}$ $\psi_{ecN} = 1$

- Eccentricity in the connection, see D.5.2.4 for eccentricity requirements

$$\psi_{edN} := \begin{cases} 1.0 & \text{if } c_{amin} \ge 1.5\cdot h_{ef} \\ \left(0.7+\frac{0.3\cdot c_{amin}}{1.5h_{ef}}\right) & \text{otherwise} \end{cases}$$ $\psi_{edN} = 1$

-Equations D-10 & D-11, Modification Factor for e effects

$\psi_{cN} := 1.25$ $\psi_{cN} = 1.25$

- D.5.2.6 1.25 for Cast-in anchors, 1.4 for Post-Installed anchors with a value of kc = 17. Otherwise refer to ACI 355.2

$c_{ac} := 4.5in$ $c_{ac} = 4.5\cdot in$ $\psi_{cpN} := \begin{cases} 1.0 & \text{if } c_{amin} \ge c_{ac} \\ \frac{c_{amin}}{c_{ac}} & \text{if } \frac{c_{amin}}{c_{ac}} \ge \frac{1.5h_{ef}}{c_{ac}} \\ \frac{1.5h_{ef}}{c_{ac}} & \text{otherwise} \end{cases}$ $\psi_{cpN} = 1.33$

- D.8.6, critical edge distance as determined fr ACI 355.2. See D.8.6 for values of c_{ac}.

$\phi N_{cbg} := \phi_{cbg}\cdot\frac{A_{Nc}}{A_{Nco}}\cdot\psi_{ecN}\cdot\psi_{edN}\cdot\psi_{cN}\cdot\psi_{cpN}\cdot N_b$ $\phi N_{cbg} = 31.88\cdot kip$

- Equation D-6, Nominal concrete breakout str in tension of a group of anchors in tension

$$check_2 := \begin{cases} \text{"OK"} & \text{if } \phi N_{cbg} \ge N_{ua} \\ \text{"NG"} & \text{otherwise} \end{cases}$$ $check_2 = \text{"OK"}$

c) Pullout Strength of anchors in tension (D.5.3)

$\phi_{pn} := 0.7$ - D.4.4 or D.4.5 - Strength reduction factor based on concrete breakout, Condition A or B.

$AB\_diam = \frac{3}{4}\cdot in$ - Anchor diameter, see table 34-2 in Notes on ACI 318-05 for Bearing area or washers & nuts.

$\psi_{cP} := 1.0$ - D.5.3.6 For an anchor located in a region where analysis indicates no cracking at service load level. Where cracking will occur ψ_{cP} shall be taken as 1.0.

$$A_{brg\_reqd} := \frac{\frac{N_{ua}}{n}}{\phi_{pn}\cdot\psi_{cP}\cdot 8\cdot f'_c}$$

$A_{brg\_reqd} = 0.09\cdot in^2$ - Bearing area from equation D-15, in ACI 318-05

$A_{brg} := 0.911 in^2$ - Bearing area of a heavy hex nut per table 34-2 of the Notes on ACI 318-05 or of a flat round washer. See table on adjacent page

$$check3 := \begin{cases} \text{"OK"} & \text{if } A_{brg} \geq A_{brg\_reqd} \\ \text{"NG"} & \text{otherwise} \end{cases}$$

$check3 = \text{"OK"}$

$N_p := 8\cdot A_{brg}\cdot f'_c$

$\phi N_{pn} := \phi_{pn}\cdot\psi_{cP}\cdot N_p$ $\phi N_{pn} = 20.41\cdot kip$

d) Concrete side face blowout strength of a headed anchor in tension (D.5.4)

$\phi_{nsb} := 0.7$ $c_{a1} := \min(c_{amin}, c_{amax})$ $c_{a2} := \max(c_{amin}, c_{amax})$

$$N_{sb} := \begin{cases} 160\cdot c_{a1}\cdot\sqrt{A_{brg}}\cdot\sqrt{\frac{f'_c}{psi}}\cdot psi & \text{if } c_{a1} \leq 0.4 h_{ef} \\ \left(160\cdot c_{a1}\cdot\sqrt{A_{brg}}\cdot\sqrt{\frac{f'_c}{psi}}\cdot psi\right)\cdot\frac{\left(1+\frac{c_{a2}}{c_{a1}}\right)}{4} & \text{if } c_{a1} \leq 0.4 h_{ef} \wedge c_{a2} \leq 3\cdot c_{a1} \\ \text{"Not Applicable"} & \text{otherwise} \end{cases}$$

- Equation D-17, nominal side-face blowout strength of a anchor (usually applies to cast anchors), without modifica a perpendicular edge distance. Use for anchor groups. Th requirements are applicable to Cast-in anchors.

$N_{sb} = \text{"Not Applicable"}$

$s := \min(vert\_anchor\_spacing, hor\_anchor\_spacing, 6c_{a1})$

$\phi N_{sbg} := \phi_{nsb}\cdot\left(1+\frac{s}{6\cdot c_{a1}}\right)\cdot N_{sb}$ $\phi N_{sbg} = 816.67\cdot kip$

- Equation D-18, nominal strength of the group of anchors side-face blowout (usually applies to cast anchors), withc modification for a perpendicular edge distance. Use for groups.

$$check2 := \begin{cases} \text{"OK"} & \text{if } \phi N_{sbg} \geq N_{ua} \\ \text{"NG"} & \text{otherwise} \end{cases}$$

$check2 = \text{"OK"}$

Summary of design requirements for tensile loading:

Steel strength of anchor in tension D.5.1 : $\phi N_{sa} = 58.2\cdot kip$

Concrete breakout strength of anchor in tension D.5.2 : $\phi N_{cbg} = 31.88\cdot kip$

Pullout strength of anchor in tension D.5.3 : $\phi N_{pn} = 20.41\cdot kip$

Concrete side-face blowout strength of a headed anchor in tension : $\phi N_{sbg} = 816.67\cdot kip$

e) Steel strength of anchor in shear (D.6.1)

$\phi_s := 0.7$ grout_pad := 0.8

$V_{sa} := n \cdot 0.6 \cdot A_{se} \cdot f_{uta} \cdot grout\_pad$ $V_{sa} = 37.25 \cdot kip$ $\phi V_s := \phi_s \cdot V_{sa}$ $\phi V_s = 26.07 \cdot kip$

$check4 := \begin{cases} \text{"OK"} & \text{if } \phi V_s \geq V_{ua} \\ \text{"NG"} & \text{otherwise} \end{cases}$ $check4 = \text{"OK"}$

- Equation D-20, D.6.1.2 b for cast-in headed bolts and for post-instc anchors where sleeves do not extend through shear plane. Also see D.6.1.3 for anchors used with built up grout pads.

f) Concrete Breakout Strength of anchor in shear (D.6.2)

$\phi_{vcbg} := 0.7$

The two anchors located closest to the edge toward which the shear is directed will control the concrete bre strength. These anchors are assumed to carry one half of the shear. The total breakout strength will be twi value calculated for these two anchors (the anchors away from the edge are assumed to develop the same valu

$ca1 := \min(top\_edge, bot\_edge)$ $c_{a1} = 6 \cdot in$ $1.5 \cdot c_{a1} = 9 \cdot in$

- Applicable only to shear as shown on the diagram at the beginning of this worksheet. If shear is applied in the other direction, change the input parameters of cc to right_edge & left_edge. Similar for right & left edges.

$right\_edge_1 := \min(right\_edge, 1.5c_{a1})$ $right\_edge_1 = 6 \cdot in$

$left\_edge_1 := \min(left\_edge, 1.5c_{a1})$ $left\_edge_1 = 6 \cdot in$

$Avc := (right\_edge_1 + hor\_anchor\_spacing + left\_edge_1) \cdot (1.5 \cdot c_{a1})$ $A_{vc} = 162 \cdot in^2$

- Avc, projected concrete failure area of an anchor or anchors

$A_{vco} := 4.5 \cdot c_{a1}^2$ $A_{vco} = 162 \cdot in^2$

- Avco, pojected concrete failure area of one anchor, u limited by corner influences, spacing or member thickn

$A_{vc} := \min(Avc, n \cdot A_{vco})$ $A_{vc} = 162 \cdot in^2$

$eV' := 0in$ $\psi_{ecV} := \begin{cases} \dfrac{1}{\left(1 + \dfrac{2 \cdot eV'}{3 \cdot c_{a1}}\right)} & \text{if } \dfrac{1}{\left(1 + \dfrac{2 \cdot eV'}{3 \cdot c_{a1}}\right)} \leq 1 \\ 1.0 & \text{otherwise} \end{cases}$ $\psi_{ecV} = 1$

- NO eccentricity in the connection, see D.6.2.5 for eccentricity requirements

$ca2 := \min(right\_edge, left\_edge)$ $c_{a2} = 6 \cdot in$

- Applicable only to shear as shown on the diagram at the beginning of this worksheet. If shear is applied in the other direction, change the input parameters to top_edge & bot_edge in the calculation of ca1 above and right & left edge also above.

$\psi_{edV} := \begin{cases} 1.0 & \text{if } c_{a2} \geq 1.5 \cdot c_{a1} \\ \left(0.7 + 0.3 \cdot \dfrac{c_{a2}}{1.5 \cdot c_{a1}}\right) & \text{otherwise} \end{cases}$ $\psi_{edV} = 0.9$ - D.6.2.6

$\psi_{cV} := 1$ $\psi_{cV} = 1$

- D.6.2.7, For anchors located in a region of the membe where analysis indicates no cracking at service loads. Conservative, for locations where cracking is likely to occur.

$l_e := \min(typical\_embedment, 8 \cdot d_o)$ $l_e = 6 \cdot in$

$V_b := 7 \cdot \left(\dfrac{l_e}{d_o}\right)^{0.2} \cdot \sqrt{d_o \cdot \dfrac{1}{in}} \cdot \sqrt{f'_c \cdot \dfrac{1}{psi}} \cdot \left(c_{a1} \cdot \dfrac{1}{in}\right)^{1.5} \cdot lb$ $V_b = 8.54 \cdot kip$

- D.6.2.2 load bearing length of the anchor for shear. A basic breakout strength in shear of a single anchor in c concrete Vb.

Total breakout strength of the four anchor group (2 anchors) :

$\phi V_{cbg} := 2 \cdot \phi_{cbg} \cdot \dfrac{A_{vc}}{A_{vco}} \cdot \psi_{ecV} \cdot \psi_{edV} \cdot \psi_{cV} \cdot V_b$ $\phi V_{cbg} = 10.76 \cdot kip$ $check5 := \begin{cases} \text{"OK"} & \text{if } \phi V_{cbg} \geq V_{ua} \end{cases}$ $check5 = \text{"OK"}$

g) Concrete Pryout Strength of anchor in shear (D.6.3)

$\phi_{cpg} := 0.7$

$$k_{cp} := \begin{cases} 1.0 & \text{if } h_{ef} < 2.5in \\ 2.0 & \text{if } h_{ef} \geq 2.5in \end{cases}$$

$k_{cp} = 2$ - D.6.3.1, kcp coefficient for pryout strength

$$\phi V_{cpg} := \phi_{cpg} \cdot k_{cp} \cdot \frac{\phi N_{cbg}}{\phi_{cbg}}$$

$\phi V_{cpg} = 63.75 \cdot kip$ - Equation D-30, D.6.3.1 Nominal pryout strength

$$check_6 := \begin{cases} \text{"OK"} & \text{if } \phi V_{cpg} \geq V_{ua} \\ \text{"NG"} & \text{otherwise} \end{cases}$$

$check_6 = \text{"OK"}$

Summary of design requirements for SHEAR:

SSteel strength of anchor in shear D.6.1 : $\phi V_s = 26.07 \cdot kip$

Concrete breakout strength of anchor in tension D.6.2 : $\phi V_{cbg} = 10.76 \cdot kip$

Concrete pryout strength of anchor in shear D.6.3 : $\phi V_{cpg} = 63.75 \cdot kip$

Therefore, $\phi V_n := \min(\phi V_s, \phi V_{cbg}, \phi V_{cpg})$ $\phi V_n = 10.76 \cdot kip$

h) Interaction of tensile and shear forces (D.7)

Is the full TENSION strength permitted?

$$answer3 := \begin{cases} \text{"yes"} & \text{if } V_{ua} \le 0.2 \cdot \phi V_n \\ \text{"no"} & \text{otherwise} \end{cases}$$

answer3 = "no"

Is the full SHEAR strength permitted?

$$answer4 := \begin{cases} \text{"yes"} & \text{if } N_{ua} \le 0.2 \cdot \phi N_n \\ \text{"no"} & \text{otherwise} \end{cases}$$

answer4 = "no"

If both answers above are "NO", the interaction equation must be used.

$$interaction\_equation := \frac{N_{ua}}{\phi N_n} + \frac{V_{ua}}{\phi V_n}$$

interaction_equation = 0.79

$$check7 := \begin{cases} \text{"OK"} & \text{if } interaction\_equation \le 1.2 \\ \text{"NG"} & \text{otherwise} \end{cases}$$

check7 = "OK"

i) Required edge distances, spacings, and center to center spacing (D.8)

Minimum center to center spacing of the anchors:

$min\_spacing := 4 \cdot d_o$

min_spacing = 3 in

- Section D.8.1 & D.8.4, minimum spacing of ancho shall be 4 do for untorqued cast-in anchors, 6 do f torqued cast-in anchors and post installed anchors Otherwise refer to ACI 355.2 for product-specif tests.

Minimum edge distance for the anchors:

min_edge_distance_ACI := 3in

(per ACI 318, 7.7)

min_edge_distance_ACI = 3 in

- Section D.8.2 ~ D.8.4,

ATTACHMENT C: GEOTECHNICAL ANALYSIS

Geotechnical Data Summary and Proposed Supplemental Geotechnical Investigation

The purpose of this geotechnical summary is to provide information on existing site geology and geotechnical data in support of the groundwater remedy design and to propose areas where supplemental geotechnical investigation is needed to verify design parameters. Coordination with the Soil RCRA Facility Investigation/Remedial Investigation (RFI/RI) investigation program was conducted in planning the supplemental geotechnical investigation to minimize the number of required boreholes, thereby minimizing ground disturbance.

C.1 Summary of Existing Site Geologic and Geotechnical Data

In 2004 and 2009, CH2M HILL conducted geotechnical investigations in and around the compressor station and Area of Concern (AOC) 4, respectively. Results were presented in the following reports and are summarized below:

- *Geotechnical Investigation Report, Topock Compressor Station, Water Treatment Plant*. Prepared by CH2M HILL in September 2004. (Full report presented in PDF format as part of this Attachment to Appendix C of the 60% Basis of Design Report on the Appendix C CD-ROM).
- *Geotechnical Investigation, Topock AOC 4 Remediation – Pre-Work Plan Data Collection Activities, PG&E Compressor Station, Needles, California*. Prepared by CH2M HILL in October 2009. (Full report presented in PDF format as part of this Attachment to Appendix C on the Appendix C CD-ROM).

In addition, geologic information for the MW-20 Bench and hydrogeologic cross sections throughout the site are also summarized in the sections below. Original results were reported in the following reports:

- *Work Plan for Installation of Extraction Well TW-3D, Interim Measure No. 3 Groundwater Extraction System, PG&E Topock Compressor Station, Needles, California.* Prepared by CH2M HILL in October 2005.
- *RCRA Facility Investigation/Remedial Investigation Report, PG&E Topock Compressor Station, Needles, California, Volume 2 – Hydrogeologic Characterization and Results of Groundwater and Surface Water Investigation.* Prepared by CH2M HILL in February 2009. A selection of relevant borings logs from this report is included following this geotechnical data summary on the Appendix C CD-ROM.

C.1.1 Compressor Station

The 2004 geotechnical investigation found that in the vicinity of monitoring wells MW-13 and MW-14 the area consists of alternating layers of gravelly sand and sandy gravel down to an approximate elevation of 435 feet above mean sea level (msl). In the vicinity of MW-37D gravelly sand with clay and sandy clay layers starts at an elevation of approximately 465 feet msl underlying the sandy gravel. The difference in material in this boring can be attributed to the fact that it was located in a wash that transports the finer material from higher elevations.

Soil borings B-01, B02, B-02A, and B-03 were also advanced during this investigation. Exhibit C.1-1 presents a summary of the generalized subsurface profile and design strength parameters. Complete details of the soil borings can be found in the 2004 *Geotechnical Investigation Report*, which is included in PDF format as part of this Attachment to Appendix C on the Appendix C CD-ROM. Generally, medium dense to very dense, silty sands and poorly graded silty sands underlie the proposed treatment plant site. Blow counts in the dry, silty sands were generally in the range of 20 to greater than 50. Therefore, liquefaction potential of the site soils is estimated to be low, especially where the groundwater is greater than 50 feet below ground surface (bgs).

In addition, the following conclusions were made as a result of the 2004 geotechnical investigation:

- Expansion/Collapse – Based on the medium dense to very dense granular material encountered at the project site, expansion and collapse potential is regarded as low.

- Settlement – Based on the medium dense to very dense granular material encountered at the project site (above and below the proposed/ existing footing elevation), and the relatively deep groundwater table (>45 feet), consolidation settlement is not considered an issue. Secondary compression settlement has been determined to be negligible.

- Corrosion Conditions – Comparison between the laboratory test results and the Caltrans corrosion criteria indicates that the onsite soils are considered to be corrosive to concrete structures. The Caltrans corrosion criteria should not be applied to piping and other metal structures. Concrete in contact with onsite soil shall be batched using Type V cement in accordance with the 2001 California Building Code (CBC). Adequate concrete cover over reinforcing steel should be provided in accordance with good construction practices and design standards. Exhibit C.1-2 summarizes the results of the laboratory corrosion tests.
- Solubility – The solubility results are low at this site, so it is not expected to be an issue. Exhibit C.1-3 summarizes the results of the solubility tests.
- Seismicity – The Chemehuevi Graben Fault, approximately 18.8 kilometers from the project site, is the controlling fault at the project site. The Chemehuevi Graben Fault is a normal style fault with a maximum credible earthquake (MCE) moment magnitude (Mw) of 6.0. The fault is classified as Seismic Source Type C, the project site lies in Seismic Zone 3, and the soil profile is classified as type SD as defined in the 2001 CBC.

Using the attenuation curves of Sadigh et al. (see Blake 1998), probabilistic analyses indicate that a horizontal peak ground acceleration (HPGA) of 0.07g may be used for a 10 percent probability of exceedance in 50 years. Deterministic analyses indicate a peak ground acceleration (PGA) of 0.20g at the project site.

Recommendations that were discussed in 2004 geotechnical investigation include:

- Shallow foundations are recommended for support of the water treatment plant. The depth of foundation support should be down to a minimum of 2 feet bgs.
- The slab and footings should be set on a minimum 6-inch-thick layer of granular base leveling course. The granular material should consist of well-graded sand and gravel with a maximum particle size of 3 inches and no more than 6 percent passing the No. 200 sieve. The granular material should be placed in 6-inch lifts and compacted to 95 percent of maximum dry density per American Society for Testing and Materials (ASTM) D1557.
- The native soil under the granular base course should be well compacted down to a depth of 12 inches to a minimum of 95 percent of maximum dry density per ASTM D1557 to provide a firm, unyielding surface. If the native soil under the granular course cannot be compacted to a minimum of 95 percent of maximum dry density per ASTM D1557, it should be removed to a maximum depth of 1 foot and replaced with competent granular backfill compacted in 6-inch lifts.
- The foundation design should be based on an evaluation of the allowable bearing capacity, settlement, and sliding coefficient of friction.
- Bearing capacity – Based on the calculations, it was determined that the subgrade at or near the bottom of the proposed footings will have an allowable bearing capacity of 2,000 pounds per square foot.

- Siding coefficient of friction – An ultimate sliding coefficient of friction equal to 0.45 may be used for foundation design.
- Cut and fill slopes – Cut slopes in the native soil are recommended to be 2H:1V or flatter. In fill areas, the native soil should be placed in 6-inch lifts and compacted to 95 percent of maximum dry density per ASTM D1557.

C.1.2 AOC 4

During the 2009 geotechnical investigation, four geotechnical borings were drilled in the areas on top of the ravine slopes in the AOC 4 area. The scope of the geotechnical investigation did not include evaluation of fill along the slope face and at the bottom of the slope. The four borings were drilled until the augers refused on possible rock or other obstructions. Exhibit C.1-4 presents a summary of field exploration details. Complete results of the 2009 investigation can be found in the 2009 *Geotechnical Investigation, Topock AOC 4 Remediation – Pre-Work Plan Data Collection Activities* report, which is included as part of this Attachment to Appendix C on the Appendix C CD-ROM.

Exploration Number	Approximate Location (NAD 83 Lat./Long,)	Approximate Ground Surface Elevation (feet)	Type of Boring	Depth to Auger Refusal (feet)	Groundwater Depth (feet)
AOC4-GEO1	34°42’47” N; 114° 29’37” W	611.0	Hollow-stem auger	38.5	NE
AOC4-GEO2	34°42’47” N; 114°29’38” W	611.0	Hollow-stem auger	56	NE
AOC4-GEO3	34°42’46” N; 114°29’37” W	612.0	Hollow-stem auger	26	NE
AOC4-GEO4	34°42’46” N; 114°29’36” W	612.0	Hollow-stem auger	8.5	NE

Notes:
NE = Not Encountered
Source: *Geotechnical Investigation, Topock AOC 4 Remediation – Pre-Work Plan Data Collection Activities, PG&E Compressor Station, Needles, California* (CH2M HILL 2009)

Based on the soil borings, the subsurface materials in the vicinity of AOC 4 generally consist of gray to grayish brown, dry, medium dense to very dense, silty sand and silty gravel. The gravel sizes ranged from 0.5 to 3 inches. The uncorrected standard penetration test (SPT) N-value in this zone ranges from 17 for 12 inches of penetration to 50 for 6 inches of penetration.

Below the fill layer and alluvial sediments, weathered rock materials were encountered in some of the borings to the explored maximum depths overlying relatively unweathered metadiorite bedrock. The weathered rock generally consists of dense to very dense gravel and sand with silt. Gravel sizes varied from less than an inch up to 5 inches. In some areas broken cobbles or fragments of bedrock were present in the recovered samples. The uncorrected SPT N-values within the native soil zone were above 50. Detailed boring logs are presented in the 2009 *Geotechnical Investigation, Topock AOC 4 Remediation – Pre-Work Plan Data Collection Activities* report that is included as part of this Attachment.

Results and conclusions of the 2009 geotechnical investigation include:

- The depth of debris fill materials encountered in the borings extends approximately 5 feet bgs on the nearly level area of AOC 4 and contains silty sand and gravel mixed with debris including some trash, roots and peaty materials. This depth corresponds to elevations of 606 feet and 607 feet above mean sea level on the west and east sides of the AOC 4 area, respectively, above the ravines.
- The debris fill is underlain by possible weakly cemented alluvium and weathered metadiorite bedrock. These materials consist of dense to very dense silty sand (SM) to silty gravels (GM). The gravel sizes ranges from 0.5 to 3 inches.
- Boring refusal, indicating bedrock or obstructions, was encountered at depths varying from 56 to 5 feet bgs. Boring AOC4-GEO2, located on the west edge of the existing slope, encountered refusal at EL 556 feet or about 56 feet bgs. Boring AOC4-GEO4, located on the east side of the existing slope, encountered refusal at EL 607 feet or at about 5 feet bgs. With respect to the exposed bedrock observed near the investigation site, boring refusal is interpreted as the surface of relatively unweathered bedrock.
- Based on the results of the slope stability analyses, a 35-foot-tall slope with a 1H: 1V slope ratio is expected to be globally stable during construction and remediation activities. A factor of safety (FOS) for slope failure of 1.2 was computed for this condition. An FOS of 1.1 or greater is normally considered adequate for temporary slopes during construction activities.
- It is recommended that temporary slopes be maintained no steeper than 1H: 1V and not higher than 35 feet. Shorter, steeper slopes may be achievable and should be evaluated if proposed.
- The surficial stability of a localized side slope should be considered during the grading and other construction activities. Localized instabilities, if left unchecked, could lead to larger stability issues.

C.1.3 MW-20 Bench Geology

In the vicinity of the MW-20 Bench, the current active interim measure (IM) extraction well TW-2D is screened from 115 feet to 150 feet bgs, in the lower portion of the Alluvial Aquifer above Miocene conglomerate bedrock. During initial pumping tests, TW-2D was pumped at sustained rates of 90 to 100 gallons per minute (gpm). The specific capacity of TW-2D has increased by a factor of two since installation and is currently 8 gpm per foot of drawdown.

Well TW-2D is screened in sandy gravel alluvial deposits that appear to be more conductive than the formations encountered at similar elevations in monitoring wells MW-20 to the south or MW-31 to the north. Although the saturated alluvium above bedrock is thicker to the north of TW-2D, the alluvial deposits at the two monitoring well locations generally had higher clay content and may be less productive than the formation at the TW-2D/TW-2S well pair.

Well TW-2S is screened as a water table extraction well, with the bottom of the screen at 95 feet bgs and the top of the screen at 45 feet bgs. The static water level in both TW-2S and TW-2D is roughly 45 feet bgs under non-pumping conditions. The screened intervals of TW-2S and TW-2D are separated, with TW-2S screened above 95 feet and TW-2D screened below 115 feet. The reason for drilling separate shallow TW-2S and deep TW-2D wells was that an aquitard appeared to be present at the intervening depth in the MW-20 wells, and Consultative Technical Workgroup members expressed concern that a single extraction well should not be screened across the aquitard. However, this aquitard does not appear to be present in the northern portion of the MW-20 bench at the MW-31 location.

A fine-grained unit that forms a local aquitard was encountered at a depth between 100 and 110 feet bgs in TW-2D. Flowing sands were encountered within the fine-grained horizon during drilling at well MW-20. The TW-2 wells were drilled using mud rotary methods, which did not allow for identification of flowing sands.

C.1.4 Hydrogeologic Cross Sections

In the 2009 RFI/RI hydrogeologic characterization report a series of cross sections were prepared to illustrate the site hydrogeology, hydrostratigraphy, bedrock structure, and aquifer distribution and geometry. The hydrogeologic features shown on several of the cross sections which are pertinent to the 60% design are summarized below. A complete discussion of the cross section and site hydrogeology can be found in Volume 2 of the 2009 RFI/RI report.

Hydrogeologic Cross Section A-A' (Figure 5-2 of the 2009 RFI/RI) extends northward from the bedrock outcrop of the Chemehuevi Mountains, along the upper part of Bat Cave Wash, and farther north to the Colorado River floodplain. Wells shown include the former injection well PGE-8 (SWMU 2) as well as the well clusters in the upland area (MW-24), IM extraction area (TW-2, TW-3, MW-20), and the floodplain (MW-34, MW-36, MW-39). Also shown on this cross section are the southward pinch-out of the saturated Alluvial Aquifer, the Alluvial Aquifer hydrostratigraphic units, and the inferred depiction of bedrock contacts and the projected trace of the regional Chemehuevi detachment fault.

Hydrogeologic Cross Section B-B' (Figure 5-3 of the 2009 RFI/RI) extends along the axis of Bat Cave Wash and illustrates the progressive south-to-north thickening of the saturated Alluvial Aquifer. The Alluvial Aquifer consists of the older alluvial fan deposits of the Tertiary Alluvium and Basal Alluvium.

Hydrogeologic Cross Section E-E' (Figure 5-6 of the 2009 RFI/RI) extends from the IM-3 injection area eastward to the Colorado River. Key features shown include the generalized Miocene bedrock structure and the inferred distribution and depositional contacts of the alluvial fan deposits (Toa0, Toa) and the younger fluvial sediments of the Colorado River (Qr1, Qr2, Qr3). As shown on this cross section, the injection interval at the injection well field (wells IW-2 and IW-3) span the mid-depth and deep portions of the Alluvial Aquifer.

Hydrogeologic Cross Section F-F' (Figure 5-7 of the 2009 RFI/RI) extends eastward from the MW-20 bench across the floodplain to the MW-34 monitoring well cluster adjacent to the Colorado River. Features shown include the screen depths of the two active IM extraction wells (TW-3D and PE-1) and the distribution and depositional contacts of the alluvial fan deposits (Toa0, Toa) and the younger fluvial sediments of the Colorado River (Qr1, Qr2, Qr3).

C.2 Proposed Areas for Supplemental Geotechnical Investigation to support Remedy Design

Collection of additional geotechnical samples to support remedy design was coordinated with the Soil RFI/RI investigation program; as a result, no new boreholes will be required just for geotechnical data collection, thereby minimizing disturbance. Geotechnical samples will be collected from proposed soil sample locations SD-19 and SD-20 near the Compressor Station and Bat Cave Wash; and AOC11-3 on the Transwestern Bench (see Exhibit C.2-1). The supplemental geotechnical data will be evaluated to verify design assumptions associated with the new pipe bridge that crosses Bat Cave Wash and the new Central Maintenance Facility at the Transwestern Bench.

As PG&E continues to engage in discussions with transportation agencies, counties, and other property owners/land managers to obtain institutional controls, access agreements, and permits, additional geotechnical data may be required to meet specific requirements of agencies and/or property owners/land managers. This attachment will be updated as needed to reflect changes in requirements.

SOIL BORING LOG

PROJECT NAME: PG&E Topock IM Investigation (Phase 1 2004)		**HOLE DEPTH (ft):** 180.0	**DRILLING CONTRACTOR:** WDC Exploration and Wells, Montclair, CA	
SURFACE ELEVATION: 497.0 ft. MSL	**NORTHING (CCS NAD 27 Z 5):** 2,102,633.34	**EASTING (CCS NAD 27 Z 5):** 7,615,861.57	**DATE AND TIME STARTED:** 03/30/2004	**DATE AND TIME COMPLETED:** 04/01/2004
DRILLING METHOD: Mud Rotary		**WATER LEVEL (ft):** ---	**DRILLING EQUIPMENT:** Speedstar 30K Rig with 94-mm Punch Core	
LOCATION: MW-20 Bench			**LOGGED BY:** J. Sarabia	

DEPTH BGS (feet)	SAMPLE INTERVAL	SAMPLE TYPE/ NUMBER	SAMPLE RECOVERY (ft)	USCS CODE	SOIL DESCRIPTION SOIL NAME, USCS SYMBOL, COLOR, PERCENT COMPOSITION, GRADING, GRAIN SHAPE, MINERALOGY, DENSITY/CONSISTENCY, STRUCTURE, MOISTURE.	COMMENTS DRILLING OBSERVATIONS AND OPERATIONS, DAILY START AND END TIMES , DRILL RATE, REFUSALS, SAMPLING AND TESTING NOTES.
				SW	**WELL GRADED SAND WITH GRAVEL (SW)** - brn 10YR4/3, c silt, gravel up to 1, subang to subrnd.	attempted to core at 70'bgs - refusal, will drill ahead
75						rig chatter significant in this zone, becomes progressively harder to drill with depth, and impossible to core (possible basal conglomerate)
80						at ~79.5 bgs, rig chatter subsides (possible lith, contact), will attempt to core at 80'bgs attempted to core at 80' bgs, could not advance the core barrel - will continue to attempt to get core.
85						attempted to core - could not advance core, will drill forward and attempt to core when lithology changes or 90' bgs (which ever comes first)
90						
					SILTY SAND WITH GRAVEL (SM) - brn 10YR4/3, silt.	core barrel cannot be advanced (too many rocks/ cobbles. Will continue to drill direct with tricone bit and attempt to core every 3-5 feet.
95						continued strong rig chatter. Still unable to advance core barrel
100				GM		
105

COMMENTS DRILLING OBSERVATIONS AND OPERATIONS, DAILY START AND END TIMES , DRILL RATE, REFUSALS, SAMPLING AND TESTING NOTES.
					SILTY SAND WITH GRAVEL (SM) - brn 10YR4/3, silt.	
110						
		CC137	2.75		**WELL GRADED SAND WITH GRAVEL (SW)** - reddish brn 2.5YR4/4, well graded c silt, gravel up to 2, subang to ang, massive.	lithology still causing rig chatter, but will attempt core run.
115						partial core recovery; core color implies geologic contact
		CC138	1.75	SW		poor core recovery, punch coring bit has been chewed up due to cobbles/rocks. Well put on another bit. Very hard coring
120						
		CC139	1			
		CC140	1.75			hard to very hard coring
		CC141	2			very hard coring
125						
		CC142	0.5		**SILTY SAND (SM)** - reddish brn 2.5YR4/4, increasing silts and clays, ang gravel clasts, variable mineralogy, massive.	very hard coring
		CC143	4			hard coring - good core recovery and competence (less very large stones/cobbles, more cohesion in lithology)
130						
		CC144	2.5	SM		alternating moderate to hard coring
135						stones/cobbles stuck on both ends of returned core preventing better recovery
		CC145	2			moderate to easy coring
		CC146	2			
140						moderate coring difficulty

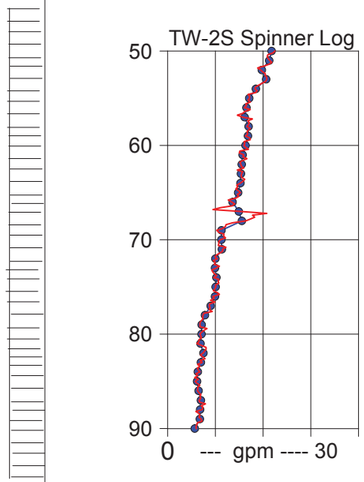
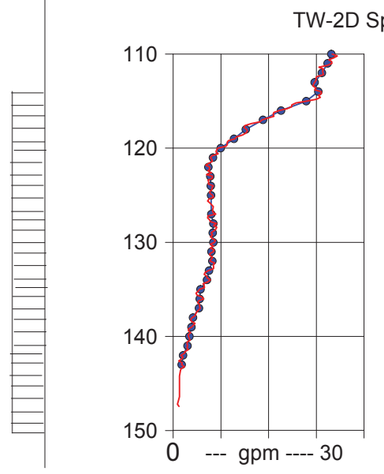
TW-2 Core Log

Plot shows percentages of coarse sediment (> No. 200 sieve) and gravel-size fragments logged in OW corehole adjacent to IW location. Core log depths adjusted to match ground surface datum for IW logs.

TW-2 Geophysical Logs



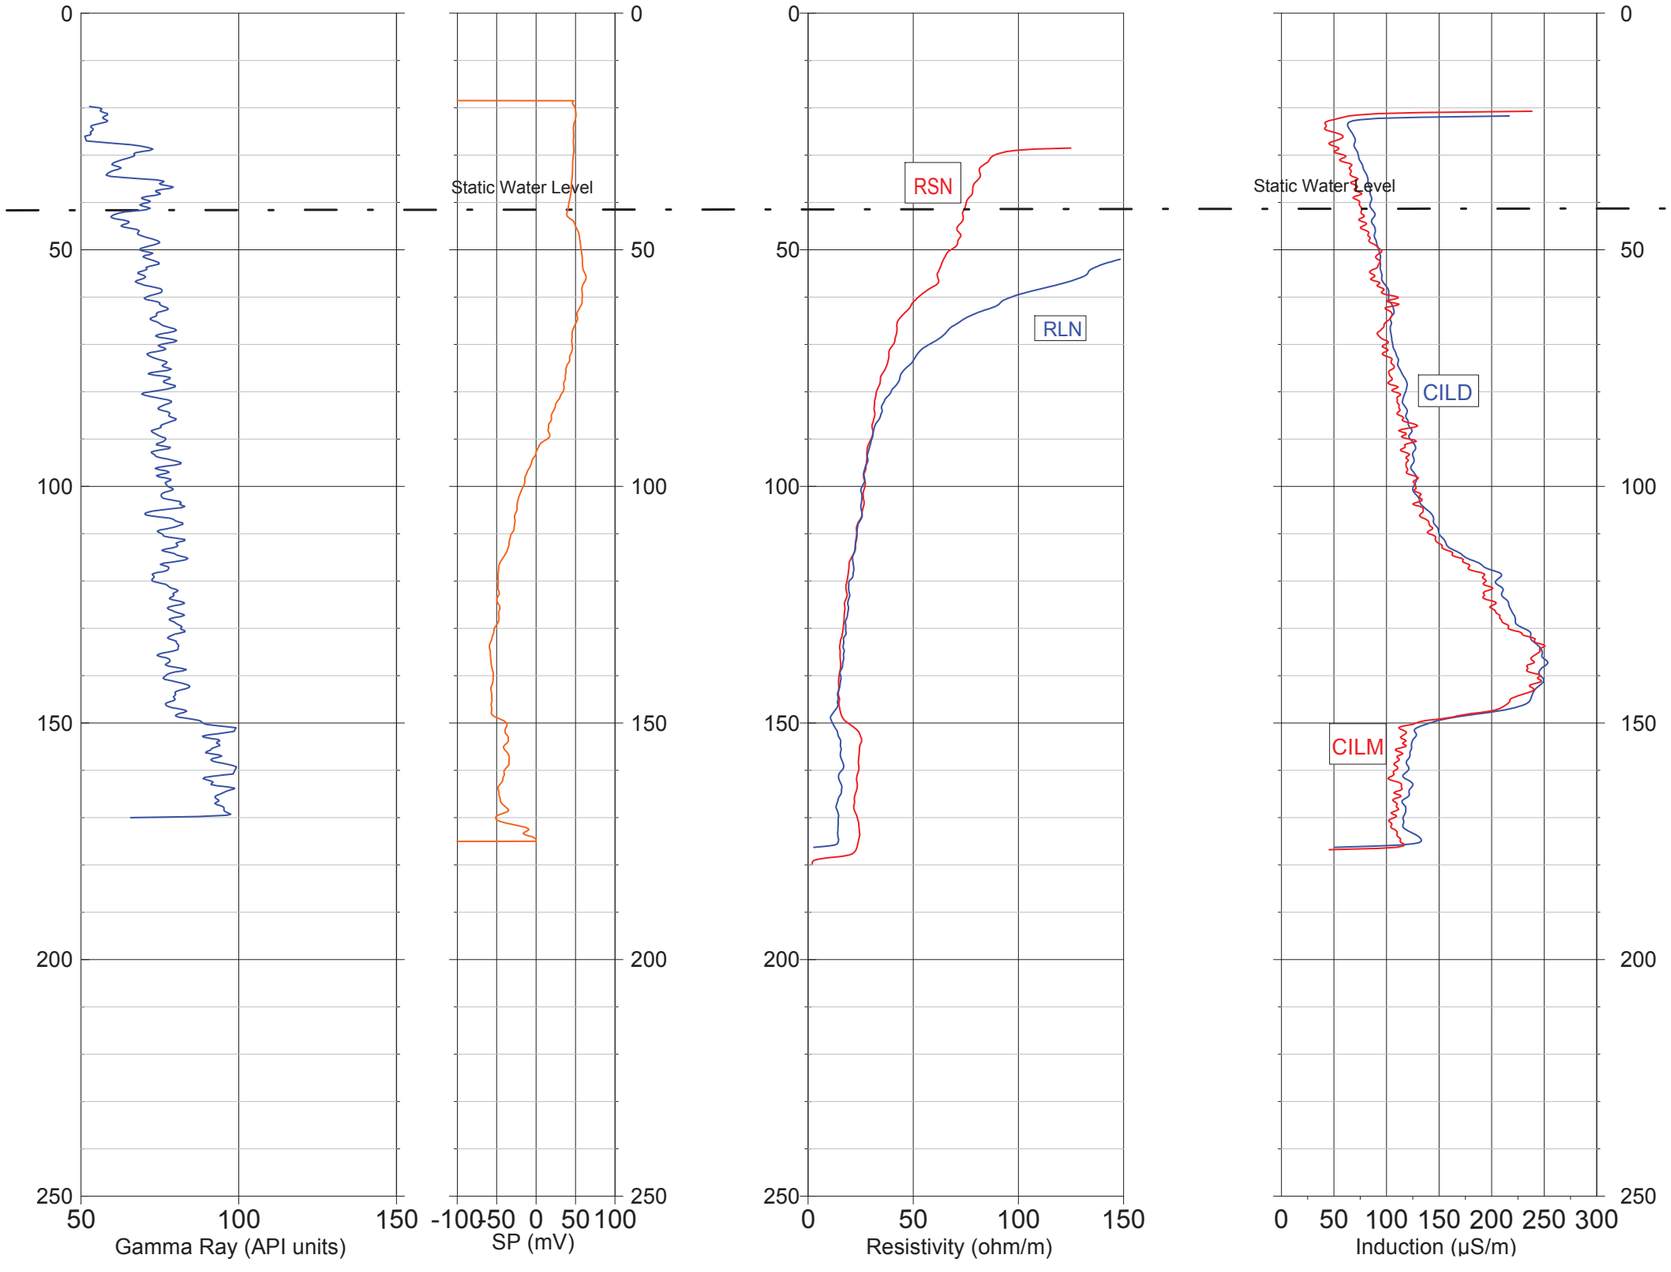


Cased Well Geophysical Log April 1, 2004

Log Units:
Sonic (µsecs/ft), SP (mV/div.), Gamma Ray (API units), Resistivity (RLN = 64" Normal (ohm/m), RSN = 16" Normal (ohm/m)), Induction (µS/m)

Well TW-2 Production Spinner Log

Log Date: May 10, 2004



Spinner Logs Represent a combination of data from two Spinner tests.
One in TW-2S and one in TW-2D

TW-2S (screen 42-93 ft bgs) pumped at 18 pgm, pump at about 50 feet bgs
TW-2D (screen 113-148 ft bgs) pumped at 33 gpm, pump at about 80 ft bgs

1.0 Introduction

1.1 Project Description

This report describes the results of a geotechnical investigation regarding construction of a new water treatment plant (WTP) for remediating contaminated groundwater at Pacific Gas and Electric Company's (PG&E's) Topock compressor station. The Topock site is located in eastern San Bernardino County, approximately 15 miles to the southeast of Needles, California. Figure 1 shows the Topock site and the location of WTP, while Figure 2 shows a detailed layout of the WTP and soil borings drilled during this investigation. The main purpose of this investigation was to provide site-specific data regarding geotechnical properties for foundation design and excavation in the existing ground, and to develop appropriate geotechnical design recommendations.

The water treatment plant is situated on Metropolitan Water District of Southern California (MWD) property and permission was required from MWD, as well as the Bureau of Land Management (BLM), to conduct the geotechnical investigation.

1.2 Objectives and Scope

The primary objective of CH2M HILL's geotechnical services was to provide appropriate geotechnical information for the foundation design of the water treatment plant. The geotechnical design criteria and recommendations described here were developed based on evaluation of available subsurface information, field exploration, laboratory testing, and engineering analyses.

The scope of work for this study includes the following tasks:

Task 1. Compile and Review Existing Information

This task involved compilation and review of available geologic and geotechnical information in the vicinity of the WTP. The following information was reviewed:

- Area geologic data
- Area monitoring well installation logs

Task 2. Field Exploration

This task included drilling four (4) soil borings within the treatment plant footprint. This task also included planning the field investigation, arranging for a drilling subcontractor, obtaining the necessary utility clearances for the work, and coordinating with the various parties involved.

Task 3. Laboratory Testing

A laboratory testing program was conducted on selected soil samples as required to determine pertinent engineering properties and to aid in soil classification.

Task 4. Engineering Evaluation

Engineering evaluations were carried out to aid in the development of geotechnical design and construction recommendations for the WTP.

Task 5. Geotechnical Report Preparation

This geotechnical report was prepared to document the methods and results of the field and laboratory investigations, and to provide geotechnical design criteria for various project facilities.

1.3 Limitations

This report has been prepared according to generally accepted principles and practices of geotechnical engineering applicable at the time of the work. No other warranty, express or implied, is made. This report is for the exclusive use of PG&E and CH2M HILL for specific application to the Topock water treatment plant project.

The analyses and recommendations contained in this report are based on the results of field exploration, laboratory testing, and engineering evaluation. The soil explorations indicate subsurface conditions only at specific locations and times, and only to the depths penetrated. They do not necessarily reflect strata variations that may exist between or outside such locations. If variations in subsurface conditions from those described are noted during construction, the recommendations in this report must be reevaluated.

If any significant changes in the nature, design, or location of the facilities are planned, the conclusions and recommendations contained in this report should not be considered valid unless the changes are reviewed and the conclusions of this report are modified or verified in writing by CH2M HILL. CH2M HILL is not responsible for any claims, damages, or liability associated with interpretation of subsurface data or reuse of the subsurface data or engineering analyses without the express written authorization of CH2M HILL.

We recommend that CH2M HILL be provided the opportunity to review the project plans and specifications to confirm that the intent of the geotechnical recommendations provided in this report has been appropriately incorporated.

2.0 Technical Data

2.1 Field Exploration

The geotechnical field exploration program conducted at the Topock water treatment plant site included site reconnaissance and drilling soil borings. The reconnaissance was performed to locate onsite utilities and to identify locations of soil borings.

2.1.1 Current Investigation

CH2M HILL conducted a field exploration at the project site on August 13, 2004. Four borings were advanced to depths ranging from 11.5 to 36.5 feet below existing ground surface. Approximate boring locations are shown on Figure 2. Locations were determined by measuring from existing site reference features.

Boring locations were selected to provide site-specific information below the proposed structure. Before drilling began, utility locates were requested so boring locations would avoid underground utility lines.

Kleinfelder, Inc. of Las Vegas, Nevada mobilized a truck-mounted B-61 drill rig to the site. Soil borings were advanced using 6-inch outside diameter hollow stem auger techniques.

Soil samples were obtained in borings by driving 1.4-inch ID split spoon samplers. The 1.4-inch ID sampler was driven by a 140-pound autohammer with a 30-inch drop in accordance with standard penetration test (SPT) procedures described in ASTM Standard D1586. Recovered soil samples obtained with the split spoon samplers were sealed in double plastic bags with locking tops to preserve the natural moisture content. Soil samples were typically obtained at 5-foot intervals throughout each boring. One sample was also obtained using a modified California sampler, but this method was abandoned due to the difficulty in obtaining a full sample in the sample liner.

Bulk samples were also obtained from each boring by taking a grab sample directly from the auger stem.

A CH2M HILL geotechnical engineer supervised drilling and sampling operations, and also logged soil borings and obtained representative soil samples. The soils encountered during drilling were visually classified in the field according to the Unified Soil Classification System (USCS). Table 2-1 provides a summary of the depth of the soil borings. Logs of the soil borings drilled during this study are included in Appendix A. A key sheet explaining terms used on the logs is also included in Appendix A.

All borings were terminated above the groundwater table; therefore, no groundwater levels were recorded. At the completion of drilling, all borings were backfilled with drill cuttings back to ground surface.

Table 2-1
Soil Boring Summary
Topock Water Treatment Plant

Soil Boring	Approximate Ground Surface Elevation (ft msl)	Depth Explored (ft bgs)
B-01	508	36.5
B-02	505	11.5
B-02A	505	15.0
B-03	508	31.5

2.1.2 Previous Investigations

Several monitoring wells have been installed throughout the Topock site to characterize and monitor the groundwater. The new water treatment plant is located north of the compressor station and Interstate 40, and west of Bat Cave Wash (see Figure 1). The closest monitoring well to the WTP site is approximately 400 feet away to the southeast (MW-13). The discussion of existing subsurface information will focus on three wells that have been installed near the WTP site (MW-13, MW-14, and MW-37D). These boring logs are included in Appendix B.

The logs for MW-13 and MW-14 indicate that the area consists of alternating layers of gravelly sand and sandy gravel down to an approximate elevation of 435 feet above mean sea level (msl). The log for MW-37D revealed gravelly sand with clay and sandy clay layers starting at an elevation of approximately 465 feet msl underlying the sandy gravel. The difference in material in this boring can be attributed to the fact that it was located in a wash that transports the finer material from higher elevations.

Groundwater elevations encountered during drilling range from 455 to 459.5 feet msl.

2.2 Laboratory Testing Program

Laboratory tests to determine pertinent geotechnical index and engineering properties on selected soil samples were performed by Kleinfelder, Inc. of Las Vegas, Nevada. Tests were conducted to confirm field classifications and provide additional data needed for geotechnical engineering analyses. Laboratory tests were conducted in accordance with American Society for Testing and Materials (ASTM) standards as follows:

- Moisture Content (ASTM D2216)
- Grain-size Analyses (ASTM D422 and D1140)
- Corrosion Potential (pH, resistivity, sulfates, chlorides)
- R-value (ASTM D2844)
- Solubility (AWWA test methods)

Laboratory test results are presented in Appendix C.

3.0 Interpretation

3.1 Regional and Local Geology

The Topock site is located in the Mojave Desert area southeast of Needles, CA and west of the Colorado River. The surficial soils consist of nonmarine sedimentary rocks and alluvial deposits of the Cenozoic period (California Geologic Survey, 2002). Volcanic rocks may also be present.

Logs from current borings and installation of monitoring wells indicate that the surficial soils consist of silty sands, sandy gravels and gravelly sands at depths of over 50 feet below ground surface. There is also evidence of sandy clay layers.

3.2 Site Conditions

The interpretation of site and subsurface conditions presented here has been developed from the soil borings, laboratory testing, and review of previous investigations.

3.2.1 Surface

The topography of the site is relatively flat with an elevation ranging between 505 and 510 feet above mean sea level (msl). Historic Route 66 runs north of the site. Bat Cave Wash runs east of the site into the Colorado River.

3.2.2 Subsurface

3.2.2.1 Soil Classification

In the preparation of this report, soil has been classified using the USCS per ASTM Standards D2487 and D2488. The relative consistency of the soil, used in the soil description, relies on the standard penetration test (SPT) blow count (N) that was obtained during the subsurface investigation.

3.2.2.2 General

A total of four borings (B-01 to B-03) were drilled across the site ranging in depth from 11.5 to 36.5 feet. Boring B-01 was drilled down to a depth of 36.5 feet near the southeast corner of the WTP footprint. Boring B-02 was located near the northwest corner of the WTP site and hit refusal at 11.5 feet. The drill rig was moved approximately 12 feet west where boring B-02A was drilled and the auger hit refusal at 15 feet. The driller stated that boulders were probably the cause of refusal in both borings. Boring B-03 was drilled at the center of the WTP site down to 31.5 feet. The soils encountered can be grouped into two general categories. These categories are silty sand with gravel, and poorly graded sand with silt and gravel. Not all soil categories are present at each location drilled. Discussions of individual soil categories, including locations encountered, are presented below.

3.2.2.3 Silty Sand with Gravel

The entire site appears to be underlain by a layer of silty sand with gravel ranging from 11.5 to 31.5 feet thick as identified in the borings. The consistency of the material ranged from medium dense to very dense, according to SPT blow counts. The sand was fine to coarse grained and the amount of gravel was estimated to range from 10 to 30 percent of the sample. The percentage of gravel increased with depth and the gravel sizes ranged from 1/8 to 2 inches.

The driller noted the presence of cobbles and boulders. In the deeper holes, there was no sample recovery after 15 feet, most likely due to the presence of cobbles obstructing the sampling tip. Boring B-02 and B-02A probably encountered large boulders at depths of 11.5 and 15 feet, respectively, causing auger refusal.

3.2.2.4 Poorly Graded Sand with Silt and Gravel

A 1.5 feet thick layer of poorly graded sand with silt and gravel was identified below the silty sand with gravel layer in Boring B-03 at a depth of 20 feet. The consistency of the material was very dense containing approximately 40 to 50 percent gravels ranging in size from 1/8 to 1/2 inch.

3.2.3 Engineering Parameters

Current and previous investigations and laboratory test results were used to develop the engineering properties of the subsurface materials. In addition to laboratory tests, SPT blow counts from various test borings were used to estimate equivalent friction angles for granular soils based on established correlations in the literature (Federal Highway Administration [FHWA], 1996).

The generalized soil profiles and material properties used for engineering analyses are presented in Table 3-1.

TABLE 3-1
Generalized Subsurface Soil Profile and Design Strength Parameters

Alluvium	<488	SP-SM	>50	120	35

Notes:
1. Bottom of footing elevation for the proposed slab on grade at the treatment plant is approximately 2 feet below grade.
2. SPT blow counts corrected for overburden and efficiency.
3. Groundwater table was not encountered during current investigation.

3.3 Groundwater

The groundwater table was not encountered during the current investigation. The deepest boring (Boring B-01) was terminated at a depth of 36.5 feet below ground surface, or approximately elevation 471.5 feet msl. There was no surface flow in washes at the time the borings were performed. The groundwater table may fluctuate due to seasonal variation, nearby construction, irrigation, vegetation, and other man-made influences. Groundwater elevations in the monitoring wells nearby ranged from 455 to 459.5 feet msl.

3.4 Liquefaction

The term liquefaction, as used herein, describes a phenomenon in which a cohesionless saturated soil loses strength during an earthquake and acquires a degree of mobility sufficient to permit movements ranging from settlement to lateral spreading. The factors known to influence liquefaction potential include grain size, relative density, groundwater conditions, effective confining pressures, and intensity and duration of ground shaking. Saturated, loose and medium dense, near-surface cohesionless soils exhibit the highest liquefaction potential, while dry, dense cohesionless soils, and cohesive soils exhibit low to negligible liquefaction potential.

Generally, medium dense to very dense, silty sands and poorly graded silty sands underlie the proposed treatment plant site. Blow counts in the dry, silty sands were generally in the range of 20 to greater than 50. Therefore, liquefaction potential of the site soils is estimated to be low, especially where the groundwater is greater than 50 feet bgs.

3.5 Expansion/Collapse

Based on the medium dense to very dense granular material encountered at the project site, expansion and collapse potential is regarded as low.

3.6 Settlement

Primary consolidation settlement occurs when a load is applied to saturated compressible materials, causing an increase in pore water pressure (in excess of the static groundwater conditions) that results in a reduction in volume due to the expulsion of water from the pores of the soil (Fang, 1991). Based on the medium dense to very dense granular material encountered at the project site (above and below the proposed/existing footing elevation), and the relatively deep groundwater table (>45 feet), consolidation settlement is not considered an issue.

Secondary compression settlement is not a result of a reduction in volume due to the expulsion of water from the pores of the soil. It is the result of compression of bonds between individual particles after excess hydrostatic pressure is zero (Fang, 1991). Secondary compression settlement has been determined to be negligible.

3.7 Corrosion Conditions

Two samples collected at the site were tested for minimum soil resistivity, soil pH, water soluble sulfate content, and chloride content. The results of those laboratory tests are presented in Appendix C. Caltrans Bridge Memo to Designers 3-1 (Caltrans, 1998), regarding deep foundations, defines a corrosive environment as being a site where the soil has electrochemical resistivity of less than 1,000 ohm-centimeters (ohm-cm), a sulfate content greater than 2,000 parts per million (ppm), or chloride content of greater than 500 ppm. Comparison between the laboratory test results and the Caltrans corrosion criteria indicates that the onsite soils are considered to be corrosive to concrete structures. The results of the laboratory corrosion testing are summarized in Table 3-1. The Caltrans corrosion criteria should not be applied to piping and other metal structures. A corrosion engineer should review the test results and make recommendations for any metal structures.

Concrete in contact with onsite soil shall be batched using Type V cement in accordance with the 2001 California Building Code (CBC, 2001). Adequate concrete cover over reinforcing steel should be provided in accordance with good construction practices and design standards.

TABLE 3-2
Summary of Laboratory Corrosion Tests
Topock Water Treatment Plant

Boring	Sample Depth (ft)	Soil Type	Minimum Resistivity (ohm-cm)	pH	Sulfate Content (ppm)	Chloride Content (ppm)
B-01	6.5 – 8.0	SM	370	8.63	2,888	1,025
B-02	6.5 – 8.0	SM	725	8.67	3,988	350

3.8 Solubility

Due to the highly corrosive nature of the granular soil at the site, two soil samples were tested for solubility. Solubility refers to the potential for soluble particles to be present (i.e. salts, gypsum) that appear to be sand/gravel, but will dissolve when wet and cause excessive settlement. The results are shown in Table 3-3 and included in Appendix C.

TABLE 3-3
Summary of Solubility Tests
Topock Water Treatment Plant

Boring	Sample Depth (ft)	Soil Type	Solubility (%)
B-01	6.5 – 8.0	SM	0.79
B-03	5.0 – 6.5	SM	0.33

Local practice dictates that solubility results greater than 1.0 % require remedial efforts. Remedial efforts include mixing non-soluble soil with the soluble soil or pre-wetting the soluble soil. The solubility results are low at this site, so it is not expected to be an issue.

3.9 Seismicity

The proposed site is located in a seismically active region. The nearest faults that are considered capable of producing strong ground shaking are the Chemehuevi Graben Fault, Pahrump-Stateline Fault, and the Pisgah-Bullion Fault. The Chemehuevi Graben Fault, approximately 18.8 kilometers from the project site, is the controlling fault at the project site. The Chemehuevi Graben Fault is a normal style fault with a maximum credible earthquake (MCE) moment magnitude (M_w) of 6.0. The fault is classified as Seismic Source Type C, the project site lies in Seismic Zone 3, and the soil profile is classified as type S_D as defined in the California Building Code (CBC, 2001).

There are no Alquist-Priolo Fault-Rupture Hazard Zones in proximity to the project site, and no active faults are known to transect the proposed site. Therefore, the possibility of primary surface rupture or deformation at the site is considered low.

Site-specific probabilistic and deterministic analyses of ground motion were performed for active faults within the region using the computer programs EQFAULT and FRISKSP published by Thomas Blake (1998). The deterministic ground-motion analysis requires information regarding the fault geometry, maximum credible earthquake (MCE) magnitude of the fault, and a regional attenuation equation, which relates the relevant seismic parameters to the magnitude source and the source-site distance. Fault geometry was based on the CGS fault database for the State of California. Using the attenuation curves of Sadigh et al. (see Blake, 1998), probabilistic analyses indicate that a horizontal peak ground acceleration (HPGA) of 0.07g may be used for a 10 percent probability of exceedance in 50 years. Deterministic analyses indicate a peak ground acceleration (PGA) of 0.20g at the project site.

In order to verify the deterministic analysis, the results were compared to the California Seismic Hazard Map (Caltrans, 1996). Using this map, the peak bedrock acceleration at the site was estimated to be 0.20g. Additionally, the attenuation equation by Sadigh (Sadigh et al., 1997), which accounts for fault style and proximity, also estimated a peak bedrock acceleration of 0.20g based on distance to fault and fault MCE data from the Caltrans Seismic Hazard Map.

3.10 Frost Depth

According to a figure in NAVFAC DM 7.01-42 (1986), the depth of extreme frost penetration in the Needles, CA area is approximately 8 to 10 inches. Structures should be founded below this depth to mitigate frost heave potential.

4.0 Discussions and Recommendations

4.1 General

The soils at the Topock water treatment plant site consist primarily of alluvial deposits of silty sand with gravel and some poorly graded sand with silt and gravel. Groundwater was not encountered in any of the borings.

4.2 Water Treatment Plant

4.2.1 Facility Description

The water treatment plant consists of a prefabricated metal building with dimensions of approximately 50 feet by 140 feet built on a 6-inch concrete slab. The slab has a thickened edge that acts as a footing embedded approximately 2 feet below ground surface with a width of 2 feet. Tanks, compressors, and reactors will be installed inside the building and will sit on individual concrete footings also embedded 2 feet below ground surface with widths between 2 and 8.5 feet. There is also one area that will be excavated down to 12 feet bgs to accommodate a drain sump.

The existing ground will be leveled to build the WTP. One side will be cut and the other filled to make a level pad with a net fill of approximately 72 cubic yards. An access road with a ditch will surround the treatment plant facility. Site access will come from historic Route 66 at the north end of the site.

4.2.2 Recommendations

Shallow foundations are recommended for support of the water treatment plant. The depth of foundation support should be down to a minimum of 2 feet bgs.

The slab and footings should be set on a minimum 6-inch thick layer of granular base leveling course. The granular material should consist of well-graded sand and gravel with a maximum particle size of 3 inches and no more than 6 percent passing the No. 200 sieve. The granular material should be placed in 6-inch lifts and compacted to 95 percent of maximum dry density per ASTM D1557.

The native soil under the granular base course should be well compacted down to a depth of 12-inches to a minimum of 95 percent of maximum dry density per ASTM D1557 to provide a firm, unyielding surface. If the native soil under the granular course cannot be compacted to a minimum of 95 percent of maximum dry density per ASTM D1557, it should be removed to a maximum depth of 1 foot and replaced with competent granular backfill compacted in 6-inch lifts.

The foundation design should be based on an evaluation of the allowable bearing capacity, settlement, and sliding coefficient of friction.

4.2.2.1 Bearing Capacity

The allowable bearing capacity was determined, using soil parameters determined based on SPT blow counts and laboratory test results, for the soil at the proposed bottom of footing elevation. Calculations were based on methods proposed by Meyerhoff (1965), Bowles (1977), and Peck et al. (1974). All three methods are based on SPT blow counts in sandy soils, and all take into account an allowable settlement. For the purpose of design, an allowable settlement of 1 inch was used in the calculations. Based on the calculations, it was determined that the subgrade at or near the bottom of the proposed footings will have an allowable bearing capacity of 2,000 psf.

4.2.2.2 Sliding Coefficient of Friction

An ultimate sliding coefficient of friction equal to 0.45 may be used for foundation design. The recommended sliding coefficient of friction was estimated for mass concrete on silty medium to coarse sand through the use of a correlation table given in NAVFAC DM 7.2-63 (1986).

4.2.2.3 Cut and Fill Slopes

Cut slopes in the native soil are recommended to be 2H:1V or flatter. The native soil was classified as medium dense to very dense in the borings. In fill areas, the native soil should be placed in 6-inch lifts and compacted to 95 percent of maximum dry density per ASTM D1557.

Excavation of the overburden can be accomplished using conventional heavy earth-moving equipment. According to the boring logs, boulders and cobbles may be encountered in the excavation for the drain sump. The contractor should be aware of this possibility and be suitably prepared. All excavations should conform to OSHA, state, and local standards. Using OSHA criteria (CCH, 2000), the overburden soil would be classified as Type B.

5.0 Construction Considerations

5.1 Trenching and Temporary Excavations

The design of all temporary excavations (either braced or sloped) and work safety should be the responsibility of the contractor. Temporary excavations should be designed in accordance with the Occupational Safety and Health Administration's (OSHA) most recent revised standard for excavations. Adequate provisions should be made to protect the slopes from raveling and sloughing during construction. The design of the excavation wall support system is the responsibility of the contractor. The contractor should develop their own means and methods, based on experience and availability of materials, for constructing the required elements. Performance of the temporary construction must conform to the requirements stated in the contract documents. The analysis of the stability of the excavation and design of appropriate sheeting or shoring may require the contractor to hire a qualified professional engineer. Existing structures near the excavations shall be monitored during the excavation to detect any movement due to the excavations.

Soil types may mandate different types/styles of bracing or excavation support. However, regardless of soil type, excavation depth and configuration drive the requirement to brace or not to brace.

If groundwater is encountered in an excavation, instability may be created as a result of upward seepage of water into the cut if the water level inside the cut is lowered below the groundwater table. The design of the dewatering systems should consider these factors. It shall be the contractor's responsibility to install an appropriate dewatering system to achieve a proper working base for the subgrade of the excavation.

Temporary excavation bracing should be designed to protect adjacent traffic, utilities, and construction personnel. Suitable factors of safety should be used in the contractor's sheeting and bracing design.

During excavation, all equipment should be stored at a distance from the edge of the excavation equal to at least the depth of the excavation, so as not to produce a surcharge load, which could affect the stability of the slope. Temporary stockpiles of excavated materials should be stored well away from any settlement-sensitive utilities and pipelines.

5.2 Pipeline Design

It is our understanding that PVC or HDPE pipe will be used in the buried pipelines. The performance of the pipe is highly dependent on the support provided by the soils around it. Flexible pipe, such as PVC, normally is designed to transmit the load of the backfill over the pipe to the soil at the sides of the pipe. As the vertical load increases on the pipe, the vertical diameter of the pipe decreases and the horizontal diameter increases due to deformation of the pipe (i.e., the pipe becomes more elliptical). The increase in horizontal diameter is resisted by the soil at the sides of the pipe. The side soil must support the load without the pipe deflecting beyond acceptable limits. Thus, adequate soil support at the sides of the pipe is essential for the structural integrity of the pipe.

Along with depth of fill, unit weight of fill, and compaction of fill, the modulus of soil reaction, E', of the soil surrounding the trench is a parameter in flexible pipe design, because it controls the lateral support provided by the soil and, therefore, the deformation of the pipe. For the soils found along the project, an E' value of 1,000 pounds per square inch (psi) is recommended for pipe design. For the purposes of design, a total unit weight of 120 pounds per cubic foot (pcf) may be used for the fill above the pipeline.

5.2.1 Pipe Zone Backfill

The pipe zone backfill material placed surrounding the pipe from 6 inches below the invert to 1 foot above the top of pipe should be composed of sand, gravel, or crushed rock, that is reasonably well graded from coarse to fine with a maximum particle size of ½-inch, and free from excessive clay, organic material, and other deleterious substances.

Pipe zone backfill should be placed and spread in layers, not to exceed 6 inches loose thickness and compacted to at least 90 percent of the maximum dry density as determined by ASTM D1557, within 2 percent of the optimum moisture content. Compaction of the pipe zone backfill should be increased to 95 percent relative compaction (RC) in areas that are sensitive to surficial settlement. The contractor should be responsible for verifying that the pipe strength is adequate to withstand the weight and energy delivered by a compactor during the pipe backfill operation.

Although unanticipated, areas where weaker soil (e.g., soft clay or loose sand) is encountered during construction of the pipeline should be overexcavated a minimum depth of 1 foot below the proposed trench bottom and replaced with granular fill in 6-inch lifts compacted to 95 percent of the maximum dry density as determined by ASTM D1557.

5.2.2 Trench Backfill

Backfill material around structures and more than 1 foot above the top of the pipe (above the pipe zone backfill) may consist of excavated onsite soil. However, all topsoil, organic material, rubbish, debris, rock, and broken concrete larger than 2 inches in diameter and other unsuitable material should be removed prior to use as backfill. Rocks greater than 6 inches in any dimension should not be permitted in backfill placed within 1 foot of pavement subgrade.

Backfill should be placed and spread in layers, not to exceed 8 inches loose thickness and compacted to at least 90 percent of the maximum dry density as determined by ASTM D1557. Moisture conditions of backfill soils shall be at or above the optimum moisture content. Increased compaction is advised where greater sensitivity to surficial settlements may exist, so long as it does not damage or cause excessive deflections of the pipe.

5.3 Roadways

It is our understanding that the roadway around the WTP will consist of graded aggregate base course. No asphalt or Portland cement concrete pavement will be laid.

5.4 Fill Placement and Compaction

Native on-site materials may be considered for use as backfill if they have an expansion index (EI) less than 50, and contain less than 8 percent fines as determined in accordance with ASTM D4829 and D422, respectively. If native materials are considered, they should be tested for verification. The granular base course material shall be imported. The geotechnical engineer should approve the imported material prior to placement.

All fill soil should be placed in thin, loose lifts; moisture-conditioned, as necessary, to near optimum moisture content; and compacted to a minimum 95 percent relative compaction beneath structures as determined by ASTM D1557.

5.5 Site Drainage

Drainage is an important key to successful performance of any foundation or pavement scheme. Good surface drainage should be established prior to construction and maintained afterward to prevent water from ponding within or adjacent to the structures, or pavement areas. During and after construction, positive drainage should be provided to direct surface water away from structures and all excavations towards suitable, non-erosive drainage devices. Final grading should slope away from structures.

5.6 Geotechnical Observation

A geotechnical engineer or a technician under the supervision of a geotechnical engineer should observe the preparations for footing subgrades and backfill. Variations in soil and geologic conditions are possible and may be encountered during construction. To permit correlation between the exploration data and the actual conditions encountered during construction, a qualified geotechnical engineer should perform onsite reviews during construction.

5.7 Review of Construction Plans and Specifications

The geotechnical recommendations in this report are based on preliminary construction plans. The geotechnical designer should review construction plans and specifications to verify that the geotechnical recommendations have been incorporated into the design. If the nature, design, or location of the proposed facilities vary from those used to develop the recommendations provided in this report, then the recommendations should be re-evaluated.

Soil Classification System Used on Logs (From ASTM D2488, Based on Unified Soil Classification System)

TERMS USED ON LOGS

Criteria for Describing Moisture Condition

Description	Criteria
Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp, but no visible water
Wet	Visible free water, usually soil is below water table

Relative Density of Coarse-Grained Soil

Blows/ Foot*	Description	Approximate Relative Density (%)	Field Test
0-4	Very loose	0-20	Easily penetrated with 1/2-inch steel rod pushed by hand
5-10	Loose	20-40	Easily penetrated with 1/2-inch steel rod pushed by hand
11-30	Medium	40-70	Easily penetrated with 1/2-inch steel rod driven with 5-pound hammer
31-50	Dense	70-90	Penetrated a foot with 1/2-inch steel rod driven with 5-pound hammer
50	Very Dense	90-100	Penetrated only a few inches with 1/2-inch steel rod driven with 5-pound hammer

Consistency of Fine-Grained Soil

Blows/ Foot*	Consistency	Pocket Penetrometer (TSF)	Torvane (TSF)	Field Test
<2	Very soft	<0.25	<0.12	Easily penetrated several inches by fist
2-4	Soft	0.25-0.50	<0.12-0.25	Easily penetrated several inches by thumb
5-8	Firm	0.50-1.0	0.25-0.5	Can be penetrated several inches by thumb with moderate effort
9-15	Stiff	1.0-2.0	0.5-1.0	Readily indented by thumbnail, but penetrated only with great effort
16-30	Very stiff	2.0-4.0	1.0-2.0	Readily indented by thumbnail
30	Hard	>4.0	>2.0	Indented with difficulty by thumbnail

*The number of blows on a 2-inch OD, split-spoon sampler by a 140-pound hammer falling 30 inches required to drive the sampler a distance of 1 foot from 6 to 18 inches (Standard Penetration Test, ASTM D1586). Actual sampler/hammer characteristics and actual field blow counts are noted on the boring logs.

REPORT OF DETERMINATION

BORING NUMBER	B-01	B-02				
SAMPLE NO.	27468-B2A	27468-B2B				
DEPTH (feet)	6.5-8.0	6.5-8.0				
pH VALUE	8.63	8.67				
RED-OX (mv)	+646	+668				
SULFATE (mg/Kg)	2,888	3,988				
SULFIDE (mg/Kg)	Nil	Nil				
TOTAL SALTS (mg/Kg)	7,890	6,574				
CHLORIDE (mg/Kg)	1,025	350				
RESISTIVITY (Ohm-cm)	370	725				

Respectfully submitted,

Robert L. Summers
Analytical Chemist

NOTES:

1. The soil:water extract ratio was 1:5, the results are in mg/Kg in the soil.
2. The standard methods used for the determinations are AWWA 4500 H pH Value, ASTM D 1498 Red-Ox, AWWA 4500-SO_4 E Turbidimetric, AWWA 4500-S D Methylene Blue, AWWA 2510 Electrical Conductivity, AWWA 4500-Cl B Argentometric and ASTM G 57.
3. Nil is less than 1.0 mg/Kg.

Summary

This memorandum presents a summary of the geotechnical investigation conducted for the PG&E's Topock Compressor Station AOC 4 Pre-Work Plan data collection activities, including the field logs and laboratory test results. The purpose of this memorandum is to summarize the field investigation program, laboratory tests performed to evaluate the strength parameters of the subsurface materials, and present the findings from the stability analyses performed to assist with the planning of construction activities. This memorandum includes descriptions of the field investigation program and laboratory tests performed on collected samples including strength characteristics of the subsurface soils.

Four geotechnical borings were drilled in the areas on top of the ravine slopes in the AOC4 area. The scope of the geotechnical investigation did not include evaluation of fill along the slope face and at the bottom of the slope. The four borings were drilled until the augers refused on possible rock or other obstructions. Soil samples were obtained from the borings and tested for index properties, strength, and compaction characteristics. Profiles were developed based on the subsurface data and laboratory results. Slope stability analyses were also performed to evaluate the maximum slope ratio that can be maintained during construction activities, based on the estimated material strengths of the subsurface materials encountered.

Based on the subsurface exploration conducted, all the borings indicated fill material to depths of 5 feet below the existing ground surface. Based on results of the slope stability analyses, a 35 foot tall cut-slope with a 1 Horizontal (H): 1 Vertical (V) slope ratio is expected to be globally stable during construction and remediation activities. A factor of safety (FOS) for slope failure of over 1.2 was computed for this condition considering a surcharge of about 500 pounds per square foot (psf) on top of the slope. A factor of safety of 1.1 or greater is normally considered adequate for temporary slopes during construction activities.

Field Explorations

To characterize the subsurface conditions at the project site, a geotechnical field exploration was conducted at the truck-accessible locations in a nearly level area within the primary debris area of AOC4. The geotechnical field investigation included drilling four hollow stem auger (HSA) soil borings. Figure 1 shows the boring locations relative to the existing ravine, slopes, and the AOC4 area at the plant site. The figure also shows the existing grading at 1-foot contour intervals. Table 1 summarizes the field exploration.

Table 1 Summary of Field Exploration

NE – Not Encountered
NAD – North American Datum
Lat. – Latitude
Lon. – Longitude

Cascade Drilling, Inc., of La Habra, California, was contracted by CH2M HILL to drill the soil borings using a truck-mounted CME 85 drill rig equipped with an 8-inch-diameter HSA. The soil borings, B-1 and B-2, were drilled and sampled to the depth of 38.5 and 56 feet below ground surface (bgs), and borings B-3 and B-4 were drilled and sampled to the depth of 26 and 8.5 feet bgs. The borings were drilled until augers refused to advance either due to potential top of hard bedrock or due to hard cobbles. Groundwater was not encountered in the borings during drilling. A CH2M HILL geotechnical specialist specified the locations, depths, and sampling intervals of the borings, logged materials encountered, and observed the drilling and sampling operations.

Hand augering was performed for the first 5 feet in each of the boring to avoid possible underground utilities. Soil samples were collected at 5-foot intervals using the standard penetration test (SPT) and modified California ring (ring) samplers. The SPT and ring samplers were driven using a down-hole hydraulic hammer, 140-pound, free falling from a height of approximately 24 inches, for a total penetration of 18 inches into the ground. The blow counts were recorded for every 6 inches of penetration. The blow counts presented in parentheses on the boring logs are the blow counts for the last 12 inches of penetration and represent the field N-value.

Relatively intact soil samples were collected from the borings using the ring sampler. Sampling procedures generally followed SPT and split-barrel sampling of soils (American Society for Testing and Materials [ASTM] D1586). In addition, representative bulk samples

were collected from the borings at shallow depths from the hand auger cuttings. Each soil sample collected was examined and classified in accordance with the Unified Soils Classification System (USCS) per ASTM D2488. Following drilling, sampling, and logging, the borings were grouted with a Sodium Bentonite slurry mix. The soil boring logs are included in Attachment A of this memorandum.

Laboratory Testing

A laboratory testing program was conducted using the soils collected during the surface sampling program, as discussed in the previous section. These samples were used to perform index testing, strength testing, and compaction testing.

Index, Strength, and Compaction Testing

Index testing was performed to properly classify the soil obtained from the field exploration program in accordance with the Unified Soil Classification System (USCS). Compaction characteristics were also determined including the maximum dry density and optimum moisture content of a surface sample. Direct-shear tests were performed to evaluate the strength characteristics of the fill and native soil materials. Confining pressures were used corresponding to the depth from which the sample is obtained.

The laboratory testing was conducted by Environmental Geotechnology Laboratories of Arcadia, California, under subcontract to CH2M HILL. Test assignment and coordination were provided by CH2M HILL. Laboratory testing included the following ASTM standard test methods:

- ASTM D422 – Test Method for Particle-Size Analysis of Soils (grain size and hydrometer analyses)
- ASTM D4318 – Standard Test Methods for Liquid Limit, Plastic Limit, and Plasticity Index of Soils
- ASTM D1557 – Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort
- ASTM D3080 – Test Method for Direct-Shear Test of Soils Under Consolidated Drained Conditions

Laboratory Test Results

The results of the laboratory testing programs are summarized in Tables 1 and 2 below. Laboratory testing is also summarized in Table B-1 provided in Attachment B. Detailed test results are presented in Attachment B.

The results of the index testing are presented in Table 2. Results of the index testing indicate that the grain size analyses for soil samples have predominantly granular components with fines content up to 32 percent. The results also indicate that all the tested samples had amounts of gravel ranging from 24 to 55 percent.

TABLE 2

Subsurface Conditions

Based on the subsurface exploration conducted in AOC 4, the depth of debris fill materials is approximately 5 feet in the nearly level area and consists of silty sands and gravel mixed with debris, including some trash, roots, and peaty materials. These depths correspond to elevations of 606 feet and 607 feet, respectively, above mean sea level on the west and east side of the AOC4 area above the ravine. The debris and fill material is underlain by possible weakly cemented alluvium or weathered native materials. Boring AOC4-GEO2, located at the west edge of the existing slope above the ravine, encountered gravelly materials to approximately 35 feet bgs (El 577 feet). Based on the soil borings, the subsurface materials at the project site generally consist of gray to grayish brown, dry, medium dense to very dense, silty sand and silty gravel. The gravel sizes ranges from 0.5 to 3 inches. The uncorrected SPT N-values in this zone range from 17 for 12 inches of penetration to 50 for 6 inches of penetration.

Below the fill layer and alluvial sediments, weathered rock materials were encountered in some of the borings to the explored maximum depths overlying relatively unweathered metadiorite bedrock. The weathered rock generally consists of dense to very dense gravel and sand with silt. Gravel sizes varied from less than an inch up to 5 inches. In some areas broken cobbles or fragments of bedrock were present in the recovered samples. The uncorrected SPT N-values within the native soil zone were above 50. Detailed boring logs are presented in Attachment A.

Stability Analyses

Development of Stability Profiles

A critical cross section location was chosen passing through the existing slope at the point of maximum height. The section location is designated A-A'. CH2M HILL located the sections with respect to the existing grading plans, and the potential for overall impacts during slope excavations. As such, section A-A' is located along the western side of the AOC 4 area running north-south across the slope as shown in Figure 1.

Cross sections to develop stability profile models used in the stability analyses were generated from the most recent topographic map provided. The cross sections were developed manually using the topographic map. Section modifications were completed to demarcate estimated fill, alluvium, and the bedrock. The existing ravine slopes in the AOC 4 area are approximately 1.5H: 1V. Steeper slopes of varying grades ranging from 1H: 1V to less than 0.75H: 1V were modeled to represent the potential temporary slopes that may be maintained during remediation and construction operations. The material types within the slopes and below the slope subsurface were stratified, and their boundaries were demarcated based on materials encountered in the borings.

Design Soil Parameters

The strength parameters used in the stability analyses are developed based on the geotechnical exploration and laboratory testing data. Shear strength parameters of 100 psf of cohesion (C) and a friction angle (ϕ) of 38 degrees were used for the fill and alluvial

materials. For native materials consisting of very dense alluvium and weathered bedrock, a C of 100 psf and a ϕ of 40 degrees were used. The bedrock beneath the native soils is modeled using a C of 350 psf and a ϕ of 48 degrees.

Analyses Methodology

The slope stability analyses performed considers the overall (global) stability of slopes using circular and wedge-shaped failure planes. The slope stability analyses were performed using the Modified Bishop method for circular slip surfaces and Janbu Corrected method for wedge failures. The calculations were performed using the limit equilibrium computer program SLIDE v.5.0 (Rocscience, 2006). The method of slices estimates slope stability by assuming a failure surface and calculating the forces that would cause slope movement (driving forces) and the forces resisting slope movement (resisting forces) for the selected failure surface. The ratio of resisting forces to driving forces is known as the factor of safety. SLIDE 5.0 employs a searching routine to determine the failure surface with the minimum factor of safety. The critical slip surface for each major slope is shown on the analyses results.

Static slope stability analyses were conducted. A factor of safety of 1.1 or greater is normally considered adequate for temporary slopes during construction activities.

An equipment surcharge load of up to 500 psf is considered in the stability analyses to account for additional wheel loads on top of the slopes from vehicles and construction equipment. The following sections discuss the results and limitations of the analyses.

Stability Analyses Results

Cross section A-A' was analyzed for slope stability assuming global circular and block failure surfaces considering a 1H: 1V slope. The maximum slope height used is 35 feet. The lowest FOS obtained is 1.2. The results show a 35 foot tall slope with a 1H: 1V slope ratio is expected to be globally stable during construction and remediation activities. A steeper slope with 0.75H: 1V was also analyzed for global stability. The lowest FOS obtained considering circular and block failure surfaces is slightly less than 1.1.

The surficial stability of a localized side slope should be considered during the grading and other construction activities. Localized instabilities, if left unchecked, could lead to larger stability issues.

Conclusions, Recommendations, and Discussion

Based on the results of the field explorations, laboratory testing results, and stability analyses, the following can be inferred:

- The depth of debris fill materials encountered in the borings extends approximately 5 feet bgs on the nearly level area of AOC 4 and contains silty sand and gravel mixed with debris including some trash, roots and peaty materials. These depths correspond to elevations of 606 feet and 607 feet above mean sea level, respectively, on the west and east side of the AOC 4 area above the ravines.

- The debris fill is underlain by possible weakly cemented alluvium and weathered metadiorite bedrock. These materials consist of dense to very dense silty sand (SM) to silty gravels (GM). The gravel sizes ranges from 0.5 to 3 inches.
- Boring refusal, indicating bedrock or obstructions, was encountered at depths varying from 56 to 5 feet bgs. Boring AOC4-GEO2, located on the west edge of the existing slope, encountered refusal at EL 556 feet or about 56 feet bgs. Boring AOC4-GEO4, located on the east side of the existing slope, encountered refusal at EL 607 feet or at about 5 feet bgs. With respect to the exposed bedrock observed near the investigation site, boring refusal is interpreted as the surface of relatively unweathered bedrock.
- Based on the results of the slope stability analyses, a 35 foot tall slope with a 1H: 1V slope ratio is expected to be globally stable during construction and remediation activities. A FOS for slope failure of 1.2 was computed for this condition. An FOS of 1.1 or greater is normally considered adequate for temporary slopes during construction activities.
- It is recommended that temporary slopes be maintained no steeper than 1H: 1V and not higher than 35 feet. Shorter, steeper slopes may be achievable and should be evaluated if proposed.
- The surficial stability of a localized side slope should be considered during the grading and other construction activities. Localized instabilities, if left unchecked, could lead to larger stability issues

The scope of the geotechnical investigation and subsequent analyses noted above did not include evaluation of fill along the slope face and at the bottom of the slope. The fill thickness and engineering properties are unknown in these areas. Because of this, stability of the fill along the slope was not conducted. In addition, a detailed geologic assessment of bedrock conditions, including mapping of fractures and bedding planes, was not part of this scope of work. The analyses conducted assumed a homogeneous subgrade consisting of dense to very dense alluvial type materials underlain by bedrock, which was encountered in the borings.

Additional assessments are recommended during the removal phase of the slope. This may include, but may not be limited to, conducting test pits along the slope face and bottom of slope to determine fill thicknesses and engineering properties. Once obtained, this data should be reviewed by the removal contractor to provide further direction on the contractor's means and methods for fill removal.

Limitations

This memorandum has been prepared for the use of the PG&E for specific application to the Topock AOC 4 – Pre-Work plan data collection activities. This memorandum was prepared in accordance with generally accepted geotechnical engineering practice; no warranty, expressed or implied, is made.

The conclusions and recommendations contained in this memorandum are based on information from the current field exploration, laboratory testing, and analyses performed. These results reflect subsurface conditions only at specific locations, times, and to the depths explored. They do not necessarily reflect strata variations that might exist between exploration locations. The nature and extent of any variations in subsurface conditions might not become evident until construction. If conditions encountered during construction differ from those described in this memorandum, recommendations made in this memorandum will need to be re-evaluated by CH2M HILL.

If any changes in the nature, design, or locations of the facilities are planned, the conclusions and recommendations contained in this memorandum should not be considered valid unless the changes are reviewed and the conclusions of this memorandum are modified or verified in writing by CH2M HILL.

Attachment D:
Remediation Well Design and Field Approach
(*on CD-ROM only*)

1. Introduction

The three primary types of remediation wells that are part of the remedy design are as follows.

1) Extraction Wells
2) Freshwater/Upland Injection Wells
3) In-situ Reactive Zone (IRZ) Injection Wells

Although each type of remediation well has its specific function within the remedy design, there are design and construction objectives in common with each of the remediation wells. For example, each type of remediation well will be constructed within boreholes of a 12-inch diameter or larger. Also common to each of the three types of remediation wells are the following overall design goals: (1) optimize the hydraulic connection between the remediation well and the natural subsurface materials (i.e., the formation); (2) select the optimal interval(s) at which to screen the well (i.e., the well screen interval[s]); and (3) build the well to ease/minimize well maintenance.

This Design Bulletin presents an approach for achieving these goals through well design planning and field construction methods. Section 2 presents the general design plan, including three designs for the remediation wells: (1) single-screen wells; (2) multi-screen wells; and (3) bedrock wells. Section 3 is a discussion of field methods to be considered for design and construction of the remediation wells.

2. Remediation Well Design General Plan

Geology at the site consists of unconsolidated alluvial and fluvial sediments that overlie a conglomerate bedrock unit. The unconsolidated sediments are typically a poorly-sorted mixture of silt, sand, and gravel with varying amounts of clay, and these sediments vary in thickness significantly from north to south, with thicknesses of greater than 400 ft reported to the north near proposed well IRZ-1and less than 75 ft reported to the south near proposed well IRZ-39. The identification of distinct, laterally-continuous lithostratigraphic or hydrostratigraphic zones cannot be correlated from borehole to borehole. Therefore, the screened intervals proposed for the remediation wells as shown on Table 3.2.1-1 of the 60% design document are preliminary, and are based in part on the total vertical thickness of the unconsolidated sediments that are saturated.

Final determination of the screened intervals will be made based on information collected in the field during construction of the wells. Borehole data, discrete vertical interval sampling, and data from newly constructed wells may be used to inform each well design as the construction program proceeds. Information collected during the drilling of the boreholes can be used to identify permeable portions of the vertical section (i.e., these may represent target intervals for either extraction, injection, or delivery of the carbon source material), and in the case of the IRZ wells, to identify the zones with the highest concentrations of Cr(VI). The screened intervals will be based on these considerations.

The remediation wells will be constructed using 8-inch or larger nominal diameter well casing with one or more screens targeting a specific interval or intervals of the unconsolidated sediments (and also bedrock in a few of the extraction wells). The following are three general designs for the remediation wells that will likely be implemented.

1) **Single Screen Wells** – This type of construction would consist of a single screen well installed within

the unconsolidated sediments. The length of the screen would be based on formation thickness, the intended function of the well, and potentially other data developed in the field. This is the likely construction of the Freshwater/Upland Injection Wells, most of the Extraction Wells, and potentially some of the IRZ Injection wells. Depending on the geologic conditions encountered in the field, it is possible that one or more blank sections of casing could be inserted within the screen zone to avoid screening intervals where significant fines are encountered.

2) **Multi-Screen Wells** – This type of construction would consist of two or more screens installed within the unconsolidated sediments. The well screen intervals would be selected using field data to target specific zones based on permeability and concentrations of Cr(VI) in groundwater. This is the expected construction for many of the IRZ Wells, although as noted above, there is the potential that some of the IRZ wells could be installed using a longer single screen design.
3) **Bedrock Wells** – This type of construction would consist of drilling through the unconsolidated sediments and installing an outer/conductor casing to the top of the bedrock. After the conductor casing is installed the drilling methodology may change to accommodate drilling in the bedrock formation. Sonic, air rotary, and wire line drilling methods – or combinations of these methods may be employed to reach the target depth within the bedrock. The final well construction may be either an open hole completion within the bedrock or a more traditional well with a single screened interval installed within the bedrock. This will depend on the competency of the bedrock. If the bedrock is weathered and/or unstable, it would be desirable to install a traditional well with a single screen. The most appropriate construction will be deployed based on site conditions encountered in the East Ravine.

3. Field Methods

There are a number of potential tools that may be used for the collection and analysis of field data for final well design. Such tools described herein include: pilot borings, grain-size distribution analysis, vertical aquifer sampling, and downhole geophysical logging. These tools can be important in the selection and design of well screens and the associated filter pack material. Also discussed in this section are well drilling, construction, and development methods.

It is likely that the field program will evolve as data are collected and assessed for the purposes of remediation well design. Thus, it is important that the well design program, including the field methods described below, retain a measure of flexibility.

Pilot Borings

Drilling boreholes of the size and depth necessary to install the remediation wells generally requires the use of rotary drilling methods (see below for further discussion of drilling methods). It is difficult when using rotary drilling methods to gain accurate and depth-specific information on subsurface materials. For this reason, it may be desirable to drill a smaller diameter (4 to 6-inch diameter) pilot boring at selected locations using the sonic drilling method. Pilot borings would facilitate the collection of a continuous core of subsurface materials, allowing more accurate visual assessment of the geology and selection of subsurface sediment and groundwater samples for further analysis in support of well design.

Visual Description and Grain-Size Distribution Analysis

The subsurface materials will be described in the field and written descriptions will be included on the field boring log. If a pilot boring is drilled at a location, then the continuous core would be described. If a pilot boring is not drilled then the cuttings would be described. The descriptions will be used to identify potential screen interval(s).

Subsurface sediment samples may be collected at several intervals and submitted to a geotechnical laboratory (potentially onsite if needed for quick sample analysis turnaround) for grain-size distribution analysis. The lab would run each subsurface sediment sample through a series of sieves to determine grain-size distribution. The grain-size distribution data would be used to custom design the remediation well screen slot size and filter pack (Driscoll, 1987).

Vertical Aquifer Sampling

Vertical aquifer sampling (VAS) may be conducted at selected pilot borings to further define the subsurface distribution of Cr(VI) in groundwater. VAS depth interval(s) will be selected based on data developed during drilling of the pilot holes, available data from previous investigations, and general aquifer characteristics (i.e., saturated thickness, grain size distribution, etc.). The decision to conduct VAS at any individual pilot boring and the decision of which depth intervals to sample will likely evolve as the field program progresses. .

VAS would likely be conducted as the borehole is advanced using a Hydro-Punch, a temporary well, or another alternate sampling method. The VAS sampling methodology selected would typically depend on drilling conditions and saturated aquifer thickness. In general, the Hydro-Punch method is quicker but typically produces a more turbid sample as compared to a temporary well method. The Hydro-Punch method is essentially a “grab” sample that allows for collection of a groundwater sample at a discrete depth without purging using a specialized tool that is run inside the drill stem using drilling rods. The temporary well sampling method uses a temporary 2-inch diameter well with an inflatable packer above the well screen; and once the target depth is reached, the temporary well is installed inside the drill stem which is then pulled back 5ft to expose the screen to the formation. The packer is inflated to isolate the well screen from the overlying water column and then the well is purged/pumped to collect the sample.

In instances when drilling conditions are difficult, the Hydro-Punch method would likely be the preferred method. In instances when drilling conditions are not difficult, the temporary well method may be preferred due to its ability to produce a less turbid sample and its greater sample integrity.

Downhole Geophysical Logging

Another type of data that may be collected from the pilot borings is downhole geophysical logs. There are many types of geophysical logging instruments that could potentially be used to develop additional subsurface data at the site to assist with determining appropriate remediation well screened intervals. Some types of downhole geophysical logging devices require direct access to the formation while others can be used inside a casing. Because the borehole may collapse when the drill stem is pulled back within the unconsolidated sediments, downhole geophysical logging methods may be limited to those that can be used inside a casing. One such geophysical logging method that could be used inside a drilling casing would be gamma-ray logging (Keys, 1988). If boreholes are stable, then open-hole borehole geophysical tools can be considered, including spontaneous potential, electrical resistivity, and sonic methods along with gamma-ray.

Screen and Filterpack Design

There are two key well components that can be designed using site-specific lithologic data: well screen slot size and filter pack. The screen slot size for a particular well design may be selected on a site-specific basis using lithologic data collected from a pilot boring as described above (samples selected from a continuous core for grain-size distribution analysis). Otherwise, if there is found to be little variability in the subsurface sediments, a more qualitative averaging approach can be used to select the screen slot size instead.

Typical accepted screen slot size design recommendations for non-homogeneous formations allows for a range of 40-50% of the formation materials to pass through the screen based on the grain size distribution (Driscoll, 1987 and Misstear et al., 2006). The percent passing recommendation for screen slot size selection may influence screen interval selection depending on the degree of heterogeneity in the subsurface materials.

Recommendations for well screen slot size design are typically a balance between maximizing open screen area which improves well performance and reduces the frequency of well maintenence, well development requirements which increase as percent passing increases, and the amount of fine-grained heterogeneities that could pose longer term turbidity issues in the well, a potential concern for the remediation wells. In some instances it may be desirable to recommend a different slot size for one portion of a screened interval compared to another or to even recommend that a blank section be installed.

In addition, the filter pack material that surrounds the screen may also be custom designed for each screen section in the well based on the formation grain-size and screen slot size recommendation. Typically, the recommended filter pack will consist of a well sorted, well rounded, sand of a grain size that allows <10% passing through the screen.

Well Drilling/Construction Methods

Unconsolidated Deposits

There are only a few drilling technologies available that will drill boreholes in the unconsolidated sediments of the size and depth needed to install the remediation wells. Drilling methods such as sonic and hollow stem augers are limited in regards to borehole diameter, and the cable tool method is generally considered too slow. Therefore, rotary methods are the likely recommendation for drilling the remediation wells in the unconsolidated sediments due to their speed and ability to drill large diameter (i.e., >12-inch diameter) boreholes to the likely target depths at the site. In general, it will be preferable to avoid the use of drilling mud to optimize the hydraulic connection between the well and the formation and to reduce the required well development time. For these reasons, dual tube rotary or reverse circulation rotary drilling methods which typically use water as drilling fluid would be preferred over the mud rotary drilling method. When pilot borings are needed the likely drilling method would be sonic.

Bedrock

The East Ravine area is the only location at the site where bedrock drilling is anticipated. Geology in this area consists of <200ft of unconsolidated sediments directly on top of bedrock. As discussed above, the bedrock wells would consist of installing a conductor casing to the top of the bedrock (or perhaps a few feet into the bedrock if the bedrock is weathered) using sonic drilling, followed by changing drilling methods to air rotary,

wire line, or another appropriate method to drill the bedrock portion of the borehole.

Well Development Methods

Well development is a primary step in optimizing well performance after well construction and before well operation. A variety of development methods may be used to properly develop the remediation wells, including over pumping, jetting, air lifting, surging, and backwashing. The specific development methods will be determined based on the drilling method, well construction characteristics such as the number and length of well screens, and the grain-size distribution and sorting of the formation.

In general, the goals of well development are to repair damage to the formation incurred during drilling, and to optimize the hydraulic connection of the well to the formation. Typically it is recommended that turbidity and potentially other field parameters such as conductivity and pH are measured in the extracted fluids during well development to assess progress.

Firewater System Analyses
(*on CD-ROM only*)

Topock Remediation Design

Hydraulic Analysis of Fire Water System

The existing fire water system at Topock Compressor Station needs to be expanded to accommodate new facilities associated with the groundwater remediation system. The existing fire water system is supplied from the freshwater tanks and consists of a pump station discharging to a six inch diameter distribution loop with branches to fourteen hydrants serving buildings and structures at the compressor station. This system needs to be expanded to provide water in case of fire at either the carbon amendment building at the TW bench or the MW-20 bench. A hydraulic network analysis was conducted to determine 1) the size of the expanded piping segments to serve TW and MW-20 bench, 2) whether existing storage capacity is sufficient and 3) if the existing fire pump station is adequate or needs to be modified.

A hydraulic network model of the expanded fire water system proposed for Topock remediation improvements was constructed using EPANET. EPANET is a software program that models water distribution piping systems. EPANET tracks the flow of water at each pipe, the pressure at each node, pumping heads and levels of water in tanks and reservoirs. Chemical species can be tracked, although that was not needed for the fire water system at Topock.

Pipe junctions, reservoirs and tanks are represented as nodes. A listing of nodes is contained on the following pages. Pipes, pumps and valves are represented as links. A listing of links is contained on the pages following the node listing. A schematic map showing the location of all nodes and links is shown on the sheet following the links listing.

The existing fire water system was compiled from as-built drawings when available. In the areas where as-built information was not available, piping routes were hypothesized based on logical assumptions. If more as-built information becomes available, then the analysis can be refined.

The piping routes and corridors for expanded piping segments have been approved by the client, Pacific Gas & Electric; however, they are subject to change pending stakeholder and regulatory review. The following summary describes the development of the hydraulic model:

Ground elevations for pipe junctions and tanks were taken from the 60% plan and profile sheets, which were based on the Toponex aerial survey. Pipe lengths have been taken off from plant as-built drawings and plan and profile drawings for the 60% submittal. Pump curve and test data was provided by PG & E

Projected fire flow demands are based on information provided from PG & E's fire protection consultant and data provided by the carbon amendment building designers. For the both the TW bench and MW-20 bench, the worst case fire flow scenario occurs at the carbon amendment buildings with its combustible roof and flammable liquid mixing. The projected fire flow demands are 0.30 gpm per sq ft plus a 500 gpm hose allowance. For the 480 sq ft building at the TW bench, this amounts to 644 gpm (at node 103). At the MW-20 bench this computes to 863 gpm (at node 102).

There are two existing fresh water tanks located above TCS at a base elevation of 672 feet (above sea level). Each tank is 30 feet high and contains 210,000 gallons. A minimum tank level of 2 feet and maximum tank level of 28 feet was assumed for this analysis.

There are two fire water pumps. One is an electric driven pump rated for approximately 900 gpm. The other is a diesel engine backup rated for approximately 1050 gpm.

Hazen-Williams C value of 120 was assumed for all existing pipes. New HDPE pipes were assumed to have a C value of 150.

The hydraulic network model of existing system was calibrated against the most recent pump test data results (September 2012) at hydrant 78. A comparison is shown in the table below.

Hydrant at Node 78	Measured	Modeled
Static pressure (closed)	160	156
Dynamic pressure (flowing)	98	96

Pipe sizing is an iterative process. After the initial simulation, pipe diameters for various segments of pipes are increased or decreased for subsequent simulations until an optimum size is selected for each segment. Typically, the criterion used for determining optimum size is unit head loss. In general, unit head losses of between 1 to 10 feet per 1,000 foot of pipe length yield the optimal combination of pipe capital cost and pumping energy costs. In this instance, the TW bench and MW-20 are sufficiently lower than the existing fire water system so that head losses in excess of 10 feet per 1,000 feet of pipe length are tolerable. The governing factor then becomes providing a minimum of 20 psi dynamic pressure at the hydrant. Hydraulic analysis simulations of 6 inch diameter (5.421 internal diameter for SDR 11 HDPE) for the expanded fire water piping yield sufficient dynamic pressures as shown in the table below:

Location	Pump	Tank Level	Residual Pressure
TW Bench	Electric	High	145
TW Bench	Electric	Low	133
TW Bench	Diesel	High	145
TW Bench	Diesel	Low	133
MW-20 Bench	Electric	High	44
MW-20 Bench	Electric	Low	33
MW-20 Bench	Diesel	High	44
MW-20 Bench	Diesel	Low	33

The criteria for fire flow volume is based on Insurance Services Office standard of one hour duration for each 1,000 gpm of fire flow plus one hour for each increment of 1,000 gpm fire flow. For the worst case scenario of 863 gpm, this indicates a one hour duration and a required fire flow volume of 51,780 gallons. The combined capacity of the 30 foot high freshwater tanks when full is 420,000 gallons, which is more than adequate. If the tanks are less than full, then storage is adequate assuming the following minimum tanks are maintained prior to the onset of a fire:

No. of Tanks in service	Supply wells	Required Minimum tank level
2	On	5.7
2	Off	7.2
1	On	9.4
1	Off	12.3

The required minimum tank level calculation assumes that the bottom two feet of the tank is dead storage and not available for consumption. It is assumed that the supply wells (from Arizona) will fully supply the groundwater remediation system and compressor system water demands during a fire flow emergency. If for some reason the supply wells are off (power outage, etc), then the tank must supply the fire flow (863 gpm) plus the combined remediation and compressor station demand (1200 gpm).

The supply well pumps will be set to maintain tanks levels significantly higher than the highest required minimum tank level (12.3).

The horsepower required to pump fire flows is less than the rated horsepower for the electric motor and diesel engine pumps. The electric driven pump results are summarized as follows:

Location	Q (gpm)	TDH (ft)	Pump Eff	Motor Eff	Hp	Rated Hp
TW bench	644	255.4	0.83	0.90	55.6	69.0
MW-20 bench	863	211.2	0.80	0.90	63.9	69.0

Q and TDH are taken from the hydraulic network simulations. Pump Eff is from the pump curves supplied by PG & E. Motor Eff is assumed at 90%. The rated hp includes a 1.15 service factor.

The diesel engine driven pump results are summarized as follows:

Location	Q (gpm)	TDH (ft)	Pump Eff	Engine Eff	Hp	Rated HP
TW bench	644	256.6	0.72	0.92	63.0	75.0
MW-20 bench	863	212.8	0.76	0.92	66.3	75.0

Q and TDH are taken from the hydraulic network simulations. Pump Eff and Engine Eff are from the pump curves supplied by PG & E. Engine Eff is back calculated from the engine hp curve.

The following conclusions may be drawn from the hydraulic analysis:

- Six inch diameter piping is sufficient for the expanded portion of the fire water system
- Existing storage is adequate for the fire flow scenarios anticipated
- Existing pumps are capable of supplying the worst case fire flows

If building sizes increase, then this analysis may need to be revisited.

SECTION 01 11 00
SUMMARY OF WORK

PART 1 GENERAL

1.01 WORK COVERED BY CONTRACT DOCUMENTS

A. The completed Work will provide OWNER with the Final Groundwater Remedy described including:

B. The Work is divided into the following schedules:

1. Installation of 51 new remedy wells including drilling, casing, concrete well and meter vaults, piping, pumps, valves, instrumentation and controls, and pipe appurtenances. Well installation includes post construction well development.
2. 2 carbon amendment facilities including ethanol storage tanks, 5 building-housing equipment (pumps, piping, instrumentation and controls, valves, pipe appurtenances, and PLCs), and additional security fencing.
3. Construction of a Remedy Produced Water Conditioning Plant, including but not limited to; metal building, concrete foundation, retaining wall, decontamination pad, filtration equipment, laboratory, motor control center, chemical storage area, electrical and control systems and ancillary support systems.
4. Construction of 1 (Produced Water) Influent Tank Farm, including but not limited to frac tanks, secondary containment, pumps, sumps, and piping.
5. Construction of 1 Conditioned Water Storage Tank Farm, including but not limited to frac tanks, secondary containment, pumps, sumps, and piping.
6. Construction of a Conditioned Water Storage Tank, including but not limited to the tank, foundation, piping, and appurtenances.
7. Construction of interconnecting piping, valves, and controls for freshwater, extracted groundwater, remedy produced water and conditioned water distribution.
8. Construction of medium voltage power distribution wiring, electrical transformers, remote terminals (HMI), and communications lines to all wells and facilities.
9. Upgrade of existing well HNWR-1 located in Arizona to include new equipment pads, controls, piping, valves, appurtenances, electrical panels, submersible pump, site improvements, and fencing. Also,

©COPYRIGHT 2012 CH2MHILL

includes installing new freshwater pipe from the well to the Compressor Station crossing the Colorado River on an existing pipe bridge (Arch Bridge) and demolition of existing 6-inch water supply pipeline.

C. Alternates: Only those alternates that were selected by the OWNER, as evidenced in the Agreement, are made a part of this Contract.

1.02 WORK NOT COVERED BY CONTRACT DOCUMENTS

A. 3,000-gallon double-wall ethanol storage tank provided by OWNER.

B. 3 500-barrel frac tanks provided by OWNER

1.03 PROVISIONS FOR FUTURE WORK

A. Provisions for future construction are as shown.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION (NOT USED)

SECTION 03 10 00
CONCRETE FORMING AND ACCESSORIES

PART 1 - GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. American Concrete Institute (ACI):
   a. 117/117R, Standard Tolerances for Concrete Construction and Materials.
   b. 301, Specifications for Structural Concrete in Buildings.
   c. 318/318R, Building Code Requirements for Structural Concrete and Commentary.
   d. 347, Guide to Formwork for Concrete.
   e. SP-4, Formwork for Concrete
2. APA – The Engineered Wood Association (APA/EWA):
3. PS 1, Construction and Industrial Plywood.
4. Western Wood Products Association (WWPA): G5, Western Lumber Grading Rules.

1.02 DESIGN REQUIREMENTS

A. Design, engineer, and construct formwork in accordance with ACI 301, ACI 347 and ACI 318/318R to provide concrete finishes specified in Section 03 30 00, Cast-in-Place Concrete.

A. CONTRACTOR responsible for form design, form removal procedures and sequences, shoring and re-shoring, and shore removals according to ACI 301 Section 2.

B. Make joints in forms watertight.

C. Limit panel deflection to 1/360th of each component span to achieve tolerances specified.

1.03 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
   a. Layout of panel joints, form liners, and tie hole pattern.

©COPYRIGHT 2013 CH2M HILL

b. Form Ties-Tapered Through-Bolts: Proposed method of sealing form tie hole; coordinate with details shown.
c. Manufacturer's data for form release agent.
d. Manufacturer's literature for form materials, form accessories, and prefabricated forms, including type, size, quantity and strength of all form materials.
e. Plan for jointing of facing panels.
f. Details affecting the appearance.
g. Assumed design values. And loading conditions.

2. Samples: One each as follows:
   a. Form ties.
   b. Form liners.

1.04 INFORMATIONAL SUBMITTALS:

A. Statement of qualification for formwork designer.

1. Manufacturer's Certificate of Proper Installation in accordance with Section 01 43 33, Manufacturers' Field Services.
2. Design computations for the formwork.
3. On-Site contractor quality Control Plan.
4. On-Site Contractor Quality Control Reports.

1.05 QUALIFICATIONS

A. Formwork Designer: Formwork, falsework, and shoring design shall be by an engineer licensed in the state of California.

1.06 CONTRACTOR QUALITY CONTROL

A. Perform work in accordance with ACI 301, ACI 318, and ACI 347. Tolerance shall be as necessary to provide completed concrete structure within the tolerance specified in ACI 117.

B. Supply all labor, tools, equipment and materials to set forms so that the resultant concrete conforms to required shapes, lines, and dimensions of the design, as well as the necessary code requirements.

1. It is the Contractor's responsibility to design and build adequate forms and to leave them in in-place until the forms can be safely removed.
2. Bear responsibility for damage and injury caused by removing forms carelessly or before the concrete has gained sufficient strength.

©COPYRIGHT 2013 CH2M HILL

C. Inspect erected formwork, shoring, and bracing to ensure that work is in accordance with formwork design and that supports, fastenings, wedges, ties, and items are secure.

D. Monitor forms during concrete placement and correct deficiencies.

PART 2 - PRODUCTS

2.01 FORM MATERIALS

A. Wall Forms and Underside of Slabs and Beams:

1. Materials: Plywood, hard plastic finished plywood, overlaid waterproof particle board, or steel in "new and undamaged" condition, of sufficient strength and surface smoothness to produce specified finish. Use plywood forms when using form liners. Plywood may be of lower finish grade when use in conjunction with form liners.

B. Form Liners:

1. Glass Fiber Reinforced Plastic Forms: Matched, tight fitting stiffened to support weight of concrete without deflection detrimental to structural tolerances and appearances of finished concrete surface.
2. Lumber: Fir species No. 2 grade or better, with grade stamp clearly visible.
3. Steel: Minimum 16 gauge sheet, well matched, tight fitting, stiffened to support weight of concrete without deflection detrimental to structural tolerances and appearance of finished surfaces.

C. Sandblasted Surface Forms: Medium density overlay plywood for flat concrete surfaces to be sandblasted.

D. Painted Surface Forms: High-density overlay plywood for flat concrete surfaces to be painted.

E. All Other Forms: Materials as specified for wall forms.

F. Form Release Agent:

1. Material: Release agent shall be colorless, not bond with, stain, or adversely affect concrete surfaces, and shall not impair subsequent treatments of concrete surfaces when applied to forms or form liners. A ready-to-use water based material formulated to reduce or eliminate surface imperfections, containing no mineral oil or organic solvents.

©COPYRIGHT 2013 CH2M HILL

Environmentally safe, meeting local, state, and federal regulations and can be used in potable water facilities.

2. Manufacturers and Products:
   a. BASF, Shakopee, MN; MBT, Rheofinish 211.
   b. Cresset Chemical Company; Crete-Lease 20-VOC.
3. Form Ties:
   a. Material: Removable snap-off type, galvanized metal, 3/4-inch break back dimension, fixed length, cone type.
   b. Spreader Inserts:
      1) Conical or spherical type.
      2) Design to maintain positive contact with forming material.
      3) Furnish units that will leave no metal closer than 1.5 inches to concrete surface when forms, inserts, and tie ends are removed.
   c. Wire ties not permitted
   d. Flat bar ties for panel forms; furnish plastic or rubber inserts with minimum 1.5-inch depth and sufficient dimensions to permit patching of tie hole.
   e. Water Stop Ties: For water-holding structures, basements, pipe galleries, and accessible spaces below finish grade, furnish the following:
4. Neoprene water stop 3/16 inch thick and 15/16 inch diameter whose center hole is one half diameter of tie, or molded plastic water stop of comparable size.
5. Through-Bolt: Tapered minimum 1-inch diameter at smallest end.
6. Nails, Spikes, Lag Bolts, Anchorages: Sized as required, of sufficient strength and character to maintain formwork in place while placing concrete.
7. Joint filler: A dense, closed-cell foam rubber.

B. Corners: Chamfered strip type; 3/4 inch by 3/4 inch size; maximum possible lengths.

C. Preformed Plastic Adhesive Waterstop Fuel Resistant (PPAWS FR): extruded rope form (consisting of N.B.R. compound with poly propylene resins and other solvent resistant elastomers) between two protective silicone treated papers, 7/8 inch x 1 inch cross section, 1 inch lap splice, furnish and use with primer; Henry Company, SF312-Synko-Flex FR, or as approved.

©COPYRIGHT 2013 CH2M HILL

PART 3 - EXECUTION

3.01 FORM SURFACE PREPARATION

A. Thoroughly clean form surfaces that will be in contact with concrete or that have been in contact with previously cast concrete, dirt, and other surface contaminants as erection proceeds and prior to coating surface.

B. Exposed Wood Forms in Contact with Concrete: Apply form release agent as recommended by the manufacturer.

1. Apply prior to placement of reinforcing steel, anchoring devices and embedded items.
2. After form release agent is applied to forms, place concrete within 14 calendar days. If concrete is not placed within 14 calendar days, remove the forms and reapply the form release agent.
3. Do not apply form release agent where concrete surfaces are scheduled to receive special finishes which may be affected by the agent, such as crystal forming waterproofing. Soak contact surfaces of untreated forms with clean water. Keep surfaces wwet prior to placing concrete.

C. Steel Forms: Apply form release agent to steel forms as soon as they are cleaned to prevent discoloration of concrete from rust.

D. Form Liners: Provide liners with full sheets and place seams at horizontal and vertical grooves. Prepare as recommended by manufacturer.

1. Use anchorage systems recommended by manufacturer to anchor liner to formwork.
2. Do not use form release agent on formwork.

E. Earth Forms:

1. Hand trim sides and bottom of earth forms. Remove loose soil prior to placing concrete.
2. Do not use rock cuts for forms except where specifically indicated or permitted. When rock form is indicated or permitted, the rock face shall be sound and no rock shall extend inside the concrete lines indicated.

3.02 ERECTION

A. General: Unless specified otherwise, follow applicable recommendations of ACI 347 and ACI 301.

©COPYRIGHT 2013 CH2M HILL

1. Provide bracing to ensure stability of formwork. Shore or strengthen formwork subject to overstressing by construction loads.
2. Arrange assemble formwork to permit dismantling and stripping. Do not damage concrete during stripping.
3. Align joints and make watertight to prevent leakage of mortar. Keep form joints to a minimum.
4. Verify lines, levels and centers before proceeding with formwork. Ensure that dimensions agree with Drawings.
5. Obtain approval before framing openings in structural members which are not indicated on Drawings.
6. Retighten forms and bracing after concrete placement, if required.

B. Beveled Edges (Chamfer):

1. Form 3/4-inch bevels at concrete edges, unless otherwise shown.
2. Where beveled edges on existing adjacent structures are other than 3/4 inch, obtain ENGINEER's approval of size prior to placement of beveled edge.

C. Wall Forms:

1. Do not reuse forms with damaged surfaces.
2. Locate form ties and joints in an uninterrupted uniform pattern.
3. Inspect form surfaces prior to installation to assure conformance with specified tolerances.

D. Forms Supporting Form Liners:

1. Construct forms to structurally withstand deflection, movement, leakage, high hydraulic pressures resulting from rapid filling and heavy-high frequency vibration.
2. Lay out form joints and ties in uniform pattern, unless otherwise shown.

E. Forms for Curbs, Sidewalks, and Driveways:

1. Provide standard steel or wood forms.
2. Set forms to true lines and grades, and securely stake in position.

F. Form Tolerances: Provide forms in accordance with ACI 117/117R, ACI 347, and ACI 318/318R and the following tolerances for finishes specified:

1. Wall Tolerances:
   a. Straight Vertical or Horizontal Wall Surface: Flat planes within tolerance specified.
   b. Wall Type W-A:

©COPYRIGHT 2013 CH2M HILL

1) Plumb within 1/4 inch in 10 feet or within 1 inch from top to bottom for walls over 40 feet high.
2) Depressions in Wall Surface: Maximum 5/16 inch when 10-foot straightedge is placed on high points in all directions.

c. Wall Type W-B:
1) Plumb within 1/8 inch in 10 feet or within 1/2 inch from top to bottom for walls over 40 feet high.
2) Depressions in Wall Surface: Maximum 1/8 inch when 10-foot straightedge is placed on high points in all directions.

d. Thickness: Maximum 1/4 inch minus or 1/2 inch plus from dimension shown.

e. Form Offset: Between adjacent pieces of formwork, facing material shall not exceed 1/8 inch].

2. Beam Tolerances:

a. Exposed Straight Horizontal and Vertical Surfaces: Flat planes within tolerances specified.

b. Lateral Alignment:
1) Centerlines must be within plus or minus 1/2 inch from dimensions shown.
2) At intersections, centerlines shall intersect within plus or minus 1/2 inch of dimensions shown.

c. Beam Type B-A:
1) Physical Dimensions: Maximum 1/4 inch minus or 1/2 inch plus from dimension shown.
2) Elevations: Within plus or minus 1/2 inch, except where tops of beams become part of finished slab. In this case refer to slab tolerances.

G. Application - Form Release Agent:

1. Clean reused forms of concrete residue. Repair and patch as required to return forms to acceptable surface condition.

2. Apply form release agent on formwork prior to placement of reinforcing steel, anchoring devices, and embedded items.

3. Do not apply form release agent where concrete surfaces will receive special finishes which are affected by agent. Soak inside surfaces of untreated forms with clean water. Keep surfaces coated prior to placement of concrete.

H. Inserts, Embedded Parts and Openings:

1. Provide formed openings where required for items to e embedded in or pass through the concrete work.

©COPYRIGHT 2013 CH2M HILL

2. Locate and set in place items which will be cast directly into concrete.
3. Coordinate work of other sections in forming and placing openings, sleeves, bolts, anchors and other inserts.
4. Install accessories in accordance with the manufacturer's instructions, straight, level and plumb. Secure all embedded items before placing concrete. Ensure that items are not disturbed during concrete placement. Fill voids with readily removable material to prevent entry of concrete.
5. Provide block outs wherever necessary, even when not shown on the Drawings.
6. Install waterstops, where required, continuous without displacing reinforcement. Heat seal joints watertight per waterstop manufacturer's instructions.
7. Provide temporary ports or openings in formwork where required to facilitate cleaning and inspection. Locate openings at bottom of forms to allow flushing water to drain.
8. Close temporary openings with tight fitting panels, flush with inside face of forms and neatly fitted so joints will not be apparent in exposed concrete surfaces.

I. Form Cleaning

1. Clean forms as erection proceeds to remove foreign matter within forms.
2. Clean formed cavities of debris prior to placing concrete.
3. Flush with water or use compressed air to to remove remaining foreign matter. Ensure that water and debris drain to exterior of the formwork through the clean-out ports.
4. During cold weather, remove ice and snow from within forms. Do not use de-icing salts. Do not use water to clean out forms, unless formwork and concrete construction proceed within a heat enclosure. Use compressed air or other means to remove foreign matter.

3.03 FORM REMOVAL

A. General:

1. Notify the ENGINEER prior to removal of forms.
2. Remove forms in a manner that will not damage concrete.
3. Do not wedge pry bars, hammers or tools against finish concrete surfaces scheduled for exposure to view.

B. Nonsupporting forms (sides of beams, walls, columns, and similar parts of Work) may be removed after cumulatively curing at not less than 50 degrees F for 24 hours from time of concrete placement if:

©COPYRIGHT 2013 CH2M HILL

1. Concrete is sufficiently hard so as not to sustain damage by form removal operations.
2. Curing and protection operations are maintained.

C. Elevated Structural Slabs or Beams: In accordance with ACI 318/318R, Chapter 6, and at such time as concrete has reached compressive strength equal to 80 percent of specified 28-day compressive strength as determined by test cylinders. In no case shall the formwork be removed less than the following number of days after concrete placement. Where forms may be removed without disturbing shores, use half the values given, but in no event less than three days after concrete placement. Distance between supports indicated below refer to permanent structural supports only.

1. Joist, beam and girder soffits:
   a. Clear span less than 10 feet: 7 days
   b. Clear span 10 to 20 feet: 14 days
   c. Clear span greater than 20 feet: 21 days
2. Floor slabs:
   a. Clear span less than 10 feet: 4 days
   b. Clear span 10 to 20 feet: 7 days
   c. Clear span greater than 20 feet: 10 days

D. Construction Loads: Limit construction loads at all times to those which can be carried safely by the developed strength of the structure at the time of loading, and by formwork and shoring in-place at the time of loading.

E. Store removed forms in a manner that the surfaces to be in contact with fresh concrete will not be damaged. Discard and remove from the job site damaged forms.

1.02 SUBMITTALS

A. Action Submittals:

1. Shop Drawings prepared in accordance with CRSI Manual of Standard Practice and ACI SP-66, and ACI 315:
   a. Bending lists.
   b. Placement drawings.
      1) Indicate bar sizes, spaces, locations and quantities of reforcing steel, bending and cutting schedules, and supporting and spacing devices.
      2) Show location of splices. Obtain ENGINEER's approval of proposed reinforcing splices not indicated on the Drawings.

B. Informational Submittals:

1. Certified Lab (Mill) test reports for reinforcing steel showing stress-strain curves and ultimate strengths.
2. Mechanical Threaded Connections:
   a. Current ICC Evaluation Services Report or equivalent code agency report listing findings to include acceptance, special inspection requirements, and restrictions.
   b. Verification device threads have been tested and meet requirements for thread quality, in accordance with manufacturer's published methods.
   c. Manufacturer's instructions.
3. Epoxy-Coated Reinforcing Bars: Written certification in accordance with Paragraph 14.1 of ASTM A775/A775M.
4. Test results of field testing.
5. Contractor CQC Plan.
6. Contractor CQC Reports.

1.1 ADJUSTMENT PRICE - MEASUREMENT AND PAYMENT

A. The Contract Price shall include the cost of providing 5,000 pounds of reinforcing steel to be used as directed by ENGINEER and not to be fabricated or delivered to the Project until ordered by ENGINEER. At completion of the Project, OWNER shall be given a credit for the unused amount and such credit shall be at the adjustment price included in the Contract, or as agreed upon

©COPYRIGHT 2013 CH2M HILL

1.03 QUALITY ASSURANCE

A. Perform concrete reinforced work in accordance with CRSI manual of standard Practice and Document 63 and 65.

1.04 DELIVERY, STORAGE, AND HANDLING

A. Unload, store, and handle bars in accordance with CRSI publication "Placing Reinforcing Bars."

1. Store reinforcement of different sizes and shapes in separate piles or racks raised above ground to avoid rusting.
2. Protect from contaminants such as grease, oil and dirt.
3. Provide identification on reinforcement after bundles are broken and tags removed.

B. Epoxy-coated Reinforcing Bars:

1. Protect contact areas of epoxy-coated bars from handling equipment.
2. Lift bundles of bars at multiple pickup points to minimize bar-to-bar abrasion from sags in bundles.
3. Do not drop or drag bars or bundles of bars.
4. Store bars on protective cribbing.
5. Color fading of coating is not cause for rejection of epoxy-coated reinforcing bars.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Reinforcing Bars:

1. Includes stirrups, ties, and spirals.
2. ASTM A615/A615M, Grade 60.
3. ASTM A767/767M, Grade 60, for galvanized bars.
4. ASTM A775/A775M, for epoxy-coated bars.

B. Mechanical Splices and Connections:

1. Metal Sleeve Splice:
   a. Furnish with cast filler metal, capable of developing, in tension or compression, 125 percent of minimum tensile strength of bar.

©COPYRIGHT 2013 CH2M HILL

b. Manufacturer and Product: Erico Products, Inc., Cleveland, OH; Cadweld T-Series.

2. Mechanical Threaded Connections:
   a. Furnish positive-locking, straight or taper-threaded bars and couplers developing in tension or compression 125 percent of yield strength of bar. Flanged coupler with nail holes for form attachment and internal coupler thread protection. System shall posses a current and valid International Code Council Evaluation Service Report.
   b. Manufacturers and Products:
      1) Erico Products, Inc., Cleveland, OH; Lenton Reinforcing Steel Couplers.
      2) Richmond Screw Anchor Co., Inc., Fort Worth, TX; Richmond DB-SAE Dowel Bar Splicers.

C. Welded Wire Fabric:

1. ASTM A185 or ASTM A497 and ACI 318, using ASTM A82 wire of 75 ksi minimum tensile strength.
2. Furnish flat sheets only, rolled sheets not permitted.

2.02 ACCESSORIES

A. Tie Wire:

1. Black, soft-annealed 16-gauge wire.
2. Nylon-, epoxy-, or plastic-coated wire.

B. Bar Supports and Spacers:

1. Use precast concrete bar supports and side form spacers, unless noted otherwise. Do not use other types of supports or spacers.
2. Bar supports shall have sufficient strength and stiffness to carry loads without failure, displacement, or significant deformation. Space bar supports so minimum concrete cover is maintained for reinforcing between supports.
3. Use only precast concrete bar supports where concrete surfaces are exposed to weather, earth, water, chloride intrusion, or corrosive chemicals. Bar supports shall be nonconductive and have geometry and bond characteristics that deter movement of moisture from the surface to the reinforcement.
4. Precast concrete supports shall have same minimum strength (minimum 4,000 pounds per square inch at 28 days) and shall be made from same materials as that of the concrete in which they are to be embedded. Precast concrete supports shall be cast and properly cured for at least 7 days before

©COPYRIGHT 2013 CH2M HILL

use and shall have a wire or other device cast into each block for the purpose of attaching them securely to reinforcing steel.

5. In Beams, Columns, Walls, and Slabs Exposed to View after Form Removal: Use small precast concrete blocks made of same color as concrete in which they are embedded.
6. Design and fabricate special bar supports for top reinforcing bars in slabs where standard bar supports do not possess necessary geometry, strength, or stiffness.
7. Use supports made of dielectric material for epoxy-coated reinforcing bars supported from formwork.
8. If epoxy-coated reinforcing is used, furnish epoxy-coated reinforcing bars for spreader bars.
9. Precast Concrete Supports: Total bond precast high performance concrete bar supports as supplied by Con Sys Inc., Pinawa, MB, Canada.

2.03 FABRICATION

A. Follow CRSI Manual of Standard Practice, ACI SP-66, and ACI 315.

B. Bend bars cold.

C. Welding reinforcing bars is not permitted.

PARTPART 3 - EXECUTION

3.01 PREPARATION

A. Notify ENGINEER when reinforcing is ready for inspection and allow sufficient time for inspection prior to placing concrete.

B. Repair epoxy coating damaged due to handling, shipment, and placing. Repair with patching material in accordance with ASTM A775/A775M and manufacturer’s recommendations.

C. Clean reinforcing bars of loose mill scale, oil, earth, and other contaminants. Remove rust by vigorous rubbing with burlap cloth or wire brushing.

D. Coat wire projecting from precast concrete bar supports with dielectric material, epoxy, or plastic.

©COPYRIGHT 2013 CH2M HILL

3.02 INSTALLATION

A. Bundle or space bars, instead of field bending where construction access through reinforcing is necessary. Field Bending is not allowed unless approved by the ENGINEER. Do not bend reinforcement after embedment in hardened concrete

1. Accommodate formed openings.

B. Spacing and Positioning: Conform to ACI 318. Place, support and secure reinforcement against displacement. Do not deviate from the required position.

C. Location Tolerances: In accordance with CRSI publication, "Placing Reinforcing Bars".

D. Splicing:

1. Lap splices to be in accordance with Lap Splice Dimension Table on Drawings.
   1. Follow ACI 318.
   2. Use lap splices, unless otherwise shown or permitted in writing by Engineer. Securely wire together lap splicesENGINEER.
   3. Welded Splices: Welding reinforcing bars is not permitted.
   4. Stagger splices in adjacent bars where indicated.
   5. Reinforcing splices have been located on the Drawings. Additional splices shall be reviewed and approved by the ENGINEER.

E. Mechanical Splices and Connections:

1. Use only in areas specifically approved in writing by ENGINEER.
2. Install threaded rods as recommended by manufacturer with threads totally engaged into coupling sleeve and in accordance with ICC Evaluation Services Report or equivalent code agency report.
3. For metal sleeve splice, follow manufacturer's installation recommendations.
4. Maintain minimum edge distance and concrete cover.

F. Tying Reinforcing Bars:

1. Tie every other intersection on mats made up of Nos. 3, 4, 5, and 6 bars to hold them firmly at required spacing.
2. Bend tie wire away from concrete surface to provide clearance of 1 inch from surface of concrete to tie wire.
3. Epoxy-coated Reinforcing Bars:
   a. Use epoxy-coated or nonmetallic clips.

©COPYRIGHT 2013 CH2M HILL

b. Repair coating damage at clipped or welded intersections.

G. Reinforcement Around Openings: On each side and above and below pipe or opening, place an equivalent area of steel bars to replace steel bars cut for opening. Extend steel reinforcing a standard lap length beyond opening at each end.

H. Straightening and Rebending: Field bending of reinforcing steel bars is not permitted.

I. Unless permitted by ENGINEER, do not cut reinforcing bars in field. When epoxy-coated reinforcing bars are cut in field, coat ends of bars with same material specified for repair of epoxy coating damage.

J. Place and secure embedded metalwork and conduit.

K. Place reinforcement with clear distance of 1-inch, minimum, between reinforcement and anchor bolts, form ties, or other embedded metalwork unless otherwise shown on the Drawings.

L. See Drawings for Structural Notes, and for Reinforcement cover Requirements.

M. Tolerances:

1. Maintain concrete cover over reinforcement within 1/2 inch of specified cover where the specified cover is greater than 2-1/2 inches.
2. Maintain concrete cover over reinforcement within 1/4 inch of the specified cover where the specified cover is 2-1/2 inches or less.
3. Maintain spacing of reinforcing bars within 1 inch of the required spacing.

3.03 WELDED WIRE FABRIC INSTALLATION

A. Use only where specifically shown.

B. Extend fabric to within 2 inches of edges of slab, and lap splices at least 1-1/2 courses of fabric or minimum 8 inches.

C. Tie laps and splices securely at ends and at least every 24 inches with tie wire.

D. Place welded wire fabric on concrete blocks and rigidly support equal to that provided for reinforced bars. Do not use broken concrete, brick, or stone.

E. Follow ACI 318 and WRI WWR-500.

©COPYRIGHT 2013 CH2M HILL

F. Do not use fabric that has been rolled. Install flat sheets only.

3.04 TESTS AND INSPECTION

A. Notify the ENGINEER when reinforcing steel is in place and provide sufficient time in the schedule for the ENGINEER to inspect the reinforcing steel prior to placement of concrete. Concrete placed without inspection and approval by the ENGINEER may be subject to rejection and removal at no additional cost to the OWNER.

B. An independent testing agency [will be retained by OWNER] [shall be retained by CONTRACTOR and approved by ENGINEER] to visually inspect and test reinforcing steel welds in accordance with AWS D1.4/D1.4M as specified in Section 05 05 23, Welding.

C. An independent testing agency [will be retained by OWNER] [shall be retained by CONTRACTOR and approved by ENGINEER] to inspect each mechanical splice and verify each component is installed in accordance with manufacturer's instructions and ICC Evaluation Services Report or equivalent code agency report.

D. Special inspection will be provided by OWNER as indicated on Drawings.

E. The ENGINEER's (and Special Inspector's) inspection of steel reinforcing prior to concrete placement will not relieve the CONTRACTOR from responsibility to conform to the Drawings and Specifications.

3.05 SCHEDULE

A. ASTM A615/A615M, Grade 60 reinforcing bars:

1. TCS Loop Injection and Extraction Well and Well Casing Vaults.
2. IRZ Injection and Extraction Well and Well Casing Vaults.
3. Inner Recirculation Loop Injection and Extraction Well and Well Casing Vaults.
4. MW-20 Bench Storage Tank Foundation.
5. MW-20 Bench Building Foundation.
6. MW-20 Bench Unloading Pad.
7. TW Bench Storage Tank Foundation.
8. TW Bench Building Foundation.

1.02 DEFINITIONS

A. [Architectural Concrete: Concrete indicated as such in Contract Documents. Requires specified care in selection of concrete materials, forming, placing, and finishing in order to obtain desired architectural appearance.]

B. Basin Train: Series of interconnected basins that operate as a unit with same water level.

C. Cold Weather: When ambient temperature is below 40 degrees F or is approaching 40 degrees F and falling.

D. CONTRACTOR’s Licensed Design Engineer: Individual representing CONTRACTOR who is licensed to practice engineering as defined by statutory requirements of professional licensing laws in state or jurisdiction in which Project is to be constructed.

E. Defective Area: Surface defects that include honeycomb, rock pockets, indentations, and surface voids greater than 3/16-inch deep, surface voids greater

©COPYRIGHT 2013 CH2M HILL

than 3/4 inch in diameter, cracks in liquid containment structures and below grade habitable spaces that are 0.005-inch wide and wider, and cracks in other structures that are 0.010-inch wide and wider, spalls, chips, embedded debris, sand streaks, mortar leakage from form joints, deviations in formed surface that exceed specified tolerances and include but are not limited to fins, form pop-outs, and other projections. At exposed concrete, defective areas also include texture irregularities, stains, and other color variations that cannot be removed by cleaning.

F. Exposed Concrete: Concrete surface that can be seen inside or outside of structure regardless of whether concrete is above water, dry at all times, or can be seen when structure is drained.

G. Hot Weather: As defined in ACI 305.1.

H. Hydraulic Structure: Liquid containment structure.

I. New Concrete: Less than 60 days old.

J. Slurry Mixture: Mixture of sand, 3/8-inch maximum nominal aggregate size, cement, and water for wall construction joints with waterstop.

1.03 SYSTEM DESCRIPTION

A. Performance Requirements:

1. General:
   a. Except as otherwise specified, provide concrete composed of Portland cement, fine aggregate, coarse aggregate, and water so proportioned and mixed as to produce plastic, workable mixture in accordance with requirements as specified in this Section and suitable to specific conditions of placement.
   b. Proportion materials in a manner such as to secure the lowest water-cement ratio which is consistent with good workability, plastic, cohesive mixture, and one which is within the specified slump range.
   c. Proportion fine and coarse aggregate in a manner such as not to produce harshness in placing nor honeycombing in structures.
2. Watertightness of Concrete work: It is the intent of this Section to secure for every part of the Work concrete and grout of a homogeneous structure, which when hardened will have the required strength, watertightness, and durability.
   a. It is recognized that some surface hairline cracks and crazing will develop in the concrete surfaces.

©COPYRIGHT 2013 CH2M HILL

b. Construction, contraction and expansion joints have been positioned in structures as indicated on the Drawings, and curing methods specified for purpose of reducing the number and size of these expected cracks, due to normal expansion and contraction expected from the specified concrete mixes.
c. Class A, B-1, B-2 and Class D Concrete – Watertight: Repair cracks which develop in walls or slabs and repair cracks which show any signs of leakage until all the leakage is stopped.
d. Except for hairline cracks and crazing, visible cracks shall be pressure-injected in the following areas with epoxy, as specified in Section 03 XX 00B, <<insert title>>:
    1) Floors and walls of water-bearing structures.
    2) Walls and overhead slabs of passageways of occupied spaces, outsides of which are exposed to weather, or may be washed down and are not specified to receive a separate waterproof membrane.
    3) Other Items Not Specified to Receive a Separate Waterproofing Membrane: Slabs over water channels, wet wells, and other similar surfaces.
e. Walls or slabs as specified above that leak or sweat because of porosity or cracks too small for successful pressure grouting: Seal on water or weather side by coatings of surface sealant system as specified in this Section.
f. Grouting and Sealing: Continue as specified above until structure is watertight and remains watertight for not less than one year after final acceptance or date of final repair, whichever occurs later in time.
g. Workmanship and methods: Provide concrete work, including detailing of reinforcing conforming with the best standard practices and as set forth in ACI 318, Manuals, and Recommended Practices.

1.04 SUBMITTALS

A. Action Submittals:

1. Mix Designs:
    a. Contain proportions of materials and admixtures to be used on Project, signed by mix designer.
    b. Documentation of average strength for each proposed mix design in accordance with ACI 301.
    c. Manufacturer’s Certificate of Compliance, in accordance with Section 01 43 33, Manufacturers’ Field Services, for the following:
        1) Portland cement.

©COPYRIGHT 2013 CH2M HILL

2) Fly ash.
3) Slag cement.
4) Aggregates, including specified class designation for coarse aggregate.
5) Admixtures.
6) Concrete producer has verified compatibility of constituent materials in design mix.

d. Test Reports:
1) Cement: Chemical analysis report.
2) Supplementary Cementitious Materials: Chemical analysis report and report of other specified test analyses.
3) Water-Soluble Chloride-Ion Content in Hardened Concrete: Unless otherwise permitted, in accordance with ASTM C1218/C1218M at an age between 28 days and 42 days.
4) Shrinkage Test Results: In accordance with ASTM C157/C157M as modified herein.

e. Aggregates:
1) Coarse Aggregate Gradation: List gradings and percent passing through each sieve.
2) Fine Aggregate Gradation: List gradings and percent passing through each sieve.
3) Combined gradation for coarse and fine aggregates. List gradings and percent passing through each sieve.
4) Deleterious substances in fine aggregate per ASTM C33/C33M, Table 2.
5) Deleterious substances in coarse aggregate per ASTM C33/C33M, Table 4.

f. Test Reports:
1) Alkali Aggregate Reactivity: Aggregate shall be classified as nonpotentially reactive in accordance with Article Concrete Mix Design. Include documentation of test results per applicable standards.

g. Admixtures:
1) Manufacturer’s catalog cut sheets and product data sheets for each admixture used in proposed mix designs.
2) Color Pigment: Product data including application rate and color chart.

2. Product Data: Specified ancillary materials.
a. Name and manufacturer of each cementitious material, aggregate source, admixture, and curing compound.

©COPYRIGHT 2013 CH2M HILL

1) The ENGINEER reserves the right to require submission of manufacturer's test data and certification of compliance with specification.
2) The ENGINEER reserves the right to require submission of samples of concrete materials for testing before or during use in concrete.
3) Detailed plan for curing and protection of concrete placed and cured in cold weather. Details shall include, but not be limited to, the following:

b. Procedures for protecting subgrade from frost and accumulation of ice or snow on reinforcement, other metallic embeds, and forms prior to placement.
c. Procedures for measuring and recording temperatures of reinforcement and other embedded items prior to concrete placement.
d. Methods for temperature protection during placement.
e. Types of covering, insulation, housing, or heating to be provided.
f. Curing methods to be used during and following protection period.
g. Use of strength accelerating admixtures.
h. Methods for verification of in-place strength.
i. Procedures for measuring and recording concrete temperatures.
j. Procedures for preventing drying during dry and windy conditions.

3. Detailed plan for hot weather placements including curing and protection for concrete placed in ambient temperatures over 80 degrees F. Plan shall include, but not be limited to, the following:
   a. Procedures for measuring, and recording temperatures of reinforcement and other embedded items prior to concrete placement.
   b. Use of retarding admixture.
   c. Methods for controlling temperature of reinforcement and other embedded items and concrete materials before and during placement.
   d. Types of shading and wind protection to be provided.
   e. Curing methods, including use of evaporation retardant.
   f. Procedures for measuring and recording concrete temperatures.
   g. Procedures for preventing drying during dry, windy conditions.
4. [Thermal Control Plan: For concrete sections with a minimum specified dimension that is greater than [2 feet 6 inches] [_____].]
   a. Samples:
   b. Prior to starting work on mockup panel, one Sample of each type of architectural concrete wall finish and color, 24 inches by 24 inches square by 1-1/2 inches thick.
   c. Prior to starting work on mockup panels, one Sample for slab finish Type S-4, 24 inches by 24 inches square by 1-1/2 inches thick.

©COPYRIGHT 2013 CH2M HILL

5. Concrete repair techniques.
    a. Concrete Placement Drawings and Schedule:
    b. Drawings for each individual concrete placement. An individual concrete placement is defined as a portion of concrete work placed in one continuous operation between specified lines or joints.
        1) Show locations, dimensions, blockouts, openings, recesses, waterstops, and finishes. Identify construction joints, control joints, contraction joints and expansion joints. Submit concrete placement drawing with or prior to reinforcement placing drawing.
        2) Show details of items embedded in or associated with placement, except reinforcing steel.
        3) Include a separate drawing showing placement sequence.
        4) Place a title block with CONTRACTOR's name, contract title and number, placement identification, and identifying drawing number in lower right corner of each drawing.
    1) List reference drawings from which details shown on placement drawing were obtained on each drawing.
    2) Reference related steel reinforcement drawings associated with placement on each drawing.
    3) Complete, detailed concrete placement schedule showing the CONTRACTOR's plan for reinforcement of individual features, units, and other elements of concrete work.
    4) Detail as necessary to show location, sequence, and date of concrete placements scheduled for each item of concrete work.
    5) Show submittal of detail drawings and placement of reinforcement and embedded items.
2. Material Approval Data for Joint filler: Name and manufacturer of joint filler. The ENGINEER reserves the right to require submission of manufacturer's test data and certification of compliance with specifications.

B. Informational Submittals:

1. Pre-installation conference minutes of meeting.
2. Manufacturer's application instructions for bonding agent and bond breaker.
3. Manufacturer's Certificate of Compliance to specified standards:
    a. Bonding agent.
    b. [Bond breaker.]
    c. [Repair materials.]
4. Statement of Qualification:
    a. Batch Plant: Certification as specified herein.
    b. Mix designer.

©COPYRIGHT 2013 CH2M HILL

c. Installer.
d. Testing agency.

5. Field test reports.
6. Recorded temperature data from concrete placement where specified.
7. Tightness test results.
8. Concrete Delivery Tickets:
   a. For each batch of concrete before unloading at Site.
   b. In accordance with ASTM C94/C94M, including requirements 14.2.1. through 14.2.10.
   c. Indicate amount of mixing water withheld and maximum amount that may be permitted to be added at Site.
   d. On-Site Contractor Quality Control Plan.
   e. On-Site Quality Control Reports.
9. Project Record Documents:
   a. Accurately record as-built concrete dimensions and tolerances and location sof embedded utilities and components on placement drawings and submit to ENGINEER prior to final completion.

1.05 QUALITY ASSURANCE

A. Concrete construction shall conform to requirements of ACI 117 and ACI 301, except as modified herein.

B. Comply with ACI 305R when concreting during hot weather.

C. Comply with ACI 306R when concreting during cold weather.

D. Maintain one copy of ACI 301 on Site.

E. Acquire cement and aggregate from same source for all Work.

F. Qualifications:

1. Batch Plant: NRMCA Program for Certification of Ready-Mixed Concrete Production Facilities or approved equivalent program.
2. Mix Designer: Person responsible for developing concrete mixture proportions certified as NRMCA Concrete Technologist Level 2 or DOT certified mix designer in jurisdiction of the Work. Requirement may be waived if individual is CONTRACTOR's Licensed Design Engineer.
3. Flatwork Finisher: Unless otherwise permitted, at least one person on finishing crew shall be certified as an ACI Flatwork Finisher, or equivalent.

©COPYRIGHT 2013 CH2M HILL

4. Testing Agency: Unless otherwise permitted, an independent agency, [acceptable to authorities having jurisdiction,] qualified according to ASTM C1077 and ASTM E329 for testing indicated.
    a. Where field testing is required of CONTRACTOR, personnel conducting field tests shall be qualified as ACI Concrete Field Testing Technician, Grade 1, according to ACI CP-1 or an equivalent certification program.
    b. Personnel performing laboratory tests shall be ACI-certified Concrete Strength Testing Technician and Concrete Laboratory Testing Technician - Grade I. Testing Agency laboratory supervisor shall be an ACI-certified Concrete Laboratory Testing Technician - Grade II.]

G. Thermal Control Plan: When required, shall include the following minimum requirements:

1. Calculated or measured adiabatic temperature rise of concrete.
2. Upper limit for concrete temperature at time of placement.
3. Description of specific measures and equipment that will be used to ensure maximum temperature in placement will not exceed specified maximum temperature limit.
4. Calculated maximum temperature in placement based on expected conditions at time of placement and use of proposed measures to control temperatures.
5. Description of specific measures and equipment that will be used to ensure temperature difference will not exceed specified temperature difference limit.
6. Calculated maximum temperature difference in placement based on expected conditions at time of placement and use of proposed measures to control temperature differences.
7. Description of equipment and procedures that will be used to monitor and log temperatures and temperature differences.
8. Drawing showing locations for temperature sensors in placement.
9. Description of format and frequency of providing temperature data to ENGINEER.
10. Description of measures to address and reduce excessive temperatures and temperature differences, if they occur.
11. Description of curing procedures, including materials and methods, and curing duration.
12. Description of formwork removal procedures to ensure temperature difference at temporarily exposed surface will not exceed temperature difference limit, and how curing will be maintained.
13. Alternate temperature limits when permitted by ENGINEER.

©COPYRIGHT 2013 CH2M HILL

a. Determination of alternate temperature limits shall be based on detailed thermal and crack analyses.
b. Analyses shall be stamped by CONTRACTOR's Licensed Design Engineer.

14. If concrete design mixture is changed, thermal control plan must be updated.

H. Mockup Panels:

1. [Construct one panel for each form liner type specified in Section 03 10 00, Concrete Forming and Accessories.]
2. Construct in accordance with requirements of Contract Documents to demonstrate wall finish Type W-7 [, W-8] [, W-9] [, W-10] [, and W-11] [and slab finish Type S-4 [, S-5] [, and S-6]].
   a. Dimensions: 10 feet by 8 feet, minimum.
   b. [Demonstrate sandblasting on Type W-10 and Type W-11 to show how uniform appearance will be achieved regardless of age of concrete.]
3. Before concrete work starts, construct panels with specified materials, forming systems, reinforcing details, and leakage prevention techniques.
4. Show architectural details, joints, form ties, form liners, and rebar spacers to produce finished surface required.
5. Test form release agent on one mockup panel to ensure no adverse effects are caused on form or form liner materials.
6. Cast panels from minimum of 3-cubic-yard truck mixer load.
7. Surface finish and color shall be uniform in appearance to Samples.
8. Approved panels shall establish standards of quality by which Work will be judged.
9. Replace panels if not representative of Work as specified.
10. Panels may be incorporated into Work if approved by ENGINEER.
11. Use [mockup panel(s) or] ENGINEER-selected portion of as-cast wall surface hidden from view to develop and test patching techniques and mixes.
    a. Obtain ENGINEER approval prior to using material to repair project structures.
    b. Demonstrate application, curing, and finishing procedures of repair material.
    c. Approved repairs shall establish standards of quality by which Work will be judged.

©COPYRIGHT 2013 CH2M HILL

I. Preinstallation Conference:

1. Required Meeting Attendees:
   a. CONTRACTOR, including pumping, placing and finishing, and curing subcontractors.
   b. Ready-mix producer.
   c. Admixture representative.
   d. Testing and sampling personnel.
   e. ENGINEER's representative.
2. Schedule and conduct prior to incorporation of respective products into Project. Notify ENGINEER of location and time. Give attendees 4 days advance notice of the meeting time and place.
3. Agenda shall include:
   a. Introduction of personnel and responsibilities.
   b. Work sequence.
   c. Approved concrete mix designs.
   d. Discussion of batch ticket to be presented with each truck.
   e. Admixture types, dosage, performance, and redosing at Site.
   f. Placement methods, techniques, equipment, consolidation, and form pressures.
   g. Slump and placement time to maintain slump.
   h. Testing procedures including frequency.
   i. Transmitting test reports from OWNER's testing lab.
   j. Transmitting field testing information on concrete.
   k. Storage of cylinders on Site for OWNER's testing lab.
   l. Finish, curing, and water retention.
   m. Protection procedures for weather conditions.
   n. Other specified requirements requiring coordination.
4. Conference minutes as specified in Section 01 31 19, Project Meetings.

1.06 SEQUENCING AND SCHEDULING

A. Notify the ENGINEER at least 48 hours prior to commencing concrete work.

B. Allow ENGINEER to perform an immediate inspection of concrete surfaces upon removal of forms.

C. Notify the ENGINEER upon discovery of any honeycombing, foreign-embedded items and defective concrete.

©COPYRIGHT 2013 CH2M HILL

PART 2 - PRODUCTS

2.01 MATERIALS

A. Cementitious Materials:

1. Cement:
   a. Portland Cement: Unless otherwise specified, conform to requirements of ASTM C150/C150M, Type II cement.
   b. Meet equivalent alkalis requirements of ASTM C 150, Table 2.
   c. Meet false-set requirement of ASTM C150, Table 4.
   d. Blended Hydraulic Cement:
      1) Unless otherwise specified, conform to requirements of ASTM C595/C595M.
      2) Portland cement used in blended hydraulic cement, conform to requirements of ASTM C150/C150M.
   e. Furnish from one source.
2. Supplementary Cementitious Materials (SCM):
   a. Fly Ash (Pozzolan): Class F fly ash in accordance with ASTM C618, except as modified herein:
      1) Shall not be produced from process that has utilized hazardous or potentially hazardous materials.
      2) ASTM C618, Table 1, Loss on Ignition: Unless permitted otherwise, maximum 2.5 percent.
      3) Do not decrease sulfate resistance of concrete by use of pozzolan.
         a) Demonstrate pozzolan will have an "R" factor less than 2.5, where:
            (1) R = (C-5) /F
            (2) C: Calcium oxide content of pozzolan determined in accordance with ASTM C114.
            (3) F: Ferric oxide content of pozzolan in percent determined in accordance with ASTM C114.
      4) Pozzolan when tested in accordance with ASTM C441, shall conform to the following: 65 percent minimum reduction in mortar expansion at 14 days, and 0.02 percent maximum mortar expansion at 14 days. Expansion shall be less than control sample expansion.
      5) Pozzolan content shall not be less than 15 percent or more than 20 percent by weight of the total cementitious materials.
      6) Store and batch pozzolan and cement separately:

©COPYRIGHT 2013 CH2M HILL

a) Slag Cement: In accordance with ASTM C989, Grade 100 or Grade 120.

7) Shall not be produced from process that has utilized hazardous or potentially hazardous materials.

8) Slag content shall not be less than 15 percent or more than 20 percent by weight of the total cementitious materials.

9) Total SCM Content in Mix Design shall not be less than 15 percent or more than 20 percent by weight of the total cementitious materials.

B. Aggregates: Unless otherwise permitted, furnish from one source for each aggregate type used in a mix design.

1. Fine and coarse aggregate shall not be of a carbonate-based rock. Coarse and fine aggregates shall not contain any materials that are deleteriously reactive with the alkalis in the cement in an amount sufficient to cause excessive expansion of mortar or concrete. The amount of coal and lignite in the fine aggregate shall be less than 0.5 percent.
2. Normal-Weight Aggregates:
   a. In accordance with ASTM C33/C33M, except as modified herein.
   b. Free of materials and aggregate types causing popouts, discoloration, staining, or other defects on surface of concrete.
   c. Alkali Silica Reactivity: See Article Concrete Mix Design.
3. Fine Aggregates:
   a. Clean, sharp, natural sand.
   b. ASTM C33/C33M.
   c. Limit deleterious substances in accordance with ASTM C33/C33M, Table 2 and as follows: Limit material finer than 75-µm (No. 200) sieve to 3 percent mass of total sample.
4. Coarse Aggregate:
   a. Natural gravels, combination of gravels and crushed gravels, crushed stone, or combination of these materials containing no more than 15 percent flat or elongated particles (long dimension more than five times the short dimension).
   b. ASTM C33/C33M, Size No. 67.
   c. Limit deleterious substances in accordance with ASTM C33/C33M, Table 4 for specified class designation.
5. Nonslip Aggregate:
   a. Hard, homogeneous, nonglazing, rustproof, unaffected by freezing, moisture, or cleaning compounds.

©COPYRIGHT 2013 CH2M HILL

b. Fully graded between 1/32-inch to 1/4-inch size and composed of minimum 60 percent aluminum oxide or silicon carbide abrasive bonded by vitreous ceramic material.

6. [Special Aggregates for Exposed Aggregate Finishes:
   a. Uniform, hard, sound, and clean, color shall match Sample.
   b. Furnish [_____]].

C. Admixtures: Unless otherwise permitted, furnish from one manufacturer.

1. Characteristics:
   a. Compatible with other constituents in mix.
   b. Contain at most, only trace amount chlorides in solution.
   c. Do not use admixtures known to be toxic after concrete is 30 days.
   d. Furnish type of admixture as recommended by manufacturer for anticipated temperature ranges.
2. Air-Entraining Admixture: ASTM C260/C260M.
3. Water-Reducing Admixture: ASTM C494/C494M, Type A or Type D.
   a. Use a neutralized vinsol resin formulation for air-entraining admixture used with ASTM C494, type F or G; and ASTM C1017, Type I or II chemical admixtures.
   b. Manufacturers and Products:
      1) BASF Admixtures Inc., Shakopee, MN; Pozzolith Series or PolyHeed Series.
      2) Euclid Chemical Co., Cleveland, OH; Eucon Series.
      3) W. R. Grace & Co., Cambridge, MA; Daracem Series or Mira Series.
4. Retarding Admixture: ASTM C 494/C 494M, Type B.
   a. Approval does not relax hot-weather placement requirements.
5. Accelerating Admixture: ASTM C 494/C 494M, Type C.
   a. Approval does not relax cold-weather placement requirements. Calcium chloride is prohibited.
6. High-Range, Water-Reducing Admixture: ASTM C494/C494M, Type A, D, F or Type G, to achieve workability without exceeding specified water/cement ratio and slump.
   a. Manufacturers and Products:
      1) BASF Admixtures Inc., Shakopee, MN; Glenium Series, PS 1460, or Rheobuild 1000.
      2) Euclid Chemical Co., Cleveland, OH; Eucon Series or Plastol Series.
      3) W. R. Grace & Co., Cambridge, MA; ADVA Series, Daracem Series, or EXP 950.
7. [Corrosion Inhibiting Admixtures: ASTM C1582/C1582M.]

©COPYRIGHT 2013 CH2M HILL

8. [Shrinkage Reducing Admixture:
   a. Manufacturers and Products:
      1) BASF Admixtures Inc., Shakopee, MN; Tetraguard AS20.
      2) Euclid Chemical Co., Cleveland, OH; Eucon SRA Series.
   b. W. R. Grace & Co., Cambridge, MA; Eclipse Series.]
9. Color Pigment: ASTM C979/C979M, ACI 303.1 and ASTM C494, inert, synthetic mineral or metaloxide pigments or colored water-reducing admixtures; color stable, free of carbon black, nonfading, and resistant to lime and other alkalis.
   a. Color: As selected by Architect from manufacturer's full range.
      1) Color admixture for electrical duct bank shall be a red colored, water reducing admixture.
      2) Raw pigments are not an equivalent and may not be substituted.
      3) Curing and sealing compound shall comply with ASTM C309 and be of the same manufacturer as the colored admixture, for use with integrally colored concrete.
10. Do not use calcium chloride as an admixture.
11. Admixtures with no standard, ASTM or other, designation may be used where permitted.

D. Water and Ice: Mixing water for concrete and water used to make ice shall be potable water, unless alternative sources of water are permitted.

1. Water shall be clean and free from injurious amounts of oils, acids, alkalis, salts, organic materials, or other substances that may be deleterious to concrete or reinforcement, with limits for each as indicated below.
2. Water from alternative sources shall comply with requirements of ASTM C1602/C1602M, including optional requirements of Table 2, and concentration of chemicals in combined mixing water shall be less than:
   a. Chloride Content: 500 ppm.
   b. Sulfate Content as SO_4: 3,000 ppm.
   c. Alkalis as (Na_2O + 0.658 K_2O): 600 ppm.
   d. Total Solids by Mass: Less than 50,000 ppm.

2.02 ANCILLARY MATERIALS

A. Bonding Agent: Unless otherwise specified, in accordance with the following:

1. ASTM C881/C881M, Type V.
2. Two-component, moisture insensitive, 100 percent solids epoxy.
3. Consult manufacturer for surface finish, pot life, set time, vertical or horizontal application, and forming restrictions.

©COPYRIGHT 2013 CH2M HILL

4. Manufacturers and Products:
   a. BASF Building Systems Inc., Shakopee, MN; Concresive Standard LVI.
   b. Euclid Chemical Co., Cleveland, OH; Euco # 352 Epoxy System LV.
   c. Prime Resins, Conyers, GA; Prime Bond 3000 to 3900 Series.
   d. Sika Chemical Corp., Lyndhurst, NJ; Sikadur 32 Hi-Mod.

B. [Bond Breaker:

1. Nonstaining type, providing positive bond prevention.]
2. Manufacturers and Products:
   a. Dayton Superior Corporation, Kansas City, KS; EDOCO Clean Lift Bond Breaker.
   b. Nox-Crete Products Group, Omaha, NE; Silcoseal Select.

C. Repair Material:

1. In accordance with requirements of Section 03 01 32, Repair of Vertical and Overhead Concrete Surfaces.
2. In accordance with requirements of Section 03 01 33, Repair of Horizontal Concrete Surfaces.

D. Crack Repair: In accordance with requirements of Section 03 64 23, Crack Repair Epoxy Injection Grouting.

E. Epoxy Grout: Two-component epoxy resin bonding system capable of developing a minimum bond strength of 1,100 psi in 48 hours; ASTM C881 Type IV, Grade 3, Class B and C; Euclid Chemical Company EUCO 452 GEL; or as approved.

F. Sealant: Follow Section 07 92 00.

G. Concrete Sealer:

1. Product and Manufacturers – One of the following or equal:
   a. SEAL 341 by Hilyard Chemical Company, St Joseph , Missouri
   b. Horn Clear Seal EM-180 by A.C. Horn, Inc.

2.03 CONCRETE MIX DESIGN

A. General:

1. See Supplement at the end of this section for mix design requirements for each class of concrete used on Project.

©COPYRIGHT 2013 CH2M HILL

2. Prepare design mixtures for each type and strength of concrete, selecting and proportioning ingredients in accordance with requirements of ACI 301, unless otherwise specified.
3. Selection of constituent materials and products in mix design are optional, unless specified otherwise.
4. Unless otherwise permitted, use water-reducing admixture or water-reducing admixture and high-range, water-reducing admixture in pumped concrete, in concrete with a water-cementitious materials ratio below 0.50, and in concrete that is part of a liquid-containment structure.
5. Unless otherwise permitted, use water-reducing admixture and high-range, water-reducing admixture in columns, piers, pilasters, and walls.
6. Use water-reducing admixture or high-range, water-reducing admixture to achieve fresh properties that facilitate handling, placing, and consolidating of concrete, and specified hardened properties.
7. Use water-reducing and retarding admixture when anticipated high temperatures, low humidity, or other adverse placement conditions can adversely affect fresh properties of concrete.
8. Unless otherwise specified, desired fresh properties of concrete shall be determined by CONTRACTOR, and coordinated with concrete producer. Fresh properties of concrete shall remain stable to satisfaction of CONTRACTOR, for duration of placement and consolidation, and shall remain in conformance with requirements of Contract Documents.
9. CONTRACTOR is encouraged to consider using environmentally sustainable concrete mix design technologies such as use of supplementary cementitious materials and aggregate packing.
10. Color Pigment: Where required in Supplement, add color pigment to concrete mixture according to manufacturer's written instructions and to result in hardened concrete color consistent with approved mockup.

B. Potential alkali-aggregate reactivity of concrete:

1. Do not use aggregates known to be susceptible to alkali-carbonate reaction (ACR).
2. Aggregates shall have been tested to determine potential alkali-aggregate reactivity in concrete in accordance with ASTM C1260 or ASTM C1567.
    a. Aggregates that indicate expansion greater than 0.10 percent at 16 days after casting shall not be used unless they have been shown to be non-deleteriously reactive in accordance with ASTM C227 or ASTM C1293, with less than 0.04 percent expansion at 1 year for cement-aggregate combinations or less than 0.04 percent expansion at 2 years for combinations with pozzolan or slag.

©COPYRIGHT 2013 CH2M HILL

b. Alkali content of cement used in proposed concrete mixture shall not be greater than alkali content of cement used in test for potential alkali-aggregate reactivity.
c. Use low-alkali cement or incorporate pozzolan into concrete mixture as necessary to satisfy testing for potential alkali reactivity

C. Proportions:

1. Concrete Proportions: Comply with ACI 301, 4.2.
2. Design mix to meet aesthetic, durability, and strength requirements.
3. Where fly ash is included in mix, minimum fly ash content shall be a minimum of 15 percent of weight of total cementitious materials.

D. Concrete Shrinkage Limits: Where shrinkage limits are specified, design mix for following shrinkage limits and test in accordance with ASTM C157/C157M, with the following modifications:

1. Prisms shall be moist cured for 7 days prior to 28-day drying period.
2. Comparator reading at end of 7-day moist cure shall be used as initial length in length change calculation.
3. Reported results shall be average of three prisms.
4. If shrinkage of a specimen departs from average of that test age by more than 0.004 percent, disregard results obtained from that specimen.
5. Unless otherwise specified, results at end of 28-day drying period shall not exceed 0.040 percent if 3-inch prisms are used, or exceed 0.038 percent if 4-inch prisms are used. Aggregate will be rejected if test values exceed these limits.

E. Slump Range at Site:

1. Slump value to be 3 inches at point of delivery due to water alone.
2. Add high-range, water-reducing admixture at site only to increase slump to 6 inches +/- ½ inches.
3. Slump tolerance shall meet requirements of ACI 117.

F. Combined Aggregate Gradation:

1. Combined Gradation Limits: Fine aggregate shall be in range of 36 percent to 40 percent of total aggregate weight.
2. Combined Gradation Limits: Limits shown are for coarse aggregates and fine aggregates mixed together (combined). Select one of the gradations shown in the following table:

©COPYRIGHT 2013 CH2M HILL

Sieve Sizes	Combined Gradation Percentage Passing		
	1-1/2" Max.	**1" Max.**	**3/4" Max.**
2"	100	-	-
1-1/2"	95 - 100	100	-
1"	65 - 85	90 – 100	100
3/4"	55 - 75	70 – 90	92 - 100
1/2"	-	-	68 - 86
3/8"	40 - 55	45 – 65	57 - 74
No. 4	30 - 45	31 – 47	38 - 57
No. 8	23 - 38	23 – 40	28 - 46
No. 16	16 - 30	17 – 35	20 - 36
No. 30	10 - 20	10 – 23	14 - 25
No. 50	4 - 10	2 – 10	5 - 14
No. 100	0 - 3	0 – 3	0 - 5
No. 200	0 - 2	0 – 2	0 - 2

3. [Architectural Concrete with Type W-10, Fractured Fin Finish: 3/4-inch maximum size aggregate.]

G. Concrete Mixes

1. Proportioning of Concrete Mix: Proportion mixes on required average on compressive strength f'cr, for each class of concrete, using calculated standard deviation and its corresponding specified compressive strength f'c, in accordance with ACI 318, Part 3, Chapter 5.
2. Mixes:
   a. Adjusting of Water: After acceptance, do not change mixes without acceptance by ENGINEER, except that at all times adjust batching of water to compensate for free moisture content of fine aggregate.
   b. Total Water Content of Each Concrete Class: Not exceed those specified in Table A in this Section.
   c. Checking Moisture Content Fine Aggregate: Furnish satisfactory means at batching plant for checking moisture content of fine aggregate.
3. Change in Mixes: Undertake new trial batch and test program as specified in this Section.

©COPYRIGHT 2013 CH2M HILL

4. Hand Mixed Concrete:
   a. Hand mix concrete only when acceptable to the ENGINEER.
   b. Prepare hand mixed concrete on watertight, level platform in batches not to exceed 1/3 cubic yard each.
   c. Aggregate:
      1) First spread required amount of coarse aggregate on platform in an even and uniform layer, and then over such aggregate spread the proper proportion of fine aggregate.
      2) Combined Depth of Both Such Layers: Not greater than one foot.
   d. Cement:
      1) First evenly spread required quantity of cement over fine aggregate.
      2) Then turn entire batch with shovels at least twice before adding water.
   e. Water:
      1) Following step d.1) above uniformly sprinkle or spray proper amount of water over batched materials.
      2) Then turn with shovels not less than three times before being removed from the platform.
5. Classes of Concrete:
   a. Provide concrete consisting of 6 classes, referred herein as Classes A, B-1, B-2, C, D, and CE specified in this Section and use where specified or indicated on the Drawings.
   b. Weight of Concrete Classes: Provide classes of concrete having minimum weight of 140 pounds per cubic foot.
   c. Class B-2 Concrete: class B-2 concrete may be substituted for Class B-1 concrete, when high early strength concrete is needed in areas specifically accepted by the ENGINEER, and that do not require sulfate resistant concrete.
   d. Class C Concrete: Class C concrete may be used for fill for unauthorized excavation, for thrust blocks and ground anchors for piping, for bedding of pipe, and where indicated on the Drawings.
   e. Class D Concrete: Use for precast concrete items.
   f. Class CE Concrete: Use for electrical conduit encasements.
   g. All Other Concrete, unless otherwise specified (herein below) or indicated on the Drawings: Use Class A concrete.
   h. Use Class B-1 concrete for the following structures:
      1) TCS Loop Injection and Extraction Well and Well Casing Vaults.
      2) IRZ Injection and Extraction Well and Well Casing Vaults.

©COPYRIGHT 2013 CH2M HILL

3) Inner Recirculation Loop Injection and Extraction Well and Well Casing Vaults.
4) MW-20 Bench Storage Tank Foundation.
5) MW-20 Bench Building Foundation.
6) MW-20 Bench Unloading Pad.
7) TW Bench Storage Tank Foundation.
8) TW Bench Building Foundation.

i. Pumped Concrete: Provide pumped concrete that complies with all requirements of this Section.

j. Do not place concrete with slumps outside the limits indicated in Table A.

k. Classes:
1) Classes A, B-1, C, D and CE Concrete: Make with Type V [II ??] low alkali cement.
2) Class B-2 Concrete: Make with Type V low alkali cement.
3) Admixtures: Provide admixtures as specified in this Section.

l. Air Entraining Admixture:
1) Add agent to batch in portion of mixing water.
2) Batch solution by means of mechanical batcher capable of accurate measurement.

TABLE A: CONCRETE WITH AIR ENTRAINMENT*

Class	Specified Compressive Strength f'c at 28 Days (Pounds per Square Inch)	Maximum Net Water to Cement Ratio	Maximum Cement per Cubic Yard of Concrete by Weight (Pounds)	Slump Range** (Inches)
A	5,000	0.42	??	2 to 4
B-1	4,000	0.45	564	3
B-2 (Type V Cement)	4,000	0.45	564	2 to 4
C	3,000	0.6	564	2 to 4
D	4,500	0.45	658	3
CE	2,500	0.62	564	3 to 6

NOTE: *Class B-1 and D to have air entrainment of 6% +/-1%.
**Slump due to water alone. See section 2.3E "Slump Range at Site"

©COPYRIGHT 2013 CH2M HILL

2.04 CONCRETE MIXING

A. General: In accordance with ACI 301, except as modified herein.

B. Truck Mixers:

1. For every truck, test slump of samples taken per ASTM C94/C94M, paragraph 12.5.1.
2. Where specified slump is more than 4 inches, and if slump tests differ by more than 2 inches, discontinue use of truck mixer, unless causing condition is corrected and satisfactory performance is verified by additional slump tests.

2.05 [TEMPERATURE LIMITS

A. For concrete sections with a minimum specified dimension that is greater than [2 feet 6 inches] [_____], and unless otherwise permitted:

1. Provide documentation that maximum concrete temperature in structure will not exceed [158] [_____] degrees Fahrenheit, and maximum temperature differential between center of section and external surfaces of concrete will not exceed [35] [_____] degrees Fahrenheit.

2.06 SPONGE RUBBER JOINT FILLER

A. ASTM D1752, Type 1, except as otherwise specified or shown on the Drawings.

B. Test specimen compression Load: 50 to 15 pounds per square inch.

C. Joint filler Adhesive: Non-bituminous adhesive recommended by filler manufacturer.

D. Pre-molded sponge rubber fully compressible with recovery rate of minimum 95 percent.

2.07 SOURCE QUALITY CONTROL

A. Source Quality Control Inspection: ENGINEER shall have access to and have right to inspect batch plants, cement mills, and supply facilities of suppliers, manufacturers, and Subcontractors, providing products included in this section.

©COPYRIGHT 2013 CH2M HILL

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verify that joint locations conform to the approved placement drawings.

B. Verify requirements for concrete cover over reinforcement are met.

C. Verify waterstops are providing in joints called for on contract drawings.

D. Verify that anchors, seats, plates, reinforcement, embeds, openings, and other items to be cast into concrete are accurately placed, positioned securely, and will not cause hardship in placing concrete.

E. Verify appropriate mix design for designated placement, see Section 2.3G.5.

F. ENGINEER's inspection and approval of foundations are required prior to any concrete being placed. Verify with ENGINEER that all surfaces on which concrete is to be placed has been inspected and is adequate for concrete placement.

3.02 PREPARATION

A. Meet requirements of ACI 301, except as modified herein.

B. Remove standing water, ice, mud, and debris from foundation surfaces to be covered by concrete.

C. Prepare rock surfaces free from oil, objectionable coatings, and loose, semi-detached and unsound fragments. Immediately before placement of concrete, wash rock surfaces with an air-water jet and dry to a uniform surface-dry condition.

D. Prepare earth foundations free from frost or ice.

E. Thoroughly moisten surfaces of absorptive foundations to be covered with concrete so that moisture will not be drawn from fresh concrete.

F. Remove hardened concrete, wood chips, ice and other debris from the interior of forms.

G. Place form release agent or wet forms just prior to placing concrete. Form release agent or any other deleterious material are not acceptable on previously placed concrete surfaces.

©COPYRIGHT 2013 CH2M HILL

H. Treat surfaces of mud mat concrete as construction joints, in accordance with subparagraph__ of this Section.

I. Install vapor retarder under interior building slabs-on-grade. Lap joints minimum 6 inches and seal water-tight by taping edges and ends.

J. Slope positively floors containing sumps, gutters, or floor drains.

K. Construct isolation joints in slabs-on-grade at points of contact between slabs-on-grade and vertical surfaces such as column pedestals, foundation walls, or as indicated. Use joint filler and a sealant as specified in Section 07 92 00.

L. Place epoxy grout in full accordance with manufacturer's instructions, including compressed air cleaning of all contact surfaces.

3.03 PLACING CONCRETE

A. Inspection: Notify ENGINEER and Special Inspector at least 72 hours prior to starting to place concrete. The ENGINEER shall inspect all surfaces on which concrete is to be placed.

B. Placement into Formwork:

1. Place concrete in accordance with ACI 301, ACI 304, ACI 309 ACI 318.
2. Do not place concrete until all formwork, installation of items to be embedded, and preparation of surfaces involved in the placement have been approved. Moistened and keep moist formwork and foundation surfaces on which cast-in-place concrete is placed until overlying concrete is placed.
3. Do not place concrete during heavy rain (more than 0.3 inch per hour or 0.03 inch in 6 minutes). If unusual adverse weather such as heavy rain, severe cold, heavy snow, high wind, or other adverse conditions occurs, or is forecast to occur during placement, an interruption in placing operations may be approved or directed. Fully consolidate all placed concrete materials before stopping work. Allow for construction schedule risk and added expense that could occur as a result of adverse weather. Weather delays shall receive no additional compensation. Conform to ACI 306.1 for additional cold weather placement requirements.
4. Concrete temperature at placing: 50 to 80 degrees F.
5. Where vapor retarder or barrier is required, coordinate subgrade preparation with requirements in [Division 07] of Specifications.
6. Place concrete as soon as possible after leaving mixer, without segregation or loss of ingredients, without splashing forms or steel above, and in layers not over 1.5 feet deep, except for slabs which shall be placed full depth.

©COPYRIGHT 2013 CH2M HILL

Place and consolidate successive layers prior to initial set of first layer to prevent cold joints.

7. Place concrete in as nearly a continuous operation as practical and in a manner to produce a concrete mass with sufficient continuity and continuance so that it shall harden and act as a monolithic mass with no discontinuous joints or potential places of separation or weakness.
8. Provide sufficient concrete placing capacity and equipment to deliver and place concrete without undue delay; do not permit cold joints to occur. Discharge concrete into forms within 90 minutes following the first introduction of water and cement or cement and aggregates, whichever occurs first. If the air temperature is 85 degrees F or higher, the time limit specified above shall be reduced to 60 minutes unless the ENGINEER's approval has been obtained for means to maintain acceptable concrete quality without such time reduction.
9. Do not use concrete that has been subjected to more than 250 total revolutions of any combination of mixing and agitating equipment following the first introduction of aggregates to the mixer.
10. Placement frequency shall be such that lift lines will not be visible in exposed and architectural] concrete finishes.
    a. Place concrete on prepared foundation or previously completed concrete materials in near horizontal layers.
    b. The depth of the first layer shall not exceed 12 inches and for subsequent layers it shall not exceed 18 inches.
    c. Place each successive layer as soon as practicable after the preceding layer is completed.
11. Use placement devices, for example chutes, pouring spouts, and pumps as required to prevent segregation, deposits concrete as close as practicable to its final position, and that produces layers of widths and thicknesses as necessary for compaction to the required dimensions.
12. Vertical Free Fall Drop to Final Placement: Not more than 3 feet.
13. For placements where drops are greater than specified:
    a. Use placement device such that free fall below placement device conforms to required value.
    b. Limit free fall to prevent segregation caused by aggregates hitting steel reinforcement.
14. Do not use aluminum conveying devices.
15. Provide sufficient illumination in the interior of forms so concrete deposition is visible, permitting confirmation of consolidation quality.
16. When Class I concrete arrives at the Project with slump below 3 inches, water may be added only if neither the maximum permissible water-cement

©COPYRIGHT 2013 CH2M HILL

ratio nor the maximum slump is exceeded. Slump adjustment, with water, shall be made only one time.

17. Start wall lifts with 2 to 3 inches of grout.
18. Placement of concrete under water is not permitted.
19. Deposit and consolidate concrete slabs in a continuous operation, within limits of construction joints, until the placing of a panel or section is completed.
    a. Consolidate concrete during placing operations so that concrete is thoroughly worked around reinforcement and other embedded items and into corners.
    b. Bring slab surfaces to correct level with straight-edge and strike-off. Use bullfloats or darbies to smooth surface, free of humps and hollows. Do not disturb slab surfaces prior to beginning finishing operations.
    c. Maintain reinforcing in proper position during concrete placement operations
20. Joints in Footings and Slabs:
    a. Ensure space beneath plastic waterstop completely fills with concrete.
    b. During concrete placement, make visual inspection of entire waterstop area.
    c. Limit concrete placement to elevation of waterstop in first pass, vibrate concrete under waterstop, lift waterstop to confirm full consolidation without voids, and place remaining concrete to full height of slab.
    d. Apply procedure to full length of waterstop.
21. Trowel and round off top exposed edges of walls with 1/4-inch radius steel edging tool.
22. Cure concrete as specified in Section 03 39 00, Concrete Curing.

C. Conveyor Belts and Chutes:

1. Design and arrange ends of chutes, hopper gates, and other points of concrete discharge throughout conveying, hoisting, and placing system for concrete to pass without becoming segregated.
2. Do not use chutes longer than 50 feet.
3. Minimum Slopes of Chutes: Angled to allow concrete to readily flow without segregation.
4. Conveyor Belts:
    a. Approved by ENGINEER.
    b. Wipe clean with device that does not allow mortar to adhere to belt.
    c. Cover conveyor belts and chutes.

©COPYRIGHT 2013 CH2M HILL

D. Retempering: Not permitted for concrete where cement has partially hydrated.

E. Pumping of Concrete:

1. Provide standby pump, conveyor system, crane and concrete bucket, or other system onsite during pumping, for adequate redundancy to ensure completion of concrete placement without cold joints in case of primary placing equipment breakdown.
2. Minimum Pump Hose (Conduit) Diameter: 4 inches.
3. Replace pumping equipment and hoses (conduits) that are not functioning properly.

F. Concrete sections with a minimum specified dimension that is greater than 2 feet 6 inches:

1. Cure and protect concrete in accordance with accepted thermal control plan and as follow:
   a. Minimum curing period shall be 14 days.
   b. Unless otherwise permitted, preserve moisture by maintaining forms in place.
2. Strength measurement shall be representative of in-place concrete within 2 inches of concrete surface.
3. Concrete strength shall be verified through correlation of concrete temperature and compressive strengths established by cylinder compressive tests and in accordance with ASTM C1074.
4. Unless otherwise specified, control concrete temperatures to within specified limits from time concrete is placed until time internal temperature has cooled from its maximum, such that difference between average daily ambient and maximum internal concrete temperature at time of protection removal, is less than specified temperature difference limit.
5. Unless otherwise specified, place one temperature sensor at center of mass of placement and one temperature sensor at a depth 2 inches from center of nearest exterior surface. Place additional sensor at each location to serve as a backup in event that other temperature sensor fails. In addition, provide temperature sensor in shaded location for monitoring ambient onsite temperature.
   a. Unless otherwise specified, monitor temperatures hourly using electronic sensors capable of measuring temperature from 32 degrees F to 212 degrees F to an accuracy of 2 degrees F.
   b. Ensure temperature sensors are operational before placing concrete.
   c. Unless otherwise specified, provide data from sensors to ENGINEER on a daily basis, until requirements are met.

©COPYRIGHT 2013 CH2M HILL

d. Compare temperatures and temperature differences with maximum limits specified in Article Temperature Limits every 12 hours, unless otherwise permitted. If either exceeds specified limits, take immediate action as described in accepted thermal control plan to remedy situation. Do not place additional mass concrete until cause of excessive temperature or temperature difference has been identified and corrections are accepted.

G. Consolidation and Visual Observation:

1. Consolidation Equipment and Methods: ACI 301 and ACI 309.
   a. Consolidation equipment shall be flexible, electric or pneumatic-drive immersion type vibrators with a minimum operating speed of 7,000 rpm when immersed.
2. Provide at least one standby vibrator and one extra generator in operable condition at Site at all times prior to placing concrete and during placement, to be used in the event of a breakdown of primary equipment.
3. Do not place vibrator against reinforcing or forms, or use vibrator to transport concrete within forms.
4. Provide sufficient windows in forms or limit form height to allow for concrete placement through windows and for visual observation of concrete.
5. Vibrate concrete in vicinity of joints to obtain impervious concrete.

H. Hot Weather:

1. Prepare ingredients, mix, place, cure, and protect in accordance with ACI 301, ACI 305.1, and as follows:
   a. Maintain concrete temperature below 80 degrees F at time of placement, or furnish test data or other proof that admixtures and mix ingredients do not produce flash set plastic shrinkage, or cracking as a result of heat of hydration. Cool ingredients before mixing to maintain fresh concrete temperatures as specified or less.
   b. Provide for windbreaks, shading, fog spraying, sprinkling, ice, wet cover, or other means as necessary to maintain concrete at or below specified temperature.
2. Concrete Curing: As specified in Section 03 39 00, Concrete Curing.

I. Cold Weather Placement:

1. Unless otherwise permitted, shall be in accordance with requirements of ACI 306.1 and as follows:

©COPYRIGHT 2013 CH2M HILL

a. Cold weather requirements shall apply when ambient temperature is below 40 degrees F or approaching 40 degrees F and falling.
b. Do not place concrete over frozen earth or against surfaces with frost or ice present. Frozen earth shall be thawed to acceptance of ENGINEER.
c. Unless otherwise permitted, do not place concrete in contact with surfaces less than 35 degrees F; requirement is applicable to all surfaces including reinforcement and other embedded items.
d. Provide supplemental external heat as needed when other means of thermal protection are unable to maintain minimum surface temperature of concrete as specified in ACI 306.1.
e. Maintain minimum surface temperature of concrete as specified in ACI 306.1 for no less than 3 days during cold weather conditions.
f. Cure concrete as specified in Section 03 39 00, Concrete Curing.
    1) Protect concrete from freezing until end of curing period and until concrete has attained a compressive strength of 3,500 psi or design compressive strength if less than 3,500 psi.

2. Provide maximum and minimum temperature sensors placed on concrete surfaces spaced throughout Work to allow monitoring of concrete surface temperatures representative of Work. Unless otherwise permitted, record surface temperature of concrete at least once every 12hours during specified curing period.
3. External Heating Units: Do not exhaust heater flue gases directly into enclosed area as it causes concrete carbonation as a result of concentrated carbon dioxide.
4. Maintain curing conditions as specified in Section 03 39 00, Concrete Curing.

3.04 JOINTS

A. General - Maximum Size of Concrete Placements:

1. Limit size of each placement to allow for strength gain and volume change as a result of shrinkage.
2. Locate expansion, control, and contraction joints where shown on Drawings.

B. Construction Joints (CJ):

1. Construction joints are joints which are purposely placed in concrete to facilitate construction; to reduce initial shrinkage stresses and cracks; to

©COPYRIGHT 2013 CH2M HILL

allow time for the installation of embedded metalwork; or to allow for subsequent placing of other concrete.

2. Bond is required at construction joints regardless of whether or not reinforcement is continuous across the joint.
3. Unless otherwise shown or permitted, locate construction joints as follows:
4. Locate construction joints as shown on Drawings or where approved by the ENGINEER in joint location submittal required in Section 03 15 00, Concrete Joints and Accessories.
    a. Provide vertical construction joints in walls and slabs at maximum spacing of 40 feet, unless shown or approved otherwise.
    b. When vertical expansion, contraction, or control joint spacing does not exceed 60 feet, intermediate construction joints are not required.
    c. Uniformly space vertical construction joints within straight sections of walls and slabs, avoiding penetrations.
5. Consider beams, girders, brackets, column capitals, and haunches as part of floor or roof system and place monolithically with floor or roof system.
6. Should placement sequence result in cold joint located below finished water surface, install waterstop in joint.
7. Relocation, addition, or elimination of construction joints shall be subject to the approval by the ENGINEER.
8. Clean, roughen, and surface dry surfaces of construction joints to be covered with fresh concrete. The roughened surface shall meet the requirements of ACI 318, Section 11.7.9.
    a. Remove laitance, loose or defective concrete, coatings, sand, curing compound and other foreign material.
    b. Sandblast, steel shot-blast, or high-pressure water jet surfaces, or use other method approved by the ENGINEER to create a surface equivalent to or larger than CSP 5 in accordance with ICRI 03732. Wash surface thoroughly, and surface dry immediately before placement of adjoining concrete.
    c. Do not use a mortar layer on construction joints.

C. Contraction Joints (CRJ):

1. Contraction Joints are joints placed in concrete to provide for volumetric shrinkage of a monolithic unit or movement between monolithic units.
2. Construct contraction joints so no bond exists between concrete surfaces forming the joint.

D. Minimum Time between Adjacent Placements:

1. Construction or Control Joints: 7 days unless otherwise specified.

©COPYRIGHT 2013 CH2M HILL

2. Construction joint between top of footing or slab, and column or wall: As soon as can safely be done without damaging previously cast concrete or interrupting curing thereof, but not less than 24 hours.
3. Expansion or Contraction Joints: 1 day.
4. For columns and walls with a height in excess of 10 feet, wait at least 2 hours before depositing concrete in beams, girders, or slabs supported thereon.
5. For columns and walls 10 feet in height or less, wait at least 1 hour prior to depositing concrete in beams, girders, brackets, column capitals, or slabs supported thereon.

3.05 REPAIRING CONCRETE

A. General:

1. Inject cracks that leak with crack repair epoxy as specified in Section 03 64 23, Crack Repair Epoxy Injection Grouting.
2. Repair surface defects, including tie holes, immediately after form removal.
3. Remove honeycombed and other defective concrete down to sound concrete.
4. [Repair horizontal concrete surfaces in accordance with Section 03 01 33, Repair of Horizontal Concrete Surfaces.]
5. [Repair vertical and overhead concrete surfaces in accordance with Section 03 01 32, Repair of Vertical and Overhead Concrete Surfaces.]
6. Use manufactured, non-shrink, cementitious materials specifically formulated for patching concrete in conjunction with a compatible bonding material. The complete repair procedure along with a list of all materials to be used must be submitted to and approved by ENGINEER before any repair work is started. Preparation of defective areas to be approved by ENGINEER prior to patching. ENGINEER
7. Develop repair techniques with material manufacturer on surface that will not be visible in final construction [or on mockup panels] prior to starting actual repair work and show how finish color will blend with adjacent surfaces. Obtain approval from ENGINEER.
8. Obtain quantities of repair material and manufacturer’s detailed instructions for use to provide repair with finish to match adjacent surface or apply sufficient repair material adjacent to repair to blend finish appearance.
9. Repair of concrete shall provide structurally sound surface finish, uniform in appearance or upgrade finish by other means until acceptable to ENGINEER.

B. Tie Holes:

©COPYRIGHT 2013 CH2M HILL

1. Unless otherwise specified, fill with specified repair material. Prepare substrate, liberally coat with a bonding agent, and then thoroughly fill with the repair material per manufacturer's written recommendations.
2. When required, color of tie-hole patch shall match adjacent concrete.
    a. Demonstrate patch of tie hole on mockup panels.
    b. Clean and dampen tie holes before applying mortar. Do not use separate bonding agent.
    c. Fill with site-mixed Portland-cement repair mortar per ACI 301.
    d. Cure repair mortar with water.

C. Alternate Form Ties, Through-Bolts:

1. Mechanically roughen entire interior surface of through hole.
2. Apply bonding agent to roughened surface and drive elastic vinyl plug to half depth.
3. Dry pack entire hole from both sides of plug with nonshrink grout, as specified in Section 03 62 00, Nonshrink Grouting.
4. Use only enough water to dry pack grout.
5. Dry pack while bonding agent is still tacky.
6. If bonding agent has dried, remove bonding agent by mechanical means and reapply new coat of bonding agent.
7. Compact grout using steel hammer and steel tool to drive grout to high density.
8. Cure grout with water.
9. When specified, color of alternate form tie-hole patch shall match adjacent concrete.
    a. Demonstrate patch of hole on mockup panels.
    b. Fill hole with nonshrink grout as described in paragraph above, except hold materials back 1 inch from concrete surfaces.
    c. Allow nonshrink grout to fully cure.
    d. Remove dried bonding agent by mechanical means.
    e. Clean and dampen remaining depressions before applying mortar.
    f. Do not use separate bonding agent on existing surfaces in remaining depression.
    g. Fill with site-mixed Portland-cement repair mortar per ACI 301.
    h. Cure repair mortar with water.

D. Exposed Metal Objects:

1. Remove metal objects not intended to be exposed in as-built condition of structure including wire, nails, and bolts, by chipping back concrete to depth of 1 inch and then cutting or removing metal object.

©COPYRIGHT 2013 CH2M HILL

2. Repair area of chipped-out concrete as specified for defective areas.

E. Blockouts at Pipes or Other Penetrations: Where shown install in accordance with requirements of Drawings.

3.06 CONCRETE WALL FINISHES

A. Type W-1 (Ordinary Wall Finish):

1. Patch tie holes.
2. Knock off projections.
3. Repair defective areas.
4. Inject cracks in accordance with requirements of Section 03 64 23, Crack Repair Epoxy Injection Grouting.

B. Type W-2 (Smooth Wall Finish):

C. All interior formed surfaces shall have a smooth form finish as defined in ACI 301 and specified herein.

1. Patch tie holes.
2. Grind off fins and other projections.
3. Repair defective areas to provide smooth uniform appearance.
4. Inject cracks in accordance with requirements of Section 03 64 23, Crack Repair Epoxy Injection Grouting.

D. [Type W-3 (Controlled Permeability Form Liner):

1. Apply Controlled Permeability Form Liner, as specified in Section 03 10 00, Concrete Forming and Accessories, to each face of wall section.
2. Patch tie holes.
3. Grind off fins and other projections.
4. Repair defective areas to provide smooth uniform appearance.
5. Inject cracks in accordance with requirements of Section 03 64 23, Crack Repair Epoxy Injection Grouting.]

E. [Type W-4 (Finish for Cementitious Coatings):

1. In accordance with requirements for Type W-2 except as follows: Leave surface ready for cementitious coating specified in Section 09 97 26, Cementitious Coatings.]

F. [Type W-5 (Finish for Painting):

©COPYRIGHT 2013 CH2M HILL

1. In accordance with requirements for Type W-2 except as follows: Leave surface ready for painting as specified in Section 09 90 00, Painting and Coating.]

G. [Type W-7 (Smooth Rubbed Wall Finish):

1. All exposed, exterior vertical surfaces shall have a smooth rubbed finish as defined in ACI 301 and specified herein.
2. Only water curing will be permitted on walls scheduled to be rubbed.
3. Perform rubbing while green concrete can be physically worked and smoothed without adding other materials, if structurally possible, the day following placement. Finish no later than 3 days after placement has been completed.
4. Remove forms at such a rate that finishing, form tie filling, fin removal, and patching can be completed on same day forms are removed while curing wall.
5. After patches have set sufficiently to permit working on surface, thoroughly saturate entire surface with water for period of 3 hours and rub until uniform surface is obtained.
6. Rub either by hand with carborundum stone of medium-coarse grade or abrasive of equal quality, or mechanically operated carborundum stone.
7. Mechanically operated carborundum stones shall be approved by ENGINEER before concrete finishing.
8. No cement grout, other than cement paste drawn from concrete itself by rubbing process shall be used.
9. Finish paste formed by rubbing by either brushing or floating as follows:
    a. Brushing:
        1) Carefully strike with clean brush.
        2) Brush in long direction of surface being finished.
    b. Floating:
        1) Spread uniformly over surface and allow to reset.
        2) Finish by floating with canvas, carpet face, or cork float, or rub down with dry burlap.
10. Continue water curing of wall during finishing operation in areas not being rubbed.
11. Move water curing onto rubbed areas as soon as water will not erode rubbed surface.

H. [Type W-8 (Rubbed Wall Finish):

1. Meet requirements for Type W-7, except allow paste obtained from rubbing to set at least 24 hours.

©COPYRIGHT 2013 CH2M HILL

2. After thoroughly saturating with water, coat surface with mixture of 85 percent cement and 15 percent lime with sufficient water to give creamy consistency. Demonstrate on sample panel prior to production finishing.
3. Rub this mixture into surface with coarse carborundum stone and brush with damp brush.
4. Brush in long direction of surface being finished.
5. Latex bonding admixture may be used. Consult with Euclid Chemical Co., Cleveland, OH or BASF Building Systems Inc., Shakopee, MN.]

I. [Type W-9 (Grout Cleaned Wall Finish):

1. Meet requirements for Type W-7, except that finish must be accomplished within 7 days of placement.
2. Grout: Mixed with one part Portland cement and one and one half parts fine sand and bonding agent to produce grout with consistency of thick paint. White Portland cement shall be substituted for part of gray Portland cement in order to produce color matching color of surrounding concrete, as determined by trial patch.
3. Wet surface of concrete sufficiently to prevent absorption of water from grout and apply grout uniformly with brushes or spray gun.
4. Immediately after applying grout, scrub surface vigorously with cork float or stone to coat surface and fill air bubbles and holes.
5. While grout is still plastic, remove excess grout by working surface with rubber float, burlap, or other means. After surface whitens from drying, about 30 minutes at 70 degrees F, rub vigorously with clean burlap. Continue to water cure wall until curing period of 7 days is complete.
6. Latex bonding admixture may be used.]

J. [Type W-10 (Fractured Fin Wall Finish):

1. Form exterior surface of walls with approved form liner.
2. Use stainless steel form ties and place at valleys.
3. Patch form tie holes.
4. Achieve final texture by light sandblast and then breaking off tips of ridge with light bush hammering, or other approved process.
5. Same person starting bush hammering shall complete process for any given structure and match approved mockup panel.]

K. [Type W-11 (Abrasive Blast Wall Finish):

1. Repair cracks before abrasive blasting.

©COPYRIGHT 2013 CH2M HILL

2. Perform abrasive blasting on concrete surfaces in same area of view, at same time, to obtain uniformity of appearance.
3. Same person shall accomplish sandblasting on one structure and on concrete in same area.
4. Perform abrasive blasting to match approved mockup panel.
5. Abrasive: Use clean silica sand, free of foreign materials, and supplied in sealed sacks.
6. When specified, begin abrasive blasting to expose aggregate when concrete has a compressive strength of at least 2,000 psi and after safe removal of forms and supports. Blast to match mockup. Achieve degree of abrasive blasting as specified in Contract Documents:
   a. Brush: Dull surface sheen.
   b. Light: Exposure of fine aggregate.
   c. Medium: Coarse aggregate exposure.
   d. Heavy: Coarse aggregate revealed.
7. When abrasive grits contain free water for dust abatement, wash abrasive blasting debris off finished wall surface before drying occurs.

L. Prepare concrete surfaces to be water-proofed as specified in Section 07 11 00? in strict accordance with the water-proofing manufacturer's instructions. On surfaces to be water-proofed, defects shall include, but not be limited to, voids, air holes, and honeycomb that the normal application of water-proofing will not fill or otherwise seal effectively

M. Surface Sealant System: Apply as recommended by the manufacturer’s published instructions. Where concrete continues to sweat or leak, apply additional coats of surface sealant until the sweating or leaks stop.

3.07 CONCRETE SLAB FINISHES

A. General:

1. Use manual screeds, vibrating screeds, or roller compacting screeds to place concrete level and smooth.
2. Do not use “jitterbugs” or other special tools designed for purpose of forcing coarse aggregate away from surface and allowing layer of mortar, which will be weak and cause surface cracks or delamination, to accumulate.
3. Finish slab in accordance with specified slab finish.
4. Do not dust surfaces with dry materials nor add water to surfaces.
5. Cure concrete as specified in Section 03 39 00, Concrete Curing.

©COPYRIGHT 2013 CH2M HILL

6. All exterior slab surfaces shall be sloped a minimum of1/8 inch in 1 foot or as indicated on the Drawings. All exterior slab surfaces shall have a troweled finish as defined in ACI 301.
7. Edges:
    a. Chamfer edges of permanently exposed concrete, except slabs and top edges of walls, with a 45 degree bevel ¾ inch by ¾ inch, unless otherwise shown on the Drawings.
    b. Tool exposed edges of slabs and top edges of walls to a radius of ¼ inch unless otherwise shown on the Drawings.

B. Type S-1 (Steel Troweled Finish):

1. Finish by screeding and floating with straightedges to bring surfaces to required finish elevation.
2. Wood float to true, even plane with no coarse aggregate visible.
3. Use sufficient pressure on wood floats to bring moisture to surface.
4. After surface moisture has disappeared, hand steel trowel concrete to produce smooth, smooth dense surface, free from trowel marks.
5. Provide light steel-troweled finish (two trowelings) at air-entrained slabs. Provide hard steel-troweled finish (ringing sound from the trowel) for nonair-entrained slabs.
6. Do not use dry cement or additional water during troweling, nor will excessive troweling be permitted.
7. Power Finishing:
    a. Approved power machine may be used in lieu of or in addition to hand finishing in accordance with directions of machine manufacturer.
    b. Do not use power machine when concrete has not attained necessary set to allow finishing without introducing high and low spots in slab.
    c. Do first steel troweling for slab S-1 finish by hand.

C. Type S-2 (Wood Float Finish):

1. Finish slab to receive fill and mortar setting bed by screeding with straightedges to bring surface to required finish plane.
2. Wood float finish to compact and seal surface.
3. Remove laitance and leave surface clean.
4. Coordinate with other finish procedures.

D. Type S-3 (Underside Elevated Slab Finish): When forming is removed, grind off projections on underside of slab and repair defective areas, including small shallow air pockets where schedule of concrete finishes requires:

©COPYRIGHT 2013 CH2M HILL

1. [Prepare surfaces to match Type W-2 (Smooth Wall Finish).]
2. [Prepare surfaces to match [Type W-7 (Smooth Rubbed Wall Finish)] [_____].]
3. [Prepare surfaces to match Type W-4 (Finish for Cementitious Coatings).]
4. [Prepare surfaces to match Type W-5 (Finish for Painting).]

E. Type S-5 (Broomed Finish):

1. Finish as specified for Type S-1 floor finish, except use only a light-steel troweled finish, and then finish surface by drawing fine-hair broom lightly across surface.
2. Broom in same direction and parallel to expansion joints, or, in case of inclined slabs, perpendicular to slope, except for round roof slab, broom surface in radial direction.

F. Type S-6 (Sidewalk Finish):

1. Slope walks down 1/4 inch per foot away from structures, unless otherwise shown.
2. Strike off surface by means of strike board and float with wood or cork float to true plane, then flat steel trowel before brooming.
3. Broom surface at right angles to direction of traffic or as shown.
4. Lay out sidewalk surfaces in blocks, as shown or as directed by ENGINEER, with grooving tool.

G. Concrete Curbs:

1. Float top surface of curb smooth, and finish all discontinuous edges with steel edger.
2. After concrete has taken its initial set, remove front form and give exposed vertical surface an ordinary wall finish, Type W-1.

3.08 CONCRETE SLAB TOLERANCES

A. [Slab Tolerances:

1. Exposed Slab Surfaces: Comprise of flat planes as required within tolerances specified.
2. Slab Finish Tolerances and Slope Tolerances: Crowns on floor surface not too high as to prevent 10-foot straightedge from resting on end blocks, nor low spots that allow block of twice the tolerance in thickness to pass under supported 10-foot straightedge.
3. Slab Type S-A: Steel gauge block 5/16 inch thick.

©COPYRIGHT 2013 CH2M HILL

4. Slab Type S-B: Steel gauge block 1/8 inch thick.
5. Slab Type S-A and S-B: Finish Slab Elevation: Slope slabs to floor drain and gutter, and shall adequately drain regardless of tolerances.
6. Thickness: Maximum 1/4 inch minus or 1/2 inch plus from thickness shown. Where thickness tolerance will not affect slope, drainage, or slab elevation, thickness tolerance may exceed 1/2 inch plus.]
7. [Slab Flatness and Levelness:
   a. Floor finish tolerances shall meet requirements specified herein, and as measured in accordance with ASTM E1155.
   b. Levelness tolerance, FL, shall not apply to slabs placed on unshored form surfaces or shored form surfaces after removal of shores.
   c. Levelness tolerances, FL, shall not apply to cambered or inclined surfaces, and shall be measured within 72 hours after slab concrete placement.

Slab Type S-A			
Minimum Overall F Numbers		Minimum Local F Numbers	
Flatness, FF	Levelness, FL	Flatness, FF	Levelness, FL
20	15	15	10
Slab Type S-B			
Minimum Overall F Numbers		Minimum Local F Numbers	
Flatness, FF	Levelness, FL	Flatness, FF	Levelness, FL
30	20	15	10
Slab Type S-C			
Minimum Overall F Numbers		Minimum Local F Numbers	
Flatness, FF	Levelness, FL	Flatness, FF	Levelness, FL
50	30	25	15]

B. Slab Elevation and Thickness:

1. Finish Slab Elevation: Slope slabs to floor drains and gutter. Slabs shall adequately drain regardless of tolerances.
2. Thickness: Maximum 1/4 inch minus or 1/2 inch plus from thickness shown. Where thickness tolerance will not affect slope, drainage, or slab elevation, thickness tolerance may exceed 1/2 inch plus.

©COPYRIGHT 2013 CH2M HILL

3.09 BEAM AND COLUMN FINISHES

A. Type B-1: Match wall Type W-1.

B. Type B-2: Match wall Type W-2.

C. Type B-3:

1. Repair rock pockets.
2. Fill air voids.
3. Match wall Type [W-3] [W-4] [W-5].

D. Type C-1: Match wall Type W-1.

E. Type C-2: Match wall Type W-2.

F. Type C-3:

1. Fill air pockets.
2. Match wall Type [W-3] [W-4] [W-5].

3.10 BACKFILL AGAINST STRUCTURES

A. Do not backfill against walls until concrete has obtained specified 28-day compressive strength.

B. Refer to General Structural Notes on the Drawings for additional requirements, including elevated slab and diaphragm completion prior to backfill.

C. Unless otherwise permitted, place backfill simultaneously on both sides of structure, where such fill is required, to prevent differential pressures.

3.11 CURING

A. Immediately after placement, protect concrete from premature drying, excessively hot or cold temperatures, and mechanical injury.

B. Comply with the requirements specified in Section 03 30 00, Concrete Curing.

3.12 FIELD QUALITY CONTROL

A. General:

©COPYRIGHT 2013 CH2M HILL

1. Furnish a batch ticket (delivery ticket) for each load of concrete received. Concrete delivered without a batch ticket containing complete information as specified below shall be rejected. Collect and complete the batch ticket at the placement site and deliver all batch tickets to the ENGINEER on a daily basis. The ENGINEER shall have access to the batch tickets at any time during placement. Provide the following information on each batch ticket:
    a. Supplier's name and date.
    b. Truck number.
    c. Project number and location.
    d. Concrete class designation and item number.
    e. Cubic yards batched.
    f. Time batched.
    g. Mix design number.
    h. Type, brand and amount of each admixture.
    i. Type, brand and amount of cement and pozzolan.
    j. Mass (weights) of fine and coarse aggregate, respectively.
    k. Moisture of fine and coarse aggregate, respectively.
    l. Gallons of batch water (including ice).
2. Add the following information to the batch ticket at the placement site:
    a. Gallons of water added by truck operator plus quantity of concrete in the truck each time water is added.
    b. Number of revolutions of drum at mixing speed (for truck mixed concrete).
    c. Discharge time.
    d. Location of batch in placement.
    e. Water cement ratio.
3. The CONTRACTOR will be allowed to add water to the batched concrete once at the site, provided that the specified water to cement ratio is not exceeded and the amount of water withheld at the batch plant is on the delivery ticket.
4. Provide adequate facilities for safe storage and proper curing of concrete test specimens onsite for first 24 hours, and for additional time as may be required before transporting to test lab.
5. Unless otherwise specified, sample concrete for testing for making test specimens, from point of delivery.
    a. Maintain records of placed concrete items. Record truck number, date and stop times, location of placed concrete, quantity, air temperature, concrete placement temperature, slump, air content, admixture quantities, test samples collected and times, and cast test cylinder numbers.

©COPYRIGHT 2013 CH2M HILL

6. When concrete is pumped, sample and test air content at point of delivery and at point of placement.
    a. For Each Concrete Mixture: Provided results of air content tests for first load of the day are within specified limits, testing need only be performed at point of delivery for subsequent loads of that concrete mixture except that testing should be performed at point of placement every 4 hours.
7. Evaluation will be in accordance with ACI 301 and Specifications.
8. Test specimens shall be made, cured, and tested in accordance with ASTM C31/C31M and ASTM C39/C39M.
9. Frequency of testing may be changed at discretion of ENGINEER.
10. Pumped Concrete: Take concrete samples for slump, ASTM C143/C143M, and test specimens, ASTM C31/C31M and ASTM C39/C39M, [and shrinkage specimens (ASTM C157/C157M) at placement (discharge) end of line].
11. If measured air content at delivery is greater than specified limit, check test of air content will be performed immediately on a new sample from delivery unit. If check test fails, concrete has failed to meet requirements of Contract Documents. If measured air content is less than lower specified limit, adjustments will be permitted in accordance with ASTM C94/C94M, unless otherwise specified. If check test of adjusted mixture fails, concrete has failed to meet requirements of Contract Documents. Concrete that has failed to meet requirements of Contract Documents shall be rejected.

B. Concrete Strength Test:

1. Unless otherwise specified, one specimen at age of 7 days for information, and two 6-inch diameter or when permitted three 4-inch diameter test specimens at age of 28 days for acceptance.
2. If result of 7-day concrete strength test is less than 50 percent of specified 28-day strength, extend period of moist curing specified in Section 03 39 00, Concrete Curing, by 7 additional days.
3. Provide a minimum of one spare test specimen per sample. Test spare cylinder as directed by ENGINEER.

C. Shrinkage Tests:

1. When required to conform to shrinkage limits, collect actual concrete materials being batched and before liquids have been added to mix.
2. Mix sampled material in a laboratory at proportions matching batched concrete.

©COPYRIGHT 2013 CH2M HILL

3. Test shrinkage characteristics every 5,000 cubic yards of concrete used on job and every 3 months during construction when compression test cylinders are made.
4. Concrete Shrinkage Limits: Test in accordance with ASTM C157/C157M, with the following modifications:
    a. Prisms shall be moist cured for 7 days prior to 28-day drying period.
    b. Comparator reading at end of 7-day moist cure shall be used as initial length in length change calculation.
    c. Reported results shall be average of three prisms.
    d. If drying shrinkage of a specimen departs from average of that test age by more than 0.004 percent, disregard results obtained from that specimen.
    e. Results at end of 28-day drying period shall not exceed 0.040 percent if 3-inch prisms are used, or exceed 0.038 percent if 4-inch prisms are used.
    f. If 7-day or 14-day shrinkage tests results exceed shrinkage limits established by design mix testing, furnish additional 14 days of water curing beyond original curing period, for concrete surfaces of hydraulic structures represented by prisms. Modify concrete mix design to reduce shrinkage prior to casting additional concrete on Project.
5. Cold Weather Placement Tests:
    a. During cold weather concreting, cast cylinders for field curing as follows. Use method that will produce greater number of specimens:
        1) Six extra test cylinders from last 100 cubic yards of concrete.
    b. Minimum three specimens for each 2 hours of placing time or for each 100 cubic yards.
6. These specimens shall be in addition to those cast for lab testing.
7. Protect test cylinders from weather until they can be placed under same protection provided for concrete of structure that they represent.
8. Keep field test cylinders in same protective environment as parts of structure they represent to determine if specified strength has been obtained.
9. Test cylinders in accordance with applicable sections of ASTM C31/C31M and ASTM C39/C39M.
10. Use test results to determine specified strength gain prior to falsework removal or for prestressing.

D. Tolerances:

1. Walls: Measure and inspect walls for compliance with tolerances specified in Section 03 10 00, Concrete Forming and Accessories.
2. [Slab Finish Tolerances and Slope Tolerances:

©COPYRIGHT 2013 CH2M HILL

a. Make floor flatness measurements day after floor is finished and before shoring is removed to eliminate effects of shrinkage, curing, and deflection.
b. Support 10-foot long straightedge at each end with steel gauge blocks of thicknesses equal to specified tolerance.
c. Compliance with designated limits in four of five consecutive measurements is satisfactory, unless defective conditions are observed.]

3. [Slab Finish Tolerances and Slope Tolerances:
   a. Slab Flatness and Levelness: Make measurements within 72 hours of concrete placement.
   b. Flatness measurements are not applicable to unshored form surfaces or shored form surfaces after removal of shores.
   c. Levelness measurements are not applicable to cambered or sloped surfaces.
   d. Slab flatness and levelness shall be determined in accordance with ASTM E1155.]

E. Liquid Tightness Tests:

1. Purpose: To determine integrity and liquid-tightness of finished exterior and interior concrete surfaces of liquid containment structures.
2. Test the following structures for liquid-tightness:
   a. [_____]
   b. [_____]
3. [Water] for initial tightness test [will] [shall] be provided by [OWNER] [CONTRACTOR].
   a. Water source will be [_____].
   b. Provide means to transport water to structure to be tested.
   c. If additional tightness tests are required because of failure to meet criteria, provide water for subsequent tests.
4. After testing has been completed,[dispose of test water in a manner approved by OWNER Requirement:
   a. Perform tightness tests in accordance with ACI 350.1 and as specified herein.
   b. Do not place backfill or install brick facing, grout topping slab, coatings, or other work that will cover concrete surfaces until tightness testing has been completed and approved.
   c. Measure evaporation, precipitation, and temperature as specified.
5. Measure water surface at two points 180 degrees apart when possible where attachments, such as ladders exist, at 24-hour intervals.
6. Acceptance Criteria:

©COPYRIGHT 2013 CH2M HILL

a. Volume loss shall not exceed [0.050] [_____] percent of contained liquid volume per 24-hour period, adjusted for evaporation, precipitation, and temperature.
b. Acceptance that structure has passed tightness test shall be based on total volume loss at end of specified test period.

7. Repairs When Test Fails:
a. Dewater structure; fill leaking cracks with crack repair epoxy as specified in Section 03 64 23, Crack Repair Epoxy Injection Grouting.
b. Patch areas of damp spots previously recorded, and repeat water leakage test in its entirety until structure successfully passes test.]

F. Defective Concrete:

1. Defective Concrete: Concrete not conforming to required lines, levels, details elevations, dimensions, tolerances or specified requirements.
2. Defective concrete will be determined by the ENGINEER and shall be repaired or replaced at no additional cost to the OWNER. Perform repair in accordance with Guide to Concrete Repair (USBR) and as specified in the Article "Repairing Concrete" above.
3. Repair of Hardened Concrete Not Within Specified Tolerances. Accomplish such repair to bring it within the specified tolerances in a manner approved by the ENGINEER, after consultation with the ENGINEER regarding the repair method. Notify the ENGINEER sufficiently in advance to enable his attendance as to the time when the repair shall be performed.
4. Defective concrete that shall be exposed to public view shall be repaired in a manner that shall result in a concrete surface with a uniform appearance. Grinding of concrete surface exposed to view shall be limited in depth such that no aggregate particles are exposed more than 1/6 inch in cross section at the finished surface. Where grinding has caused or will cause exposure of aggregate particles greater than 1/6 inch in cross section at the finished surface, repair the concrete by excavating and replacing the concrete at no additional cost to the OWNER.
5. Prevention of Repeated Failure to Meet Tolerances: When concrete placements result in hardened concrete that does not meet specified tolerances, the CONTRACTOR shall upon request submit to the ENGINEER an outline of all preventative actions, such as modifications to forms, modified procedure for setting screeds, and different finishing techniques, to be implemented by the CONTRACTOR to avoid repeated failures. The ENGINEER reserves the right delay concrete placements until the CONTRACTOR implements such preventive actions that are approved by the ENGINEER.

©COPYRIGHT 2013 CH2M HILL

6. Modify or replace concrete not conforming to required levels and lines, details, and elevations.
7. Repair or replace concrete not properly placed or not of the specified type.
8. Disposal of defective concrete removed will be the responsibility of the CONTRACTOR and shall be conducted in accordance with local, state and federal laws and regulations.

3.13 MANUFACTURER'S SERVICES

A. Provide representative at Site in accordance with Section 01 43 33, Manufacturers' Field Services, for installation assistance, inspection, and certification of proper installation for concrete ingredients, mix design, mixing, and placement.

1. Concrete Producer Representative:
   a. Assist with concrete mix design, performance, placement, weather problems, and problems as may occur with concrete mix throughout Project, including instructions for redosing.
   b. Establish control limits on concrete mix designs.
   c. Provide equipment for control of concrete redosing for air entrainment or high-range, water-reducing admixture, superplasticizers, at Site to maintain proper slump and air content if needed.
2. Admixture Manufacturer's Representative: Available for consultations as required to ensure proper installation and performance of specified products.
3. Bonding Agent Manufacturer's Representative: Available for consultations as required to ensure proper installation and performance of specified products.

3.14 PROTECTION OF INSTALLED WORK

A. Protect finished work under provisions of ACI 301.

B. After curing as specified in Section 03 39 00, Concrete Curing, and after applying final floor finish, cover slabs with plywood or particle board or plastic sheeting or other material to keep floor clean and protect it from material and damage as a result of other construction work.

1. Protect concrete from damage until final acceptance of the Work by the ENGINEER.
   a. Do not load, remove forms or shoring, or backfill against concrete until concrete has gained sufficient strength to safely support its weight and imposed loads.

©COPYRIGHT 2013 CH2M HILL

b. Protect fresh concrete against erosion from rain, hail, sleet, or snow; contamination from foreign materials; and damage from foot traffic until the concrete has hardened.
c. Remove and dispose of temporary covering when no longer required.

C. Protect concrete when freezing temperatures are imminent:

1. Maintain concrete at a temperature of 50 degrees F or greater for 72 hours, minimum, after placement. Vent heater and prevent concrete from drying where artificial heat is employed.
2. Protect concrete from freezing during water curing. After discontinuance of water curing, maintain at a temperature of 50 degrees F or greater for the next 72 hours.
3. Discontinue protection against cold weather such that the drop in temperature of the concrete will be gradual and will not exceed 5 degrees F per hour and 40 degrees F in 24 hours for thin sections and 5 degrees F per hour and 20 degrees F in 24 hours for massive section greater than 36 inches in thickness.

D. Maintain concrete with minimal moisture loss at relatively constant temperature for a period of time necessary for satisfactory hydration of cement and hardening of concrete.

E. Remove formwork in accordance with the requirements of Section 03 10 00, Concrete Forming and Accessories.

F. Repair areas damaged by construction, using specified repair materials and approved repair methods.

3.15 SCHEDULE OF CONCRETE FINISHES

A. Form Tolerances: As specified in Section 03 10 00, Concrete Forming and Accessories.

B. Special Floor Finishes: As specified in Section 03 35 00, Concrete Finishing.

C. Provide concrete finishes as scheduled:

©COPYRIGHT 2013 CH2M HILL

Area	Type of Finish	Required Form Tolerances
Exterior Wall Surfaces

SUPLLMENETAL INFORMATION

[Concrete Mix Design, Class 5000F3S1P2C2

A. Mix Locations: [Typical, unless otherwise specified.]

B. Exposure Categories and Classifications: F3S1P2C2.

C. Mix Properties:

1. Limit water to cementitious materials ratio (W/Cm) in mix design to maximum value of 0.40.
2. Minimum concrete compressive strength (f'c) shall be 4,000 psi at 28 days and 5,000 psi at 56 days.
3. [Designed to conform to shrinkage limits.]
4. Air-entraining admixtures are prohibited in concrete mixtures and total air content shall not be greater than 3 percent, for the following:
   a. Slabs to receive hard-troweled finish.
   b. Slabs to receive dry shake floor hardener.
   c. Slabs to receive topping placed monolithically as two-course floor on top of plastic concrete.
5. Unless otherwise specified, provide air content based on nominal maximum size of aggregate as follows:

Nominal Maximum Aggregate Size in.‡	**Air Content (%)***
3/8	7.5
1/2	7.0
3/4	6.0
1	6.0
1-1/2	5.5
2§	5.0
3§	4.5

©COPYRIGHT 2013 CH2M HILL

Nominal Maximum Aggregate Size in.‡	Air Content (%)*
‡See ASTM C33/C33M for tolerance on oversize for various nominal maximum size designations. *Tolerance of air content is ±1-1/2 percent. §Air contents apply to total mixture. When testing concretes, however, aggregate particles larger than 1-1/2 inches are to be removed by sieving and air content will be measured on sieved fraction (tolerance on air content as delivered applies to this value). Air content of total mixture is computed from value measured on the sieved fraction passing the 1-1/2-inch sieve in accordance with ASTM C231/C231M.	

6. Limit supplementary cementitious materials measured as a percent of weight of total cementitious materials in mix design, as follows:
   a. Fly Ash and other Pozzolans: 25 percent.
   b. Slag Cement: 50 percent.
   c. [Silica Fume: 10 percent.]
   d. Combined Fly Ash and other Pozzolans [and Slag Cement] [, Slag Cement, and Silica Fume]: 50 percent, with fly ash and other pozzolans not exceeding 25 percent [, and silica fume not exceeding 10 percent].
   e. [Combined Fly Ash and other Pozzolans and Silica Fume: 35 percent, with fly ash and other pozzolans not exceeding 25 percent, and silica fume not exceeding 10 percent.]
   f. Total cementitious materials include ASTM C150/C150M and ASTM C595/C595M cement.
      1) Fly ash and other pozzolans in Type IP, blended cement, ASTM C595/C595M.
      2) Slag used in the manufacture of an IS blended cement, ASTM C595/C595M.
      3) [Silica fume, ASTM C1240, present in blended cement.]
7. Provide cementitious materials in accordance with one of the following:
   a. ASTM C150/C150M Type II; inclusion of supplementary cementitious materials in design mix is optional.
   b. ASTM C150/C150M types other than Type II, plus supplementary cementitious materials in accordance with one of the following:
      1) Tricalcium Aluminate Content of Total Cementitious Materials: Maximum 8 percent by weight.

©COPYRIGHT 2013 CH2M HILL

2) Provide documentation of test results in accordance with ASTM C1012/C1012M, for combinations of cementitious materials providing sulfate resistance with expansion less than 0.10 percent at 6 months.

c. ASTM C595/C595M Type IP or Type IS (less than 70), tested to comply with moderate sulfate resistance option (MS).

1) Provide documentation of test results in accordance with ASTM C1012/C1012M, for combinations of cementitious materials providing sulfate resistance with expansion less than 0.10 percent at 6 months.

8. Unless otherwise permitted, minimum cementitious materials content in mix design shall be as follows:
   a. 515 pounds per cubic yard for concrete with 1-1/2-inch nominal maximum size aggregate.
   b. 535 pounds per cubic yard for 1-inch nominal maximum size aggregate.
   c. 560 pounds per cubic yard for 3/4-inch nominal maximum size aggregate.
   d. 580 pounds per cubic yard for 1/2-inch nominal maximum size aggregate.
   e. 600 pounds per cubic yard for 3/8-inch nominal maximum size aggregate.
   f. Unless otherwise permitted, limit cementitious materials content to 100 pounds per cubic yard greater than specified minimum cementitious materials content in mix design.
9. Limit water-soluble, chloride-ion content in hardened concrete to 0.10 percent, unless otherwise specified.
   a. [Regardless of assigned C Exposure Class, for prestressed and post-tensioned concrete: 0.06 percent.]
   b. Limits are stated in terms of chloride ions in percent by weight of cement.
   c. Unless otherwise permitted, provide documentation from concrete tested in accordance with ASTM C1218/C1218M at an age between 28 days and 42 days.

D. Refer to PART 1 through PART 3 of this section for additional requirements.]

[Concrete Mix Design, Class SM00F2S1P2C1

A. Mix Locations: Slurry mixture at horizontal construction joints with waterstop in wall.

B. Exposure Categories and Classifications: F2S1P2C1.

C. Mix Properties:
   1. Limit water to cementitious materials ratio (W/Cm) in mix design to maximum value of 0.42.
   2. Minimum concrete compressive strength (f'c) shall be same as concrete mix for wall.
   3. Maximum Nominal Aggregate: 3/8 inch.
   4. Unless otherwise specified, provide 7.5 percent air content.
      a. See ASTM C33/C33M for tolerance on oversize for various nominal maximum size designations.
      b. Tolerance of air content is plus or minus 1.5 percent.
   5. Provide cementitious materials in accordance with one of the following:
      a. ASTM C150/C150M Type II; inclusion of supplementary cementitious materials in design mix is optional.
      b. ASTM C150/C150M types other than Type II, plus supplementary cementitious materials in accordance with one of the following:
         1) Tricalcium Aluminate Content of Total Cementitious Materials: Maximum 8 percent by weight.
         2) Provide documentation of test results in accordance with ASTM C1012/C1012M, for combinations of cementitious materials providing sulfate resistance with expansion less than 0.10 percent at 6 months.
      c. ASTM C595/C595M Type IP or Type IS (less than 70), tested to comply with moderate sulfate resistance option (MS).
         1) Provide documentation of test results in accordance with ASTM C1012/C1012M, for combinations of cementitious materials providing sulfate resistance with expansion less than 0.10 percent at 6 months.
   6. Unless otherwise permitted, minimum cementitious materials content in mix design shall be 600 pounds per cubic yard for 3/8-inch nominal maximum size aggregate.
   7. Limit water-soluble, chloride-ion content in hardened concrete to 0.10 percent, unless otherwise specified.
      a. [Regardless of assigned C Exposure Class, for prestressed and post-tensioned concrete: 0.06 percent.]
      b. Limits are stated in terms of chloride ions in percent by weight of cement.

[Concrete Mix Design, Class 4500F1S1P0C1

A. Mix Locations:

1. Electrical duct banks.
2. Pipe encasements that are not cast monolithically with concrete base mats or slabs.
3. Where specified in Contract Documents.

B. Exposure Categories and Classifications: F1S1P0C1.

C. Mix Properties:

1. Limit water to cementitious materials ratio (W/Cm) in mix design to maximum value of 0.45.
2. Minimum concrete compressive strength (f'c) shall be 3,500 psi at 28 days and 4,500 psi at 56 days.
3. Air-entraining admixtures are prohibited in concrete mixtures and total air content shall not be greater than 3 percent, for the following:
   a. Slabs to receive hard-troweled finish.
   b. Slabs to receive dry shake floor hardener.
   c. Slabs to receive topping placed monolithically as two-course floor on top of plastic concrete.
4. Unless otherwise specified, provide air content based on nominal maximum size of aggregate as follows:

Nominal Maximum Aggregate Size in. ‡	**Air Content (%)***
3/8	6.0
1/2	5.5
3/4	5.0
1	4.5
1-1/2	4.5
2§	4.0
3§	3.5

SECTION 03 35 00
CONCRETE FINISHING

PART 1 - GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. ASTM International (ASTM): C109, Standard Test Method for Compressive Strength of Hydraulic Cement Mortars (Using 2-In. or 50-Mm Cube Specimens).

1.02 SUBMITTALS

A. Action Submittals: Manufacturer's product data sheet(s).

B. Informational Submittals:

1. Agenda: Conference prior to slab placement.
2. Manufacturer's written procedures for slab preparation, product application, protection of finished surface, and post-application cleanup.
3. Product manufacturers representatives' names and phone numbers.
4. Manufacturer's Certificate of Compliance for products to be furnished.
5. Manufacturer's Certificate of Proper Installation.
6. Statement of Qualifications:
   a. Manufacturer's Product Service Record.
   b. Application personnel.
   c. Manufacturer's representative.
7. Manufacturer's installation instructions.
8. Manufacturer's written instructions for maintenance and repair of floor finishes installed.

1.03 QUALITY ASSURANCE

A. Qualifications:

1. Manufacturer's Product Service Record: Five previous projects at least 5 years old where product was used at representative coverage per square foot.
2. Floor Product Manufacturer: Manufacture components of floor material, except the epoxy, in own plant and under control of trained quality control manager.

©COPYRIGHT 2013 CH2M HILL

3. Application Personnel: Four previous projects of successful installation of specified materials or manufacturer's training.

B. Preinstallation Training: Manufacturer-approved training of application personnel and quality control inspectors for these floor finishes.

C. Conference Prior to Slab Placement:

1. Conducted by CONTRACTOR.
2. Agenda:
   a. Concrete mix design.
   b. Placing techniques.
   c. Finishing techniques.
   d. Floor hardener application procedures.
   e. Equipment required for these procedures.
3. Attendees:
   a. CONTRACTOR's superintendent.
   b. Subcontractor's representative involved in slab installation and finishing.
   c. ENGINEER.

D. Mockups: Install one 10-foot by 20-foot area for each type of finish floor to demonstrate that the material and methods produce a finished product acceptable to the ENGINEER.

1. Mockup will establish the standard of quality for floor finishes.
2. Use specified materials at a location designated by ENGINEER or OWNER.
3. Notify ENGINEER 5 days in advance of commencement of mockup floor slab application and training.
4. Do not purchase floor materials until mockup slab installation has been accepted by the ENGINEER or OWNER.

E. Color Samples: Minimum 2-inch by 2-inch Sample applications of floor finishes available.

1.04 EXTRA MATERIALS

A. Furnish, tag, and box for shipment and storage the following materials:

Quantity	Item
[_____]	[_____]

©COPYRIGHT 2006 CH2M HILL

B. Deliver to Site and store in the location directed by ENGINEER or OWNER.

PART 2 - PRODUCTS

2.01 CLEAR LIQUID SEALER DUST PROOFER

A. Colorless, aqueous solution of zinc and magnesium fluorosilicate.

B. Each gallon of solution shall contain a minimum of 2 pounds of fluorosilicate compound.

C. Manufacturers:

1. Master Builders Co., Cleveland, OH.
2. Sonneborn, Minneapolis, MN.
3. Euclid Chemical Co., Cleveland, OH.

2.02 DRY SHAKE HARDENERS

A. Mix: Surface hardener with metallic or natural aggregate, premixed and packaged at factory, delivered to Site ready to apply.

B. Natural Aggregate: Mixture of specially processed graded iron aggregate, selected portland cement, and necessary plasticizing agents formulated, processed, and packaged under stringent quality control at the manufacturer's factory.

1. Manufacturer and Product:
   a. [Natural concrete gray, "Surflex" by Euclid Chemical Co. or "Mastercron" by Master Builders, Cleveland, OH.]
   b. [Colored and high reflective (white) "Surflex" by Euclid Chemical Co. or "Colorcron" by Master Builders, Cleveland, OH.]
   c. [Light reflective, (off-white) 50 percent light reflective "Surflex" by Euclid Chemical Co. or "Light Reflective Mastercron" by Master Builders, Cleveland, OH.]

C. Metallic Aggregate: Metallic aggregate, cementitious binder, plasticizer, water-reducing admixtures, and other ingredients free from nonferrous particles, rust, and material intended to disguise rust.

1. Manufacturer and Product:
   a. [Natural, concrete gray, and colored "Euco-Plate HD" by Euclid Chemical Co. or "Masterplate 200" by Master Builders, Cleveland, OH.]

©COPYRIGHT 2013 CH2M HILL

b. [Light reflective, (off-white) 50 percent to 57 percent reflectivity "Light Reflective Euco-Plate HD" or "Light Reflective Masterplate 200" by Master Builders, Cleveland, OH.]

c. ["Light Reflective Nonoxidizing" (off-white) 50 percent to 57 percent reflectivity. Composed of specially processed nonoxidizing metallic aggregate and other proprietary ingredients with light reflective properties; "Lumiplate" by Master Builders, Cleveland, OH, or "Light Reflective Diamond Plate" by Euclid Chemical Co., Cleveland, OH.]

2.03 METALLIC AGGREGATE TOPPING

A. Topping Mix: Ready-to-use cement, iron aggregate, and plasticizing agent premixed and prepackaged, requiring only addition of water.

1. Manufacturer and Product: Euco-Top (screedable formulation) by Euclid Chemical Co. or ANVIL-TOP 300 by Master Builders, Cleveland, OH.

B. Topping Compressive Strength: 5,000 psi at 24 hours, 8,800 psi at 7 days, and 12,000 psi at 28 days.

C. Bonding Agent: 100 percent reactive, two-component, modified aliphatic/amine type epoxy resin bonding agent to dry base concrete; "Euco Epoxy No. 452MV" by Euclid Chemical Co. or ANVIL-BOND, manufactured by Master Builders, Cleveland, OH.

D. Membrane Curing Compound: "Super Floor Coat" by Euclid Chemical Co. or [Masterkure] [Masterkure CR] by Master Builders, Cleveland, OH.

E. Epoxy Joint Filler: The epoxy joint filler shall be a two-component, 100 percent solids compound, with a minimum shore D hardness of 50, "Euco 700" by Euclid Chemical Co., "MM-80" Metzger/McGuire.

PART 3 - EXECUTION

3.01 CLEAR LIQUID SEALER DUST PROOFER APPLICATION

A. Before application, thoroughly cure floors to receive treatment for minimum 28 days, keep clean, unpainted, free from membrane curing compounds, and perfectly dry with all Work above them completed.

B. Apply hardener evenly to surface, using three coats, allowing 24 hours between coats.

©COPYRIGHT 2006 CH2M HILL

1. First coat 1/3 strength, second coat 1/2 strength, and third coat 2/3 strength, mix with water.
2. Apply each coat so as to remain wet on surfaces for 15 minutes.
3. Apply approved treatment in accordance with manufacturer's instructions.
4. After final coat is completed and dry, remove surplus hardener from surface by scrubbing and mopping with water.

3.02 INSTALLATION OF DRY SHAKE HARDENERS

A. Application:

1. Application Rate: [2] [_____] pounds per square foot or as recommended by manufacturer.
2. Penetration: Top 1/8-inch to 3/16-inch depth of floor slab.
3. Commence application immediately upon completion of floating surface area; bleed water shall not be present during and after application.
4. Distribute 2/3 of specified total quantity evenly on concrete surface to receive treatment by mechanical spreader; do not throw shake product.
5. Apply first to areas adjacent to forms, entry ways, columns, and walls where rapid moisture loss may occur.

B. Finishing:1

1. Commence first mechanical float with finishing machines using float blades as soon as shake has absorbed moisture, as indicated by darkening of the surface area.
2. Float until moisture from base slab penetrates through first shake application.
3. Immediately distribute remaining 1/3 of total required shake by spreader and commence second mechanical float, as specified above.
4. Compact surface further by third mechanical float as time and setting characteristics of concrete allow.
5. Do not add water to surface area. In drying conditions, an evaporation retarder may be used to prevent plastic shrinkage cracking and rapid surface drying, subject to manufacturer's recommendations and approval of ENGINEER.
6. Hand or mechanically trowel surface while stiffening progresses, as indicated by loss of sheen with blades relatively flat.
7. Run trowel blades as soon as possible to achieve representative finish obtained on mockup panel.
8. Avoid excessive trowel blade speed which may "burn" or darken floor surface resulting in loss of wear.
9. Remove marks and pinholes in final raised trowel operation.

©COPYRIGHT 2013 CH2M HILL

C. Curing:

1. Cure treated floor surface to meet the recommendations of the dry shake hardener manufacturer. Apply curing compounds as soon as possible without marring the slab surface.
2. Commence slab protection when curing compound is dry.
   a. Cover slab with nonstaining kraft building paper to protect area from droppings.
   b. Maintain floor free of traffic and loads for at least 10 days after completion.

3.03 INSTALLATION OF METALLIC AGGREGATE TOPPING

A. Existing Concrete Surface Preparation:

1. Conduct vapor transmission test as specified, prior to application of bonding agent.
2. Prepare surface using Blastrac by Wheelabrator-Frye, Inc. or Porta-Shotblast by Nelco Manufacturing Corp. to depth that leaves dry, clean, surface free of unsound areas.
3. Apply bonding agent to dry base concrete slab just prior to placement of topping mix.

B. Armored Joint Treatment:

1. Cut down and remove concrete at joint lines to depth of 1/2 inch and taper back to surface level over 4-inch wide line for joints to receive armor.
2. Hand float cutdown area, working up sufficient paste at surface to ensure integral bond.
3. Mix metallic aggregate dry shake with sufficient water to produce a stiff mortar.
4. Place mortar into prepared joint; screed and float to top of form.
5. Use 2.25 pounds of metallic aggregate dry shake on each side of joint per linear foot.
6. Apply dry shake surface hardener as specified over designated floor area, including armored joint area after armored joint is in place.

C. Mixing: Mix in concrete mixer or ready-mix truck.

1. First add 3/4 of specified water quantity as recommended on product data sheet to mixer.
2. Proceed to add topping mix to water in a slow steady stream, followed by addition of remaining 1/4 of water.

©COPYRIGHT 2006 CH2M HILL

3. Mix for 3 minutes or as recommended by manufacturer to provide 5-inch to 7-inch slump.
4. Mix shall be screedable and workable similar to concrete and shall not require compaction to attain specified strengths and density.
5. Perform slump test on each placement to ensure compliance with specified slump.
6. Place topping within 1 hour of water addition to mix and prior to loss of required slump.

D. Placement of Aggregate:

1. Application Rate: [1] [_____] inch thick with a minimum of 18 pounds of material per square foot per inch of thickness.
2. Place topping mixture by pump, bucket, or flow and screed level.
3. Finish with wooden bull float, one power floating, and one power troweling, or to meet the manufacturer's recommendations. Do not over finish.

E. Curing:

1. Commence curing immediately after completion of finish operation.
2. Wet cure by continuous water sprinkling or use wet burlap covered with polyethylene for minimum 2-day wet cure.
   a. Apply membrane curing compound specified as recommended by topping manufacturer.

3.04 TESTS AND INSPECTION

A. Vapor Transmission Test: Conduct test on new and existing concrete to show that no surface moisture exists prior to application of specified special floor treatment, as follows:

1. Place polyethylene plastic sheet, minimum 4 feet by 4 feet and sealed along four sides with duct tape to prevent moisture transmission by evaporation, over concrete floor area for 24 hours.
2. Indication of moisture transmission will be apparent by accumulation of moisture on enclosed surface of polyethylene plastic sheet.
3. Do not apply concrete bonding agent until test results indicate moisture is not being transmitted from concrete surface.

B. Strength Tests: Test metallic aggregate topping for compressive strength by making 2-inch by 2-inch cubes in accordance with ASTM C109.

©COPYRIGHT 2013 CH2M HILL

B. Epoxy Joint Filler:
   1. Allow 90 days after slab placement before filling joints.
   2. Mix and install in accordance with manufacturer's instructions.
   3. Fill contraction or construction joints in areas receiving armored joint treatment.

3.05 MANUFACTURER'S SERVICES

A. Provide manufacturer's representative at Site in accordance with Section 01 43 33, Manufacturers' Field Services, for installation assistance, inspection and certification of proper installation, and training of application personnel.

   1. Technical assistance with design and adjustment of concrete mixes to receive floor finishes and toppings.
   2. Technical assistance to assure and certify application and installation of system being used.
   3. Consultation, direction, and certification of mockup, for full-scale application of floor finishes, and at other times as needed.
   4. Attendance at the conference prior to slab placement to finalize proper methods and procedures.

SECTION 03 39 00
CONCRETE CURING

PART 1 - GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. ASTM International (ASTM):
   a. C309, Standard Specification for Liquid Membrane-Forming Compounds for Curing Concrete.
   b. C1315, Standard Specification for Liquid Membrane-Forming Compounds Having Special Properties for Curing and Sealing Concrete.
2. NSF International: 61, Drinking Water System Components – Health Effects.

1.02 SUBMITTALS

A. Action Submittals:

1. Manufacturers' data indicating compliance with the requirements specified herein for the following products:
   a. Exposed aggregate finish retardant on formed surface.
   b. Evaporation retardant.
   c. Curing compound.
   d. Clear sealer.
   e. Clear floor hardener.
2. Curing methods proposed for each type of element such as slab, walls, beams, and columns in each facility.

B. Informational Submittals:

1. Manufacturer's Certificate of Compliance, in accordance with Section 01 43 33, Manufacturers' Field Services for the following:
   a. Curing compound showing moisture retention requirements.
   b. Retardants for exposed aggregate finish

1.03 QUALITY ASSURANCE

A. Comply with ACI 301 and ACI 302.

©COPYRIGHT 2013 CH2M HILL

PART 2 - PRODUCTS

2.01 MATERIALS

A. Water-based, high-solids content, non-yellowing, clear, curing compound meeting requirements of ASTM C309 Type I, Class A & B .

B. Curing compound shall be compatible with coatings (including sealer, water-proofing, bonded cementitious topping, or floor tile) which are to be applied to the concrete surface.

C. Manufacturers and Products:

1. BASF Construction Chemicals, Shakopee, MN; Kure 1315.
2. Euclid Chemical Co., Cleveland, OH; Super Diamond Clear VOX.
3. WR Meadows, Inc., Hampshire, IL; VOCOMP-30.
4. BASF Construction Chemicals., Shakopee, MN; Kure-N-Seal.
5. Euclid Chemical Co., Cleveland, OH; Kurez VOX.

D. Evaporation Retardant:

1. Optional: Fluorescent fugitive dye color tint that disappears completely upon drying.
2. Manufacturers and Products:
   a. Master Builders Co., Cleveland, OH; Confilm.
   b. Euclid Chemical Co., Cleveland, OH; Eucobar.

E. Clear Sealer (One-Component Penetrating Silane Sealer):

1. Manufacturers and Products:
   a. Chemrex, Inc., Shakopee, MN; Masterseal SL.
   b. Euclid Chemical Co.; Eucoguard 200.

F. Clear Floor Hardener:

1. Colorless, aqueous solution of zinc and magnesium fluorosilicate.
2. Each gallon of solution shall contain a minimum of 2 pounds of fluorosilicate compound.
3. Manufacturers:
   a. Chemrex, Inc., Shakopee, MN.
   b. Euclid Chemical Co., Cleveland, OH.
   c. Sonneborn, Minneapolis, MN.

G. Retardant for Exposed Aggregate Finish on Slabs:

©COPYRIGHT 2013 CH2M HILL

1. Manufacturers and Products:
   a. Sika Chemical Corp., Lyndhurst, NJ; Rugasol.
   b. Conrad Sovig Co., San Francisco, CA; Conreveal Top Surface.
   c. Burke Co., San Mateo, CA; Burke True Etch Surface Retarder.
   d. Euclid Chemical Co., Cleveland, OH; Surface Retarder S.
2. Retardant for Exposed Aggregate Finish on Formed Surface:
   a. Manufacturers and Products:
   b. L. M. Scofield Co., Los Angeles, CA; Lithotex Top Surface Retarder.
   c. Conrad Sovig Co., San Francisco, CA; Control Set.
   d. Burke Co., San Mateo, CA; Burke True Etch Surface Retarder.
   e. Euclid Chemical Co., Cleveland, OH; Surface Retarder F.

H. Absorptive Mats: Burlap-polyethylene, minimum 8 ounces per square yard bonded to prevent separation during handling and placing.

I. Water: Clean and potable, containing less than 500 ppm of chlorides.

PART 3 - EXECUTION

3.01 CONCRETE CURING

A. General:

1. Where surfaces are to receive coatings, painting, cementitious material, or other similar finishes, use only water curing procedures. Refer to Interior Finish Schedule for surfaces to receive coatings.
2. Use only water curing on potable water structures.
3. Where curing compound cannot be used, water curing as described below or special methods using moisture shall be agreed upon by ENGINEER prior to placing concrete.
4. As required in Section 03 30 00, Cast-in-Place Concrete, if result of 7-day concrete strength test is less than 50 percent of specified 28-day strength, extend period of moist curing specified below, by 7 additional days.

B. Use one of the following methods as approved by ENGINEER:

1. Walls:
   a. Method 1: Leave concrete forms in place and keep surfaces of forms and concrete wet for 7 days.
   b. Method 2: Continuously sprinkle with water 100 percent of exposed surfaces for 7 days starting immediately after removal of forms.
   c. Method 3: Apply curing compound, where allowed, immediately after removal of forms.

©COPYRIGHT 2013 CH2M HILL

2. Slabs, Pavements, Sidewalks, and Curbs:
   a. Method 1: Protect surface by water ponding for 7 days.
   b. Method 2: Cover with burlap or cotton mats and keep continuously wet for 7 days.
   c. Method 3: Cover with 1-inch layer of wet sand, earth, or sawdust, and keep continuously wet for 7 days.
   d. Method 4: Continuously sprinkle exposed surface for 7 days.
   e. Method 5 (For Pavements, Sidewalks, and Curbs only; Methods 1 thru 4 only for slabs): Apply curing compound, where allowed, immediately after final finishing when surface will no longer be damaged by traffic.

3.02 EVAPORATION RETARDANT APPLICATION

A. Use on flatwork when environmental conditions are anticipated to cause rapid drying of the concrete surface. Do not use evaporation retardant on potable water structures, unless product is NSF 61 approved.

B. Spray onto surface of fresh flatwork concrete immediately after screeding to react with surface moisture.

C. Reapply as needed to ensure a continuous moist surface until final finishing is completed.

3.03 PRESTRESSED TANK CONCRETE CURING

A. Keep concrete surfaces and form continuously wet for 7 days where portland cement is used, or 3 days where high-early-strength cement is used.

B. Begin curing immediately after initial concrete set has occurred.

C. Do not use curing compounds.

3.04 CLEAR SEALER APPLICATION

A. Apply to floor slabs.

B. Before application and with Work above completed, water cure concrete walls and floors for a minimum of 28 days to receive sealer, keep clean, unpainted, and free from membrane curing compounds.

C. Apply with stiff brush, short nap roller, squeegee, garden sprayer, or conventional paint spray equipment.

©COPYRIGHT 2013 CH2M HILL

D. Apply at a coverage rate of 125 square feet per gallon to 200 square feet per gallon. Cure sealer on slabs for the following minimum cure time at ambient temperatures shown prior to allowing foot traffic:

1. 90 degrees F: 2 hours.
2. 75 degrees F: 4 hours.
3. 50 degrees F: 8 hours.
4. 35 degrees F: 16 hours.

3.05 CLEAR FLOOR HARDENER APPLICATION

A. [Apply where indicated in Interior Finish Schedule.] [Apply to floor slabs.]

B. Before application and with Work above completed, water cure concrete walls and floors for a minimum of 28 days to receive sealer, keep clean, unpainted, and free from membrane curing compounds.

C. Apply hardener evenly, using three coats, allowing 24 hours between coats.

1. First coat 1/3 strength, second coat 1/2 strength, and third coat 2/3 strength, mix with water.
2. Apply each coat so as to remain wet on surface for 15 minutes.
3. Apply approved hardener in accordance with manufacturer's instructions.
4. After final coat is completed and dry, remove surplus hardener from surface by scrubbing and mopping with water.

3.06 RETARDANT FOR EXPOSED AGGREGATE SURFACES

A. [Apply where indicated on [Interior] [Exterior] Finish Schedule.] [Apply to floor slabs.]

B. Apply in accordance with manufacturer's product instructions.

3.07 MANUFACTURER'S SERVICES

A. Provide manufacturer's representative at Site [in accordance with Section 01 43 33, Manufacturers' Field Services,] for installation assistance, inspection, and certification of proper installation for products specified.

B. Provide clear sealer manufacturer's representative to demonstrate proper application of product.

C. Provide clear floor hardener manufacturer's representative to demonstrate proper mixing and application of product.

©COPYRIGHT 2013 CH2M HILL

D. Provide curing compound manufacturer's representative to demonstrate proper application of curing compound to show coverage in one coat.

E. Provide retardant for exposed aggregate surfaces manufacturer's representative to demonstrate proper application and surface mortar removal procedures.

1.02 SUBMITTALS

A. Action Submittals:

1. Retardant for Exposed Aggregate Finish:
   a. Technical data.
   b. Instructions for product application.
2. Bond Breaker for Tilt-Up Walls:
   a. Technical data.
   b. Evidence of successful use in this type of application.
   c. Instructions for product mixing/application.
3. Sealer for Exterior Surfaces: Product data with mixing/application instructions.
4. Form Liners: Manufacturer’s literature and product data.

©COPYRIGHT 2013 CH2M HILL

5. Calculations and Technical Data: Proposed details and design calculations for stresses in all critical sections of precast members for all loading conditions including transportation, handling, and erection.
6. Tilt-Up Panel Walls: Show type and location of inserts, extra reinforcement for handling, and other pertinent data for proposed tilt-up construction.
7. Precast Concrete Underground Utility Trench System:
    a. Engineering layout drawings, including: Dimensions of components and identification and location of each trench part in the trench layout.
    b. Bill of Materials.
    c. Detailed catalog cuts for bases, covers, standard miters, tee sections, cross sections, end walls, reducers, radius corners, lifting bars, sealants and tie plates.

B. Informational Submittals:

1. For Precasting Manufacturers Not Listed in Article Quality Assurance:
    a. Experience record on production of precast concrete as shown, with information on precasting plant that will indicate capability to satisfactorily perform the Work.
    b. Evidence of current PCI plant certification.
    c. Complete list of architectural panelwork accomplished in past 2 years, including:
        1) Type of structure.
        2) Name of OWNER.
        3) Address of completed work.
2. Certificate of Compliance: Certify admixtures and concrete do not contain calcium chloride.
3. Test Reports:
    a. For precast manufacturer’s concrete test cylinders.
    b. Inspection of installed panels.
4. Precast Concrete Underground Utility Trench System: Manufacturer’s printed instructions for installation of the precast concrete trench system components.

1.03 QUALITY ASSURANCE

A. Qualifications of Precasting Manufacturers:

1. Precast Concrete and Precast Prestressed Concrete: Product of manufacturer with 3 years experience of producing precast concrete products of quality specified.
2. Precast Plant: PCI certified plant with current certification.

©COPYRIGHT 2013 CH2M HILL

3. Precasting Manufacturers with Apparent Capability to Meet the Specifications of this Section.
4. Calculations stamped by an ENGINEER registered in the state of California.

B. Samples for Exposed Aggregate Finish:

1. Before starting tilt-up panels, provide two Sample concrete panels for each aggregate finish required, 4 feet square and 3 inches thick for ENGINEER's approval.
2. Vary amounts of retardant to be used.
3. Approved Finish: Constitutes standard of quality required in completed Work.

C. Mockup Panels for Architectural Precast Panels:

1. Review Sample in ENGINEER's office as a guide in preparation of mockup panels.
2. Construct:
   a. One full-size mockup panel for each different type of color or finish as shown to be used and installed in their respective places after approval of final precast Shop Drawings and calculations.
   b. In accordance with details shown using materials, forming systems, reinforcing details, cast-in inserts, and mix proportions, and as specified and approved.
3. Finish:
   a. Uniform in appearance and similar in all respects to Samples on display in ENGINEER's office.
   b. Constitutes standard of quality required in completed Work.
4. If mockup panel does not represent quality required, construct additional mockup panels until approved by ENGINEER.
5. Protect and maintain approved mockup panels at location selected by ENGINEER or until ENGINEER approves installation in their respective locations in the Project.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Formwork:

1. One-piece, full-length, and without seams.
2. As specified in Section 03 10 00, Concrete Forming and Accessories.

©COPYRIGHT 2013 CH2M HILL

B. Reinforcing Steel: As specified in Section 03 21 00, Reinforcing Steel.

C. Cement: As specified in Section 03 30 00, Cast-in-Place Concrete.

D. Pretensioning Strands: Seven-wire, uncoated, stress relieved, ASTM A416, Grade 270.

E. Aggregates: As specified in Section 03 30 00, Cast-in-Place Concrete, for 3/4-inch maximum size. Furnish of consistent quality, gradation, and color for precast architectural panels to produce uniformity of appearance in all panels.

F. Admixtures: As specified in Section 03 30 00, Cast-in-Place Concrete.

G. Embedded Items:

1. ASTM A36 steel.
2. Anchor Studs: Headed anchor studs (HAS), deformed bar anchors (DBA), or threaded studs as manufactured by Nelson Stud Welding Co., Lorain, OH.
3. Furnish inserts for lifting tilt-up walls, bolting stiffeners, attaching braces, and as otherwise required.
4. Tie Plates in Precast Concrete Utility Trench: hot dipped galvanized.

H. Grout: Nonshrink, nonmetallic Type II grout as specified in Section 03 62 00, Nonshrink Grouting.

I. Retardant for Exposed Aggregate Finish Manufacturers:

1. Sika Chemical Corp.; Rugasol.
2. Burke Co.; Exposed Aggregate Compound.

J. Sealer for Exterior Surfaces:

1. Silane Sealer: One-component penetrating sealer, hydrophilic (isopropyl alcohol as a carrier) with 40 percent active ingredients.
2. Manufacturers:
   a. Master Builders Co.
   b. Euclid Chemical Co.

K. Bond Breaker for Tilt-up Walls: Nonstaining, effective as a parting compound, will not leave film, quick drying, nontacky, rainproof, and provides reasonable abrasion resistance.

©COPYRIGHT 2013 CH2M HILL

1. Manufacturers:
   a. Cresset Chemical Co.
   b. The Burke Co.

L. Precast Prestressed Concrete Members: [girders,] [single tees,] [double tees,] [voided slabs,] [_____,] [_____] feet wide by [_____] feet deep.

2.02 CONCRETE MIX

A. As specified in Section 03 30 00, Cast-in-Place Concrete.

B. Design Strength: 5,000psi at 28 days.

C. Water/Cement Ratio: 0.38 maximum.

D. For colored precast concrete, coordinate ingredients and procedures to achieve uniformity of color.

2.03 DESIGN REQUIREMENTS

A. Precast Architectural Wall Panels:

1. Crack Control: PCI MNL-120.
2. Stresses: Limit tensile stress in the panels, from all handling and installation loads, to that less than that which would cause cracking on the exposed face.
3. Impact Design: Minimum 50 percent of member weight.
4. Tensile Stresses: Do not exceed those recommended in Chapter 5 of above referenced manual for a safety factor of 1.5 in critical sections under all loading conditions.
5. Design and reinforce to withstand handling and erection loads.

B. Structural Precast and Prestressed Members, Except for Architectural Panels:

1. Meet applicable sections of PCI MNL-120.
2. Design for spans and superimposed live and dead loads shown plus dead loads of members.

C. Precast Concrete Underground Utility Trench System:

1. Components shall be designed to conform to requirements of ASTM C857, ASYM C858, and ACI 318, and as specified herein.
2. Provide a one-piece trench section with solid bottom having all components designed for AASHTO HS20, 32,000 pound axle loads.

©COPYRIGHT 2013 CH2M HILL

3. Provide trench system cross-section dimensions as detailed and per indicated location shown on the Drawings.
4. Provide the precast base in 10 foot lengths unless otherwise approved by the ENGINEER or required to satisfy the horizontal and vertical alignment, or to complete closures, shown on the Drawings.
5. Provide steel reinforced concrete lids on all length of trench section except where galvanized steel lid is shown on the drawings at a specific location. Length of the galvanized steel lid shall be as indicated on the Drawings.
6. Provide bolted tie plates with 6-inch minimum length channel strut embedded in the bases to connect the sections together to minimize shifting and/or differential settlement. Provide a tie plate every 50 feet minimum designed with capability for accommodating thermal expansion and contraction anticipated at the Project site conditions.
7. Manufacturer:
   a. Trenwa, Ft. Thomas, Kentucky.
   b. Barkman, Winnipeg, Canada.
   c. Modern Precast Concrete, Pennsylvania.
   d. Or approved equal

2.04 FABRICATION

A. General:

1. Comply with PCI MNL-117.
2. Reinforcing Steel and Pretensioning Strands:
   a. Place in position before concrete is cast.
   b. Keep clean and free from form oil or other substances harmful to bond.
3. Pretensioning Force, if Used: Determine by elongation and by gauge pressure.
   a. Method: Meet requirements of Prestressed Concrete Institute.
   b. Forms: Produce smooth surfaces.
   c. Concrete: Deposit, vibrate, finish, and cure in accordance with recommended practices of ACI 304R. Steam curing is permitted.
4. Release Strength for Pretensioning Method: Minimum 4,000 psi, unless otherwise approved.
5. Coordinate dimensions, determine type, quantity, size, and location of, and furnish necessary embedded items in precast concrete. Coordinate location of embedded items in cast-in-place concrete necessary to connect precast items.

B. Surface Finish for Precast Structural Units:

©COPYRIGHT 2013 CH2M HILL

1. Furnish concrete finish, as specified in Section 03 30 00, Cast-in-Place Concrete, to additional concrete field placed on precast units.
2. Other Surfaces: Smooth screeded finishes, unless otherwise shown.

C. Surface Finish for Precast Architectural Panels or Tilt-Up Walls:

1. Exposed Surfaces in Building Interior: As shown.
2. Panel Interior Surface: [As shown.] [Steel trowel, Type S-1, as specified in Section 03 30 00, Cast-in-Place Concrete.]
3. Meet standard of quality represented by approved mockup panel.
4. Furnish panels from same manufacturer.

D. Sealer:

1. Apply to panels or walls as indicated on the Drawings or specified herein, at Site in accordance with manufacturer's instructions.
2. Protect surface until installed in the Work.
3. Repair damage as approved by manufacturer.

2.05 SOURCE QUALITY CONTROL

A. Prepare minimum three standard concrete test cylinders for each 50 cubic yards or fraction thereof of concrete placed in the precast work in accordance with ASTM C31.

B. Test and record concrete strengths.

PART 3 - EXECUTION

3.01 ERECTION

A. Verify that anchorage inserts are in correct locations.

B. Handle and erect precast concrete with care as recommended by manufacturer.

C. Erect precast units plumb, straight, level, square, and in proper alignment.

D. Fasten units securely in place and brace to maintain position, stability, and alignment until permanently connected and structure is complete and stable.

E. Field Cutting: Not allowed without prior approval of ENGINEER.

©COPYRIGHT 2013 CH2M HILL

3.02 TILT-UP PANEL WALLS

A. General: Plan operation so no equipment for raising slabs is placed on concrete floors.

B. Casting Slab:

1. Use finished concrete floor.
2. Cast tilt-up panels on this slab, unless otherwise approved.
3. Do not cast panels on warped surfaces, across construction joints, or surfaces pitched to drain outlets.
4. Bond Breaker: Apply in accordance with manufacturer's recommendations.

C. Casting Slab:

1. Finished Slab: True and level plane with smooth trowel finish.
2. Bond Breaker: Apply in accordance with manufacturer's recommendations as approved.

D. Reglets: Install in forms in straight lines in accordance with manufacturer's recommendations.

E. Exposed Aggregate Finish:

1. Retardant Application:
   a. Shake uniformly over freshly placed concrete surface immediately following finishing process and before all surface water has disappeared.
   b. Rate: To affect a depth of 1/8 inch or more exposure of aggregate, as approved.
   c. In accordance with manufacturer's recommendations.
2. Curing: Cover with wet burlap or other acceptable covering and maintain in a moist state.
3. Hose or brush off retarded concrete surface to expose clean aggregate.
4. After retarded concrete has been removed, cure panels in the manner specified in Section [03 39 00, Concrete Curing] [_____].
5. Where sides of panels are to be exposed aggregate, paint forms with two coats of retardant before placing concrete.
6. Finish: To match Sample approved by ENGINEER.

F. Lifting and Setting Panels in Position:

©COPYRIGHT 2013 CH2M HILL

1. Caution: Walls or panels are not stable in themselves against lateral loads, such as wind until construction is complete. Provide bracing as required.
2. Do not move panels until concrete has obtained the design field strength required by design calculation for handling stresses, including impact. Field strength shall be determined by test cylinders.
3. Pickup Lines: Provide equal lifting force at panel pickup points, applied simultaneously and acting at right angles to panel.
4. Excessive Stresses or Shock Loading: Prevent when lifting panel from casting surface, consider form suction and impact using Part 5 of PCI MNL-120 Design Handbook.
5. Lifting Equipment: Of size and capacity to prevent damage to panel.
6. Set panels on carefully leveled shims.
7. Position, plumb and align true to line, and brace securely.
8. Bottom Joint Space: Fill with nonshrink nonmetallic grout as shown and as specified in Section 03 62 00, Nonshrink Grouting, as soon as panels are placed and braced.
9. Insert Holes: Fill with nonshrink nonmetallic grout.
10. Holes in Exposed Surfaces: Patch to match adjacent surfaces.
11. Make welded connections.

G. Cast-In-Place Pilasters and Closing Sections: As specified in Section 03 30 00, Cast-in-Place Concrete.

3.03 PRECAST CONCRETE TRENCH SYSTEMS

A. Install the precast concrete trench system in strict accordance with the manufacturer’s printed instructions and as shown on the Drawings to provide a completed system in accordance with the grades and horizontal alignment as shown on the Drawings.

B. Set the trench bases on a minimum 4-inch depth bed of sand to ensure continuous, uniform support. Ensure no protruding rocks in the trench bottom or sides are closer than 4 inches to the precast concrete sections.

C. Provide mitered ends, tee sections, cross sections, and end walls to construct a fully enclosed trench base section for a completed system as shown on the Drawings.

D. Handle the base sections and covers when transporting and installing in the prepared trench in a manner that prevents damage to any component of the completed system. Remove and replace any damaged (in the opinion of the ENGINEER) component.

©COPYRIGHT 2013 CH2M HILL

E. All joints between sections shall be water-resistant. Provide joint sealant material provided by the system manufacturer. Install in accordance with the trench system manufacturer's printed instructions.

F. After the bases have been securely set in the prepared trench and pulled together bolt together the furnished tie plates.

G. Backfill the space between the exterior walls of precast sections and the side walls of the prepared trench as shown on the Drawings with Class __ material as specified in Section ____ and compact to the requirements for pipe installation as specified in Section ____.

H. Provide corner guards on all corners of tees, crosses and interior corners of turns 45 degrees and greater to protect contained pipe from abrasion.

I. After the base section installation has been completed and the trench backfilled and compacted, install the trench lids.

1. On trenches with concrete lids, furnish and install a neoprene gasket the full length of the horizontal lid bearing surface on each side of the base to minimize movement that may chip the lid sections. Clean the bearing surface of any foreign material before installing the neoprene gasket and then clean the exposed surface of the gasket before setting the lid to ensure a continuous, uniform bearing surface.
2. Avoid overlapping the joints as this may cause an uneven bearing surface that could result in damage to the lid.

J. Fill the recessed cavity surrounding each lifting eye with sealant in accordance with the requirements specified in Section _____.

3.04 PATCHING

A. To minimize shrinkage, mix and place patching mixture to match color and texture of surrounding concrete.

B. Demonstrate patching method and obtain acceptance and approval.

3.05 CLEANING

A. After installation, clean soiled precast concrete surfaces with detergent and water, using fiber brush and sponge.

©COPYRIGHT 2013 CH2M HILL

B. Use acid solution only to clean particularly stubborn stains after more conservative methods have been tried unsuccessfully.

C. Use extreme care to prevent damage to precast concrete surfaces and to adjacent materials.

D. Rinse thoroughly with clean water immediately after using cleaner.

3.06 FIELD QUALITY CONTROL

A. Inspection:

1. With ENGINEER, inspect precast architectural wall panels for chips, cracks, discoloration, and other damage.
2. Compare every panel to approved mockup panel and finish sample panel.
3. Record location and condition of damaged or nonmatching panels.

B. Resolution:

1. Repair damage to satisfaction of ENGINEER and OWNER.
2. Remove panels with damage or repairs not acceptable to ENGINEER.
3. Install new acceptable panels in place of those removed.
4. Perform reinspection and obtain acceptance by ENGINEER.

3.07 PROTECTION

A. Protect precast units from chipping, spalling, cracking, or other damage to the units after delivery to Site.

B. After erection, protect units from damage.

SECTION 03 62 00
NONSHRINK GROUTING

PART 1 - GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. ASTM International (ASTM):
   a. C230, Standard Specification for Flow Table for Use in Tests of Hydraulic Cement.
   b. C621, Standard Specification for Packaged Dry, Hydraulic-Cement Grout (Nonshrinkable).
   c. C939, Standard Test Method for Flow of Grout for Preplaced-Aggregate Concrete (Flow Cone Method).
   d. C1107/C1107M, Standard Specification for Packaged Dry, Hydraulic-Cement Grout (Nonshrink).

1.02 SUBMITTALS

A. Action Submittals:

1. Product data of grouts.
2. Proposed method for keeping existing concrete surfaces wet prior to placing grout.
3. Forming method for fluid grout placements.
4. Curing method for grout.

B. Informational Submittals:

1. Manufacturer's Written Instructions:
   a. Adding fiber reinforcing to batching.
   b. Cement-water ratio of grout topping.
   c. Mixing of grout.
2. Manufacturer's proposed training schedule for grout work.
3. Manufacturer's Certificate of Compliance:
   a. Grout free from chlorides and other corrosion-causing chemicals.
   b. Nonshrink grout properties of Category II and Category III, verifying expansion at 3 days or 14 days will not exceed the 28-day expansion and nonshrink properties are not based on gas or gypsum expansion.
4. Manufacturer's Certificate of Proper Installation.

©COPYRIGHT 2013 CH2M HILL

5. Statements of Qualification: Nonshrink grout manufacturer's representative.
6. Test Reports:
   a. Test report for 24-hour evaluation of nonshrink grout.
   b. Test results and service report from demonstration and training session.
   c. Field test reports and laboratory test results for field-drawn Samples.

1.03 QUALIFICATIONS

A. Nonshrink Grout Manufacturer's Representative: Authorized and trained representative of grout manufacturer. Minimum of 1-year experience that has resulted in successful installation of grouts similar to those for this Project.

B. For grout suppliers not listed herein, provide completed 24-hour Evaluation of Nonshrink Grout Test Form, attached at the end of this section. Independent testing laboratory to certify that testing was conducted within last 18 months.

1.04 GUARANTEE

A. Manufacturer's guarantee shall not contain disclaimer on the product data sheet, grout bag, or container limiting responsibility to only the purchase price of products and materials furnished.

B. Manufacturer guarantees participation with CONTRACTOR in replacing or repairing grout found defective as a result of faulty materials, as determined by industry standard test methods.

PART 2 - PRODUCTS

2.01 NONSHRINK GROUT SCHEDULE

A. Furnish nonshrink grout for applications in grout category in the following schedule:

Application	Temperature Range	Max. Placing Time	
	40 deg F to 100 deg F	20 Min.	Greater Than 20 Min.
Filling tie holes	I	I	I
Blockouts for gate guides	I or II		II

©COPYRIGHT 2013 CH2M HILL

Application	Temperature Range	Max. Placing Time	
	40 deg F to 100 deg F	20 Min.	Greater Than 20 Min.
Precast joints	I or II		II
Column baseplates single-story	I or II		II
Machine bases 25 hp or less	II	II	II
Bases for precast wall sections	II	II	II
Baseplates for columns over one story	II	II	II
Precast base joints higher than one story	II	II	II
Through-bolt openings	II	II	II
Machine bases 26 hp and up	III	III	III
Baseplates and/or soleplates with vibration, thermal movement, etc.	III	III	III

2.02 NONSHRINK GROUT

A. Category I:

1. Nonmetallic and nongas-liberating.
2. Prepackaged natural aggregate grout requiring only the addition of water.
3. Test in accordance with ASTM C1107/C1107M:
   a. Grout shall have flowable consistency.
   b. Flowable for 15 minutes.
4. Grout shall not bleed at maximum allowed water.
5. Minimum strength of flowable grout, 3,000 psi at 3 days, 5,000 psi at 7 days, and 7,000 psi at 28 days.
6. Manufacturers and Products:
   a. BASF Building Systems, Inc., Shakopee, MN; Construction Grout.

©COPYRIGHT 2013 CH2M HILL

b. Euclid Chemical Co., Cleveland, OH; NS Grout.
c. Dayton Superior Corp., Kansas City, KS; 1107 Advantage Grout.
d. US MIX Co., Denver, CO; US Spec MP Grout.
e. L & M Construction Chemicals, Inc., Omaha, NE; Duragrout.

B. Category II:

1. Nonmetallic, nongas-liberating.
2. Prepackaged natural aggregate grout requiring only the addition of water.
3. Aggregate shall show no segregation or settlement at fluid consistency at specified times or temperatures.
4. Test in accordance with ASTM C1107/C1107M:
   a. Fluid consistency 20 seconds to 30 seconds in accordance with ASTM C939.
   b. Temperatures of 40 degrees F, 80 degrees F, and 100 degrees F.
5. 1 hour after mixing, pass fluid grout through flow cone with continuous flow.
6. Minimum strength of fluid grout, 3,500 psi at 1 day, 4,500 psi at 3 days, and 7,500 psi at 28 days.
7. Maintain fluid consistency when mixed in 1 to 9 yard loads in ready-mix truck.
8. Manufacturers and Products:
   a. BASF Building Systems, Inc., Shakopee, MN; Master Flow 928.
   b. Five Star Products Inc., Fairfield, CT; Five Star Fluid Grout 100.
   c. Euclid Chemical Co., Cleveland, OH; Hi Flow Grout.
   d. Dayton Superior Corp., Kansas City, KS; Sure Grip High Performance Grout.
   e. L & M Construction Chemicals, Inc., Omaha, NE; Crystex.

C. Category III:

1. Metallic and nongas-liberating.
2. Prepackaged aggregate grout requiring only the addition of water.
3. Aggregate shall show no segregation or settlement at fluid consistency at specified times or temperatures.
4. Test in accordance with ASTM C1107/C1107M:
   a. Fluid consistency 20 seconds to 30 seconds in accordance with ASTM C939.
   b. Temperatures of 40 degrees F and 100 degrees F.
5. 1 hour after mixing, pass fluid grout through flow cone with continuous flow.

©COPYRIGHT 2013 CH2M HILL

6. Minimum strength of fluid grout, 4,000 psi at 1 day, 5,000 psi at 3 days, and 9,000 psi at 28 days.
7. Maintain fluid consistency when mixed in 1 to 9 yard loads in ready-mix truck.
8. Manufacturer and Product:
   a. BASF Building Systems, Inc., Shakopee, MN; EMBECO 885.
   b. L & M Construction Chemicals, Inc., Omaha, NE; Ferrogrout.

PART 3 - EXECUTION

3.01 NONSHRINK GROUT

A. General: Mix, place, and cure nonshrink grout in accordance with grout manufacturer's representative's training instructions.

B. Form Tie or Through-Bolt Holes: Provide nonshrink grout, Category I and Category II, fill space with dry pack dense grout hammered in with steel tool and hammer. Through-bolt holes; coordinate dry pack dense grout application with vinyl plug in Section 03 10 00, Concrete Forming and Accessories, and bonding agent in Section 03 30 00, Cast-in-Place Concrete.

C. Grouting Machinery Foundations:

1. Block out original concrete or finish off at distance shown below bottom of machinery base with grout. Prepare concrete surface by sandblasting, chipping, or by mechanical means to remove any soft material.
2. Set machinery in position and wedge to elevation with steel wedges, or use cast-in leveling bolts.
3. Form with watertight forms at least 2 inches higher than bottom of plate.
4. Fill space between bottom of machinery base and original concrete in accordance with manufacturer's representative's training instructions.

3.02 FIELD QUALITY CONTROL

A. Evaluation and Acceptance of Nonshrink Grout:

1. Provide a flow cone and cube molds with restraining plates onsite. Continue tests during Project as demonstrated by grout manufacturer's representative.
2. Perform flow cone and bleed tests, and make three 2-inch by 2-inch cubes for each 25 cubic feet of each type of nonshrink grout used. Use restraining caps for cube molds in accordance with ASTM C1107/C1107M.

©COPYRIGHT 2013 CH2M HILL

3. For large grout applications make three additional cubes and one more flow cone test. Include bleed test for each additional 25 cubic feet of nonshrink grout placed.
4. Consistency: As specified in Article Nonshrink Grout. Grout with consistencies outside range requirements shall be rejected.
5. Segregation: As specified in Article Nonshrink Grout. Grout when aggregate separates shall be rejected.
6. Nonshrink grout cubes shall test equal to or greater than minimum strength specified.
7. Strength Test Failures: Nonshrink grout work failing strength tests shall be removed and replaced.
8. Perform bleeding test to demonstrate grout will not bleed.
9. Store cubes at 70 degrees F.
10. Independent testing laboratory shall prepare, store, cure, and test cubes in accordance with ASTM C1107/C1107M.

3.03 MANUFACTURER'S SERVICES

A. General:

1. Coordinate demonstrations, training sessions, and applicable Site visits with grout manufacturer's representative.
2. Provide and conduct onsite, demonstration and training sessions for bleed tests, mixing, flow cone measurement, cube testing, application, and curing for each category and type of nonshrink grout.
3. Necessary equipment and materials shall be available for demonstration.

B. Training:

1. Training is required for all [Type II and] Type III grout installations.
2. Grout manufacturer's representative shall train CONTRACTOR to perform grout work.
3. Establish location at Site and schedule time for grout manufacturer's demonstration and training session of proposed nonshrink grouts. Mix nonshrink grouts to required consistency, test, place, and cure on actual Project, such as, baseplates and tie holes to provide actual on-the-job training.
4. Use minimum of **[**five] **[_____]** bags for each grout [Category II and] Category III. Mix grout to fluid consistency and conduct flow cone and two bleed tests, make a minimum of six cubes for testing of two cubes at 1 day, 3 days, and 28 days. Use remaining grout for final Work.
5. Training shall include methods for curing grout.

©COPYRIGHT 2013 CH2M HILL

6. [Mix and demonstrate patching through-bolt holes and blockouts for gate guides, and similar items.]
7. Transport test cubes to independent test laboratory and obtain test reports.

3.04 SUPPLEMENTS

A. The supplement listed below, following "End of Section," is part of this Specification.

1. 24-hour Evaluation of Nonshrink Grout Test Form and Grout Testing Procedures.

END OF SECTION

©COPYRIGHT 2013 CH2M HILL

THIS PAGE INTENTIONALLY LEFT BLANK

GROUT TESTING PROCEDURES

A. Bagged Material:

1. List lot numbers. _____

2. List expiration date. _____

3. Weigh bags and record weight. _____

OWNER's Representative will disqualify grout if bag weights have misstated measure plus or minus 2 pounds by more than one out of five bags. (Accuracy of weights is required to regulate amount of water used in mixing since this will affect properties.)

B. Mixing and Consistency Determination:

1. Mix full bag of grout in 10 gallon pail.

2. Use electric drill with a paddle device to mix grout (jiffy or jiffler type paddle).

3. Use maximum water allowed per water requirements listed in bag instructions.

4. Mix grout to maximum time listed on bag instructions.

5. In accordance with ASTM C939 (flow cone) determine time of mixed grout through the flow cone. _____ seconds.

6. Add water to attain 20 to 30 second flow in accordance with ASTM C939.

7. Record time of grout through cone at new water demand. _____ seconds

8. Record total water needed to attain 20 to 30 second flow. _____ pounds

9. Record percent of water. _____ percent

C. When fluid grout is specified and additional water is required beyond grout manufacturer's listed maximum water, ASTM C1107/C1107M will be run at new water per grout ratio to determine whether grout passes using actual water requirements to be fluid. Use new water per grout ratio on remaining tests.

D. Bleed Test:

1. Fill two gallon cans half full of freshly mixed grout at ambient temperatures for each category and at required consistency for each.

©COPYRIGHT 2013 CH2M HILL

2. Place one can of grout in tub of ice water and leave one can at ambient temperature.

3. Cover top of both cans with glass or plastic plate preventing evaporation.

4. Maintain 38 degrees F to 42 degrees F temperature with grout placed in ice and maintain ambient temperature for second container for 1 hour.

5. Visually check for bleeding of water at 15-minute intervals for 2 hours.

6. Perform final observation at 24 hours.

If grout bleeds a small amount at temperatures specified, grout will be rejected.

E. Extended Flow Time and Segregation Test (for Category II and Category III):

1. Divide the remaining grout into two 3 gallon cans. Place the cans into the 40-degree F and 100-degree F containers and leave for 20, 40, and 60 minutes. Every 20 minutes remove and check for segregation or settlement of aggregate. Use a gloved hand to reach to the bottom of the can, if more than 1/4-inch of aggregate has settled to the bottom or aggregate has segregated into clumps reject the grout.

2. Right after the settlement test mix the grout with the drill mixer for 10 seconds. Take ASTM C939 flow cone test of grout and record flow time. Maintain this process for 1 hour at ambient temperatures of 40 degrees F and 100 degrees F.

   a. 20 min _____, sec. @ 40 degrees F.

   b. 40 min _____, sec. @ 40 degrees F.

   c. 60 min _____, sec. @ 40 degrees F.

   d. 20 min _____, sec. @ 100 degrees F.

   e. 40 min _____, sec. @ 100 degrees F.

   f. 60 min _____, sec. @ 100 degrees F.

All Category II and Category III grout that will not go through the flow cone with continuous flow after 60 minutes will be disqualified.

_____ Qualified

_____ Disqualified

©COPYRIGHT 2013 CH2M HILL

2. Place one can of grout in tub of ice water and leave one can at ambient temperature.

3. Cover top of both cans with glass or plastic plate preventing evaporation.

4. Maintain 38 degrees F to 42 degrees F temperature with grout placed in ice and maintain ambient temperature for second container for 1 hour.

5. Visually check for bleeding of water at 15-minute intervals for 2 hours.

6. Perform final observation at 24 hours.

If grout bleeds a small amount at temperatures specified, grout will be rejected.

E. Extended Flow Time and Segregation Test (for Category II and Category III):

1. Divide the remaining grout into two 3 gallon cans. Place the cans into the 40-degree F and 100-degree F containers and leave for 20, 40, and 60 minutes. Every 20 minutes remove and check for segregation or settlement of aggregate. Use a gloved hand to reach to the bottom of the can, if more than 1/4-inch of aggregate has settled to the bottom or aggregate has segregated into clumps reject the grout.

2. Right after the settlement test mix the grout with the drill mixer for 10 seconds. Take ASTM C939 flow cone test of grout and record flow time. Maintain this process for 1 hour at ambient temperatures of 40 degrees F and 100 degrees F.

   a. 20 min _____, sec. @ 40 degrees F.

   b. 40 min _____, sec. @ 40 degrees F.

   c. 60 min _____, sec. @ 40 degrees F.

   d. 20 min _____, sec. @ 100 degrees F.

   e. 40 min _____, sec. @ 100 degrees F.

   f. 60 min _____, sec. @ 100 degrees F.

All Category II and Category III grout that will not go through the flow cone with continuous flow after 60 minutes will be disqualified.

_____ Qualified

_____ Disqualified

©COPYRIGHT 2013 CH2M HILL

F. 24-hour Strength Test:

1. Using grout left in mixing cans in accordance with ASTM C1107/C1107M for mixing and consistency determination test and for extended time flow test, make minimum of nine cube samples.

2. Store cubes at 70 degrees F for 24 hours.

3. Record average compressive strength of nine cubes at 24 hours.

Grout will be disqualified if 24-hour compressive strengths are less than 2,500 psi for grouts claiming fluid placement capabilities.

Grouts that have not been disqualified after these tests are qualified for use on the Project for the application indicated in Nonshrink Grout Schedule.

M. WPS: Welding Procedure Specification.

1.03 SUBMITTALS

A. Shop Drawings:

1. Shop and field WPSs and PQRs.
2. NDT procedure specifications prepared in accordance with ASME BPVC SEC V.
3. Welding Data (Shop and Field): Submit welding data together with shop drawings as a complete package.
    a. Show on Shop Drawings or a weld map complete information regarding base metal specification designation, location, type, size, and extent of welds with reference called out for WPS and NDE numbers in tails of combined welding and NDE symbols as indicated in AWS A2.4.
    b. Distinguish between shop and field welds.
    c. Indicate, by welding symbols or sketches, details of welded joints and preparation of base metal. Provide complete joint welding details showing bevels, groove angles, and root openings for welds.
    d. For pipe fittings, provide a joint weld beveling diagram. Refer to AWS D1.1/D1.1M, Annex P Local Dihedral Angle that can be used to calculate bevels for weld joint details of intersecting pipes.
    e. Welding and NDE symbols shall be in accordance with AWS A2.4.
    f. Welding terms and definitions shall be in accordance with AWS A3.0.

B. Informational Submittals:

1. WPQs.
2. CWI credentials.
3. Testing agency personnel credentials.
4. CWI reports.
5. Welding Documentation: Submit on forms in referenced welding codes.

1.04 QUALIFICATIONS

A. WPSs: In accordance with [AWS D1.1/D1.1M (Annex N Forms)] for shop or field welding; or ASME BPVC SEC IX (Forms QW-482 and QW-483) for shop welding only.] [_____].

B. WPQs: In accordance with [AWS D1.1/D1.1M (Annex N Forms) ; or ASME BPVC SEC IX (Form QW-484)] [_____].

C. CWI: Certified in accordance with AWS QC1, and having prior experience with specified welding codes. Alternate welding inspector qualifications require approval by Engineer.

D. Testing Agency: Personnel performing tests shall be NDT Level II certified in accordance with ASNT SNT-TC-1A.

1.05 SEQUENCING AND SCHEDULING

A. Unless otherwise specified, Submittals required in this section shall be submitted and approved prior to commencement of welding operations.

PART 2 - PRODUCTS

2.01 SOURCE QUALITY CONTROL

A. CWI shall be present whenever shop welding is performed. CWI shall perform inspection, as necessary, prior to assembly, during assembly, during welding, and after welding. CWI shall perform inspections as required in AWS D1.1/D1.1M or referenced welding code and as follows:

1. Verifying conformance of specified job material and proper storage.
2. Monitoring conformance with approved WPS.
3. Monitoring conformance of WPQ.
4. Inspecting weld joint fit-up and performing in-process inspection.
5. Providing 100 percent visual inspection of welds.
6. Supervising nondestructive testing personnel and evaluating test results.
7. Maintaining records and preparing report confirming results of inspection and testing comply with the Work.

©COPYRIGHT 2013 CH2M HILL

PART 3 - EXECUTION

3.01 GENERAL

A. Welding and Fabrication by Welding: Conform to governing welding codes referenced in attached Welding and Nondestructive Testing Table.

B. [Welding procedure specifications [for pressure piping] [_____] shall be qualified for notch toughness by limiting heat input; charpy testing of weld metal and heat-affected zone shall be done as a part of the welding procedure qualification. Full-size specimens shall be charpy tested in accordance with ASTM A370 at a test temperature of [30 degrees F] [_____]. The minimum average energy of the test coupons shall not be less than [25 foot-pounds] [_____].]

3.02 NONDESTRUCTIVE WELD TESTING REQUIREMENTS

A. Weld Inspection Criteria:

1. Selection of welds to be tested, unless 100 percent NDT is specified herein, shall be as agreed upon between Engineer and Contractor.
2. Unless otherwise specified, perform NDT of welds at a frequency as shown below and in the attached Table in accordance with referenced welding codes as follows. Perform UT on CJP groove welds that cannot be readily radiographed. In case there is a conflict, higher frequency level of NDT shall apply.
   a. CJP Groove, Butt Joint Welds: [10 percent random RT] [_____].
   b. All other CJP Groove Welds: [10 percent random UT] [_____].
   c. Fillet Welds and PJP Groove Welds: [10 percent random PT or MT] [_____].
   d. All Welds: 100 percent VT.
3. Weld Acceptance:
   a. VT:
      1) Structural Pipe and Tubing: AWS D1.1/D1.1M, Paragraph 6.9, Visual Inspection, Tubular Connections.
      2) All Other Structural Steel: AWS D1.1/D1.1M, Paragraph 6.9, Visual Inspection, Statically Loaded Nontubular Connections.
      3) Stud Connections: AWS D1.1/D1.1M, Paragraph 7.8.1.
   b. UT: Perform on CJP groove welds in accordance with AWS D1.1/D1.1M, Paragraph 6.13.3, Class R Indications.
   c. RT: Perform on CJP butt joint welds in accordance with AWS D1.1/D1.1M, Paragraph 6.12.1.
   d. PT or MT:

©COPYRIGHT 2013 CH2M HILL

1) Perform on fillet and PJP groove welds in accordance with AWS D1.1/D1.1M, Paragraph 6.10.
2) Acceptance shall be in accordance with VT standards specified above.

3.03 FIELD QUALITY CONTROL

A. CWI shall be present whenever field welding is performed. CWI shall perform inspection, as necessary, prior to assembly, during assembly, during welding, and after welding. CWI shall perform inspections as required in AWS D1.1/D1.1M or referenced welding code and as follows:

1. Verify conformance of specified job material and proper storage.
2. Monitor conformance with approved WPS.
3. Monitor conformance of WPQ.
4. Inspect weld joint fit-up and perform in-process inspection.
5. Provide 100 percent visual inspection of all welds.
6. Supervise nondestructive testing personnel and evaluating test results.
7. Maintain records and prepare report confirming results of inspection and testing comply with the Work.

3.04 WELD DEFECT REPAIR

A. Repair and retest rejectable weld defects until sound weld metal has been deposited in accordance with appropriate welding codes.

3.05 SUPPLEMENTS

A. The supplement listed below, following “End of Section,” is a part of this Specification.

1. Welding and Nondestructive Testing Table.

1.02 SUBMITTALS

A. Action Submittals:

1. Provide Shop Drawing details showing:
   a. Erection plans.
   b. Members, including piece numbers, sizes, grades, dimensions, cambers, and connection details.
   c. Anchor bolt layouts.
   d. Hardened washer details.
   e. Joint details for complete penetration welds.
2. Product specifications, including primer and other coatings.
3. [Designation of the members and connections that are part of the seismic load resisting system (SLRS).
4. Connection material specifications.
5. Location of demand critical shop welds.
6. Locations and dimensions of protected zones.
7. Gusset plates drawn to scale when they are detailed to accommodate inelastic rotation.
8. Welding requirements as specified in AISC 341 Appendix W, Section W2.2.]

©COPYRIGHT 2013 CH2M HILL

B. Informational Submittals:

1. [Schedule for submittal of shop and erection drawings.]
2. Name and address of manufacturer(s).
3. Mill Certificates of tests made in accordance with ASTM A6/A6M.
4. Manufacturers' testing procedures and standards.
5. Preparation and installation or application instructions, as appropriate.
6. Proposed method to resolve misalignment between anchor bolts and bolt holes in steel members.
7. High-Strength Bolts (Plain Noncoated and Hot-Dip Galvanized):
   a. Manufacturer's Certificate of Compliance, in accordance with Section 01 43 33, Manufacturers' Field Services that products meet specified chemical and mechanical requirements.
   b. Manufacturer's inspection test report results for production lot(s) furnished, to include:
      1) Tensile strength.
      2) Yield strength.
      3) Reduction of area.
      4) Elongation and hardness.
   c. Certified Mill Test Reports for Bolts and Nuts:
      1) Name and address of manufacturer.
      2) Bolts correctly marked.
      3) Marked bolts and nuts used in required mill tests and manufacturer's inspection tests.
8. Direct Tension Indicators (DTIs): Manufacturer's test report meeting requirements of ASTM F959.
9. Tension Control (TC) Bolts: Manufacturer's test report meeting requirements of ASTM A325 and ASTM F1852.
10. Welding Procedures, Qualifications, and Inspection Reports: As specified in Section 05 05 23, Welding.
11. [Hot-Dip Galvanizing: Certificate of compliance signed by galvanizer with description of material processed and ASTM standard used for coating.]
12. [AISC Quality Certification: AISC certificate showing name and address of certified firm, effective date, and category of certification; or, for erectors, documentation of similar project experience to include project name, location, date of completion, and name and phone number of owner's contact person.]
13. Charpy V-notch test results.
14. Nondestructive Testing (NDT) report.

©COPYRIGHT 2013 CH2M HILL

1.03 QUALITY ASSURANCE

A. Qualifications:

1. Welding qualifications as specified in Section 05 05 23, Welding.

1. [Galvanized Coating Applicator: Company specializing in hot-dip galvanizing after fabrication and following procedures of AGA's Quality Assurance Manual.]

B. Certifications:

1. Mill identification marks, heat number, size of section, and length in accordance with ASTM A6/A6M.
2. [AISC Quality Certification for Fabricator: Standard for Steel Building Structures (STD).]
3. [AISC Quality Certification as Certified Steel Erector (CSE) [, or documented experience in erection of at least five similar structural steel facilities over past 10 years in lieu of AISC certification].]

1.04 DELIVERY, STORAGE, AND HANDLING

A. Delivery: Load structural members in such a manner that they will be transported and unloaded without damage to coatings and without being excessively stressed, deformed, or otherwise damaged.

B. Storage:

1. Protect structural steel members and packaged materials from corrosion and deterioration.
2. Store in dry area and not in direct contact with ground.
3. Protect fasteners from dirt and moisture. Do not remove lubricant from bolts and nuts.

C. Handle materials to avoid distortion or damage to members or supporting structures.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Rolled Plates, Shapes except W-Shapes and Bars: ASTM [A36/A36M] [or] [A572/A572M, Grade 50], unless indicated otherwise.

B. W-Shapes: ASTM A992/A992M, unless indicated otherwise on Drawings.

©COPYRIGHT 2013 CH2M HILL

C. Steel Pipe: ASTM A53/A53M, Grade B.

D. Round Hollow Structural Sections (HSS): ASTM A500/A500M, Grade B (Fy equals 42 ksi).

E. Square and Rectangular Hollow Structural Sections (HSS): ASTM A500/A500M, Grade B (Fy equals 46 ksi).

F. [For hot-dip galvanized steel that is exposed to view and does not receive paint, limit combined phosphorus and silicon content to 0.04 percent. For steels that require a minimum of 0.15 percent silicon, such as plates over 1.5 inches thick for ASTM A36/A36M and ASTM A572/A572M steels, limit maximum silicon content to 0.21 percent and phosphorous content to 0.03 percent].

2.02 FASTENERS

A. Anchor Bolts: As specified in Section 05 50 00, Metal Fabrications.

B. High-Strength Bolts:

1. ASTM A325 or ASTM A490, bolt Type [1, plain uncoated] [_____].
2. Bolt Length and Thread Length: As required for connection type shown, with hardened washers as required.

C. Direct Tension Indicators (DTIs) or Load Indicator Washers:

1. ASTM F959, coating type to match bolt finish.
2. Type A325 or A490, to match bolt type.
3. Manufacturers and Products:
4. TurnaSure LLC, Langhorne, PA; DTIs.
   a. Applied Bolting Technology Products, Ludlow, VT; DTIs, regular or Squirter type.

D. Tension Control (TC) Bolts:

1. High-strength, ASTM A325 and ASTM F1852.
2. Manufacturers:
   a. LeJeune Bolt Company, Burnsville, MN.
   b. Nucor Fastener, Saint Joe, IN.
   c. Haydon Bolts, Philadelphia, PA.
   d. Vermont Fasteners Manufacturing, Swanton, VT.

E. Nuts: ASTM A563, type to match bolt type and finish.

©COPYRIGHT 2013 CH2M HILL

F. Hardened Steel Flat and Beveled Washers: ASTM F436, type to match bolt finish.

G. Welded Shear Studs: As specified in Section 05 50 00, Metal Fabrications.

2.03 ANCILLARY MATERIALS

A. Surface Preparation and Primer: As specified in Section 09 90 00, Painting and Coating.

B. Grout: As specified in Section 03 62 00, Nonshrink Grouting.

2.04 FABRICATION

A. General:

1. Fabricate as shown and in accordance with AISC 360 and AISC 303.
2. Columns shall be full length members without splices, unless shown otherwise or approved by Engineer.
3. Mark and match mark materials for field assembly.
4. Complete assembly, including bolting and welding of units, before start of finishing operations.
5. Fabricate to agree with field measurements.
6. [Provide camber as indicated on Drawings.]
7. [Fillet re-entrant cuts and corners to radius of not less than 1/2 inch.]
8. [Sheared and flame-cut edges shall be free from rough corners and projections.]

B. Connections:

1. Shop Connections: Weld or bolt as shown on Drawings.
2. Meet requirements of AISC 325 for bolted double-angle shear connections, unless indicated otherwise.
3. Meet OSHA requirements for one independent bolt at beams framing in to column web connections.
4. [Provide oversized holes for anchor bolts in column baseplate in accordance with AISC 325, unless indicated otherwise.]

C. Welded Construction:

1. As specified in Section 05 05 23, Welding.
2. Groove and Butt Joint Welds: Complete penetration, unless otherwise indicated.

©COPYRIGHT 2013 CH2M HILL

D. [Preheating of Heavy Shapes and Plates:]

1. [For ASTM A6/A6M, steel shapes and plates thicker than 2 inches.]
2. [Minimum Preheat Temperature:]
   a. [Groove Weld Splices: 350 degrees F.]
   b. [Thermal Cutting of Beam Copes and Weld Access Holes: 150 degrees F.]

E. Interface with Other Work:

1. Holes:
   a. As necessary or as indicated for securing other Work to structural steel framing, and for passage of other Work through steel framing members shall be approved by Engineer.
   b. No flame-cut holes are permitted without prior approval of Engineer.
2. Weld threaded nuts to framing members, and other specialty items to receive other Work.

F. [Architecturally Exposed Structural Steel (AESS): Fabricate in accordance with AISC 303, Section 10.]

2.05 FINISHES

A. Shop Paint Primer:

1. Surface Preparation and painting as specified in Section 09 90 00, Painting and Coating.
2. Do not shop prime the following surfaces, unless indicated otherwise:
   a. Faying surfaces of slip critical bolted connections.
   b. Within 2 inches of field-welded connections.
   c. Steel members to be completely encased in reinforced concrete or coated with cementitious fireproofing.
3. Apply shop primer to top flange surfaces of composite steel beams, unless indicated otherwise.
4. [Shop primer for steel members to be coated with intumescent fireproofing shall be compatible with specified fireproofing.]

B. [Galvanizing:

1. Fabricate steel to be galvanized in accordance with ASTM A143/A143M, ASTM A384/A384M, and ASTM A385/A385M. Avoid fabrication techniques that could cause distortion or embrittlement of steel.

©COPYRIGHT 2013 CH2M HILL

2. Remove welding slag, splatter, burrs, grease, oil, paint, lacquer, and other deleterious material prior to delivery for galvanizing.
3. Remove by blast cleaning or other methods surface contaminants and coatings not removable by normal chemical cleaning process in galvanizing operation.
4. Hot-dip galvanize steel members, fabrications, and assemblies after fabrication in accordance with ASTM A123/A123M.
5. Hot-dip galvanize ASTM A325 bolts, nuts, washers, and hardware components in accordance with ASTM A153/A153M. Oversize holes to allow for zinc alloy growth. Shop-assemble bolts, nuts, and washers with special lubricant and test in accordance with ASTM A325 and ASTM A563.
6. Mechanically zinc coat tension-control (TC) bolts, nuts, and washers in accordance with ASTM F1852 and ASTM B695, Class 50.
7. Galvanize components of bolted assemblies separately before assembly.]

C. Slip Critical Bolted Connections:

1. Mask faying surfaces of slip critical (SC) bolted connections to be shop painted as specified in Section 09 90 00, Painting and Coating.
2. [Roughen galvanized faying surfaces with hand wire brushing.]

D. [Fully Tensioned Bolted Connections:

1. Provide Class A faying surface. Mask faying surfaces of fully tensioned (FT) bolted connections to be shop painted as specified in Section 09 90 00, Painting and Coating.
2. Exclude threads from shear plane, unless approved by Engineer.]

2.06 SOURCE QUALITY CONTROL

A. [Charpy V-notch test for ASTM A6/A6M shapes with flanges 1-1/2 inches thick and thicker, or built up cross section consisting of plates with thickness exceeding 2 inches, in accordance with the following:

1. ASTM A6/A6M, Supplementary Requirement S30.
   a. Minimum average value of 20 foot-pounds absorbed energy at 70 degrees F.
   b. Tested in alternate core location.]
2. [Charpy V-notch test for ASTM A6/A6M shapes with flanges 2 inches thick and thicker, in accordance with the following:
   a. ASTM A6/A6M, Supplementary Requirement S30.

©COPYRIGHT 2013 CH2M HILL

b. Minimum average value of 20 foot-pounds absorbed energy at 70 degrees F.
c. Tested in the alternate core location.]

B. [Heavy Shapes and Plates: [Thermally cut surfaces of beam copes and weld access holes shall be inspected and tested by an independent testing agency, retained by [Owner] [Contractor and approved by Engineer] [, in accordance with AISC 360, Paragraph J1.6.]

C. Welding:

1. Visually inspect fabrication welds in accordance with AWS D1.1/D1.1M, Section 6 and Table 6.1, Visual Inspection Acceptance Criteria.
2. An independent testing agency [will be retained by Owner] [shall be retained by Contractor and approved by Engineer] to perform the following inspection and testing of fabrication welds as specified in Section 05 05 23, Welding.
   a. Groove welds:
      1) Radiographic (RT) or ultrasonic (UT) testing for [10] [_____] percent of randomly selected welds, unless otherwise indicated.
      2) Use RT only for butt joint groove welds.
   b. Fillet Welds Larger than 5/16-inch: Liquid penetrant (PT) or magnetic particle (MT) for 10 percent of randomly selected welds, unless otherwise indicated.
   c. All Welds: 100 percent visually inspected (VT).
3. Repair and retest defective welds as specified in Section 05 05 23, Welding.

D. [Special inspection of fabrication process and shop welding will be provided by Owner as indicated on Drawings.]

E. [Hot-Dip Galvanizing:]

1. [An independent testing agency [, will be retained by Owner] [, shall be retained by Contractor and approved by Engineer] to inspect and test hot-dip galvanized fabricated items [, except _____] in accordance with ASTM A123/A123M and ASTM A153/A153M.]
2. [Visually inspect and test for thickness and adhesion of zinc coating for minimum of three test samples from each lot in accordance with ASTM A123/A123M and ASTM A153/A153M.]
3. [Reject and retest nonconforming articles in accordance with ASTM A123/A123M and ASTM A153/A153M.]

©COPYRIGHT 2013 CH2M HILL

PART 3 - EXECUTION

3.01 ERECTION

A. General:

1. Meet requirements of AISC 360 and AISC 303, with exceptions as specified.
2. Install Contractor-designed temporary construction bracing to provide necessary support until components are in place and construction is complete.
3. Provide additional field connection material as required by AISC 303.
4. Splice members only where indicated and accepted on Shop Drawings.
5. [Architecturally Exposed Structural Steel (AESS): Erect in accordance with AISC 303, Section 10.]

B. Field Assembly:

1. Clean bearing surfaces and other surfaces that will be in permanent contact before assembly.
2. Set structural frames accurately to lines and elevations shown.
3. Align and adjust various members forming a part of a complete frame or structure before permanently fastening.
4. Level and plumb individual members of structure within tolerances shown in AISC 303.
5. Establish required leveling and plumbing measurements on mean operating temperature of structure. Make allowances for difference between temperature at time of erection and mean temperature at which structure will be completed and in service.
6. Perform necessary adjustments to compensate for minor discrepancies in elevations and alignment.

C. Setting Baseplates and Bearing Plates:

1. Clean concrete and masonry bearing surfaces of bond reducing materials and roughen to improve bond to surfaces.
2. Clean bottom surface of baseplates and bearing plates.
3. Set loose and attached baseplates and bearing plates for structural members on wedges, shims, leveling nuts, or other adjustable devices. Use leveling plates where indicated.
4. Tighten anchor bolts after supported members have been positioned and plumbed. Do not remove wedges or shims, but if protruding, cut off flush

©COPYRIGHT 2013 CH2M HILL

with edge of base or bearing plate prior to placing grout. Weld plate washer to baseplate where indicated.

5. Grout Under Baseplate: As specified in Section 03 62 00, Nonshrink Grouting, prior to placing loads on structure.

D. Anchor Bolts:

1. Coordinate installation of anchor bolts and other connectors required for securing structural steel to in-place work.
2. Provide templates and other devices for presetting bolts and other anchors to accurate locations.
3. Projection of anchor bolts beyond face of concrete and threaded length shall be adequate to allow for full engagement of threads of hold-down nuts, adjustment of leveling nuts, washer thicknesses, and construction tolerances, unless indicated otherwise.
    a. Placement Tolerances:
    b. As required by AISC 303, unless indicated otherwise.
    c. Embedded anchor bolts shall not vary from dimensions shown on Drawings by more than the following:
        1) Center to center of any two bolts within an anchor group: 1/8 inch.
        2) Center to center of adjacent anchor bolt groups: 1/4 inch.
        3) Variation from perpendicular to theoretical bearing surface: 1:50.

E. Connections:

1. High-Strength Bolted:
    a. Tighten in accordance with RCSC Specification for Structural Joints Using ASTM A325 or ASTM A490 Bolts.
    b. Hardened Washers:
        1) Provide at locations required by Washer Requirements section of RCSC Specification for Structural Joints Using ASTM A325 or ASTM A490 Bolts, to include slip critical connections using slotted or oversized holes or ASTM A490 bolts.
        2) Use beveled style and extra thickness where required by RCSC Specification.
        3) Use square or rectangular beveled washers at inner flange surfaces of American Standard beams and channels.
        4) Do not substitute DTIs for hardened flat washers required at slotted and oversize holes.

©COPYRIGHT 2013 CH2M HILL

a) For bearing-type connections not fully tensioned (N, X), tighten to snug tight condition. Use hardened washer over slotted or oversize holes in outer plies.

5) Fully Tensioned Bolted:

c. Use DTIs or TC bolts at slip critical (SC) and fully tensioned (FT) bearing-type connections.

d. DTIs:

1) Position within bolted assembly in accordance with ASTM F959.

2) Install bolts, with DTIs plus hardened washers as required, in holes of assembly and tighten until plies are in firm contact and fasteners are uniformly snug tight.

e. Final tightening bolts begin at most rigid part of bolted connection and progress toward free edges until final twist off of TC bolts or until DTIs have been compressed to an average gap equal to or less than shown in ASTM F959, Table 2.

2. Welded:

a. As specified in Section 05 05 23, Welding.

b. Groove and Butt Joint Welds: Complete penetration, unless otherwise indicated.

3.02 MISFITS

A. At Bolted Connections:

1. Immediately notify Engineer for approval of one of the following methods of correction:

a. Ream holes that must be enlarged to admit bolts and use oversized bolts.

b. Plug weld misaligned holes and redrill holes to admit standard size bolts.

c. Drill additional holes in connection, conforming to AISC for bolt spacing and end and edge distances, and add additional bolts.

d. Reject member containing misfit, incorrect sized, or misaligned holes and fabricate new member to ensure proper fit.

1) Do not enlarge incorrectly sized or misaligned holes in members by burning or by use of drift pins.

B. At Anchor Bolts:

1. Resolve misalignments between anchor bolts and bolt holes in steel members in accordance with approved Shop Drawing.

©COPYRIGHT 2013 CH2M HILL

2. Do not flame cut to enlarge holes without prior approval of Engineer.

C. Gas Cutting:

1. Do not use gas cutting torches in field for correcting fabrication errors in structural framing.
2. Secondary members not under stress and concealed in finished structure may be corrected by gas cutting torches, if approved by Engineer.

2. Finish flame-cut sections equivalent to sheared and punched appearance.

3.03 REPAIR AND CLEANING

A. Clean shop primer from field welds, bolted connections, and abraded areas immediately after erection.

B. Remove and grind smooth tack welds, fit-up-lugs, and weld runoff tabs.

C. Remove weld back-up bars and grind smooth where indicated on Drawings.

D. Apply touchup paint primer by brush or spray of same thickness and material as that used in shop application and as specified in Section 09 90 00, Painting and Coating.

E. [Hot-Dip Galvanized Coating Repair:

1. Conform to ASTM A780/A780M.
2. For minor repairs at abraded areas, use sprayed zinc conforming to ASTM A780/A780M.
3. For flame cut or welded areas, use zinc-based solder, or zinc sticks, conforming to ASTM A780/A780M.
4. Use magnetic gauge to determine thickness is equal to or greater than base galvanized coating.]

3.04 FIELD QUALITY CONTROL

A. High-Strength Bolted Connections:

1. An independent testing agency [will be retained by Owner] [shall be retained by Contractor and approved by Engineer] to perform the following inspection and testing in accordance with the RCSC Specification for Structural Joints Using ASTM A325 or ASTM A490 Bolts:
   a. Marking identification and conformance to ASTM standards.
   b. Alignment of bolt holes.

©COPYRIGHT 2013 CH2M HILL

c. Placement, type, and thickness of hardened washers.
d. Tightening of bolts.

B. Bearing-Type Connections Not Fully Tensioned (N, X): Snug tight condition with plies of joint in firm contact.

1. Fully Tensioned (FT) Bearing and Slip Critical (SC) Connections:
   a. Conduct preinstallation test.
   b. Monitor installation and tightening of DTIs or TC bolts.
   c. Monitor condition of faying surfaces for slip critical connections.
2. Preinstallation Test:
   a. Conduct test in accordance with Specification for Structural Joints Using ASTM A325 or ASTM A490 bolts prior to using bolt tension measuring device.
   b. Select representative sample of not less than three bolts of each diameter, length, and grade.
   c. Include DTIs and flat hardened washers as required to match actual connection assembly.
3. Nondestructive Testing (NDT): Inspect bolted connections and perform corrections as required to meet code acceptance criteria per RCSC Specification for Structural Joints Using ASTM A325 or ASTM A490 Bolts.
4. Defective Connections: Correct and reinspect defective and improperly tightened high-strength bolted connections. Retest fully tensioned bolts as necessary to demonstrate compliance of completed work.

C. Welded Connections:

1. Visually inspect field welds in accordance with AWS D1.1/D1.1M, Section 6 and Table 6.1, Visual Inspection Acceptance Criteria.
2. An independent testing agency [will be retained by Owner] [shall be retained by Contractor and approved by Engineer] to perform the following inspection and testing of field welds as specified in Section 05 05 23, Welding.
   a. Groove Welds:
      1) Radiographic (RT) or ultrasonic (UT) testing for [10] [_____] percent of randomly selected welds, unless otherwise indicated.
      2) Use RT only for butt joint groove welds.
   b. Fillet Welds Larger Than 5/16 Inch: Liquid penetrant (PT) or magnetic particle (MT) for 10 percent of randomly selected welds, unless otherwise indicated.

©COPYRIGHT 2013 CH2M HILL

c. All Welds: 100 percent visually inspected (VT).

3. Repair and retest defective welds as specified in Section 05 05 23, Welding.

D. [Special inspection will be provided by Owner as indicated on Drawings.]

E. [Welded Shear Studs: Inspect and test welded shear studs as specified in Section 05 50 00, Metal Fabrications.]

PART 1 - GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. American Institute of Steel Construction (AISC):
   a. Specification for Structural Steel Buildings-Allowable Stress Design and Plastic Design.
   b. Allowable Stress Design Specification for Structural Joints using ASTM A325 or A490 Bolts.
   c. Code of Standard Practice for Steel Buildings and Bridges.
2. American Welding Society (AWS): D1.1, Structural Welding Code - Steel.
3. Steel Joist Institute (SJI):
   a. Standard Specifications and Load Tables:
      1) Open-Web Steel Joists, K-Series.
      2) Long Span Steel Joists, LH-Series, and Deep Long Span Steel Joists, DLH-Series.
      3) Super Longspan Steel Joists, SLH-Series.
      4) Joist Girders.
   b. Recommended Code of Standard Practice for Steel Joists and Joist Girders.

1.02 SUBMITTALS

A. Action Submittals:

1. Plan view layout of joists and bridging.
2. Elevation view of each type of joist showing configuration, chord and web member sizes, panel point dimensions, and chord extensions.
3. Connection and bearing details.
4. Special joist reinforcing and connections for supported items, such as monorails and mechanical equipment.
5. Bridging member sizes and connection details.
6. Complete design, including stress and deflection calculations, for joists, joist members, and connections for design load and equipment weight as indicated, plus any construction loads applied by CONTRACTOR’s operations.

©COPYRIGHT 2013 CH2M HILL

7. Calculations shall include check of joist chord bending stresses for concentrated loads applied between panel points.
8. Registered Professional ENGINEER's stamp, valid in same state as Project, on structural calculations.
9. Procedure for handling, erection, and bracing of steel joists.

B. Informational Submittals:

1. Joist manufacturer's installation requirements.
2. Welding Procedures, Qualifications, and Inspection Report: As specified in Section 05 05 23, Welding.

1.03 QUALITY ASSURANCE

A. General: Design and fabricate steel joists and bridging to meet requirements of SJI Standard Specifications and Load Tables.

B. Certification: SJI Membership, with certification for joist types as indicated on Drawings.

C. Qualifications for Field Welding: As specified in Section 05 05 23, Welding.

1.04 DELIVERY, STORAGE, AND HANDLING

A. Protect from corrosion, deformation, and other damage during delivery, storage, and handling.

B. Protect joist paint system from abrasion at steel bands and other joists.

C. Store joists and bridging off ground on wood sleepers.

D. Support joists so there is no danger of tipping, sliding, rolling, shifting or material damage.

PART 2 - PRODUCTS

2.01 STEEL JOISTS AND BRIDGING

A. Provide type of joist, chord configuration, and depth as indicated on Drawings.

B. Design and Manufacture:

1. In accordance with the applicable SJI Standard Specifications.
2. Chord Members: Rolled double angle sections only.

©COPYRIGHT 2013 CH2M HILL

3. Provide the following where indicated, in accordance with SJI Standard Specifications and Load Tables:
   a. Bottom chord bracing and end anchorage for uplift design criteria.
   b. Ceiling extension to within 1 inch of finished wall surface, unless otherwise indicated.
   c. Top chord extension, [S type,] [R type,] unless otherwise indicated.
   d. Bottom chord extension and stabilizer plates for joist girders.
   e. Full camber, unless otherwise indicated.

C. Joist Bridging:

1. In accordance with applicable SJI Standard Specifications for type of joist.
2. Furnish bridging of minimum size and type as indicated.
3. Provide anchorage connection to walls and girders at bridging lines as indicated.

2.02 SHOP PRIMER

A. [Surface Preparation and Primer: As specified in Section 09 90 00, Painting and Coating].

B. [Apply one shop coat of rust-inhibitive primer in accordance with SJI Standard Specifications.]

1. [Remove loose scale, rust, and slag from welds before painting.]
2. [Apply primer within 8 hours after surface preparation.]

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine supporting framing and field conditions for compliance with requirements for installation tolerances and other conditions affecting performance of steel joists.

3.02 INSTALLATION

A. Erection: SJI Standard Specifications and approved shop drawings.

B. Welded Connections: As specified in Section 05 05 23, Welding.

C. [High-Strength Bolted Connections: Install as specified in Section 05 12 00, Structural Steel Framing.]

©COPYRIGHT 2013 CH2M HILL

3.03 TOUCHUP PAINTING

A. Immediately following erection, remove debris from completed installation.

B. Clean field welds, bolted connections, rust spots, and abraded areas.

C. Repair damaged painted and galvanized surfaces as specified in Section 09 90 00, Painting and Coating.

3.04 FIELD QUALITY CONTROL

A. Welding:

1. [Visually inspect field welds in accordance with AWS D1.1, Section 6 and Table 6.1, Visual Inspection Acceptance Criteria.]
2. [An independent testing agency [will be retained by OWNER] [shall be retained by CONTRACTOR and approved by ENGINEER] to visually inspect field welded connections in accordance with AWS D1.1, Table 6.1, and as specified in Section 05 05 23, Welding.]
3. Repair defective welds as specified in Section 05 05 23, Welding.

B. [High-Strength Bolted Connections:

1. An independent testing agency [will be retained by OWNER] [shall be retained by CONTRACTOR and approved by ENGINEER] to perform inspection and testing in accordance with the AISC Specification for Structural Joints Using ASTM A325 or ASTM A490 Bolts.
2. Inspect and test as specified in Section 05 12 00, Structural Steel Framing.]

C. [Special inspection will be provided by OWNER where indicated on Drawings.]

SECTION 05 31 00
STEEL DECKING

PART 1 - GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. American Iron and Steel Institute (AISI): Specifications for the Design of Cold Formed Steel Structural Members.
2. American Welding Society (AWS): D1.3, Structural Welding Code - Sheet Steel.
3. ASTM International (ASTM):
   a. A611, Standard Specification for Structural Steel (SS), Sheet, Carbon, Cold-Rolled.
   b. A653, Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
   c. A780, Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings.
   d. A924, Standard Specification for General Requirements for Steel Sheet, Metallic-Coated by the Hot-Dip Process.
4. Steel Deck Institute (SDI):
   a. Design Manual for Composite Decks, Form Decks and Roof Decks.
   b. Diaphragm Design Manual.
5. Factory Mutual (FM):
   a. Factory Mutual Approval Guide.
   b. FM Research Corporation (FMRC): Approval Requirements for Steel Roof Deck Construction.
6. International Code Council Evaluation Service, Inc. (ICC-ES): Evaluation Reports for Deck Fasteners.
7. Underwriters Laboratories, Inc. (UL): Fire Resistance Directory.

1.02 SUBMITTALS

A. Action Submittals:

1. Plan view layout of decking showing type and section properties of deck panels, reinforcing channels, pans, special jointing, and accessories.
2. Location of openings, deck laps, and deck attachment details.

©COPYRIGHT 2013 CH2M HILL

3. [Location of temporary shoring for placement of concrete topping.]

B. Informational Submittals:

1. Decking manufacturer's installation requirements.
2. Welding Procedures, Qualifications, and Inspection Report: As specified in Section 05 05 23, Welding.
3. Operation manuals for mechanical fastener installation tools.
4. Manufacturer's Certificate of Compliance, in accordance with Section 01 33 00, Submittal Procedures.

1.03 QUALITY ASSURANCE

A. General: For metal decking section properties, meet requirements of AISI Specifications for Design of Cold-Formed Steel Structural Members.

B. FM Requirements:

1. Steel Roof Deck: Listed in Factory Mutual "Approval Guide" for Class 1 fire rating and [Class 1-90] [_____] wind uplift rating.
2. Mechanical Fasteners: Packing containers shall show name of manufacturer and product and FMRC approval mark.

C. Qualifications for Field Welding: As specified in Section 05 05 23, Welding.

1.04 DELIVERY, STORAGE, AND HANDLING

A. Protect steel deck from corrosion, deformation, and other damage during delivery, storage, and handling.

B. Store deck bundles on platforms or pallets, with one end elevated to provide drainage.

C. Protect bundles against condensation with a ventilated waterproof covering.

D. Stack bundles so there is no danger of tipping, sliding, rolling, shifting or material damage.

E. [Architecturally exposed deck shall be appropriately packaged and protected to prevent damage during shipment.]

©COPYRIGHT 2012 CH2M HILL

PART 2 - PRODUCTS

2.01 METAL DECKING

A. Provide metal deck as shown in the following schedule:

Steel Deck Schedule								
Type	**Depth (in)**	**Panel Width (in)**	**Design Thickness (in)**	**Min. Yield Strength Fy (ksi)**	**Min. (+) S (in^3/ft)**	**Min. I (in^4/ft)**	**Minimum Diaphragm Shear Capacity (lbs/ft)**	**Finish**
Roof Deck	[1-1/2] [3]	[36] [24]	[0.0358] [_____]	[33] [_____]	[0.23] [0.48] [_____]	[0.21] [0.84] [_____]	[400] [_____]	[Galv, G-60] [Galv, G-90]
Composite Floor Deck	[3] [2]	[36] [24]	[0.0358] [_____]	[A:33] [_____]	[0.53] [0.36] [	[0.90] [0.42] [	[1,600] [_____]	[Galv, G-60] [
Non-composite Form	[1-5/16] [_____]	[36] [32]	[0.0358] [_____]	[A:80] [_____]	[0.19] [_____]	[0.14] [_____]	[N/A] [_____]	[Galv, G-60] [

B. Materials and Finishes:

1. Galvanized Deck:
   a. Sheet steel for galvanized deck and accessories shall conform to ASTM A653 Structural Quality Grade 33 or higher, as shown in Steel Deck Schedule.
   b. Galvanizing shall conform to ASTM A924 with coating class of G60 or G90 as defined in ASTM A653 and as shown in Steel Deck Schedule.
2. [Painted Deck:]
   a. [Sheet steel for primer painted roof deck and accessories shall conform to ASTM A611 with minimum yield strength of 33, or higher as indicated.]
   b. [Steel deck shall have a coat of manufacturer's standard rust-inhibitive primer.]
3. [Vented Form Deck:
   a. Use galvanized noncomposite form deck for use with insulating concrete fill, unless indicated otherwise.

©COPYRIGHT 2013 CH2M HILL

b. Manufacturer's standard vent slots shall provide 1-1/2-percent minimum open area.]

C. Manufacturers:

1. Vulcraft Division of Nucor Co., Brigham City, UT.
2. BHP Steel Building Products, USA, Inc., West Sacramento, CA.
3. Verco Manufacturing, Inc., Phoenix, AZ.
4. United Steel Deck, Inc., Summit, NJ.

2.02 [SHOP PRIMER]

A. [Clean and coat with shop paint primer where shown in Finish Schedule.]

B. [Surface Preparation and Primer: As specified in Section 09 90 00, Painting and Coating].

2.03 ACCESSORIES

A. Provide pour stops, column closures, end closures, cover plates, girder fillers, ridge and valley plates, finish strips, reinforcing channels, and other accessories as required for complete installation.

B. Accessories shall be minimum 22-gauge, except edge forms shall be sized as required by the deck manufacturer, unless shown otherwise on the Drawings.

2.04 MECHANICAL FASTENERS

A. Self-Drilling Screws:

1. Self-drilling, self-tapping screws with hexagonal washer head and corrosion-resistant finish.
2. Manufacturers and Products:
   a. ITW Buildex, Itasca, IL; ICH Traxx Self-Drilling Fasteners with Climaseal Coating and Autotraxx Standup Installation Tool.
   b. Hilti, Inc., Tulsa, OK; Kwik-Pro HWH Self-Drilling Screws with Kwik-Cote Treatment and Kwik-Tapper Screwdriver.

B. Powder Driven Fasteners:

1. Knurled shank, minimum 1/2-inch-diameter steel washer, corrosion-resistant coating.

©COPYRIGHT 2012 CH2M HILL

2. Pin diameter and length to suit deck type and flange thickness of steel support member.
3. Manufacturers and Products:
   a. ITW Buildex, Itasca, IL; Buildex BX14 pins with yellow dichromate galvanizing and BX900 Installation Tool.
   b. Hilti, Inc., Tulsa, OK; ENP-series fasteners with electroplated zinc coating and DX-750 Installation Tool.

2.05 [SHEAR CONNECTORS FOR COMPOSITE DECK

A. Welded Headed Anchor Studs: Size and spacing as indicated on Drawings and as specified in Section 05 50 00, Metal Fabrications.]

PART 3 - EXECUTION

3.01 EXAMINATION

A. Examine supporting framing and field conditions for compliance with requirements for installation tolerances and other conditions affecting performance of steel deck.

3.02 INSTALLATION

A. Locate deck bundles to prevent overloading of support framing members.

B. Install at right angles to supporting members in a three span minimum lay-up, unless shown otherwise, and in accordance with Specification and manufacturer's installation recommendation.

C. Bearing: 1-1/2 inches, minimum.

D. Endlaps: Minimum of 2 inches and located over supports.

E. Do not stretch sidelaps.

F. Closure Plates:

1. Install closure and cover plate accessories as recommended by the metal deck manufacturer, unless shown otherwise on the Drawings.
2. Floor Deck and Form Deck Closures:
   a. Fasten column closures, cell closures, and zee closures to deck to provide tight fitting closures at open ends of ribs and sides of decking.

©COPYRIGHT 2013 CH2M HILL

b. Fasten cell closures at changes of direction of deck units unless otherwise indicated.

G. Holes and Openings:

1. Cut and fit around roof openings and other work projecting through or adjacent to decking.
2. Locate holes and openings as shown to clear structural framing and bracing members.
3. Reinforcement Around Openings:
   a. Roof Deck: For hole sizes of at least 6 inches across, but not more than 12 inches across in roof deck, reinforce with 0.0474-inch design thickness steel plate, painted or galvanized to match deck coating. Extend plate at least 12 inches beyond opening in all directions and attach to top of roof deck with No. 10 self-drilling screws at 6-inch spacing and at all corners. For openings larger than 12 inches across, reinforce roof deck with framing as shown on Drawings.
   b. Composite Floor Deck and Form Deck: Reinforce openings as indicated on Drawings.

H. Protect deck areas from heavy concentrated loads or wheel traffic with planking or other approved means.

I. Install temporary shoring, if required, to meet strength and deflection limitations, before placing any concrete topping on deck panels.

J. Completed Deck: Free from buckles and irregularities, and in accordance with FM and UL requirements.

3.03 DECK ATTACHMENT

A. [Fasten panels as shown on Drawings.]

B. [Fasten panels as shown in the following schedule:]

Steel Deck Attachment Schedule

		At Perpendicular Supports		**At Parallel Supports**		**At Sidelaps**	
Type	Depth (in.)	Type	No. Per Sheet	Type	Spacing (in.)	Type	Spacing
Roof Deck	[1-1/2]	[5/8" dia. spot	[7]	[5/8" dia. spot	[A:12]	[1-1/2" seam	[12"]

©COPYRIGHT 2012 CH2M HILL

Steel Deck Attachment Schedule							
		At Perpendicular Supports		At Parallel Supports		At Sidelaps	
Type	Depth (in.)	Type	No. Per Sheet	Type	Spacing (in.)	Type	Spacing
	[3]	welds] [#12 Self-drilling screws] [Power driven fasteners]	[5] [4] [_____]	welds] [#12 Self-drilling screws] [Power driven fasteners]	[24]	weld] [#10 Self-drilling screws]	[24"] [_____]
Composite Floor Deck	[3] [2]	[5/8" dia. spot welds] [#12 Self-drilling screws] [Power driven fasteners]	[7] [5] [4] [_____]	[5/8" dia. spot welds] [#12 Self-drilling screws] [Power driven fasteners]	[A:12] [24].	[1-1/2" seam weld] [#10 Self-drilling screws] [Button-punch]	[36"] ["] [per span]
Non-composite Form Deck	[1-5/16] [_____]	[5/8" dia. spot welds] [#12 Self-drilling screws] [Power driven fasteners]	[7] [5] [4] [_____]	[5/8" dia. spot welds] [#12 Self-drilling screws] [Power driven fasteners]	[A:12] [24].	[1-1/2" seam weld] [#10 Self-drilling screws] [Button-punch]	[36"] ["] [per span]

C. Welded Connections: Weld deck sidelaps, attachments to framing, and accessories shall be in accordance with AWS D1.3 and as specified in Section 05 05 23, Welding.

D. Mechanical Fasteners:

1. Self-Drilling Screws:
   a. Install screws in accordance with manufacturer's written instructions and with special installation tool. Do not over-torque.
   b. Remove and redrive screws at sidelaps where upper sheet is not drawn tightly against lower sheet.

©COPYRIGHT 2013 CH2M HILL

2. Powder Driven Fasteners:
   a. Install fasteners in accordance with manufacturer's written instructions and with special installation tool.
   b. Minimum Sidelap Edge Distance: 3/8 inch.
   c. Minimum End/End Lap Distance: 1 inch.
   d. Head Projection: As specified by manufacturer for correct penetration into flange of steel support member.

3.04 TOUCHUP PAINTING

A. Immediately following erection, remove unused deck edge trimmings, screws, fasteners, welding washers, butt ends of welding rods, and debris from completed installation.

B. Clean field welds, bolted connections, rust spots, and abraded areas.

C. Repair damaged painted surfaces as specified in Section 09 90 00, Painting and Coating.

D. Repair damaged galvanized surfaces with zinc-rich spray paint in accordance with ASTM A780; color to match galvanized deck.

E. Use magnetic gauge to determine that thickness of repair is equal to or greater than base painted or galvanized coating.

3.05 FIELD QUALITY CONTROL

A. An independent testing agency [will be retained by OWNER] [shall be retained by Contractor and approved by ENGINEER] to perform following inspections.

1. Welded Connections: Visually inspect in accordance with AWS D1.3, Section 7, and as specified in Section 05 05 23, Welding.
2. Mechanical Fasteners: Visually inspect, in accordance with manufacturer's instructions, for each type of fastener.

B. Repair or replace defective welds and fasteners.

C. [Special inspection will be provided by OWNER where indicated on Drawings.]

D. [Welded Shear Studs: Inspect and test as specified in Section 05 50 00, Metal Fabrications.]

1.02 SUBMITTALS

A. Action Submittals:

1. Plan and elevation views of all metal framing systems, including location and framing of all openings.
2. Material specifications, member sizes, and properties.
3. Details of track, web stiffeners, stud bracing, blocking, bridging, and other members as required to provide a complete installation.
4. Details of connections including welding, mechanical fasteners, and accessory items.
5. [Light-Gauge Steel Trusses: Complete design calculations for member stresses, deflections, and connections, stamped by a registered professional engineer, valid in same state as Project. Include calculations for anchorage connections to resist wind uplift and lateral loads and for temporary handling and bracing requirements.]
6. Installation and erection instructions, including sequence of operations and requirements for temporary bracing and bridging.

B. Informational Submittals:

1. Manufacturer’s installation requirements.
2. Welding Procedures, Qualifications, and Inspection Report: As specified in Section 05 05 23, Welding.
3. Operation manuals for mechanical fastener installation tools.

1.03 QUALITY ASSURANCE

A. General: For member section properties, meet requirements of AISI, Specification for the Design of Cold-Formed Steel Structural Members.

B. Qualifications for Welding: As specified in Section 05 05 23, Welding.

1.04 DELIVERY, STORAGE, AND HANDLING

A. Deliver to Site in bundles marked with name of manufacturer, section type, thickness, grade of material, and length.

B. Store bundles on wood blocking, flat and off ground, to keep clean and to prevent any damage or permanent distortion.

©COPYRIGHT 2013 CH2M HILL

PART 2 - PRODUCTS

A. GENERAL

B. Provide size and type of members as indicated on Drawings.

C. Sheet Steel: ASTM A653/A653M, with G-60 galvanized coating.

D. Cold-Formed Members and Accessories: ASTM C955.

E. Dimensions and Properties: Calculate section properties in accordance with AISI Cold-Formed Steel Design Manual.

2.02 STUDS AND JOISTS

A. Material:

1. ASTM A653/A653M, Structural Steel (SS) Grade 33, or High-Strength Low-Alloy Steel (HSLAS), Type A or B, Grade 50.
2. Section: Type, size, and thickness as indicated on Drawings.
3. Flanges: Stiffened with return lip.
4. Webs:
   a. Studs: Punched.
   b. Joists: Unpunched, unless indicated otherwise on Drawings.

B. Accessories:

1. Track: Size as required to fit over studs, same thickness as stud material, unpunched.
2. Blocking, Bridging, and Fire Stops: Same depth as studs or joists, 0.0566-inch minimum design thickness, unpunched.
3. Bracing Straps, Angle Bracing, Clip Angles: Size and thickness as indicated on Drawings.
4. Mounting Plates: 0.0566-inch minimum design thickness by 8 inches by 18 inches.
5. Accessories shall be from same manufacturer as studs and joists.

C. Manufacturers and Products:

1. AMS, Los Angeles, CA; Angeles Metal Systems.
2. Clark Steel, Middleton, OH; Steel Framing Systems.
3. Dale Industries; Dearborn, MI; Dale/Incor Steel Framing.
4. Dietrich Industries, Pittsburgh, PA; Lightgauge Metal Framing Products.

5. Knorr Steel Framing Systems, Salem, OR; Light Gauge Steel Framing.
6. Marino/Ware, South Plainfield, NJ; Stud-Rite Lightweight Steel Framing Systems.
7. Unimast Incorporated, Schiller Park, IL; Steel Framing Systems.

2.03 [LIGHT-GAUGE STEEL TRUSSES

A. General: Provide type, chord configuration, span, and depth of trusses as indicated on Drawings.

B. Material:

1. Chord and Web Members:
   a. ASTM A653/A653M, Structural Steel (SS) Grade 33, High-Strength Low-Alloy Steel (HSLAS), Type A or B, Grade 50, or A500, Grade B, with G60 galvanized coating and minimum design thickness equal to 0.0346 inch.
   b. Section: Cold-formed rectangular tubing or C-sections with return lips and unpunched webs.
2. Accessories: Provide manufacturer's standard bracing, bridging, blocking, reinforcements, tie straps, holddowns, fasteners, and accessories as required for a complete light gauge steel truss system.

C. Design:

1. Load Criteria: Dead, live, wind, and seismic, as shown on Drawings.
2. Deflection Criteria:
   a. Roof Live Load: [1/240] [1/360] of span.
   b. Floor Live Load: 1/480 of span.
3. Design Standards:
   a. AISI, Specification for Design of Cold-Formed Steel Structural Members.
   b. AISI, Design Guide for Cold-Formed Steel Trusses.
   c. CCFSS, Technical Bulletin for screw connections.
   d. AWS C1.1, C1.3, and D1.3 for welded connections.

D. Manufacturers and Products:

1. Alpine Engineered Products, Inc., Pompano Beach, FL; TrusSteel.
2. MiTek Industries, Inc., St. Louis, MO; Ultra-Span.]

©COPYRIGHT 2013 CH2M HILL

2.04 MECHANICAL FASTENERS

A. Self-Drilling Screws:

1. Self-drilling, self-tapping screws with hexagonal washer head and corrosion-resistant finish.
2. Manufacturers and Products:
   a. ITW Buildex, Itasca, IL; ICH Traxx Self-Drilling Fasteners with Climaseal Coating and Autotraxx Standup Installation Tool.
   b. Hilti, Inc., Tulsa, OK; Kwik-Pro HWH Self-Drilling Screws with Kwik-Cote Treatment and Kwik-Tapper Screwdriver.

B. Powder-Driven Fasteners:

1. Knurled shank, minimum 1/2-inch-diameter steel washer, corrosion-resistant coating.
2. Pin diameter and length to suit deck type and flange thickness of steel support member.
3. Manufacturers and Products:
   a. ITW Buildex, Itasca, IL; Buildex BX14 pins with yellow dichromate galvanizing and BX900 Installation Tool.
   b. Hilti, Inc., Tulsa, OK; ENP-series fasteners with electroplated zinc coating and DX-750 Installation Tool.

2.05 CONCRETE ANCHORS

A. Drilled anchors, size and type as shown on Drawings and as specified in Section 05 50 00, Metal Fabrications.

2.06 PREFABRICATION

A. Structural wall framing panels may be prefabricated prior to erection.

B. [Light-gauge steel trusses shall be shop prefabricated.]

C. Prefabricated assemblies shall be not more than 1/8 inch out of square within length of assembly and shall be braced against racking. Use jig templates for layout and fabrication.

D. Protect prefabricated panels from damage during handling.

©COPYRIGHT 2013 CH2M HILL

2.07 SOURCE QUALITY CONTROL

A. [Special inspection of fabrication process and shop welding for light-gauge steel trusses will be provided by Owner as indicated on Drawings.]

PART 3 - EXECUTION

3.01 EXAMINATION

A. Inspect all prefabricated assemblies and repair any damage.

B. Examine bearing support surfaces for compliance with requirements for installation tolerances and other conditions affecting performance of metal framing systems.

C. Provide smooth level bearing surfaces for bottom track of load-bearing walls.

D. Clean all member and bearing surfaces that will be in contact after assembly.

3.02 INSTALLATION

A. General:

1. Install framing systems as indicated on Drawings, complete and in accordance with manufacturer's recommendations.
2. Provide temporary bracing for support of all construction loads until framing system is installed complete with sheathing or decking.
3. Install framing in true line, plumb, level, and in proper alignment.
4. Cut ends of framing members with saw or shear to bear uniformly against abutting members. Flame cutting is not permitted.
5. All structural framing members shall be full-length without splices, unless indicated otherwise.
6. Fasten members together in accordance with AISI, Cold-Formed Steel Design Manual, Part IV, Connections. Wire tying is not permitted.

B. Stud Bearing Walls:

1. Secure bottom track to floor slab with concrete anchors as indicated on Drawings.
2. Seat studs squarely and firmly within track before securing with fasteners. Gap between end of stud and track shall be less than 1/16 inch.
3. Install studs with spacing as shown and not more than 2 inches from abutting walls.

©COPYRIGHT 2013 CH2M HILL

4. Provide double studs at jambs of openings wider than stud spacing.
5. Provide triple studs at corners and at jambs of openings wider than 48 inches, unless indicated otherwise.
6. Track shall be continuous. Center splices between studs and splice with stud section full length between studs.
7. Frame wall penetrations for pipes and ducts larger than stud spacing to avoid cutting structural members.
8. Fire stop stud walls and partitions with unpunched blocking full width of stud at midpoint or where required for nailers, in conformance with applicable building code.
9. Provide blocking for support of mechanical items.
10. Do not remove the web knockouts within 10 inches of either end of load-bearing studs.
11. Provide bracing straps with gusset plates and anchor holddown assemblies where indicated on Drawings.
12. Tolerances:
    a. Stud Plumbness: 1/8 inch in 10 feet.
    b. Stud Spacing: Plus or minus 1/8 inch.

C. Joists:

1. Position joists directly over bearing studs and attach to track.
2. Joists shall be one-piece within a single span. For multiple spans, lap joists and splice as shown on Drawings.
3. Immediately install bridging and solid blocking to support joists. Maximum spacing of bridging shall be 5 feet.
4. Install web stiffeners where indicated
5. Web Penetrations:
    a. Drilled holes for other trades shall be limited to the middle 1/3 of the joist depth within the middle 1/3 of the span, unless indicated otherwise. Minimum spacing between drilled holes shall be 1-1/2 times the joist depth. Notching of joist flanges and flame cutting of holes are not permitted.
6. Tolerances:
    a. Joist Spacing: Plus or minus 1/8 inch.
    b. Joist Levelness: Plus or minus 1/8 inch in 10 feet.

D. [Light-Gauge Steel Trusses:

1. Follow truss fabricator’s instructions for proper handling, installation, and bracing of prefabricated trusses.

©COPYRIGHT 2013 CH2M HILL

2. Provide proper lifting equipment adequate for size of trusses. Use designated lift points to avoid bending truss in weak direction.
3. Position trusses directly over bearing studs and attach to bearing track with holddown anchors.
4. Immediately install temporary bracing as required at top and bottom chords to keep trusses plumb and true to line.
5. Use temporary diagonal bracing to support top chords as required.
6. Install solid blocking at bearing tracks and ridge and attach permanent bridging.
7. Do not apply load to trusses until all bracing and bridging have been installed complete.
8. Do not remove, cut, or otherwise alter truss members or connections.
9. Tolerances:
    a. Truss Length: Plus or minus 1/2 inch up to 30 feet in length, plus or minus 3/4 inch over 30 feet.
    b. Truss Height: Plus or minus 1/4 inch up to 5 feet in height, plus or minus 1/2 inch over 5 feet.
    c. Truss Spacing: Plus or minus 1/8 inch.
    d. Truss Levelness: Plus or minus 1/8 inch in 10 feet.]

3.03 FASTENERS

A. Self-Drilling Screws:

1. Install in accordance with manufacturer’s written instructions and with special installation tool.
2. Screw type, diameter, and length shall be in accordance with AISI, Fasteners for Residential Steel Framing, minimum two screws per connection unless indicated otherwise.
3. Use clamp to hold members together. Drive screw from lighter to heavier gauge, to allow plies to be pulled together without stripping metal. Do not over torque. A minimum of three exposed threads shall extend through steel.
4. Minimum screw spacing, end distance, and edge distance shall be 3 diameters.

B. Powder-Driven Fasteners:

1. Use only for connecting cold-formed steel to structural steel members, unless indicated otherwise.
2. Install in accordance with manufacturer’s written instructions and with special installation tool.

©COPYRIGHT 2013 CH2M HILL

C. Welded Connections:

1. Welding shall not be used for material thinner than 0.0451 inch.
2. Weld framing members and accessories in accordance with AWS D1.3.
3. Resistance welding for prefabricated framing shall be in accordance with AWS C1.1 and AWS C1.3.
4. Repair galvanized surfaces damaged by welding with zinc-rich spray paint in accordance with ASTM A780.

D. Concrete Anchors: Install in accordance with Section 05 50 00, Metal Fabrications.

3.04 FIELD QUALITY CONTROL

A. An independent testing agency [will be retained by Owner] [shall be retained by Contractor and approved by ENGINEER] to perform following inspections.

1. Welded Connections: Visually inspect in accordance with AWS D1.3, Section 7, and as specified in Section 05 05 23, Welding.
2. Mechanical Fasteners: Visually inspect, in accordance with manufacturer's instructions, for each type of fastener.

B. Repair or replace defective welds and fasteners.

C. [Special inspection will be provided by Owner where indicated on Drawings.]

1.02 DEFINITIONS

A. Anchor Bolt: Cast-in-place anchor; concrete or masonry.

©COPYRIGHT 2013 CH2M HILL

B. Concrete Anchor: Post-installed concrete anchors listed in this specification.

C. Corrosive Area: Containment area or area exposed to delivery, storage, transfer, or use of chemicals.

D. Exterior Area: Location not protected from weather by building or other enclosed structure.

E. Interior Dry Area: Location inside building or structure where floor is not subject to liquid spills or washdown, nor where wall or roof slab is common to a water-holding or earth-retaining structure.

F. Interior Wet Area: Location inside building or structure where floor is sloped to floor drains or gutters and is subject to liquid spills or washdown, or where wall, floor, or roof slab is common to a water-holding or earth-retaining structure.

G. Masonry Anchor: Post-installed masonry anchors listed in this specification.

H. Submerged: Location at or below top of wall of open water-holding structure, such as basin or channel, or wall, ceiling or floor surface inside a covered water-holding structure, or exterior belowgrade wall or roof surface of water-holding structure, open or covered.

1.03 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
   a. Metal fabrications, including welding and fastener information.
   b. Specific instructions for concrete anchor installation, including drilled hole size, preparation, placement, procedures, and instructions for safe handling of anchoring systems.
2. Samples: Color samples of abrasive stair nosings.

B. Informational Submittals:

1. Concrete and Masonry Post-Installed Anchors:
   a. Manufacturer’s product description and printed installation instructions.
   b. Current ICC-ES Report for each type of post-installed anchor to be used.
   c. Adhesive Anchor Installer Certification.
2. U-Channel Concrete Inserts:
   a. Manufacturer’s product description.
   b. Allowable load tables.

©COPYRIGHT 2013 CH2M HILL

3. Ladders: Letter of certification that ladder meets OSHA 29 CFR 1910.27 requirements.
4. Passivation method for stainless steel members.
5. [Hot-Dip Galvanizing: Certificate of compliance signed by galvanizer, with description of material processed and ASTM standard used for coating.]

1.04 QUALITY ASSURANCE

A. Qualifications:

1. Adhesive Anchor Installer: Trained to install adhesive anchors in accordance with manufacturer's printed installation instructions.
2. Galvanized Coating Applicator: Company specializing in hot-dip galvanizing after fabrication and following procedures of Quality Assurance Manual of the American Galvanizers Association.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Insofar as practical, factory assemble specified items. Assemblies, because of necessity, have to be shipped unassembled shall be packaged and tagged in manner that will protect materials from damage and will facilitate identification and field assembly.

B. Package stainless steel items in a manner to provide protection from carbon impregnation.

C. Protect painted coatings and hot-dip galvanized finishes from damage as a result of metal banding and rough handling. Use padded slings and straps.

D. Store fabricated items in dry area, not in direct contact with ground.

E. Store adhesives anchors at service temperature ranges recommended by manufacturer.

1.06 SPECIAL GUARANTEE

A. Manufacturer's extended guarantee or warranty, with Owner named as beneficiary, in writing, as special guarantee. Special guarantee shall provide for correction, or at option of Owner, removal and replacement of [sidewalk doors] [and] [floor hatches] found defective during a period of 5 years after date of Substantial Completion. Duties and obligations for correction or removal and replacement of defective Work as specified in General Conditions.

©COPYRIGHT 2013 CH2M HILL

1.07 EXTRA MATERIALS

A. Furnish, tag, and box for shipment and storage the following extra materials:

Item	**Quantity**
[Neoprene Gasket]	[Two] [_____] for each location requiring neoprene gaskets.
[4 inches wide by 50 feet long Neoprene Gasket Material]	[One] [_____] roll for each location requiring neoprene gaskets.
[Neoprene Gasket Adhesive]	[One] [_____] (manufacturer's recommended) for each location requiring neoprene gaskets.
[_____]	[One] [_____] complete set.

B. Delivery: [In accordance with Section 01 61 00, Common Product Requirements.]

PART 2 - PRODUCTS

2.01 GENERAL

A. [For hot-dip galvanized steel that is exposed to view and does not receive paint, limit the combined phosphorus and silicon content to 0.04 percent. For steels that require a minimum of 0.15 percent silicon (such as plates over 1.5 inches thick for ASTM A36/A36M steel), limit maximum silicon content to 0.21 percent and phosphorous content to 0.03 percent.]

B. Unless otherwise indicated, meet the following requirements:

Item	**ASTM Reference**
Steel Wide Flange Shapes	A992/992M
Other Steel Shapes and Plates	A36/A36M
Steel Pipe	A501 or A53/A53M, Type E or S, Grade B
Hollow Structural Sections (HSS)	A500/A500M, Grade B
Stainless Steel:	
Bars and Angles	A276, AISI Type 316 (316L for welded connections)

©COPYRIGHT 2013 CH2M HILL

Item	ASTM Reference
Shapes	A276, AISI Type 304 (304L for welded connections)
Steel Plate, Sheet, and Strip	A240/A240M, AISI Type 316 (316L for welded connections)
Bolts, Threaded Rods, Anchor Bolts, and Anchor Studs	F593, AISI Type 316, Condition CW
Nuts	F594, AISI Type 316, Condition CW
Steel Bolts and Nuts:	
Carbon Steel	A307 bolts, with A563 nuts
High-Strength	A325, Type 1 bolts, with A563 nuts
Anchor Bolts and Rods	F1554, Grade [36] [55], with weldability supplement S1.
Eyebolts	A489
Threaded Rods	A36/A36M
Flat Washers (Unhardened)	F844
Flat and Beveled Washers (Hardened)	F436
Thrust Ties for Steel Pipe:	
Threaded Rods	A193/A193M, Grade B7
Nuts	A194/A194M, Grade 2H
Plate	A283/A283M, Grade D
Welded Anchor Studs	A108, Grades C-1010 through C-1020
Aluminum Plates and Structural Shapes	B209 and B308/B308M, Alloy 6061-T6
Aluminum Bolts and Nuts	F468, Alloy 2024-T4
Cast Iron	A48/A48M, Class 35

C. Bolts, Washers, and Nuts: Use stainless steel, hot-dip galvanized steel, zinc-plated steel, and aluminum material types as indicated in Fastener Schedule at end of this section.

2.02 ANCHOR BOLTS AND ANCHOR BOLT SLEEVES

A. Cast-In-Place Anchor Bolts:

1. Headed type, unless otherwise shown on Drawings.

©COPYRIGHT 2013 CH2M HILL

2. Material type and protective coating as shown in Fastener Schedule at end of this section.

B. Anchor Bolt Sleeves:

1. Plastic:
   a. Single unit construction with corrugated sleeve.
   b. Top of sleeve shall be self-threading to provide adjustment of threaded anchor bolt projection.
   c. Material: High-density polyethylene.
   d. Manufacturer: Sinco Products, Inc., Middletown, CT, (800) 243-6753.

2. Fabricated Steel: ASTM A36/A36M.

2.03 POST-INSTALLED CONCRETE ANCHORS

A. General:

1. AISI Type 316 stainless, hot-dip galvanized, or zinc-plated steel, as shown in Fastener Schedule at end of this section.
2. Current ICC-ES Report indicating acceptance per IBC 2006 and IBC 2009 for anchors at structural applications in cracked concrete.
3. Anchors shall be suitable for long-term loads, as well as for wind and seismic loads.
4. Acceptable for use in potable water structures by EPA and local health agencies or NSF 61.
5. Torque-Controlled Expansion Anchors (Wedge Anchors):
   a. Wedge anchors used in sustained tension applications (such as overhead or cantilevered applications) shall have current ICC-ES Report that demonstrates compliance with ICC-ES AC193 for cracked concrete.
   b. Manufacturers and Products:
      1) ITW Ramset/Red Head, Addison, IL; Trubolt+ Wedge Anchor (ESR-2427).
      2) Hilti, Inc., Tulsa, OK; Kwik-Bolt–TZ (KB-TZ) Anchors (ESR-1917).
      3) Powers Fasteners, Brewster , NY; Power-Stud +SD2 or +SD1 Anchors (ESR-2502 and ESR-2818).
      4) Simpson Strong-Tie Co., Inc., Pleasanton, CA; Strong-Bolt Anchors (ESR-1771).
      5) Wej-It Corp., Tulsa, OK; ANKRtite CCAT Wedge Anchor (ESR-2777).
6. Displacement-Controlled Expansion Anchors (Drop-in Anchors):
   a. Self-drilling anchors, snap-off or flush type, zinc-plated.

©COPYRIGHT 2013 CH2M HILL

b. Nondrilling Anchors: Flush type for use with zinc-plated or stainless steel bolt, or stud type with projecting threaded stud.
c. Manufacturers and Products:
1) ITW Ramset/Red Head, Addison, IL; Multi-Set II Drop-In and Self Drill Anchor.
2) Hilti, Inc., Tulsa, OK; Hilti HDI Drop-In Anchor.
3) Powers Fasteners, Brewster, NY; Steel Drop-In Anchor.
4) Simpson Strong-Tie Co., Inc., Pleasanton, CA; Drop-In Anchor.

7. [Undercut Anchors:
a. When used in sustained tension applications (such as overhead or cantilevered applications) shall have current ICC-ES Report that demonstrates compliance with ICC-ES AC193 for cracked concrete.
b. Manufacturers and Products:
1) USP Structural Connectors, Burnsville, MN; DUC Undercut Anchor (ESR-1970).
2) Hilti, Inc., Tulsa, OK; HDA Undercut Anchor (ESR-1546).
3) Powers Fasteners, Brewster, NY; Atomic+ Undercut (ESR-3067).
4) Simpson Strong-Tie Co., Inc., Pleasanton, CA; Torq-Cut (ESR pending).]

8. [Self-Tapping Concrete Screw Anchors:
a. When used in sustained tension applications (such as overhead or cantilevered applications) shall have current ICC-ES Report that demonstrates compliance with ICC-ES AC193 for cracked concrete.
b. Manufacturers and Products:
1) Powers Fasteners, Brewster, NY; Wedge-Bolt+ (ESR-2526).
2) Powers Fasteners, Brewster, NY; Vertigo+ Rod Hanger Screw Anchor (ESR-2989).
3) Powers Fasteners, Brewster, NY; Snake+ Flush Mount Screw Anchor (ESR-2272).
4) Hilti, Inc., Tulsa, OK; HUS-EZ Screw Anchor (ESR-3027).
5) Simpson Strong-Tie Co., Inc., Pleasanton, CA; Titen HD Screw Anchor (ESR-2713).]

9. Light-Duty Torque Controlled Expansion Anchors (Sleeve Anchors):
a. Manufacturers and Products:
1) ITW Ramset/Red Head, Addison, IL; Dynabolt Hex Nut Sleeve Anchor.
2) Powers Fasteners, Brewster, NY; Lok-Bolt AS.
3) Simpson Strong-Tie Co., Inc., Pleasanton, CA; Sleeve-All Hex Head Anchor.
4) Wej-It Corp., Tulsa, OK; Wej-It Sleeve Anchor.
b. Heavy-Duty Torque Controlled Expansion Anchors (Sleeve Anchors):

©COPYRIGHT 2013 CH2M HILL

c. Manufacturers and Products:
   1) Powers Fasteners, Brewster, NY; Power-Bolt+ Anchor.
   2) Hilti, Inc., Tulsa, OK; HSL-3 Heavy Duty Sleeve Anchor.

B. Adhesive Anchors (Epoxy Anchors):

1. If approved by ENGINEER, adhesive anchors used in sustained tension applications (such as overhead or cantilevered applications) shall have current ICC-ES Report that demonstrates compliance with ICC-ES AC308 for cracked concrete.
2. Threaded Rod:
   a. ASTM F593 stainless steel threaded rod, diameter as shown on Drawings.
   b. Length as required, to provide minimum depth of embedment.
   c. Clean and free of grease, oil, or other deleterious material.
   d. For hollow-unit masonry, provide galvanized or stainless steel wire cloth screen tube to fit threaded rod.
3. Adhesive:
   a. Two-component, insensitive to moisture, designed to be used in adverse freeze/thaw environments.
   b. Cure Temperature, Pot Life, and Workability: Compatible for intended use and anticipated environmental conditions.
   c. Mixed Adhesive: Nonsag light paste consistency with ability to remain in 1-inch diameter overhead drilled hole without runout.
   d. Meet requirements of ASTM C881/C881M.
4. Packaging and Storage:
   a. Disposable, self-contained cartridge system capable of dispensing both components in proper mixing ratio and fitting into manually or pneumatically operated caulking gun.
   b. Store adhesive cartridges [and adhesive components] on pallets or shelving in covered storage area.
   c. Container Markings: Include manufacturer’s name, product name, batch number, [mix ratio by volume], product expiration date, ANSI hazard classification, and appropriate ANSI handling precautions.
   d. Dispose of when:
      1) Shelf life has expired.
      2) Stored other than in accordance with manufacturer’s instructions.
5. Manufacturers and Products:
   a. Hilti, Inc., Tulsa, OK; HIT Doweling Anchor System, HIT RE 500 SD (ESR-2322).
   b. Simpson Strong-Tie Co., Inc., Pleasanton, CA; SET-XP Epoxy Adhesive Anchors(ESR-2508).

©COPYRIGHT 2013 CH2M HILL

c. Powers Fasteners, Brewster NY, PE1000+ Adhesive anchoring system (ESR-2583).

C. Adhesive Threaded Inserts:

1. Stainless steel, internally threaded inserts.
2. Manufacturer and Product: Hilti, Inc., Tulsa, OK; HIS-RN Insert with HIT-RE 500-SD adhesive.

2.04 POST-INSTALLED MASONRY ANCHORS

A. General: AISI Type 316 stainless, hot-dip galvanized, or zinc-plated steel, as shown in Fastener Schedule at end of this section.

B. Current ICC Evaluation Report indicating acceptance per IBC 2006 for anchors at structural applications in masonry.

C. Manufacturers and Products:

1. Hilti, Inc., Tulsa, OK;Kwik-Bolt-3 (KB-3) (ESR-1385), for grout-filled masonry.
2. Powers Fasteners, Brewster NY, T308+ Epoxy Adhesive Anchoring System in Unreinforced Masonry (ESR-3149), Power-Stud+ SD1 (ESR-2966) for grout-filled masonry, Wedgebolt+ (ESR-1678) for grout-filled masonry.

2.05 STUD SHEAR CONNECTORS

A. Headed anchor studs (HAS), or threaded anchor studs (TAS),or stud shear connectors, as indicated on Drawings.

1. Carbon Steel: ASTM A108, Standard Quality Grades 1010 through 1020, inclusive either semikilled or killed aluminum or silicon dioxidation, unless indicated otherwise.
2. Stainless Steel: ASTM F593, AISI Type 316, Condition CW, where indicated.

B. Manufacturers:

1. Nelson Stud Welding, FabriSteel Co., Elyria, OH.
2. Stud Welding Associates, Inc., Elyria, OH.

2.06 PIPE SLEEVES

A. [As specified in Section 40 27 01, Process Piping Specialties.]

©COPYRIGHT 2013 CH2M HILL

B. [ASTM A53/A53M, Schedule 40 steel pipe sleeves with continuously welded 3/16-inch-thick seep ring with outside diameter 3 inches greater than sleeve outside diameter. Hot-dip galvanize in accordance with ASTM A123/A123M.]

2.07 STEEL LINTELS AND SHELF ANGLES

A. ASTM A36/A36M, hot-dip galvanize after fabrication in accordance with ASTM A123/A123M.

2.08 EMBEDDED STEEL SUPPORT FRAMES FOR FLOOR PLATE AND GRATING

A. Steel angle support frames to be embedded in concrete shall be stainless steel, ASTM A276, AISI Type 316, unless indicated otherwise.

B. Welded anchors for stainless steel support frames shall also be stainless steel.

2.09 U-CHANNEL CONCRETE INSERTS

A. Rolled ASTM A240/A240M, AISI Type 316 stainless steel, 0.105-inch-thick, 1-5/8 inches wide by 1-3/8 inches deep, with stainless steel anchors at 10-inch maximum spacing, styrofoam fillers, and end caps.

B. Nut and Bolt Hardware: Type 316 stainless steel, 5/8-inch minimum diameter, unless indicated otherwise. Manufacturer’s standard to match insert.

C. Manufacturers and Products:

1. Power-Strut, Wayne, MI; PS 349 Series.
2. B-Line Systems, Inc., Highland, IL; B32 Series.
3. Halfen Anchoring Systems, Converse, TX; Channel Type 4141HTA.

2.10 ABRASIVE NOSING FOR STAIRS

A. Unless otherwise shown on Drawings, furnish flush type abrasive nosings on stairs.

B. Nosing Components:

1. Homogeneous epoxy abrasive, with minimum 50 percent aluminum oxide content, formed and cured upon an extruded aluminum base.
2. Epoxy abrasive shall extend over and form curved front edge of nosing.
3. Base of Nosing: Extruded aluminum alloy, 6063-T5, heat-treated.

C. Anchoring System: Double-set anchors consisting of two rows of integrally extruded anchors.

©COPYRIGHT 2013 CH2M HILL

D. Size: 3 inches wide by 1/4 inch to 3/8 inch thick by length as shown.

E. Color: Selected by ENGINEER from manufacturer's standard color range.

F. Manufacturers and Products:

1. Wooster Products, Inc., Wooster, OH; [Spectra Type WP3J] [and] [Spectra Type WP3C] [_____].
2. American Safety Tread Co., Inc., Helena, AL; [Type BF-311D] [and] [Type FA-311D] [_____].

2.11 FLOOR PLATE

A. Material:

1. Galvanized Steel: Carbon steel, ASTM A786/A786M, commercial grade, hot-dip galvanized after fabrication in accordance with ASTM A123/A123M.
2. Stainless Steel: ASTM A793, AISI Type 304.
3. Aluminum: ASTM B632/B632M, Alloy 6061-T6.

B. Minimum Thickness:

1. Steel: 1/4 inch, unless shown otherwise on Drawings.
2. Aluminum: 3/8 inch, unless shown otherwise on Drawings.

C. Surface shall be raised-lug pattern or diamond tread, unless shown otherwise on Drawings.

D. Slip-Resistant Surface:

1. Provide where indicated on Drawings.
2. Manufacturers and Products:
   a. IKG/Borden, Clark, NJ; MEBAC 2.
   b. W.S. Molnar Co., Detroit, MI; SLIPNOT Grade 2–Medium.

2.12 EXTRUDED FLOOR PLATE

A. Extruded Deck Plate:

1. Minimum Section Height: As shown on Drawings.
2. Minimum Section Width: 12 inches.
3. Accessories: [Dovetail interlock strips.] [Anchor clamp fixtures.] [Toeboard, 1-inch raised lip.]

©COPYRIGHT 2013 CH2M HILL

4. Manufacturer and Product: Alcoa Building Products, Inc., Sidney, OH; Standard Diamondback.

B. Extruded Tread Plate:

1. Minimum Section Height: 0.360 inch, plus serrations.
2. Section Width: 12 inches.
3. Accessories: Edgebands, tongue-and-groove attachment.
4. Manufacturer and Product: Alcoa Building Products, Inc., Sidney, OH; Standard Diamondback.

2.13 SIDEWALK DOORS

A. Load Capacity: 300 psf with maximum deflection of 1/150th of span. [Provide H-20 wheel loading capacity where indicated on Drawings.]

B. Component Fabrication:

1. Access Door Leaf(s): 1/4-inch aluminum diamond pattern plate. [Provide stainless steel safety chain and attachments for end of double-leaf door assembly when open.]
2. Channel Frame: 1/4-inch-thick extruded aluminum trough frame with continuous anchor flange around perimeter. Weld 1-1/2-inch diameter drain coupling, and drain pipe, to frame trough at front right corner, unless indicated otherwise on Drawings.
3. [Safety Grate: Aluminum grating with 300 psf live load capacity, 5-inch by 5-inch grate openings, permanent hinging system that locks grate in 90-degree position, and opening arm with vinyl grip handle and locking device.]

C. Door Hardware:

1. Hinges: Heavy-duty brass or stainless steel with stainless steel pins through-bolted to cover plate with tamper-proof stainless steel bolts flush with top of cover and to outside leg of channel frame with stainless steel bolts and locknuts.
2. Lifting Mechanism: Stainless steel compression lift springs enclosed in telescoping vertical housing or stainless steel torsion lift springs.
3. Hold-Open Arm:
   a. Locks automatically in open position.
   b. Disengages with slight pull on vinyl grip with one hand.
   c. Door can be easily closed with one hand by pulling forward and down on vinyl grip.
4. Snap Lock:

©COPYRIGHT 2013 CH2M HILL

a. Stainless steel snap lock mounted on bottom of door leaf with removable topside key wrench and inside fixed lever handle.
b. Threaded plug for flush outside surface with key wrench removed.

D. Aluminum shall be mill finished with protective coating applied to surfaces to be in contact with concrete, as specified in Section 09 90 00, Painting and Coating.

E. Manufacturers and Products:

1. Bilco Co., New Haven, CT; J Series.
2. Nystrom Products Co., Minneapolis, MN; FG Series.
3. U.S.F. Fabrication, Hialeah, FL; T Series.
4. ITT Flygt Corporation, Trumbull, CT; FDRN Series.
5. Thompson Fabricating Co., Birmingham, AL; TE Series.
6. Halliday Products, Orlando, FL; WS Series.

2.14 FLOOR HATCHES

A. Load Capacity: [150] [300] psf with maximum deflection of 1/150th of span.

B. Component Fabrication:

1. Access Door Leaf(s): 1/4-inch-thick aluminum diamond pattern plate. [Provide stainless steel safety chain and attachments for end of double-leaf door assembly when open.]
2. Angle Frame: 1/4-inch thick extruded aluminum angle frame with concrete anchors and integral neoprene gasket strip.

C. Door Hardware:

1. Hinges: Heavy-duty brass or stainless steel with stainless steel pins, through-bolted to cover plate with tamper-proof stainless steel bolts flush with top of cover and to outside leg of channel frame with stainless steel bolts and locknuts.
2. Lifting Mechanism: Stainless steel compression lift springs enclosed in telescoping vertical housing or stainless steel torsion lift springs.
3. Hold-Open Arm:
   a. Locks automatically in open position.
   b. Disengages with slight pull on vinyl grip with one hand.
   c. Door can be easily closed with one hand by pulling forward and down on vinyl grip.
4. Snap Lock:

©COPYRIGHT 2013 CH2M HILL

a. Stainless steel snap lock mounted on bottom of door leaf with removable topside key wrench and inside fixed lever handle.
b. Threaded plug for flush outside surface with key wrench removed.

D. Aluminum shall be mill finished with protective coating applied to surfaces to be in contact with concrete, as specified in Section 09 90 00, Painting and Coating.

E. Manufacturers and Products:

1. Bilco Co., New Haven, CT; K Series.
2. Nystrom Products Co., Minneapolis, MN; FH Series.
3. U.S.F. Fabrication, Hialeah, FL; A Series.
4. ITT Flygt Corporation, Trumbull, CT; FLE Series.
5. Thompson Fabricating Co., Birmingham, AL; TI Series.
6. Halliday Products, Orlando, FL; SS Series.

2.15 HATCH SAFETY NET

A. General:

1. Conforms to ASSE A10.11 and OSHA CFR Part 1926.105.
2. Size to fit hatch opening where indicated.

B. Components and Accessories:

1. Rails and Slide Rings: Aluminum 6061-T6 extruded rails and aluminum-alloy 713.0 slide rings.
2. Corner Hooks and Eyebolts: AISI Type 316 stainless steel.
3. Netting: Polyester, 5-inch by 5-inch net openings; 5,000 pounds minimum breaking strength.
4. Bolts, Nuts, and Concrete Anchors: AISI Type 316 stainless steel.

C. Manufacturer and Product: Safe Approach Inc., Auburn, ME; Hatch Net 121.

2.16 HINGED MANHOLE COVERS

A. Slab type rectangular manhole frame and cover with flush, waterproof lift handles, and stainless steel butt hinges.

B. ASTM A48/A48M, Class 35, cast iron, unpainted.

C. Furnish as shown in table:

©COPYRIGHT 2013 CH2M HILL

Hinged Manhole Covers			
Mark	**Duty**	**Size (inches)**	**Weight (pounds)**
HMC-1	Light	24 x 36	275
HMC-2	Light	30 x 30	290
HMC-3	Light	30 x 36	335
HMC-4	Light	30 x 48	450
HMC-5	Heavy	30 x 36	525
HMC-6	Heavy	36 x 36	700

D. Manufacturers:

1. Neenah Foundry Co., Neenah, WI.
2. Flockhart Foundry Co., Newark, NJ.

2.17 LADDERS

A. Fabricate ladders with rails, rungs, landings, and cages to meet applicable requirements of OSHA, CFR Part 1910.27, and ALI A14.3.

1. Concentrated load of 200 pounds loads imposed by persons occupying ladder shall be considered to be concentrated at such points as will cause maximum stress in structural member being considered.
2. Weight of ladder and attached appurtenances together with live load shall be considered in design of rails and fastenings.
3. Self-closing gates at landings.

B. Flat Bar Ladder:

1. Punch rails, pass rungs through rails, and weld on outside.
2. Weld brackets to ladder for fastening ladder to wall.
3. [Hot-dip galvanize steel after fabrication in accordance with ASTM A123/A123M and ASTM A385/A385M.]

C. Aluminum Pre-engineered Pipe Ladder:

1. Rungs:
   a. Aluminum extrusions of Alloy 6063-T6.
   b. [Nonslip grip surface, 1-inch wide flat top, and semicircular bottom with mill finish.]

©COPYRIGHT 2013 CH2M HILL

c. [Diamondback, finish to match rails, as manufactured by Alcoa Building Products, Inc., Sidney, OH.]

2. Side Rails: ASTM B429/B429M, Alloy 6063-T6, 1-1/2 inches, Schedule 40 pipe with anodized finish, AA M32-C22-A41.
3. Ladder Attachments and Cage Assembly Fasteners: Stainless steel.
4. Welded, pop riveted, or glued construction is not acceptable.
5. Fabricate to longest length as practical but not to exceed 24 feet.
6. Furnish support attachments to side rails at 6 feet maximum spacing.
7. Manufacturer: Thompson Fabricating Co. Inc., Tarrant, AL.

D. Ladder Safety Post:

1. Telescoping tubular, spring balanced and automatically locking in raised position, with release lever for unlocking.
2. Post: [Hot-dip galvanized steel in accordance with ASTM A123/A123M.] [Stainless steel, AISI Type 316.] [Aluminum.]
3. Spring Mechanism: Stainless steel.
4. Furnish dissimilar metal protective coatings at connections.
5. Manufacturer and Product: Bilco Co., New Haven, CT; "Ladder Up" to fit ladder rungs.

2.18 SAFETY CLIMB DEVICE

A. General:

1. Conforms to ALI A14.3 and OSHA CFR Part 1910.27.
2. Belt and harness shall withstand minimum drop test of 250 pounds in 6-foot free fall.
3. Fall Prevention System Material: [Aluminum 6061-T6.] [Hot-dip galvanized steel in accordance with ASTM A123/A123M.] [Stainless steel, AISI Type 316.]

B. Components and Accessories:

1. Main Components: Sleeve or trolley, safety harness, and carrier or climbing rail.
2. Ladder rung clamps with [aluminum] [hot-dip galvanized steel] [stainless steel, AISI Type 316,] mounting brackets and hardware.
3. Removable extension kit with tiedown rod or trolley gate, mandrel, and carrier rail for ladders under manholes and hatches.

C. Manufacturers and Products:

©COPYRIGHT 2013 CH2M HILL

1. Miller Equipment, Franklin, PA; Sure Track Rail System.
2. TS Products, St. Charles, IL; TS Safety Rail System.

2.19 LADDER CLIMB PREVENTION SHIELD

A. Eight feet long with angled sides to within 2 inches of wall when closed.

B. Furnish dissimilar metals protective coatings at bolted connections.

C. Manufacturer and Product: North Safety Products, Specialty Products Division, Toronto, Ontario, Canada; Ladder Gate 770-000-001.

2.20 FALL ARREST ANCHORS

A. General:

1. Conforms to OSHA CFR Part 1926.502.
2. Minimum Breaking Strength: 5,000 pounds.
3. Material: [Hot-dip galvanized steel in accordance with ASTM A123/A123M.] [Stainless steel, AISI Type 304.]

B. Components and Accessories:

1. Forged combination eye and base assembly with [headed anchor bolt, backer plate,] [hooked anchor bolt,] lock washer, and nut.
2. Suitable for embedment in concrete wall or slab.

C. Manufacturers and Products:

1. Thaler Metal Industries, Buffalo, NY; FARA Wall Anchor.
2. Rose Manufacturing Company, Pittsburgh, PA; Anchorage Connector.

2.21 SPIRAL STAIR

A. Design: Aluminum, open-riser design, [54] [_____]-inch diameter, 30-degree cast aluminum treads or 12 treads per circle with abrasive surface on treads and platforms with risers of equal height.

B. Meet applicable standards in Federal Register Volume 36, No. 105, Part II, Department of Labor Occupational Safety and Health Administration, and state and municipal codes.

C. Fabrication:

©COPYRIGHT 2013 CH2M HILL

1. Landing(s): Similar material to treads.
2. Center Aluminum Column: 3-1/2-inch minimum OD with top capped and 10-inch minimum baseplate.
3. Furnish adequate bracing to wall at each circle of height.
4. Furnish manufacturer's standard aluminum handrail satisfying OSHA strength requirements with balusters at each tread.
5. Fasteners: Stainless steel.
6. Furnish minimum 10-minute etch on aluminum, and satin finish on rails.

D. Manufacturers and Products:

1. Duvinage Corp., Hagerstown, MD; Series 320.
2. Woodbridge Ornamental Iron Co., Chicago, IL.

2.22 ALTERNATING STAIR TREADS

A. Material:

1. Landings, Treads, and Foot Castings: Cast aluminum alloy F356F.
2. Handrails: Aluminum alloy 6063-T4, 1-1/2-inch by 1/8-inch tube.
3. Central Stringer: Aluminum alloy 6063-T52, 1-3/4-inch by 4-inch by 1/8-inch tube with rubber bumper strip.

B. Treads: Skid-resistant with upturned integrally cast skid barriers.

C. Risers: Equally spaced to within 3/16 inch for adjacent risers and to within 3/8 inch for nonadjacent risers.

D. Handrails: Contoured for body guidance and underarm support, with supports positioned to allow free sliding of hands along rails.

E. Foot Divider: Cast aluminum integral part of landing, which provides support for rubber bumper strip attached to central stringer.

F. Stair Angle: 68 degrees from horizontal.

G. Vertical Drop: As shown on Drawings.

H. Finish: Natural aluminum finish.

I. Manufacturer and Product: Lapeyre Stair, Inc., Harahan, LA; 68-Degree Alternating Tread Aluminum Stair.

©COPYRIGHT 2013 CH2M HILL

2.23 FABRICATED UNITS

A. Mooring Cable Anchors for Floating Aerators: [5/8-inch diameter by _____ long galvanized steel, as manufactured by Chance; Catalog No. 617 with triple eye.]

B. Chlorine Cylinder Trunnions: [_____]-ton, as manufactured by Chlorine Specialties, Inc., San Francisco, CA; Model C-256.

C. Chlorine Cylinder Lift Beam:

1. Maximum 13 inches from top of cylinder to hook hole.
2. Hot-dip galvanize after fabrication.
3. Manufacturers and Products:
   a. Mansaver Industries, Inc., New Haven, CT; Style 1118.
   b. Allied Steel Co., Inc., Los Angeles, CA.

D. Decant Arm:

1. Fabricate from welded steel pipe.
2. Coat interior with coal-tar enamel as specified in Section 09 90 00, Painting and Coating.
3. Paint exterior as specified in Section 09 90 00, Painting and Coating.

E. Pressure Type Manhole Hatches:

1. Aluminum cover suitable for 15 psi with steel weld neck and cam locks.
2. Hot-dip galvanize manhole and extension sleeve in accordance with ASTM A123/A123M after welding.
3. Furnish cam handle, bar, and six extra gaskets.
4. Manufacturer and Product: West Coast Engineered Products, Huntington Park, CA; West Coast No. 1520.

F. Digester Wall Manholes:

1. Fabricate of steel.
2. Shop coat as specified in Section 09 90 00, Painting and Coating.
3. Weld joints continuously and make watertight.
4. Furnish neoprene gasket of type that is satisfactory for use in contact with sewage to cover full bearing surface.

G. Shell Manhole:

1. Flanged and bolted type with confined rubber gasket.

©COPYRIGHT 2013 CH2M HILL

2. Manhole Unit: Capable of withstanding pressure of full tank of water with no leakage.
3. Minimum clear opening of 24 inches.
4. Cover: Hinged to tank.
5. Grind welds and sheared edges smooth.

H. Weir or Staff Gauge: Porcelain enameled, [_____] long, graduated in [_____] and marked at every [_____] and every [_____] as manufactured by Stevens Water Monitoring Equipment, Beaverton, OR; Style C.

I. Filter Screens: Steel, expanded metal, 3/4 inch, galvanized, as manufactured by Diamond Expanded Metals Co., Gardena, CA; Style No. 9.

J. Overflow Pipe and Accessories:

1. Use steel pipe and fabricate flared section at top of overflow of steel plate, weld seams, and grind smooth.
2. Flange at Base:
   a. Standard 125-pound steel ring flange drilled 125-pound ANSI Standard.
   b. Flange: Parallel to upper edge of fitting so lip can be installed in horizontal plane with pipe vertical.
   c. Grind upper lip smooth.
3. Fabricate supporting brackets of structural shapes and flat bar stock, as shown.
4. Bolts: Hot-dip galvanized steel machine bolts with hexagon nuts in accordance with ASTM A153/A153M.
5. Hot-dip galvanize assembly after fabrication in accordance with ASTM A123/A123M.
6. Coat interior with coal-tar enamel as specified in Section 09 90 00, Painting and Coating.

K. Float Pipe:

1. Standard weight steel pipe.
2. Furnish flanges of 1/2-inch steel plate for mid-height connection.
3. Furnish steel angle braces and all accessories.
4. Hot-dip galvanize float pipe after fabrication in accordance with ASTM A123/A123M.

L. Vortex Breaker: Use aluminum shapes and plate.

1. Plate Pattern: Approved nonslip pattern.
2. Supporting Frame: Aluminum, furnished with anchors for embedment in concrete.

©COPYRIGHT 2013 CH2M HILL

3. Make connections with welds, bolts, or machine screws.
4. Grind smooth sheared edges of structural shapes and plates.
5. Hardware: Aluminum.
6. Apply protective coating of bituminous paint to aluminum surfaces in contact with concrete.

M. T-Handled Operating Wrenches: Galvanized operating wrenches, [4] [_____]-foot total length, No. A-2461 as manufactured by Mueller.

N. Valve Operator Access Box: Cast iron, 8 inches by 4 inches, as manufactured by Zurn; No. ZN-1930-K.

O. Sampling Hatch Covers for [_____]: 6 inches in diameter, as manufactured by Vapor Recovery Systems, Varec No. 42-81.

P. Nonsparking Manhole Covers for [_____]: 24 inches, with galvanized steel roof insert frame and 1/4-inch neoprene gasket for each, as manufactured by Vapor Recovery Systems; Varec No. 220-82.

Q. Wire Mesh Screen:

1. Fabricate frame of aluminum shapes and flat bar stock.
2. Wire Mesh: Woven of 14-gauge aluminum wire, three openings per inch, stretched taut over frame before bolts are tightened down.

R. Weir and Baffle Plates: Fabricate plates and associated framing of [stainless steel, AISI Type 316] [aluminum alloy 6061-T6 using welding filler wire as manufactured by Alcoa, No. 4043], unless indicated otherwise on Drawings.

S. Stop Gates and Guide Frames: Aluminum plate with aluminum channel or angle sections as stiffeners.

1. Guides, Rests, and Fasteners: AISI Type 316 stainless steel.
2. Identification Plate:
   a. 16-gauge aluminum or stainless steel securely mounted on each gate.
   b. Text: 1-inch die-stamped word “WATERSIDE” and corresponding gate number [as shown in Gate Schedule].
   c. Mount plate on side opposite gate stiffeners.
3. Extruded Aluminum Guide Manufacturer: Washington Aluminum Co., Baltimore, MD.

2.24 DUMPING EQUIPMENT AND GRIT DRUMS

A. Dumping Equipment:

©COPYRIGHT 2013 CH2M HILL

1. Girdle: Suitable for use with 55-gallon standard steel drums, complete with locking toggle and handwheel adjustment for variations in drum size.
2. Dumping Frame:
   a. Suitable for use with grit washer hoist.
   b. Suitable for dumping open-end drums, 1,000-pound capacity.
3. Manufacturers and Products:
   a. Girdle: Star Machinery Co., Portland, OR; Cecor Model 95.

a. Dumping Frame: Star Machinery Co., Portland, OR; Cecor Model 1095.

B. Grit Drums:

1. Furnish [four] [_____] 55-gallon standard steel drums.
2. Finish: Commercial blast clean and paint in accordance with Section 09 90 00, Painting and Coating.

2.25 CASTINGS

A. Frame and Cover for [_____]: Olympic Foundry; No. [_____]

B. Meter Box Manhole: Nonslip surface and handle, as manufactured by Olympic Foundry Co.; 5823B.

C. Floor Boxes:

1. Cast iron, except as otherwise shown.
2. Depth: Equal to slab thickness where installed.
3. Diameter: As shown.
4. Manufacturers and Products:
   a. Neenah Foundry, Neenah, WI; R 7506.
   b. Mueller, Decatur, IL; No. A-27010.
   c. Olympic Foundry Co., Seattle, WA; No. 5680.

2.26 ACCESSORIES

A. Antiseizing Lubricant for Stainless Steel Threaded Connections:

1. Suitable for potable water supply.
2. Resists washout.
3. Manufacturers and Products:
   a. Bostik, Middleton, MA; Neverseez.
   b. Saf-T-Eze Div., STL Corp., Lombard, IL; Anti-Seize.

©COPYRIGHT 2013 CH2M HILL

B. Neoprene Gasket:

1. ASTM D1056, 2C1, soft, closed-cell neoprene gasket material, suitable for exposure to sewage and sewage gases, unless otherwise shown on Drawings.
2. Thickness: Minimum 1/4 inch.
3. Furnish without skin coat.
4. Manufacturer and Product: Monmouth Rubber and Plastics Corporation, Long Branch, NJ; Durafoam DK1111LD.

2.27 FABRICATION

A. General:

1. Finish exposed surfaces smooth, sharp, and to well-defined lines.
2. Furnish necessary rabbets, lugs, and brackets so work can be assembled in neat, substantial manner.
3. Conceal fastenings where practical; where exposed, flush countersink.
4. Drill metalwork and countersink holes as required for attaching hardware or other materials.
5. Grind cut edges smooth and straight. Round sharp edges to small uniform radius. Grind burrs, jagged edges, and surface defects smooth.
6. Fit and assemble in largest practical sections for delivery to Site.

B. Materials:

1. Use steel shapes, unless otherwise noted.
2. Steel to be hot-dip galvanized: Limit silicon content to less than 0.04 percent or to between 0.15 and 0.25 percent.
3. Fabricate aluminum in accordance with AA Specifications for Aluminum Structures–Allowable Stress Design.

C. Welding:

1. Weld connections and grind exposed welds smooth. When required to be watertight, make welds continuous.
2. Welded fabrications shall be free from twisting or distortion caused by improper welding techniques.
3. Steel: Meet fabrication requirements of AWS D1.1/D1.1M, Section 5.
4. Aluminum: Meet requirements of AWS D1.2/D1.2M.
5. Stainless Steel: Meet requirements of AWS D1.6/D1.6M.
6. Welded Anchor Studs: Prepare surface to be welded and weld with stud welding gun in accordance with AWS D1.1/D1.1M, Section 7, and manufacturer’s instructions.

©COPYRIGHT 2013 CH2M HILL

7. Complete welding before applying finish.

D. Painting:

1. Shop prime with rust-inhibitive primer as specified in Section 09 90 00, Painting and Coating, unless otherwise indicated.
2. Coat surfaces of galvanized steel and aluminum fabricated items to be in direct contact with concrete, grout, masonry, or dissimilar metals, as specified in Section 09 90 00, Painting and Coating, unless indicated otherwise.
3. Do not apply protective coating to galvanized steel anchor bolts or galvanized steel welded anchor studs, unless indicated otherwise.

E. Galvanizing:

1. Fabricate steel to be galvanized in accordance with ASTM A143/A143M, ASTM A384/A384M, and ASTM A385/A385M. Avoid fabrication techniques that could cause distortion or embrittlement of the steel.
2. Provide venting and drain holes for tubular members and fabricated assemblies in accordance with ASTM A385/A385M.
3. Remove welding slag, splatter, burrs, grease, oil, paint, lacquer, and other deleterious material prior to delivery for galvanizing.
4. Remove by blast cleaning or other methods surface contaminants and coatings not removable by normal chemical cleaning process in the galvanizing operation.
5. Hot-dip galvanize steel members, fabrications, and assemblies after fabrication in accordance with ASTM A123/A123M.
6. Hot-dip galvanize bolts, nuts, washers, and hardware components in accordance with ASTM A153/A153M. Oversize holes to allow for zinc alloy growth. Shop assemble bolts and nuts.
7. Galvanized steel sheets in accordance with ASTM A653/A653M.
8. Galvanize components of bolted assemblies separately before assembly. Galvanizing of tapped holes is not required.

F. Electrolytic Protection: Coat surfaces of galvanized steel and aluminum fabricated items to be in direct contact with concrete, grout, masonry, or dissimilar metals, as specified in Section 09 90 00, Painting and Coating, unless indicated otherwise.

G. Watertight Seal: Where required or shown, furnish neoprene gasket of a type that is satisfactory for use in [contact with sewage] [_____]. Cover full bearing surfaces.

H. Fitting: Where movement of fabrications is required or shown, cut, fit, and align items for smooth operation. Make corners square and opposite sides parallel.

©COPYRIGHT 2013 CH2M HILL

I. Accessories: Furnish as required for a complete installation. Fasten by welding or with stainless steel bolts or screws.

2.28 SOURCE QUALITY CONTROL

A. Visually inspect all fabrication welds and correct deficiencies.

1. Steel: AWS D1.1/D1.1M, Section 6 and Table 6.1, Visual Inspection Acceptance Criteria.
2. Aluminum: AWS D1.2/D1.2M.
3. Stainless Steel: AWS D1.6/D1.6M.

B. [Hot-Dip Galvanizing:]

1. [An independent testing agency [, will be retained by Owner] [, shall be retained by Contractor and approved by ENGINEER] to inspect and test hot-dip galvanized fabricated items [, except _____] in accordance with ASTM A123/A123M and ASTM A153/A153M.]
2. [Visually inspect and test for thickness and adhesion of zinc coating for minimum of three test samples from each lot in accordance with ASTM A123/A123M and ASTM A153/A153M.]
3. [Reject and retest nonconforming articles in accordance with ASTM A123/A123M and ASTM A153/A153M.]

PART 3 - EXECUTION

3.01 INSTALLATION OF METAL FABRICATIONS

A. General:

1. Install metal fabrications plumb and level, accurately fitted, free from distortion or defects.
2. Install rigid, substantial, and neat in appearance.
3. Install manufactured products in accordance with manufacturer’s recommendations.
4. Obtain ENGINEER approval prior to field cutting steel members or making adjustments not scheduled.

B. Aluminum:

1. Do not remove mill markings from concealed surfaces.
2. Remove inked or painted identification marks on exposed surfaces not otherwise coated after installed material has been inspected and approved.

©COPYRIGHT 2013 CH2M HILL

3. Fabrication, mechanical connections, and welded construction shall be in accordance with the AA Aluminum Design Manual.

C. Pipe Sleeves:

1. Provide where pipes pass through concrete or masonry.
2. Holes drilled with a rotary drill may be provided in lieu of sleeves in existing walls.
3. Provide center flange for water stoppage on sleeves in exterior or water-bearing walls.
4. Provide rubber caulking sealant or a modular mechanical unit to form watertight seal in annular space between pipes and sleeves.

D. Steel Lintels and Shelf Angles: Provide as required for support of masonry and other construction not attached to structural steel framing, unless otherwise shown on Drawings.

3.02 CAST-IN-PLACE ANCHOR BOLTS

A. Locate and hold anchor bolts in place with templates at time concrete is placed.

B. Use anchor bolt sleeves for location adjustment and provide two nuts and one washer per bolt of same material as bolt.

C. Minimum Bolt Size: 1/2-inch diameter by 12 inches long, unless otherwise shown.

3.03 CONCRETE AND MASONRY POST-INSTALLED ANCHORS

A. Begin installation only after concrete or masonry to receive anchors has attained design strength.

B. Install in accordance with manufacturer's instructions.

C. Provide minimum embedment, edge distance, and spacing as follows, unless indicated otherwise by anchor manufacturer's instructions or shown otherwise on Drawings:

Anchor Type	Minimum Embedment (Bolt Diameters)	Minimum Edge Distance (Bolt Diameters)	Minimum Spacing (Bolt Diameters)
Expansion	9	6	12

©COPYRIGHT 2013 CH2M HILL

Anchor Type	Minimum Embedment (Bolt Diameters)	Minimum Edge Distance (Bolt Diameters)	Minimum Spacing (Bolt Diameters)
Undercut	9	12	16
Adhesive	9	9	13.5

D. Use only drill type and bit type and diameter recommended by anchor manufacturer. Clean hole of debris and dust with brush and compressed air per manufacturer's printed installation instructions.

E. For undercut anchors, use special undercutting drill bit and rotary hammer drill and apply final torque as recommended by anchor manufacturer.

F. When embedded steel or rebar is encountered in drill path, slant drill to clear obstruction. If drill must be slanted more than 10 degrees to clear obstruction, notify ENGINEER for direction on how to proceed.

G. Adhesive Anchors:

1. Do not install adhesive anchors when temperature of concrete is below 40 degrees F or above 100 degrees F, unless cold temperature adhesives, compliant with ACI 308 are used. Refer to the respective ICC-ES report and manufacturer's printed installation instructions.
2. Remove water from hole with oil-free compressed air. Damp or water filled holes may be allowed only if approved in manufacturer's printed installation instructions and ICC-ES report.
3. For hollow-unit masonry, install screen tube in accordance with manufacturer's printed installation instructions.
4. Do not disturb anchor during recommended curing time.
5. Do not exceed maximum torque as specified in manufacturer's printed installation instructions.

H. Prestressed Concrete: Do not use post-installed anchors in prestressed or post-tensioned concrete members without ENGINEER's prior approval, unless specifically shown on Drawings. If ENGINEER approves anchor installation all prestressed tendons in vicinity of anchors must be located prior to drilling.

3.04 U-CHANNEL CONCRETE INSERTS

A. Provide as indicated for pipe supports and where otherwise shown on Drawings.

©COPYRIGHT 2013 CH2M HILL

B. Except for interior dry areas, use plastic clips or similar dielectric material to isolate channel anchors from concrete reinforcing steel.

3.05 ABRASIVE NOSINGS

A. Provide abrasive nosings on concrete steps not being supplied or coated with another type of nosing or nonskid material.

3.06 ACCESS COVERS

A. Install access covers, including sidewalk doors, floor hatches, and hinged manhole covers in accordance with manufacturer's instructions.

B. Accurately position prior to placing concrete, such that covers are flush with floor surface.

C. Protect from damage resulting from concrete placement. Thoroughly clean exposed surfaces of concrete spillage to obtain a clean, uniform appearance.

B. [Route drain pipe to exterior face of concrete or as shown on Drawings].

3.07 SAFETY CLIMB DEVICE SYSTEM

A. Provide for each ladder where unbroken height between levels exceeds 20 feet, or at lesser height where indicated on Drawings.

B. Install in accordance with manufacturer's instructions.

C. Furnish additional accessories required to complete system for each ladder.

D. Furnish one harness for each ladder equipped with safety climb device.

E. Furnish pivot section at platforms, landings, and roofs.

F. When installed to required height, fall prevention system shall be rigid and an integral part of the structure.

3.08 ELECTROLYTIC PROTECTION

A. Aluminum and Galvanized Steel:

©COPYRIGHT 2013 CH2M HILL

1. Coat surfaces of galvanized steel and aluminum fabricated items to be in direct contact with concrete, grout, masonry, or dissimilar metals, as specified in Section 09 90 00, Painting and Coating, unless indicated otherwise.
2. Do not apply protective coating to galvanized steel anchor bolts or galvanized steel welded anchor studs, unless indicated otherwise.
3. Allow coating to dry before installation of the material.
4. Protect coated surfaces during installation.
5. Should coating become marred, prepare and touch up in accordance with paint manufacturer's written instructions.

B. Titanium: Where titanium equipment is in contact with concrete or dissimilar metal, provide full-face neoprene insulation gasket, 3/32-inch minimum thickness and 70-durometer hardness.

C. Stainless Steel:

1. During handling and installation, take necessary precautions to prevent carbon impregnation of stainless steel members.
2. After installation, visually inspect stainless steel surfaces for evidence of iron rust, oil, paint, and other forms of contamination.
3. Remove contamination using cleaning and passivation methods in accordance with requirements of ASTM A380 and ASTM A967.
4. Brushes used to remove foreign substances shall utilize only stainless steel or nonmetallic bristles.
5. After treatment, visually inspect surfaces for compliance.

3.09 PAINTING

A. Painted Galvanized Surfaces: Prepare as specified in Section 09 90 00, Painting and Coating.

B. Repair of Damaged Hot-Dip Galvanized Coating:

1. Conform to ASTM A780/A780M.
2. For minor repairs at abraded areas, use sprayed zinc conforming to ASTM A780/A780M.
3. For flame cut or welded areas, use zinc-based solder, or zinc sticks, conforming to ASTM A780/A780M.
4. Use magnetic gauge to determine thickness is equal to or greater than base galvanized coating.

C. [Field Painting of Shop Primed Surfaces: Prepare surfaces and field finish in accordance with Section 09 90 00, Painting and Coating.]

©COPYRIGHT 2013 CH2M HILL

3.10 FIELD QUALITY CONTROL

A. Owner-Furnished Quality Assurance:

1. In accordance with IBC Chapter 17 requirements, is provided in the Statement of Special Inspections Plan on Drawings.
2. Contractor responsibilities and related information on special inspection [, observation,] and testing are included in Section 01 45 33, Special Inspection [, Observation,] and Testing.

B. Contractor-Furnished Quality Control:

1. Inspection and testing required in Section 01 45 16.13, Contractor Quality Control.
2. Certificate of Compliance per Section 01 43 33, Manufacturer's Field Services, for test results, or calculations, or drawings that ensure material and equipment design and design criteria meet requirements of Section 01 61 00, Common Product Requirements [and Section 01 88 15, Anchorage and Bracing].

C. [Stud Shear Connectors:

1. At start of each production period, conduct the following test to determine proper generator, control unit, and stud welding gun settings, in accordance with AWS D1.1/D1.1M, Chapter 7:
   a. Weld two test studs and visually inspect for full 360-degree flash.
   b. Bend test studs 30 degrees from vertical for headed anchor studs (HAS). Torque test threaded anchor studs (TAS) studs per AWS D1.1/D1.1M, Section 7.6.6.2.
   c. Test studs will be acceptable if there is no failure of welds.
   d. If weld fails, repeat test until two consecutive test studs test to be satisfactory.
2. During production, if visual inspection reveals weld does not exhibit full 360-degree flash or that stud has been repaired by welding, conduct the following test in accordance with AWS D1.1/D1.1M, Chapter 7:
   a. Bend HAS studs or stud shear connectors approximately 15 degrees from vertical, away from missing portion of flash. For TAS studs, torque test per AWS D1.1/D1.1M, Section 7.6.6.2.
   b. Studs meeting this test without exhibiting cracks in weld will be considered acceptable and left in bent position.
   c. Replace studs failing test.]
3. [Special inspection shall be provided by Owner where indicated on Drawings.]

©COPYRIGHT 2013 CH2M HILL

D. [Concrete and Masonry Drilled Anchors: Special inspection and testing will be provided by Owner where indicated on Drawings.]

3.11 [MANUFACTURER'S SERVICES

A. Anchor Installation: Conduct site training of installation personnel for proper installation, handling, and storage of mechanical and adhesive anchor systems. Notify ENGINEER of time and place for sessions.]

3.12 FASTENER SCHEDULE

A. Unless indicated otherwise on Drawings, provide fasteners as follows:

Service Use and Location	Product	Remarks
1. Anchor Bolts Cast Into Concrete for Structural Steel, Metal Fabrications and Castings		
Interior Dry Areas	[Plain uncoated] [Hot-dip galvanized] steel headed anchor bolts, unless indicated otherwise	
Exterior and Interior Wet Areas	[Hot-dip galvanized] [Stainless] steel headed anchor bolts	
Submerged and Corrosive Areas	Stainless steel headed anchor bolts with fusion bonded coating	See Section 09 90 00, Painting and Coating
2. Anchor Bolts Cast Into Concrete for Equipment Bases		
Interior Dry Areas	Stainless steel headed anchor bolts, unless otherwise specified with equipment	
Submerged, Exterior, Interior Wet, and Corrosive Areas	Stainless steel headed anchor bolts with fusion bonded coating, unless otherwise specified with equipment	See Section 09 90 00, Painting and Coating

©COPYRIGHT 2013 CH2M HILL

Service Use and Location	Product	Remarks
3. Drilled Anchors for Metal Components to Cast-in-Place Concrete (e.g., Ladders, Handrail Posts, Electrical Panels, and Equipment)		
Interior Dry Areas	Zinc-plated or stainless steel wedge or expansion anchors	[Use zinc-plated undercut anchors for overhead and ceiling installations.] [Use zinc-plated wedge anchors approved for use in cracked concrete for overhead and ceiling installations.]
Submerged, Exterior, Interior Wet, and Corrosive Areas	Adhesive stainless steel anchors	[Use stainless steel undercut anchors for overhead and ceiling installations.] [Use stainless steel wedge anchors approved for use in cracked concrete for overhead and ceiling installations.]
4. Anchors in Grout-Filled Concrete Masonry Units		
Exterior and Interior Wet and Dry Areas	Hot-dip galvanized steel headed anchor bolts, zinc-plated or stainless steel sleeve anchors, or stainless steel adhesive anchors	
5. Anchors in Hollow Concrete Masonry Units		
Exterior and Interior Wet and Dry Areas	Zinc-plated or stainless steel sleeve anchors, or stainless steel adhesive anchors with screen tube	
6. Connections for Structural Steel Framing		
Exterior and Interior Wet and Dry Areas	High-strength steel bolted connections	Use hot-dipped galvanized high-strength bolted connections for galvanized steel framing members.
7. Connections for Steel Fabrications and Wood Components		

©COPYRIGHT 2013 CH2M HILL

Service Use and Location	Product	Remarks
Exterior and Interior Wet and Dry Areas	[Hot-dip galvanized carbon] [Stainless] steel bolted connections	
8. Connections of Aluminum Components		
Submerged, Exterior and Interior Wet and Dry Areas	Stainless steel bolted connections, unless otherwise specified with equipment	
9. All Others		
Exterior and Interior Wet and Dry Areas	Stainless steel fasteners	

B. Antiseizing Lubricant: Use on stainless steel threads.

C. Do not use adhesive anchors to support fire-resistive construction or where ambient temperature will exceed 120 degrees F.

SECTION 05 52 00
METAL RAILINGS

PART 1 - GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. Aluminum Association, Incorporated (AA): DAF45, Designation System for Aluminum Finishes.
2. American Iron and Steel Institute (AISI).
3. ASTM International (ASTM):
   a. A36/A36M, Standard Specification for Carbon Structural Steel.
   b. A53/A53M, Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.
   c. A123/A123M, Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.
   d. A167, Standard Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip.
   e. A193/A193M, Standard Specification for Alloy-Steel and Stainless Steel Bolting Materials for High Temperature or High Pressure Service and Other Special Purpose Applications.
   f. A194/A194M, Standard Specification for Carbon and Alloy Steel Nuts for Bolts for High Pressure or High Temperature Service, or Both.
   g. A501, Standard Specification for Hot-Formed Welded and Seamless Carbon Steel Structural Tubing.
   h. A554, Standard Specification for Welded Stainless Steel Mechanical Tubing.
   i. E985, Standard Specification for Permanent Metal Railing Systems and Rails for Buildings.
4. International Code Council (ICC): International Building Code (IBC).
5. Occupational Safety and Health Act (OSHA): 29 CFR 1910, Code of Federal Regulations.

1.02 DEFINITIONS

A. Handrails: Synonymous with terms; i.e., guardrail system, railing system, ramp-rail system, and stair-rail system. Handrails are comprised of a framework of

©COPYRIGHT 2013 CH2M HILL

vertical, horizontal, or inclined members, grillwork or panels, accessories, or combination thereof.

B. ICC Evaluation Services Report for concrete anchor manufacturers.

C. Special Inspection: As governed by the ICC IBC.

D. Toeboards: Vertical barrier at floor level usually erected on handrails along exposed edges of floor or wall openings, platforms, ramps, or stairs to prevent miscellaneous items from falling through.

1.03 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
   a. Indicate handrail profiles, sizes, connections, anchorage, size and type of fasteners, and accessories. Project-specific scale plans and elevations of handrails.
   b. Manufacturer's literature and catalog data of handrail and components.
   c. Design Data: Calculations or test data using design performance loads and include the following:
      1) Bending stress in, and deflection of, posts in accordance with ASTM E985.
      2) Stress in post base connection.
      3) Calculation of anchorage forces and comparison of these forces to ICC IBC recommendations regarding safe allowable design loads of anchorages.
      4) For concrete anchor spacings less than 12 anchor diameters and edge distances less than six anchor diameters, make reduction in allowable pullout and shear values. Provide independent laboratory inspection service for ICC Evaluation Services Report values with Special Inspection.
2. Samples:
   a. Railing sections, 6 inches long showing different connections and proposed finish.
   b. Each fitting including wall brackets, castings, toeboard fittings, and rail expansion joints.

B. Informational Submittals:

1. Manufacturer's assembly and installation instructions.

©COPYRIGHT 2013 CH2M HILL

2. Special Inspection:
   a. Manufacturer's instructions for Special Inspection of concrete anchors.
   b. Special Inspection report in accordance with Article Tests and Inspections.

C. Manufacturer's Certificate of Proper Installation in accordance with Section 01 43 33, Manufacturers' Field Services.

1. Manufacturer's written recommendations describing procedures for maintaining handrails including cleaning materials, application methods, and precautions to be taken in the use of cleaning materials.
2. Test Reports: Test data may supplement load calculations providing data covers the complete handrail system, including anchorage:
   a. Test data for handrail and components showing load and deflection due to load, in enough detail to prove handrail is strong enough and satisfies national, state, local standards, regulations, code requirements, and OSHA 29 CFR 1910, using design loads specified. Include test data for the following:
      1) Railing and post connections.
      2) Railing wall connections.
      3) Post and base connections.
      4) Railing expansion joint connections.
      5) Railing gate assembly, including latch and gate stop. Both gate latch and stop to support required loads applied, independent of each other.
      6) Railing gate hinges.
      7) [Railing picket panel clamps and connections.]
   b. Deflection Criteria: In accordance with ASTM E985 and design loads specified.
   c. Aluminum Rail Piping: Test data showing yield strength of pipe as-delivered equals or exceeds values specified in this section.
   d. Concrete Anchors: Calculations and test data for review prior to use, on anchors other than those specified.

1.04 QUALITY ASSURANCE

A. Qualifications: Calculations required for design data stamped by a registered civil or structural engineer licensed in the state where the Project will be constructed.

©COPYRIGHT 2013 CH2M HILL

1.2 DELIVERY, STORAGE, AND HANDLING

A. Handrails adequately packaged and wrapped to prevent scratching and denting during shipment, storage, and installation. Maintain protective wrapping until railing is completely installed.

A. Aluminum Handrails:

1. Shop assemble into practical modules of lengths not exceeding 24 feet for shipment.
2. Deliver toeboards loose for field assembly.
3. Deliver clear anodized handrail pipe and posts with protective plastic wrap.

1.05 ENVIRONMENTAL REQUIREMENTS

A. Thermal Movements: Allow for thermal movement resulting from the following maximum range in ambient temperature in design, fabrication, and installation of handrails to prevent buckling, opening up of joints, over stressing of components, connections and other detrimental effects. Base design calculation on actual surface temperatures of materials due to both solar heat gain and night time sky heat loss. Temperature change is difference between high or low temperature and installation temperature.

1. Temperature Change Range: [70] [_____] degrees F, ambient; [100] [_____] degrees F, material surfaces.

PART 2 - PRODUCTS

2.01 DESIGN PERFORMANCE

A. Structural Performance of Handrails: Design, test, fabricate, and install handrails to withstand the following structural loads without exceeding allowable design working stress or allowable deflection. Apply each load to produce maximum stress and deflection in each of the respective components comprising handrails.

1. Top Rail of Handrails: Capable of withstanding the following load cases applied:
   a. Concentrated load of 200 pounds applied at any point and in any direction in accordance with ICC IBC.
   b. [Uniform load of 50 pounds per linear foot applied in any direction in accordance with ICC IBC.]
   c. Concentrated load need not be assumed to act concurrently with uniform loads in accordance with ICC IBC.

©COPYRIGHT 2013 CH2M HILL

2. In-Fill Area of Railing Systems:
   a. Capable of withstanding a horizontally applied normal load of 50 pounds applied to 1 square foot at any point in the system including panels, intermediate rails, balusters, and openings and space between railings.
   b. Horizontal concentrated load need not be assumed to act concurrently with loads on top rails of handrails.
3. Mid-rails with corner returns to withstand a 300-pound concentrated vertical load applied at any point or direction without damage and loosening of pipe, fittings, or attachment hardware.
4. Concrete Anchors for Handrail Wall Brackets: Anchors with a strength required by calculations with concrete strength assumed at 4,000 psi and in conformance with ICC IBC.
5. Concrete Anchors: In accordance with ICC IBC for size, length, embedment, spacing, and edge distance to match required loads shown in calculations.

2.02 ALUMINUM HANDRAILS

A. General:

1. Furnish pre-engineered and prefabricated [two] [three] picket handrails.
2. Pop rivets and glued railing construction not permitted.

B. Manufacturers:

1. Thompson Fabricating Co., Birmingham, AL.
2. Moultrie Manufacturing, Moultrie, GA; Wesrail II.
3. [No “or-equal” or substitute products will be considered.]

C. Rails, Posts, and Formed Elbows: Extruded Alloy 6105-T5 or 6061-T6, minimum tensile strength of 38,000 psi and minimum yield strength of 35,000 psi.

1. Miscellaneous Aluminum Parts: 6063-T6 or 6061-T6 extruded aluminum of adequate strength for all loads.
2. Post and Railing: Nominal 1-1/2 inch diameter.
   a. Rails: 1.900-inch outside diameter by 0.145-inch wall thickness, Schedule 40.
   b. Posts: 1.900-inch outside diameter by 0.200-inch wall thickness, Schedule 80.
   c. Solid dowel interconnectors of 6105-T5 or 6061-T6 aluminum.

©COPYRIGHT 2013 CH2M HILL

D. Fittings:

1. Handrail and Post Fittings: Extruded, machined bar stock, permanent mold castings, or die castings of sufficient strength to meet load requirements. Fittings shall match color of pipe in handrails. Sand cast parts not permitted.
2. Concrete Top Mount Post Base:
   a. Four holes in base for concrete anchors. For narrow walls or curbs, furnish two holes in base for concrete anchors with required edge distance.
   b. Manufacturers and Products:
      1) Thompson Fabricating Co.; Part No. TBF-3.4 and Part No. TBF-3.2 for narrow walls and curbs.
      2) Moultrie Manufacturing Co.; Part No. WII4HB and WII2HB for narrow walls and curbs.
3. Concrete Side Mounted Handrail Bracket: Extruded aluminum, Alloy 6063-T6 with four holes for bolts or concrete anchors.
   a. Manufacturers and Products:
      1) Thompson Fabricating Co.; Part No. TSM-1.5.
      2) Moultrie Manufacturing Co.; Part No. WIISMB.
4. Concrete Anchors for Securing Bases and Brackets to Concrete: Type 304 or Type 316 stainless steel 1/2-inch concrete anchors.
5. Handrail Connections for Metal Stairway Stringers:
   a. Extruded aluminum bracket, Alloy 6063-T6.
   b. Brackets bolts 1/2-inch diameter Type 304 or Type 316 stainless steel bolts.
   c. Offset Adjustable Stair Fitting:
      1) Thompson Fabricating Co.; Part No. ASF of cast Al-mag.
      2) Moultrie Manufacturing Co.; Standard and custom elbow angles, Part No. W51XXX (numbers vary based on angle).
   d. Additional Offset Adjustable Fitting for Picket Railing System: Thompson Fabricating Co.; Part No. APF of cast Al-mag.
   e. Base Connection:
      1) Manufacturers and Products:
         a) Thompson Fabricating Co.; Part Nos. SMB-2 or SMB-3, ASF, APF.
         b) Moultrie Manufacturing Co.; Part No. WIISMBEXT.
6. Handrail Connections for Metal Beams:
   a. Extruded aluminum bracket, Alloy 6063-T6.
   b. Bracket bolts 1/2-inch diameter Type 304 stainless steel bolts.
   c. Manufacturers and Products:
      1) Thompson Fabricating Co.; Part Nos. SMB-2 or SMB-3. Use Part No. TSM-1.5 if bracket is attached to flat side of channel.

©COPYRIGHT 2013 CH2M HILL

2) Moultrie Manufacturing Co.; Part No. WIISMBEXT. Use Part No. WIISMB if bracket is attached to flat side of channel.

7. Handrail Wall Brackets: Adjustable wall fitting, with provision for three 3/8-inch Type 304 stainless steel bolts or concrete anchors.
   a. Manufacturers and Products:
      1) Thompson Fabricating Co.; Part No. AWF cast Al-mag aluminum bracket.
      2) Moultrie Manufacturing Co.; Part No. W41100.
8. Miscellaneous Rail to Post Fittings:
   a. Aluminum Tee Fittings:
      1) Manufacturers and Products:
         a) Thompson Fabricating Co.; Part Nos. TF-1 and TX-1.
         b) Moultrie Manufacturing Co.; Part Nos. WIIT40, WIIT40/05, WIIT80, and WIIT80/05.
   b. Aluminum Ell Fittings:
         a) Manufacturers and Products:
         b) Thompson Fabricating Co.; Part Nos. TE-1, TE-2, and TE-3.
         c) Moultrie Manufacturing Co.; Part No. 51900.
   c. Aluminum Splice Lock:
      1) Manufacturers and Products:
         a) Thompson Fabricating Co.; Part No. SL-1.
         b) Moultrie Manufacturing Co.; Part No. WIIS40.
   d. Aluminum Expansion Joint Splice:
      1) Manufacturers and Products:
         a) Thompson Fabricating Co.; Part No. ES-1.
         b) Moultrie Manufacturing Co.; Part No. WII40, omit set screws on one side.
   e. Formed Aluminum Wall Flange:
      1) Manufacturers and Products:
         a) Thompson Fabricating Co.; Part No. CF-2.
         b) Moultrie Manufacturing Co.; Part No. 41250.
9. Handrail Gate: 6063-T6, 6105-T5, or 6061-T6 extruded aluminum.
   a. Hardware Manufacturers and Products:
      1) Julius Blum & Co., Inc., Carlstadt, NJ; No. 782/3 gate hinges with springs, and No. 784 gate latch and stop.
      2) CraneVeyor Corp., South El Monte, CA; No. C4370b gate hinges with spring, No. C4369 gate latch, and No. C4368 gate stop.
      3) Thompson Fabricating Co., Birmingham, AL.
      4) Moultrie Manufacturing Co., Moultrie, GA; Part No. W60006.

©COPYRIGHT 2013 CH2M HILL

10. In-Fill Area Picket and Attachments:
    a. 1/2-inch Schedule 40 aluminum pipe (picket). Alloy 6105, 6063, or 6061.
    b. Extruded aluminum 1-1/2-inch by 7/8-inch by 1/8-inch channel. Alloy 6105, 6063, or 6061.
    c. Fittings for Offset Stair Railings:
        1) Cast Al-mag Adjustable Picket Fitting Manufacturer and Product: Thompson Fabricating Co.; Part No. APF.
        2) Cast Al-mag Adjustable Stair Fitting Manufacturer and Product: Thompson Fabricating Co.; Part No. ASF.
    d. Furnish neoprene plug for each end of the picket.
11. Toeboards and Accessories:
    a. Material: Molded or extruded 6063 or 6061 aluminum.
        1) Manufacturers:
        2) Thompson Fabricating Co.
        3) Moultrie Manufacturing Co.; Part No. WIIKP20.
    b. Castings for Handrails:
        1) Cast Al-mag with sufficient strength to meet load and test requirements.
        2) Anodizable grade finish with excellent resistance to corrosion when subject to exposure of sodium chloride solution intermittent spray and immersion.

E. Concrete Embedded Metal Anchorages: In accordance with Section [05 50 00, Metal Fabrications] [_____].

F. Finishes:

1. Handrail Pipe and Post: In accordance with AA DAF45, designation AA-M32-C22-A41.
2. Cast Fittings and Toeboards: In accordance with AA DAF45, designation AA-M10-C22-A41.

2.03 GALVANIZED STEEL HANDRAILS

A. Pipe: Hot-dip galvanized carbon steel, ASTM A53/A53M, Type E or S, Grade B; or ASTM A501, 1-1/2-inch NPS with 1.900-inch outside diameter and a minimum 0.145-inch wall thickness for rails and a minimum of 0.200-inch wall thickness for posts.

B. Fittings:

1. Anchor Bolts and Fasteners: Stainless steel.

©COPYRIGHT 2013 CH2M HILL

2. Handrail Post Bolted Baseplate Connector: Baseplate, carbon steel ASTM A36/A36M.
    a. Insert: Minimum wall thickness of 0.200 inch or from solid rod in accordance with ASTM A36/A36M.
3. Handrail Wall Brackets: Malleable iron, round top, and galvanized.
    a. Manufacturers and Products:
        1) R & B Wagner; No. 1765.
        2) Julius Blum; No. 1382.
4. Handrail Gate: As specified for galvanized steel piping.
    a. Gate Hardware Manufacturers and Products: Type 304 stainless steel:
        1) Julius Blum & Co., Inc., Carlstadt, NJ; Connectorail System, No. 782/3 gate hinges with spring, and No. 784 gate latch and stop.
        2) Craneveyor Corp., South El Monte, CA; No. C4370b gate hinges with spring, No. C4369 gate latch, and No. C4368 gate stop.
5. Handrail Picket Panels and Clamps:
    a. Solid bar steel meeting minimum requirements specified for piping.
    b. Fasteners: Stainless steel.
6. Toeboards and Accessories:
    a. ASTM A36/A36M steel.
    b. Fasteners: Stainless steel.

C. Concrete Embedded Metal Anchorages: In accordance with Section [05 50 00, Metal Fabrications] [_____].

D. Fasteners: Stainless steel.

2.04 ANCHOR BOLTS, FASTENERS, AND CONCRETE ANCHORS

A. Locknuts, Washers, and Screws:

1. Elastic Locknuts, Steel Flat Washers, RHMS Round Head Machine Screws: Type A 304 or Type A 316 stainless steel.
2. Flat Washers: Molded nylon.
3. Manufacturer: McMaster-Carr Supply Co., Los Angeles, CA.

B. Bolts and Nuts for Bolting Handrail to Metal Beams: ASTM A193/A193M and ASTM A194/A194M, Type A 316 stainless steel with minimum yield strength for bolts of 95,000 psi, unless otherwise shown.

©COPYRIGHT 2013 CH2M HILL

C. Concrete Anchors:

1. Stainless steel Type 304 or Type 316.
2. Use ICC IBC approved values for size, length, embedment, spacing, and edge distance to match required loads shown in calculations.

D. Epoxy Anchors: Heavy-duty 1/2-inch diameter, for exterior use only in accordance with Section 05 50 00, Metal Fabrications, as an alternative to mechanical concrete anchors. Design and provide the number required. Do not use where fire or elevated temperatures above 110 degrees F exist.

2.05 FABRICATION OF ALUMINUM HANDRAILS

A. Shop Assembly:

1. Post Spacing: Maximum [6-foot] [_____] horizontal spacing.
2. Railing Posts Bolted to Metal or Concrete:
   a. In lieu of field cutting, provide approved fitting with sufficient post overlap, containing provisions for vertical adjustment.
   b. Field fit-up is required.
3. Free of burrs, nicks, and sharp edges when fabrication is complete.
4. Welding is not permitted.

B. Shop/Factory Finishing:

1. Use same alloy for uniform appearance throughout fabrication for railings.
2. Handrail and Post Fittings: Match fittings with color of pipe in handrail.
3. Sand cast parts not permitted.

C. Tolerances:

1. Shop assemble rails, posts, and formed elbows with a close tolerance for tight fit.
2. Fit dowels tightly inside posts.

2.06 FABRICATION OF GALVANIZED STEEL HANDRAILS

A. Shop Assembly:

1. Alternate Post to Baseplate Connection:
   a. Field measure elevation of concrete at each post location and determine exact post length so baseplate is on concrete surface

©COPYRIGHT 2013 CH2M HILL

without shims or grout. Rails shall be in straight alignment when all rails to posts and posts to baseplates are welded.

b. Grind welds prior to hot-dip galvanizing of railing sections.

2. Handrail Post Bolted to Metal or Concrete:
   a. Field fit-up is required.
   b. Field measure and weld post to baseplate as an alternative to field cutting.
3. Remove burrs from cut edges.
4. Form elbow bends and wall returns to uniform radius, free from buckles and twists, with finished surfaces smooth.
5. Cover exposed ends of steel pipe by welding 3/16-inch thick steel plate in place or use prefabricated fittings.
6. Welding:
   a. Thoroughly fuse without undercutting or overlap.
   b. Remove splatter, grind exposed welds to blend, and contour surfaces to match those adjacent.
7. Furnish explosion prevention holes at closed ends of pipes.
8. Form and assemble joints exposed to weather to prevent water and moisture from penetrating.

B. Shop/Factory Finishing: Hot-dip galvanize all components in accordance with ASTM A123/A123M after fabrication.

C. Tolerances:

1. Cut pipe square within 2 degrees and to lengths within 1/8 inch.
2. Welding: Miter and cope intersections of posts and rails within 2 degrees, fit to within 0.020 inch, and perform continuous welds around joints.
3. Repair of Defective Work: Remove stains and replace defective Work.

PART 3 - EXECUTION

3.01 GENERAL

A. Provide railing posts longer than needed and field cut to exact dimensions required in order to satisfy vertical variations on the actual structure. Install railing with a base that provides plus or minus 1/4-inch vertical adjustment inside the base fitting. If adjustment is required in the field and exceeds plus or minus 1/4-inch, reduce post length not to exceed beyond bottom of lowest set-screw or bolt in base fitting.

B. Field fabrication of aluminum railing systems not permitted.

©COPYRIGHT 2013 CH2M HILL

C. Modification to structure not permitted where handrail is attached.

D. [Mount handrails only on completed walls. Do not support handrails temporarily by means not satisfying structural performance requirements.] [Mount handrails only on gypsum board assemblies reinforced to receive anchors and where the location of concealed anchor plates has been clearly marked for benefit of installer.]

3.02 HANDRAIL INSTALLATION

A. Assembly and Installation: Perform in accordance with manufacturer's written recommendations for installation.

B. Protection from Entrapped Water:

1. Make provisions in exterior and interior installations subject to high humidity to drain water from railing system.
2. Posts mounted in concrete, bends and elbows occurring at low points, drill weep holes of 1/4-inch diameter at lowest possible elevations, one hole per post or rail. Drill hole in the plane of the rail.

C. Expansion Joints:

1. Maximum intervals of 54 feet on center and at structural joints.
2. Slip joint with internal sleeve extending 2 inches beyond each side of joint. Provide 1/2-inch slip joint gap to allow for expansion.
3. Fasten to one side using 3/8-inch diameter set-screw. Place set-screw at bottom of pipe.
4. Locate joints within 12 inches of posts. Locate expansion joints in rails that span expansion joints in structural walls and floors supporting the posts.

D. Setting Posts:

1. Embedded:
   a. Clean dust and foreign matter from sleeves or blockouts.
   b. Moisten interior of hole and surrounding surface with clean water. Fill hole with nonshrink grout prior to installing post.
   c. Brace railing until grout sets.
   d. Posts installed outside and exposed to freezing temperatures, drill weep hole through post approximately 1/2 inch above level of grout inside post and in plane of rail to prevent entrapment and freezing of water inside post.
2. Surface Mounted:

©COPYRIGHT 2013 CH2M HILL

a. Bolt post baseplate connectors firmly in place.
b. Shims, wedges, grout, and similar devices for handrail post alignment not permitted.

E. Posts and Rails:

1. Set posts plumb and aligned to within 1/8 inch in 12 feet.
2. Set rails horizontal or parallel to slope of steps to within 1/8 inch in 12 feet.
3. Install posts and rails in same plane. Remove projections or irregularities and provide a smooth surface for sliding hands continuously along top rail. Use offset rail for use on stairs and platforms if post is attached to web of stringers or structural platform supports.
4. Support 1-1/2-inch rails directly above stairway stringers with offset fittings.

F. Handrail Wall Brackets:

1. Support wall rails on brackets spaced maximum 6 feet on centers for steel and 5 feet for aluminum as measured on the horizontal projection.
2. Install wall anchor backplates on solid blocking in stud walls.

G. Toeboard:

1. Provide at all handrails except where 4-inch or higher concrete curbs are installed or at gates.
2. Accurately measure in field for correct length, after handrail post installation, cut and secure to posts.
3. Dimension between bottom of toeboard and walking surface not to exceed 1/4 inch.
4. Aluminum Toeboards: Provide expansion and contraction connections between each post.
5. Steel Toeboards: Between each post cut toeboard and provide slotted holes for expansion and contraction.

H. Railing Gate: Install in accordance with manufacturer’s installation instructions.

3.03 FIELD FINISHING

A. Corrosion Protection: Prevent galvanic action and other forms of corrosion caused from direct contact with concrete and dissimilar metals by coating metal surfaces as specified in Section 09 90 00, Painting and Coating.

©COPYRIGHT 2013 CH2M HILL

1. Treatment of Field Welds for Galvanized Steel Railings: Touch up welds by application of two coats high-zinc dust content paint to dry film thickness of 2 mils.

3.04 TESTS AND INSPECTIONS

A. Perform Special Inspection for anchors where ICC Evaluation Services Reports require them for anchor strength value used.

B. Provide an independent test laboratory to perform Special Inspection.

3.05 CLEANING

A. Wash railing system thoroughly using clean water and soap. Rinse with clean water.

B. Do not use acid solution, steel wool, or other harsh abrasive.

C. If stain remains after washing, restore in accordance with manufacturer's recommendations, or replace stained handrails.

END OF SECTION

SUPPLEMENTAL PARAGRAPH

PART 1 - GENERAL

1.01 SUBMITTALS

A. Information Submittals:

1. Test Reports:
   a. Stainless Steel Rail Piping: Test data showing yield strength of pipe as-delivered and insert equals or exceeds 50,000 psi.

PART 2 - PRODUCTS

2.01 STAINLESS STEEL HANDRAILS

A. Manufacturer: KDI Paragon, Inc., Pleasantville, NY.

B. Pipe:

1. Welded stainless steel, Type 304, ornamental grade, ASTM A554 with minimum yield strength of 50,000 psi.
2. Outside diameter for rails, posts, and fittings 1.900 inches.
3. Wall thickness for horizontal railing tubular materials, 0.109 inch minimum.
4. Wall thickness for posts, 0.145 inch minimum.

C. Fittings: Tubular railing components, flanges, wall brackets, and anchor plates and similar accessories, Type 304 stainless steel with physical strength properties equivalent to piping materials.

1. Anchor Bolts: Type 316 stainless steel.
2. Handrail Post Bolted Baseplate Connector:
   a. Baseplate: ASTM A167, Type 304 stainless steel with minimum yield strength of 30,000 psi.
   b. Insert: Pipe ASTM A584 with minimum yield strength of 50,000 psi and minimum wall thickness of 0.230 inch or from solid rod ASTM A36/A36M.

D. Handrail Wall Brackets: Stainless steel with round top, with stain finish.

1. Manufacturers and Products:
   a. R & B Wagner; No. 1768.

©COPYRIGHT 2013 CH2M HILL

b. Julius Blum; No. 275.

E. Handrail Gate: Type 304 stainless steel.

1. Gate Hardware Manufacturers and Products:
   a. Julius Blum & Co., Inc., Carlstadt, NJ; Connectorail System, No. 782/3 gate hinges with spring, and No. 784 gate latch and stop.
   b. Craneveyor Corp., South El Monte, CA; No. C4370b gate hinges with spring, No. C4369 gate latch, and No. C4368 gate stop.

F. Picket Panels:

1. Handrail Picket Panels and Clamps: Solid bar Type 304 stainless steel.
   a. Fasteners: Stainless steel.
2. Toeboards and Accessories:
   a. Type 304 stainless steel.
   b. Fasteners: Stainless steel.
   c. Furnish expansion connections between each post.

G. Concrete Embedded Metal Anchorages: In accordance with Section [05 50 00, Metal Fabrications] [_____].

H. Exposed Stainless Steel Surface Finish: [AISI SS306, No. 4, satin.] [Mechanical rubbed, 180 grit.] [Circumferentially polished to 320 grit finish.]

2.02 FABRICATION OF STAINLESS STEEL HANDRAILS

A. Shop Assembly:

1. Handrail Post Bolted to Metal or Concrete: Field fit-up is required.
2. Joints Between Rails and Posts: Grind for 100 percent contact between the two parts and fully weld using a gas shielded arc. After welding, clean, smooth, and blend joints to the finish of tubular material.

B. Shop/Factory Finishing: Apply finish after fabrication and welding.

SECTION 05 53 00
METAL GRATINGS

PART 1 - GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. American Association of State Highway and Transportation Officials (AASHTO): Standard Specifications for Highway Bridges.
2. ASTM International (ASTM):
   a. A36/A36M, Standard Specification for Carbon Structural Steel.
   b. A510, Standard Specification for General Requirements for Wire Rods and Coarse Round Wire, Carbon Steel.
   c. A666, Standard Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar.
   d. A1011/A1011M, Standard Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, and Ultra-High Strength.
   e. B221, Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.
3. National Association of Architectural Metal Manufacturers (NAAMM):
   a. MBG 531, Metal Bar Grating Manual.
   b. MBG 532, Heavy-Duty Metal Bar Grating Manual.

1.02 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
   a. Grating: Show dimensions, weight, size, and location of connections to adjacent grating, supports, and other Work.
   b. Grating Anchorage: Show details of anchorage to supports to prevent displacement from traffic impact.
   c. Product data for grating, grating clips, anchors, accessories, and other manufactured products specified herein.
   d. Manufacturer’s specifications, including coatings, surface treatment, and finishes.
      1) [Samples: Two Samples of [_____] grating approximately 4 inches by 8 inches, showing at least four crossbars each and

©COPYRIGHT 2013 CH2M HILL

four bearing bars each. One Sample will be retained at Site to be used as a basis for acceptance or rejection of grating installed.]

B. Informational Submittals:

1. Special handling and storage requirements.
1. Installation instructions.

1.03 DELIVERY, STORAGE, AND HANDLING

A. Insofar as is practical, factory assemble items.

B. Package and clearly tag parts and assemblies that are, due to necessity, shipped unassembled.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Materials, equipment, and accessories specified in this section shall be products of:

1. Alabama Metal Industries Corporation (AMICO), Birmingham, AL.
2. IKG Industries, Houston, TX.
3. Ohio Gratings, Inc., Canton, OH.
2. Seidelhuber Metal Products, Inc., South San Francisco, CA.

2.02 GRATING MATERIALS

A. [Aluminum: Provide alloy and temper as designated below.

1. Bearing Bars and Banding: ASTM B221 alloy 6061-T6 or 6063-T6.
2. Swaged Crossbar Rods: ASTM B221 alloy 6061 or 6063, or ASTM B210 alloy 3003.
3. Finish: Mill.]

B. [Carbon Steel:

1. Bearing Bars, Banding, and Rectangular Cross Bars: ASTM A1011/A1011M commercial steel Type II for hot rolled carbon steel sheet and strip, or ASTM A36/A36M.
2. Cross Bars made from Wire Rods: Not Permitted.
3. Finish: Galvanized after fabrication.]

C. [Stainless Steel:

©COPYRIGHT 2013 CH2M HILL

1. Bearing Bars, Banding and Cross Bars: ASTM A666, Type [304L] [316L].
2. Finish: Mill.]

2.03 METAL BAR GRATING

A. General Requirements:

1. Maximum Service Load:
   a. Light Duty (Type A): [100 psf] [_____] uniformly distributed load.
   b. Medium Duty (Type B): [500 psf] [_____] uniformly distributed load.
2. Maximum Deflection: [Span/240 or 1/4 inch, whichever is less] [_____].
3. Bearing Bar Spacing:
   a. Light Duty: [1-3/16 inch] [_____] maximum, center-to-center.
   b. Medium Duty: [15/16 inch] [_____] maximum, center-to-center.
4. Cross Bar Spacing: [4] [2] inches maximum, center-to-center. [For aluminum I-bar grating with depths greater than 2 inches, provide cross bars at 2 inches maximum, center-to-center.]
5. Bearing Bars, Cross Bars and Banding: Minimum thickness as specified in NAAMM MBG 531 or as shown on Drawings.

B. Grating Materials:

1. [Aluminum, pressure-locked [I-bar grating fabricated by swaging crossbars between extruded I-shaped bearing bars] [rectangular bar grating fabricated by pressing crossbars between rectangular bearing bars].]
2. [Galvanized steel [welded, rectangular bar grating fabricated by electro-forging cross bars to bearing bars] [pressure-locked rectangular bar grating fabricated by pressing rectangular crossbars into slots in rectangular bearing bars] [pressure-locked rectangular bar grating fabricated by swaging crossbars between rectangular bearing bars].]
3. [Stainless steel [pressure-locked rectangular bar grating fabricated by swaging crossbars between rectangular bearing bars] [pressure-locked rectangular bar grating fabricated by pressing rectangular crossbars into slots in rectangular bearing bars] [welded, rectangular bar grating fabricated by welding cross bars to bearing bars].]

C. Surface:

1. [Plain.] [Serrated.] [Slip resistant, consisting of an applied abrasive finish of aluminum-oxide aggregate.] [Striated.]

©COPYRIGHT 2013 CH2M HILL

2. [When surface of bars is serrated provide 1/4-inch deeper bearing bars than shown on Drawings to maintain specified load carrying capacity of grating.]

D. Stair Treads:

1. Material and Type: Same as grating material and grating type as furnished for connecting walkway or work surface.
2. Nosings: Integral ribbing and serrated edge on one long axis of tread, or nonslip abrasive on each tread along one long edge.
3. Carrier Plate or Angle: Furnish at each end for connection to stair stringers.

2.04 HEAVY-DUTY METAL BAR GRATING (TYPE C)

A. General Requirements:

1. Maximum Service Load: AASHTO H-20.
2. Maximum Deflection: [Span/240] [_____].
3. Bearing Bar Spacing: [1-7/8 inch] [_____] maximum center-to-center.
4. Cross Bar Spacing: 4 inches maximum center-to-center.
5. Bearing Bars, Cross Bars and Banding: Minimum thickness as specified in NAAMM MBG 532 or as shown on Drawings.
6. Grating Type: Galvanized steel, heavy-duty, rectangular bar grating fabricated by [welding crossbars between rectangular bearing bars] [pressing deep rectangular crossbars into slots in rectangular bearing bars].

2.05 ACCESSORIES

A. Embedded Frames:

1. As indicated on Drawings and as specified in Section 05 50 00, Metal Fabrications.
2. [Extruded aluminum frames as manufactured by:
   a. Ohio Gratings, Inc., Canton, OH.
   b. Thompson Fabricating, LLC, Tarrant, AL.]

B. Grating Clamps:

1. Use at flanged beam and bolted angle frame supports.
2. Removable from above grating walkway surface.
3. Provide hat bracket, recessed bolt, and bottom clamp of same material as grating.
4. Manufacturers and Products:
   a. Direct Metals Company, LLC, Kennesaw, GA; Grating Clamp.
   b. Grating Fasteners, Inc., Harvey, LA; G-Clip.

©COPYRIGHT 2013 CH2M HILL

C. Anchor Stud and Saddle Clip:

1. Use at embedded angle frame supports with stud anchor and nut recessed below top of grating surface.
2. Removable from above grating walkway surface.
3. Provide Type 316 stainless steel welded threaded stud anchor, nut, washer, and saddle clip.
4. Manufacturers and Products:
   a. Welded Stud Anchor:
      1) Nelson Stud Welding, Inc., Elyria, OH.
      2) Stud Welding Associates, Inc. Elyria, OH.
   b. Saddle Clip:
      3) Direct Metals Company, LLC, Kennesaw, GA; Saddle Clip.
      4) Grating Fasteners, Inc., Harvey, LA; Saddle Clip.
      5) Struct-Fast, Inc., Baltimore, MD; Gratefast.
5. [At Embedded Extruded Aluminum:
   a. Provide aluminum clip, bolt, nut, and washer, with clip engaging bottom flange of I-bar.
   b. Manufacturers and Products:
6. Direct Metals Company, LLC, Kennesaw, GA; Plank Clip.
7. Thompson Fabricating Company, Inc., Birmingham, AL; TFCO Standard Hold Down Clip.]

2.06 [PLANK STYLE GRATING

A. Material: [Aluminum] [Galvanized Steel] [Stainless Steel].

B. Style: [_____].

C. Openings: [_____].

D. Manufacturers and Products:

1. [_____].
2. [_____].]

2.07 FABRICATION

A. General:

1. In accordance with NAAMM MBG 531 or NAAMM MBG 532.
2. Do not weld aluminum grating.
3. Conceal fastenings where practical.

©COPYRIGHT 2013 CH2M HILL

4. Drill metalwork and countersink holes as required for attaching hardware or other materials.
5. Cutouts:
   a. Fabricate in grating sections for penetrations indicated.
   b. Arrange to permit grating removal without disturbing items penetrating grating.
   c. Edge band openings in grating that interrupt four or more bearing bars with bars of same size and material as bearing bars.
6. Do not notch bearing bars at supports to maintain elevation.
7. Field measure areas to receive grating. Verify dimensions of new fabricated supports, and fabricate to dimension required for specified clearances.
8. Section Length: Sufficient to prevent section from falling through clear opening when oriented in the span direction and one end is touching either the concrete or the vertical leg of grating support.
9. Minimum Bearing: 1 inch for grating depth up to 2-1/4 inches and 2 inches for grating depth greater than 2-1/4 inches.
10. Banding and Toe Plates: Same material as grating and welded to bearing bars in accordance with requirements of NAAMM MBG 531 and NAAMM MBG 532.

B. Metal Bar Grating: A single grating section shall be not less than 1.5 feet or greater than 3 feet in width, or weigh more than 150 pounds.

C. Heavy Duty Metal Bar Grating: Minimum width of grating sections shall be 2 feet regardless of length and weight.

D. Supports:

1. Same material as grating, except that supports which are to be embedded in concrete shall be Type 316 stainless steel, unless part of an extruded aluminum system.
2. Coordinate dimensions and fabrication with grating to be supported.
3. [Coordinate dimensions with increased depth due to serrations.]

PART 3 - EXECUTION

3.01 PREPARATION

A. Electrolytic Protection:

1. Protect aluminum surfaces in contact with dissimilar metals, or embedded or in contact with masonry, grout, or concrete as specified in [Section 09 90 00, Painting and Coating] [_____].
2. Allow paint to dry before installation of material.

©COPYRIGHT 2013 CH2M HILL

3.02 INSTALLATION

A. Until grating sections are securely fastened in place, area shall be appropriately barricaded or flagged to alert people working in the area of potential fall hazard.

B. Install manufactured products in accordance with manufacturer's recommendations.

C. Install supports such that grating sections have a solid bearing on both ends, and that grating sections will not rock or wobble under design loads.

D. Install grating supports plumb and level as applicable.

E. Install sections of welded frames with anchors to straight plane without offsets.

F. Field locate and install fasteners to fit grating layout.

G. Anchor grating securely to supports using minimum of four fastener clips and bolts per grating section.

H. Each grating or plank section shall be easily removable and replaceable.

I. Completed installation shall be rigid and neat in appearance.

J. Protect painted and galvanized surfaces during installation.

K. Repair damaged coatings as specified in [Section 09 90 00, Painting and Coating] [_____].

END OF SECTION

SECTION 07 14 00
FLUID-APPLIED WATERPROOFING

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes fluid applied elastomeric membrane waterproofing; and protective covering.

B. Related Sections:

1. Section 07 21 13, Board Insulation: Perimeter protective cover.
2. Section 07 62 00, Sheet Metal Flashing and Trim.
3. Section 31 23 23, Fill.
4. Section 33 46 00, Subdrainage.

1.02 REFERENCES

A. ASTM International:

1. ASTM C836, Standard Specification for High Solids Content, Cold Liquid-Applied Elastomeric Waterproofing Membrane for Use with Separate Wearing Course.
2. ASTM D412, Standard Test Methods for Vulcanized Rubber and Thermoplastic Elastomers-Tension.
3. ASTM D429, Standard Test Method for Rubber Property, Adhesion to Rigid Substrates.
4. ASTM D471, Standard Test Method for Rubber Property - Effect of Liquids.
5. ASTM D624, Standard Test Method for Tear Strength of Conventional Vulcanized Rubber and Thermoplastic Elastomers.
6. ASTM D746, Standard Test Method for Brittleness Temperature of Plastics and Elastomers by Impact.
7. ASTM D822, Standard Practice for Filtered Open-Flame Carbon-Arc Exposures of Paint and Related Coatings.
8. ASTM D1004, Standard Test Method for Tear Resistance (Graves Tear) of Plastic Film and Sheeting.
9. ASTM D2240, Standard Test Method for Rubber Property-Durometer Hardness.
10. ASTM D3468, Standard Specification for Liquid-Applied Neoprene and Chlorosulfonated Polyethylene Used in Roofing and Waterproofing.
11. ASTM E96/E96M, Standard Test Methods for Water Vapor Transmission of Materials.

B. National Roofing Contractors Association: NRCA, The NRCA Waterproofing and Damp proofing Manual.

1.03 SYSTEM DESCRIPTION

A. Waterproofing System: Fluid applied material to prevent moisture migration to interior.

1.04 PERFORMANCE REQUIREMENTS

A. Waterproofing System: Capable of resisting water head of [_____] feet and preventing moisture migration to interior.

1.05 SUBMITTALS

A. Section 01 33 00, Submittal Procedures: Submittal procedures.

B. Shop Drawings: Indicate special joint or termination conditions and conditions of interface with other materials.

C. Product Data: Submit data for [surface conditioner], flexible flashings, joint cover sheet, and joint and crack sealants, with temperature range for application of waterproofing membrane.

D. Manufacturer's Installation Instructions: Submit special procedures and perimeter conditions requiring special attention.

E. Manufacturer's Certificate: Certify products meet or exceed specified requirements.

F. Warranty: Submit manufacturer warranty and ensure forms have been completed in Owner's name and registered with manufacturer.

1.06 QUALITY ASSURANCE

A. Perform Work in accordance with NRCA Waterproofing Manual.

B. Perform Work in accordance with local jurisdiction requirements.

C. Maintain one copy of each document on site.

1.07 QUALIFICATIONS

A. Waterproofing Material Manufacturer: Company specializing in waterproofing membrane with minimum three years documented experience.

©COPYRIGHT 2013 CH2M HILL

B. Applicator: Company specializing in performing the work of this section and approved by manufacturer.

1.08 MOCKUP

A. Section 01 40 00, Quality Requirements: Requirements for mockup.

B. Construct Mockup, 100 sq ft of waterproofed panel; to represent finished work including internal and external corners, jointing, attachment method, flashings, drainage panel, base flashings,, protective cover.

C. Locate where indicated on Drawings.

D. Incorporate accepted mockup as part of Work.

1.09 PRE-INSTALLATION MEETINGS

A. Section 01 30 00, Administrative Requirements: Pre-installation meeting.

B. Convene minimum one week prior to commencing work of this section.

1.10 ENVIRONMENTAL REQUIREMENTS

A. Section 01 60 00, Product Requirements.

B. Maintain ambient temperatures above 40 degrees F for 24 hours before and during application and until liquid or mastic accessories have cured. Follow manufacturer's requirements.

1.11 WARRANTY

A. Section 01 70 00, Execution and Closeout Requirements: Product warranties and product bonds.

B. Furnish five year manufacturer warranty for waterproofing failing to resist penetration of water.

C. For warranty repair work, remove and replace materials concealing waterproofing.

PART 2 - PRODUCTS

2.01 FLUID APPLIED WATERPROOFING

A. Manufacturers:

©COPYRIGHT 2013 CH2M HILL

1. [American Hydrotech, Inc.] Model [_____].
2. [Barrett Co.] Model [_____].
3. [Carlisle Coatings & Waterproofing] Model [_____].
4. [Tremco Sealants & Waterproofing.] Model [_____].
5. [_____] Model [_____].

B. COMPONENTS

C. Waterproofing Membrane: ASTM C836; two component elastomeric compound; quick setting.

D. Cured Membrane Characteristics:

Properties	**Test**	**Results**
Tensile Strength	ASTM D412	[_____]
Elongation	ASTM D412	[_____]
Hardness - Shore A	ASTM D2240	[_____]
Tear Strength	ASTM [D624] [D1004]	[_____]
Water Absorption	ASTM [D471]	[_____]
Water Vapor Permeance (perms)	ASTM E96/E96M [desiccant method] [water method]	[_____]
Exposure	ASTM D822	[_____]
Brittleness	ASTM D746	[_____]
Adhesion	ASTM D429	[_____]

2.02 ACCESSORIES

A. Surface Primer: compatible with membrane compound; as recommended by membrane manufacturer.

B. Elastic Flashings: [0.047] [_____] inch thick, [butyl] [neoprene] [EPDM] [_____], as recommended by membrane manufacturer.

C. Joint Cover Sheet: [_____] inch thick elastic sheet material designated for and compatible with membrane.

D. Cant Strips: Premolded composition material Approved by membrane manufacturer.

©COPYRIGHT 2013 CH2M HILL

E. Drainage Panel: 3/8 inch thick formed plastic, or as approved by membrane manufacturer.

F. Joint and Crack Sealant: As recommended by membrane manufacturer.

G. Back-up Material: [PVC membrane] [Butyl rod] [_____].

H. Counterflashings: [_____] as specified in Section [07 62 00.] [_____.]

****** [OR] ******

I. Counterflashings: [Galvanized steel] [_____] type, [_____] inch thick.

J. Tack-free Surfacing: [Type 1 Portland cement.] [Stone dust.]

K. Separation Sheet: Sheet [polyethylene] [_____], [6] [_____] mil thick.

L. Protection Board: Rigid insulation specified in Section 07 21 13.<<part of package?>>

PART 3 - EXECUTION

3.01 EXAMINATION

A. Section 01 30 00, Administrative Requirements: Coordination and project conditions.

B. Verify substrate surfaces are free of frozen matter, dampness, loose particles, cracks, pits, projections, penetrations, or foreign matter detrimental to adhesion or application of waterproofing system.

C. Verify substrate surfaces are smooth, free of honeycomb or pitting, and not detrimental to full contact bond of waterproofing materials.

D. Verify items penetrating surfaces to receive waterproofing are securely installed.

E. Verify substrate surface slopes to drain for horizontal waterproofing applications.

3.02 PREPARATION

A. Protect adjacent surfaces not designated to receive waterproofing.

B. Clean and prepare surfaces to receive waterproofing. [Vacuum substrate clean.]

©COPYRIGHT 2013 CH2M HILL

C. Do not apply waterproofing to surfaces unacceptable to [manufacturer] [or] [applicator].

D. Seal cracks and joints with sealant materials using depth to width ratio as recommended by sealant manufacturer.

3.03 INSTALLATION

A. Apply surface conditioner at rate recommended by manufacturer. Protect conditioner from rain or frost until dry.

B. Apply 12 inch wide strip of joint cover sheet over cracks, non-working joints , and expansion joints over 1/16 inch but not exceeding 1/2 inch in width.

C. At expansion joints from 1/2 to 1 inch in width, loop cover sheet down into joint between 1-1/4 and 1-3/4 inch. Extend sheet 6 inches on both sides of expansion joint.

D. Center cover sheet over crack or joints. Roll sheet into 1/8 inch coating of waterproofing material. Apply second coat over sheet extending minimum of 6 inches beyond sheet edges. Apply this procedure to expansion joints between horizontal and vertical surfaces.

E. Apply waterproofing material.

F. Extend membrane over cants and up intersecting surfaces at membrane perimeter minimum 6 inches above horizontal surface.

G. Install cant strips at inside corners.

H. Apply extra thickness of waterproofing material at corners, intersections, angles, and over joints as recommended by manufacturer.

I. Seal items protruding to or penetrating through membrane and install Counterflashing membrane material.

J. Install membrane flashings and seal into waterproofing material.

K. Place drainage panel directly against membrane, butt joints, place to encourage drainage downward.

L. Place protection panel directly against drainage panel membrane; butt joints.

M. Adhere drainage panel to substrate. Scribe and cut boards around projections, penetrations, and interruptions.

©COPYRIGHT 2013 CH2M HILL

3.04 FIELD QUALITY CONTROL

A. Section 01 40 00, Quality Requirements 01 70 00,Execution and Closeout Requirements: Field inspecting, testing, adjusting, and balancing.

3.05 PROTECTION OF INSTALLED CONSTRUCTION

A. Section 01 70 00, Execution and Closeout Requirements: Protecting installed construction.

B. Do not permit traffic over unprotected or uncovered membrane.

C. Immediately after curing, protect membrane per manufacturer's requirements.

3.06 SCHEDULE

A. Foundation Wall: 0.020 inch thick waterproofing; 0.030 inch thick at inside and external corners; asphalt impregnated board protective cover.

B. Subgrade Tunnel: 0.045 inch thick waterproofing on walls and roof of tunnel; 0.060 inch thick at external corners; 2 inch thick rigid insulation protective cover.

END OF SECTION

SECTION 07 21 00
THERMAL INSULATION

PART 1 - GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. ASTM International (ASTM):
2. C272, Standard Test Method for Water Absorption of Core Materials for Structural Sandwich Constructions.
3. C303, Standard Test Method for Dimensions and Density of Preformed Block and Board-Type Thermal Insulation.
4. C549, Standard Specification for Perlite Loose Fill Insulation.
5. C578, Standard Specification for Rigid, Cellular Polystyrene Thermal Insulation.
6. C665, Standard Specification for Mineral-Fiber Blanket Thermal Insulation for Light Frame Construction and Manufactured Housing.
7. D4397, Standard Specification for Polyethylene Sheeting for Construction, Industrial, and Agricultural Applications.
8. E84, Standard Test Method for Surface Burning Characteristics of Building Materials.
9. E96/E96M, Standard Test Methods for Water Vapor Transmission of Materials.

1.02 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
   a. Manufacturer’s product literature identifying products proposed for use.
   b. Drawings or letter indicating proposed locations of holes for injection of foam-in-place insulation in exposed, unpainted walls.

1.03 DELIVERY, STORAGE, AND HANDLING

A. On packaging clearly identify manufacturer, contents, brand name, applicable standard, and R-value.

©COPYRIGHT 2013 CH2M HILL

B. Store materials off ground and keep them dry. Protect against weather, condensation, and damage.

PART 2 - PRODUCTS

2.01 BATT INSULATION AND FASTENERS

A. Fiberglass or Mineral Wool Batts:

1. ASTM C665, III, Class A, with 0.10 or less perm rating, reinforced reflective aluminum foil vapor retarder membrane laminated to one side with R-values as indicated on Drawings.
2. Manufacturers:
   a. CertainTeed Corp.
   b. Owens-Corning Insulating Systems.
   c. Johns Manville.

B. Fasteners: As recommended by insulation manufacturer.

C. Tape: As recommended by insulation manufacturer.

2.02 VAPOR RETARDER

A. Plastic Sheeting: ASTM D4397, minimum thickness of [6] [10] mils.

B. Sealant and Tape: As recommended by vapor retarder manufacturer.

2.03 MASONRY INSERT INSULATION

A. Molded Expanded Polystyrene Inserts:

1. ASTM C578, Type I.
2. Fabricate to fit standard two-core concrete masonry units of 6-inch, 8-inch, 10-inch, and 12-inch width, as applicable.
3. Minimum Density: 1 pound per cubic foot when tested in accordance with ASTM C303.
4. R-Value at 1 inch Thickness:
   a. At 40 degrees F: 4.17.
   b. At 75 degrees F: 3.92.
5. Moisture Resistance:
   a. Water Vapor Transmission: 0.80 to 2.80 perm inches when tested in accordance with ASTM E96/E96M.

©COPYRIGHT 2013 CH2M HILL

b. Absorption: Less than 2 percent by volume when tested in accordance with ASTM C272.

6. Flame Spread: Less than 5 when tested in accordance with ASTM E84.
7. Pre-install at concrete masonry unit plant in accordance with manufacturer's instructions prior to delivery to Site.
8. Manufacturer and Product: Concrete Block Insulating Systems, Inc.; Korfil Standard U-Shaped Insulation Inserts.

2.04 RIGID INSULATION

A. Extruded Polystyrene Foam:

1. ASTM C578, Type IV.
2. Flame Spread: Less than 25 when tested in accordance with ASTM E84.
3. Thickness: As shown.
4. Manufacturers and Products:
   a. Dow Chemical Co.; Styrofoam Square Edge.
   b. UC Industries; Foamular.

B. Adhesives and Fasteners: As recommended by insulation manufacturer.

PART 3 - EXECUTION

3.01 BATT INSULATION

A. Install in accordance with manufacturer's instructions and as specified below:

1. Install in widths required by framing spacing with vapor retarder facing warm side.
2. Fit tightly to ensure continuous seal. Tape overlapping flanges of vapor retarder when necessary, using tape as recommended by insulation manufacturer.
3. Where electrical outlets, ducts, pipes, vents, or other utility items occur, place insulation on cold weather side of obstruction.
4. Protect installed insulation from tears and other damage until covered with finish material.
5. Remove and replace damaged material.

3.02 VAPOR RETARDER

A. Install in accordance with the following:

1. Apply to wall and ceiling framing in sheets as large as possible.

©COPYRIGHT 2013 CH2M HILL

2. Lap joints 6 inches.
3. Seal joints with sealant and tape as recommended by vapor retarder manufacturer.
4. Fit tightly and seal around penetrations.
5. Repair minor tears or holes with tape.
6. Replace sheets with tears or holes, which require more than 6-inch length of tape to repair.

3.03 RIGID INSULATION

A. Install in accordance with the following:

1. Install boards in location and in [thickness] [R-value] as [specified] [shown].
2. Cut insulation with saw, knife, or other sharp tool to fit tightly around obstructions.
3. Butt insulation boards together tightly at joints.
4. Where thickness required exceeds 1-1/2 inches, install two layers of boards.
5. [Apply to masonry or concrete with adhesive recommended by insulation manufacturer:
   a. Adhere first layer to substratum, then adhere second layer to first, staggering joints.
   b. Follow manufacturer's recommendations for preparing surfaces and applying adhesive.]
6. [Apply to masonry or concrete with fasteners recommended by insulation manufacturer.]

3.04 INSULATING SHEATHING

A. Install in accordance with the following:

1. Apply with long dimension perpendicular to supports.
2. Abut ends of sheathing at centers of supports.
3. Stagger end joints where applicable.
4. Attach sheathing to studding with fasteners as recommended by sheathing manufacturer.

SECTION 07 26 00
VAPOR RETARDERS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes sheet materials for controlling vapor diffusion.

B. Related Sections:

1. Section 07 27 00 Air Barriers.
2. Section 07 90 00 Joint Protection.

1.02 REFERENCES

A. Abbreviations and Acronyms:

1. American Society of Testing and Materials (ASTM)
2. Ethylene Propylene Diene Monomer (EPDM)
3. Green Seal (GS)
4. South Coast Air Quality Management District (SCAQMD)
5. Sealant, Waterproofing and Restoration Institute (SWRI)

B. References Standards:

1. American Society of Testing and Materials (ASTM) C920, Standard Specification for Elastomeric Joint Sealants.
2. ASTM E96, Standard Test Methods for Water Vapor Transmission of Materials.
3. Green Seal (GS) 36, Aerosol Adhesives.
4. Sealant, Waterproofing and Restoration Institute (SWRI), Sealant and Caulking Guide Specification.
5. South Coast Air Quality Management District (SCAQMD) Rule 1168, Adhesive and Sealant Applications.

1.03 PERFORMANCE REQUIREMENTS

A. Vapor Retarder Permeance: Maximum [1 perm] [[_____] perms] ([57][_____] ng/Pa/s/sq m) when tested in accordance with ASTM E96, Procedure A.

©COPYRIGHT 2013 CH2M HILL

1.04 SUBMITTALS

A. Refer to the Submittal Schedule at the end of PART 3 for a list of submittal requirements for this Section.

1.05 QUALITY ASSURANCE

A. Perform Work in accordance with SWRI, Sealant and Caulking Guide Specification requirements for materials and installation.

B. Maintain one copy of each document on site.

1.06 SEQUENCING

A. Sequence Work to permit installation of materials in conjunction with other retardant materials and seals , and air barrier assemblies specified in Section 07 27 00 Air Barriers.

B. Do not install vapor retarder until items penetrating vapor retarder are in place.

PART 2 - PRODUCTS

2.01 VAPOR RETARDERS

A. Manufacturers:

1. Alumiseal Corp.
2. Fiberweb Corp.
3. Griffolyn, Reef Industries
4. Raven Industries

2.02 COMPONENTS

A. Sheet Retarder [Type [1][_____]]: [Black] [Clear] [_____] polyethylene film for above grade application, [10][20][_____]-mil ([0.25][0.50][_____]-mm) thick.

B. Sheet Retarder [Type [2][_____]]: [Black] [_____] polyethylene film reinforced with glass fiber square mesh, [_____]-mil ([_____]mm) thick.

C. Sheet Retarder [Type [3][_____]]: [Butyl] [Neoprene] [Ethylene Propylene Diene Monomer (EPDM)] [_____], black color, [45][_____]-mil ([1.2][_____]-mm) thick.

©COPYRIGHT 2013 CH2M HILL

D. [Butyl] Sealant [Type [A][_____]]: [ASTM C920, Grade [_____], Class [_____], Use [_____];] butyl rubber base, single component, solvent release, non-skinning, [black][_____] color.

1. Elongation Capability: [5][_____] percent.
2. Service Temperature Range: [-40 to 180][_____] degrees F ([-40 to 82][_____] degrees C).
3. Shore A Hardness Range: [10 to 30] [_____].
4. [Interior] Sealants and Sealant Primers: Maximum volatile organic compound content in accordance with SCAQMD Rule 1168.

E. Polysulfide Sealant [Type [B][_____]]: [ASTM C920, Grade [_____], Class [_____], Use [_____];] single component, chemical curing, capable of continuous water immersion, non-sagging type; [black][_____] color.

1. Elongation Capability: [25][_____] percent.
2. Service Temperature Range: [-40 to 180][_____] degrees F ([-40 to 82][_____] degrees C).
3. Shore A Hardness Range: [20 to 35][_____].
4. [Interior] Sealants and Sealant Primers: Maximum volatile organic compound content in accordance with SCAQMD Rule 1168.

F. [Polyurethane] Sealant [Type [C][_____]]: [ASTM C920, Grade [_____], Class [_____], Use [_____];] single component, chemical curing, non-sagging; [black] [_____] color.

1. Elongation Capability: [25][_____] percent.
2. Service Temperature Range: [-40 to 180][_____] degrees F ([-40 to 82][_____] degrees C).
3. Shore A Hardness Range: [20 to 35][_____].
4. [Interior] Sealants and Sealant Primers: Maximum volatile organic compound content in accordance with SCAQMD Rule 1168.

G. Sealant: [_____] Type specified in Section 07 90 00 Joint Protection.

H. Primer and Backer Rods: Recommended by sealant manufacturer to suit application.

1. [Interior] Sealants and Sealant Primers: Maximum volatile organic compound content in accordance with SCAQMD Rule 1168.

I. Cleaner: Non-corrosive type; recommended by sealant manufacturer; compatible with adjacent materials.

©COPYRIGHT 2013 CH2M HILL

J. Mastic Adhesive [Type [1][_____]]: Asphalt type, compatible with sheet retarder and substrate, thick mastic of uniform consistency.

1. [Interior] Adhesives: Maximum volatile organic compound content in accordance with SCAQMD Rule 1168.
2. [Interior] Aerosol Adhesives: Maximum volatile organic compound content in accordance with GS 36.

K. Adhesive [Type [2][_____]]: Compatible with sheet retarder and substrate, permanently non-curing.

1. [Interior] Adhesives: Maximum volatile organic compound content in accordance with SCAQMD Rule 1168.
2. [Interior] Aerosol Adhesives: Maximum volatile organic compound content in accordance with GS 36.

L. ACCESSORIES

M. Thinner and Cleaner for [Butyl] [Neoprene] [_____] Sheet: As recommended by sheet material manufacturer.

N. Tape: [Bright aluminum] [Polyethylene] [Polyester] self-adhering type, [mesh reinforced], [2][_____]-inch ([50][_____]-mm) wide, compatible with sheet material.

O. Attachments: [Galvanized steel] [_____] bars and anchors.

PART 3 - EXECUTION

3.01 PREPARATION

A. Remove loose or foreign matter capable of impairing adhesion.

B. Clean and prime substrate surfaces to receive adhesive and sealants.

3.02 EXISTING WORK

A. Clean and repair existing construction to provide positive and continuous seal for vapor retarders.

3.03 INSTALLATION

A. Vapor Retarder For Solid Substrate: Secure sheet retarder [Type [_____]] to solid construction with [adhesive] [tape] [continuous metal bar with anchors]. Lap

©COPYRIGHT 2013 CH2M HILL

edges and ends [6][_____] inches ([150][_____] mm) and [adhesive seal] [caulk with [Type [_____]] sealant] to ensure complete and continuous seal.

B. Vapor Retarder For Stud Framed Walls: Secure sheet retarder [Type [_____]] to stud faces with [adhesive] [_____]. Lap edges over stud faces, lap ends onto adjacent construction; caulk ends with [Type [_____]] sealant to ensure complete seal.

C. Vapor Retarder For Wall/Roof Junction: Lap sheet retarder [Type [_____]] from wall retarder onto roof vapor retarder continuously. Seal edges and ends with [sealant] [adhesive]. Caulk with [Type [_____]] sealant to ensure complete seal. [Position laps over firm bearing.]

D. Vapor Retarder Seal For Openings: Install sheet retarder [Type [_____]] between [window] [and] [door] frames and adjacent vapor retarder and seal with [sealant] [adhesive]. Caulk with [Type [_____]] sealant to ensure complete seal. [Position laps over firm bearing.]

E. Apply sealant within recommended application temperature ranges. Consult manufacturer when sealant cannot be applied within these temperature ranges or where compatibility with adjacent materials may be in doubt.

F. Install Work in accordance with applicable [State] [Municipality] of [_____] [Highways] [Public Works] standards.

3.04 SCHEDULES

A. Window Frame Perimeter: Lap sheet retarder Type 4 from wall vapor retarder (with 3 inches (75 mm) of contact over firm bearing) to window frame (with 1 inch (25 mm) of contact). Seal with sealant Type A.

B. Wall and Roof Junction: Lap sheet retarder Type 2 from wall vapor retarder (with 6 inches (150 mm) of contact over firm bearing) to roof vapor retarder (with 4 inches (100 mm) of contact). Seal with sealant Type A.

3.05 SUBMITTAL SCHEDULE.

ITEM NO.	SUBMITTAL REQUIREMENT	WITH BID	AS INDICATED
07 26 00-01	Product Data: Submit data indicating material characteristics, performance criteria, limitations.	[ ]	Prior to delivery
07 26 00-02	Manufacturer's Installation Instructions: Submit preparation and installation requirements and techniques.	[ ]	Per construction schedule.
SUSTAINABLE DESIGN SUBMITTALS			
07 26 00-03	Manufacturer's Certificate: Certify products meet or exceed specified sustainable design requirements. Materials Resources Certificates: 1. Certify recycled material content for recycled content products. 2. Certify source for local and regional materials and distance from Project site. a. Indoor Air Quality Certificates. b. Certify volatile organic compound content for each interior adhesive and sealant and related primer.	[ ]	Per construction schedule.
CLOSEOUT SUBMITTALS			

©COPYRIGHT 2013 CH2M HILL

ITEM NO.	SUBMITTAL REQUIREMENT	WITH BID	AS INDICATED
07 26 00-01	Product Data: Submit data indicating material characteristics, performance criteria, limitations.	[ ]	Prior to delivery
07 26 00-05	Project Record Documents: Accurately record actual locations of capped utilities, concealed utilities discovered during demolition, subsurface obstructions.	[ ]	With record documents.
07 26 00-06	Maintenance Data: Submit description of system, cleaning requirements and methods, inspection data, and parts lists.	[ ]	With record documents.

SECTION 07 92 00
JOINT SEALANTS

PART 1 - GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. ASTM International (ASTM):
   a. C661, Standard Test Method for Indentation Hardness of Elastomeric Type Sealants by Means of a Durometer.
   b. C834, Standard Specification for Latex Sealants.
   c. C920, Standard Specification for Elastomeric Joint Sealants.
   d. C1193, Standard Guide for Use of Joint Sealants.

1.02 SUBMITTALS

A. Action Submittals:

1. Shop Drawings: Surface preparation instructions. Indicate where each product is proposed to be used.
2. Samples: Material proposed for use showing color [range available] [selected].

1.03 INFORMATIONAL SUBMITTALS:

1. Installation instructions.
2. Documentation showing applicator qualifications.
3. Manufacturer's Certificate of Compliance, in accordance with Section 01 43 33, Manufacturers' Field Services.
4. Special guarantee.

1.04 QUALITY ASSURANCE

A. Applicator Qualifications: Minimum of 5 years' experience installing sealants in projects of similar scope.

©COPYRIGHT 2013 CH2M HILL

1.05 ENVIRONMENTAL REQUIREMENTS

A. Ambient Temperature: Between 40 degrees F and 80 degrees F (4 degrees C and 27 degrees C) when sealant is applied. Consult manufacturer when sealant cannot be applied within these temperature ranges.

1.06 SPECIAL GUARANTEE

A. Product: Furnish manufacturer's extended guarantee or warranty, with Owner named as beneficiary, in writing, as special guarantee. Special guarantee shall provide for correction or, at the option of the Owner, removal and replacement of Work specified in this section found defective during a period of 5 years after the date of Substantial Completion. Duties and obligations for correction or removal and replacement of defective Work shall be as specified in the General Conditions.

B. Conditions: No adhesive or cohesive failure of sealant.

C. Sealed Joints: Watertight and weathertight with normal usage.

PART 2 - PRODUCTS

2.01 SEALANT MATERIALS

A. Characteristics:

1. Uniform, homogeneous.
2. Free from lumps, skins, and coarse particles when mixed.
3. Nonstaining, nonbleeding.
4. Hardness of 15 minimum and 50 maximum, measured by ASTM C661 method.
5. Immersible may be substituted for nonimmersible.

B. Color: [Unless specifically noted, match color of the principal wall material adjoining area of application.] [As selected by Engineer.] [As indicated in Joint Sealant Schedule in this section.]

C. Type 1—Silicone, Nonsag, Nonimmersible:

1. Silicone base, single-component, moisture curing; ASTM C920, Type S, Grade NS, Class 25.
2. Capable of withstanding movement up to 50 percent of joint width.
3. Manufacturers and Products:

©COPYRIGHT 2013 CH2M HILL

a. Dow Corning Corp.; No. 790.
b. General Electric; Silpruf.
c. BASF; Sonneborn, Omniseal-50.

D. Type 2—Multipart Polyurethane, Self-leveling, Immersible:

1. Polyurethane base, multicomponent, chemical curing; ASTM C920, Type M, Grade P, Class 25.
2. Capable of being continuously immersed in water.
3. Manufacturers and Products:
   a. BASF; Sonneborn, SL-2.
   b. Pecora Corp.; Urexspan NR-200.
   c. Tremco; THC-900/901.
   d. Sika Chemical Corp.; Sikaflex 2c SL.

E. Type 3—Multipart Polyurethane, Nonsag, Immersible:

1. Polyurethane base, multicomponent, chemical curing; ASTM C920, Type M, Grade NS, Class 25.
2. Capable of being continuously immersed in water.
3. Manufacturers and Products:
   a. Pecora; DynaTrol II.
   b. Tremco; Dymeric 240.
   c. BASF; Sonneborn NP-2.
   d. Sika Chemical Corp.; Sikaflex 2c NS.

F. Type 4—Multipart Polyurethane, Nonsag, Nonimmersible:

1. Polyurethane base, multicomponent, chemical curing; ASTM C920, Type M, Grade NS, Class 25.
2. Manufacturers and Products:
   a. BASF; Sonneborn NP-2.
   b. Pecora Corp.; Dynatrol II.
   c. Tremco; Dymeric 240.
   d. Sika Chemical Corp.; Sikaflex 2c NS.

G. Type 5—One-part Polyurethane, Immersible:

1. Polyurethane base, single-component, moisture curing; ASTM C920, Type S, Grade NS or P, Class 25.
2. Capable of being continuously immersed in water.
3. Manufacturers and Products for Nonsag:
   a. Sika Chemical Corp.; Sikaflex-1a.

©COPYRIGHT 2013 CH2M HILL

b. Tremco; Vulkem 116.

4. Manufacturers and Products for Self-leveling:
   a. BASF; Sonneborn, SL-1.
   b. Tremco; Vulkem 45.
   c. Sika Chemical Corp.; Sikaflex 1c SL.

H. Type 6—One-Part Polyurethane, Nonimmersible:

1. Polyurethane base, single-component, moisture curing; ASTM C920, Type S, Grade NS, Class 25.
2. Manufacturers and Products:
   a. Pecora Corp.; Dynatrol 1 XL.
   b. Tremco; Dymonic.
   c. BASF; Sonneborn, NP-I.

I. Type 7—Multipart Polysulfide, Immersible:

1. Polysulfide base, two-component, chemical curing; ASTM C920, Type M, Grade P or NS, Class 25.
2. Capable of being continuously immersed in water.
3. Manufacturers and Products:
   a. W. R. Meadows; Deck-O-Seal Gun Grade, two-part.
   b. BASF; Sonolastic, two-part Polysulfde.

J. Type 8—One-Part Polysulfide, Nonsag, Nonimmersible:

1. Polysulfide base, single-component, moisture curing; ASTM C920, Type S, Grade NS, Class 12 1/2.
2. Capable of withstanding movement up to 20 percent of joint width.
3. Manufacturer and Product: W. R. Meadows; Deck-O-Seal, one-part.

K. Type 9—One-Part Acrylic Terpolymer, Nonsag, Nonimmersible:

1. Acrylic base, single-component, solvent curing; ASTM C834 nonsag.
2. Capable of withstanding movement up to 7.5 percent of joint width; Shore “A” hardness of 55 maximum.
3. Manufacturer and Product: Tremco; Mono 555.

L. Type 10—Sanitary Sealant:

1. Silicone sealant similar to Type 1, above, formulated to resist mold growth and repeated exposure to high humidity while retaining adhesion, flexibility, and color.

©COPYRIGHT 2013 CH2M HILL

2. Manufacturers and Products:
   a. Dow Corning; 786.
   b. General Electric; Sanitary Sealant SCS1700.

M. Type 11—Fire Penetration Seal:

1. Manufacturers and Products:
   a. 3M Corp.; Fire Barrier Caulk CP25 and Putty 303.
   b. General Electric; Pensil Sealant or Foam.
   c. Unifrax Corporation; Fyre Putty.
   d. Hilti USA; CP 604.

N. Type 12—One-Part Polycarbonate, Immersible:

1. Polycarbonate base, single-component, moisture curing; ASTM C920, Type S, Grade NS, Class 25.
2. Capable of being continuously immersed in water.
3. Manufacturer and Product: Pro-Seal Products, Inc.; Pro-Seal 34.

O. Type 13—Tape Sealant:

1. Compressible polyurethane foam impregnated with polybutylene or polymer-modified asphalt.
2. Color: Black.
3. Size: 3/4 inch wide by length required by expanded thickness recommended by manufacturer for particular application.
4. Manufacturers and Products:
   a. Emseal Joint Systems, Ltd.; AST—High Acrylic.
   b. Dayton Superior; Polytite Standard.
   c. PARR Technologies; PARR Sealant EP-7212-T.

2.02 BACKUP MATERIAL

A. Nongassing, extruded, closed-cell round polyurethane foam or polyethylene foam rod, compatible with sealant used, and as recommended by sealant manufacturer.

B. Size: As shown or as recommended by sealant material manufacturer. Provide for joints greater than 3/16 inch wide.

C. Manufacturers and Products:

1. Sonneborn; Sonolastic Closed-cell Backing Rod.
2. Tremco; Closed-cell Backing Rod.

©COPYRIGHT 2013 CH2M HILL

3. Pecora Corporation; Green Rod.

2.03 ANCILLARY MATERIALS

A. Bond Breaker: Pressure sensitive tape as recommended by sealant manufacturer to suit application.

B. Joint Cleaner: Noncorrosive and nonstaining type, recommended by sealant manufacturer; compatible with joint forming materials.

C. Primer: Nonstaining type recommended by sealant manufacturer to suit application.

2.04 PREFORMED SEALS

A. Preformed Compressible Joint Seals:

1. Widths Up to 5 Inches:
   a. BASF, Watson Bowman Acme Div.; Wabo Weatherseal II.
   b. Emseal Joint Systems Limited; Colorseal.
   c. LymTal International; Iso-flex Joint System.
2. Other Widths: Series or model recommended by seal manufacturer.

PART 3 - EXECUTION

3.01 GENERAL

A. Use of more than one material for the same joint is not allowed unless approved by sealant manufacturer.

B. Install joint sealants in accordance with ASTM C1193.

C. Horizontal and Sloping Joints up to 1 Percent Maximum Slope: Use self-leveling (Grade P) joint sealant.

D. Steeper Sloped Joints, Vertical Joints, and Overhead Joints: Use nonsag (Grade NS) joint sealant.

E. Use joint sealant as required for the applicable application and as follows:

©COPYRIGHT 2013 CH2M HILL

Joint Size	Sealant Type
Less than 1"	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, or 12
Less than 2"	1, 2, 3, 4, or 7
Over 2"	Follow manufacturer’s recommendation

3.02 PREPARATION

A. Verify that joint dimensions, and physical and environmental conditions, are acceptable to receive sealant.

B. Surfaces to be sealed shall be clean, dry, sound, and free of dust, loose mortar, oil, and other foreign materials.

1. Mask adjacent surfaces where necessary to maintain neat edge.
2. Starting of work will be construed as acceptance of subsurfaces.
3. Apply primer to dry surfaces as recommended by sealant manufacturer.

C. Verify joint shaping materials and release tapes are compatible with sealant.

D. Examine joint dimensions and size materials to achieve required width/depth ratios.

E. Follow manufacturer’s instructions for mixing multi-component products.

3.03 INSTALLATION

A. Use joint filler to achieve required joint depths, to allow sealants to perform intended function.

1. Install backup material as recommended by sealant manufacturer.
2. Where possible, provide full length sections without splices; minimize number of splices.
3. Tape sealant may be used as joint filler if approved by sealant manufacturer.

B. Use bond breaker where recommended by sealant manufacturer.

C. Seal joints around window, door and louver frames, expansion joints, control joints, and elsewhere as indicated.

D. Joint Sealant Materials: Follow manufacturer’s recommendation and instructions, filling joint completely from back to top, without voids.

©COPYRIGHT 2013 CH2M HILL

E. Joints: Tool slightly concave after sealant is installed.

1. When tooling white or light color sealant, use a water-wet tool.
2. Finish joints free of air pockets, foreign embedded matter, ridges, and sags.

F. Tape Sealant: Compress to 50 percent of expanded thickness and install in accordance with manufacturer's instructions.

3.04 PREFORMED SEALS

A. Prepare joint surfaces clean and dry, free from oil, rust, laitance, and other foreign material.

B. Construct joints straight and parallel to each other and at proper width and depth.

C. Apply joint sealant manufacturer's approved primer and adhesive in accordance with manufacturer's instructions.

D. Install seal in accordance with manufacturer's instructions.

3.05 CLEANING

A. Clean surfaces next to the sealed joints of smears or other soiling resultant of sealing application.

B. Replace damaged surfaces resulting from joint sealing or cleaning activities.

3.06 JOINT SEALANT SCHEDULE

A. This schedule lists the sealant types acceptable for each joint location. Use as few different sealant types as possible to meet the requirements of Project.

Joint Locations	Sealant Type(s)
Expansion/Contraction and Control Joints At:	
Concrete Walls (except water-holding and belowgrade portions of structures)	1, 3, 4, 5, 6, 7, 12
Concrete Floor Slabs (except for water-holding Structures)	2, 5
Slabs Subject to Vehicle and Pedestrian Traffic	2, 5
Masonry Walls	1, 3, 4, 5, 6, 7, 12, 13

©COPYRIGHT 2013 CH2M HILL

Joint Locations	Sealant Type(s)
Exterior Insulation and Finish System	4
Ceramic Tile Floors	1, 2, 5, 10
Ceramic Tile Walls	1, 3, 5, 10
Precast Concrete Wall Panels	3, 4, 5, 12, 13
Material Joints At:	
Metal Door, Window, and Louver Frames (Exterior)	1, 5, 6, 8, 12
Metal Door, Window, and Louver Frames (Interior)	1, 5, 6, 8, 9
Wall Penetrations (Exterior)	1, 5, 6, 8, 12
Wall Penetrations (Interior)	1, 5, 6, 8
Floor Penetrations	5, 6, 7
Ceiling Penetrations	1, 3, 4, 5, 6, 7
Roof Penetrations	5
Sheet Metal Flashings	5, 13
Sheet Metal Roofing and Siding	5, 13
Precast Concrete Wall Panels	1, 3, 4, 5, 6, 7, 12, 13
Glazed Concrete Masonry Unit Joints	1
Precast/Prestressed Floor Panels (Interior)	2, 7
Precast/Prestressed Floor and Roof Panels (Exterior)	3, 7
Other Joints:	
Threshold Sealant Bed	5
Between Counter Tops and Backsplashes	10
Around Plumbing Fixtures	10
Openings Around Pipes, Conduits, and Ducts Through Fire-Rated Construction	11
Concrete Form Snap-Tie Holes	1, 4, 5

©COPYRIGHT 2013 CH2M HILL

B. [Use sealant Type [4] [5] [6] [1] [12] [_____] for building joints and elsewhere as indicated.]

C. [Use sealant Type 10 for joints between counter tops and backsplashes and around plumbing fixtures where they fit against walls and floors.]

D. [Use sealant Type 11 to seal voids and holes around penetrations through fire-rated elements.]

METAL DOORS AND FRAMES

PART 1 - GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. American National Standards Institute (ANSI):
   a. A250.6, Hardware on Standard Steel Doors (Reinforcement - Application).
   b. A250.8, Recommended Specification for Standard Steel Doors and Frames.
   c. A250.11, Recommended Erection Instructions for Steel Frames.
2. ASTM International (ASTM):
   a. A167, Standard Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip.
   b. A480/A480M, Standard Specification for General Requirements for Flat-Rolled Stainless and Heat-Resisting Steel Plate, Sheet, and Strip.
   c. A653/A653M, Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
   d. A1008/A1008M, Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, Solution Hardened, and Bake Hardenable.
   e. E90, Standard Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions and Elements.
3. Builders Hardware Manufacturers Association (BHMA): A156.115, Hardware Preparations in Standard Steel Doors and Frames.
4. National Fire Protection Association (NFPA): 80, Standard for Fire Doors and Other Opening Protectives.
5. Underwriters Laboratories, Inc. (UL): Building Materials Directory.

1.02 SUBMITTALS

A. Action Submittals: Applicable information for each type of door and frame, including:

1. Frame conditions and complete anchorage details, supplemented by suitable schedules covering doors and frames.

©COPYRIGHT 2013 CH2M HILL

2. Glass and louver opening sizes and locations in doors.
3. Connections of door frames to structural steel framing concealed in frames.
4. Location and field splice joints for frames too large to ship in one piece; indicate complete instructions for making field splices.
5. Joints required to accommodate expansion joint movement.
6. Relate to door numbers used in Contract Drawings.

1.03 DELIVERY, STORAGE, AND HANDLING

A. Properly identify each item with number used in Contract Drawings.

B. Store doors upright, in protected dry area, at least 1 inch off ground or floor and at least 1/4 inch between individual pieces.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Materials, equipment, and accessories specified in this section shall be products of:

1. Curries Manufacturing.
2. The Ceco Corp.
3. Fenestra Division, Marmon Group.
4. Mesker Industries, Inc.
5. Monarch Steelcraft, Ltd.
6. Overly Manufacturing Co.
7. Pioneer Industries.
8. Precision Metals, Inc.
9. Republic Steel Corp.
10. Steelcraft Manufacturing Co.
11. Trussbilt, Inc.
12. Williamsburg Steel Products Co.
13. Stiles Custom Metal, Inc.

2.02 MATERIALS

A. Basic Metal Material:

1. ASTM A1008/A1008M; sheet steel, cold-rolled, stretcher level.
2. ASTM A167, Type 316 stainless steel.

©COPYRIGHT 2013 CH2M HILL

B. Hollow Metal Frames:

1. Products of hollow metal door manufacturer.
2. ANSI 250.8, except as modified herein.
3. Frames for Doors [and Windows:] 16 gauge for interior and 14 gauge [, with thermal break,] for exterior, [knockdown or] welded type, of cross-section shown.
4. Prepare floor and wall anchors, reinforcement, and cutouts for hardware to meet requirements of BHMA A156.115 and ANSI A250.6.
5. Finished size, shape, and profile of frame members as shown.
6. Concealed fasteners or welding are preferred to through-the-face fasteners.
7. Identification: Stamp opening number, as shown on Drawings, on center hinge reinforcement of each frame.

C. Hollow Metal Doors: ANSI A250.8, except as modified herein. BHMA A156.115 and ANSI A250.6 to receive hardware specified in Door and Hardware Schedule.

1. Interior:
   a. Flush Panel Doors: [18 gauge, Level 2, Model 1.] [18 gauge, Level 2, Model 2.] [_____]
   b. Stile and Rail Doors: 16 gauge, Level 3, Model 3.
   c. Flush end closure at top of doors.
2. Exterior:
   a. Flush Panel Doors: [16 gauge, Level 3, Model 1.] [16 gauge, Level 3, Model 2.] [_____]
   b. Stile and Rail Doors: 16 gauge, Level 3, Model 3.
   c. Double Doors: Overlapping astragals for active leaf, except as noted or detailed otherwise.
   d. Flush end closure at top of doors.
   e. R-Value: [_____]

D. Labeled Fire Doors and Frames:

1. Conform to listing requirements of Underwriters Laboratories, Inc. (UL).
2. Label each door and frame for class of rating required.
3. Overlapping astragal on active leaf of double doors.
4. Label requirements, dimensions, and type of door are indicated [in Door and Hardware Schedule.] [on Drawings.]
   a. Modify drawing details if required to secure label.
   b. Clearly identify modifications on Shop Drawings.
   c. Maximum temperature rise of 450 degrees F for stairway enclosures.

©COPYRIGHT 2013 CH2M HILL

E. Glazing:

2. Doors: Furnish with formed flush-type glazing strips with butt corner joints to permit selection of secure side in field.
3. Glazing Arrangements: Accommodate glass of type and thickness indicated and as specified in Section 08 80 00, Glazing.

1.2 MISCELLANEOUS ITEMS

A. Filler or Transom Panels: Furnish of same construction and finish as door to include fire-resistive label and sound-retardant construction.

B. Furnish manufacturer's standard core filler, anchors, fasteners, and other ancillary items.

1.3 FACTORY FINISHING REQUIREMENTS

A. Galvanized with A60 zinc coating in accordance with ASTM A653/A653M.

B. Phosphate treat metal for paint adhesion.

C. One shop coat of baked-on rust-inhibiting prime coating compatible with finish coating [as shown and] as specified in Section 09 90 00, Painting and Coating.

D. Stainless Steel: ASTM A480, No. 3 or No. 4.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Frames:

1. Follow ANSI A250.11 and manufacturer's instructions.
   a. Maintain scheduled dimensions, hold head level, and maintain jambs plumb and square.
   b. Secure anchorages and connections to adjacent construction.
   c. Wherever possible, leave frame spreader bars intact until frames are set perfectly square and plumb and anchors are securely attached.

B. Doors:

1. Hollow Metal Doors: ANSI A250.8.
2. Hardware: In accordance with manufacturer's templates and instructions.
   a. Adjust operable parts for correct function.

©COPYRIGHT 2013 CH2M HILL

b. Remove hardware, with exception of prime coated items, tag, box, and reinstall after finish paint work is completed.

3. Labeled Doors: NFPA Pamphlet No. 80.

3.02 FIELD PAINTING

A. Where prime coat has been damaged, sand smooth and touch up with same primer as applied at shop.

1. Remove rust before painting.
2. Touch Up: Not obvious.
3. Perform immediately after door and frame installation.

3.03 PROTECTION

A. Protect installed doors and frames against damage from other construction work.

3.04 SCHEDULES

A. For tabulation of door and frame characteristics, such as size, type, detail, and finish hardware requirements see Section 08 06 01, Door and Hardware Schedule on Drawings.

SECTION 08 33 23
OVERHEAD COILING DOORS

PART 1 - GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. ASTM International (ASTM):
   a. A653/A653M, Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
   b. A666, Standard Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar.
   c. A924/A924M, Standard Specification for General Requirements for Steel Sheet, Metallic-Coated by the Hot-Dip Process.
   d. B221, Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.
   e. E84, Standard Test Method for Surface Burning Characteristics of Building Materials.
2. Intertek Testing Services (Warnock Hersey Listed) (WH): Certification Listings.
3. National Association of Metal Manufacturers (NAAMM).
4. National Electrical Manufacturers Association (NEMA): 250, Enclosures for Electrical Equipment (1000 Volts Maximum).
5. ICS 2, Industrial Control and Systems: Controllers, Contactors, and Overload Relays Rated 600 Volts.
6. MG 1, Motors and Generators.
7. National Fire Protection Association (NFPA):
   a. 80, Standard for Fire Doors and Other Opening Protectives.
   b. 252, Standard Methods of Fire Tests of Door Assemblies.
8. Underwriters Laboratories Inc. (UL):
   a. Building Materials Directory.
   b. 10B, Standard Safety for Fire Tests of Door Assemblies.
   c. 325, Standard Safety for Door, Drapery, Gate, Louver, and Window Operators and Systems.

1.02 SUBMITTALS

A. Action Submittals:

©COPYRIGHT 2013 CH2M HILL

1. Shop Drawings: Indicate pertinent dimensioning, anchorage methods, hardware locations, and installation details.
2. Product Data: General construction, component connections and details [, wiring diagram and electrical equipment].
3. Samples: Submit two shutter slats, 12 by 12 inch in size illustrating shape, color and finish texture.

B. Informational Submittals:

1. Third party testing documentation or manufacturer’s literature qualifying door model as meeting required developed wind pressures [and impact testing for small or large missile]. Miami-Dade Notice of Approval (NOA) documentation is acceptable as third party evidence of certification.
2. Manufacturer's Instructions: Indicate installation sequence and procedures, and adjustment and alignment procedures.
3. Operation and Maintenance Data as specified in Section 01 78 23, Operation and Maintenance Data, include lubrication requirements and frequency, and periodic adjustments required.
4. Seismic Anchorage and Bracing:
   a. Drawings and product data as required by Section 01 88 15, Seismic Anchorage and Bracing.
   b. Calculations as required by Section 01 88 15, Seismic Anchorage and Bracing.
   c. Installer’s factory authorization.

1.03 QUALITY ASSURANCE

A. Qualifications:
1. Manufacturer: Company specializing in manufacturing products specified in this section with minimum 3 years documented experience.
2. Installer: Company specializing in performing work of this section approved by manufacturer.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Materials, equipment, and accessories specified in this section shall be products of:

1. [Cookson Co.] Model [_____].
2. [Cornell Iron Works, Inc.] Model [_____].

©COPYRIGHT 2013 CH2M HILL

3. [Dynaflair Corp.] Model [_____].
4. [Metro Door] Model [_____].
5. [Raynor Garage Door] Model [_____].
6. [Trac-Rite Door] Model [_____].
7. [Overhead Door Co. Model [_____].

2.02 GENERAL

A. Wind Loads: Design door assembly to withstand wind/suction load of [_____ psf (_____ Pa)] with a maximum deflection of 1/120 without damage to [door] [shutter] or assembly components.

B. Operation: Design door assembly , including operator, to operate for not less than 10,000 cycles and 10 cycles per day.

C. Fire Rated Door Construction: Conform to one of the following:

1. NFPA 252.
2. UL 10B.

D. Fire Rated Assemblies: Fire rated [door] [shutter] fusible link [fire alarm system] activated with automatically governed closing speed.

1. Design release mechanism for easy resetting by facility maintenance personnel.
2. Provide units allowing manual lifting for emergency exit after automatic closing, with curtain closing when released.

E. Products Requiring Electrical Connection: Listed and classified by UL or another testing firm acceptable to authority having jurisdiction.

F. Surface Burning Characteristics, Foam Insulation: Maximum 75/450 flame spread/smoke developed index when tested in accordance with ASTM E84.

2.03 COMPONENTS

A. Curtain: Conform to following:

1. Stainless Steel Slats:
   a. Interlocking, minimum 24 gauge thick of stainless steel conforming to ASTM A666 Type 304 rollable temper.
   b. Type: Single thickness perforated S-configuration slat.
2. Nominal Slat Size: 3 inches wide by required length.

©COPYRIGHT 2013 CH2M HILL

3. Slat Ends: Each slat fitted with end locks to act as wearing surface in guides and to prevent lateral movement.
4. Curtain Bottom: Fitted with angles, channels, or tubes to provide reinforcement and positive contact withfloor in closed position.

B. Guides:

1. Minimum 3/16 inch thick; galvanized steel conforming to ASTM A653/A653M, minimum galvanized coating designation G90 in accordance with ASTM A924/A924M stainless steel conforming to ASTM A666 Type 304 rollable temper.
2. Furnish continuous angles of profile to retain door in place; mounting brackets of same metal.

C. Roller Shaft Counterbalance: Steel pipe and [helical] steel spring system, capable of producing torque sufficient to ensure smooth operation of curtain from any position and capable of holding position at mid-travel; with adjustable spring tension.

D. Hood Enclosure and Fascia: Square shape, minimum 24 gauge thick galvanized steel; internally reinforced to maintain rigidity and shape.

E. Hardware:

1. Locks: Furnish locks to allow doors to be secured.
   a. Manual Doors: Manufacturer's standard cylinder dead lock on inside at door jamb, key operated from interior.
2. Cylinders: Minimum six-pin cylinders Furnished under Section 08 71 00, Door Hardware installed as part of Work of this section; doors keyed alike master keyed.
3. Handle: Inside [center] [side] mounted, adjustable keeper, spring activated latch bar with feature to keep in locked or retracted position; interior [and exterior] handle.
4. Weatherstripping (Exterior Assemblies): Moisture and rot proof, resilient type for complete weathertight installation.
   a. Rubber, neoprene, or vinyl water seal at hood to prevent airflow around coil on exterior doors.
   b. Weather seal sealing strip on guide to close space between guide and curtain on exterior doors.
5. Smoke Seals (Fire Rated Assemblies): Perimeter gaskets and closures to prevent spread of smoke through door assembly and to maintain required fire rating and fire label.

©COPYRIGHT 2013 CH2M HILL

F. Manual Operation: Manual hand chain lift unit with overhead counter balance device, requiring 25 lb nominal force to operate.

2.04 FINISHES

A. Curtain Slats: Stainless steel, NAAMM No. 4 satin directional polished finish.

B. Steel Guides and Hood Enclosure: Primed and painted

2.05 SOURCE QUALITY CONTROL

A. Attach label from agency approved by authority having jurisdiction to identify each fire rated door.

1. Oversize Door Certification: Provide UL Certificate of Inspection or comparable certification acceptable to authorities having jurisdiction, in lieu of label for oversize door assemblies exceeding 120 square feet or 24 feet in any dimension.

B. Apply label from agency approved by authority having jurisdiction to identify each foam plastic insulation board.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Verify opening sizes, tolerances and conditions are acceptable.

3.02 INSTALLATION

A. Use anchorage devices to securely fasten assembly to wall construction and building framing without distortion or stress.

B. Securely and rigidly brace components suspended from structure. Secure guides to structural members only.

C. Fit and align assembly including hardware; level and plumb, to provide smooth operation.

D. Coordinate installation of sealants and backing materials at frame perimeter as specified in Section 07 92 00, Joint Sealants.

E. Install perimeter trim and closures.

©COPYRIGHT 2013 CH2M HILL

3.03 TOLERANCES

A. Maintain dimensional tolerances and alignment with adjacent Work.

B. Maximum Variation from Plumb: 1/16 inch.

C. Maximum Variation from Level: 1/16 inch.

D. Longitudinal or Diagonal Warp: Plus or minus 1/8 inch per 10 ft straight edge.

3.04 ADJUSTING

A. Adjust door, hardware and operating assemblies for smooth and noiseless operation.

B. Test smoke activated assemblies for proper activation.

3.05 CLEANING

A. Leave door and components clean.

B. Remove labels and visible markings.

END OF SECTION

SECTION 08 71 00
DOOR HARDWARE

PART 1 - GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. Builders Hardware Manufacturer's Association (BHMA):
   a. A156.1, Butts and Hinges.
   b. A156.2, Bored and Preassembled Locks and Latches.
   c. A156.3, Exit Devices.
   d. A156.4, Door Controls - Closers.
   e. A156.13, Mortise Locks & Latches.
   f. A156.16, Auxiliary Hardware.
   g. A156.18, Materials and Finishes.
2. International Code Council (ICC): A117.1, Accessible and Usable Buildings and Facilities.
3. Underwriters Laboratories, Inc. (UL): Fire Protection Equipment List.

1.02 SUBMITTALS

A. Action Submittals:
   1. Shop Drawings:
      a. Product Data: Manufacturer's literature for each item of finish hardware required herein, clearly marked.
      b. Finish Hardware Schedule: Furnish complete and detailed schedule, show product items, numbers, and finishes for hardware for each separate opening.
      c. Special Tools: Provide listing and description of usage.

B. Informational Submittals:
   1. Operation and Maintenance Data as specified in Section 01 78 23, Operation and Maintenance Data.
   2. Manufacturer's Field Service Report.
   3. Certification of Hardware Consultant.
   4. Manufacturer's Certificate of Proper Installation, in accordance with Section 01 43 33, Manufacturers' Field Services.

1.03 QUALITY ASSURANCE

A. Qualifications of Supplier: Recognized supplier of architectural finish hardware, with warehousing facilities, who has been furnishing hardware in vicinity of Project for not less than 5 years, and who is, or who employs, architectural hardware consultant.

B. Qualifications of Architectural Hardware Consultant (AHC): Certified by Door and Hardware Institute.

1.04 DELIVERY, STORAGE, AND HANDLING

A. Before delivery, clearly identify and tag each item of hardware with respect to specified description and location of installation.

B. Provide secure storage for finish hardware until installation is made.

1.05 EXTRA MATERIALS

A. Special Tools: Two sets for installation and maintenance of hardware.

PART 2 - PRODUCTS

2.01 MATERIALS

A. Provide end products of one manufacturer for each product in order to achieve standardization for appearance, maintenance, and replacement.

B. Finishes: BHMA A156.18.

C. [Some products listed below may not be used on this Project.]

2.02 FASTENERS

A. Stainless steel.

2.03 BUTT HINGES

A. BHMA A156.1.

B. Quantity per Door Leaf (Minimum):

©COPYRIGHT 2013 CH2M HILL

Door Height	Hinges
Up to 5'-0"	1 pair
5'-1" to 7'-7"	1-1/2 pair
7'-8" to 10'-0"	2 pairs
10'-1" to 12'-6"	2-1/2 pairs

C. Hinge Height (Minimum):

Door Width	Hinge Height
Up to 3'-0"	4-1/2"
3'-1" to 4'-0"	5"
Over 4'-0"	6"

C. Width: Minimum for clearance of trim and 180-degree swing.

D. Exterior Hinges: Nonremoveable pin.

E. Joint Tolerance: 0.012 inch maximum, gauged in CLOSED position.

F. Finish: [Satin stainless steel No. 630.] [Satin bronze No. 612.] [Satin chromium-plated brass or bronze No. 626.] [Satin chromium-plated steel No. 652.] [Primed for paint No. 600.] [As indicated for each type.]

G. Types and Manufacturers:

No.	Type Description	Stanley	Mc-Kinney	Lawrence	BHMA
H1	Regular weight, two ball-races, full mortise, [brass, bronze] [steel] [stainless steel]	 [FBB191] [FBB179] [FBB191-32D]	 [TB2314] [TB2714] [TB2314]	 [BB4101-1] [BB4101] [BB4101-32D]	 [A2112] [A8112] [A5112]
H2	Plain bearing, full mortise, [brass or bronze] [steel] [stainless steel]	 [F191-32D] [F191] [AA: F179]	 [T2314] [T2314] [AB: T2714]	 [4181-32D] [4181-1] [AC: 4181]	 [A2133] [A8133] [AD: A5133]
H3	Hinges or pivots furnished by door manufacturer				
H4	Extra heavy-weight, four ball races, full mortise, stainless steel	FBB199-32D	T4B3386	BB5151-A	A5111
H5	Heavyweight, four ball races, half mortise, stainless steel	FBB98	T4B3384	BB5651-32D	A5211

©COPYRIGHT 2013 CH2M HILL

No.	Type Description	Stanley	Mc-Kinney	Lawrence	BHMA

2.04 LOCKS AND LATCH SETS

A. Cylindrical or Bored Locks: BHMA A156.2, highest grade.

1. Trim: Wrought or cold-forged metal knobs and roses.
2. Core Cylinders: Interchangeable, removable; minimum of six pins.
3. Strikes: Lip dimensions to fit configuration of trim.
4. Bolt Throw: 3/4 inch minimum, on latchbolts for pair of doors.
5. Knob Backset: [3-3/4] [2-3/4] inches.
6. Manufacturers and Products:
   a. Sargent; AC.
   b. Schlage; Plymouth.
   c. Best; 4C Washington.

B. Mortise Locks: BHMA A156.13, Series 1000, Grade 1.

1. Materials: Brass or stainless steel.
2. Trim: Wrought or forged lever handles and roses.
3. Core Cylinders: Interchangeable, removable; minimum of six pins.
4. Bolt Throw: 5/8 inch minimum.
5. Lever Backset: 2-3/4 inches.
6. Manufacturers and Products:
   a. Sargent; LNJ.
   b. Schlage; 03.
   c. [Best; 3H Fairbanks.]

C. Tactile Warning: Knurl knob backs and lever handles for touch identification; ICC A117.1, Section 4.29.3.

D. Finish:

1. [Satin stainless steel No. 630.] [Satin chromium-plated No. 626.]
2. [Coat exterior [knobs] [and] [levers] with Teflon.]

E. [Locks and Latches: Match existing in manufacturer, design, finish, and keying. No substitutions allowed.]

F. Types and Manufacturers:

L16	Lock by exit device manufacturer; furnish cylinders for keying to other locks as required				

G. Keying:

1. Lock Cylinders: Operate by [grand] master key system that allows for future expansion.

©COPYRIGHT 2013 CH2M HILL

2. Keylocks: [As indicated in Door and Hardware Schedule.] [Key new locks into existing [Best] master key system.] [As directed by Owner.]
3. Keys: Two per lock; tag with schedule information.
4. Master Keys: Four; send by registered mail to [Engineer] [Owner].
5. [Key cabinet and casework locks into building system.]
6. [Furnish lock manufacturer's removable core maximum security keying system.]

2.05 CONSTRUCTION KEY SYSTEM

A. Removable construction core system for locks.

B. See Article Manufacturer's Services under Part 3, Execution.

2.06 CONSTRUCTION KEY SYSTEM

A. Assemble permanent cylinders with construction inserts and ship with all lock sets.

B. Change Keys: Pack in separately identified envelopes and ship.

C. Construction Keys: Pack in cartons marked "packing list" and ship.

D. Construction Insert Extractor Keys, Master Keys, and Grand Master Keys: Ship by registered mail to [Engineer] [Owner].

E. On completion of job, deliver construction keys to Owner.

2.07 EXIT DEVICES

A. BHMA A156.3.

B. Furnish fire exit devices and mullions at fire-rated doors.

C. [Key Lockable,] Removable Mullion: [Steel] [Aluminum] construction, by exit device manufacturer.

D. Trim:

1. Knobs: Sargent PRK; Von Duprin K.
2. Levers: Sargent ETJ; Von Duprin 03.

©COPYRIGHT 2013 CH2M HILL

E. Finish:

1. Exit Device: Satin chromium-plated No. 626.
2. Removable Mullion: [Steel with prime coat.] [Aluminum with prime coat.] [Mill aluminum.]

F. Types and Manufacturers:

No.	Type Description	Sargent	VonDuprin	BHMA
X1	Rim type, active leaf; with removable mullion for pairs	[8813PRK] [8813ETJ]	[99K] [99L]	Type 1 08
X2	Rim type, exit only	8810	99EO	Type 1 01
X3	Vertical rod type	[8713PRK] [8713ETJ]	[9927K] [9927L]	Type 2 08

C7	Closer furnished by door and frame manufacturer			

2.09 PUSH-PULLS

A. Solid metal, not plated.

©COPYRIGHT 2013 CH2M HILL

B. Finish: [Satin stainless steel No. 630,] [Satin chromium-plated No. 626,] [Satin bronze No. 612,] unless indicated otherwise.

C. Plates: Beveled four edges, square corners.

D. Pulls: Bolted through door.

E. Push Plates: Countersink pull-through bolts and cover with push plate.

F. Types and Manufacturers:

No.	Type Description	BBW	Baldwin
P1	8" x 3/4" Pull handle on plate: 0.050" x 4" x 16", and push plate: 0.050" x 8" x 16"	1017-3B and 47-G	2367 and 2125
P2	Push bar and pull handle: Furnished by door manufacturer		
P3	8" x 3/4" Pull handles: Both sides	2903	2552

2.10 STOPS AND HOLDERS

A. BHMA A156.16.

B. Machine Screws: In threaded anchors at concrete or masonry.

C. Self-Tapping Screws: At stud partitions, wood, or metal mountings.

D. Metal Risers: For mounting at carpet floors.

E. Finish: Satin chromium-plated No. 626.

F. Types and Manufacturers for Each Leaf:

No.	Type Description	BBW or GJ	Baldwin	BHMA
S1	Floor stop	F121X	4086	L02131
S2	Wall bumper	[WC9X] [WC9T]	[4031] [4032]	[L02241] [L02251]
S3	Wall stop-holder	[W140] [W141X]	[4090] [4091]	[L02251] [L01351]
S4	Floor stop-holder	F823X	4096	L01371

No.	Type Description	BBW or GJ	Baldwin	BHMA
S5	Door-attached holder	872	4105	L01381
S6	Overhead stop	GJ90S Series	Sargent 590S Series	C02511
S7	Overhead stop with hold-open	GJ90H Series	Sargent 590H Series	C05541
S8	Heavy-duty overhead stop	GJ79HDS		
S9	Spring and chain stop	Ives 115	4485	
S10	Stop or holder furnished by door manufacturer			

2.11 BOLTS

A. BHMA A156.16.

B. Finish: Bright nickel No. 645.

C. Types and Manufacturers:

No.	Type/Description	Stanley	Lawrence	BHMA
B1	Top and bottom flush bolts	393-1/2	280	L04201
B2	Top and bottom surface bolts	CD4060	283	(L04151)
B3	Top: 8" bolt w/48" chain	1055	T146	
	Bottom: 8" foot-bolt or surface bolt	1056 4060	T145 283	
B4	Surface bolt, 4"	4060	283	
B5	Cane bolt, 18"	1010	T250	
B6	Automatic flush bolts	GJ [FB7] [FB8]	Ives [559] [556]	

©COPYRIGHT 2013 CH2M HILL

2.12 KICKPLATES

A. [Solid metal, not plated.] [Plastic laminate.] Bevel four edges.

B. Width of door leaf less than 1-1/2 inches at single leaf and less than 1 inch at pairs.

C. Finish: [Satin stainless steel No. 630.] [Color as scheduled.] [Color: _____.]

D. Types and Manufacturers: Builders Brass Works, Baldwin, or Cipco as follows:

1. K1: 10 inches high by [0.05] [0.125] inch thick.
1. K2: 36 inches high by [0.05] [0.125] inch thick.

2.13 THRESHOLDS

A. Thresholds: One-piece full width of opening; extend beyond jamb where indicated.

B. Provide with stainless steel machine screws in threaded expansion anchors at concrete.

C. Finish: [Mill finish] [Dark bronze anodized] aluminum, unless indicated otherwise.

D. Types and Manufacturers:

No.	Type Description	Pemko	Reese
T1	Saddle (smooth, 4" x 1/2")	[175A] [175D]	[S104A] [S104D]
T2	Saddle (serrated, 4" x 1/4")	[270A] [270D]	[S404A] [S404D]
T3	Threshold furnished by door manufacturer		
T4	Thermal break saddle (6-1/8")	[253XAFG] [253XDFG]	[S473A] [S473D]
T5	Carpet edge	[174C] [174D]	[266A] [266D]
T6	Panic exit saddle	[2005AV] [2005DV]	[S483AV] [S483DV]

©COPYRIGHT 2013 CH2M HILL

2.14 WEATHERSTRIP

A. Finish: [Clear] [Dark bronze] anodized aluminum, unless indicated otherwise.

B. Seal Types and Manufacturers:

No.	Type Description	Pemko	Reese
W1	Rubber or vinyl bulb at jambs and head, and at meeting stiles of pairs	S88D	797B
	Door shoe	[222AV] [222DV]	[DB596AF] [DB596DF]
	Rain drip	[346C] [346D]	[R201C] [R201D]
W2	Rubber or vinyl bulb at jambs and head, and at meeting stiles of pairs	S88D	797B
	Door shoe	[222AV] [222DV]	[DB596AF] [DB596DF]
W3	Rubber vinyl bulb at jambs and head, and at meeting stiles of pairs	S88D	797B
	Door bottom with drip	[345AV] [345DV]	[353A] [353D]
	Interlocking watershed	[68 AR & 347A] [68DR & 347D]	[202C & 203C] [202D & 203D]
W4	Flexible plastic at jambs, head, and at meeting stiles of pairs	PF114PS	794B
W5	Weatherstripping furnished by door manufacturer		
W6	Rubber or vinyl bulb at jambs and head, and at meeting stiles of pairs	S88D	797B
	Automatic door bottom	[412CRL] [412DRL]	[320C] [320D]

2.15 MISCELLANEOUS ITEMS

A. Provide as indicated in Door and Hardware Schedule:

M1	Nameplate as specified in Section 10 14 00, Signage, in text noted in Door and Hardware Schedule		
M2	Nameplate and barrier-free pictorial symbol as specified in Section 10 14 00, Signage, in text noted in Door and Hardware Schedule		
M3	Barrier-free pictorial symbol, 6 inch by 6 inch, as specified in Section 10 14 00, Signage, in text noted in Door and Hardware Schedule		
M4	Bypassing Door Hardware:		
		Lawrence	Stanley
	Set	EDF500 Series, with integral fascia	Series 1700, with integral fascia
	Brass pulls	405	303-STL3
M5	Pocket Door Hardware:		
		Lawrence	Stanley
	Set	PF619	Series 40-3940
	Brass pulls	411	100-B
M6	Bifold Door Hardware:		
		Lawrence	Stanley
	Set	ED600	Series 2700
	Brass pulls	Quality 813	4484
M7	Coordinator:		
		GJ	Ives
	Model	COR-65	469

2.16 SILENCERS

A. Ives, Glynn-Johnson.

B. At metal frame of each hinged door that does not have seals scheduled.

©COPYRIGHT 2013 CH2M HILL

2.17 THREE AT SINGLE LEAVES AND TWO AT PAIRS.

2.18 NAMEPLATES

A. Material: Plastic plate; 1/8 inch thick with beveled edges.

B. Types and Manufacturers: Builders Brass Works, Trimco, and as follows:

1. N1: 2-inch-high black plate with 1-inch-high white Helvetica medium letters in text noted in Door and Hardware Schedule
2. N2: Same as N1 with addition of barrier-free pictorial symbol

2.19 TEMPLATES

A. Fabricate to template hardware applied to metal doors and frames.

B. Ensure that required templates are furnished to various manufacturers for fabrication purposes.

C. Templates: Make available not more than 10 days after receipt of approved Hardware Schedule.

2.20 EXIT AND FIRE DOORS

A. Exit Doors: Always openable from inside by simple turn of [knob] [lever handle] or push on panic bar without use of key or any special knowledge or effort, to include each leaf of door pairs.

B. Hardware for Fire Doors: Underwriters Laboratories Inc., Fire Protection Equipment List.

2.21 KEY CONTROL SYSTEM

A. System: Key Control Systems Co., Telkee, Inc., expandable system with [150 (E8351)] [25 (E8331)]-key capacity expandable to [425] [125].

B. Cabinet:

1. Manufacturer’s standard surface mounted cabinet, single-door with continuous hinge, and pin tumbler lock, color as selected from standard colors to match Engineer’s color schedule. [Use Telkee AWC 150-S] [Use Telkee RWC-P 25-S].
2. Complete system with standard components such as envelopes, transient key tags, reserve key tags, receipts and holders, and card index.

©COPYRIGHT 2013 CH2M HILL

PART 3 - EXECUTION

3.01 INSTALLATION

A. In accordance with manufacturer's written instructions.

B. Make Work neat and secure, develop full strength of components, and provide proper function.

C. Prevent marring, scratching, or otherwise damaging adjacent finishes during hardware installation.

D. Latchbolts:

1. Install to engage in strikes automatically, whether activated by closers or manually.
2. In no case shall additional manual pressure be required to engage latchbolt in strike.

E. Stops and Holders: Set to allow doors to open as far as possible.

F. Wall Mounted Hardware: Install over solid structural backing or solid blocking in hollow walls.

G. Thresholds:

1. Cope ends neatly to profile of jamb.
2. Set in sealant and seal ends to jambs.

H. Key Control System Cabinet: Install where shown.

I. Hardware: Adjust for easy, noise-free operation.

J. Replace damaged hardware items.

3.02 MOUNTING DIMENSIONS

A. Standard Door Hardware Locations: As recommended and published by Door and Hardware Institute, except as noted or detailed otherwise.

B. Door Silencers: Install 3 inches from top and bottom of jamb and 1 inch above strike at single doors, and 3 inches from edges of doors in head for pairs of doors.

©COPYRIGHT 2013 CH2M HILL

C. Nameplates: Attach to doors [or walls adjacent to doors] 5 feet 6 inches above floor using [Phillips head screws] [self-sticking [permanent] [removable] adhesive].

3.03 MANUFACTURER'S SERVICES

A. Deliver permanent lock cores to Site.

B. Remove temporary construction cores and insert permanent cores.

C. Inspect each lock set to ensure permanent cores are operating satisfactorily.

D. Deliver to Owner change and control keys for permanent system.

E. Return temporary construction cores to manufacturer.

F. Furnish manufacturer's representative for the following services at Site or classroom as designated by [Owner,] [_____,] for minimum person-days listed below, travel time excluded:

1. [_____] person-days for installation assistance, inspection, and Manufacturer's Certificate of Proper Installation.
2. [_____] person-days for [functional] [and] [performance] testing.

3.04 PROTECTION

A. Cover and protect exposed surfaces of hardware during installation and until Substantial Completion.

B. Fit, dismantle, and reinstall finish hardware as required for finish painting work.

C. Protect and prevent staining of hardware during construction in accordance with manufacturer's recommendations.

D. Remove protective measures and permanent lock cylinders installed prior to final cleaning.

3.05 DOOR AND HARDWARE SCHEDULE

A. Door and Hardware Schedule [on Drawings] [in Section 08 06 01, Door and Hardware Schedule,] is guide to functional requirements of each opening.

B. Provide finish hardware as scheduled. Sizes omitted shall be as recommended by manufacturer.

©COPYRIGHT 2013 CH2M HILL

SECTION 08 90 00
LOUVERS [AND VENTS]

PART 1 - GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. Air Movement and Control Association (AMCA): 500-L, Laboratory Methods of Testing Louvers for Rating.
2. The Aluminum Association, Incorporated (AA): Designation System for Aluminum Finishes.
3. ASTM International (ASTM):
   a. A480/A480M, Standard Specification for General Requirements for Flat-Rolled Stainless and Heat-Resisting Steel Plate, Sheet, and Strip.
   b. D1187, Standard Specification for Asphalt-Base Emulsions for Use as Protective Coatings for Metal.
   c. E84, Standard Test Method for Surface Burning Characteristics of Building Materials.
4. Underwriters Laboratories, Inc. (UL): Building Materials Directory.

1.02 DESIGN REQUIREMENTS

A. Installed Louvers:

1. Capable of resisting [wind load of] [20] [30] [_____] [pounds per square foot].
2. [_____]

1.03 SUBMITTALS

A. Action Submittals:

1. Shop Drawings: Large scale details of louvers, anchorage, and relationship to adjoining construction.
   a. Manufacturer’s Literature:
      1) Descriptive and performance data of louvers, including standard drawings and louver-free area.
   b. [Seismic anchorage and bracing drawings and data sheets, as required by Section 01 88 15, Seismic Anchorage and Bracing.]
2. Samples: Manufacturer’s standard finishes and colors.

©COPYRIGHT 2013 CH2M HILL

B. Informational Submittals:

1. Seismic anchorage and bracing calculations as required by Section 01 88 15, Seismic Anchorage and Bracing.
2. Factory test data.
3. Certificates of AMCA ratings.
4. Installation instructions.
5. Parts list, if applicable.
6. Maintenance procedures.
7. Special Guarantee.

1.04 SPECIAL GUARANTEE

A. Manufacturer's extended guarantee or warranty, with Owner named as beneficiary, in writing, as Special Guarantee. Special Guarantee shall provide for correction, or at option of Owner, removal and replacement of special fluorocarbon or baked-on finish found defective during a period of 20 years after date of Substantial Completion. Duties and obligations for correction or removal and replacement of defective Work as specified in General Conditions.

PART 2 - PRODUCTS

2.01 GENERAL

A. Nonacoustical louver sizes are based on [50] [_____] percent free area and [800] [_____] fpm maximum velocity through free area. If louvers furnished do not meet these parameters, Contractor is responsible for resizing louvers and wall openings, and for making other adjustments to allow for larger openings.

B. Water Penetration Rate: No greater than 0.02 ounce per square foot.

C. Louvers: Rated and tested in accordance with AMCA 500-L.

D. Furnish louvers with interior duct collars.

2.02 FIXED STORMPROOF LOUVERS (TYPE SP)

A. Frame: Extruded aluminum channel, 0.081 inch thick, 4 inches deep, with concealed mullions.

B. Blades: Extruded aluminum, 0.081 inch thick, Z-shaped, 35-degree to 45-degree pitch angle, spaced 3 inches to 4.25 inches on center.

©COPYRIGHT 2013 CH2M HILL

C. Pressure Loss: AMCA certified rating of no greater than 0.10-inch WC.

D. Sizes: As shown on Drawings.

E. Screen: Inside mounted, painted aluminum, 1/2-inch mesh.

F. Finish: Kynar 500 fluorocarbon coating [in color as scheduled [AA-M1022A41, clear anodized] [AA-M1022A44, [light] [medium] [dark] bronze anodized].]

G. Manufacturers and Products:

1. Construction Specialties; Model 4110.
2. Dowco; Series LEB-4.
3. Ruskin; Model ELF-375DXH.

2.03 ACCESSORIES

A. Anchors and Fasteners: Stainless steel.

B. Flashings: Match louver frame.

C. Isolation Tape: Tremco 440, 3M EC1202, or Presstite 579.6.

D. Isolation Paint: ASTM D1187, bituminous coating.

2.04 SOURCE QUALITY CONTROL

A. Factory Performance Tests:

1. Airflow versus pressure loss.
2. Rain penetration data.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Check openings to ensure dimensions conform to Drawings.

B. Ensure openings are free of irregularities that would interfere with installation.

C. Do not install louvers until defects have been corrected.

©COPYRIGHT 2013 CH2M HILL

3.02 INSTALLATION

A. Install louvers as shown on reviewed Shop Drawings. Coordinate with heating or ventilation ductwork to be connected.

B. Follow procedures in manufacturer's recommended installation instructions.

C. Install insulated blank-off panels where indicated, completely closing space between ducts and louver frames.

D. Separate aluminum from other metals with isolation tape or paint.

3.03 CLEANING

A. After erection, protect exposed portions from damage by machines, paint, lime, acid, cement, or other harmful compounds.

B. Remove protective materials and clean with plain water, water with soap, or household detergents.

3.04 SUPPLEMENTS

A. The supplement listed below, following "End of Section," is a part of this Specification.

1. Louver [and Vent] Schedule: A tabulation of louver [and vent] characteristics for each opening numbered on Drawings. Provide items as scheduled.

END OF SECTION

GYPSUM BOARD

PART 1 - GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. ASTM International (ASTM):
   a. A641/A641M, Standard Specification for Zinc-Coated (Galvanized) Carbon Steel Wire.
   b. C208, Standard Specification for Cellulosic Fiber Insulating Board.
   c. C475/C475M, Standard Specification for Joint Compound and Joint Tape for Finishing Gypsum Board.
   d. C514, Standard Specification for Nails for the Application of Gypsum Board.
   e. C645, Standard Specification for Nonstructural Steel Framing Members.
   f. C665, Standard Specification for Mineral-Fiber Blanket Thermal Insulation for Light Frame Construction and Manufactured Housing.
   g. C754, Standard Specification for Installation of Steel Framing Members to Receive Screw-Attached Gypsum Panel Products.
   h. C840, Standard Specification for Application and Finishing of Gypsum Board.
   i. C1002, Standard Specification for Steel Self-Piercing Tapping Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Wood Studs or Steel Studs.
   j. C1047, Standard Specification for Accessories for Gypsum Wallboard and Gypsum Veneer Base.
   k. C1177/C1177M, Standard Specification for Glass Mat Gypsum Substrate for Use as Sheathing.
   l. C1178/C1178M, Standard Specification for Glass Mat Water-Resistant Gypsum Backing Panel.
   m. C1396/C1396M, Standard Specification for Gypsum Board.
   n. D4977, Standard Test Method for Granule Adhesion to Mineral Surfaced Roofing by Abrasion.
   o. D5420, Standard Test Method for Impact Resistance of Flat, Rigid Plastic Specimen by Means of a Striker Impacted by a Falling Weight (Gardner Impact).
   p. E84, Standard Test Method for Surface Burning Characteristics of Building Materials.

©COPYRIGHT 2013 CH2M HILL

q. E90, Standard Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions and Elements.
r. E119, Standard Test Methods for Fire Tests of Building Construction and Materials.
s. E413, Classification for Rating Sound Insulation.
t. E695, Standard Test Method of Measuring Relative Resistance of Wall, Floor, and Roof Construction to Impact Loading.

2. Gypsum Association (GA):
   a. 214, Recommended Levels of Gypsum Board Finish.
   b. 216, Application and Finishing of Gypsum Panel Products.
3. Underwriters Laboratories Inc. (UL): UL Fire Resistance Directory.

1.02 SUBMITTALS

A. Submittals:

1. Control joint pattern proposed for gypsum board.
2. Control joint pattern proposed for gypsum soffit.
3. Manufacturer's list of items and materials proposed for use, with descriptive literature for each system used.

1.03 QUALITY ASSURANCE

A. General: Regardless of the minimum specifications herein, utilize materials and applications recommended by manufacturer.

B. Applicator's Qualifications: Use only workers regularly employed in this type of work who can show experience in application of similar materials and specific systems specified.

C. Single Source Responsibility: Use gypsum board and related joint treatment materials from a single manufacturer for each type used.

1.04 DELIVERY, STORAGE, AND HANDLING

A. Delivery: Deliver fire-rated materials bearing testing agency label and required fire classification numbers.

B. Storage:

1. Store materials inside, under cover, stacked flat, off floor.
2. Stack gypsum board so that long lengths are not over short lengths.
3. Avoid overloading floor system of storage area.

©COPYRIGHT 2013 CH2M HILL

4. Store adhesives and finishing compounds in dry areas; protect against freezing at all times.

1.05 ENVIRONMENTAL CONDITIONS

A. Temperature: In areas receiving gypsum board installation, maintain minimum temperature of 40 degrees F for 48 hours before, during, and after gypsum board application. Maintain minimum temperature of 50 degrees F for 48 hours before, during, and after application of adhesive methods of attachment and finishing compounds until drying is complete.

B. Ventilation:

1. Provide ventilation during and following adhesives and joint treatment applications.
2. Use temporary air circulators in enclosed areas lacking natural ventilation.
3. Under slow drying conditions, allow additional drying time between coats of joint treatment.
4. Protect installed materials from drafts of ambient air during hot, dry weather.
5. Protect materials from drying too rapidly during hot and dry weather.

PART 2 - PRODUCTS

2.01 GYPSUM BOARD

A. Regular Board (GWB): ASTM C1396/C1396M, 5/8-inch thick with tapered edges tapered and featured rounded or beveled for prefilling.

B. Water-Resistant Board (WRB): ASTM C1396/C1396M, 5/8-inch thick with tapered edges.

C. Gypsum Soffit Board (GSB): 5/8-inch thick, Edges tapered.

2.02 FASTENERS

A. Gypsum Board:

1. Annular Ring Nail: ASTM C514, GWB-54, 1-1/4 inches long for 1/2-inch gypsum board, and 1-3/8 inches long for 5/8-inch gypsum board.
2. Smooth Shank Nail: ASTM C514, 1-3/8 inches long for 1/2-inch gypsum board, and 1-1/2 inches long for 5/8-inch gypsum board.
3. Screws: ASTM C1002, self-drilling, self-tapping, bugle head, for use with power-driven tool.

©COPYRIGHT 2013 CH2M HILL

a. Type S, 1 inch long for gypsum board to sheet metal.
b. Type W, 1-1/4 inches long for gypsum board to wood.

2.03 JOINT TREATMENT MATERIALS

A. Tape:

1. General Interior Applications: ASTM C475/C475M, perforated paper tape.
2. Soffit Board, Glass Mesh Mortar Units, and Cementitious Backer Board: 2-inch wide 10 by 10 open weave glass mesh tape as recommended by manufacturer.

B. Compound:

1. General Interior Applications: ASTM C475/C475M, all-purpose, ready-mixed compound.
2. Water-Resistant GWB and Soffit Boards: Chemically curing, polyindurate type material as recommended by manufacturer.

2.04 ANCILLARY MATERIALS

A. Adhesives: As recommended by gypsum board manufacturer for intended use. Use adhesives that have VOC content of 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

2.05 TRIM ACCESSORIES

A. ASTM C1047, Zinc-Coated Metal.

B. Manufacturers and Products:

C. Corner Bead:

1. 1-1/4 inches by 1-1/4 inches:
   a. United States Gypsum; Dur-A-Bead.
   b. Gold Bond; standard corner beads.
2. Edge Trim:
   a. United States Gypsum; 200B metal trim.
   b. Gold Bond; No. 200 casing bead.
3. Metal Control Joint:
   a. United States Gypsum; No. 093.
   b. Gold Bond; E-Z strip control joint.

©COPYRIGHT 2013 CH2M HILL

2.06 NONSTRUCTURAL METAL FRAMING MEMBERS

A. ASTM C645, galvanized C-studs with 1-5/8-inch flanges.

B. Sizes and Gauge: As noted on Drawings

C. Manufacturers:

1. United States Gypsum.
2. Dale/Incor.
3. Gold Bond.
4. Unimast, Inc.

2.07 LIGHT-GAUGE METAL FRAMING ACCESSORIES

A. Cold-Rolled Carrying Channel: Cold-rolled steel, 18-gauge metal with minimum 1/2-inch wide flange, free of rust galvanized [1-1/2] [2] [2-1/2] inches deep.

B. Cold-Rolled Bridging Channel: Cold-rolled steel, 18-gauge metal with minimum 1/2 inch wide flange galvanized [1-1/2] [_____] inches deep.

C. Cold-Rolled Furring Channel: Cold-rolled steel, 25-gauge metal with minimum 1/2-inch wide flange, free of rust galvanized 3/4 inches deep.

D. Z-Furring: Galvanized 18-gauge, [1-1/2] [2] [2-1/2] [3] inch(es) deep.

E. Hat-Shaped Furring Channels: Roll-formed hat shaped section of [25] [22] [20] [18] [16]-gauge galvanized steel with a face width of 1-1/4 inches and a depth of [7/8] [1-1/2] inch(es).

F. Resilient Furring Channels: Roll-formed section of 25-gauge galvanized steel with face width of 1-1/2 inches designed for resilient attachment of gypsum board to framing.

G. Hanger Wire: ASTM A641/A641M, Class 1 zinc coating, soft temper, 0.162-inch diameter.

H. Tie Wire: ASTM A641/A641M, Class 1 zinc coating, soft temper, 0.625-inch diameter or double strand of 0.0475-inch diameter wire.

2.08 DRY WALL CEILING SUSPENSION SYSTEM

A. Use system of main runners, cross tees, and furring channels.

©COPYRIGHT 2013 CH2M HILL

B. Manufacturers:

1. Armstrong World Industries, Inc.; Furring Systems/Drywall.
2. Chicago Metallic Corporation.
3. USG Interiors, Inc.; Drywall Suspension System.

2.09 SPRAY TEXTURE

A. Manufacturers and Products:

1. Aggregate Finish:
   a. National Gypsum Company; ProForm Spray Quick.
   b. United States Gypsum Company; Ceiling Spray Texture.

B. Manufacturers and Products:

1. Nonaggregate Finish:
   a. National Gypsum Company; ProForm Perfect Spray EM/HF.
   b. United States Gypsum Co.; SHEETROCK Wall and Ceiling Spray Texture (unaggregated).

PART 3 - EXECUTION

3.01 EXAMINATION

A. Inspect surfaces to receive gypsum board and related materials before beginning work and report to Engineer any defects in such work which will adversely affect the quality of work specified herein.

3.02 PREPARATION

A. General: Provide, install, and maintain necessary scaffold, staging, trestles, planking, and temporary heating, lighting, and ventilation as necessary for duration of gypsum board work.

B. Protection: Protect work of other trades.

C. Coordination:

1. Coordinate work with that of other trades. Check specifications and drawings of other trades to determine parts of work requiring coordination.
2. Cut and repair gypsum board systems for installation of omitted work.

©COPYRIGHT 2013 CH2M HILL

D. Surface Preparation: Repair defective surfaces prior to starting work. Prepare as specified for application of specific materials.

3.03 ERECTION OF SUSPENDED CEILING

A. General:

1. Securely brace all ceiling areas against sway as required by code for seismic control.
2. Prevent runner and furring channels from contacting masonry walls.
3. Provide 1-1/2-inch channels around recessed lighting fixture openings to support fixtures.

B. Hangers:

1. Space not over 4 feet on center (OC) in direction of runners and within 6 inches of ends of runners.
2. Securely attach to structure above and provide for full saddle tie to main runner at indicated height.
3. Install additional hangers at ends of each suspension member and at light fixtures, 6 inches from vertical surfaces.
4. Do not splay wires more than 5 inches in a 4-foot vertical drop.
5. Provide four-way wire splays at 45 degrees from main runner to support structure for every 144 square feet of ceiling area to prevent sway.
6. Wrap wire minimum three times horizontally, turning ends upward.
7. Where hanger wires cannot be hung vertically from structure above because of ducts, pipes, cable trays, or other interferences, provide trapezes of steel channels (minimum 2-inch deep, 16-gauge cold-rolled carrying channels) hung on steel rods or 8-gauge wire from structural members above. Hang ceiling wires from trapezes or similar members supporting ducts or pipes. Do not hang directly from ducts or pipes.

C. Main Runner Channels:

1. Run main runner channels spaced not more than 4 feet OC, and 6 inches from parallel walls, at right angles to the length of joists.
2. Overlap splices in main runners 12 inches minimum, interlock flanges, and securely tie near each end of splice with double loops of tie wire.

D. Furring Channels:

1. Attach furring channels to main runners at right angles, space at 16 inches OC.

©COPYRIGHT 2013 CH2M HILL

2. Securely saddle tie furring to the main runners at each crossing or equivalent clips or attachments.
3. Splices in Cross-Furring: Lap 8 inches minimum, interlock flanges, and securely tie near each end of splice with two loops of tie wire.

3.04 ERECTION OF DRY WALL CEILING SUSPENSION SYSTEM

A. Follow manufacturer's printed instructions.

B. Hangers:

1. Space not over 4 feet OC in direction of runners and within 6 inches of ends of runners.
2. Securely attach to structure above and provide for full saddle tie to main runner at indicated height.
3. Connections shall develop full strength of hanger wire.

C. Bracing:

1. Securely brace ceiling areas against sway.
2. Where required by code, install for seismic control.
3. Prevent runner and furring channels from contacting masonry walls.

D. Where ducts interfere with normal spacing of hangers and carrying channels, install additional hangers and channels to properly suspend ceiling.

3.05 ERECTION OF LIGHT-GAUGE NONSTRUCTURAL METAL FRAMING

A. Layout: Align partitions as shown on Drawings.

B. Tracks:

1. Attach metal runner tracks to floor slabs with suitable fasteners located 2 inches from each end and spaced not more than 24 inches OC.
2. Where partitions terminate at suspended or framed ceilings attach top tracks to suspended ceiling with toggle or molly bolts spaced 24 inches OC.
3. Where partitions terminate at underside of concrete or metal decking attach deflection channels to substrate with suitable fasteners located 2 inches from each end and spaced not more than 24 inches OC. Locate partition top tracks within deflection channels with a minimum top clearance of 1 inch. Do not attach track to channel.

C. Studs:

©COPYRIGHT 2013 CH2M HILL

1. ASTM C754.
2. Following manufacturer's printed instructions, position studs vertically, engaging floor and ceiling tracks and spaced as noted on Drawings.
3. Splice: When necessary, use 8-inch nested lap and one positive attachment per stud flange.
4. Place in direct contact with doorframe jambs, abutting partitions, and partition corners. Provide for anchorage of doorframes to studs.
5. Anchor studs for shelf-walls and those adjacent to window and doorframes, partition intersections, and corners to ceiling and floor runner flanges. Securely anchor studs to jamb and head anchor clips of door or borrowed-light frames by bolt or screw attachment.
6. Over metal door and borrowed-light frames, place horizontally a cut-to-length section of runner, with a web-flanged bend at each end, and secure with one positive attachment per flange. Position a cut-to-length stud (extending to ceiling runner) at vertical panel joints over doorframe header.
7. Locate studs at abutting construction, partition intersections, and partition corners.
8. Spacing: At [24] [16] inches OC, unless otherwise required by manufacturer.
9. At Doorframes and Cased Openings:
    a. Full height double studs, No. 20 gauge minimum, secured to jamb anchors by bolts, screws, or welds.
    b. Header Track: Secure to frame head anchors and double studs.
    c. Provide double channel stiffeners through studs above frame and extend at least one stud space beyond each jamb.
10. Windows: Similar framing to door openings with stiffeners both above and below.
11. Wall Mounting Accessories: Provide channels, horizontal studding, No. 16 gauge sheet 8 inches by 2 inches greater than stud spacing, or other members within walls as required to provide secure and adequate support.

D. Furring:

1. Space furring channels the same as studs or as shown.
2. Around columns and beams construct furring as shown using metal studs and furring channels securely tied together and anchored in-place.
3. Attach resilient furring channels to wood framing with screws.

3.06 APPLICATION OF GYPSUM BOARD

A. Inspection and Preparation:

1. Check framing for accurate spacing and alignment.

©COPYRIGHT 2013 CH2M HILL

2. Verify spacing of installed framing does not exceed maximum allowable for thickness of gypsum board to be used.
3. Verify frames are set for thickness of gypsum board to be used.
4. Do not proceed with installation of gypsum board until deficiencies are corrected and surfaces to receive gypsum board are acceptable.
5. Repair protrusions of framing, twisted framing members, or unaligned members before installation of gypsum board is started.

B. General:

1. Meet requirements of ASTM C840 and GA 216.
2. Joints: Use gypsum board of maximum lengths to minimize end joints. Stagger end joints when they occur. Locate end joints as far as possible from center of wall or ceiling. Abut gypsum board without forcing. Neatly fit ends and edges of gypsum board. Do not place butt ends against tapered edges.
3. Support ends and edges of gypsum board panels on framing or furring members except for face layer of double layer and where ends are back blocked and floated.
4. Use metal edge trim where gypsum board abuts another material, at corners, and where shown or noted on Drawings.
5. [Use [water-resistant board] [glass mesh mortar units] [cementitious backer board] in toilet, shower, and janitor room walls behind ceramic tile [and elsewhere as indicated on Drawings].]
6. Follow manufacturer’s recommendation of good practice.

C. Over Framing:

1. Apply gypsum board first to ceiling and then to walls for single layer horizontal application.
2. Use vertical application for fire-rated walls.
3. Fasten gypsum board securely to framing using double nailing, screw, or adhesive method.

D. Sound-Rated Partitions:

1. Fabricate and erect in accordance with manufacturer’s printed instructions for required rating.
2. Install sound-deadening board and attenuation blankets as detailed.
3. Seal with acoustical sealant perimeter edges of gypsum board, joints around penetrations, and other joints as noted.

©COPYRIGHT 2013 CH2M HILL

E. Fireproofing:

1. Install fireproofing of columns, beams, and shaft walls as shown.
2. Close tops of duct and pipe shafts, and elevator hoistways with horizontal metal framing and gypsum board to provide [1] [2]-hour rated assembly.

3.07 INSTALLATION OF [GLASS MESH MORTAR UNIT (GMMU)] [CEMENTITIOUS BACKER BOARD]

A. Follow manufacturer's printed instructions for erection, cutting, attachments, and joint treatment.

B. Verify framing is installed at maximum 16 inches OC, and necessary blocking to support fixtures and accessories has been installed. Where backing plates or straps are used, space out from framing to ensure a smooth finish application. Do not proceed until defects are corrected and are acceptable.

C. Precut boards to required sizes and make necessary cutouts. Fasten with appropriate fasteners. Space fasteners 6 inches OC maximum or as directed by manufacturer. Fit ends closely but not forced together. Maintain 1/4-inch spacing between edge of board and fixture. Caulk all joints and corners that are to receive tiles. Apply 2-inch glass fiber tape over joints and corners embedded with tile setting mortar.

3.08 JOINT SYSTEM FOR GYPSUM WALLBOARD

A. Interior Gypsum Board: Conform to ASTM C840.

B. Required: On exposed gypsum board, under ceramic tile and wall covering, and behind casework.

C. Prefill: Fill V-grooves formed by abutting rounded edges of gypsum board with prefill joint compound. Fill V-joint flush and remove excess compound beyond groove. Leave clear depression to receive tape. Permit prefill joint compound to harden prior to application of tape.

D. Taping and Finishing Joints:

1. Taping or Embedding Coat: Apply compound in thin, uniform layer to joints and angles to be reinforced. Apply reinforcing tape immediately. Center tape over joint and seat tape into compound. Leave approximately 1/64-inch to 1/32-inch compound under tape to provide bond. Apply skim coat immediately following tape embedment but not to function as fill or

©COPYRIGHT 2013 CH2M HILL

second coat. Fold tape and embed in angles to provide true angle. Dry embedding coat prior to application of fill coat.

2. Filling Coat: Apply joint compound over embedding coat. Fill taper flush with surface. Apply fill coat to cover tape. Feather out fill coat beyond tape and previous joint compound line. For joints with no taper, feather out at least 4 inches on either side of tape. Do not apply fill coat on interior angles. Allow fill coat to dry prior to application of finish coat.
3. Finishing Coat: Spread joint compound evenly over and beyond fill coat on joints. Feather to smooth uniform finish. Apply finish coat to taped angles to cover tape and taping compound. Sand final application of compound to provide surface ready for decoration.
4. Filling and Finishing Depressions: Apply joint compound as first coat to fastener depressions. Apply at least two additional coats of compound after first coat is dry. Leave filled and finished depressions level with plane of surface.

E. Finishing Beads and Trim:

1. First Fill Coat: Apply joint compound to bead and trim. Feather out from ground to plane of the surface. Dry compound prior to application of second fill coat.
2. Second Fill Coat: Apply joint compound in same manner as first fill coat. Extend beyond first coat onto face of gypsum board. Dry compound prior to application of finish coat.
3. Finish Coat: Apply joint compound to bead and trim. Extend beyond second fill coat. Feather finish coat from ground to plane of surface. Sand finish coat to provide flat surface ready for decoration.

3.09 FINAL FINISHES FOR GYPSUM WALLBOARD

A. Levels of Finish: Conform to GA 214.

B. Level 1:

1. Taping or embedding coat only.
2. Use in concealed areas, and where indicated, unless a higher level is required for fire-resistive or sound-rated assemblies.

C. Level 2:

1. Taping, filling, and finishing coats.
2. Use on water-resistant gypsum backing board.

©COPYRIGHT 2013 CH2M HILL

D. Level 3:

1. Taping, filling, and finishing coats.
2. Use on surfaces indicated to have spray texture or ceramic tile.

E. Level 4:

1. Taping, filling, and finishing coats plus two separate coats applied over joints, angles, fastener heads, and trim accessories.
2. Sand between coats and after last coat.
3. Use on surfaces indicated to receive wall coverings.

F. Level 5:

1. Same as Level 4, plus a thin, smooth, uniform skim coat of joint compound, or product specially formulated for this purpose, over entire surface.
2. Produce surfaces free of tool marks and ridges, ready for decoration.
3. Use on surfaces not indicated otherwise, those indicated to receive gloss, semi-gloss, and nontextured flat paints, and where indicated.

3.10 SPRAY TEXTURE

A. Application:

1. Apply [where scheduled] [on gypsum board wall [and ceiling] surfaces, except behind ceramic tile and wall covering,] following manufacturer's printed directions for a medium build [spray/spatter] [spatter] [orange peel] texture.
2. Before texture application, finish gypsum board as specified for Level 3.
3. When surfaces are prepared and dry, apply sealer and allow to dry. Mix texture finish material as directed by manufacturer.
4. Use spray equipment of a size and type to assure acceptable results.
5. Apply by spray only at a coverage rate as recommended by manufacturer and in accordance with directions printed on container. Apply material to blend uniformly and cover fully without starved spots or other evidence of thin application. Provide uniform texture without application patterns.
6. [After spray application, knockdown and flatten high spots with trowel to produce a Brocade or Travertine marble texture.]

3.11 ADJUST AND CLEAN

A. Clean: Remove droppings or texture overspray from walls, windows, and floor, leaving room clean for following trades.

©COPYRIGHT 2013 CH2M HILL

B. Nail Pop: Repair nail pop by driving new nail approximately 1-1/2 inches from nail pop and reseat nail. When face paper is punctured, drive new nail or screw approximately 1-1/2 inches from defective fastening and remove defective fastening. Fill damaged surface with compound.

C. Ridging:

1. Do not repair ridging until condition has fully developed, approximately 6 months after installation or one heating season.
   a. Sand ridges to reinforcing tape without cutting through tape.
   b. Fill concave areas on both sides of ridge with topping compound.
   c. After fill is dry, blend in topping compound over repaired area.
2. Fill cracks with compound and finish smooth and flush.

1.02 DEFINITIONS

A. Terms used in this section:

1. Coverage: Total minimum dry film thickness in mils or square feet per gallon.
2. FRP: Fiberglass Reinforced Plastic.
3. HCl: Hydrochloric Acid.
4. MDFT: Minimum Dry Film Thickness, mils.
5. MDFTPC: Minimum Dry Film Thickness per Coat, mils.
6. Mil: Thousandth of an inch.
7. PDS: Product Data Sheet.
8. PSDS: Paint System Data Sheet.
9. PVC: Polyvinyl Chloride.
10. SFPG: Square Feet per Gallon.
11. SFPGPC: Square Feet per Gallon per Coat.
12. SP: Surface Preparation.

1.03 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
   a. Data Sheets:
      1) For each product, furnish a Product Data Sheet (PDS), the manufacturer's technical data sheets, and paint colors available (where applicable). The PDS form is appended to the end of this section.
      2) For each paint system, furnish a Paint System Data Sheet (PSDS). The PSDS form is appended to the end of this section.
      3) Technical and performance information that demonstrates compliance with Specification.
      4) Furnish copies of paint system submittals to the coating applicator.
      5) Indiscriminate submittal of only manufacturer's literature is not acceptable.
   b. Detailed chemical and gradation analysis for each proposed abrasive material.
2. Samples:
   a. Proposed Abrasive Materials: Minimum 5-pound sample for each type.
   b. Reference Panel:
      1) Surface Preparation:

©COPYRIGHT 2013 CH2M HILL

a) Prior to start of surface preparation, furnish a 4-inch by 4-inch steel panel for each grade of sandblast specified herein, prepared to specified requirements.
b) Provide panel representative of the steel used; prevent deterioration of surface quality.
c) Panel to be reference source for inspection upon approval by ENGINEER.

2) Paint:
a) Unless otherwise specified, before painting work is started, prepare minimum 8-inch by 10-inch sample with type of paint and application specified on similar substrate to which paint is to be applied.
b) Furnish additional samples as required until colors, finishes, and textures are approved.
c) Approved samples to be the quality standard for final finishes.

B. Informational Submittals:

1. [Applicator's Qualification: List of references substantiating experience.]
2. Coating manufacturer's Certificate of Compliance, in accordance with Section 01 43 33, Manufacturers' Field Services.
3. Factory Applied Coatings: Manufacturer's certification stating factory applied coating system meets or exceeds requirements specified.
4. Manufacturer's written verification that submitted material is suitable for the intended use.
5. If the manufacturer of finish coating differs from that of shop primer, provide finish coating manufacturer's written confirmation that materials are compatible.
6. Manufacturer's written instructions and special details for applying each type of paint.

1.04 QUALITY ASSURANCE

A. Applicator Qualifications: Minimum 5 years' experience in application of specified products.

B. Regulatory Requirements:

1. Meet federal, state, and local requirements limiting the emission of volatile organic compounds.
2. Perform surface preparation and painting in accordance with recommendations of the following:

©COPYRIGHT 2013 CH2M HILL

a. Paint manufacturer's instructions.
b. SSPC PA 3, Guide to Safety in Paint Applications.
c. Federal, state, and local agencies having jurisdiction.

C. Mockup:

1. Before proceeding with Work under this section, finish one complete space or item of each color scheme required showing selected colors, finish texture, materials, quality of work, and special details.
2. After ENGINEER approval, sample spaces or items shall serve as a standard for similar work throughout the Project.

1.05 DELIVERY, STORAGE, AND HANDLING

A. Shipping:

1. Where precoated items are to be shipped to the Site, protect coating from damage. Batten coated items to prevent abrasion.
2. Protect shop painted surfaces during shipment and handling by suitable provisions including padding, blocking, and use of canvas or nylon slings.

B. Storage:

1. Store products in a protected area that is heated or cooled to maintain temperatures within the range recommended by paint manufacturer.
2. Primed surfaces shall not be exposed to weather for more than 2 months before being topcoated, or less time if recommended by coating manufacturer.

1.06 PROJECT CONDITIONS

A. Environmental Requirements:

1. Do not apply paint in temperatures or moisture conditions outside of manufacturer's recommended maximum or minimum allowable.
2. Do not perform final abrasive blast cleaning whenever relative humidity exceeds 85 percent, or whenever surface temperature is less than 5 degrees F above dew point of ambient air.

B. Status of Existing Coatings:

1. The following information on existing coatings or substrate conditions is provided for information only, and is generally believed to be accurate, but

©COPYRIGHT 2013 CH2M HILL

is not guaranteed. Perform tests as required to verify applicability of this information to the Work.
a. [_____]

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Nationally recognized manufacturers of paints and protective coatings who are regularly engaged in the production of such materials for essentially identical service conditions.

B. Minimum of 5 years' verifiable experience in manufacture of specified product.

C. Each of the following manufacturers is capable of supplying most of the products specified herein:

1. [_____]

2.02 ABRASIVE MATERIALS

A. Select abrasive type and size to produce surface profile that meets coating manufacturer's recommendations for specific primer and coating system to be applied.

2.03 PAINT MATERIALS

A. General:

1. Manufacturer's highest quality products suitable for intended service.
2. Compatibility: Only compatible materials from a single manufacturer shall be used in the Work. Particular attention shall be directed to compatibility of primers and finish coats.
3. Thinners, Cleaners, Driers, and Other Additives: As recommended by coating manufacturer.

2.04 PRODUCTS:

Product	**Definition**
Acrylic Latex	Single-component, finish as required
Acrylic Latex (Flat)	Flat latex
Acrylic Sealer	Clear acrylic
Alkyd (Semigloss)	Semigloss alkyd

©COPYRIGHT 2013 CH2M HILL

Product	Definition
Alkyd Enamel	Optimum quality, gloss or semigloss finish as required, medium long oil
Alkyd Wood Primer	Flat alkyd
Bituminous Paint	Single-component, coal-tar pitch based
Block Filler	Primer-sealer designed for rough masonry surfaces, 100% acrylic emulsion
Coal-Tar Epoxy	Amine, polyamide, or phenolic epoxy type 70% volume solids minimum, suitable for immersion service
DTM Acrylic Primer	Surface tolerant, direct-to-metal water borne acrylic primer
DTM Acrylic Finish	Surface tolerant, direct-to-metal water borne acrylic finish coat
Elastomeric Polyurethane	100% solids, plural component, spray applied, high build, elastomeric polyurethane coating, suitable for the intended service
Epoxy Filler/Surfacer	100% solids epoxy trowel grade filler and surfacer, nonshrinking, suitable for application to concrete and masonry. Approved for potable water contact and conforming to NSF 61, where required
Epoxy Nonskid (Aggregated)	Polyamidoamine or amine converted epoxies aggregated; aggregate may be packaged separately
Epoxy Primer—Ferrous Metal	Anticorrosive, converted epoxy primer containing rust-inhibitive pigments
Epoxy Primer—Other	Epoxy primer, high-build, as recommended by coating manufacturer for specific galvanized metal, copper, or nonferrous metal alloy to be coated
Fusion Bonded Coating	100% solids, thermosetting, fusion bonded, dry powder epoxy, suitable for the intended service
Fusion Bonded, TFE Lube or Grease Lube	Tetrafluoroethylene, liquid coating, or open gear grease as supplied by McMaster-Carr Supply Corporation., Elmhurst, IL; RL 736 manufactured by Amrep, Inc., Marietta, GA
High Build Epoxy	Polyamidoamine epoxy, minimum 69% volume solids, capability of 4 to 8 MDFT per coat

©COPYRIGHT 2013 CH2M HILL

Product	Definition
Inorganic Zinc Primer	Solvent or water based, having 85% metallic zinc content in the dry film; follow manufacturer's recommendation for topcoating
Latex Primer Sealer	Waterborne vinyl acrylic primer/sealer for interior gypsum board and plaster. Capable of providing uniform seal and suitable for use with specified finish coats
NSF Epoxy	Polyamidoamine epoxy, approved for potable water contact and conforming to NSF 61
Epoxy, High Solids	Polyamidoamine epoxy, 80% volume solids, minimum, suitable for immersion service
Polyurethane Enamel	Two-component, aliphatic or acrylic based polyurethane; high gloss finish
Rust-Inhibitive Primer	Single-package steel primers with anticorrosive pigment loading
Sanding Sealer	Co-polymer oil, clear, dull luster
Silicone/Silicone Acrylic	Elevated temperature silicone or silicone/acrylic based
Stain, Concrete	Acrylic, water repellant, penetrating stain
Stain, Wood	Satin luster, linseed oil, solid or transparent as required
Varnish	Nonpigmented vehicle based on a variety of resins (alkyd, phenolic, urethane) in gloss, semigloss, or flat finishes, as required
Water Base Epoxy	Two-component, polyamide epoxy emulsion, finish as required

2.05 MIXING

A. Multiple-Component Coatings:

1. Prepare using each component as packaged by paint manufacturer.
2. No partial batches will be permitted.
3. Do not use multiple-component coatings that have been mixed beyond their pot life.
4. Furnish small quantity kits for touchup painting and for painting other small areas.
5. Mix only components specified and furnished by paint manufacturer.

©COPYRIGHT 2013 CH2M HILL

6. Do not intermix additional components for reasons of color or otherwise, even within the same generic type of coating.

B. Colors: Formulate paints with colorants free of lead, lead compounds, or other materials that might be affected by presence of hydrogen sulfide or other gas likely to be present at Site.

2.06 SHOP FINISHES

A. Shop Blast Cleaning: Reference Paragraph, Shop Coating Requirements.

B. Surface Preparation: Provide ENGINEER minimum 7 days' advance notice to start of shop surface preparation work and coating application work.

C. Shop Coating Requirements:

1. When required by equipment Specifications, such equipment shall be primed and finish coated in shop by manufacturer and touched up in field with identical material after installation.
2. Where manufacturer's standard coating is not suitable for intended service condition, ENGINEER may approve use of a tie-coat to be used between manufacturer's standard coating and specified field finish. In such cases, tie-coat shall be surface tolerant epoxy as recommended by manufacturer of specified field finish coat. Coordinate details of equipment manufacturer's standard coating with field coating manufacturer.

D. Pipe:

1. Ductile Iron Pipe:
   a. Use SSPC standards as a guide for desired prepared surface. Follow recommendations of pipe and coating manufacturers for means and methods to achieve SSPC-equivalent surface.
   b. The surface preparation and application of the primer [and finish coats] shall be performed by pipe manufacturer.
   c. For high performance (epoxy) coatings, follow additional recommendations of pipe and coating manufacturers.
   d. Prior to blast cleaning, grind smooth surface imperfections, including, but not limited to delaminating metal or oxide layers.
   e. [For conventional (alkyd) coatings, clean asphalt varnish supplied on pipe and apply one full coat of a tar stop before two full coats of the color coats specified.]

©COPYRIGHT 2013 CH2M HILL

PART 3 -EXECUTION

3.01 GENERAL

A. Provide ENGINEER minimum 7 days' advance notice to start of field surface preparation work and coating application work.

B. Perform the Work only in presence of ENGINEER, unless ENGINEER grants prior approval to perform the Work in ENGINEER's absence.

C. Schedule inspection of cleaned surfaces and all coats prior to succeeding coat in advance with ENGINEER.

D. External coatings on aboveground equipment outside PG&E property will consist of muted, earth tone colors that are consistent with the surrounding natural color palette, and matte finishes, unless overridden by OSHA requirements. Colors for aboveground equipment inside PG&E property will be selected based on PG&E standards.

3.02 EXAMINATION

A. Factory Finished Items:

1. Schedule inspection with ENGINEER before repairing damaged factory-finished items delivered to Site.
2. Repair abraded or otherwise damaged areas on factory-finished items as recommended by coating manufacturer. Carefully blend repaired areas into original finish. If required to match colors, provide full finish coat in field.

B. Surface Preparation Verification: Inspect and provide substrate surfaces prepared in accordance with these Specifications and printed directions and recommendations of paint manufacturer whose product is to be applied. The more stringent requirements shall apply.

3.03 PROTECTION OF ITEMS NOT TO BE PAINTED

A. Remove, mask, or otherwise protect hardware, lighting fixtures, switchplates, aluminum surfaces, machined surfaces, couplings, shafts, bearings, nameplates on machinery, and other surfaces not specified elsewhere to be painted.

B. Provide drop cloths to prevent paint materials from falling on or marring adjacent surfaces.

©COPYRIGHT 2013 CH2M HILL

C. Protect working parts of mechanical and electrical equipment from damage during surface preparation and painting process.

D. Mask openings in motors to prevent paint and other materials from entering.

E. Protect surfaces adjacent to or downwind of Work area from overspray.

3.04 SURFACE PREPARATION

A. Field Abrasive Blasting:

1. Perform blasting for items and equipment where specified and as required to restore damaged surfaces previously shop or field blasted and primed or coated.
2. Refer to coating systems for degree of abrasive blasting required.
3. Where the specified degree of surface preparation differs from manufacturer's recommendations, the more stringent shall apply.

B. Surface Contamination Testing:

1. A surface contamination analysis test shall be performed every [500] [_____] square feet by means of a [Chlor Test CSN Salts] [_____] [or approved equivalent].
2. Surface with chloride levels exceeding 3 µg/square centimeter for submerged surfaces and 5 µg/square centimeter for exposed surfaces shall be treated with a liquid soluble salt remover equivalent to CHLOR*RID (CHLOR*RID International, Chandler, AZ).
3. Follow manufacturer's recommendations and procedures for the use of this product to remove the surface contamination.

C. Metal Surface Preparation:

1. Where indicated, meet requirements of SSPC Specifications summarized below:
   a. SP 1, Solvent Cleaning: Removal of visible oil, grease, soil, drawing and cutting compounds, and other soluble contaminants by cleaning with solvent.
   b. SP 2, Hand Tool Cleaning: Removal of loose rust, loose mill scale, loose paint, and other loose detrimental foreign matter, using nonpower hand tools.
   c. SP 3, Power Tool Cleaning: Removal of loose rust, loose mill scale, loose paint, and other loose detrimental foreign matter, using power-assisted hand tools.

©COPYRIGHT 2013 CH2M HILL

d. SP 5, White Metal Blast Cleaning: Removal of visible oil, grease, dust, dirt, mill scale, rust, coatings, oxides, corrosion products, and other foreign matter by blast cleaning.
e. SP 6, Commercial Blast Cleaning: Removal of visible oil, grease, dust, dirt, mill scale, rust, coatings, oxides, corrosion products, and other foreign matter, except for random staining limited to no more than 33 percent of each unit area of surface which may consist of light shadows, slight streaks, or minor discolorations caused by stains of rust, stains of mill scale, or stains of previously applied coatings.
f. SP 7, Brush-Off Blast Cleaning: Removal of visible rust, oil, grease, soil, dust, loose mill scale, loose rust, and loose coatings. Tightly adherent mill scale, rust, and coating may remain on surface.
g. SP 10, Near-White Blast Cleaning: Removal of visible oil, grease, dust, dirt, mill scale, rust, coatings, oxides, corrosion products, and other foreign matter, except for random staining limited to no more than 5 percent of each unit area of surface which may consist of light shadows, slight streaks, or minor discolorations caused by stains of rust, stains of mill scale, or stains of previously applied coatings.
h. SP 11, Power Tool Cleaning to Bare Metal: Removal of visible oil, grease, dirt, dust, mill scale, rust, paint, oxide, corrosion products, and other foreign matter using power-assisted hand tools capable of producing suitable surface profile. Slight residues of rust and paint may be left in lower portion of pits if original surface is pitted.
i. SP 12, Surface Preparation and Cleaning of Metals by Waterjetting Prior to Recoating: Surface preparation using high-pressure and ultrahigh-pressure water jetting to achieve specified surface cleanliness condition. Surface cleanliness conditions are defined in SSPC SP 12 and are designated WJ-1 through WJ-4 for visual surface preparation definitions and SC-1 through SC-3 for nonvisual surface preparation definitions.

2. The words “solvent cleaning”, “hand tool cleaning”, “wire brushing”, and “blast cleaning”, or similar words of equal intent in these Specifications or in paint manufacturer’s specification refer to the applicable SSPC Specification.
3. Where OSHA or EPA regulations preclude standard abrasive blast cleaning, wet or vacu-blast methods may be required. Coating manufacturers’ recommendations for wet blast additives and first coat application shall apply.
4. Ductile Iron Pipe Supplied with Asphaltic Varnish Finish: Remove asphaltic varnish finish prior to performing specified surface preparation.
5. Hand tool clean areas that cannot be cleaned by power tool cleaning.
6. Round or chamfer sharp edges and grind smooth burrs, jagged edges, and surface defects.

©COPYRIGHT 2013 CH2M HILL

7. Welds and Adjacent Areas:
8. Prepare such that there is:
    a. No undercutting or reverse ridges on weld bead.
    b. No weld spatter on or adjacent to weld or any area to be painted.
    c. No sharp peaks or ridges along weld bead.
    d. Grind embedded pieces of electrode or wire flush with adjacent surface of weld bead.
9. Preblast Cleaning Requirements:
    a. Remove oil, grease, welding fluxes, and other surface contaminants prior to blast cleaning.
    b. Cleaning Methods: Steam, open flame, hot water, or cold water with appropriate detergent additives followed with clean water rinsing.
    c. Clean small isolated areas as above or solvent clean with suitable solvent and clean cloth.
10. Blast Cleaning Requirements:
    a. Type of Equipment and Speed of Travel: Design to obtain specified degree of cleanliness. Minimum surface preparation is as specified herein and takes precedence over coating manufacturer's recommendations.
    b. Select type and size of abrasive to produce surface profile that meets coating manufacturer's recommendations for particular primer to be used.
    c. Use only dry blast cleaning methods.
    d. Do not reuse abrasive, except for designed recyclable systems.
    e. Meet applicable federal, state, and local air pollution and environmental control regulations for blast cleaning, confined space entry (if required), and disposition of spent aggregate and debris.
11. Post-Blast Cleaning and Other Cleaning Requirements:
    a. Clean surfaces of dust and residual particles from cleaning operations by dry (no oil or water vapor) air blast cleaning or other method prior to painting. Vacuum clean enclosed areas and other areas where dust settling is a problem and wipe with a tack cloth.
    b. Paint surfaces the same day they are blasted. Reblast surfaces that have started to rust before they are painted.

D. Galvanized Metal, Copper, and Nonferrous Metal Alloy Surface Preparation:

1. Remove soil, cement spatter, and other surface dirt with appropriate hand or power tools.
2. Remove oil and grease by wiping or scrubbing surface with suitable solvent, rag, and brush. Use clean solvent and clean rag for final wiping to avoid contaminating surface.

©COPYRIGHT 2013 CH2M HILL

3. Obtain and follow coating manufacturer's recommendations for additional preparation that may be required.

E. Concrete Surface Preparation:

1. Do not begin until 30 days after concrete has been placed.
2. Meet requirements of SSPC SP 13.
3. Remove grease, oil, dirt, salts or other chemicals, loose materials, or other foreign matter by solvent, detergent, or other suitable cleaning methods.
4. Brush-off blast clean to remove loose concrete and laitance, and provide a tooth for binding. Upon approval by ENGINEER, surface may be cleaned by acid etching method. Approval is subject to producing desired profile equivalent to No. 80 grit flint sandpaper. Acid etching of vertical or overhead surfaces shall not be allowed.
5. Secure coating manufacturer's recommendations for additional preparation, if required, for excessive bug holes exposed after blasting.
6. Unless otherwise required for proper adhesion, ensure surfaces are dry prior to painting.

F. Plastic and FRP Surface Preparation:

1. Hand sand plastic surfaces to be coated with medium grit sandpaper to provide tooth for coating system.
2. Large areas may be power sanded or brush-off blasted, provided sufficient controls are employed so surface is roughened without removing excess material.

G. Masonry Surface Preparation:

1. Complete and cure masonry construction for 14 days or more before starting surface preparation work.
2. Remove oil, grease, dirt, salts or other chemicals, loose materials, or other foreign matter by solvent, detergent washing, or other suitable cleaning methods.
3. Clean masonry surfaces of mortar and grout spillage and other surface deposits using one of the following:
   a. Nonmetallic fiber brushes and commercial muriatic acid followed by rinsing with clean water.
   b. Brush-off blasting.
   c. Water blasting.
4. Do not damage masonry mortar joints or adjacent surfaces.
5. Leave surfaces clean and, unless otherwise required for proper adhesion, dry prior to painting.

©COPYRIGHT 2013 CH2M HILL

6. Masonry Surfaces to be Painted: Uniform texture and free of surface imperfections that would impair intended finished appearance.
7. Masonry Surfaces to be Clear Coated: Free of discolorations and uniform in texture after cleaning.

H. Wood Surface Preparation:

1. Replace damaged wood surfaces or repair in a manner acceptable to ENGINEER prior to start of surface preparation.
2. Solvent clean (mineral spirits) knots and other resinous areas and coat with shellac or other knot sealer, prior to painting. Remove pitch by scraping and wipe clean with mineral spirits or turpentine prior to applying knot sealer.
3. Round sharp edges by light sanding prior to priming.
4. Filler:
   a. Synthetic-based wood putty approved by paint manufacturer for paint system.
   b. For natural finishes, color of wood putty shall match color of finished wood.
   c. Fill holes, cracks, and other surface irregularities flush with surrounding surface and sand smooth.
   d. Apply putty before or after prime coat, depending on compatibility and putty manufacturer's recommendations.
   e. Use cellulose type putty for stained wood surfaces.
5. Ensure surfaces are clean and dry prior to painting.

I. Gypsum Board Surface Preparation: Typically, new gypsum board surfaces need no special preparation before painting.

1. Surface Finish: Dry, free of dust, dirt, powdery residue, grease, oil, or any other contaminants.

J. Existing Painted Surfaces to be Repainted Surface Preparation:

1. Detergent wash and freshwater rinse.
2. Clean loose, abraded, or damaged coatings to substrate by hand or power tool, SP 2 or SP 3.
3. Feather surrounding intact coating.
4. Apply one spot coat of specified primer to bare areas, overlapping prepared existing coating.
5. Apply one full finish coat of specified primer to entire surface.
6. If an aged, plural-component material is to be topcoated, contact coating manufacturer for additional surface preparation requirements.

©COPYRIGHT 2013 CH2M HILL

7. For ductile iron pipe with asphaltic varnish finish not specified to be abrasive blasted, apply coat of tar stop prior to application of cosmetic finish coat.
8. Application of Cosmetic Coat:
    a. It is assumed that existing coatings have oxidized sufficiently to prevent lifting or peeling when overcoated with paints specified.
    b. Check compatibility by application to a small area prior to starting painting.
    c. If lifting or other problems occur, request disposition from ENGINEER.
9. Perform blasting as required to restore damaged surfaces. Materials, equipment, procedures shall meet requirements of SSPC.

3.05 SURFACE CLEANING

A. Brush-off Blast Cleaning:

B. Equipment, procedure, and degree of cleaning shall meet requirements of SSPC SP 7.

1. Abrasive: Either wet or dry blasting sand, grit, or nutshell.
2. Select various surface preparation parameters, such as size and hardness of abrasive, nozzle size, air pressure, and nozzle distance from surface such that surface is cleaned without pitting, chipping, or other damage.
3. Verify parameter selection by blast cleaning a trial area that will not be exposed to view.
4. ENGINEER will review acceptable trial blast cleaned area and use area as a representative sample of surface preparation.
5. Repair or replace surface damaged by blast cleaning.

C. Acid Etching:

1. After precleaning, spread the following solution by brush or plastic sprinkling can: One part commercial muriatic acid reduced by two parts water by volume. Adding acid to water in these proportions gives an approximate 10 percent solution of HCl.
2. Application:
    a. Rate: Approximately 2 gallons per 100 square feet.
    b. Work acid solution into surface by hard-bristled brushes or brooms until complete wetting and coverage is obtained.
    c. Acid will react vigorously for a few minutes, during which time brushing shall be continued.

©COPYRIGHT 2013 CH2M HILL

d. After bubbling subsides (10 minutes), hose down remaining slurry with high pressure clean water.
e. Rinse immediately to avoid formation on the surface of salts that are difficult to remove.
f. Thoroughly rinse to remove any residual acid surface condition that may impair adhesion.
g. Ensure surface is completely dry before application of coating.

3. Apply acid etching to obtain a "grit sandpaper" surface profile. If not, repeat treatment.

D. Solvent Cleaning:

1. Consists of removal of foreign matter such as oil, grease, soil, drawing and cutting compounds, and any other surface contaminants by using solvents, emulsions, cleaning compounds, steam cleaning, or similar materials and methods that involve a solvent or cleaning action.
2. Meet requirements of SSPC SP 1.

3.06 APPLICATION

A. General:

1. The intention of these Specifications is for [existing and] new, [interior] [and exterior] [wood,] [masonry,] [concrete,] [and] [metal,] [and submerged metal] surfaces to be painted, whether specifically mentioned or not, except as specified otherwise. [Do not paint exterior concrete surfaces, unless specifically indicated.]
2. Extent of Coating (Immersion): Coatings shall be applied to internal vessel and pipe surfaces, nozzle bores, flange gasket sealing surfaces, carbon steel internals, and stainless steel internals, unless otherwise specified.
3. For coatings subject to immersion, obtain full cure for completed system. Consult coatings manufacturer's written instructions for these requirements. Do not immerse coating until completion of curing cycle.
4. Apply coatings in accordance with these Specifications and paint manufacturers' printed recommendations and special details. The more stringent requirements shall apply. Allow sufficient time between coats to assure thorough drying of previously applied paint.
5. Sand wood lightly between coats to achieve required finish.
6. Vacuum clean surfaces free of loose particles. Use tack cloth just prior to applying next coat.
7. Fusion Bonded Coatings Method Application: Electrostatic, fluidized bed, or flocking.

©COPYRIGHT 2013 CH2M HILL

8. Coat units or surfaces to be bolted together or joined closely to structures or to one another prior to assembly or installation.
9. Water-Resistant Gypsum Board: Use only solvent type paints and coatings.
10. On pipelines, terminate coatings along pipe runs to 1 inch inside pipe penetrations.
11. Keep paint materials sealed when not in use.
12. Where more than one coat is applied within a given system, alternate colors to provide a visual reference showing required number of coats have been applied.

B. Galvanized Metal, Copper, and Nonferrous Metal Alloys:

1. Concealed galvanized, copper, and nonferrous metal alloy surfaces (behind building panels or walls) do not require painting, unless specifically indicated herein.
2. Prepare surface and apply primer in accordance with System No. 10 specification.
3. Apply intermediate and finish coats of the coating system appropriate for the exposure.

C. Porous Surfaces, Such As Concrete and Masonry:

1. Filler/Surfacer: Use coating manufacturer's recommended product to fill air holes, bug holes, and other surface voids or defects.
2. Prime Coat: May be thinned to provide maximum penetration and adhesion.
   a. Type and Amount of Thinning: Determined by paint manufacturer and dependent on surface density and type of coating.
3. Surface Specified to Receive Water Base Coating: Damp, but free of running water, just prior to application of coating.

D. Film Thickness and Coverage:

1. Number of Coats:
   a. Minimum required without regard to coating thickness.
   b. Additional coats may be required to obtain minimum required paint thickness, depending on method of application, differences in manufacturers' products, and atmospheric conditions.
2. Application Thickness:
   a. Do not exceed coating manufacturer's recommendations.
   b. Measure using a wet film thickness gauge to ensure proper coating thickness during application.
3. Film Thickness Measurements and Electrical Inspection of Coated Surfaces:

©COPYRIGHT 2013 CH2M HILL

a. Perform with properly calibrated instruments.
b. Recoat and repair as necessary for compliance with Specification.
c. Coats are subject to inspection by ENGINEER and coating manufacturer's representative.

4. Visually inspect concrete, masonry, nonferrous metal, plastic, and wood surfaces to ensure proper and complete coverage has been attained.
5. Give particular attention to edges, angles, flanges, and other similar areas, where insufficient film thicknesses are likely to be present, and ensure proper millage in these areas.
6. Apply additional coats as required to achieve complete hiding of underlying coats. Hiding shall be so complete that additional coats would not increase the hiding.

3.07 PROTECTIVE COATINGS SYSTEMS AND APPLICATION SCHEDULE

A. [Unless otherwise shown or specified, paint surfaces in accordance with the following application schedule. In the event of discrepancies or omissions in the following, request clarification from ENGINEER before starting work in question.]

B. [As shown in Section 09 06 00, Schedules for Finishes.] [As shown in Finish Schedule on Drawings.] [Additional requirements are included in the Piping Schedule.]

C. System No. 1 Submerged Metal—Potable Water:

Surface Prep.	**Paint Material**	**Min. Coats, Cover**
SP 5, White Metal Blast Cleaning	NSF Epoxy	3 coats, 3 MDFTPC

1. Use on the following items or areas:

a. Metal surfaces [new and] [existing] below a plane 1 foot above the maximum liquid surface; metal surfaces above the maximum liquid surface that are a part of the immersed equipment; surfaces of metallic items, such as wall pipes, pipes, pipe sleeves, access manholes, gate guides and thimbles, and structural steel that are embedded in concrete; and the following specific surfaces:
1) Interior surfaces of steel piping noted in the Piping Schedule.

3.09 COLORS

A. Provide as [shown in Section 09 06 00, Schedules for Finishes] [designated herein] [shown for equipment and appurtenances and designated herein] [and shown in Piping Schedule] [selected by] [Owner or] [ENGINEER].

B. Proprietary identification of colors is for identification only. Selected manufacturer may supply matches.

C. Equipment Colors:

1. Equipment includes the machinery or vessel itself plus the structural supports and fasteners and attached electrical conduits.
2. [Paint equipment and piping one color as selected.]
3. Paint nonsubmerged portions of equipment the same color as the piping it serves, except as itemized below:
   a. Dangerous Parts of Equipment and Machinery: OSHA Orange.
   b. Fire Protection Equipment and Apparatus: OSHA Red.
   c. Radiation Hazards: OSHA Purple.

©COPYRIGHT 2013 CH2M HILL

d. Physical hazards in normal operating area and energy lockout devices, including, but not limited to, electrical disconnects for equipment and equipment isolation valves in air and liquid lines under pressure: OSHA Yellow.

D. Pipe Identification Painting:

1. Color code nonsubmerged metal piping, except electrical conduit. Paint fittings and valves the same color as pipe, except equipment isolation valves.
2. Pipe Color Coding: [In accordance with Piping Schedule.] [As shown in table below.]
3. On exposed stainless steel piping, apply color 24 inches in length along pipe axis at connections to equipment, valves, or branch fittings, at wall boundaries, and at intervals along piping not greater than 9 feet on center.
4. Pipe Supports: Painted light gray, as approved by [Owner] [ENGINEER].
5. [Fiberglass reinforced plastic (FRP) pipe, polyvinylidene fluoride (PVDF), and polyvinyl chloride (PVC) pipe located inside of buildings and enclosed structures will not require painting, except as noted or scheduled.]

E. Pipe System Color Code:

Pipe System	**Color**

3.10 FIELD QUALITY CONTROL

A. Testing Equipment:

1. Provide magnetic type dry film thickness gauge to test coating thickness specified in mils, as manufactured by Nordson Corp., Anaheim, CA, Mikrotest.
2. Provide low-voltage wet sponge electrical holiday detector to test completed coating systems, 20 mils dry film thickness or less, except zinc primer, high-build elastomeric coatings, and galvanizing, for pinholes, holidays, and discontinuities, as manufactured by Tinker and Rasor, San Gabriel, CA, Model M-1.
3. Provide high-voltage spark tester to test completed coating systems in excess of 20 mils dry film thickness. Unit as recommended by coating manufacturer.

B. Testing:

1. Thickness and Continuity Testing:
   a. Measure coating thickness specified in mils with a magnetic type, dry film thickness gauge, in accordance with SSPC PA 2. Check each coat for correct millage. Do not make measurement before a minimum of 8 hours after application of coating.
   b. Holiday detect coatings 20 mils thick or less, except zinc primer and galvanizing, with low voltage wet sponge electrical holiday detector in accordance with NACE RP0188.
   c. Holiday detect coatings in excess of 20 mils dry with high voltage spark tester as recommended by coating manufacturer and in accordance with NACE RP0188.
   d. After repaired and recoated areas have dried sufficiently, retest each repaired area. Final tests may also be conducted by ENGINEER.

C. Inspection: Leave staging and lighting in place until ENGINEER has inspected surface or coating. Replace staging removed prior to approval by ENGINEER. Provide additional staging and lighting as requested by ENGINEER.

D. Unsatisfactory Application:

©COPYRIGHT 2013 CH2M HILL

1. If item has an improper finish color or insufficient film thickness, clean surface and topcoat with specified paint material to obtain specified color and coverage. Obtain specific surface preparation information from coating manufacturer.
2. Evidence of runs, bridges, shiners, laps, or other imperfections is cause for rejection.
3. Repair defects in accordance with written recommendations of coating manufacturer.

E. Damaged Coatings, Pinholes, and Holidays:

1. Feather edges and repair in accordance with recommendations of paint manufacturer.
2. Hand or power sand visible areas of chipped, peeled, or abraded paint, and feather the edges. Follow with primer and finish coat. Depending on extent of repair and appearance, a finish sanding and topcoat may be required.
3. Apply finish coats, including touchup and damage-repair coats in a manner that will present a uniform texture and color-matched appearance.

3.11 MANUFACTURER'S SERVICES

A. In accordance with Section 01 43 33, Manufacturers' Field Services, coating manufacturer's representative shall be present at Site as follows:

1. On first day of application of any coating system.
2. A minimum of [two] [_____] additional Site inspection visits, each for a minimum of 4 hours, in order to provide Manufacturer's Certificate of Proper Installation.
3. As required to resolve field problems attributable to or associated with manufacturer's product.
4. To verify full cure of coating prior to coated surfaces being placed into immersion service.

3.12 CLEANUP

A. Place cloths and waste that might constitute a fire hazard in closed metal containers or destroy at end of each day.

B. Upon completion of the Work, remove staging, scaffolding, and containers from Site or destroy in a legal manner.

C. Remove paint spots, oil, or stains upon adjacent surfaces and floors and leave entire job clean.

©COPYRIGHT 2013 CH2M HILL

3.13 SUPPLEMENTS

A. The supplements listed below, following "End of Section," are a part of this Specification:

1. Paint System Data Sheet (PSDS)
2. Product Data Sheet (PDS).
3. [_____]

END OF SECTION

©COPYRIGHT 2013 CH2M HILL

PAINT SYSTEM DATA SHEET

Complete this PSDS for each coating system, include all components of the system (surface preparation, primer, intermediate coats, and finish coats). Include all components of a given coating system on a single PSDS.

Paint System Number (from Spec.):		
Paint System Title (from Spec.):		
Coating Supplier:		
Representative:		
Surface Preparation:		
Paint Material (Generic)	**Product Name/Number (Proprietary)**	**Min. Coats, Coverage**

©COPYRIGHT 2013 CH2M HILL

PAINT PRODUCT DATA SHEET

Complete and attach manufacturer's Technical Data Sheet to this PDS for each product submitted. Provide manufacturer's recommendations for the following parameters at temperature (F)/relative humidity:

Temperature/RH	50/50	70/30	90/25
Induction Time			
Pot Life			
Shelf Life			
Drying Time			
Curing Time			
Min. Recoat Time			
Max. Recoat Time			

Provide manufacturer's recommendations for the following:

Mixing Ratio:

Maximum Permissible Thinning:_____

Ambient Temperature Limitations: min.: max.:_____

Surface Temperature Limitations: min.: max.:_____

Surface Profile Requirements: min.: max.:_____

[Attach additional sheets detailing manufacturer's recommended storage requirements and holiday testing procedures.]

©COPYRIGHT 2013 CH2M HILL

SECTION 09 90 05
ARCHITECTURAL PAINTING

PART 1 -GENERAL

1.01 DEFINITIONS

A. Terms used in this section:

1. Coverage: Total minimum dry film thickness in mils, or square feet per gallon.
2. FRP: Fiberglass Reinforced Plastic.
3. HCl: Hydrochloric Acid.
4. MDFT: Minimum Dry Film Thickness.
5. MDFTPC: Minimum Dry Film Thickness Per Coat.
6. mil: Thousandth of an inch.
7. Military Specification-Paint.
8. PSDS: Paint System Data Sheet.
9. SFPG: Square Feet Per Gallon.
10. SFPGPC: Square Feet Per Gallon Per Coat.
11. SP: Surface Preparation.
12. Existing: Those coated surfaces that are cut into, connected to, or otherwise changed or affected by the work of this contract.

B. Paint Terms: Conform to ASTM D16.

1.02 SUBMITTALS

A. Action Submittals:

1. Product Data: Manufacturer’s descriptive literature for coating materials and coating application accessories.
   a. For each paint system used, furnish a Paint System Data Sheet (PSDS) and technical data sheet for each product used in the paint system. PSDS form is appended to the end of this section.
   b. Submit required information on a system by system basis.
   c. Provide copies of paint system submittals to applicator.
2. Verification Samples: Two samples, minimum size 6 inches (152 mm) square, representing actual color and finish of each finish coating type, color, and finish to be applied.

©COPYRIGHT 2013 CH2M HILL

B. Informational Submittals:

1. List of references substantiating applicator's experience.
2. Manufacturer's printed application instructions for each product, including product storage requirements and surface preparation requirements.

1.03 QUALITY ASSURANCE

A. Applicator's Experience: Minimum 5 years' practical experience in application of specified products and approved by the paint manufacturer.

1.04 DELIVERY, STORAGE, AND HANDLING

A. Store products of this section in manufacturer's unopened packaging until installation.

B. Establish and maintain storage area conditions for products of this Section in accordance with manufacturer's instructions until installation.

C. Store and dispose of solvent-based materials, and materials used with solvent-based materials, in accordance with requirements of local authorities having jurisdiction over project.

1.05 PROJECT CONDITIONS

A. Do not apply coatings to exterior surfaces except under environmental conditions recommended by coating manufacturer.

B. Establish and maintain environmental conditions recommended by coating manufacturer before, during, and after application of coatings to interior surfaces.

C. During application of coating materials, post "WET PAINT" signs.

D. During application of solvent-based materials, post "NO SMOKING" signs.

1.06 SEQUENCING

A. Do not allow application of finish coats in an area until moisture-producing construction activities, dust-producing construction activities, and other construction activities which could impair performance or appearance of finish coatings, have been completed in that area.

©COPYRIGHT 2013 CH2MHILL

1.07 EXTRA MATERIALS

A. Supply for each finish coating material, color, and finish specified 2 gallons (7.75L) of paint material, in sealed 1-gallon (3.875L) containers, marked with color and finish identification.

B. Custom Colors: Provide details of color formulae and product availability.

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Manufacturers: Products of the following manufacturers, meeting these specifications, may be used on this Project:

1. Ameritone, Long Beach, CA.
2. Fuller/O'Brien Paint Company, San Francisco, CA.
3. Benjamin Moore Paint Company, San Francisco, CA.
4. Pratt & Lambert, Inc., Buffalo, NY.
5. Sherwin Williams, Cleveland, OH.
6. Duron, Inc., Beltsville, MD.

B. Unless otherwise specified for an individual product or material, supply products specified in this section from the same manufacturer.

2.02 MATERIALS

A. General:

1. Unless otherwise indicated, furnish factory-mixed paints. When required, mix coatings to correct consistency in accordance with manufacturer's instructions before application. Do not dilute or thin paints, except as instructed.
2. Do not add additives, except as instructed or recommended by paint manufacturer.
3. Furnish each coating material in quantity required for this section from a single production run.
4. Colors: [Indicated in Interior Finish Schedule and Color List.] [On Drawings.] [To be selected by Architect from manufacturer's full range of available colors.]

B. Paint Application Accessories: As specified in this section or as recommended by paint manufacturer's application instructions, including but not limited to

©COPYRIGHT 2013 CH2M HILL

thinners, sealers, primers, cleaning agents, etching agents, cleaning cloths, sanding materials, and clean-up materials.

C. Oil Stain: Sherwin-Williams; WoodScapes Semi-Transparent A15 Series.

D. Interior Wood Stain: Sherwin-Williams; Wood Classics Interior Wood Stain A48-200 Series.

E. Alkyd Wood Primer: Sherwin-Williams; A-100 Alkyd Semi-Gloss Y24 Series.

F. Alkyd Semigloss: Sherwin-Williams; ProMar 200 Alkyd Semi-Gloss B34W200 Series.

G. Acrylic Low Sheen: Sherwin-Williams; ProMar 200 EgShel B20W200.

H. Acrylic Latex, Semigloss: Sherwin-Williams; ProMar 200 Semi-Gloss B31W200.

I. Latex Primer Sealer: Sherwin-Williams; PrepRite High-Build B28W600.

J. Sanding Sealer: Sherwin-Williams; Wood Classics FastDry Sanding Sealer B26V43.

K. Varnish: Sherwin-Williams; Wood Classic FastDry Oil Base Varnish Satin A66-300 Series.

L. Rust-Inhibitive Primer: Sherwin-Williams; Kem Kromik Universal Metal Primer B50Z Series.

M. Block Filler: Sherwin-Williams; ProMar Interior/Exterior Block Filler B25.

N. Masonry Primer: Sherwin-Williams; Loxon Interior Acrylic Masonry Primer B28 Series.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Immediately prior to coating application, ensure that surfaces to receive coatings are dry.

B. Ensure that moisture-retaining substrates to receive coatings have moisture content within tolerances allowed by coating manufacturer, using moisture measurement techniques recommended by coating manufacturer.

©COPYRIGHT 2013 CH2MHILL

C. Immediately prior to coating application, examine surfaces to receive coatings for surface imperfections and for contaminants which could impair performance or appearance of coatings, including but not limited to, loose primer, rust, scale, oil, grease, mildew, algae, or fungus, stains or marks, cracks, indentations, or abrasions.

D. Correct the above conditions and other conditions that could impair performance or appearance of coatings in accordance with specified surface preparation procedures before proceeding with coating application.

3.02 PREPARATION

A. Do not start work until surfaces to be finished are in proper condition to produce finished surfaces of uniform, satisfactory appearance.

B. Stains and Marks: Remove completely, if possible, using materials and methods recommended by coating manufacturer; cover stains and marks which cannot be completely removed with isolating primer or sealer recommended by coating manufacturer to prevent bleed-through.

C. Mildew, Algae, and Fungus: Remove, using materials and methods recommended by coating manufacturer.

D. Remove dust and loose particulate matter from surfaces to receive coatings immediately prior to coating application.

E. Remove or protect hardware, electrical plates, mechanical grilles and louvers, lighting fixture trim, and other items not indicated to receive coatings that are adjacent to surfaces to receive coatings.

F. Existing Painted Surfaces: Remove loose and peeling paint. Degloss surface if recommended by manufacturer. Sand smooth. Clean entire surface prior to painting.

G. Aluminum Surfaces: Remove surface contamination by steam or high pressure water. Remove oxidation by phosphoric acid-water solution etching and solvent washing. Apply specified primer as soon as cleaned surfaces are dry.

H. Concrete and Concrete Masonry: Clean surfaces free of loose particles, sand, efflorescence, laitance, form oil, curing compounds, and other substances which could impair coating performance or appearance.

I. Concrete Floors: Remove contaminants which could impair coating performance or appearance, acid-etch, flush with clean water; verify alkaline-acid balance

©COPYRIGHT 2013 CH2M HILL

recommended by coating manufacturer; mechanically abrade surface, if required, to achieve medium-sandpaper texture.

J. Galvanized Surfaces: Remove surface contamination and oils by solvent cleaning (SSPC-SP1) and allow to dry. Apply Galvanized Metal Primer in accordance with manufacturer instructions.

K. Wood:

1. Seal knots, pitch streaks, and sap areas with sealer recommended by coating manufacturer; fill nail recesses and cracks with filler recommended by coating manufacturer; sand surfaces smooth.
2. Apply primer coat to back of wood trim and paneling.

L. Gypsum Board: Repair cracks, holes, indentations, and other surface defects using joint compound to produce surface flush with adjacent undamaged surface; sand to produce uniform flat surface when dry.

M. Gypsum Plaster: Cut out cracks, holes, indentations, and other surface defects to extent required for bonding adhesion; apply patching plaster or joint compound to produce surface flush with adjacent undamaged surface; sand to produce uniform flat surface when dry; allow to cure 30 days before coating application.

N. Wood and Metal Doors: Seal top and bottom edges with specified primer.

O. Uncoated Steel and Iron Surfaces: Remove grease, rust, scale, and dust from steel and iron surfaces in accordance with Solvent Cleaning SSPC-SP1. Where heavy coatings of scale or contaminants are evident, clean in accordance with Hand Tool Cleaning SSPC-SP2 or other approved SSPC-SP method as needed.

P. Shop Primed Steel Surfaces: Remove loose primer and dust. Sand and feather edges to smooth surface. Clean areas with solvent and spot prime bare metal surfaces with appropriate primer recommended by manufacturer.

3.03 APPLICATION

A. Apply paint where indicated in Interior Finish Schedule.

B. Apply each coat to uniform coating thickness following manufacturer’s instructions, not exceeding manufacturer’s specified maximum spread rate for indicated surface; thins, brush marks, roller marks, orange-peel, or other application imperfections are not permitted.

©COPYRIGHT 2013 CH2MHILL

C. For opaque finishes, tint each coat, including primer coat and intermediate coats, one-half shade lighter than succeeding coat, with final finish coat as base color.

D. Allow manufacturer's specified drying time, and ensure correct coating adhesion, for each coat before applying next coat.

E. Inspect each coat before applying next coat; touch-up surface imperfections with coating material, feathering, and sanding if required; touch-up areas to achieve flat, uniform surface without surface defects visible from 5 feet (1.5 m).

F. Do not apply succeeding coat until previous coat has been approved by Engineer; only Engineer-approved coats will be considered in determining number of coats applied.

G. Remove dust and other foreign materials from substrate immediately prior to applying each coat.

H. Where coating application abuts other materials or other coating color, terminate coating, making clean sharp termination line without coating overlap.

I. Where color changes occur between adjoining spaces, through framed openings that are of same color as adjoining surfaces, change color at outside stop corner nearest to face of closed door.

J. Re-prepare and recoat unsatisfactory finishes; refinish entire area to corners or other natural terminations.

3.04 ITEMS NOT TO BE PAINTED

A. Do not paint the following:

1. Items specified or provided with factory finish.
2. Items indicated to receive other finishes.
3. Items indicated to remain unfinished.
4. Brick, precast concrete, integrally colored plaster.
5. Concrete masonry in utility, mechanical, and electrical spaces.
6. Stainless steel, anodized aluminum, bronze, terne, or lead.
7. Equipment nameplates, fire rating labels, and operating parts of equipment.
8. Acoustical materials.
9. Concealed piping, ductwork, and conduit.

B. Materials and products having factory-applied primer are not considered factory finished.

SECTION 09 96 35
CHEMICAL-RESISTANT COATINGS

PART 1 - GENERAL

1.01 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
   a. List materials in proposed system.
   b. Manufacturer's product specification.
   c. Chemical resistance test results for exposure to service conditions.
   d. Application instructions.
   e. Configuration details of materials at terminations, construction joints, floor drains, and trenches.
2. Samples: 4-inch square complete system proposed for use showing thickness and finish.

B. Informational Submittals:

1. Letter from manufacturer stating applicator is qualified to do the Work and meets the quality assurance minimum experience requirements.
2. Sample of warranty, prior to starting the Work.
3. Installation instructions.
4. Field inspection and test reports.
5. Manufacturer's Certificate of Proper Installation.
6. Special guarantee.

1.02 QUALITY ASSURANCE

A. Manufacturer's Experience: Minimum 5 years manufacturing proposed products.

B. Applicator's Experience: Minimum 3 years applying proposed products.

1.03 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials in manufacturer's original, unopened containers.

B. Storage: Maintain #materials in clean and dry condition. Follow manufacturer's instructions.

©COPYRIGHT 2013 CH2M HILL

1.04 ENVIRONMENTAL REQUIREMENTS

A. Temperature: Apply coating only when substrate, ambient air, and coating material are 65 degrees F or above.

B. Substrate: Not wet or have standing water.

C. Ventilation: Provide during and after application to meet all applicable safety and health regulations.

1.05 EXTRA MATERIALS

A. Furnish minimum 2 gallons of unopened topcoating material for future use by OWNER.

1.06 SPECIAL GUARANTEE

A. Furnish manufacturer's extended guarantee or warranty, with OWNER named as beneficiary, in writing, as special guarantee. Special guarantee shall provide for correction, or at the option of the OWNER, removal and replacement of Work specified in this Specification section found defective during a period of [_____] years after the date of Substantial Completion. Duties and obligations for correction or removal and replacement of defective Work as specified in the General Conditions.

PART 2 -PRODUCTS

2.01 MANUFACTURERS

A. [_____]

2.02 SERVICE CONDITIONS

A. Location: [Outdoors, exposed to weather.] [Covered, ambient temperature conditions.]

B. Surface: [Concrete] [and] [masonry] floors, walls, and vault for chemical storage and handling.

C. Traffic: Foot, light hand truck, forklifts.

D. Chemicals Stored in Containment Areas:

1. Sulfuric acid, 20 percent and 93 percent solutions.

©COPYRIGHT 2013 CH2M HILL

2. Hydrochloric acid solutions to 37 percent.
3. Anionic and cationic polymers, various concentrations.
4. Acetone.
5. Methyl ethyl ketone.
6. Acidic compounds such as hydrofluoric, phosphoric, and sulfuric.
7. Sodium bisulfite, 38 percent solution.

2.03 COATING SYSTEMS

A. Chemical-Resistant Coatings: A mixture of liquid resin-based material, setting agent, and filler designed to be troweled into place to cure to a hard state.

B. Mat-Reinforced Vinyl Ester (System CRC-1): Primer, fiberglass mat, saturant, and two trowel-applied coats of vinyl ester resin with silica fillers. Finished system thickness 150 mils minimum.

C. Epoxy (System CRC-2): Primer and one trowel-applied coat of epoxy resin with silica fillers. Finished system thickness 100 mils minimum.

2.04 MIXING

A. Thoroughly mix until homogeneous following manufacturer's instructions.

B. Mix only components furnished by coating manufacturer.

PART 3 -EXECUTION

3.01 EXAMINATION

A. Surface Preparation:

1. Inspect and provide substrate surfaces prepared in accordance with these Specifications and the printed directions and recommendations of the system manufacturer whose product is to be applied.
2. Provide ENGINEER minimum 3 days' advance notice of start of surface preparation and system application Work.
3. Perform Work only in presence of ENGINEER, unless ENGINEER grants prior approval to perform Work in ENGINEER's absence.

B. Schedule inspection with ENGINEER in advance for cleaned surfaces and system application Work.

©COPYRIGHT 2013 CH2M HILL

3.02 PREPARATION

A. In accordance with [Section 09 90 00, Painting and Coating] [, and] the manufacturer's printed directions and recommendations.

B. Fill holes and cracks with manufacturer's recommended materials to produce even surface for application of systems.

C. Concrete Surfaces:

1. Do not begin until 30 days after concrete has been placed.
2. Remove grease, oil, dirt, salts or other chemicals, loose materials, or other foreign matter by solvent, detergent, or other suitable cleaning methods.
3. Brushoff blast clean to remove loose concrete and provide a tooth for binding. Upon approval by ENGINEER, surface may be acid etched with muriatic acid solution. Approval, subject to producing desired profile.
4. Secure coating manufacturer's recommendations for additional preparation if required for excessive bug holes exposed after blasting.
5. Unless otherwise required for proper adhesion, ensure surfaces are dry prior to painting.

D. Masonry Surfaces:

1. Complete and cure masonry construction for 14 days or more before starting surface preparation Work.
2. Remove oil, grease, dirt, salts or other chemicals, loose materials, or other foreign matter by solvent, detergent washing, or other suitable cleaning methods.
3. Clean masonry surfaces of mortar and grout spillage and other surface deposits using one of the following:
   a. Nonmetallic fiber brushes and commercial muriatic acid followed by rinsing with clean water.
   b. Brushoff blasting.
   c. Water blasting.
4. Do not damage masonry mortar joints or adjacent surfaces.
5. Leave surfaces clean and, unless otherwise required for proper adhesion, dry prior to painting.
6. Masonry Surfaces to be Coated: Uniform texture and free of surface imperfections which would impair the intended finished appearance.

3.03 APPLICATION

A. Install coating systems in accordance with manufacturer's printed instructions.

©COPYRIGHT 2013 CH2M HILL

B. Install coating systems on vertical and horizontal surfaces, including caps, within containment wall for storage tanks, pumps, and piping.

C. Extend surfacing completely under structures and equipment located within the containment area. Install at construction joints in substrate and floor drains, trenches, and other components within the containment area.

3.04 FIELD QUALITY CONTROL

A. Inspection:

1. Inspect finished system for complete, uniform coverage of specified area. Evidence of defects include improper thickness, hardness, and appearance.
2. ENGINEER may require electrical spark test or other tests to be performed by CONTRACTOR when evidence of incomplete coverage exists.

3.05 MANUFACTURER'S SERVICES

A. Provide manufacturer's representative at Site [in accordance with Section 01 43 33, Manufacturers' Field Services,] for installation assistance, inspection, and Manufacturer's Certificate of Proper Installation.

3.06 APPLICATION SCHEDULE

A. [As shown in Section 09 06 00, Schedules for Finishes.]

B. [Unless otherwise shown or specified, apply coatings in accordance with the following application schedule. In the event of discrepancies or omissions in the following, request clarification from ENGINEER before starting Work in question.]

C. Coating System CRC-1: Use in the following areas:

1. [_____]
2. [_____]

D. Coating System CRC-2: Use in the following areas:

1. [_____]
2. [_____]

SECTION 09 97 13
STEEL TANK COATINGS

PART 1 - GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. NACE International: RP0188, Discontinuity (Holiday) Testing of New Protective Coatings on Conductive Substrates.
2. NSF International (NSF): 61, Drinking Water System Components - Health Effects.
3. Society for Protective Coatings (SSPC):
   a. Surface Preparation Standards:
      1) SP 1, Solvent Cleaning.
      2) SP 2, Hand Tool Cleaning.
      3) SP 3, Power Tool Cleaning.
      4) SP 5, White Metal Blast Cleaning.
      5) SP 7, Brush-Off Blast Cleaning.
      6) SP 10, Near White Blast Cleaning.
      7) SP 11, Power Tool Cleaning to Bare Metal.
      8) SP 12, Surface Preparation and Cleaning of Metals by Waterjetting Prior to Recoating.
   b. Paint Application Guides:
      1) PA 1, Shop, Field, and Maintenance Painting of Steel.
      2) PA 2, Measurement of Dry Coating Thickness with Magnetic Gages.
      3) PA Guide 3, A Guide to Safety in Paint Application.
   c. [Technology Guide: Guide 6, Guide for Containing Debris Generated During Paint Removal Operations.]

1.02 DEFINITIONS

A. Terms used in this section:

1. Coverage: Total minimum dry film thickness in mils, or square feet per gallon.
2. MDFT: Minimum Dry Film Thickness, mils.
3. MDFTPC: Minimum Dry Film Thickness per Coat, mils.
4. Mil: Thousandth of an inch.
5. PPDS: Paint Product Data Sheet.

©COPYRIGHT 2013 CH2M HILL

6. PSDS: Paint System Data Sheet.
7. SP: Surface preparation.
8. VOC: Volatile Organic Compounds.

1.03 SUBMITTALS

A. Action Submittals:

1. Data Sheets:
   a. For each paint system used, furnish a Paint System Data Sheet (PSDS), Paint Product Data Sheet (PPDS), and paint colors available (where applicable) for each product used in paint system. The PSDS and PPDS forms are appended to the end of this section.
   b. Submit required information on a system-by-system basis.
   c. Provide copies of paint system submittals to coating applicator.
   d. Also provide copies of paint system submittals to the coating applicator.
   e. Indiscriminate submittal of manufacturer's literature only is not acceptable.
2. Detailed chemical and gradation analysis for each proposed abrasive material.
3. Samples:
   a. For each paint system used, furnish colors available (where applicable) for each product used in paint system.
   b. [Proposed Abrasive Materials: Minimum 1/2-pound Sample for each type proposed.]

B. Informational Submittals:

1. Coating manufacturer's Certificate of Compliance, in accordance with Section 01 43 33, Manufacturers' Field Services.
2. Current NSF certification for potable water contact, where applicable.
3. Anticipated tank coating sequence.
4. [Dehumidification plan, including equipment and air change rates. Submit plan based on type of equipment used, length of time required to hold blast, reservoir volume, and time of year that coating work is undertaken.]
5. [Applicator's Qualification: List of references substantiating experience.]
6. [Independent structural ENGINEER review of proposed tank containment system.]
7. Shop and field applicator's quality control program, including, but not limited to:
   a. Environmental test methods and frequency.

©COPYRIGHT 2013 CH2M HILL

b. Steel surface temperature and profile measurement procedure and frequency.
c. Record keeping form.
d. [Submit Quality Control Plan in accordance with Section 01 45 16.13, Contractor Quality Control.]

8. Manufacturer's written instructions for applying each type of coating.
9. [When self-contained blast cleaning equipment using recycled abrasives is proposed. Submit the following:
   a. List of at least three successful projects within past 3 years where equipment and procedures have been used on steel tank of similar size and dimensions.
   b. Provide tank owner's name and telephone numbers.
   c. Description of proposed equipment, procedures, and abrasive blast mix to be used.]
10. Field Testing: Inspection and test reports.
11. Manufacturer's Certificate of Proper Installation, in accordance with Section 01 43 33, Manufacturers' Field Services.

1.04 QUALITY ASSURANCE

A. Applicator Qualifications:

1. [Minimum 5 years' experience in application of specified products.] [_____]
2. [Certified by coating manufacturer for application of 100 percent solids epoxy.]

B. Regulatory Requirements: Meet federal, state, and local agencies having jurisdiction for Site and types of work activities included in Project, including, but not limited to:

1. Limitations on emission of volatile organic compounds, dust, and other contaminants.
2. Requirements for disturbance, handling, and disposal of paint waste and associated debris, including lead, coal tar, abrasive, and other regulated substances.

C. Industry Best Practices:

1. Perform surface preparation and painting in accordance with recommendations of the following:
   a. Paint manufacturer's instructions.

©COPYRIGHT 2013 CH2M HILL

b. SSPC–PA Guide 3.

2. Do not apply paint in temperatures outside of manufacturer's recommended maximum or minimum allowable, in dust, in smoke-laden atmosphere, in damp or humid weather.
3. Do not perform abrasive blast cleaning whenever relative humidity exceeds 85 percent or whenever surface temperature is less than 5 degrees F above dewpoint of ambient air.

D. Mockup:

1. Before proceeding with Work under this section, finish one complete space or item of each color scheme required showing selected colors, finish texture, materials, quality of work, and special details.
2. After approval, sample spaces or items shall serve as a standard for similar work throughout the Project.

E. [Preinstallation Meeting:

1. Prior to beginning painting Work, schedule a meeting and be prepared to discuss the following subjects, as a minimum:
   a. Required schedule.
   b. Sequence of critical path work items.
   c. Use of Site, access, office and storage areas, security, and temporary facilities.
   d. Major product delivery and priorities.
   e. Safety plan.
2. Attendees shall include:
   a. OWNER's representatives.
   b. CONTRACTOR's office representative.
   c. CONTRACTOR's resident superintendent.
   d. CONTRACTOR's quality control representative.
   e. Subcontractors' representatives whom CONTRACTOR may desire or ENGINEER may request to attend.
   f. ENGINEER's representative.
   g. Paint manufacturer's technical representative.
   h. Others as appropriate.]

1.05 DELIVERY, STORAGE, AND HANDLING

A. Shipping:

©COPYRIGHT 2013 CH2M HILL

1. Protect precoated items from damage. Batten coated items to prevent abrasion.
2. Use nonmetallic or padded slings and straps in handling.

B. Deliver materials to Site in unopened containers labeled with designated name, date of manufacture, color, and manufacturer.

C. Store paints in a protected area that is heated or cooled as required to maintain temperatures within range recommended by paint manufacturer.

1.06 SPECIAL GUARANTEE

A. Furnish manufacturer's extended guarantee or warranty, with OWNER named as beneficiary, in writing, as special guarantee. Special guarantee shall provide for correction, or at the option of OWNER, removal and replacement of Work specified in this Specification section found defective during a period of [2] [_____] years after date of Substantial Completion. Duties and obligations for correction or removal and replacement of defective Work as specified in General Conditions.

1. [24] [_____]-Month Warranty Period Inspection: OWNER will conduct inspection of interior and exterior coated surfaces prior to the end of warranty period. OWNER will notify CONTRACTOR in advance of inspection and CONTRACTOR may attend at its option. OWNER will prepare list of coating defects and failures identified during inspection and transmit to CONTRACTOR. List shall serve as notice of repairs required under warranty.
2. Repairs:
   a. If repairs are required, requirements of Contract shall apply including, but not limited to, requirements to remove standing water in tanks, perform repair work, and tank cleaning prior to disinfection.
   b. Repair defective coatings using coating materials, equipment, and methods similar to those used in original work. Materials shall be of fresh manufacture and within manufacturer's stated shelf life at time of application.
   c. Provide extended warranty of 1 year for repairs.
   d. [Provide separate bond for 1-year repair warranty period.]
   e. Complete repairs within 30 calendar days of Warranty Period Inspection.

©COPYRIGHT 2013 CH2M HILL

1.07 EXISTING COATING STATUS

A. The following information is provided for CONTRACTOR's information. Information shall not relieve CONTRACTOR from responsibility to inspect reservoir and assess existing coatings and structural dimensions.

1. [_____]
2. [_____]
3. [_____]

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Materials, equipment, and accessories specified in this section shall be products of:

1. Carboline Coatings Company, St. Louis, MO.
2. ICI Devoe, Louisville, KY.
3. International Protective Coatings, Houston, TX.
4. Sherwin-Williams, Cleveland, OH.
5. Tnemec Coatings, Kansas City, MO.
6. PPG Coatings, Pittsburgh, PA.

2.02 MATERIALS

A. Quality: Manufacturer's highest quality products and suitable for intended use.

B. Materials Including Primer and Finish Coats: Produced by same paint manufacturer.

C. Thinners, Cleaners, Driers, and Other Additives: As recommended by paint manufacturer of the particular coating.

D. [NSF Epoxy, Low VOC: 100 percent solids, two-component epoxy for water tank lining, approved for potable water contact and conforming to NSF 61.]

E. [NSF Epoxy: Polyamidoamine or phenalkamine cured epoxy coatings approved for potable water contact and conforming to NSF 61.]

F. Epoxy Primer: Two-component, polyamidoamine, phenalkamine, or polyamide cured epoxy, capable of 4-mil to 6-mil dry film thickness, and compatible with specified finish.

©COPYRIGHT 2013 CH2M HILL

G. Polyurethane Enamel: Two-component, aliphatic or acrylic based polyurethane; [semi-gloss] [high-gloss] finish.

H. Flexible Polyurethane: Modified polyurethane flexible lining membrane, approved for potable water contact conforming to NSF 61 and compatible with the NSF epoxy.

I. Caulking: Two-component polyurethane caulk, suitable for potable water contact conforming to NSF 61 and compatible with the NSF Epoxy.

2.03 COLORS

A. Formulate with colorants free of lead and lead compounds [or other materials which might be affected by presence of hydrogen sulfide or other gas likely to be present on the Project].

B. Furnish as [designated herein] [selected by [OWNER or] ENGINEER].

C. Proprietary identification of colors is for identification only. Selected manufacturer may supply matches.

2.04 MIXING

A. Multiple-Component Coatings:

1. Prepare using contents of container for each component as packaged by paint manufacturer.
2. No partial batches will be permitted.
3. Do not use multiple-component coatings that have been mixed beyond their pot life.
4. Furnish small quantity kits for touchup painting and for painting other small areas.
5. Mix only components specified and furnished by paint manufacturer.
6. Do not intermix additional components for reasons of color or otherwise, even within the same generic type of coating.

B. Keep paint material containers sealed when not in use.

2.05 ABRASIVES

A. Select abrasive type and size to produce a surface profile that meets coating manufacturer’s recommendations for specific primer and coating system to be applied.

©COPYRIGHT 2013 CH2M HILL

B. Select abrasives that conform to federal and state regulations for metals and toxicity.

2.06 SOURCE QUALITY CONTROL

A. Prime coat structural steel surfaces.

B. Notify ENGINEER at least 7 days prior to start of shop blast cleaning to allow for inspection of the Work during surface preparation and shop application of paints. Work shall be subject to ENGINEER's approval before shipment to Site.

PART 3 - EXECUTION

3.01 GENERAL

A. Surface Preparation and Coating Application: Meet or exceed requirements of these Specifications and SSPC–PA 1, whichever is more stringent.

B. Inspect and provide substrate surfaces prepared in accordance with these Specifications and printed directions and recommendations of paint manufacturer whose product is to be applied.

C. Paint [new] [and] [existing] interior and exterior exposed metal surfaces whether specifically mentioned or not, except as modified herein.

D. Provide ENGINEER a minimum of 7 days' advanced notice prior to start of surface preparation work or coating application work. Perform such work only in the presence of ENGINEER, unless ENGINEER grants prior approval to perform such work in ENGINEER's absence.

E. Schedule inspection with ENGINEER in advance for cleaned surfaces and coats prior to succeeding coat.

F. Do not apply paint in temperatures outside of manufacturer's recommended maximum or minimum allowable, or in dust, smoke-laden atmosphere, damp or humid weather.

G. Do not perform abrasive blast cleaning whenever relative humidity exceeds 85 percent, or whenever surface temperature is less than 5 degrees F above dewpoint of ambient air.

H. Ventilation for Coating Cure: Provide fans to continuously ventilate tank interior, as required, to assist with coating cure.

©COPYRIGHT 2013 CH2M HILL

I. [Remove existing cathodic protection system anodes, reference electrodes, and wiring prior to starting surface preparation activities. After coating work has been completed, reinstall and test cathodic protection system as specified in Section 26 42 00, Cathodic Protection.]

3.02 PREPARATION

A. Items such as structural steel, metal floor doors, manways, and frames, metal louvers, and similar fabricated items may be shop prepared and primed. Centrifugal wheel blast cleaning is an acceptable alternative to shop blast cleaning.

B. Remove, mask, or otherwise protect hardware, machined surfaces, nameplates, and other surfaces not intended to be painted.

C. Protect surfaces adjacent to or downwind of Work area from overspray.

D. [Protect interior of inlet/outlet and overflow pipes from abrasive blast residue and dust with inflatable pipe plug, as approved by ENGINEER. Install temporary, appropriately sized polyethylene pig in pipe before installation of plug.]

3.03 ENVIRONMENTAL CONTROLS

A. Containment System:

1. Provide full containment of blast emissions during entire blast operation for tank exterior. Meet requirements of SSPC–Guide 6 as modified below.
    a. Design: Reviewed by structural ENGINEER, licensed in the State of [_____]. Consider load bearing capacity of roof for supporting containment system.
    b. Provide Class 1 containment structure. Completely shroud tank with opaque fabric that prevents spread of blast media, spent chips, corrosion byproducts, and dust.
    c. Exhaust air shall be filtered by appropriately sized dust collectors.
    d. Verify effectiveness using [Method A, General Surveillance, Level 2, as described in SSPC–Guide 6] [_____].
2. [As an option to containment, consideration will be given to use of self-contained blast cleaning equipment using recycled abrasives.
    a. Exterior coatings shall be roller-applied to surfaces prepared using contained blast cleaning equipment.]

B. Dehumidification Equipment:

©COPYRIGHT 2013 CH2M HILL

1. Provide [full-time] [_____] dehumidification for field painting interior of reservoir. Dehumidification and heating equipment shall be provided by a supplier with at least 3 years' experience with necessary equipment.
2. Use dehumidification and heating equipment to control environment [24] [_____] hours a day during blast cleaning and coating application. At CONTRACTOR's option, dehumidification equipment may also be used during curing process.
3. Provide desiccant dehumidifiers as manufactured by Cargocaire Corporation, or equal. Desiccant dehumidifiers shall have a single rotary desiccant wheel capable of fully continuous operation. No liquid, granular, or loose lithium chloride drying systems will be allowed.
4. Interior space of reservoir shall be sealed and a slight positive pressure maintained as recommended by supplier of dehumidification equipment.
5. During blasting operation, dehumidification equipment shall continuously maintain a dewpoint of air inside tank at least 5 degrees F less than temperature of coldest part of tank where the Work is underway. Inside relative humidity shall not exceed 45 percent, unless specifically required by paint manufacturer for coating application and cure.
6. Auxiliary heat may be necessary to maintain surface temperature at an acceptable level for application of coating. Auxiliary equipment shall be approved for use by dehumidification equipment supplier and shall meet the following requirements:
    a. Install heaters in process air supply duct between, and blended with, dehumidifier as close to space as possible.
    b. Use electric, indirect fired combustion, or steam coil auxiliary heaters. Direct fired space heaters will not be allowed during blasting, coating, or curing cycles.
    c. Equip heaters with controls that automatically turn heater off if airflow is interrupted or internal temperature of heater exceeds its design temperature or design temperature of supply duct.
7. Measure and record ambient temperature, relative humidity, dewpoint and reservoir wall temperature a minimum of twice daily (beginning and end of work shifts) to verify proper environmental levels are achieved inside reservoir. Field-measured test results shall be made available to ENGINEER upon request.

C. Filtration System:

1. Designed to remove dust from air so that it does not interfere with dehumidification equipment's ability to control dewpoint and relative humidity inside reservoir.

©COPYRIGHT 2013 CH2M HILL

2. Air from reservoir or dust filtration equipment shall not be recirculated through dehumidifier during coating application or when solvent vapors are present.

3.04 PREPARATION OF SURFACES

A. Metal Surfaces:

1. Meet requirements of the following SSPC Specifications:
   a. Solvent Cleaning: SP 1.
   b. Hand Tool Cleaning: SP 2.
   c. Power Tool Cleaning: SP 3.
   d. White Metal Blast Cleaning: SP 5.
   e. Brush-Off Blast Cleaning: SP 7.
   f. Near-White Blast Cleaning: SP 10.
   g. Power Tool Cleaning to Bare Metal: SP 11.
   h. High Pressure Water Jetting: SP 12.
2. Wherever the words “solvent cleaning”, “hand tool cleaning”, “wire brushing”, or “blast cleaning”, or similar words of equal intent are used in these Specifications or in paint manufacturer’s specifications, they shall be understood to refer to the applicable SSPC Specifications listed above.
3. Where OSHA or EPA regulations preclude standard abrasive blast cleaning, wet or vacu-blast methods may be required. Coating manufacturers’ recommendations for wet blast additives and first coat application shall apply.
4. Preblast Cleaning Requirements:
   a. Remove oil, grease, welding fluxes, and other surface contaminants prior to blast cleaning.
   b. Cleaning Methods: Steam, open flame, hot water, or cold water with appropriate detergent additives followed with clean water rinsing.
   c. Clean small isolated areas as above or solvent clean with suitable solvents and clean cloths.
   d. Round or chamfer sharp edges and grind smooth burrs, jagged edges, and surface defects.
   e. Welds and Adjacent Areas:
      1) Prepare such that there is:
         a) No undercutting or reverse ridges on weld bead.
         b) No weld spatter on or adjacent to weld or other area to be painted.
         c) No sharp peaks or ridges along weld bead.
      2) Grind embedded pieces of electrode or wire flush with adjacent surface of weld bead.

©COPYRIGHT 2013 CH2M HILL

5. Blast Cleaning Requirements:
    a. Type of Equipment and Speed of Travel: Design to obtain specified degree of cleanliness. Minimum surface preparation is as specified herein and takes precedence over coating manufacturer's recommendations.
    b. Select type and size of abrasive to produce a surface profile that meets coating manufacturer's recommendations for particular primer to be used.
    c. Use only dry blast cleaning methods.
    d. Do not reuse abrasive, except for designed recyclable systems.
    e. Meet applicable federal, state, and local air pollution and environmental control regulations for blast cleaning and disposition of spent aggregate and debris.
6. Post-blast Cleaning and Other Cleaning Requirements:
    a. Clean surfaces of dust and residual particles from cleaning operations by dry (no oil or water vapor) air blast cleaning or other method prior to painting. Vacuum clean enclosed areas and other areas where dust settling is a problem and wipe with a tack cloth.
    b. Paint surfaces the same day they are blast cleaned. Reblast surfaces that have started to rust before they are coated.

3.05 APPLICATION

A. General:

1. The intention of these Specifications is for [existing and] new, [interior] [and] [exterior] metal and submerged metal surfaces to be painted, whether specifically mentioned or not, except as modified herein.
2. Coatings Subject to Immersion:
    a. Apply coatings to internal vessel, pipe surfaces, nozzle bores, flange gasket sealing surfaces, carbon steel internals, and stainless steel internals unless otherwise specified.
    b. Curing:
        1) Obtain full cure for completed system.
        2) Consult coatings manufacturer's written instructions.
        3) Do not immerse coating until completion of curing cycle.
3. Apply coatings in accordance with paint manufacturer's recommendations. Allow sufficient time between coats to ensure thorough drying of previously applied coat.
4. Prior to assembly or installation, paint units to be bolted together and to structures.

©COPYRIGHT 2013 CH2M HILL

5. Where more than one coat of a material is applied within a given system, alternate color to provide a visual reference that required number of coats have been applied.
6. With brush, work coating into and behind anchor bolts, anchor chairs, and other areas that are difficult to paint by spray.

B. Shop Primed Surfaces:

1. Hand or power sand areas of chipped, peeled, or abraded coating, feathering the edges. Follow with a spot primer using specified primer.
2. For two-package or converted coatings, consult coatings manufacturer for specific procedures as relates to manufacturer's products.
3. Prior to application of finish coats, clean shop primed surfaces free of dirt, oil, and grease and apply one coat of specified primer.
4. After welding, prepare and prime holdback areas as required for specified paint system. Apply primer in accordance with manufacturer's instructions.

C. Stripe Coating:

1. Consists of one coat, brush applied, to coating thickness specified.
2. Apply between intermediate and final coats.
3. Color shall contrast intermediate coat to allow visual verification of application.
4. Apply to field welds, edges, angles, fasteners, and other irregular surfaces located inside tanks.

D. Film Thickness and Coverage:

1. Number of Coats:
   a. Minimum required without regard to coating thickness.
   b. Additional coats may be required to obtain minimum required paint thickness, depending on method of application, differences in manufacturers' products, and atmospheric conditions.
2. Maximum film build per coat shall not exceed coating manufacturer's recommendations.

3.06 PROTECTIVE COATINGS SYSTEMS AND APPLICATION SCHEDULE

A. System No. 1A Submerged Metal—Potable Water:

©COPYRIGHT 2013 CH2M HILL

Surface Prep.	Paint Material	Min. Coats, Cover
Shop: Solvent clean and abrasive blast or centrifugal wheel blast (SP-5) Field: [Detergent wash and fresh water rinse.] Brush-off blast shop primer, abrasive blast areas of damaged primer, and field weld holdback areas to white metal (SP-5)	NSF Epoxy (Shop Applied, White)	1 coat, 4 MDFT
	NSF Epoxy (white), Spot Repairs and Welds	1 coat, 4 MDFT
	NSF Epoxy Intermediate Coat (grey or beige)	1 coat, 4 MDFT
	Stripe Coat with NSF Epoxy	1 coat, 3 MDFT
	NSF Epoxy Finish Coat (white)	1 coat, 4 MDFT

1. Minimum Dry Film Thickness, Total System:
   a. Nonstripe Coated Areas: 12 MDFT.
   b. Stripe Coated Areas: 15 MDFT.
2. Application Schedule:
   a. Use on submerged metal surfaces inside tank, including, but not limited to, steel plates and structural steel, exposed surfaces of inlet, outlet, and overflow piping, hatches, covers, ladders, landings, and couplings.
   b. Coat exposed stainless steel surfaces inside tank. Coat interior surfaces of stainless steel pipe for a distance of 24 inches where stainless steel pipe is connected to coated carbon steel pipe.
   c. Use on exterior surfaces of direct buried and concrete encased steel pipe.
   d. Coating is not required for bottom side of floor plates.
   e. Provide full coating thickness to structural steel surfaces that will be covered by roof plates or otherwise shielded from full coating thickness, before structural members are installed. Not required for surfaces located behind members that are fully seal welded.

B. System No. 1B Special Coating under Column Baseplate:

©COPYRIGHT 2013 CH2M HILL

Surface Prep.	Paint Material	Min. Coats, Cover
Shop: Solvent clean and abrasive blast or centrifugal wheel blast (SP-5) Field: [Detergent wash and fresh water rinse.] Brush-off blast shop primer, and as required by paint manufacturer	NSF Epoxy (Shop Applied)	1 coat, 4 MDFT
	NSF Epoxy	Field applied, as required by paint manufacturer
	Flexible Polyurethane	1 coat, 50 MDFT

1. Minimum Dry Film Thickness, Total System: 54 mils.
2. Application Schedule:
   a. Use on bottom of column baseplate and top of steel floor surface under baseplate.
   b. Prepare surfaces and apply coating prior to installation of columns.
   c. Extend flexible polyurethane coating on floor 2 inches beyond outside perimeter of column baseplate.

C. System No. 1C Submerged Metal-Potable Water (Low VOC):

Surface Prep.	Paint Material	Min. Coats, Cover
Shop: Solvent clean and abrasive blast or centrifugal wheel blast (SP-5)	NSF Epoxy (Shop Primer)	1 coat, 4 mils MDFT
Field: [Detergent wash and fresh water rinse.] Brush-off blast shop primer, abrasive blast areas of damaged primer and field weld holdback areas to white metal (SP-5)	NSF Epoxy (Low VOC, Field Applied)	1 coat, multiple pass, [_____] MDFT

1. Minimum Dry Film Thickness, Total System: [_____] mils.
2. Application Schedule:

©COPYRIGHT 2013 CH2M HILL

a. Use on submerged metal surfaces inside tank, including, but not limited to, steel plates and structural steel, exposed surfaces of inlet, outlet, and overflow piping, hatches, covers, ladders, landings, and couplings.
b. Coat exposed stainless steel surfaces inside tank.
c. Coat interior surfaces of stainless steel pipe for a distance of 24 inches where stainless steel pipe is connected to coated carbon steel pipe.
d. Use on exterior surfaces of direct buried and concrete encased steel pipe.
e. Coating is not required for bottom side of floor plates.
f. Provide full coating thickness to structural steel surfaces that will be covered by roof plates or otherwise shielded from full coating thickness, before structural members are installed. Not required for surfaces that will be behind members that are fully seal welded.

D. System No. 1D Special Coating under Column Baseplate (Low VOC):

Surface Prep.	**Paint Material**	**Min. Coats, Cover**
Shop: Solvent clean and abrasive blast or centrifugal wheel blast (SP-5)	NSF Epoxy (Shop Applied)	1 coat, 4 MDFT
	NSF Epoxy Tie Coat	Field applied, as required by paint manufacturer
Field: [Detergent wash and fresh water rinse.] Brush-off blast shop primer, and as required by paint manufacturer	NSF Epoxy, Low VOC	1 or 2 coats, 30 MDFT

1. Minimum Dry Film Thickness, Total System: 34 mils.
2. Application Schedule:
   a. Use on bottom of column baseplate and top of steel floor surface under baseplate.
   b. Prepare surfaces and apply coating prior to installation of column.
   c. Extend coating on floor 2 inches beyond outside perimeter of column baseplate.

©COPYRIGHT 2013 CH2M HILL

E. System No. 5 Exposed Metal:

Surface Prep.	Paint Material	Min. Coats, Cover
Shop : Abrasive blast, or centrifugal wheel blast (SP 10) Field: [Detergent wash and fresh water rinse.] Brush-off blast shop primer, abrasive blast areas of damaged primer and field weld holdback areas to white metal (SP-10)	Polyamide, Anticorrosive Epoxy Primer	1 coat, 2.5 MDFT
	Polyamide, Anticorrosive Epoxy Primer	1 coat, 3 MDFT
	Polyurethane Enamel	1 coat, 3 MDFT

1. Minimum Dry Film Thickness, Total System: 8.5 mils.
2. Application Schedule:
   a. Use on the following:
      1) Exposed exterior metal surfaces of tank.
      2) For galvanized surfaces to be coated, reference System No. 10.
      3) [Exposed metal surfaces inside elevated tank supporting structures, including bottom of tank.]

F. System No. 10 Galvanized Metal Conditioning:

Surface Prep.	Paint Material	Min. Coats, Cover
Solvent Clean (SP 1) followed by Hand Tool (SP 2), Power Tool (SP 3), or Brush-off Blast (SP 7)	Coating manufacturers' recommended primer followed by System No. 5	

1. Application Schedule: Use on galvanized surfaces, including handrails and gratings, before application of System No. 5.

3.07 FIELD QUALITY CONTROL

A. Test Equipment:

©COPYRIGHT 2013 CH2M HILL

1. Provide a dry film thickness gauge to test coating thickness as specified in mils. Use [magnetic type dry as manufactured by Nordson Corp., Anaheim, CA, Mikrotest] [electronic dry film thickness, as manufactured by DeFelsko, Ogdensburg, NY, Positest] or approved equal.
2. Provide electrical holiday detector, low voltage, wet sponge type to test finish coat, except zinc primer, high-build elastomeric coatings, and galvanizing as manufactured by Tinker and Rasor, San Gabriel, CA; Model M-1.

B. Film Thickness Measurements and Electrical Inspection of Coated Surfaces:

1. Perform with properly calibrated instruments.
2. Repair or recoat defective areas as necessary for compliance with Specifications.
3. All coats are subject to inspection by ENGINEER and coating manufacturer's representative.
4. Give particular attention to edges, angles, flanges, and other similar areas, where insufficient film thicknesses are likely to be present, and ensure proper millage in these areas.

C. Thickness Testing:

1. Measure coating thickness specified in mils with magnetic or electronic type dry film thickness gauge in accordance with SSPC–PA 2.
2. Check each coat for correct thickness. Do not make measurement before a minimum of 8 hours after application of coating.
3. After repaired and recoated areas have dried sufficiently, tests will be conducted by ENGINEER.

D. Holiday (Pinhole) Testing: Test finish coat on 100 percent submerged surfaces for holidays and discontinuities with electrical holiday detector in accordance with NACE RP0188.

E. Unsatisfactory Application:

1. If improper finish color or insufficient film thickness, clean surface and topcoat with specified paint material to obtain specified color and coverage. Obtain specific surface preparation information from coating manufacturer.
2. Evidence of runs, bridges, shiners, laps, or other imperfections are causes for rejection.
3. Repair defects in coating systems in accordance with written recommendations of coating manufacturer.

©COPYRIGHT 2013 CH2M HILL

4. Leave staging up until ENGINEER has inspected surface or coating. Replace staging removed prior to approval by ENGINEER.

F. Damaged Coatings, Pinholes, and Holidays:

1. Feather edges and repair in accordance with recommendations of paint manufacturer.
2. Hand or power sand visible areas of chipped, peeled, or abraded paint, and feather edges. Follow with primer and finish coat in accordance with Specifications. Depending on extent of repair and appearance, a finish sanding and topcoat may be required.
3. Apply finish coats, including touchup and damage-repair coats in a manner that will present a uniform texture and color-matched appearance.

3.08 MANUFACTURER'S SERVICES

A. Coating manufacturer's technical representative shall be present at Site as follows:

1. On the first day of application of coating.
2. A minimum of three additional Site inspection visits, each for a minimum of 3 hours.
3. As required for application quality assurance, and to determine compliance with manufacturer's instructions and these Specifications.
4. As necessary to resolve field problems attributable to or associated with manufacturer's products furnished under this Contract.
5. To verify full cure of coating prior to placing coated surfaces into immersion service.

3.09 CLEANUP

A. Place cloths and waste that might constitute a fire hazard in closed metal containers or destroy at end of each day.

B. Upon completion of the Work, remove staging, scaffolding, and containers from Site or destroy in a legal manner.

C. Completely remove paint spots, oil, or stains upon adjacent surfaces and floors and leave Site clean.

3.10 SUPPLEMENTS

A. The supplements listed below, following "End of Section," are a part of this Specification:

©COPYRIGHT 2013 CH2M HILL

1. Data Sheet: Example Paint System Data Sheet (PSDS)
2. Data Sheet: Example Paint Product Data Sheet (PPDS)

END OF SECTION

©COPYRIGHT 2013 CH2M HILL

PAINT SYSTEM DATA SHEET

Complete and attach manufacturer's Technical Data Sheet to this PSDS for each coating system.

Paint System Number (from Spec.):		
Paint System Title (from Spec.):		
Coating Supplier:		
Representative:		
Surface Preparation:		
Paint Material (Generic)	**Product Name/Number (Proprietary)**	**Min. Coats, Coverage**

Provide manufacturer's recommendations for the following parameters at temperature (F)/relative humidity:

Temperature/RH	50/50	70/30	90/25
Induction Time			
Pot Life			
Shelf Life			
Drying Time			
Curing Time			
Min. Recoat Time			
Max. Recoat Time			

©COPYRIGHT 2013 CH2M HILL

Provide manufacturer's recommendations for the following:

Mixing Ratio: _____

Maximum Permissable Thinning:_____

Ambient Temperature Limitations: min.: _____ max.: _____

Surface Temperature Limitations: min.: _____ max.: _____

Surface Profile Requirements: min.: _____ max.: _____

[Attach additional sheets detailing manufacturer's recommended storage requirements and holiday testing procedures.]

SECTION 09 97 26
CEMENTITIOUS COATINGS

PART 1 - GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. ASTM International (ASTM):
   a. C67, Standard Test Methods of Sampling and Testing Brick and Structural Clay Tile.
   b. C109, Standard Test Method for Compressive Strength of Hydraulic Cement Mortars (Using 2-inch or 50-mm Cube Specimens).
   c. C190, Tensile Strength of Hydraulic Cement Mortars, Test Method for.
   d. C348, Standard Test Method for Flexural Strength of Hydraulic Cement Mortars.
   e. C666, Standard Test Method for Resistance of Concrete to Rapid Freezing and Thawing.

1.02 SUBMITTALS

A. Action Submittals:

1. Manufacturer’s product descriptions and specifications.
2. Samples: Three 12-inch by 12-inch Samples of finish surface, color, and texture to be provided.

B. Informational Submittals:

1. Manufacturer’s application instructions.
2. Applicator Qualifications: Manufacturer’s letter of qualification.
3. Manufacturer’s Certificate of Compliance or independent test lab data.
4. Manufacturer’s intent to warrant the applied system.
5. Manufacturer’s Certificate of Proper Installation.
6. Special guarantee.

1.03 QUALITY ASSURANCE

A. Applicator Qualifications:

©COPYRIGHT 2013 CH2M HILL

1. Minimum of 5 years' local experience.
2. Approval by system manufacturer.

B. Mockup:

1. Prior to application of the materials, erect a Sample wall panel mockup using materials and joint details required in the final Work.
2. Build mockup at Site, where directed, of full thickness, approximately 4 feet by 4 feet indicating proposed color, texture, and workmanship to be expected in the completed Work.
3. Obtain Engineer's and manufacturer's acceptance [in writing] prior to start of Work.
4. Do not alter, move, or destroy mockup until so instructed by Engineer.

1.04 DELIVERY, STORAGE, AND HANDLING

A. Store materials in area where temperatures are not less than 40 degrees F or over 85 degrees F, unless otherwise authorized by manufacturer.

1.05 ENVIRONMENTAL REQUIREMENTS

A. Approvals: Obtain Engineer's and manufacturer's representative's approval of substrate and environmental conditions prior to starting Work.

B. Temperature: Do not proceed with application of materials when ambient or substrate temperature is less than 40 degrees F or expected to fall below that within 24 hours. During cold weather maintain minimum temperature of between 40 degrees F and 50 degrees F throughout curing period.

C. Conditions: Do not apply in rainy conditions or within 3 days after surfaces become wet from rainfall. Protect surfaces to prevent rapid drying in high wind or hot sun.

1.06 SPECIAL GUARANTEE

A. Manufacturer's extended guarantee or warranty, with Owner named as beneficiary, in writing, as special guarantee. Special guarantee shall provide for correction, or at the option of the Owner, removal and replacement of Work specified in this Specification section found defective during a period of 5 years after the date of Substantial Completion. Duties and obligations for correction or removal and replacement of defective Work as specified in the General Conditions.

©COPYRIGHT 2013 CH2M HILL

PART 2 - PRODUCTS

A. CONCRETE FINISH COATING

B. Description: Heavy, cement base, waterproof, and decorative coating.

C. Performance Requirements After Curing for 28 Days:

Compressive Strength	6,000 psi (28 days)	ASTM C109
Tensile Strength	425 psi (28 days)	ASTM C190
Flexural Strength	1,000 psi (28 days)	ASTM C348
Absorption	3.6 percent	ASTM C67
Wind-Driven Rain	No penetration after 8 hours at 98 mph	
5,000-hour Weatherometer	No visible defects	

D. Materials:

1. Bonding Agent: Acrylic polymer resin.
2. Cementitious Coating: Heavy bodied, cement base, finely graded and sized aggregate type, heavy-duty, waterproof, and decorative coating formulated for brush or trowel application.
3. Water: Clean and potable.
4. Manufacturers and Products:
   a. Thoro System Products; Thoroseal.
   b. Tamms Industries Co.; Tamoseal.

2.02 CEMENTITIOUS COATING

A. Description: Heavy, cement base, waterproof, texture coating, for concrete and masonry surfaces, that hides concrete surface defects and masonry joints.

B. Performance Requirements After Curing for 28 Days:

Compressive Strength	4,000 psi	ASTM C109
Tensile Strength	310 psi	ASTM C190
Flexural Strength	850 psi	ASTM C348
Absorption	5 percent maximum	ASTM C67, 24-hour submersion

©COPYRIGHT 2013 CH2M HILL

Freeze/Thaw	DF >95 percent after 300 cycles	ASTM C666, Procedure B
Or	0.60 percent weight loss	ASTM C67 loss at 50 cycles
5,000-hour Weatherometer	No visible defects	

C. Materials:

1. Bonding Agent: Acrylic polymer resin.
2. Cementitious Leveling and Texture Coats: Heavy, cement base, aggregate type, graded, textured waterproof and decorative coating formulated for plaster spray gun or trowel application.
3. Color Coating: Acrylic masonry paint, 100 percent acrylic emulsion that is alkali, acid, and mildew resistant.
4. Water: Clean and potable.
5. Manufacturers and Products:
   a. Thoro System Products; Thoroseal Plaster Mix.
   b. Tamms Industries Co.; Concrete Finisher.

2.03 MIXES

A. Follow manufacturer's instructions.

B. Thoroughly mix cementitious materials to a uniform plastic and workable consistency and color using the proper amount of bonding agent and water. Avoid overwet or soupy mix.

PART 3 -EXECUTION

3.01 PREPARATION

A. Protection: Protect plants and vegetation that might be affected by fumes or alkalinity of the materials.

B. Surface Preparation:

1. Ensure surfaces to be coated are sound, clean, and free of efflorescence, form release agents, curing compounds, oils, dust, chalking, paint, or other imperfections that will cause loss of bond.
2. Clean and prepare new and existing surfaces in accordance with written instructions of material manufacturer.

©COPYRIGHT 2013 CH2M HILL

3. Remove loose material.
4. Patch holes deeper than 1/2 inch.
5. Cut out deep and deteriorated areas 2 inches or greater in area or depth, making a square or dove cut.
6. Vacuum, sweep, or blow out areas to be patched.
7. Dampen surface and patch as recommended by manufacturer.

3.02 APPLICATION

A. Special Techniques:

1. Do not apply materials in direct heat of sun. If extreme heat is encountered, cool surface with water prior to application.
2. Use only manufacturer's recommended application tools.

B. Concrete Finish Coating:

1. Follow manufacturer's instructions for surface preparation and application.
2. Brush apply first coat at a rate of 2 pounds per square yard.
3. Allow initial coat to set, then apply second coat at same rate.
4. After second coat has taken initial set, float to a uniform sand texture using a sponge float.

C. Cementitious Coating:

1. Leveling or Key Coat: Follow manufacturer's instructions for surface preparation, and application of minimum 1/8-inch thick coating.
2. Apply a brush coat of cementitious coating as directed by manufacturer.
3. Apply light trowel coating as directed by manufacturer. Use steel trowel and firmly press material into all voids. Level coat for application of finish coat. Mix consistency and rate of application and amount of acrylic bonding agent shall be as directed by manufacturer for the specific job conditions and requirements. Allow to cure for 7 days.
4. Evenly distribute spray applied coating. Keep spray gun a uniform distance from surface. Move nozzle with steady, even strokes. Do not angle nozzle. Float or brush out to fill holes, pores, and imperfections.
5. Finish Coat: After key coat has cured, apply a second trowel coat application mixed with at least 1 part acrylic bonding admixture to 3 parts clean water. Float with sponge float when surface is set so that it will not roll or lift. Do not use water. Mix consistency and rate of application shall be as directed by manufacturer for specific job conditions and requirements.

©COPYRIGHT 2013 CH2M HILL

6. Spray on one or more evenly distributed light coats after key coat has set and air and water bubbles have broken to achieve uniform finish. Over concrete masonry units, hide joints.
7. Finish Texture:
8. Finished Surface: [Medium to fine stippled or dash texture with irregular pattern.] [Sand float texture.] [Brocade texture.] [Vertically scraped texture.]
   a. [Leave surface clean and ready for paint.]

D. Color Coating: [Apply two coats, following manufacturer's instructions.] [As specified in Section 09 90 00, Painting and Coating] [_____].

3.03 MANUFACTURER'S SERVICES

A. Provide manufacturer's representative at Site in accordance with Section 01 43 33, Manufacturers' Field Services, for installation assistance, inspection and certification of proper installation.

B. Give manufacturer and Engineer reasonable notice as to the specific construction schedule of the surface preparation and material application. Technical service may be provided by the manufacturer or a trained, qualified representative appointed by the manufacturer.

SECTION 10 14 00
SIGNAGE

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes interior signs.

B. Related Sections:

1. Section 22 05 53, Identification for Plumbing Piping and Equipment.
2. Section 23 05 53, Identification for HVAC Piping and Equipment.

C. Allowances: Include under provisions of Section 01 20 00, Price and Payment Procedures: Allowances. Allowance includes [furnishing interior signs. Installation is included in this section and is part of Contract Sum/Price] [furnishing and installing interior signs].

1.02 REFERENCES

1.03 SUBMITTALS

A. Section 01 33 00, Submittal Procedures: Submittal procedures.

B. Action Submittals: Submit the following:

1. Shop Drawings:
   a. Indicate sign styles, lettering font, foreground and background colors, locations, overall dimensions of each sign.
   b. Schedule of all signage required for the Work, indicating signage type location, and other information to demonstrate compliance with the Contract Documents.
   c. Fabrication and erection information for each type of signage
   d. Valve schedule for small-diameter valves, in accordance with this Section.
   e. Mounting and Installation Data:
      1) Drawings of and information on anchorages and accessory items.
      2) Submit location template drawings for items supported or anchored to permanent construction.
      3) Coordinate mounting position, method, and proposed mounting accessories and fasteners with actual Project conditions. Indicate required mounting accessories on plan drawings showing locations

©COPYRIGHT 2013 CH2MHILL

of required exit signs based on measurements taken at the Site. Show final location and identify type of mounting surface for each exit sign. Coordinate location of exit signs for non-interference with other Work and as required by authorities having jurisdiction.

2. Product Data: Copies of manufacturer's technical data, including catalog information and specifications, for each product specified.
3. Samples:
   a. Each color and finish of exposed materials and accessories required for signage.
   b. Samples Sinage: Submit two full size signs illustrating type, style, letter font, and colors specified; method of attachment.
   c. Engineer's review of Samples will be for color and texture only. Compliance with other requirements is Contractor's responsibility.

C. Informational Submittals: Submit the following:

1. Manufacturer's Instructions:
   a. Templates for anchorages to be installed in concrete or masonry.
   b. Manufacturer's instructions and recommendations for support and foundations of signs installed outdoors.

1.04 QUALITY ASSURANCE

A. Perform Work in accordance with State of California standard.

B. Maintain one copy of each document on site.

1.05 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing Products specified in this section with minimum three years documented experience.

1.06 DELIVERY, STORAGE, AND HANDLING

A. Section 01 60 00, Product Requirements: Product storage and handling requirements.

B. Package signs, labeled in name groups.

1.07 ENVIRONMENTAL REQUIREMENTS

A. Section 01 60 00, Product Requirements: Environmental conditions affecting products on site.

©COPYRIGHT 2013 CH2MHILL

B. Do not install signs when ambient temperature is lower than recommended by manufacturer.

C. Maintain this minimum temperature during and after installation of signs.

PART 2 - PRODUCTS

2.01 GENERAL:

A. Details shown or indicated for signage, such as alpha-numeric and text type representation, letter spacing, designs of borders, and other graphic features, are generic and intended only to establish text, general positions, and symbols.

B. Colors shall be brilliant, distinctive shades, matching the safety colors specified in ANSI Z535.1 and OSHA 1910.144.

2.02 INTERIOR SIGNS

A. Manufacturers:

1. APCO Graphics Model
2. ASI Sign Systems Model
3. Daktronics, Inc.
4. FFI Group, Inc.
5. Mills Manufacturing
6. Unicor Model

2.03 COMPONENTS

A. Engraved Signs: Laminated colored plastic; lettering engraved through face to expose core color:

1. Face Color: [Clear.] [wood grain, [walnut] [_____].] [_____.] [Color as selected.]
2. Core Color: [_____].
3. Total Thickness: [1/16] [1/8] inch.
4. Height: [2] [3] [_____] inches.
5. Edges: [Square.] [Beveled.] [Radiused.]
6. Character Font: [Helvetica.] [_____.]

B. Sand Blasted Signs: Acrylic high gloss plastic; letters sand blasted to dull sheen:

1. Color: [Clear.] [Solid color.] [Color as selected.]
2. Total Thickness: [1/8] [_____] inch.

©COPYRIGHT 2013 CH2MHILL

3. Height: [2] [3] [_____] inches.
4. Edges: [Square.] [Beveled.] [Radiused.]
5. Character Font: [Helvetica.] [_____.]

C. Silk Screened Signs: Letters [_____] inch high silk screened onto plastic surface:

1. Sign Color: [Clear.] [Solid color.] [Color as selected.]
2. Character Color: [Contrasting] [_____] color.
3. Total Thickness: [1/8] [_____] inch.
4. Height: [2] [3] [_____] inches.
5. Edges: [Square.] [Beveled.] [Radiused.]
6. Character Font: [Helvetica.] [_____.]

D. Injection Molded [Cast] Signs: [Acrylic plastic] [Cast aluminum]:

1. Sign Color: [Clear.] [Solid color.] [Color as selected.]
2. Character Color: [Contrasting color.] [Ground satin surface.] [_____.]
3. Total Thickness: [1/8] [_____] inch.
4. Height: [2] [3] [_____] inches.
5. Edges: [Square.] [Beveled.] [Radiused.]
6. Character Font: [Helvetica.] [_____.]

E. Raised Letter Signs, Base Material: [Clear] [Solid color] acrylic plastic:

1. Total Thickness: [1/8] [_____] inch.
2. Height: [2] [3] [_____] inches.
3. Edges: [Square.] [Beveled.] [Radiused.]
4. Character Font: [Helvetica.] [_____.]

F. Raised Character Size and Style: Acrylic plastic, character adhered to base material:

1. Character Color: [Black.] [_____.]
2. Character Thickness: [1/8] [_____] inch.
3. Height: [1] [1-1/2] [_____] inch.
4. Edges: [Square.] [Beveled.] [Radiused.]
5. Character Font: [Helvetica.] [_____.]
6. Character Case: [Upper] [and] [lower] case.

G. Individual Graphics, Material: [Clear] [Solid color] acrylic plastic:

1. Thickness: [1/8] [_____] inch.
2. Height: [2] [3] [_____] inches.
3. Edges: [Square.] [Beveled.] [Radiused.]

©COPYRIGHT 2013 CH2MHILL

4. Character Color: [Black.] [_____.]
5. Character Font: [Helvetica.] [_____.]
6. Character Case: [Upper] [and] [lower] case.

H. Graphic Style: [Handicapped type.] [_____.]

2.04 ACCESSORIES

A. Tape Adhesive: Double sided tape, permanent adhesive.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Section 01 30 00, Administrative Requirements: Verification of existing conditions before starting work.

3.02 INSTALLATION

A. Install signs after doors surfaces are finished, in locations as directed by Engineer.

B. Center sign on door surface, level.

3.03 SCHEDULES

A. Office Door Signs: Individual Helvetica letters, 1 inch high, white color, identifying room name indicated on drawing schedule.

B. Service Room Signs: Plaque signs, 2 inches high, black face color, white core color, "UTILITY ROOM", "SERVICE ROOM", and "ELECTRICAL ROOM"; at each respective room location.

C. Rest Room Door Graphic: 6 inches high, "male" and "female" graphic image; black color, located on each rest room door.

END OF SECTION

SECTION 10 44 00
FIRE PROTECTION SPECIALTIES

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes fire extinguishers; fire blankets; fire extinguisher cabinets; and brackets for wall mounting.

B. Related Sections:

1. Section 06 10 53, Miscellaneous Rough Carpentry: Wood blocking and shims.
2. Section 09 90 00, Painting and Coating: Field applied paint finish.
3. Section 21 12 00, Fire-Suppression Standpipes: Cabinet enclosure for extinguishers [and blankets].

1.02 REFERENCES

A. National Fire Protection Association: NFPA 10, Standard for Portable Fire Extinguishers.

B. Underwriters Laboratories Inc.: UL, Fire Protection Equipment Directory.

1.03 PERFORMANCE REQUIREMENTS

A. Conform to NFPA 10.

B. Provide extinguishers classified and labeled by Underwriters Laboratories Inc.for purpose specified and indicated.

C. Provide fire extinguisher cabinets classified and labeled by Underwriters Laboratories Inc. for purpose specified and indicated.

1.04 SUBMITTALS

A. Section 01 33 00, Submittal Procedures: Submittal procedures.

B. Action Submittals: Submit the following:

1. Product Data: Manufacturer’s technical data, extinguisher operational features, color and finish, anchorage details, certification of UL rating, and installation instructions for fire protection specialties.

©COPYRIGHT 2013 CH2MHILL

2. Shop Drawings: Indicate cabinet physical dimensions, rough-in measurements for recessed cabinets, wall bracket mounted measurements, location, and fire ratings.
3. Manufacturer's Installation Instructions: Submit special criteria and wall opening coordination requirements.

1.05 CLOSEOUT SUBMITTALS

A. Section 01 70 00, Execution and Closeout Requirements: Closeout procedures.

B. Operation and Maintenance Data: Submit test, refill or recharge schedules and re-certification requirements.

1.06 QUALITY ASSURANCE

A. Perform Work in accordance with State of California standard.

B. Maintain one copyof each document on site.

C. Component Supply and Compatibility: Provide fire protection specialties products from one manufacturer.

D. Regulatory Requirements: Provide fire protection specialties approved and labeled by UL.

1.07 ENVIRONMENTAL REQUIREMENTS

A. Section 01 60 00, Product Requirements: Environmental conditions affecting products on site.

B. Do not install extinguishers when ambient temperature are capable of freezing extinguisher ingredients.

PART 2 - PRODUCTS

2.01 FIRE EXTINGUISHERS

A. General: Provide manufacturer’s standard mounting brackets for portable fire extinguishers size as specified.

B. Multi-Purpose Dry Chemical Fire Extinguishers:

1. Ten-pound capacity, enameled steel container with pressure-indicating gauge, for Class A, Class B, Class C fires, UL rating 4A-60 BC.

©COPYRIGHT 2013 CH2MHILL

2. Products and Manufacturers: Provide one of the following:
   a. Cosmic Model 10E by J.L. Industries.
   b. Or equal.

C. Carbon Dioxide Fire Extinguishers:

1. Ten-pound enameled steel container capacity, for Class B and Class C fires UL rating.
2. Products and Manufacturers: Provide one of the following:
   a. Sentinel Model 10 by J.L. Industries.
   b. Or equal.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Section 01 30 00, Administrative Requirements: Coordination and project conditions.

B. Examine substrates and conditions under which fire protection specialties will be installed and notify Engineer in writing of conditions detrimental to proper and timely completion of the Work. Do not proceed with Work until unsatisfactory conditions have been corrected in manner acceptable to Engineer.

3.02 INSTALLATION

A. When exact locations of fire protection specialties are not shown on Drawings, locate as directed by Engineer.

B. Securely fasten products to structure, square and plumb, per Supplier's instructions. Mounting heights shall be:

1. Install fire extinguishers with gross weight greater than 40 pounds with top of fire extinguisher no more than 3.5 feet above finished floor.
2. Install fire extinguishers with gross weight less than 40 pounds with top of fire extinguisher no more than 4.0 feet above finished floor.
3. Clearance between bottom of fire extinguisher and finished floor shall be at least four inches.

C. Identification Devices: Provide signs level and plumb directly above surface mounted portable fire extinguishers, securely mounted, and attached to substrate per sign manufacturer's instructions. Signage shall be per Section 10 14 00, Signage.

©COPYRIGHT 2013 CH2MHILL

D. Recharge fire extinguishers provided under this Contract so that most recent inspection date coincides as nearly as possible with date of Substantial Completion. Inform OWNER in writing of next required inspection and recharging date.

3.03 SCHEDULES

A. Type A – Dry chemical, wall mounted.

B. Type B – Carbon dioxide, wall mounted.

END OF SECTION

©COPYRIGHT 2013 CH2MHILL

SECTION 11 53 00
LABORATORY EQUIPMENT

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes laboratory equipment; connection to utilities; and service fittings and outlets.

B. Related Sections: Section 03 10 00 - Concrete Forming and Accessories: Execution requirements for inserts for laboratory equipment specified by this section.

C. Allowances: Include under provisions of Section 01 20 00 - Price and Payment Procedures. Allowance includes purchase and delivery of laboratory equipment. Installation is included in this section and is part of Contract Sum/Price] [purchase, delivery, and installation of laboratory equipment].

1.02 REFERENCES

A. National Electrical Manufacturers Association: NEMA MG 1 - Motors and Generators.

1.03 SUBMITTALS

A. Section 01 33 00 - Submittal Procedures: Submittal requirements.

B. Shop Drawings: Indicate equipment locations, large scale plans, elevations, cross sections, rough-in and anchor placement dimensions and tolerances, clearances required and [_____].

C. Product Data: Submit equipment dimensions and construction, equipment capacities, physical dimensions, utility and service requirements and locations, point loads

D. Manufacturer's Installation Instructions: Submit special installation requirements

E. Manufacturer's Certificate: Certify [products] meet or exceed specified requirements

1.04 SUSTAINABLE DESIGN SUBMITTALS

A. Section 01 81 13 - Sustainable Design Requirements: Requirements for sustainable design submittals.

©COPYRIGHT 2013 CH2M HILL

B. Manufacturer's Certificate: Certify products meet or exceed specified sustainable design requirements.

1. Materials Resources Certificates:
   a. Certify recycled material content for recycled content products.
   b. Certify source for local and regional materials and distance from Project site.

C. Product Cost Data: Submit cost of products to verify compliance with Project sustainable design requirements. Exclude cost of labor and equipment to install products.

1. Provide cost data for the following products:
   a. Reused products.
   b. Products with recycled material content.
   c. Local and regional products.
   d. [_____.]

1.05 CLOSEOUT SUBMITTALS

A. Section 01 70 00 - Execution and Closeout Requirements: Closeout procedures.

B. Project Record Documents: Record actual locations of concealed utility connections

C. Operation and Maintenance Data: Submit description of equipment operation, adjusting, and testing required Identify system maintenance requirements, servicing cycles, lubrication types required and [local] spare part sources.

D. Warranty: Submit Manufacturer's warranty and ensure forms have been completed in Owner's name and registered with manufacturer.

1.06 QUALITY ASSURANCE

A. Sustainable Design Requirements:

1. Recycled Content Materials: Furnish materials with recycled content including cabinets and countertops:] [.]
   a. >25 percent

B. Maintain one copy of each document on site.

1.07 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years documented experience.

©COPYRIGHT 2013 CH2M HILL

1.08 COORDINATION

A. Section 01 30 00, Administrative Requirements: Coordination and project conditions.

B. Leave building openings of sufficient size to permit transport of equipment to final position.

1.09 WARRANTY

A. Section 01 70 00, Execution and Closeout Requirements: Product warranties and product bonds.

B. Furnish five]year manufacturer warranty for laboratory equipment.

PART 2 - PRODUCTS

2.01 LABORATORY EQUIPMENT

A. Manufacturers:

1. [The Chicago Faucet Co.] Model [_____].
2. [Delta Faucet Co., Commercial Div.] Model [_____].
3. [Hemco Corporation] Model [_____].
4. [Mopec Inc.] Model [_____].
5. [T&S Brass & Bronze Works, Inc.] Model [_____].
6. Eagle Group Model #SR14-16-9.5-2.
7. Substitutions:

2.02 COMPONENTS

A. Equipment: Scheduled at end of section.

B. Rough-in: Frames, anchors, supports, accessories and closure trim; appropriate to scheduled equipment.

C. Resin counter top with splash guard; L-shaped counter-top (6.75’x2’ and 7.75’x2’) .

D. 16”x14” Type 304 stainless steel, double compartment lab sink, model #SR14-16-9.5.2 by Eagle group with faucet #300490 with 12” spout.

E. 36” Resin drying rack over each of the sink area.

F. 24” wide hinged glass door wall cabinet.

©COPYRIGHT 2013 CH2M HILL

G. Ergonomic chair (Teclab – Seatwise high ring chair Model CHRI-2432).

2.03 ELECTRICAL CHARACTERISTICS AND COMPONENTS

A. Electrical Characteristics: In accordance with Section 26 05 03 <<not in this package>>, and the following:

1. [[_____]hp] [[_____] rated load amperes.]
2. [115_____] volts, single phase, 60 Hz.
3. [_____] amperes maximum [fuse size] [circuit breaker size] [overcurrent protection].
4. [_____] minimum circuit ampacity.
5. [_____] percent minimum power factor at rated load.

B. Motors: NEMA MG 1.

2.04 SHOP FINISHING

A. Equipment and Accessories: [Zinc chromate] [_____] primer; two [baked] enamel finish coats in [_____] color [as selected].

PART 3 - EXECUTION

3.01 EXAMINATION

A. Section 01 30 00, Administrative Requirements: Coordination and project conditions.

B. Verify rough-in frames, anchors and supports are accurately placed.

3.02 PREPARATION

A. Coordinate rough-in frame and anchor placement by Section [03 10 00.]

B. INSTALLATION

C. Install in accordance with standards required by authority having jurisdiction.

D. Anchor equipment securely in place.

E. Sequence installation to accommodate required utility connections.

F. Touch-up minor damaged surfaces caused during installation. Replace damaged components.

©COPYRIGHT 2013 CH2M HILL

3.03 ADJUSTING

A. Section 01 70 00, Execution and Closeout Requirements: Testing, adjusting, and balancing.

B. Adjust operating equipment to efficient operation.

3.04 SCHEDULES

A. Fume Hood Manufacturers:

1. Teclab Model [TBD].
2. LabconcoModel [TBD].
3. Air Master Systems Corp. Model [TBD].
4. Features: Stainless steel cabinet interior, baked enamel cabinet exterior, stone work top surface, sliding framed glass sash, 75 cfm exhaust through open sash, adjustable baffles, 100 w incandescent lamp in vapor tight light fixture.
5. Working Surface of Fume Hood: Capable of supporting 75 psi live load.

B. Lab equipment schedule:

Item	**Description**	**Quantity**
Turbidity meter	2100Q turbidimeter kit	1
Vials	For turbiditimeter	1
pH/Conductivity meter	SensIon MM374 GLP Duel Channel kit	1
Colorimeter	DR890 Portable Colorimeter kit	1
Colorimeter	Ferrous Fe powder pillow	1
Colorimeter	Total Fe powder pillows	1
Colorimeter	Cr6 powder pillows	1
Colorimeter	CrT powder pillow kit (set)	1
Colorimeter	Arsenic Test kit	1
Breakers	100mL Poly pk12	1
Graduated cylinders	25 mL	2

©COPYRIGHT 2013 CH2M HILL

Item	Description	Quantity
Graduated cylinders	100 mL	2
Graduated cylinders	1000 mL	2

SECTION 13 34 19
METAL BUILDING SYSTEMS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes pre-engineered, shop fabricated structural steel building frame; [insulated] metal wall and sloped roof system including [soffits,] [gutters and downspouts,] [roof mounted equipment curbs,] [and] [_____]; and exterior doors [windows,] [skylights,] [overhead doors,] [louvers,] [and] [_____].

B. Related Sections:

1. Section 03 10 00, Concrete Forming and Accessories: Execution requirements for placement of [anchor bolts] [base plates] [_____] specified in this section in concrete.
2. Section 07 90 00, Joint Protection.
3. Section 09 90 00, Painting and Coating: Finish painting [of exterior primed steel surfaces,] [inside surface of liner sheet,] [and] [_____].
4. Section [_____-_____]: Mechanical rough-in utilities.
5. Section [_____-_____]: Electrical rough-in utilities.
6. Section [_____-_____], Fire Protection Systems.

1.03 SYSTEM DESCRIPTION

A. [Single span rigid frame.] [Tapered beam.] [Continuous beam frame.] [Truss frame.] [Lean-to.] [_____.]

B. Bay Spacing: [_____] ft.

C. Primary Framing: Rigid frame of rafter beams and columns, [canopy beams,] [intermediate columns,] [braced end frames,] [end wall columns,] [_____,] and wind bracing.

D. Secondary Framing: [Purlins,] [girts,] [eave struts,] [flange bracing,] [sill supports,] [_____,] clips, and other items detailed.

E. Wall System: Preformed metal panels of [horizontal] [vertical] [_____] profile, [with sub-girt framing/anchorage assembly,] [insulation,] [liner sheets,] and accessory components.

©COPYRIGHT 2013 CH2M HILL

F. Roof System: Preformed metal panels of [upslope] [parallel to eave] [_____] profile, [with sub-girt framing/anchorage assembly,] [insulation,] [liner sheets,] and accessory components.

G. Roof Slope: [1/8] [1] [2] [4] [_____] inches in 12 inches.

1.04 DESIGN REQUIREMENTS

A. Thermal resistance of [Calculated] [Installed] Wall System: R-Value of [_____].

B. Thermal Resistance of [Calculated] [Installed] Roof System: R-Value of [_____].

C. Design members to withstand dead load, [applicable snow load,] [vertical and horizontal seismic loads,] and design loads due to pressure and suction of wind calculated in accordance with [[applicable] [_____] code.] [design load schedule.]

D. Design members to withstand [_____] psf dead load, [[_____] psf [nominal] [progressive] snow [and live] load], and [_____] psf design loads due to pressure and suction of wind.

E. Design members to withstand UL 580 - Uplift Resistance, Uplift Class [10.] [30.] [60.] [90.]

F. [Design members to support [mechanical] [and] [electrical] equipment [and] [fire sprinkler system piping] indicated.]

G. Maximum allowable deflection: [1/90] [1/180] [_____] of span with imposed loads for exterior wall and roof system.

H. Provide drainage to exterior for water entering or condensation occurring within wall or roof system.

I. Permit movement of components without buckling, failure of joint seals, undue stress on fasteners or other detrimental effects, when subject to temperature range of [_____] degrees F.

J. Size and fabricate wall and roof systems free of distortion or defects detrimental to appearance or performance.

K. Wind-Borne Debris Loads: Design louvers located within 30 feet of grade to withstand ASTM E1996; large missile impact test.

©COPYRIGHT 2013 CH2M HILL

1.05 PERFORMANCE REQUIREMENTS

A. Conform to [applicable] [_____] code for submission of [design calculations,] [reviewed shop and erection drawings,] [and] [_____] as required for acquiring permits.

B. Cooperate with regulatory agency or authority and provide data as requested authority having jurisdiction.

C. Provide components of each type from one manufacturer compatible with adjacent materials.

D. Vapor Retarder Permeance: Maximum [1 perm] [[_____] perms] when tested in accordance with ASTM E96/E96M, [desiccant method] [water method].

1.06 SUBMITTALS

A. Section 01 33 00, Submittal Procedures: Submittal procedures.

B. Shop Drawings: Indicate assembly dimensions, locations of structural members, [connections,] [attachments,] [openings,] [cambers,] [loads,] [and] [_____]; wall and roof system dimensions, panel layout, general construction details, anchorages and method of anchorage, method or installation [and] [_____]; framing anchor bolt settings, sizes, and locations from datum, [and foundation loads]; indicate welded connections with AWS A2.4 welding symbols; indicate net weld lengths; provide professional seal and signature.

C. Product Data: Submit data on profiles, component dimensions, [fasteners,] [performance characteristics] [and] [_____].

D. Samples: Submit [two] [_____] samples of precoated metal panels for each color selected, [_____] inch in size illustrating color and texture of finish.

E. Manufacturer's Instructions: Submit preparation requirements, anchor bolt placement, [and] [_____].

F. Erection Drawings: Indicate members by label, assembly sequence, and temporary erection bracing.

1.07 SUSTAINABLE DESIGN SUBMITTALS

A. Section 01 81 13, Sustainable Design Requirements: Requirements for sustainable design submittals.

©COPYRIGHT 2013 CH2M HILL

B. Manufacturer's Certificate: Certify products meet or exceed specified sustainable design requirements.

1. Sustainable Sites Certificates: Certify roofing materials solar reflectance index.
2. Materials Resources Certificates:
   a. Certify recycled material content for recycled content products.
   b. Certify source for local and regional materials and distance from Project site.
3. Indoor Air Quality Certificates: Certify volatile organic compound content for each interior paint and coating.

C. Product Cost Data: Submit cost of products to verify compliance with Project sustainable design requirements. Exclude cost of labor and equipment to install products.

1. Provide cost data for the following products:
   a. Products with recycled material content.
   b. Local and regional products.
   c. [_____.]

1.08 CLOSEOUT SUBMITTALS

A. Section 01 70 00, Execution and Closeout Requirements: Closeout procedures.

B. Project Record Documents: Record actual locations of concealed components and utilities.

1.09 QUALITY ASSURANCE

A. Perform Work in accordance with [AISC S335,] [AISC S342L,] [AISC S344L,] [and] [MBMA Low Rise Building Systems Manual.]

B. Insulation Installed in Concealed Locations Surface Burning Characteristics:

1. Batt Insulation: Maximum 25/450 flame spread/smoke developed index when tested in accordance with ASTM E84.

C. Insulation Installed in Exposed Locations Surface Burning Characteristics: 25/450 flame spread/smoke developed index when tested in accordance with ASTM E84.

D. Sustainable Design Requirements:

1. Recycled Content Materials: Furnish materials with recycled content [including:] [.]

©COPYRIGHT 2013 CH2M HILL

Material	Minimum Recycled Content (Percent)	
	Post Consumer	Pre Consumer

a. [_____.]

2. Regional Materials: Furnish materials extracted, processed, and manufactured within 500 miles of Project site [including:] [.]
   a. [_____.]

E. Perform Work in accordance with [[State] [Municipality] of [_____] [Highways] [Public Work's] standard.]

F. Maintain [one copy] [[_____] copies] of [each] document on site.

1.10 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years documented experience.

B. Erector: Company specializing in performing Work of this section [with minimum [_____] years [documented] experience.] [approved by manufacturer.]

C. Design structural components, develop shop drawings, and perform shop and site work under direct supervision of Professional Engineer experienced in design of this Work and licensed [at Project location.] [in State of [_____].]

1.11 PRE-INSTALLATION MEETINGS

A. Section 01 30 00, Administrative Requirements: Pre-installation meeting.

B. Convene minimum [one] [_____] week prior to commencing work of this section.

1.12 WARRANTY

A. Section 01 70 00, Execution and Closeout Requirements: Product warranties and product bonds.

B. Furnish [five] [_____] year manufacturer warranty for pre-engineered building systems and components.

©COPYRIGHT 2013 CH2M HILL

C. Furnish [five] [_____] year warranty to include coverage for exterior pre-finished surfaces color coat against chipping, cracking or crazing, blistering, peeling, chalking, or fading. Include coverage for weather tightness of building enclosure elements after installation.

PART 1 - PRODUCTS

2.01 PRE-ENGINEERED BUILDINGS

A. Manufacturers:

1. [Butler Manufacturing Co.] Model [_____].
2. [Lester Building Systems] Model [_____].
3. [Trachte Building Systems, Inc.] Model [_____].
4. [Varco-Pruden Buildings] Model [_____].
5. [_____] Model [_____].
6. Substitutions: [Section 01 60 00, Product Requirements] [Not Permitted].

B. Furnish materials in accordance with [State] [Municipality] of [_____] [Highways] [Public Work's] standards.

2.02 COMPONENTS - FRAMING

A. Structural Steel Members: ASTM [A36/A36M.] [A529/A529M Grade 50.] [A572/A572M, Grade 50.] [_____.]

B. Structural Tubing: ASTM [A500/A500M, Grade [B] [_____].] [A501.]

C. Plate or Bar Stock: ASTM [A529/A529M Grade 50.] [_____.]

D. Anchor Bolts: ASTM A307 Grade A, [unprimed.] [galvanized.]

E. Bolts, Nuts, and Washers: [ASTM A325] [ASTM A490] [galvanized].

F. Welding Materials: AWS D1.1; type required for materials being welded.

G. Primer: [SSPC Paint 20, Red Oxide.] [_____.]

1. [Interior] Anti-Corrosive Paints: Maximum volatile organic compound content in accordance with GC-03.

H. Non-Shrink Grout: ASTM C1107/C1107M; premixed compound consisting of non-metallic aggregate, cement, water reducing and plasticizing agents; capable of developing minimum compressive strength of [2,400] [_____] psi in 48 hours and [7,000] [_____] psi in 28 days manufactured by [_____].

©COPYRIGHT 2013 CH2M HILL

2.03 COMPONENTS - WALL AND ROOF SYSTEM

A. Sheet Steel: [ASTM A653/A653M; [G90] [_____] zinc coating] [ASTM A792/A792M; [AZ50] [_____] aluminum-zinc alloy coating]; [0.030] [_____] inch thick.

B. Sheet Steel Stock: ASTM A792/A792M aluminum-zinc alloy Coating Designation [AZ50] [_____].

C. Insulation: [Semi-rigid] [Batt] [Roll] glass fiber type, [unfaced,] [faced with reinforced [foil] [white vinyl]], friction fit, [_____] inches thick.

D. Insulation: [ASTM C665 [Type I] [Type II Class [A] [B] [C]] [Type III Class [A] [B] [C]]] [ASTM C991 Type [I] [II]]; [_____] inches thick.

E. Joint Seal Gaskets: [Manufacturer's standard] [_____] type.

F. Fasteners: Manufacturer's standard type, [galvanized] [high performance organic coating], finish to match adjacent surfaces when exterior exposed.

G. Bituminous Paint: [Asphaltic] [_____] type.

H. Sealant: [Manufacturer's standard] [_____] type, [as specified in Section 07 90 00,] non-staining, elastomeric, skinning.

I. [Metal Mesh: Galvanized steel wire, woven.]

J. Roof Curbs: Insulated metal same as roofing, [_____] inch thick, designed for imposed equipment loads, anchor fasteners to equipment, counterflashed to metal roof system.

K. Trim, Closure Pieces, Caps, Flashings, [Rain Water Diverter,] [Facias] [Infills], [and] [_____]: Same material, thickness and finish as exterior sheets; brake formed to required profiles.

2.04 COMPONENTS - METAL DOORS AND FRAMES

A. Manufacturers:

1. [_____] Model [_____].
2. [_____] Model [_____].
3. [_____] Model [_____].
4. Substitutions: [Section 01 60 00, Product Requirements] [Not Permitted].

B. Doors: Specified in Section [08 13 15.] [_____.]

©COPYRIGHT 2013 CH2M HILL

C. Frames: Specified in Section [08 12 15.] [_____.]

D. Doors and Frames: Manufacturer's standard.

2.05 COMPONENTS - OVERHEAD DOORS

A. Manufacturers:

1. [_____] Model [_____].
2. [_____] Model [_____].
3. [_____] Model [_____].
4. Substitutions: [Section 01 60 00, Product Requirements] [Not Permitted].

B. Overhead Doors: Specified in Section [08 36 13.] [_____.]

C. Overhead Door Frame: Formed steel sections braced to building frame specified in Section 05 50 00.

D. Doors and Frames: Manufacturer's standard.

E. Glass and Glazing: Specified in Section [08 80 00.] [_____.]

2.06 COMPONENTS - WINDOWS

A. Manufacturers:

1. [_____] Model [_____].
2. [_____] Model [_____].
3. [_____] Model [_____].
4. Substitutions: [Section 01 60 00, Product Requirements] [Not Permitted].

B. Windows: Specified in Section [08 51 26.] [08 51 13.] [08 52 00.] [08 53 00.] [_____.]

C. Windows: Manufacturer's standard.

D. Glass and Glazing: Specified in Section [08 80 00.] [_____.]

2.07 PLASTIC SKYLIGHTS

A. Manufacturers:

1. [_____] Model [_____].
2. [_____] Model [_____].
3. [_____] Model [_____].

©COPYRIGHT 2013 CH2M HILL

4. Substitutions: [Section 01 60 00, Product Requirements] [Not Permitted].

B. Plastic Skylight: Specified in Section [08 62 00] [_____].

C. Plastic Skylight: Manufacturer's standard.

D. Single Dome: [Acrylic] [Polycarbonate] plastic, [_____] inch thick; [clear.] [white translucent.] [_____.]

E. Double Dome: [Acrylic] [Polycarbonate] plastic, [_____] inch thick; [air] [argon] seal space:

1. Outer Dome: [clear] [white translucent] [_____].
2. Inner Dome: [clear] [white translucent] [_____].

F. Nominal Size: [[____x____] inches single unit.] [as scheduled.]

G. Configuration: [Single] [Multiple] [_____] units.

H. Shape: [Convex] [Pyramidal] [_____].

I. Unit Frame: Extruded aluminum [thermally broken,] integral curb frame [and counterflashing,] with integral condensation drainage gutter.

J. Support Curb: Aluminum sandwich construction; [_____] inch thick, [_____] inch high, fiber glass insulated, with flange for anchorage to roof deck, counterflashed and formed to roofing metal.

2.08 FABRICATION - FRAMING

A. Fabricate members in accordance with AISC Specification for plate, bar, tube, or rolled structural shapes.

B. Anchor Bolts: Formed with [bent] [straight] shank, assembled with template for casting into concrete.

C. Provide framing for [door] [window] [louver] [skylight,] [ventilator,] [and] [_____] openings.

2.09 FABRICATION - WALL AND ROOF SYSTEMS

A. Siding: Minimum [_____] inch metal thickness, [_____] profile [indicated], [_____] inch deep, [lapped] [male/female] edges [fitted with continuous gaskets].

B. Roofing: Minimum [_____] inch metal thickness, [_____] profile, [lapped] [male/female] edges [fitted with continuous gaskets].

©COPYRIGHT 2013 CH2M HILL

1. Roof Surfaces: ENERGY STAR compliant with minimum solar reflectance index (SRI) of [78] [29] for 75 percent of roof area, calculated in accordance with ASTM E1980.
   a. Reflectance: Measured in accordance with ASTM E903, ASTM E1918, or ASTM C1549.
   b. Emittance: Measured in accordance with ASTM E408 or ASTM C1371.
2. Roof Surface: ENERGY STAR compliant with the following performance:
   a. Emissivity: Minimum 0.9 for 75 percent of roof area in accordance with ASTM E408.

C. Liner: Minimum [_____] inch metal thickness, [flat] [V crimped] [perforated] profile [indicated], [lapped V] [male/female] edges [fitted with continuous gaskets].

D. Soffit Panels: Minimum [_____] inch metal thickness, [flat] [V crimped] [_____] profile [indicated], [perforated for ventilation] [unperforated].

E. Girts/Purlins: Rolled formed structural shape to receive siding, roofing [and liner] sheet.

F. Internal and External Corners: Same material thickness and finish as adjacent material, profile [brake formed] [shop cut and factory mitered] to required angles. Back brace mitered internal corners with [_____] inch thick sheet.

G. Expansion Joints: Same material and finish as adjacent material [where exposed], [_____] inch thick, [manufacturer's standard brake formed] [infill] [_____] type, of profile [to suit system.] [formed as detailed.]

H. Flashings, Closure Pieces, [Fascia], [Infills], [Caps], and [_____]: Same material and finish as adjacent material, profile [to suit system.] [formed as detailed.]

I. Fasteners: To maintain load requirements and weather tight installation, same finish as cladding, non-corrosive [type.] [finish.]

J. Ventilator: [Sheet steel, galvanized, rotary design, [_____] inch nominal size.] [_____.]

K. Wall Louvers: [_____] type [Z] [Y] [_____] blade design, [same finish as adjacent material] [_____], with steel mesh [bird] [insect] screen and frame, [blank sheet metal] [_____] at unused portions.

2.10 FABRICATION - GUTTERS AND DOWNSPOUTS

A. Fabricate of same material and finish as roofing metal.

©COPYRIGHT 2013 CH2M HILL

B. Form gutters and downspouts [and scuppers] of [_____] profile and size [indicated] to collect and remove water. Fabricate with connection pieces.

C. Form sections in maximum possible lengths. Hem exposed edges. [Allow for expansion at joints.]

D. Fabricate support straps of same material and finish as roofing metal, color as selected.

2.11 FACTORY FINISHING

A. Framing Members: Clean, prepare, and [shop prime.] [prime to SSPC Manual requirements.] [galvanize to ASTM A123/A123M; galvanize after fabrication.] [Do not prime surfaces to be field welded.]

B. Galvanizing for Nuts, Bolts and Washers: ASTM A153/A153M.

C. Interior Surfaces of [Wall] [Roof] Components and Accessories: Precoated enamel on steel of [modified silicone] [_____] finish, [_____] color [as selected from manufacturer's standard range].

D. Exterior Surfaces of [Wall] [Roof] Components and Accessories: Precoated enamel on steel of [modified silicone] [fluoropolymer] [_____] finish, [_____] color [as selected from manufacturer's standard range].

E. Vapor Retarder at Interior Face of Insulation: Sheet vinyl, [_____] inch thick, [white.] [_____.]

PART 3 - EXECUTION

3.01 EXAMINATION

A. Section 01 30 00, Administrative Requirements: Coordination and project conditions.

B. Verify foundation, floor slab, mechanical and electrical utilities, and placed anchors are in correct position.

3.02 ERECTION - FRAMING

A. Erect framing in accordance with AISC Specification.

B. Provide for erection and wind loads. Provide temporary bracing to maintain structure plumb and in alignment until completion of erection and installation of permanent bracing. [Locate braced bays as indicated on Drawings.]

©COPYRIGHT 2013 CH2M HILL

C. Set column base plates with non-shrink grout to achieve full plate bearing.

D. Do not field cut or alter structural members without approval of Architect/Engineer.

E. After erection, prime welds, abrasions, and surfaces not [shop primed.] [galvanized.]

F. Install Work in accordance with [State] [Municipality] of [_____] [Highways] [Public Work's] standards.

3.03 ERECTION - WALL AND ROOFING SYSTEMS

A. Exercise care when cutting prefinished material to ensure cuttings do not remain on finish surface.

B. Fasten cladding system to structural supports, aligned level and plumb.

C. Locate end laps over supports. End laps minimum [2] [_____] inches. Place side laps over bearing.

D. Install expansion joints where indicated on Drawings.

E. Use [concealed] [exposed] fasteners.

F. Install insulation [and vapor retarder] utilizing [_____] for attachment. [Place wire mesh under vapor retarder for support between framing members.]

G. Install sealant and gaskets to prevent weather penetration.

H. Install Work in accordance with [State] [Municipality] of [_____] [Highways] [Public Work's] standards.

3.04 ERECTION - GUTTER AND DOWNSPOUTS

A. Rigidly support and secure components. Joint lengths with formed seams sealed watertight. Flash and seal gutters to downspouts.

B. Apply bituminous paint on surfaces in contact with cementitious materials.

C. Slope gutters minimum [_____] inch/ft.

D. Connect downspouts to [storm sewer system.] [_____.]

E. Install splash [pans] [pads] [_____] under each downspout.

©COPYRIGHT 2013 CH2M HILL

F. Install Work in accordance with [State] [Municipality] of [_____] [Highways] [Public Work's] standards.

3.05 ERECTION - SKYLIGHTS

A. Coordinate with installation of roofing system and related flashings.

B. Apply bituminous paint on aluminum surfaces of units in contact with dissimilar metals.

C. Provide weather tight installation.

D. Install Work in accordance with [State] [Municipality] of [_____] [Highways] [Public Work's] standards.

3.06 ERECTION - ACCESSORIES

A. Install [door frame,] [door,] [overhead door,] [window and glass,] [skylight,] [louvers,] [and] [_____].

B. Seal wall and roof accessories watertight [and weather tight] with sealant [in accordance with Section 07 90 00].

C. Install Work in accordance with [State] [Municipality] of [_____] [Highways] [Public Work's] standards.

3.07 ERECTION TOLERANCES

A. Section 01 40 00, Quality Requirements: Tolerances.

B. Framing Members: [1/4] [_____] inch from level; [1/8] [_____] inch from plumb.

C. Siding and Roofing: [1/8] [_____] inch from indicated position.

SECTION 21 24 00
DRY-CHEMICAL FIRE-EXTINGUISHING SYSTEMS

PART 1 - GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. American Society of Mechanical Engineers (ASME): B31.1, Power Piping.
2. ASTM International (ASTM):
   a. A53, Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.
   b. A106, Standard Specification for Seamless Carbon Steel Pipe for High-Temperature Service.
   c. A197, Standard Specification for Cupola Malleable Iron.
3. National Electrical Manufacturer's Association (NEMA): 250, Enclosures for Electrical Equipment (1000 Volts Maximum).
4. National Fire Protection Association (NFPA):
   a. 12A, Halon 1301 Fire Extinguishing Systems.
   b. 70, National Electrical Code.
   c. 72, National Fire Alarm Code.
   d. 75, Standard for the Protection of Electronic Computer/Data Processing Equipment.
   e. 2001, Standard on Clean Agent Fire Extinguishing Systems.

1.02 DEFINITIONS

A. Protected Area: The area of the building that the FM-200 system protects.

1.03 PERFORMANCE REQUIREMENTS

A. General: Design a system to detect and suppress by total flooding, fires originating in the following protected areas:

1. MW-20 Bench Building.
2. TW Bench Building.

B. Fire Detection System:

1. Engineered type suitable for interfacing with the FM-200 suppression system.

©COPYRIGHT 2013 CH2M HILL

2. Concept shall provide an alarm mode on the activation of any one fire detector and a predischarge mode on the activation of any two fire detectors located in the protected area.

C. Fire Suppression System:

1. System shall discharge the total calculated agent quantity into the protected space in a 10-second time period.
2. System shall provide sufficient FM-200 agent for a concentration of 7 percent by volume at 70 degrees F in the protected area. Adjust calculations as required for:
   a. Multiple protected areas served by a common FM-200 supply.
   b. Suspended ceiling space volume (if required).
   c. Volume of ductwork for HVAC system.

1.04 DESIGN REQUIREMENTS

A. General:

1. System shall include both automatic and manual operation, with control panel, fire detectors, alarm devices, manual discharge stations, abort stations, agent storage containers, piping, nozzles, wiring, conduit, and other auxiliary devices specified herein or required to provide a complete system.
2. System shall conform to the requirements of applicable codes, standards, and authorities including, but not limited to:
   a. National Fire Code-NFPA Nos. 12A, 70, 72, 75, and 2001, including appendages.
   b. Requirements of city, county, or state authorities having jurisdiction.
   c. Requirements of OWNER's insurance underwriter, if applicable.
   d. Equipment shall be Underwriters Laboratories (UL) listed and/or Factory Mutual (FM) approved for fire protection.
3. Obtain all permits, arrange all inspections, and perform all systems tests required by the applicable codes and the authorities having jurisdiction.

B. Protected Area Segregation:

1. System shall be based on the protected area enclosure being of sufficient tightness to guard against extinguishing agent exfiltration including, but not limited to exit doors and windows, piping, and electrical conduit.
2. Area segregation shall require HVAC system supply and return serving the protected space to shut down, and the air duct system motorized dampers to close.

©COPYRIGHT 2013 CH2M HILL

C. Hydraulic Calculations: Base on the unbalanced piping principle as defined in NFPA No. 12A., and include:

1. Agent quantity for each nozzle.
2. Nozzle type and size.
3. Nozzle pressure.
4. Number of agent storage cylinders, cylinder fill weight, and density.
5. Total FM-200 agent weight.
6. Pipe schedule including sizes, length, volume, and percent of agent in pipe after discharge.
7. Discharge time.
8. Pressure at beginning of pipe network.
9. Pressure at beginning and end of each pipe section.
10. Flow rate, density, and pressure drop per pipe section.

D. Pipe Supports: Design and fabrication shall conform to the requirements of ASME B31.1.

E. Discharge Nozzles:

1. Provide sufficient nozzles to assure a uniform agent concentration throughout protected area.
2. Space discharge nozzles as required by applicable codes and manufacturer's criteria.
3. Consider additional nozzles based on area conditions and manufacturer's recommendations.

F. Fire Detectors:

1. Ionization and photoelectric type.
2. Base spacing and installation on guidelines in NFPA 72 recommended practices for ceiling construction and airflow, and on manufacturer's recommendations.

G. Locate manual discharge and abort stations at all exit doors from the protected area.

H. Locate alarm devices within the protected area and above each exit door outside the protected area.

I. Control Panel:

1. Panel Locations:

©COPYRIGHT 2013 CH2M HILL

a. MW-20 Bench Building.
b. TW Bench Building.

2. Locate to provide control, supervision, annunciation, and power for the operation of the fire suppression zone and detection circuits.
3. Provide rechargeable battery supply to automatically operate each protected area system including detectors, control panel, manual stations, alarm sounding devices, and auxiliary equipment in the event of a loss of primary power.
4. Provide a common general alarm circuit for common area signaling.
5. Provide form "C" SPDT dry contacts for general alarm and trouble.
6. Provide a single switch that will silence active signals without affecting subsequent signals.
7. Provide diagnostic indicators to indicate, at a minimum, ac power loss, dc power fault, auxiliary power loss, system common ground fault, and trouble in the common general alarm circuit.
8. Control Circuitry: Provide each protected area with the following supervised circuits:
   a. Detection: Utilizing cross-zoned or counting zone.
   b. Individually Fused and Silenceable Audible Circuits:
      1) Three required.
      2) Individual diagnostic fault indicators.
      3) Minimum of 24V dc, at 350 mA available power.
      4) Program to operate on alarm, predischarge, and discharge.
   c. Manual Release: Programmable with the following options:
      1) Override time delay and abort circuit. Discharge will be immediate.
      2) Override abort circuit but not the time delay. Discharge occurs at the end of the time delay.
      3) Not override time delay or abort circuits.
   d. Time Delay:
      1) Field programmable in 1-second intervals from 0 to 60 seconds.
      2) Have the ability, through the abort circuit, of being recycled and held until the abort switch is released.
      3) Control panel-mounted digital countdown timer.
      4) Illuminated digital display when the system time delay is active and counting down.
   e. Agent Release:
      1) Parallel wired initiators or solenoids, fully supervised.
      2) Wired in a Class A configuration such that a trouble signal will occur if there is a break in the wiring.

©COPYRIGHT 2013 CH2M HILL

3) System shall function properly if a fire condition occurs with this abnormal condition.

f. Abort:
   1) Dedicated and supervised.
   2) Actuation shall recycle the time delay to its original setting, and begin counting after the abort station (momentary) pushbutton is released.

g. Container Low-Pressure: Dedicated and supervised.

h. Diagnostic Fault Indicators: Detection, alarm audible, predischarge audible, discharge audible, manual release, and abort circuits; discharge circuit wiring; discharge device; relay connection; and low pressure.

i. Area ALARM/DISABLED Switch:
   1) Switch to disable the FM-200 discharge circuit.
   2) Switch shall not interfere with the detection or audible circuits.
   3) Operation of this switch shall cause a distinctive trouble indication for the area involved.

j. Protected Area Control Panel:
   1) Six DPDT and two SPDT auxiliary relays rated at 10 amps at 120V ac/3V dc resistive.
   2) Programmable relays for operation in alarm, predischarge, discharge, or trouble modes.
   3) Programming of relays without the need to relocate wiring.
   4) Means to individually operate relays without the need to put the control panel into alarm condition.
   5) Means to prevent each relay from operating in event of system testing.

k. Capability to transmit a trouble indication from each area.

J. Control System:

1. Actuation of a fire detector in the protected area shall initiate the following control functions:
   a. Light the corresponding suppression zone light on control panel.
   b. Activate alarm.
   c. Shut down HVAC equipment and close motorized air duct dampers serving protected area.
   d. Transmit a signal (close a normally-open alarm contact) to the building fire alarm system.
2. Actuation of a second fire detector in the protected area shall initiate the following control functions:
   a. Light the corresponding suppression zone light on control panel.

©COPYRIGHT 2013 CH2M HILL

b. Activate strobe/horn combination signaling predischarge of FM-200.
c. Shut down control and electrical equipment in the protected area.
d. Start preset agent discharge time delay.
e. Transmit a signal (close a normally-open alarm contact) to the building fire alarm system.

3. If predischarge is not aborted, and time delay expires, system shall discharge and strobe lights shall be activated outside the protected area.
4. Actuation of manual discharge stations shall immediately discharge FM-200 into the protected area and initiate the following control functions:
   a. Light suppression zone light on control panel.
   b. Activate visual and audible alarm devices.
   c. Transmit a signal (close a normally-open alarm contact) to the building fire alarm system.
5. Trouble conditions caused by open fire detector, valve actuator circuit wiring, or loss of agent storage container pressure shall initiate the following control functions:
   a. Light the corresponding suppression zone light on control panel.
   b. Light system trouble light.
   c. Sound system trouble signal.
   d. Transmit a signal (close a normally-open trouble contact) to the building fire alarm system.
6. Trouble conditions caused by open bell wiring, open battery circuit wiring, silenced alarm sounding devices, or loss of primary power shall initiate the following control functions:
   a. Light system trouble light.
   b. Sound system trouble signal.
   c. Transmit a signal (close a normally-open trouble contact) to the building fire alarm system.

K. FM-200 Reserve Supply:

1. Provide a reserve supply of agent and storage containers equal to the main supply.
2. Include required piping, actuating devices, and miscellaneous components to provide a permanently connected reserve system.
3. Reserve containers may have a completely separate set of piping and nozzles, or be connected to the same piping as the main supply.
4. Provide a key operated selector switch to change from the main system to the reserve supply.
5. Provide isolation check valves in discharge piping to prevent loss of agent or injury to personnel in event of system actuation when an agent container is removed.

©COPYRIGHT 2013 CH2M HILL

6. Transfer to Connected Reserve shall be by means of an electrical switch mounted near the control panel.

L. Provide electrical intertie between building fire alarm system, HVAC equipment, and protected area FM-200 control panel as specified in Division 26, Electrical.

1.05 SUBMITTALS

A. Action Submittals:

1. Shop Drawings:
   a. Data sheets, catalog cuts, and technical information describing system components and devices to be installed.
   b. Calculations for standby battery power.
   c. Wiring diagrams including elementary, electrical termination, and interconnection diagrams.
   d. One-line conduit diagrams showing equipment locations, conduit locations, wire size, number of conductors, equipment mounting and other construction details.
   e. Isometric piping diagrams showing location of agent storage containers, pipe sizes, pipe lengths, and fittings. Key to required piping and nozzle calculations, and cross reference all junctions with calculations.
   f. Complete details on support of agent storage containers.
   g. Seismic anchorage and bracing drawings and cut sheets, as required by Section 01 88 15, Seismic Anchorage and Bracing.

B. Informational Submittals:

1. Experience qualification listing of firm(s) proposed to design and install the system.
2. Design Calculations:
   a. Hydraulic flow from a UL listed computer program, including the manufacturer’s name and UL listing for verification.
   b. Include individual pipe lengths and fittings to be used.
   c. Verify that the design concentration of FM-200 is reached within specified time.
3. Seismic anchorage and bracing calculations as required by Section 01 88 15, Seismic Anchorage and Bracing.
4. Test Plan: Submit as specified in Article Field Quality Control, at least 30 days prior to beginning functional testing.

©COPYRIGHT 2013 CH2M HILL

5. Component and attachment testing seismic certificate of compliance as required by Section 01 45 33, Special Inspection and Testing.
6. Operation and Maintenance Data: As specified in Section 01 78 23, Operation and Maintenance Data.
7. Manufacturer's Certificate of Proper Installation, in accordance with Section 01 43 33, Manufacturers' Field Services.

1.06 QUALITY ASSURANCE

A. Qualifications: System design and installation shall be by licensed firm(s) having a minimum of 5 years of documented experience in the design, installation, and testing of similar types of suppression systems.

1.07 MAINTENANCE

A. Inspections During Warranty Period:

1. Provide two system inspections, at 6 months and at 12 months, during the 1-year Correction Period.
2. Conduct the inspections in accordance with the manufacturer's guidelines and in compliance with NFPA 2001.
3. Submit documentation to OWNER upon completion of each inspection certifying satisfactory system operation.

PART 2 - PRODUCTS

2.01 SYSTEM CONTROL PANEL

A. General: Panel shall contain required system operation lights, reset and silence switches, circuits, relays, a standby battery power and either an enclosed or adjacently-mounted battery charger, and all other devices necessary to provide a complete automatic control system.

B. Cabinet:

1. UL listed and FM approved as an alarm-releasing control unit.
2. NEMA 250, Type 1.
3. Surface-mounted, 18-gauge steel.
4. Door: Hinged, key lockable.
5. Finish: Manufacturer's standard color.

C. Standby Battery:

1. Minimum Capacity: 6 Ah.

©COPYRIGHT 2013 CH2M HILL

2. Sized to operate the system for a minimum of 24 hours in supervisory condition and 5 minutes in alarm control condition immediately after the time in supervisory condition.
3. Sealed, gelled electrolyte type, designed for fire alarm service.
4. Supervised to provide a trouble signal on low voltage, open, or shorted cell.

D. Battery Charger:

1. Automatic, solid state, capable of charging batteries from 75 to 100 percent of full charge within 24 hours.
2. Voltmeter or other means to display battery condition.
3. Enclosure: Manufacturer's standard.

2.02 FIRE DETECTION BASE AND DEVICES

A. Base:

1. Interchangeable with photoelectric or thermal type detectors.
2. LED that illuminates steadily upon detector sensing a fire condition and with ability to power a remote annunciator that will duplicate LED indication.

B. Detection Devices, General:

1. Equip with a means of securing head to base in a manner that head may not be readily tampered with or removed.
2. UL listed and FM approved.

C. Ionization Type Device:

1. Dual chamber type, utilizing solid state circuitry.
2. Unaffected by RF energy from 1 kHz through 100 MHz or air velocities up to 3,000 fpm.

D. Photoelectric Type Device:

1. Solid state circuitry, pulsed infrared LED light source, and silicon photodiode receiving element.
2. Incorporate means to discriminate between valid fire signals and nonfire signal.
3. Include a fine stainless steel mesh cover to prevent foreign objects from entering sensing chamber.
4. Dew-proof and unaffected by air velocities up to 3,000 fpm.

©COPYRIGHT 2013 CH2M HILL

2.03 MANUAL DISCHARGE STATION

A. Furnish to provide a means of manually discharging the fire suppression system in case of an emergency.

B. Stainless steel, with keyed red release button.

C. Cover shall include operating instructions and identify discharge station as a FM-200 discharge component.

D. Double-pole switch.

E. UL listed and FM approved.

2.04 DISCHARGE ABORT STATION

A. “Dead-man” type requiring constant pressure to transfer one set of normally open and one set of normally closed contacts on each contact block.

B. Digital countdown timer to indicate time remaining until system discharge.

C. Faceplate constructed of stainless steel, with abort button, operating instructions, and identification as a component of the FM-200 system.

D. Rated 6 amps at 120V ac and 1 amp at 120V dc, with ability to override shutdown of HVAC and control equipment.

E. UL listed and FM approved.

2.05 ALARM BELL

A. Vibrating type, approved for use with the control unit provided.

B. Polarized for full supervision, and rated at 24V dc, drawing no more than 0.063 amps.

C. Noise Level: 86 to 90 dB at 10 feet.

D. Finish: Baked red enamel.

E. UL listed and FM approved.

©COPYRIGHT 2013 CH2M HILL

2.06 STROBE LIGHT

A. Rating: 24V dc with amperage draw of 0.033 amps.

B. Lamp protected by a white translucent lens imprinted with the word FM-200 in red letters.

C. Polarized, powered from the control panel.

D. UL listed and FM approved.

2.07 AGENT STORAGE CONTAINERS

A. High-strength alloy steel, equipped with the following:

1. Integral lifting ring.
2. Automatic, remotely operated discharge valve assembly.
3. 0 to 600 psi pressure gauge.
4. Electrically supervised valve actuator.
5. Filling valve to allow recharging in place.
6. Supervisory pressure switch to sense loss of agent from the container.
7. Liquid level indicating device, UL listed.

B. Container and Valve: Conform to DOT Specification 4BW500 or 4BA500.

C. Automatic Pressure Relief: On overpressure condition of 810 to 1,000 psi.

D. Superpressurized with dry nitrogen to 360 psig at 70 degrees F.

2.08 PIPING

A. In accordance with Section 22 10 01, Plumbing Piping and Accessories:

1. Distribution Piping: Black or galvanized steel, ASTM A53, Grade A, or ASTM 106, Grade A, B, or C.
2. Fittings: Malleable iron, 300-pound class, ASTM A197.

2.09 ELECTRICAL

A. In accordance with Division 26, Electrical.

©COPYRIGHT 2013 CH2M HILL

PART 3 - EXECUTION

3.01 DETECTORS

A. Install ionization and photoelectric detectors such that spacing per detector does not exceed 250 square feet.

B. Do not install detectors closer than 3 feet from air supply diffusers and 1 foot from wall.

C. Conform to NFPA No. 72E, latest edition.

3.02 AGENT STORAGE CONTAINERS

A. Floor mount and securely support to wall with wall brackets.

B. Attach mounting brackets and piping to the structure in a manner capable of withstanding the thrust developed during discharge without displacement.

C. Connect the same size containers to a common manifold.

3.03 CONNECTED RESERVE

A. Provide complete connected reserve supply of FM-200 in agent containers, duplicating those in main supply.

3.04 PIPING

A. Install in accordance with Section 22 10 01, Plumbing Piping and Accessories.

B. Cap pipe ends immediately after installation. Maintain until nozzles are installed.

C. Provide escutcheon plates at all pipe penetrations through walls, floors, and ceilings.

D. Pipe Supports: Install in accordance with ASME B31.1.

3.05 ELECTRICAL

A. Install in accordance with Division 26, Electrical.

©COPYRIGHT 2013 CH2M HILL

3.06 SIGNS

A. In addition to the following, provide as required to comply with NFPA 2001 and the recommendations of the FM-200 equipment manufacturer:

1. Caution:
   a. Provide on all entry doors to FM-200 protected areas.
   b. Wording: Alert personnel that room is protected by FM-200 and all doors must be kept closed in event of fire.
   c. Size: 10 inches by 14 inches by 1/16 inch, constructed of plastic, with black face and yellow letters.
2. Manual Discharge:
   a. Provide adjacent to each manual discharge station.
   b. Identify the manual discharge station as the place where FM-200 can be manually discharged.
   c. Size: 4 inches by 4 inches by 1/16 inch, constructed of plastic, with red face and white letters.
3. Flashing Light:
   a. Provide adjacent to each strobe horn and light.
   b. Explain the presence of the flashing lights.
   c. Size: 7 inches by 4 inches by 1/16 inch, constructed of plastic, with red face and white letters.

3.07 FIELD FINISHING

A. As specified in Section 09 90 00, Painting and Coating.

B. Pipe Labeling:

1. Label with the legend FM-200 EXTINGUISHING AGENT in letters 1 inch high.
2. Maximum Intervals:
   a. Exposed Piping: 12 feet.
   b. Concealed Piping: 20 feet.

3.08 FIELD QUALITY CONTROL

A. General: System functional and performance testing shall be conducted by qualified, trained personnel in accordance with the manufacturer’s recommended procedures and NFPA 2001.

B. Test Plan:

©COPYRIGHT 2013 CH2M HILL

1. Prepare a plan of testing to include a step-by-step description of all tests to be performed and the type and location of test apparatus to be employed.
2. Testing shall not be conducted until the Test Plan has been approved.

C. Functional Tests:

1. Perform under supervision of equipment manufacturer and with the ENGINEER present.
2. All functional testing, including system and equipment interlocks, must be successfully completed at least 5days prior to beginning performance testing.
3. Check all containers and distribution piping for proper mounting and installation.
4. Test all electrical wiring for proper connection, continuity, and resistance to ground.
5. Verify that HVAC connections to the area have properly installed dampers, and HVAC equipment will shut down upon a signal from the FM-200 control panel.
6. Test each detector in accordance with the manufacturer's recommended procedures, and record test values.
7. Demonstrate that all system and equipment interlocks, such as door release devices, audible and visual devices, equipment shutdowns, and local and remote alarms function as designed.
8. Test each control panel circuit by inducing a trouble condition into the system.

D. Performance Test:

1. Perform under actual or approved simulated operating conditions to demonstrate that the entire control system functions as designed and intended.
2. Perform under supervision of equipment manufacturer.
3. Demonstrate to the ENGINEER and authorities having jurisdiction, operation of all components under simulated fire conditions.
4. Test in accordance with NFPA 2001.
5. Conduct using the Retro-Tec Corp. door fan system, or equivalent, with integrated computer program.
6. Room Pressurization:
   a. Conduct test, at room pressurization in each protected space, to determine the presence of openings that would affect the system concentration levels.
   b. Seal all protected spaces against agent loss or leakage.

©COPYRIGHT 2013 CH2M HILL

c. Conduct pressurization tests until protected space is shown to be successfully sealed.

7. Test the following circuits:
   a. Automatic actuation.
   b. A.R.M.
   c. Manual actuation.
   d. HVAC and power shutdowns.
   e. Audible and visual alarm devices.
   f. Manual override of abort functions and agent container pressure supervision.
   g. Supervision of all panel circuits, including ac power and battery power supplies.
8. Upon acceptance by OWNER, recharge system if required, and place the completed system into normal service.

3.09 MANUFACTURER'S SERVICES

A. Provide qualified manufacturer's representative(s) for the equipment specified herein at the Job Site and classroom designated by the OWNER for the following services:

1. Installation assistance, inspection, and certification of installation.
2. Functional and performance testing assistance.
3. Classroom or Job Site training of OWNER's operations and maintenance personnel.

8. Plumbing and Drainage Institute (PDI): WH 201, Water Hammer Arresters Standard.

1.02 DESIGN REQUIREMENTS

A. Where pipe diameter, thickness, pressure class, pressure rating, or thrust restraint is not shown or specified, design piping system in accordance with the following:

1. Sanitary Building Drainage and Vent Systems Local plumbing code.

1.03 SUBMITTALS

A. Action Submittals:

1. Product data sheets.
2. Shop Drawings:
   a. Show CONTRACTOR recommended changes in location of fixtures or equipment.
   b. Seismic anchorage and bracing drawings and data sheets, as required by Section 01 88 15, Seismic Anchorage and Bracing.
3. Isometric riser diagrams.

B. Informational Submittals:

©COPYRIGHT 2013 CH2M HILL

1. Seismic anchorage and bracing calculations as required by Section 01 88 15, Seismic Anchorage and Bracing.
2. Changes in location of equipment or piping that affect connecting or adjacent work, before proceeding with the work.
3. Complete list of products proposed for installation.
4. Test records produced during testing.

PART 2 - PRODUCTS

2.01 PIPING

A. Piping Schedule: Refer to Article Supplements.

B. Piping Material: Refer to Piping Data Sheet(s), Article Supplements

2.02 PIPE HANGERS AND SUPPORTS

A. Refer to Section 40 05 15, Piping Support Systems.

2.03 INSULATION

A. As specified in Section 22 07 00 Building Mechanical Thermal Insulation.

2.04 VALVES

A. General:

1. Furnish complete with necessary operating hand wheels, chain wheels, extension stems, floor stands, worm and gear operators, operating nuts, chains, and wrenches.
2. Renewable Parts Including Discs, Packing, and Seats: Types as recommended by valve manufacturer for intended service.
3. Units shall have name of manufacturer and size of valve cast on body or bonnet or shown on a permanently attached plate in raised letters.

B. Design Features:

1. Brass and bronze components, including appurtenances in contact with water.
2. Alloys containing less than 16 percent zinc and 2 percent aluminum.
3. Alloys are of the following ASTM designations:
   a. B61, B62, B98/B98M (Alloy A, B, or D), B139 (Alloy A), B164, B194, and B127.

©COPYRIGHT 2013 CH2M HILL

b. Stainless steel Alloy 18-8 may be substituted for bronze as an option with approval of ENGINEER.

4. Gland Bolts on Iron Body Valves: Bronze, fitted with brass nuts.

C. Valve Operators:

1. Open by turning counterclockwise.
2. Worm and Gear Operators On Manually Operated Valves: Totally enclosed design, proportioned as to permit operation of valve under full operating head with maximum pull of 40 pounds on handwheel or crank.
3. Self-locking type to prevent the disc or plug from creeping.
4. Self-Locking Worm Gears:
   a. One-piece design of gear bronze material, accurately machine cut.
   b. Worm: Hardened alloy steel, with thread ground and polished.
   c. Reduction gearing shall run in a proper lubricant.
5. Galvanize handwheels.

D. Gate Valves:

1. 3 Inches and Smaller for Water and Air Services:
   a. All-bronze with screwed bonnet, single solid wedge gate with nonrising stem, and handwheel operator.
   b. Rated 125-pound SWP, 200-pound WOG.
   c. Manufacturers and Products for Threaded Ends:
      1) Crane; No. 438.
      2) Nibco; Model No. T-113.
   d. Manufacturers and Products for Soldered Ends:
      1) Crane; No. 1701S.
      2) Nibco; Model No. S-113.
2. 4 Inches and Larger for Water and Air Services:
   a. Iron body, bronze mounted, with flanged ends, solid wedge gate with nonrising stem, and handwheel operator.
   b. Rated 125-pound SWP, 200-pound WOG.
   c. Manufacturers and Products:
      1) Crane; No. 461.
      2) Nibco; Model No. F-619.

E. Ball Valves:

1. 2 Inches and Smaller for General Water and Air Service:
   a. Three-piece body type, bronze body and end pieces, hard-chrome plated bronze or brass ball, full bore port, RTFE seats and packing,

©COPYRIGHT 2013 CH2M HILL

blowout-proof stem, zinc-plated steel hand lever operator with vinyl grip.

b. Rated 6-pound WOG, 150-psi SWP.
c. [For steam service, provide stainless steel ball and stem.]
d. Manufacturers and Products:
    1) Threaded Ends:
        a) Milwaukee; BA-300.
        b) Nibco; T-595-Y.
        c) Conbraco Apollo; 82-100.
    2) Soldered Ends:
        a) Milwaukee; BA-350.
        b) Nibco; S-595-Y.
        c) Conbraco Apollo; 82-200.

2. 3 Inches and Smaller for Vacuum Service:
    a. Brass body and trim, replaceable double TFE seals and seats.
    b. Furnish screwed ends and rate for service to 0.01 micron.
    c. Manufacturers and Products:
        1) Jamesbury; Style A.
        2) Worcester; Series 400.
3. Thermoplastic Ball Valves 2 Inches and Smaller for Water Service:
    a. Rated 150 psi at 105 degrees F, with ASTM D1784, Type I, Grade 1 polyvinyl chloride (PVC) body, ball, and stem.
    b. End entry, double union design, with replaceable Teflon seats and Viton or Teflon O-ring stem seals.
    c. Furnish with hand lever operator.
    d. Single union ball valves with flanged ends drilled to 150-pound ANSI Standard are acceptable.
    e. Manufacturers:
        1) Asahi/America.
        2) R&G Sloane Manufacturing Co., Inc.
4. Deionized Water Ball Valve (1/2 Inch to 2 Inches):
    a. True Union ball valve, size as shown on the Drawings.
    b. Manufactured from virgin polypropylene using no antioxidants, plasticizers, or pigments.
    c. Socket-weld type electrically fused. Factory sealed in a protective wrap.
    d. Minimum pressure rated of 140 psi at 70 degrees F.
    e. Manufacturers:
        1) R&G Sloane Manufacturing Co., Inc.
        2) Orion Fittings, Inc.
        3) Chemline Plastics Ltd.

©COPYRIGHT 2013 CH2M HILL

F. Globe Valves:

1. 3 Inches and Smaller:
   a. Bronze body, replaceable composition disc, screwed ends, union bonnet, inside screw rising stem, and TFE disc.
   b. Rated 150-pound SWP, 300-pound WOG.
   c. Manufacturers and Products:
      1) Crane; No. 7TF.
      2) Nibco; No. T-235-Y.

G. Plug Valve:

1. 2 Inches and Smaller for Natural Gas and Propane Gas Service:
   a. Eccentric type, nonlubricated, cast iron body, and bronze plug with Buna N elastomer O-ring seal.
   b. UL listed and CSA (AGA-CGA) approved.
   c. Pressure Rating: ANSI 125, 175 psi.
   d. Threaded end connections.
   e. Manufacturers and Products:
      1) Milliken Valve Company, Inc.; Series 625.
      2) Key Port Valve; Series 400.
2. 2-1/2 Inches to 4 Inches for Natural Gas and Propane Gas Service:
   a. Eccentric type, nonlubricated, cast iron body and nickel plated cast iron plug with Buna N elastomer O-ring seal.
   b. UL listed and CSA (AGA-CGA) approved.
   c. Pressure Rating: ANSI 125, 175 psi.
   d. End Connections:
      1) 2-1/2 Inches to 3 Inches: Threaded.
      2) 4 Inches: Flanged, ASME B16.1, Class 125/150.
   e. Manufacturers and Products:
      1) Milliken Valve Company, Inc.; Series 625.
      2) Key Port Valve; Series 400.

H. Angle Valves 3 Inches and Smaller:

1. Bronze body, threaded ends, union bonnet, and rising stem.
   a. Rated 150-pound SWP and 300-pound WOG.
   b. Manufacturers and Products for Threaded End:
      1) Crane; No. 17TF.
      2) Nibco; No. T-335-Y.

I. Check Valves 3 Inches and Smaller:

©COPYRIGHT 2013 CH2M HILL

1. Bronze body, wye pattern, threaded ends and cap, regrinding seat, and swing type disc.
2. Rated 125-pound SWP, 200-pound WOG.
3. Manufacturers and Products:
   a. Crane; No. 37.
   b. Walworth Co.; Figure 406.

J. Backwater Check Valve 2 Inches to 8 Inches:

1. Coated cast iron backwater check valve, integral offset type swing-check assembly, [gasketed bolted access cover] [threaded, ferrule, and cover].
2. Manufacturers and Products:
   a. J. R. Smith; Figure 7012.
   b. Josam; Series 67500.
   c. Zurn; Model Z-1095.

K. Balancing Valves (Recirculating Hot Water):

1. Bronze, calibrated balancing type with provisions for connecting a portable differential pressure meter. Meter connections shall have built-in check valves.
2. An integral pointer shall register degree of valve opening.
3. Construct with internal seals to prevent leakage around rotating element.
4. Rated for 125 psig working pressure at maximum temperature of 250 degrees F.
5. Furnish one pressure gauge type readout meter in carrying case.
6. Furnish with preformed polyurethane insulation valve enclosure, suitable for use on hot water systems.
7. Manufacturers and Products:
   a. Bell & Gossett; No. CB circuit setter.
   b. TACO; Series 790.

L. Water Pressure Reducing Valves 1/2 Inch Through 2-1/2 Inches:

1. Spring controlled, with a neoprene diaphragm.
2. Sizes and Ratings:
   a. PRV-[_____]: [_____]-inch IPS, maximum [_____] gpm, with inlet pressure [_____] psig; outlet pressure [_____] psig.
3. Manufacturers and Products:
   a. Fisher; Type 75.
   b. Watts; No. 223.

©COPYRIGHT 2013 CH2M HILL

M. Gauge Cock Valves 1/8 Inch to 3/8 Inch:

1. Bronze body, hexagon male and female ends, and tee head.
2. Rated for 125-pound SWP.
3. Manufacturers and Products:
   a. Ernst Gage Co.; [_____]
   b. Lunkenheimer.

N. Manual Air Vent Valves:

1. With coin-operated air vent.
2. Manufacturers and Products:
   a. Bell & Gossett; No. 4V.
   b. Dole; No. 9.

O. Solenoid Valves:

1. Two-way, full line size, normally [closed,] [open,] [_____] psig body pressure, [_____] psig operating differential, for use with cold water.
2. Suitable for 115-volt, 60-Hz, ac power supply.
3. Manufacturers:
   a. Automatic Switch Co.
   b. Skinner.

2.05 MISCELLANEOUS PIPING SPECIALTIES

A. Strainers for Water Service:

1. Iron body, Y-pattern, 125-pound rated, with screwed bronze or bolted iron cap.
2. Screen: Heavy-gauge stainless steel or monel, 30 mesh.
3. Manufacturers and Products:
   a. Crane; No. 988-1/2.
   b. Mueller; No. 758.

B. Flexible Connectors for Stainless Steel Gas Lines:

1. Corrugated, Type 316 stainless steel hose, with 10-inch live length and Type 316 stainless steel male NPT pipe connectors at each end.
2. Manufacturers:
   a. Flexonics Braided Rex-Weld.
   b. Kin-Line.

©COPYRIGHT 2013 CH2M HILL

C. Vacuum Breakers 2 Inches and Smaller:

1. Angle type, as required.
2. Manufacturers:
   a. Febco.
   b. Watts.

D. Water Hammer Arresters:

1. Materials: ASSE 1010 certified, Type L copper tube, HHPP piston with two lubricated EPDM O-rings, FDA approved lubricant, rolled piston stop, wrought copper male thread adapter.
2. Manufacturers and Products:
   a. Sioux Chief Mfg. Co., Inc.; Series 650 and 660.
   b. Precision Plumbing Products, Inc.

E. Sleeves:

1. Manufacturers and Products:
   a. J. R. Smith; Figure 1720.
   b. Josam; No. 26400.

F. Flashing Sleeves for Roof Penetrations:

1. Built-Up Bituminous Roofing: Fabricate of lead as specified in Section 07 62 00, Sheet Metal Flashing and Trim.
2. Single-Ply Membrane Roofing: Pipe seals as specified in Section 07 70 01, Roof Specialties and Accessories.

G. Insulating Dielectric Unions and Flanges:

1. Galvanically compatible with piping to which attached and pressure ratings suitable for system working pressures.
2. Unions 2 Inches and Smaller: Screwed or solder-joint type.
3. Unions 2-1/2 Inches and Larger: Flanged type, complete with bolt insulators, dielectric gasket, bolts, and nuts.
4. Manufacturers:
   a. Epco Sales, Inc., Cleveland, OH.
   b. Capitol Insulation Unions.

H. Air Admittance Valve (AAV):

1. PVC construction with internal air check valve and insect screen.

©COPYRIGHT 2013 CH2M HILL

2. Unit shall meet ASSE 1051 for fixture and branch air admittance valves.
3. Unit shall bear seal of ASSE approval.
4. Manufacturer and Product: Studor, Inc., Dunedin, Florida; Maxi-Vent (2 inches to 4 inches).

I. Joint Solder: 95-5 wire solder, ASTM B32, Grade 95 TA. Do not use cored solder.

J. Pipe Joint Sealer: Compound insoluble in water or Teflon tape; approved by NFS for use in potable water.

K. Rubber Gaskets: ASTM C564.

2.06 MEASURING DEVICES

A. Thermometers:

1. Adjustable angle, organic spirit type, blue in color, with 9-inch case and scale range in degrees F, as shown.
2. Furnish with 3-1/2-inch stem length and separable NPT brass thermowell.
3. Manufacturers:
   a. Trerice Co.; Model A005.
   b. Weksler.

B. Pressure Gauges:

1. Construction: 3-1/2-inch gauge size, 0 to 690 kPa, 0 to 160 psi range, steel case, glass crystal, brass movement, and 1/4-inch NPT lower connection.
2. Furnish with 1/4-inch brass gauge cock.
3. Manufacturers and Products:
   a. Ashcroft; Type 1008.
   b. Marsh; J80.
   c. Marshalltown.

C. Natural Gas Meters:

PART 3 - EXECUTION

3.01 GENERAL

A. Install plumbing systems to meet applicable plumbing code.

B. Field Obstructions:

©COPYRIGHT 2013 CH2M HILL

1. Drawings do not attempt to show exact details of piping. Provide offsets around obstructions.
2. Do not modify structural components, unless approved by ENGINEER.

C. Sleeves:

1. Pipe sizes shown are nominal sizes, unless shown or specified otherwise.
2. Provide piping passing through walls, floors, or ceilings with standard-weight pipe sleeves.
3. Provide pipes passing through finished walls with chrome-plated canopy flanges.
4. Dry pack sleeves in existing work in-place and provide finished appearance.
5. Pack holes left by removal of existing piping with grout and finish to match adjacent surface.

D. Provide unions in piping systems at connections to equipment.

E. Provide shielded transition couplings, insulating dielectric unions and flanges between ferrous and nonferrous piping and where otherwise required for electrically insulated connection.

F. Pipe air release valves, water-lubricated bearings, and other appurtenances having water effluent with copper tubing to nearest drain.

3.02 INSTALLATION

A. Steel Pipe:

1. Ream, clean, and remove burrs and mill scale from piping before making up.
2. Seal joints with pipe joint sealer or Teflon tape.

B. Copper Tubing:

1. Cut tubing square and remove burrs.
2. Clean both inside of fittings and outside of tubing with steel wool and hydrochloric acid before soldering.
3. Prevent annealing of fittings and hard-drawn tubing when making connections.
4. Do not use mitered joints for elbows or notching of straight runs of pipe for tees.

C. Rigid PVC or CPVC:

©COPYRIGHT 2013 CH2M HILL

1. Cut, make up, and install in accordance with pipe manufacturer's recommendations.
2. Ream, clean, and remove burrs from cut ends before joining pipe.
3. Lay in trench by snaking pipe from one side to other.
4. Offset: As recommended by manufacturer for maximum temperature variation between time of solvent welding and final use.
5. Do not lay pipe when temperature is below 40 degrees F or above 90 degrees F when exposed to direct sunlight.
6. Shield ends to be joined from direct sunlight prior to and during laying operation.
7. Use strap wrenches only for tightening threaded plastic joints. Do not over tighten fittings.

D. Water System Balancing: Provide a qualified registered engineer or firm specializing in testing and balancing to adjust domestic water system. Balance system for required water flows at each plumbing fixture, terminal device, and recirculating hot water loop.

E. Water Hammer Arresters:

1. Install in piping systems where shown on Drawings and adjacent to pieces of equipment where quick closing valves are installed.
2. Install at all emergency safety showers and eyewashes.
3. Size and install in accordance with PDI-WH201.
4. Shock arresters to have access panels or to be otherwise accessible.

F. Valves: Install in accordance with manufacturer's recommendations.

G. Miscellaneous Piping Specialties: Install in accordance with manufacturer's recommendations.

H. Measuring Devices: Install in accordance with manufacturer's recommendations.

3.03 SANITARY AND WASTE DRAINS AND VENTS PIPING

A. Installation:

1. Set piping above floor slab true and plumb.
2. Set exposed risers as close to walls as possible.
3. Where vent stacks pass through roof slab, fit with flashing sleeve secured to roof.
4. Extend vents minimum 1 foot above roof.
5. Provide cleanouts where shown and where required by code.

©COPYRIGHT 2013 CH2M HILL

3.04 ACID-RESISTANT DRAINS AND VENTS

A. Install in accordance with manufacturer's recommendations.

B. Drainage Vents: Same piping system as used for acid-resistant drains.

C. Make connections between polypropylene piping systems and other acid-resistant drainage systems with adapters recommended by manufacturer.

D. Buried Polypropylene Pipe:

1. Heat join and test for leakage before placing in trench.
2. Snake slightly on long runs placed in trench.
3. When installed in extremely hot or cold weather, make proper allowance for expansion or contraction.

E. Buried Acid-Resistant Cast Iron Pipe With Teflon-Lined Couplings:

1. Install in accordance with manufacturer's instructions.
2. Do not allow acid waste to contact pipe and Teflon until installation is complete and tested.

F. Buried Polypropylene Drain and Vent Pipe:

1. Install in accordance with manufacturer's recommendations.
2. Trench shall have a clean sand bed graded to proper pitch.
3. Completely cover pipe with clean sand prior to backfilling.
4. Compact sand by flooding with water.
5. Do not permit sharp stones in backfill surrounding pipe.

3.05 HVAC CONDENSATE PIPING

A. Set piping true and plumb.

B. Slope piping 1/8 inch per foot minimum.

3.06 WATER SUPPLY PIPING

A. Water supply piping includes potable W1systems.

B. Flush water piping systems clean of internal debris, clean faucet aerators, and adjust plumbing fixture valves for manufacturer's recommended flow.

©COPYRIGHT 2013 CH2M HILL

C. Do not run water piping through electrical rooms, stairwells, or immediately over or within a 3-foot horizontal clearance of electrical panels, motor starters, or environmental control panels.

D. Provide valve operators with position indicators, where indicated, to show position of valve disc or plug.

E. Provide bypass with globe valve for emergency throttling around each reducing valve.

F. Vacuum Breakers 2 Inches and Smaller: Install minimum 6 inches above flood line of equipment they serve.

3.07 INSULATION

A. As specified in Section 22 07 00, Building Mechanical Thermal Insulation.

3.08 HANGERS AND SUPPORTS

A. Install pre-engineered support equipment in accordance with manufacturer's recommendations.

B. Hanger Rod Sizing and Spacing for:

1. Steel Pipe:

Pipe Size	Max. Hanger Spacing (feet)	Min. Rod Size (inches)
1 inch and smaller	6	1/4
1-1/4 through 2-1/2 inches	8	1/4
3 and 4 inches	10	3/8
6 inches	12	3/8
8 inches	12	1/2

2. Copper Pipe:
   a. Rod Size: Same as for steel pipe.
   b. Spacing: 2 feet less per size than for steel pipe, except pipe 1-1/4 inches and smaller shall be supported every 6 feet.
3. Cast Iron Pipe:

©COPYRIGHT 2013 CH2M HILL

a. Rod Size: Same as for steel pipe.
b. Spacing: Locate hanger rods at each pipe joint and change of direction, 10-foot maximum spacing.

4. Plastic Pipe:
   a. Rod Size: Same as for steel pipe.
   b. Spacing: As recommended by manufacturer and required by applicable plumbing code for flow and temperature in pipe.
   c. No metal portion of hanger shall contact pipe directly.

C. Attach Support Rods For Horizontal Piping:

1. To steel beams with I-clamps.
2. To concrete with inserts or with flanges fastened with flush shells.
3. To wood with thickness of 2-1/2 inches or more with bolts or angle clips.

D. Trapeze Hangers:

1. Trapeze hangers may be used in lieu of individual hangers where horizontal piping is arranged with two or more parallel lines.
2. Attach lines to horizontal with U-bolts or one-hole clamps.

E. Vertical Piping:

1. Support by channel type support system and pipe clamps on 10-foot maximum centers.
2. Copper, and Plastic Piping: Isolate from channels and pipe clamps with pipe isolators.

F. Insulated Piping: Furnish galvanized protection shield and oversized hangers under insulated piping.

3.09 INTERIM CLEANING

A. Prevent accumulation of weld rod, weld spatter, pipe cuttings and filings, gravel, cleaning rags, and other foreign material within piping during fabrication and assembly.

B. Examine piping to assure removal of foreign objects prior to assembly.

C. Shop cleaning may employ conventional commercial cleaning method if it does not corrode, deform, swell, or otherwise alter physical properties of material being cleaned.

©COPYRIGHT 2013 CH2M HILL

3.10 TESTING

A. [As specified in Section 40 80 01, Process Piping Leakage Testing.]

B. General:

1. Conduct pressure and leakage tests on newly installed pipelines.
2. Provide necessary equipment and material, and make taps in pipe, as required.
3. [ENGINEER] [_____] will monitor tests. Provide 24-hour advance notice of start of testing.
4. Test Pressures: As specified herein and in Piping Schedule.
5. Test Records: Make records of each piping system installation during test to document the following:
   a. Date of test.
   b. Description and identification of piping tested.
   c. Test fluid.
   d. Test pressure.
   e. Remarks, including:
      1) Leaks (type, location).
      2) Repairs made on leaks.
   f. Certification by CONTRACTOR and signed acknowledgment by [ENGINEER] [_____] that tests have been satisfactorily completed.

C. Testing New Pipe Connected to Existing Pipe: Isolate new pipe with grooved end pipe caps, spectacle blinds, or blind flanges.

D. Preparation and Execution:

1. Buried Pressure Piping:
   a. An initial service leak test may be conducted with a partially backfilled trench and the joints left open for inspection, if field conditions permit, as determined by ENGINEER.
   b. Expose joints for the acceptance test on buried pressure piping to be pneumatically tested or subjected to an initial service leak test.
   c. Conduct final hydrostatic acceptance tests after trench has been completely backfilled.
2. Exposed Piping: Conduct tests after piping has been completely installed including supports, hangers, and anchors, but prior to insulation.

E. Hydrostatic Leak Tests:

©COPYRIGHT 2013 CH2M HILL

1. Equipment: Provide the following:

Amount	Description
2	Graduated containers
2	Pressure gauges
1	Hydraulic force pump
	Suitable hose and suction pipe as required

2. Procedure:
   a. Use water as the hydrostatic test fluid.
   b. Provide clean test water of such quality as to minimize corrosion of the materials in the piping system.
   c. Open vents at high points of the piping system to purge air pockets while the piping system is filling.
   d. Venting during filling of system may also be provided by loosening flanges with a minimum of four bolts or by the use of equipment vents.
   e. Test piping systems at test pressure specified in Piping Schedule.
   f. Maintain hydrostatic test pressure continuously for 30 minutes minimum and for such additional time as necessary to conduct examinations for leakage.
   g. Examine joints and connections for leakage.
   h. Piping system, exclusive of possible localized instances at pump or valve packing, shall show no visual evidence of weeping or leaking.
   i. Correct visible leakage and retest to satisfaction of [ENGINEER] [_____].
3. Gravity Sewers and Drains:
   a. Test by water or air exfiltration tests as prescribed by local or state plumbing codes and visually examine for leaks.
   b. Repair leaks and retest system until no further leakage is evident.

F. Pneumatic Leak Tests:

1. Perform on compressed air, natural gas, and vacuum piping.
2. Equipment: Provide the following:

©COPYRIGHT 2013 CH2M HILL

Amount	Description
1	Pneumatic compressor separator-dryer system capable of providing oil-free dry air and equipped with one or more full capacity safety relief valves set at a pressure of not more than 105 percent of the required primary test pressure
1	Calibrated test gauge

3. Procedure:
   a. Perform pneumatic testing using accurately calibrated instruments and oil-free, dry air.
   b. Perform tests only on exposed piping, after piping has been completely installed, including supports, hangers and anchors, and inspected for proper installation.
   c. Test piping system at test pressure specified in Piping Schedule.
   d. Take necessary precautions to protect test personnel [and OWNER's operating personnel] from hazards associated with air testing.
   e. Secure piping to be tested to prevent damage to adjacent piping and equipment in event of a joint failure.
   f. Prior to test, remove or suitably isolate appurtenant instruments or devices that could be damaged by test.
   g. Apply maximum 25 psig preliminary pneumatic test to piping system prior to final leak testing, to locate major leaks.
   h. Examine joints and connections for leakage with soap bubbles.
   i. Correct visible leaks and retest to satisfaction of [ENGINEER] [_____].
   j. Gradually increase pressure in system to not more than one-half of test pressure.
   k. Thereafter increase pressure in steps of approximately 1/10 of maximum test pressure until required test pressure is reached.
   l. Maintain pneumatic test pressure continuously for minimum 10 minutes and for such additional time as necessary to conduct a soap bubble examination for leakage.
   m. Piping system, exclusive of possible localized instances at pump or valve packing, shall show no evidence of leakage.
   n. Correct visible leakage retest to satisfaction of [ENGINEER] [_____].
   o. Following pneumatic testing, thoroughly purge lines that are to carry flammable gases with nitrogen to assure no explosive mixtures will be present in system during filling process.

©COPYRIGHT 2013 CH2M HILL

3.11 CLEANING AND DISINFECTION

A. Prior to final acceptance, following assembly and testing, flush pipelines with water, except for plant process air lines and instrument air lines, and remove accumulated construction debris and other foreign matter.

B. Minimum Flushing Velocity: 5 feet per second.

C. Insert cone strainers in the connections to attached equipment and leave until cleaning has been accomplished.

D. Remove accumulated debris through drains 2 inches and larger or by dropping spools and valves.

E. Immediately following drainage of flushed lines, dry piping with compressed air.

F. Plant process air and instrument air piping shall be blown clean of loose debris with compressed air.

G. Disinfect pipelines intended to carry potable water before placing in service:

1. Meet the requirements of AWWA C651, unless otherwise specified.
2. Disinfecting Mixture:
    a. A chlorine-water solution having a free chlorine residual of 40 ppm to 50 ppm.
    b. Prepare by injecting one of the following:
        1) Liquid chlorine gas-water mixture.
        2) Dry chlorine gas.
        3) Calcium or sodium hypochlorite and water mixture.
    c. Inject mixture into pipeline at a measured rate while freshwater is allowed to flow through the pipeline at a measured rate so the combined mixture of freshwater and chlorine solution or gas is of the specified strength.
    d. Apply liquid chlorine gas-water mixture by means of a chlorinating device.
    e. Feed dry chlorine gas through proper devices for regulating the rate of flow and providing effective diffusion of gas into water within pipe being treated.
    f. Chlorinating devices for feeding solutions of chlorine gas or gas itself must prevent backflow of water into chlorine cylinder.
    g. Calcium Hypochlorite: If this procedure is used, first mix dry powder with water to make a thick paste, then thin to approximately a 1 percent solution (10,000 ppm chlorine).

©COPYRIGHT 2013 CH2M HILL

h. Sodium Hypochlorite: If this procedure is used, dilute liquid with water to obtain a 1 percent solution.

i. The following proportions of hypochlorite to water will be required:

Product	Quantity	Water
Calcium Hypochlorite[1] (65 - 70 percent C1)	1 lb	7.5 gal
Sodium Hypochlorite[2] (5.25 percent C1)	1 gal	4.25 gal
[1]Comparable to commercial products known as HTH, Perchloron, and Pittchlor. [2] Known as liquid laundry bleach, Clorox, and Purex.		

H. Point of Application:

1. Inject chlorine mixture into pipeline to be treated at the beginning of the line through a corporation stop or suitable tap in the top of pipeline.
2. Control clean water from existing system or another source so it flows slowly into newly installed piping during chlorine application.
3. Manipulate valves so the strong chlorine solution in the line being treated will not flow back into line supplying the water. Use check valves, if necessary.

I. Retention Period:

1. Retain treated water in pipeline for a minimum of 24 hours or long enough to destroy nonspore-forming bacteria.
2. At the end of the retention period, the disinfecting mixture shall have strength of at least 10 ppm of chlorine.
3. Operate valves, hydrants, and other appurtenances during disinfection to assure disinfecting mixture is dispersed into all parts of the pipeline including dead ends, new services, and similar areas that otherwise may not receive the disinfecting solution.
4. Do not place concentrated quantities of commercial disinfectants in pipeline before filling with water.
5. After chlorination, flush water from permanent source of supply until water through pipeline is equal chemically and bacteriologically to permanent source of supply.

J. Disposal of Disinfecting Water:

©COPYRIGHT 2013 CH2M HILL

1. Dispose of disinfecting water in an acceptable manner that will protect the public and receiving waters from harmful or toxic concentrations of chlorine.
2. Do not allow disinfecting water to flow into a waterway without adequate dilution or other satisfactory method of reducing chlorine concentrations to a safe level.

3.12 PROTECTION OF INSTALLED WORK

A. Protective Covers:

1. Provide over floor and shower drains during construction, to prevent damage to drain strainers and keep foreign material from entering drainage system.
2. Cover roof drains and emergency overflow drains during roofing process so roofing material and gravel do not enter drain piping.
3. Remove at time of Substantial Completion.

3.13 FIELD FINISHING

A. In accordance with Section 40 27 00, Processing Piping—General.

3.14 PIPING IDENTIFICATION

A. Refer to Section 40 27 00, Process Piping—General and Pipe Schedule.

3.15 SUPPLEMENTS

1. The supplements listed below, following "End of Section," are part of this specification.
   a. 22 10 01.01, Plumbing Piping Schedule.
   b. Plumbing Piping Data Sheets.

Section Number	Title
22 10 01.02	Polyvinyl Chloride Drain Waste and Vent (PVC-DWV) Pipe and Fittings
22 10 01.04	Acid-Resistant Cast Iron Pipe and Fittings
22 10 01.06	Acid-Resistant Polypropylene Waste and Vent Pipe and Fittings

END OF SECTION

©COPYRIGHT 2013 CH2M HILL

Section 22 10 01.02 POLYVINYL CHLORIDE DRAIN WASTE AND VENT (PVC-DWV) PIPE AND FITTINGS		
Item	Size	Description
Pipe and Fittings	All	PVC-DWV Schedule 40 nonpressure application, Class 12454B conforming to ASTM D2665 and ANSI/NSF Standard 14 system.
Joints	All	Solvent cemented conforming to ASTM D2855 except where connection to equipment may require future removal.
Solvent Cement	All	As recommended by the pipe and fitting manufacturer conforming to ASTM D2564.

END OF SECTION

©COPYRIGHT 2013 CH2M HILL

SECTION 22 10 01.04
ACID-RESISTANT CAST IRON PIPE AND FITTINGS

Item	Size	Description
Pipe and Fittings	All	High silicone cast iron, no-hub ends, extra heavy grade, conforming to ASTM A518/A518M and ASTM A861.
Joints	All	No-hub type compression coupling, with Teflon inner sleeve, neoprene outer sleeve, and stainless steel shield and clamp assembly.

END OF SECTION

©COPYRIGHT 2013 CH2M HILL

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 22 10 01.08
DOUBLE CONTAINED PIPE AND FITTINGS
HIGH-DENSITY POLYETHYLENE (HDPE)

Item	Size	Description
General	All	Pipe lengths, fittings, and flanged connections to be joined by thermal butt-fusion; shall be of the same type, grade, and class of polyethylene compound and supplied from same raw material supplier. Pipe tubing and fittings manufactured in accordance with ASTM D2239. Preferred SDR 11

©COPYRIGHT 2013 CH2M HILL

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 22 10 01.08
DOUBLE CONTAINED PIPE AND FITTINGS
HIGH-DENSITY POLYETHYLENE (HDPE)

Item	Size	Description
Pipe	1/2" to 4"	Cell class ASTM D3350 high-density polyethylene, maximum allowable hoop stress 1,600 psi at 73.4 degrees F. Polyethylene Resin: Conform to Type PE 3408 or better. Provide protection against ultraviolet light degradation using carbon black, not less than 2 percent, well dispersed in resin. Pipe wall thickness shall reflect required SDR* and diameter, as shown in Table 8, ASTM F714. For 3" and larger sizes, ASTM D3035. The containment pipe sizes (corresponding to carrier pipe sizes would be as follows (carrier pipe size first and containment pipe size second): • 2"/4" • 3"/6" • 4"/8" • 6"/10" • 8"/12" Design Stress Rating: 1600 psi hydrostatic. Pressure Rating (psi) at 100 degrees F SDR* 128 13.5 100 17.0 90 19.0 Identification: Colored [stripes extruded into pipe outside surface] [marking tape] for identification of type of service, in accordance with APWA Uniform Color Code. *SDR: standard dimension ratio = OD/thickness

SECTION 22 10 01.08
DOUBLE CONTAINED PIPE AND FITTINGS
HIGH-DENSITY POLYETHYLENE (HDPE)

Item	Size	Description
Fittings	4" & smaller	Molded fittings, butt fusion joined, conforming to ASTM D3261.
Flanges	All	Van Stone type, cast ASTM A351/A351M, Type 316 stainless steel backing ring, IPP Deltaflex convoluted design or equal for bolting to ANSI B16.1, Class 125; ANSI B16.5, Class 150; and AWWA C207, Class E. Pressure performance of backing ring equal to SDR rating of pipe with safety factor of two. Stub ends same grade HDPE and pressure rating as pipe.
Bolting		Stainless steel, ASTM A193/A193M Grade B8M studs and ASTM A194/A194M Grade 8M hex head nuts. Washers shall be same material as bolts.
Gaskets		Flat ring, 1/8" ethylene propylene rubber (EPR).
Manufacturer		Option to purchase already assembled. For steel pipe, purchase each pipe separately and contractor to install centralizers. JM Eagle PE 3408; Driscoplex 4000/4100 PE 3408.

Note: manufacturer to use standard steel pipe and weld in the field.

1.02 SUBMITTALS

A. Action Submittals:

1. Manufacturer's product data.
2. Seismic anchorage and bracing drawings and cut sheets, as required by Section 01 88 15, Seismic Anchorage and Bracing.

B. Informational Submittals:

1. Seismic anchorage and bracing calculations as required by Section 01 88 15, Seismic Anchorage and Bracing.
2. Component and attachment testing seismic certificate of compliance as required by Section 01 45 33, Special Inspection[, Observation, and Testing.

1.03 SPECIAL GUARANTEE

A. Where note below, provide manufacturer's extended guarantee in writing with Owner named as beneficiary. Special guarantee shall provide for correction, or at the option of the Owner, removal and replacement of products found defective during the stated period after date of Substantial Completion.

PART 2 - PRODUCTS

2.01 WATER HEATERS

A. Instantaneous Electric Water Heater:

1. Description: UL listed, tankless with removable cover, replaceable heating element, immersion-type thermostat, replaceable inlet filter, and flow regulator.
2. Capacity: See data sheet at end of section.
3. Manufacturers:
   a. Chronomite Laboratories, Inc.
   b. EEMAX, Inc.
   c. Weben-Jarco Inc.

2.02 SUBMERSIBLE CENTRIFUGAL SUMP PUMPS

A. Simplex, Submersible Sump Pump:

1. Description:

©COPYRIGHT 2013 CH2M HILL

a. Type: Simplex, heavy-duty, nonclog, close-coupled submersible centrifugal sewage ejector pump.
b. Volute: Cast iron, foot mounted.
c. Impeller: Cast iron, double shroud, fully enclosed
d. Wear Plates: Brass.
e. Motor Enclosure: Cast iron, Buna-N O-ring seals with corrosion-resistant exterior finish.
f. Motor: Continuous-duty, built-in thermal overload protection.
g. Shaft Seals: Tandem, mechanical type.
h. Shaft: Stainless steel.
i. Bearings: Permanently lubricated, ball bearing with B-10 bearing life of 17,500 hours.
j. Electrical: Inner seal chamber with 2 moisture sensing probes and attached power and control cables, with length, voltage, and power requirements as indicated on data sheet at end of section.
k. Controls:
1) Circuit Breakers: Motor rated.
2) Motor Starters: Magnetic with thermal overload protection device.
3) Level Control: Polypropylene-encapsulated mechanical float switch.
4) Leak Detection: Pump seal alarm circuit.

2. Capacity: See data sheet at end of section.
3. Manufacturers:
a. Hydromatic Pumps.
b. Paco Pump.
c. Weil Pump Company, Inc.

B. Duplex, Submersible Sump Pump:

1. Construction:
a. Impeller and Volute: Nonclog design, ASTM A48/A48M, Class 30, cast iron capable of passing 2-inch spherical solid.
b. Electrical: Water-resistant, UL listed and CSA approved electrical power cord.
c. Motor: Sealed, oil-filled, NEMA B design with winding thermal sensors.
d. Bearings and Shaft: Upper and lower thrust bearings, solid Type 303 stainless steel shaft.
e. Seals: Two mechanical seals, carbon rotating seal face and ceramic stationary seal face, and lower seal failure sensor and warning device.
2. Controller:

©COPYRIGHT 2013 CH2M HILL

3. Control Panel: Fabricated steel, NEMA 4 enclosure, door disconnect switch, and bear UL listing mark. Components shall bear UL recognized marking. Wiring, schematics, and workmanship shall comply with NEC and UL.
4. Wiring and Conduit: Minimum of MTH, 600V rated, 18-gauge with 90 degrees C rating, in accordance with NEC standards. Wire sized in accordance with NEC standards.
5. Motor Protection: Magnetic motor starter, across the line type, UL listing mark, under voltage and over voltage protection with manual reset button mounted in panel door.
6. Level Sensors (Duplex): Automatic pump cycle and alternation. Polypropylene encapsulated mechanical level sensors for pump on, pump off, and override (standby pump on). Additional level sensor shall activate audible-visual panel mounted light and horn. Panel mount, push-to-silence button for deactivating audible alarm.

C. Duplex, Column Type, Sump Pump (Acid-Resistant):

1. Construction:
   a. Impeller and Volute: PVC construction with stainless steel inserts.
   b. Motor Support Bracket: Cast iron, epoxy coated.
   c. Shaft: Stainless steel with PVC sleeve.
   d. Bearings: Lower and intermediate ceramic bearings with vapor seals. Upper bearing shall be external and allow shaft adjustment.
   e. Column: Ribbed PVC construction.
   f. Strainer: PVC construction with 1/4-inch diameter holes.
   g. Motor: Vertical mounted, C-face, open drip-proof (ODP), premium-efficiency, ball bearing design.
2. Sump and Cover Plate: Cylindrical design, PVC construction, vaportight with subplates and openings.
3. Controller:
   a. Float: Adjustable, rising rod, PVC construction, fume-tight design. High-level indicator light, dry contacts for remote alarm, alarm horn, and alarm acknowledge.
   b. Control Panel: NEMA 4 enclosure with fusible disconnect switch, HOA (HAND/OFF/AUTO) selector switch. Panel mounted indicator lights for “power on” and “pump off.”
   c. Motor Protection: Magnetic motor starter with overload protection.
4. Capacity: See data sheet at end of section.
5. Manufacturer: Vanton.

2.03 BACKFLOW PREVENTERS

A. Double Check Backflow Preventer (3/4 Inch Through 2 Inches):

©COPYRIGHT 2013 CH2M HILL

1. Description:
    a. Regulatory Compliance: AWWA C510, CSA B64.5, FCCHR of USC Section 10, ASSE 1015, ICC (IPC).
    b. Valve Body: Bronze.
    c. End Connections: Threaded, NPT.
    d. Maximum Working Pressure: 175 psi (350 psi test).
    e. Temperature Range: 32 degrees to 140 degrees F.
    f. Shutoff Valve: Full port, resilient seated, bronze ball valve with bronze ball valve test cock.
    g. [Inlet Strainer: bronze wye strainer, 40-mesh perforated, Type 304 stainless steel.]
2. Sizes: See data sheet at end of section.
3. Manufacturers and Products:
    a. Febco; Model 850.
    b. Watts Regulator Company; Model 709.

B. Double Check Backflow Preventer (2-1/2 Inches Through 10 Inches):

1. Description:
    a. Regulatory Compliance: AWWA C510, CSA B64.5, FCCHR of USC Section 10, ASSE 1015, ICC (IPC).
    b. Valve Body: Ductile or cast iron, Class 125, epoxy-coated (FDA approved).
    c. End Connections: Flanged.
    d. Maximum Working Pressure: 175 psi (350 psi test).
    e. Temperature Range: 32 degrees to 140 degrees F.
    f. Shutoff Valve: Nonrising stem, resilient seated gate valve with bronze ball valve test cock.
    g. [Inlet Strainer: cast-iron wye strainer, Class 125 flanged, fusion epoxy AWWA C550 coated, perforated stainless steel screen (1/16-inch perforations on 2-1/2 inches to 4 inches; 1/8-inch perforation on 6 inches to 10 inches), threaded cap plug blowout opening.]
2. Sizes: See data sheet at end of section.
2. Manufacturers and Products:
    a. Febco; Model 850.
    b. Watts Regulator Company; Model 709.

C. Reduced Pressure Backflow Preventers (1/4 Inch Through 1/2 Inch):

1. Description:
    a. Regulatory Compliance: AWWA C511, CSA B64.4, ASSE 1013, ICC (IPC), FM, USC-UL.

©COPYRIGHT 2013 CH2M HILL

b. Valve Body: Bronze.
c. End Connections: Threaded, NPT.
d. Maximum Working Pressure: 175 psi (350 psi test).
e. Temperature Range: 32 degrees to 140 degrees F.
f. Shutoff Valve: Full port, resilient seated, bronze ball valve with bronze ball valve test cock.
g. Accessories: Drainline air gap fitting.

2. Sizes: See data sheet at end of section.
3. Manufacturer and Product: Conbraco Industries; Series 20-400.

D. Reduced-Pressure Backflow Preventers (3/4 Inch Through 2 Inches):

1. Description:
a. Regulatory Compliance: AWWA C511, CSA B64.4, FCCHR of USC Section 10, ASSE 1013, ICC (IPC).
b. Valve Body: Bronze.
c. End Connections: Threaded, NPT.
d. Maximum Working Pressure: 175 psi (350 psi test).
e. Temperature Range: 32 degrees F to 140 degrees F.
f. Shutoff Valve: Full port, resilient seated, bronze ball valve with bronze ball valve test cock.
g. [Inlet Strainer: Bronze wye strainer, 40-mesh perforated, Type 304 stainless steel.]
h. Accessories: Drainline air gap fitting.

2. Sizes: See data sheet at end of section.
3. Manufacturers and Products:
a. Febco; Model 860.
b. Watts; Model 909.

E. Reduced Pressure Backflow Preventers (2-1/2 Inches Through 10 Inches):

1. Description:
a. Regulatory Compliance: AWWA C511, CSA B64.4, FCCHR of USC Section 10, ASSE 1013, IAPMO (UPC), SBCCI.
b. Valve Body: Ductile or cast iron, Class 125, epoxy-coated (FDA approved).
c. End Connections: Flanged.
d. Maximum Working Pressure: 175 psi (350 psi test).
e. Temperature Range: 32 degrees F to 140 degrees F.
f. Shutoff Valve: Nonrising stem, resilient seated gate valve with bronze ball valve test cock.
g. [Inlet Strainer: cast-iron wye strainer, Class 125 flanged, fusion epoxy AWWA C550 coated, perforated stainless steel screen (1/16-inch

©COPYRIGHT 2013 CH2M HILL

perforations on 2-1/2 inches to 4 inches; 1/8-inch perforation on 6 inches to 10 inches), threaded cap plug blowout opening.]

h. Accessories: Drainline air gap fitting.

2. Sizes: See data sheet at end of section.
3. Manufacturers and Products:
   a. Febco; Model 860.
   b. Watts; Model 909.

F. Water Meter and Meter Boxes: Refer to Section 33 12 13, Water Service Connections.

2.04 ENVIRONMENTAL ENCLOSURES

A. For Backflow Preventers 3/4 Inch to 3 Inches:

1. Description:
   a. Enclosure shall be factory-assembled unit providing heat and accessibility to the system backflow preventers. Unit shall meet the requirements of NFPA and ASSE for testing of the backflow preventer. Design to protect to minus 30 degrees F. Unit shall be suitable for concrete pad mounting.
   b. Adjustable thermostat shall control electric heaters/cables. Set thermostat to maintain 40 degrees F.
   c. Fiberglass construction, 1-inch-thick, factory applied unicellular nonwicking insulation, minimum R-value of 8, hinged and lockable access doors. Designed for exterior installation.
2. Heating Capacity:
   a. 3/4-Inch to 1-1/2-Inch: 60-watt heater, 120 volt, single-phase.
   b. 2-Inch: 90-watt heater, 120 volt, single-phase.
   c. 3-Inch: 1500-watt heaters, 120 volt, single-phase.
3. Manufacturers and Products:
   a. Hot Box; Series HB, Model [_____].
   b. Watts; Model [_____].

B. For Backflow Preventers 4 inches to 10 Inches:

1. Description:
   a. Enclosure shall be factory-assembled unit providing heat and accessibility to the system backflow preventers. Unit shall meet the requirements of NFPA and ASSE for testing of the backflow preventer. Design to protect to minus 30 degrees F. Unit shall be suitable for concrete pad mounting.

©COPYRIGHT 2013 CH2M HILL

b. Adjustable thermostat shall control electric heaters. Set thermostat to maintain 40 degrees F.
c. Reinforced 18-gauge aluminum construction, factory applied unicellular nonwicking insulation, minimum R-value of 8, hinged and lockable access doors. Designed for exterior installation.
d. Verify unit length, width, and height with manufacturer based on actual backflow preventer provided.

2. Heating Capacity:
   a. 4 Inches: One 2.0-kW heater, 120 volt, single-phase.
   b. 6 Inches and 8 Inches: Two 1.5-kW heaters, 120 volt, single-phase.
   c. 10 Inches: Two 2.0-kW heaters, 120 volt, single-phase.
3. Manufacturers and Products:
   a. Hot Box; Series HB, Model [_____].
   b. Watts; Model [_____].

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install, arrange, and connect equipment as shown on Drawings and in accordance with manufacturer's recommendations.

3.02 FIELD QUALITY CONTROL

A. Pumps: Do not hydrostatic test pumps with mechanical seals.

B. Startup:

1. In accordance with Section 01 91 14, Equipment Testing and Facility Startup, and Section 23 05 93, Testing, Adjusting, and Balancing for HVAC.
2. Piping Systems: Verify that flushing, cleaning, and testing has been completed prior to startup.

3.03 SUPPLEMENTS

A. Supplements listed below, following "End of Section," are a part of this Specification.

1. Data Sheet: Instantaneous Water Heater.
2. Data Sheet: Simplex, Submersible Sump Pump.
3. Data Sheet: Duplex, Submersible Sump Pump.
4. Data Sheet: Duplex, Column Type, Sump Pump (Acid Resistant).

Pump Efficiency =	70%
Motor Efficiency =	90%
Brake Horsepower =	1.20 bhp
Note: 1. Brake horsepower calculator should be deleted from the final equipment schedule. 2. Add a Pump Override column to the Sump Schedule is a duplex system is used.

2.02 GENERAL

A. Fixture Trim: Provide plumbing fixture trim where applicable on fixtures.

B. Plumbing Fixtures: Indicated by fixture number as shown on Drawings.

C. Drainage Products: Indicated by fixture number as shown on Drawings.

D. Plumbing Specialties: Indicated by fixture number as shown on Drawings.

E. Exposed fixture connections and piping shall be polished chrome-plated.

2.03 MATERIALS

A. Fixture Trim:

1. Supply Stop:
   a. Flexible supply with heavy cast brass, loose key, 1/2-inch IPS by 3/8-inch outside diameter tubing angle stop to wall with escutcheon plate; chrome-plated finish.
   b. Provide stop with stuffing box.
   c. Manufacturer: McGuire Manufacturing Company, Inc.
2. Trap:
   a. Chrome-plated, 17-gauge, semicast P-trap with compression ring cast brass waste and vent connection and cleanout.
   b. 1-1/2 inches for lavatories and drinking fountains.
   c. 1-1/2 inches for sinks.
   d. Manufacturer: McGuire Manufacturing Company, Inc.
3. Water Closet and Urinal Flush Valves: Sloan Valve Co., Royal Continental, low flush, quiet action with screwdriver stop and vacuum breaker.

B. Plumbing Fixtures:

1. LAV-1, Lavatory (Wall-Hung Type, ADA Compliant):
   a. Fixture: 20 inches by 18 inches, vitreous china, for floor-mounted concealed arm carrier, three-hole punched on 4-inch centers for faucet

©COPYRIGHT 2013 CH2M HILL

[; additional hole for soap dispenser]. American Standard Companies, Inc.; Lucerne, Model 0355.012.

b. Faucet: Chicago Faucet Co.; Model 2200-4CP with 0.5-gpm flow restricter.

c. Trim: 3/8-inch supply stop with loose key, 17-gauge chrome-plated cast brass P-trap.

d. Insulation: McGuire Manufacturing Company, Inc., Prowrap antimicrobial PVC resin seamless insulation for trap, tailpiece, and hot and cold water supply piping.

e. Strainer: McGuire Manufacturing Company, Inc.; Model 155A chrome-plated grid strainer with tailpiece.

f. Carrier: Jay R. Smith Mfg. Co.; 700 series concealed arm.

2. LAV-3, Lavatory (Counter Set, Oval):

a. Fixture: 20 inches by 17 inches, vitreous china, self-rimming. American Standard Companies, Inc.; Aqualyn, Model 0476.028.

b. Faucet: Chicago Faucet Co.; Model 2200-4CP with 0.5-gpm flow restricter.

c. Trim: 3/8-inch supply stop with loose key, 17-gauge chrome-plated cast brass P-trap.

d. Insulation: McGuire Manufacturing Company, Inc.; Prowrap antimicrobial PVC resin seamless insulation for trap, tailpiece, and hot and cold water supply piping.

e. Strainer: McGuire Manufacturing Company, Inc.; Model 155A chrome-plated grid strainer with tailpiece.

3. LAV-4, Lavatory (Under Counter Set, Oval):

a. Fixture: 17 inches by 14 inches, vitreous china, unglazed rim for underdeck mounting, rear overflow with mounting kit. American Standard Companies, Inc.; Ovalyn II, Model 0496.221.

b. Faucet: Chicago Faucet Co.; Model 2200-4CP with 0.5-gpm flow restricter.

c. Trim: 3/8-inch supply stop with loose key, 17-gauge chrome-plated cast brass P-trap.

d. Insulation: McGuire Manufacturing Company, Inc.; Prowrap antimicrobial PVC resin seamless insulation for trap, tailpiece, and hot and cold water supply piping.

e. Strainer: McGuire Manufacturing Company, Inc.; Model 155A chrome-plated grid strainer with tailpiece.

4. LAV-5, Lavatory (Wall Hung Type, Stainless Steel):

a. Fixture: 23 inches by 20 inches, 18-gauge Type 304 stainless steel, seamless welded construction with integral backsplash and apron,

©COPYRIGHT 2013 CH2M HILL

underside sound deadened, wall clip with integral flange, three-hole punched on 4-inch centers for faucet. Just; Model A-33338.

b. Faucet: Chicago Faucet Co.; Model 2200-4CP with 0.5-gpm flow restricter.
c. Trim: 3/8-inch supply stop with loose key, 17-gauge, chrome-plated cast brass P-trap.
d. Strainer: McGuire Manufacturing Company, Inc.; Model 155A chrome-plated grid strainer with tailpiece.

5. WF-1, Wash Fountain (ADA Compliant):
   a. 54-inch diameter wash fountain, [semi-circular] [circular]. Type 304 stainless steel, 14-gauge, one-piece polished to a No. 4 finish. Straight pedestal panels, same material as bowl. Thermostatic mixing valve, check valves, internal pipe assembly, distribution header, isolation valve s, and multiple station soap dispensers.
   b. Supply Header Operation: Infrared; furnish 24V ac transformer.
   c. Drain: 2-inch grid drain and trap assembly.
   d. Service Configuration: Refer to Drawings.
   e. Manufacturer and Product: [Semi-circular, Sentry Model SN2004.] [Circular, Sentry Model SN2008.]
6. S-1, Sink (Counter, Stainless Steel, Single Compartment):
   a. Fixture: 21 inches by 25 inches overall by 8 inches deep, 18-gauge, Type 304 stainless steel, three-hole punch, self-rimming, undercoated, ledge-type. Just Mfg. Co.; Model SL-2125-A-GR.
   b. Faucet: [Chicago Faucet Co.; Model 2300-8 single handle with 8-inch cover plate.] [Chicago Faucet Co.; Model 1201 double handle.]
   c. Trim: 1-1/2-inch outside diameter, 17-gauge chrome-plated cast tailpiece and cast brass P-trap with cleanout, and 1/2-inch wall supply stop with loose key.
   d. Strainer: Just Mfg. Co.; Model J-35, stainless steel crumb-type.
   e. [Disposer: IES (In-Sink-Erator); Model 77, 3/4 horsepower, stainless steel.]
   f. [Hot Water Dispenser: ISE (In-Sink-Erator); Model GN, 190 degrees.]
7. S-2, Sink (Counter, Stainless Steel, Double Compartment):
   a. Fixture: 21 inches by 33 inches overall by 8 inches deep, 18-gauge, Type 304 stainless steel, three-hole punch, self-rimming, undercoated, ledge-type. Just Mfg. Co.; Model DL-2133-A-GR.
   b. Faucet: [Chicago Faucet Co.; Model 2300-8; single handle with 8-inch cover plate.] [Chicago Faucet Co.; Model 1201A, double handle.]

©COPYRIGHT 2013 CH2M HILL

c. Trim: 1-1/2-inch outside diameter, 17-gauge chrome-plated cast tailpiece and cast brass P-trap with cleanout, and 1/2-inch wall supply stop with loose key.
d. Strainer: Just Mfg. Co.; Model J-35, stainless steel crumb-type.
e. [Disposer: IES (In-Sink-Erator); Model 77, 3/4 horsepower, stainless steel.]
f. [Hot Water Dispenser: ISE (In-Sink-Erator); Model GN, 190 degrees.]

8. S-4, Sample Sink (Single Compartment, Free Standing):
   a. Fixture: 24 inches by 24 inches by 14 inches deep, 14-gauge, Type 304 stainless steel, 8-inch backsplash, adjustable stainless steel tubular legs. Elkay Mfg. Co.; Model SS-8124.
   b. Faucet: Short spout with vacuum breaker, 3/4-inch hose thread outlet, pail hook, H supply arms, 4-inch to 8-3/8-inch adjustable centers, lever handles. Faucet mounted on backsplash. Chicago Faucet Co.; Model 305-VB.
   c. Trim: 1-1/2-inch outside diameter, 17-gauge chrome-plated flat strainer, tailpiece, and cast brass P-trap with cleanout, and 1/2-inch wall supply stop with loose key. Elkay Mfg. Co.; Model LK-18.
9. ES-1, Emergency Shower (Freestanding):
   a. Model: Haws Drinking Faucet Co.; Model 8100.
   b. Shower: ABS plastic deluge.
   c. Valve: Stay-open, chrome-plated brass ball valve.
   d. Support: 1-1/4-inch galvanized pipe standard with 9-inch-diameter floor flange.
   e. Alarm: Magnetically operated proximity switch.
   f. Factory applied CRP (corrosive atmospheres coating).
10. ES-2, Emergency Shower (Freeze Resistant):
    a. Model: Haws Drinking Faucet Co.; Model 8111FP.
    b. Shower: ABS plastic deluge.
    c. Valve: Stay-open, chrome-plated brass ball valve with special extension shaft for location inside of building.
    d. Support: Shower support brace to wall.
    e. Alarm: Magnetically operated proximity switch.
    f. Factory applied CRP (corrosive atmospheres coating).
11. ES-3, Emergency Shower:
    a. Model: Haws Drinking Faucet Co.; Model [8122H] [8122V].
    b. Shower: ABS plastic deluge.
12. Valve: Stay-open, chrome-plated brass ball valve.
    a. Alarm: Magnetically operated proximity switch.
13. Factory applied CRP (corrosive atmospheres coating).
    a. ES-4, Emergency Shower (All Stainless Steel):

©COPYRIGHT 2013 CH2M HILL

b. Model: Haws Drinking Faucet Co.; Model [8133H] [8133V].
c. Shower: Stainless steel deluge.
d. Valve: Stay-open, stainless steel ball valve activated by pulling stainless steel pull rod.
e. Alarm: Magnetically operated proximity switch.

14. EE-1, Emergency Eyewash (Deck-Mounted):
    a. Model: Haws Drinking Faucet Co.; Model 7612.
    b. Eyewash: Polished dual chrome-plated brass heads, swing-away design and automatic stream control.
    c. Valve: Stay-open, polished chrome-plated brass ball valve.
15. EE-2, Emergency Eyewash (Freestanding):
    a. Model: Haws Drinking Faucet Co.; Model 7720.
    b. Eyewash: ABS plastic receptor, dual PVC-covered anti-surge spray heads and automatic stream control.
    c. Valve: Stay-open, polished chrome-plated brass ball valve.
    d. Support: Galvanized steel pedestal with 9-inch-diameter floor flange.
    e. Alarm: Magnetically operated proximity switch.
    f. Factory applied CRP (corrosive atmospheres coating).
16. EE-3, Emergency Eyewash (Stainless Steel, Freestanding):
    a. Model: Haws Drinking Faucet Co.; Model 7777.
    b. Eyewash: Dual stainless steel heads and 16-inch-diameter face spray ring with stainless steel receptor.
    c. Valv5e: Stay-open, stainless steel ball valve.
    d. Support: Stainless steel pipe pedestal with 9-inch-diameter stainless steel floor flange.
    e. Alarm: Magnetically operated proximity switch.
17. EE-4, Emergency Eyewash (Stainless Steel, Wall Mount):
    a. Model: Haws Drinking Faucet Co.; Model 7778B.
    b. Eyewash: Dual stainless steel heads and 16-inch-diameter face spray ring with stainless steel receptor.
    c. Valve: Stay-open, stainless steel ball valve.
    d. Support: Stainless steel wall bracket.
    e. Alarm: Magnetically operated proximity switch.
18. EE-5, Emergency Eyewash (Wall Mount, Pull Down):
    a. Model: Haws Drinking Faucet Co.; Model [7651.] [7655.]
    b. Eyewash: Dual stainless steel heads.
    c. Valve: Stay-open, chrome-plated valve activated by pulling down on spray arm.
    d. Mount: [To wall face with lock nut.] [Mount: recessed 18-gauge, Type 304 stainless steel No. 4 finish cabinet.]
19. EE-6, Emergency Eyewash (Self-Contained, Heated):

©COPYRIGHT 2013 CH2M HILL

a. Model: Haws Drinking Faucet Co.; Model 7500EB.
b. Tank: 16-gallon, FDA high-density polyethylene material with fitted insulated protective cover.
c. Heating System: 1,000-watt heater, thermostatic control to maintain 75 degrees F water temperature.
d. Temperature and Safety Control: Two thermostats with safety override thermostat with warning light and manual reset button.
e. Electrical: UL listed components, 110-volt plug, grounded and weather tight, three lighted indicators for power is on, heater is activated, and malfunction.
f. Hydrosep: Haws Drinking Faucet Co.; Model 9081, bacteriostatic additive to permit storage of water for several months.

20. SSH-1, Safety Shower/Eyewash Combination:
    a. Model: Haws Drinking Faucet Co.; Model 8346.
    b. Shower: ABS plastic deluge.
    c. Eyewash: Stainless steel bowl with aerated eye/face wash.
    d. Valve: Stay open.
    e. Support: Freestanding, 1-1/4-inch galvanized pipe standard, stanchion, and floor flange.
    f. Alarms: Magnetically operated proximity switches.
    g. Factory applied CRP (corrosive atmospheres coating).
21. SSH-2, Safety Shower/Eyewash Combination (Freeze-proof):
    a. Model: Haws Drinking Faucet Co.; Model 8317CTFPT.
    b. Shower: ABS plastic deluge.
    c. Eyewash: Stainless steel bowl with aerated eye/face wash.
    d. Valve: Stay open.
    e. Support: Freestanding, 1-1/4-inch galvanized pipe standard, stanchion, and floor flange, cable heated and insulated.
    f. Alarms: Magnetically operated proximity switches.
22. SSH-3, Safety Shower/Eyewash Combination (Frost-proof):
    a. Model: Haws Drinking Faucet Co.; Model 8330FP.
    b. Shower: Stainless steel deluge.
    c. Eyewash: Stainless steel aerated eye/face wash, dust cover, and stainless steel bowl.
    d. Valve: Stainless steel, freeze-proof, stay open with stainless steel push-plates and rods.
    e. Bury Depth: [24 inches.] [42 inches.] [66 inches.]
    f. Support: Freestanding, 1-1/4-inch stainless steel pipe standard, stanchion, and floor flange.
    c. Alarms: Magnetically operated proximity switches.
23. SSH-4, Safety Shower/Eyewash Combination (All Stainless Steel):

©COPYRIGHT 2013 CH2M HILL

a. Model: Haws Drinking Faucet Co.; Model 8330.
b. Shower: Stainless steel deluge.
c. Eyewash: Stainless steel aerated eye/face wash and stainless steel bowl.
d. Valve: Stay open.
e. Support: Freestanding, 1-1/4-inch stainless steel pipe standard, stanchion, and floor flange.
f. Alarms: Magnetically operated proximity switches.

24. SSH-5, Safety Shower/Eyewash Combination (All PVC):
a. Model: Haws Drinking Faucet Co.; Model 8336.
b. Shower: PVC deluge.
c. Eyewash: PVC aerated eye/face wash and PVC bowl.
d. Valve: Stay open.
e. Support: Freestanding, 2-1/2 inches, Schedule 80, PVC pipe standard, stanchion, and floor flange.
f. Alarms: Magnetically operated proximity switches.

25. SSH-6, Safety Shower/Eyewash Combination (Enclosed):
a. Model: Haws Drinking Faucet Co.; Model 8605.
b. Shower: ABS plastic deludge.
c. Eyewash: Chrome-plated brass spray nozzles.
d. Valve: Stay open.
e. Enclosure: Molded fiberglass on three sides, top, and bottom with 3-inch drain.
d. Alarms: Magnetically operated proximity switches.

C. Drainage Products:

1. AD-1, Area Drain:
a. Material: Cast-iron body and grate.
b. Options: Hinged grate, sediment bucket, and vandalproof screws.
c. Manufacturer and Product: Jay R. Smith Mfg. Co.; Model 2210Y-H-U.

2. AD-2, Area Drain (Deck Drain):
a. Material: Cast-iron body and polished bronze strainer.
b. Options: Sump receiver, underdeck clamp, vandalproof screws, and seepage openings.
c. Manufacturer and Product: Jay R. Smith Mfg. Co.; Model 1470Y-R-C-PB-U.

3. CO-1, Cleanout (Exterior):
a. Material: Taper thread, bronze plug, heavy-duty, scoriated cast-iron top.
b. Manufacturer and Product: Jay R. Smith Mfg. Co.; Model 4263.

©COPYRIGHT 2013 CH2M HILL

4. CO-2, Cleanout:
   a. Material: Taper thread, bronze plug, scoriated nickel bronze top.
   b. Manufacturer and Product: Jay R. Smith Mfg. Co.; Model 4023.
5. FCO-1, Floor Cleanout (Finished Areas):
   a. Material: Tapered thread, bronze plug with round adjustable scoriated secured nickel bronze top.
   b. Manufacturer and Product: Jay R. Smith Mfg. Co.; Model 4103S.
6. FCO-2, Floor Cleanout (Unfinished Areas):
   a. Material: Tapered thread, bronze plug with round adjustable scoriated secured cast-iron top.
   b. Manufacturer and Product: Jay R. Smith Mfg. Co.; Model 4243S.
7. FCO-3, Floor Cleanout (Acid Resistant):
   a. Material: Polypropylene conforming to ASTM D4101.
   b. Ferrule supplied with countersunk plug and adjustable top with round cover, with Acid Waste Cleanout (AWCO) cast in the cover.
   c. Manufacturer and Product: Orion Fittings Inc.; Model FCO-RD.
8. FD-1, Floor Drain (Finished Areas):
   a. Materials: Cast-iron body, adjustable nickel bronze strainer.
   b. Options: Jay R. Smith Mfg. Co.; Model 2696, trap primer connection, vandalproof screws.
   c. Manufacturer and Product: Jay R. Smith Mfg. Co.; Model 2005T-U-[round] [square].
9. FD-2, Floor Drain (Unfinished Areas, General Drainage):
   a. Materials: Cast-iron body and grate.
   b. Options: Sediment bucket, Jay R. Smith Mfg. Co.; Model 2696, trap primer connection, vandalproof screws.
   c. Manufacturer and Product: Jay R. Smith Mfg. Co.; Model 2210T-U.
10. FD-3, Floor Drain (Unfinished Areas, Heavy Drainage):
    a. Materials: Cast-iron body and grate.
    b. Options: Sediment bucket, Jay R. Smith Mfg. Co.; Model 2696, trap primer connection, vandalproof screws.
    c. Manufacturer and Product: Jay R. Smith Mfg. Co.; Model 2233T-U.
    d. FD-4, Floor Drain (Gutter Drain):
    e. Materials: Rectangular cast-iron body and grate.
    f. Manufacturer and Product: Jay R. Smith Mfg. Co.; Model 2585T-U.
11. FD-5, Floor Drain (Indirect Receptor):
    a. Materials: Cast-iron body and strainer.
    b. Options: Round top, antiflood rim strainer, Jay R. Smith Mfg. Co.; with integral trap primer connection, vandalproof screws.
    c. Manufacturer and Product: Jay R. Smith Mfg. Co.; Model 2010T-U-F37.

©COPYRIGHT 2013 CH2M HILL

12. FD-6, Floor Drain (Acid Resistant):
    a. Materials: Acid-resistant polypropylene with flame-retardant body, integral flange with clamping collar, basket strainer, and top grate.
    b. Model: T & C Plastic Drain Co., Inc.; Model PP-7749 (2 inches), PP-7750 (3 inches), PP-7751 (4 inches).
13. GD-1, Gutter Drain:
    a. Material: Rough bronze flashing clamp and bronze top secured high dome.
    b. Manufacturer and Product: Jay R. Smith Mfg. Co.; Model [1630-RBB, bottom outlet] [1690-RBB, side outlet].

D. Hose Valves: Refer to Section 22 10 01, Plumbing Piping and Accessories.

E. Plumbing Specialties:

1. Water Hammer Arresters:
    a. Materials: ASSE 1010 certified, Type L copper tube, HHPP piston with two lubricated EPDM O-rings, FDA approved lubricant, rolled piston stop, wrought copper male thread adapter.
    b. Manufacturer and Product: Sioux Chief Mfg. Co., Inc.; Series 650 and 660.

PART 3 - EXECUTION

3.01 PREPARATION

A. Drawings do not attempt to show exact details of fixtures. Changes in locations of fixtures, advisable in opinion of CONTRACTOR, shall be submitted to ENGINEER for review before proceeding with the Work.

3.02 INSTALLATION

A. Fixture Trim: Install fixture trim where applicable on fixtures.

B. Plumbing Fixtures, Mounting Heights:

1. Standard rough-in catalogued heights, unless shown otherwise on Drawings.
2. Caulk fixtures in contact with finished walls with waterproof, white, nonhardening sealant which will not crack, shrink, or change color with age. See Section 07 92 00, Joint Sealants.

C. Exact fixture location and mounting arrangement shall be as indicated on toilet room elevations and details as shown on Drawings.

©COPYRIGHT 2013 CH2M HILL

D. Unless noted otherwise and as a minimum, fixtures shall be supported as indicated in PDI Code Guide 302.

E. Safety Equipment:

1. System Shutoff Valves:
   a. Shutoff valves shall give visual indication of position (open or closed).
   b. Shutoff valves shall be lockable valves and locked in open position.
2. Each safety shower, eyewash, combination safety shower/eyewash shall have red safety signoff tag. After completing requirements listed below, CONTRACTOR and OWNER shall sign red safety signoff tag. Requirements are as follows:
   a. Visually check safety shower/eyewash piping for leaks.
   b. Verify that upon operation, stay-open valves remain open.
   c. Showerheads to be between 82 inches and 96 inches above standing surface.
   d. Shower spray pattern, when valve is full open, shall be a minimum 20 inches in diameter at 60 inches above standing surface.
   e. Water arcs from eyewash spray heads must cross. Test with eyewash gauge; Haws Drinking Faucet Co., Model 9015.
   f. Minimum flow rates for safety showers shall be 20 gpm.
   g. Minimum flow rates for eyewashes shall be 3 gpm.
   h. Tempered water shall be temperature indicated on Drawings.

F. Drainage Products:

1. Floor Drains: Set top flush with floor. Provide membrane clamps where required.
2. Cleanouts: Install where shown or required for purposes intended. Set cover flush with finished floor.
3. Hub Drains: Set top of hub 2 inches above finished floor.

G. Plumbing Specialties:

1. Shock Arresters:
   a. Install PDI-certified and rated shock arresters, sized and located in accordance with PDI WH-201 and as shown on Drawings.
   b. Install adjacent to equipment wherein quick closing valves are installed.
   c. Install at each emergency safety shower.
   d. Shock arresters to have access panels or to be otherwise accessible.

©COPYRIGHT 2013 CH2M HILL

2. Drain P-Trap Priming:
   a. Pipe: Type K, soft copper.
   b. Trap and prime floor drains and hub drains, unless shown otherwise on the Drawings. No attempt has been made to show trap primer valve locations or trap primer pipe routing.
   c. Field route trap primer piping during installation of floor drains and hub drains, and install trap primer valves in mechanical rooms, janitor rooms, or other locations acceptable to ENGINEER.
   d. Priming System: Complete with connection to serving [W1] [W2] [W3] cold water system.
3. Trap Priming Valves:
   a. Floor drain traps primed with priming valves, 1/2-inch copper to floor drain.
   b. Two traps maximum primed from one priming valve or as recommended by manufacturer. Locate in mechanical spaces or janitor's rooms and as indicated on Drawings.
   c. Provide shutoff valve ahead of priming valves.
4. Thermometers and Pressure Gauges:
   a. Arrange devices to facilitate use and observation.
   b. Install in orientation that will allow clear observation from ground level.
   c. Provide pressure gauges with block valves.
   d. Install thermometers in thermowells.

H. Caulk penetrations of exterior walls with weatherproof sealant in accordance with Section 07 92 00, Joint Sealants.

I. Adjust water flows in domestic water systems for reasonable water flows at each plumbing fixture, terminal device, and recirculation loop. Flush valve fixtures shall be adjusted for proper flush cycle time and water quantity.

3.03 FIELD QUALITY CONTROL

A. Perform visual inspection for physical damage, blocked access, cleanliness, and missing items.

B. Notify OWNER and ENGINEER 48 hours prior to shower testing. OWNER and ENGINEER reserve the right to witness all tempered water and safety shower testing.

C. Test safety shower and eyewash units. Water flow must be tested at both showerhead and eyewash/face ring.

©COPYRIGHT 2013 CH2M HILL

1. Shower Flow:
   a. Test with tube-type water gauge (Haws Drinking Faucet Co., Model 9010) and 5-gallon container.
   b. Container shall fill in 10 seconds or less, with a minimum 20-gpm flow.
2. Eyewash Flow:
   a. Test with tube-type water gauge (Haws Drinking Faucet Co., Model 9010) and 1-gallon container.
   b. Container shall fill in 20 seconds or less.
   c. CONTRACTOR shall log, date, and initial inspection upon passing flow tests.

D. Verify alarm operation both locally and systemwide. Notify security prior to test if alarm is connected systemwide.

SECTION 23 05 93
TESTING, ADJUSTING, AND BALANCING FOR HVAC

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Testing adjusting, and balancing of air systems.
2. Testing adjusting, and balancing of hydronic [steam] [and] [refrigerating] systems.
3. Measurement of final operating condition of HVAC systems.
4. Sound measurement of equipment operating conditions.
5. Vibration measurement of equipment operating conditions.

B. Related Sections:

1. Section 23 09 23, Direct-Digital Control System for HVAC: Requirements for coordination between DDC system and testing, adjusting, and balancing work.
2. Section 23 09 93, Sequence of Operations for HVAC Controls: Sequences of operation for HVAC equipment.

1.02 REFERENCES

A. Associated Air Balance Council: AABC MN-1, National Standards for Testing and Balancing Heating, Ventilating, and Air Conditioning Systems.

B. American Society of Heating, Refrigerating and Air-Conditioning Engineers: ASHRAE 11, Practices for Measurement, Testing, Adjusting and Balancing of Building Heating, Ventilation, Air-Conditioning and Refrigeration Systems.

C. Natural Environmental Balancing Bureau: NEBB, Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems.

1.03 SUBMITTALS

A. Section 01 33 00, Submittal Procedures: Submittal procedures.

B. Prior to commencing Work, submit proof of latest calibration date of each instrument.

©COPYRIGHT 2013 CH2M HILL

C. Test Reports: Indicate data on [AABC MN-1 National Standards for Total System Balance forms] [forms prepared following ASHRAE 111] [NEBB Report forms] [forms containing information indicated in Schedules]. [Submit data in S.I. units.]

D. Field Reports: Indicate deficiencies preventing proper testing, adjusting, and balancing of systems and equipment to achieve specified performance.

E. Prior to commencing Work, submit report forms or outlines indicating adjusting, balancing, and equipment data required. Include detailed procedures, agenda, sample report forms [and copy of AABC National Project Performance Guaranty] [and Copy of NEBB Certificate of Conformance Certification] [_____].

F. Submit draft copies of report for review prior to final acceptance of Project.

G. Furnish reports in [soft cover, letter size, 3-ring] [_____] binder manuals, complete with table of contents page and indexing tabs, with cover identification at front and side. Include set of reduced drawings with air outlets and equipment identified to correspond with data sheets, and indicating thermostat locations.

1.04 CLOSEOUT SUBMITTALS

A. Section 01 70 00, Execution and Closeout Requirements: Closeout procedures.

B. Project Record Documents: Record actual locations of [flow measuring stations] [balancing valves and rough setting].

C. Operation and Maintenance Data: Furnish final copy of testing, adjusting, and balancing report inclusion in operating and maintenance manuals.

1.05 QUALITY ASSURANCE

A. Perform Work in accordance with [[State] [Municipality] of [_____] [Highways] [Public Work's] standard.]

B. Perform Work in accordance with [AABC MN-1 National Standards for Field Measurement and Instrumentation, Total System Balance] [ASHRAE 111] [NEBB Procedural Standards for Testing, Balancing and Adjusting of Environmental Systems].

C. Maintain one copy of each document on site.

D. Prior to commencing Work, calibrate each instrument to be used. [Upon completing Work, recalibrate each instrument to assure reliability.]

©COPYRIGHT 2013 CH2M HILL

1.06 QUALIFICATIONS

A. Agency: Company specializing in testing, adjusting, and balancing of systems specified in this section with minimum [three] [_____] years [documented] experience [certified by AABC] [Certified by NEBB].

B. Perform Work under supervision of [AABC Certified Test and Balance Engineer] [NEBB Certified Testing, Balancing and Adjusting Supervisor] [registered professional engineer experienced in performance of this Work and licensed [at place where Project is located] [in State of [_____]]].

1.07 PRE-INSTALLATION MEETINGS

A. Section 01 30 00, Administrative Requirements: Pre-installation meeting.

B. Convene minimum [one] [_____] week prior to commencing work of this section.

1.08 SEQUENCING

A. Section 01 10 00, Summary: Work sequence.

B. Sequence balancing between completion of systems tested and Date of Substantial Completion.

1.09 SCHEDULING

A. Section 01 30 00, Administrative Requirements: Coordination and project conditions.

B. Schedule and provide assistance in final adjustment and test of [life safety] [smoke evacuation] [smoke control] [_____] system with Fire Authority.

PART 2 – PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.01 EXAMINATION

A. Section 01 30 00, Administrative Requirements: Coordination and project conditions.

B. Verify systems are complete and operable before commencing work. Verify the following:

©COPYRIGHT 2013 CH2M HILL

1. Systems are started and operating in safe and normal condition.
2. Temperature control systems are installed complete and operable.
3. Proper thermal overload protection is in place for electrical equipment.
4. Final filters are clean and in place. If required, install temporary media in addition to final filters.
5. Duct systems are clean of debris.
6. Fans are rotating correctly.
7. Fire and volume dampers are in place and open.
8. Air coil fins are cleaned and combed.
9. Access doors are closed and duct end caps are in place.
10. Air outlets are installed and connected.
11. Duct system leakage is minimized.
12. Hydronic systems are flushed, filled, and vented.
13. Pumps are rotating correctly.
14. Proper strainer baskets are clean and in place or in normal position.
15. Service and balancing valves are open.

3.02 PREPARATION

A. Furnish instruments required for testing, adjusting, and balancing operations.

B. Make instruments available to Architect/ENGINEER to facilitate spot checks during testing.

3.03 INSTALLATION TOLERANCES

A. Air Handling Systems: Adjust to within plus or minus [10] [_____] percent of design.

B. Air Outlets and Inlets: Adjust total to within plus [10] [_____] percent and minus [5] [_____] percent of design to space. Adjust outlets and inlets in space to within plus or minus [10] [_____] percent of design.

C. Hydronic Systems: Adjust to within plus or minus 10 percent of design.

3.04 ADJUSTING

A. Section 01 70 00, Execution and Closeout Requirements: Testing, adjusting, and balancing.

B. Verify recorded data represents actual measured or observed conditions.

C. Permanently mark settings of valves, dampers, and other adjustment devices allowing settings to be restored. Set and lock memory stops.

©COPYRIGHT 2013 CH2M HILL

D. After adjustment, take measurements to verify balance has not been disrupted. If disrupted, verify correcting adjustments have been made.

E. Report defects and deficiencies noted during performance of services, preventing system balance.

F. Leave systems in proper working order, replacing belt guards, closing access doors, closing doors to electrical switch boxes, and restoring thermostats to specified settings.

G. At final inspection, recheck random selections of data recorded in report. Recheck points or areas as selected and witnessed by OWNER.

H. Check and adjust systems approximately six months after final acceptance and submit report.

3.05 AIR SYSTEM PROCEDURE

A. Adjust air handling and distribution systems to obtain required or design supply, return, and exhaust air quantities [at site altitude].

B. Make air quantity measurements in main ducts by Pitot tube traverse of entire cross sectional area of duct.

C. Measure air quantities at air inlets and outlets.

D. Adjust distribution system to obtain uniform space temperatures free from objectionable drafts.

E. Use volume control devices to regulate air quantities only to extent adjustments do not create objectionable air motion or sound levels. Effect volume control by using volume dampers located in ducts.

F. Vary total system air quantities by adjustment of fan speeds. Provide sheave drive changes to vary fan speed. Vary branch air quantities by damper regulation.

G. Provide system schematic with required and actual air quantities recorded at each outlet or inlet.

H. Measure static air pressure conditions on air supply units, including filter and coil pressure drops, and total pressure across fan. Make allowances for 50 percent loading of filters.

I. Adjust outside air automatic dampers, outside air, return air, and exhaust dampers for design conditions.

©COPYRIGHT 2013 CH2M HILL

J. Measure temperature conditions across outside air, return air, and exhaust dampers to check leakage.

K. At modulating damper locations, take measurements and balance at extreme conditions. [Balance variable volume systems at maximum airflow rate, full cooling, and at minimum airflow rate, full heating.]

L. Measure building static pressure and adjust supply, return, and exhaust air systems to obtain required relationship between each to maintain approximately 0.05 inches positive static pressure [near building entries] [in clean rooms] [_____].

M. Check multi-zone units for motorized damper leakage. Adjust air quantities with mixing dampers set first for cooling, then heating, then modulating.

N. For variable air volume system powered units set volume controller to airflow setting indicated. Confirm connections properly made and confirm proper operation for automatic variable-air-volume temperature control.

O. On fan powered VAV boxes, adjust airflow switches for proper operation.

3.06 WATER SYSTEM PROCEDURE

A. Adjust water systems, after air balancing, to obtain design quantities.

B. Use calibrated [Venturi tubes, orifices, or other metered] fittings and pressure gauges to determine flow rates for system balance. Where flow-metering devices are not installed, base flow balance on temperature difference across various heat transfer elements in system.

C. Adjust systems to obtain specified pressure drops and flows through heat transfer elements prior to thermal testing. Perform balancing by measurement of temperature differential in conjunction with air balancing.

D. Effect system balance with automatic control valves fully open or in normal position to heat transfer elements.

E. Effect adjustment of water distribution systems by means of balancing cocks, valves, and fittings. Do not use service or shut-off valves for balancing unless indexed for balance point.

F. Where available pump capacity is less than total flow requirements or individual system parts, simulate full flow in one part by temporary restriction of flow to other parts.

©COPYRIGHT 2013 CH2M HILL

3.07 SCHEDULES

A. Equipment Requiring Testing, Adjusting, and Balancing:

1. Fire Pumps.
2. Plumbing Pumps.
3. Steam Condensate Pumps.
4. Boiler Feedwater Pumps.
5. HVAC Pumps.
6. Water Tube Boilers.
7. Packaged Steel Water Tube Boilers.
8. Packaged Steel Fire Tube Boilers.
9. Forced Air Furnaces.
10. Direct Fired Furnaces.
11. Reciprocating Water Chillers.
12. Air Cooled Water Chillers.
13. Centrifugal Water Chillers.
14. Absorption Water Chillers.
15. Induced Draft Cooling Tower.
16. Blow Through Cooling Tower.
17. Air Cooled Refrigerant Condensers.
18. Packaged Roof Top Heating/Cooling Units.
19. Packaged Terminal Air Conditioning Units.
20. Unit Air Conditioners.
21. Computer Room Air Conditioning Units.
22. Air Coils.
23. Evaporative Humidifier.
24. Sprayed Coil Dehumidifier.
25. Terminal Heat Transfer Units.
26. Induction Units.
27. Unit Ventilators.
28. Fan Coil Units.
29. Air Handling Units.
30. Fans.
31. Air Filters.
32. Air Terminal Units.
33. Air Inlets and Outlets.
34. Heat Exchangers.

B. Report Forms

1. Title Page:
    a. Name of Testing, Adjusting, and Balancing Agency

©COPYRIGHT 2013 CH2M HILL

b. Address of Testing, Adjusting, and Balancing Agency
c. Telephone and facsimile numbers of Testing, Adjusting, and Balancing Agency
d. Project name
e. Project location
f. Project Architect
g. Project Engineer
h. Project Contractor
i. Project altitude
j. Report date

2. Summary Comments:
   a. Design versus final performance
   b. Notable characteristics of system
   c. Description of systems operation sequence
   d. Summary of outdoor and exhaust flows to indicate building pressurization
   e. Nomenclature used throughout report
   f. Test conditions
3. Instrument List:
   a. Instrument
   b. Manufacturer
   c. Model number
   d. Serial number
   e. Range
   f. Calibration date
4. Electric Motors:
   a. Manufacturer
   b. Model/Frame
   c. HP/BHP and kW
   d. Phase, voltage, amperage; nameplate, actual, no load
   e. RPM
   f. Service factor
   g. Starter size, rating, heater elements

9. Society for Protective Coatings (SSPC):
    a. SP 3, Power Tool Cleaning.
    b. SP 5, White Metal Blast Cleaning.
    c. SP 6, Commercial Blast Cleaning.
    d. SP 10, Near-White Blast Cleaning.
10. Underwriters Laboratories Inc. (UL): 507, Safety Standard for Electric Fans.

1.02 DEFINITIONS

A. The following is a list of abbreviations which may be used in this section:

1. AC: Alternating Current.
2. CISD: Chemical Industry, Severe-Duty.
3. dB: Decibel.
4. DWDI: Double Width, Double Inlet.
5. FRP: Fiberglass Reinforced Plastic.
6. hp: Horsepower.
7. ODP: Open Drip Proof.
8. SWSI: Single Width, Single Inlet.
9. TEFC: Totally Enclosed, Fan Cooled.
10. UV: Ultra Violet
11. XP: Explosion Proof.

1.03 SUBMITTALS

A. Action Submittals:

1. Provide following for specified products:
    a. Identification as referenced in Contract Documents.
    b. Manufacturer’s name and model number.
    c. Descriptive specifications, literature, and drawings.
    d. Dimensions and weights.
    e. Fan sound power level data (reference 10 to power minus 12 watts) at design operating point.
    f. Fan Curves:
        1) Performance Curves Indicating:
            a) Relationship of flow rate to static pressure for various fan speeds.
            b) Brake horsepower curves.
            c) Acceptable selection range (surge curves, maximum revolutions per minute).

©COPYRIGHT 2013 CH2M HILL

d) Static pressure, capacity, horsepower demand and overall efficiency required at duty point, including drive losses.

2) For variable air volume applications, indicate operating points at 100, 80, 60 and 40 percent of design capacity on fan curves including data to indicate effect of capacity control devices such as inlet vanes on flow, pressure, and brake horsepower.

g. Capacities and ratings.

h. Construction materials.

i. Fan type, size, class, drive arrangement, discharge, rotation, and bearings.

j. Wheel type, diameter, maximum revolutions per minute for fan class, operating revolutions per minute, and tip speed.

2. Motor data, including service factor and operating horsepower, as specified in Section 26 20 00, Low-Voltage AC Induction Motors.

a. Fan shaft first critical speed.

b. Belt service factor.

c. Drive assembly horsepower rating.

d. Sheave horsepower rating.

e. Power and control wiring diagrams, including terminals and numbers.

f. Factory run test and vibration test reports.

g. Vibration isolation.

h. Factory finish system.

i. Color selection charts where applicable.

j. [Corrosion protection coating product data.]

k. [Fiberglass Material: Statement of resins and reinforcing proposed for use.]

3. Seismic anchorage and bracing drawings and cut sheets, as required by Section 01 88 15, Seismic Anchorage and Bracing.

4. "Or Equal" Equipment:

a. Where submitted equipment results in change to fan inlet or outlet ductwork configuration shown on Drawings, submit system effect factor calculations indicating increased static pressure requirements as described in AMCA 201.

b. Where submitted equipment results in change to ductwork and equipment configuration shown on Drawings, submit detailed information on structural, mechanical, electrical, or other modifications necessary to adapt arrangement to equipment furnished.

B. Informational Submittals:

1. Seismic anchorage and bracing calculations as required by Section 01 88 15, Seismic Anchorage and Bracing.

©COPYRIGHT 2013 CH2M HILL

2. Recommended procedures for protection and handling of products prior to installation.
3. Manufacturer's installation instructions.
4. Manufacturer's Certificate of Compliance in accordance with Section 01 43 33, Manufacturers' Field Services, for the following:
   a. Motors specified to be premium efficient type.
   b. FRP fans.
5. Component and attachment testing seismic certificate of compliance as required by Section 01 45 33, Special Inspection [, Observation,] and Testing.
6. Test reports.
7. Operation and maintenance data in conformance with Section 01 78 23, Operation and Maintenance Data. Include as-built version of equipment schedules.

C. LEED Submittals:

1. Equipment and materials for [_____] [Administration Building] [Maintenance Building].
2. Refer to Section 01 81 13, Sustainable Design Requirements, for information regarding LEED submission requirements.
3. Engineer reserves right to reject products and assemblies based on incomplete or noncompliance with LEED certification requirements.
4. Documentation required indicating compliance with Optimize Energy Performance—EA Credit 1.
5. Documentation required indicating compliance with Minimum IAQ Performance—EQ Prerequisite 1.
6. Documentation required indicating compliance with Low-Emitting Materials, Adhesives and Sealants—EQ Credit 4.1.

1.04 QUALITY ASSURANCE

A. Performance Ratings: Tested in accordance with AMCA 210.

B. Sound Ratings: Tested in accordance with AMCA 300.

C. Fabrication: In accordance with AMCA 99.

1.05 EXTRA MATERIALS

A. Furnish, tag, and box for shipment and storage the following [spare parts,] [special tools,] [and] [materials:]

©COPYRIGHT 2013 CH2M HILL

Item	Quantity
Vee Belts	[One] [_____] complete set per unit
[_____]	[One] [_____] complete sets [per unit]
[Special tools required to maintain or dismantle]	[One] [_____] complete set [for each different size unit]

B. Delivery: In accordance with Section 01 61 00, Common Product Requirements.

PART 2 - PRODUCTS

2.01 EQUIPMENT SCHEDULES

A. Some specific equipment requirements are listed in Equipment Schedule. Refer to [Drawings] [Article Supplements].

2.02 GENERAL

A. Spark Resistant Construction: Fans required to be spark resistant shall comply with requirements of AMCA 99-0401.

B. Operating Limits: Fans designated to meet a specified fan class shall comply with requirements of AMCA 99-2408.

C. Acoustical Levels: Equipment selections shall produce sound power levels in each octave band no greater than shown in Equipment Schedule.

D. Fan Drives:

1. Drive assembly shall be sized for a minimum 140 percent of fan motor horsepower rating.
2. Furnish multiple drive belts where motor horsepower is 2 hp or larger.
3. Sheaves:
   a. Capable of providing 150 percent of motor horsepower.
   b. Unless otherwise noted, furnish belt-driven fans with cast iron or flanged steel sheaves.
4. Drive Adjustment:
   a. When fixed-pitch sheaves are furnished, accomplish system air balancing by either trial of different fixed-pitch sheaves or use of temporary adjustable-pitch sheaves.
   b. Provide trial and final sheaves, as well as drive belts, as required.

©COPYRIGHT 2013 CH2M HILL

5. Fan Shafts: First critical speed of at least 125 percent of fan maximum operating speed.
6. Provide speed test openings at shaft locations.
7. Belts: Oil and heat resistant, nonstatic type.
8. Motors:
    a. Motors 20 hp or Smaller:
        1) Variable pitch V-belt sheaves allowing at least 20 percent speed variation.
        2) Final operating point shall be at approximate sheave midpoint.
    b. Motors Larger than 20 hp: Fixed-pitch sheaves.
    c. Furnish motors for V-belt drives with adjustable rails or bases.
9. Weather Cover: For outdoor applications, factory fabricated drive assembly of same material as fan housing, unless specified otherwise.
10. Belt and Shaft Guards:
    a. Easily removable and to enclose entire drive assembly, meeting federal, OSHA [, and State of _____] requirements.
    b. Guard faces of expanded metal having minimum 60 percent free area for ventilation.
    c. Bright yellow finish.

E. Finishes:

1. Carbon Steel Parts: Factory finish as follows, unless indicated otherwise.
    a. Parts cleaned and chemically pretreated with phosphatizing process.
    b. Alkyd enamel primer.
    c. Air dry enamel topcoat.
2. Aluminum Parts: Finished smooth and left unpainted, unless stated otherwise.
3. Stainless Steel Parts: Finished smooth and left unpainted.
4. Fiberglass Parts: Finished in accordance with Paragraph Fiberglass Material.

2.03 CABINET FAN

A. General:

1. Factory-assembled, ceiling, wall or inline mounted, centrifugal cabinet fan; including housing, fan wheel, drive assembly, motor and accessories.
2. Bearing AMCA Certified Ratings Seal for sound and air performance.

B. Housing:

1. Material: Minimum 20-gauge galvanized steel.
2. Construction:

©COPYRIGHT 2013 CH2M HILL

a. Minimum 14-gauge blower and motor support frame.
b. Lined with minimum 1/2-inch acoustical insulation.
c. Outlet duct collar with integral reinforced aluminum backdraft damper, with nylon bushings.
d. Motor mounted on resilient vibration isolators.
e. Motor and blower removable from unit without cabinet disassembly.
f. Removable cabinet access panels.
g. Air Inlet: Field convertible for bottom or end air inlet configuration.
h. Predrilled universal mounting brackets, adjustable.

C. Wheel: Centrifugal forward curved type, galvanized steel or plastic construction.

D. Shaft, Bearings, Drive:

1. Shafts: Turned, ground and polished carbon steel.
2. Bearings: Grease lubricated, precision antifriction ball, sealed type.
3. Drives:
   a. In accordance with Paragraph on Fan Drives.
   b. Factory set to specified fan revolutions per minute.
   c. Type: Direct.

E. Electrical:

1. Integral wiring box.
2. Factory-installed disconnect receptacle.

F. Accessories: Provide [as scheduled in Equipment Schedule.] [as follows:]

1. Ceiling Grille: Factory fabricated, [steel] [aluminum] construction, white baked enamel finish.
2. Speed Controller:
   a. Wall mount.
   b. Solid state electronics.
   c. Dial type combination ON/OFF switch and SPEED selector.
   d. Filter Box:
   e. [Refer to Article Filter Housing.]
   f. [Attached to fan inlet.
   g. Box construction to match fan housing.
   h. Integral duct collars.]
   i. [Access Doors: Hinged and latched.]
   j. [Filter Media: 1-inch [aluminum wire mesh] [pleated disposable type].]
3. Wall Cap:

©COPYRIGHT 2013 CH2M HILL

a. Aluminum construction, mill finish.
b. Built-in backdraft damper.
c. Bird screen.
d. Round duct connection.

G. Manufacturers and Products:

1. Loren Cook; Gemini Series.
2. Greenheck; SP Series.
3. ACME; Model VQ Series.
4. Twin City Fan; T Series.

2.04 CEILING FAN, INDUSTRIAL

A. General:

1. Factory-assembled paddle-type ceiling fan, propeller, motor, and accessories.
2. Fans with motor speed control labeled in accordance with UL 507.
3. Warranty: 3-year duration, full coverage against manufacturer's defects.

B. Construction:

1. Industrial grade construction, with cast-iron yoke and cast-iron motor housing.
2. Blades: Aerodynamically curved, aluminum.
3. Finish: Baked white enamel.
4. Downrod:
   a. Minimum 10-inch length, other lengths as required to provide specified installation height; use factory provided extender kit where necessary.
   b. 3/4-inch nominal diameter.
5. Secondary Support: Factory-installed, minimum 6-foot-long, 1/8-inch-diameter galvanized steel cable, minimum 1,700-pound breaking strength.
6. Motor:
   a. Direct drive, permanent split-capacitor type, reversible.
   b. Permanently sealed ball bearings.
   c. Moisture and dust resistant.
   d. Thermal-overload: Built-in, self-resetting.

C. Accessories: Provide [as scheduled in Equipment Schedule.] [as follows:]

1. Speed Controller:
   a. Wall mount.
   b. Solid state electronics.
   c. Suitable for single and multiple fan operation.

©COPYRIGHT 2013 CH2M HILL

d. Dial type combination ON/OFF switch and SPEED selector.

2. Fan Blade Guard:
   a. Factory fabricated, spiral wire configuration, chrome plated steel.
   b. Full blade coverage.

D. Manufacturers and Products:

1. Leading Edge. Industrial Ceiling Fan.
2. Northwest Envirofan; Industrial Ceiling Fan.
3. Canarm; Model CP.

2.05 INLINE FAN, CENTRIFUGAL, SQUARE

A. General:

1. Factory-assembled, centrifugal, inline fan, square housing configuration; including housing, fan wheel, drive assembly, motor and accessories.
2. Bearing AMCA Certified Ratings Seal for sound and air performance.

B. Housing:

1. Construction: [Minimum 18-gauge galvanized steel.] [All aluminum.]
2. Integral duct collars.
3. Removable side panels, for ease of service.
4. Field convertible for side air discharge configuration.
5. Predrilled universal mounting brackets for vertical or horizontal installation.
6. Inlets: Aerodynamic aluminum venturi.
7. Corrosion-resistant fasteners.
8. Drive belt and bearings separated from air steam by enclosure.

C. Wheel:

1. Centrifugal backward inclined, 100 percent aluminum construction.
2. Precision machined cast aluminum hub.
3. Die-formed airfoil or backward inclined blades.
4. Matched to inlet venturi.
5. Attached to fan shaft with split taper lock bushing.

D. Shaft, Bearings, Drive:

1. Shafts:
   a. Turned, ground and polished carbon steel.
   b. Keyed for sheave installation.

©COPYRIGHT 2013 CH2M HILL

2. Bearings:
    a. Grease lubricated, precision antifriction ball, self-aligning, pillow block style, relubricatable or sealed type.
    b. Selected for average life (ABMA 9 L_{50}) of not less than 200,000 hours operation at maximum cataloged operating speed.
3. Drives:
    a. In accordance with Paragraph Fan Drives.
    b. Factory set to specified fan revolutions per minute.
    c. Type: [Belt or Direct, as indicated in Equipment Schedule.] [Belt.] [Direct.]
    d. Arrangement: [As scheduled in Equipment Schedule.] [Arrangement 9.] [Arrangement 10.] [Arrangement 4.]

E. Accessories: Provide [as scheduled in Equipment Schedule.] [as follows:]

1. Belt Guard: Sheet metal construction, OSHA type.
2. Motor and Drive Cover:
    a. Factory fabricated, OSHA type.
    b. Sheet metal construction, same material as fan housing.
    c. Vented, openings sufficient size for proper motor cooling.
    d. Fan speed controller.
3. Gravity Backdraft Damper: Galvanized steel frame, aluminum blades, brass pivot pins, neoprene seals on damper blade edges, gravity operation, and adjustable counterweight.
4. Motorized Damper: Galvanized steel frame, aluminum blades, neoprene seals on damper blade edges, [120V] [24V] operator.
5. Insulated Housing: Fiberglass insulation, 1-inch thick, [neoprene coated,] [foil faced,] on interior of housing.
6. Filter Box:
    a. [Refer to Article Filter Housings.]
    b. [Attached to fan inlet.
    c. Box construction to match fan housing.
    d. Integral duct collars.]
    e. [Access Doors: Hinged and latched.]
    f. [Filter Media: 1-inch [aluminum wire mesh] [pleated disposable type].]
7. Inlet Screen: Removable 1-inch mesh screen, aluminum construction, overexposed inlets.
8. Disconnect: Factory installed, nonfused, NEMA Type [1] [4X] [as scheduled].
9. Single Side Discharge: Package consisting of side duct connection collar and rear-discharge blank-off panel.
10. Dual Side Discharge: Package consisting of side duct connection collars and rear-discharge blank-off panel.

©COPYRIGHT 2013 CH2M HILL

11. Bearing Lubrication Lines:
    a. Extended to outside of fan housing.
    b. Terminate with zerk fittings.
12. Spark Resistant Construction Classification: AMCA 99-0401 Type [A] [B] [C] [as scheduled].
13. Corrosion Protection Coating:
    a. Provide factory-applied corrosion protection coating on the following:
        1) Wheel.
        2) Housing.
        3) Accessories.
        4) Interior surfaces in contact with airstream.
    b. [Coating system shall be [baked enamel] [baked polyester] [air-dry epoxy] [baked epoxy] [air-dry phenolic] [baked phenolic] [baked epoxy phenolic] [as scheduled in fan Equipment Schedule], and shall be in accordance with Article Corrosion Protection Coating.]
    c. [Coating system shall be in accordance with Section 09 90 00, Painting and Coating.]

F. Manufacturers and Products:

1. Greenheck; Model BSQ (Belt); SQ (Direct).
2. Loren Cook; Model SQNB (Belt); SQND (Direct).
3. ACME; Centri-Master Model XB Series (Belt); XD (Direct).
4. Twin City Fan (Aerovent); Model BSI (Belt); Model ISD (Direct).

2.06 INLINE FAN, TUBULAR CENTRIFUGAL

A. General:

1. Factory-assembled tubular centrifugal fan, belt drive; including housing, fan wheel, drive assembly, motor, and accessories.
2. Fan Performance: AMCA 99-2408 Class [I] [II] [III] [as scheduled].
3. Bearing AMCA Certified Ratings Seal for sound and air performance.

B. Housings:

1. Material: [Steel.] [Aluminum.] [Type 304 stainless steel.] [Type 316 stainless steel.]
2. Construction:
    a. Heavy-gauge rolled metal casing, with continuous seam welding.
    b. Air straightening vanes at fan outlet, integral with shaft, bearing support, and outer casing, fully welded.

©COPYRIGHT 2013 CH2M HILL

c. Bearing and drive components isolated from air stream within continuously welded tunnel.
d. Lifting lugs welded to housing.
e. Mounting brackets, welded to housing, as required for indicated fan arrangement.

3. Bearing Lubrication Lines:
   a. Extended to outside of fan housing.
   b. Type 316 stainless steel construction.
   c. Terminate with zerk fittings.
4. Inlets: Die-formed bell mouth, matched to fan wheel inlet shroud.
5. Motor Base Plate: Minimum of 3/16-inch metal plate, welded to fan housing, to provide belt tensioning and adjustment.
6. Duct Flanges: Angle ring flanges, same diameter as housing, at fan inlet and outlet, heavy construction, factory drilled.

C. Wheel:

1. Material: [Steel] [Aluminum] construction.
2. Centrifugal, one-piece, nonoverloading, backwardly inclined blades.
3. Blades continuously welded to inlet shroud and backplate.
4. Attached to fan shaft with split taper lock bushing.

D. Shaft, Bearings, Drive:

1. Shafts:
   a. Turned, ground and polished hot-rolled carbon steel.
   b. Keyed for sheave installation.
   c. Corrosion protection coating.
2. Bearings:
   a. Grease lubricated, precision antifriction ball, self-aligning type.
   b. Mounted in cast iron pillow block housing.
   c. Selected for average life (ABMA 9 L_{50}) of not less than 200,000 hours operation at maximum cataloged operating speed.
   d. Suitable for fan operation in vertical configuration.
3. Drives:
   a. In accordance with Paragraph Fan Drives.
   b. Factory set to the specified fan revolutions per minute.
   c. Type: Belt.
   d. Arrangement: [As scheduled in Equipment Schedule.] [Arrangement 1.] [Arrangement 4.] [Arrangement 9.] [Vertical.]

E. Roof Mount Accessories:

©COPYRIGHT 2013 CH2M HILL

1. Motor and Drive Cover:
   a. Factory fabricated; OSHA type.
   b. Sheet metal construction, same material as fan housing.
   c. Vented, openings sufficient size for proper motor cooling.
2. Stack Cap:
   a. Factory fabricated.
   b. Same material as fan housing.
   c. Integral backdraft dampers.
3. Curb Base:
   a. Factory fabricated.
   b. Sized to adapt fan inlet to roof curb.
   c. Same material as fan housing.

F. Accessories: Provide [as scheduled in Equipment Schedule.] [as follows:]

1. Roof Curb:
   a. Factory fabricated.
   b. [With] [Without] damper tray.
   c. Sloped to match roof pitch and to provide level top.
   d. Height Above Finished Roof: [12 inches.] [As scheduled.]
   e. [Galvanized steel] [Aluminum] construction.
   f. Mitered continuous welded corner seams.
   g. Pressure-treated wood nailer.
   h. Insulation: Minimum 1-1/2 inches thick, 3 pounds per cubic foot density, rigid mineral fiberboard insulation with metal liner.
2. Housing Access Doors: Bolted and gasketed.
3. Disconnect: Factory installed, nonfused, NEMA Type [3R] [4X].
4. Motor and Drive Cover:
   a. Factory fabricated; OSHA type.
   b. Sheet metal construction, same material as fan housing.
   c. Vented, openings sufficient size for proper motor cooling.
5. Belt Guard: Sheet metal construction, OSHA type.
6. Inlet Vanes: Variable position, for manual or automatic operation.
7. Housing Access Doors: Bolted and gasketed.
8. Shaft Seal: [Elastomeric.] [Ceramic felt.] [Lubricated.] [Stuffing box.] [Type as scheduled.]
9. Inlet Screen: Metal, spiral wire type, OSHA approved, removable.
10. Outlet Screen: Metal, spiral wire type, OSHA approved, removable.
11. Support Base: Welded metal, for standard platform or floor mounting.
12. Spark Resistant Construction: AMCA 99-0401 Type [A] [B] [C] [as scheduled].
13. Corrosion Protection Coating:

©COPYRIGHT 2013 CH2M HILL

a. Provide factory-applied corrosion protection coating on these fan components:
   1) Wheel.
   2) Housing.
   3) Accessories.
   4) Interior surfaces in contact with airstream.
b. [Coating system shall be [baked enamel] [baked polyester] [air-dry epoxy] [baked epoxy] [air-dry phenolic] [baked phenolic] [baked epoxy phenolic] [as scheduled in Equipment Schedule], and shall be in accordance with Article Corrosion Protection Coating.]
c. [Coating system shall be in accordance with Section 09 90 00, Painting and Coating.]

G. Manufacturers and Products:

1. Aerovent; Model CBD.
2. Cook; Model TCNH-B.
3. Greenheck; Model TCB.

2.07 INLINE FAN, TUBULAR CENTRIFUGAL, FIBERGLASS

A. General:

1. Factory-assembled tubular centrifugal fan, fiberglass construction, belt drive; including housing, fan wheel, drive assembly, motor and accessories.
2. Fiberglass Construction: In accordance with ASTM D4167.
3. Fan Performance: AMCA 99-2408 Class [I] [II] [III] [as scheduled].
4. Air Stream Hardware: Type 316 stainless steel.

B. Fiberglass Material:

1. Construction: Resin reinforced fiber cloth and mat.
2. Resin:
   a. [Polyester] [Vinyl ester] thermosetting resin.
   b. Selected by fabricator, subject to approval by Engineer.
   c. Suitable for intended service with no fillers or thixotropic agents.
   d. Premium grade and corrosion resistant.
   e. Structural wall resin may be of different chemical resistance, subject to conditions of service and approval by Engineer.
   f. [Flame Spread Index:
   g. ASTM E84, less than 25; fire retardant additives used only in structural layer.

©COPYRIGHT 2013 CH2M HILL

1) Structural wall resin shall contain a minimum of 3 percent antimony trioxide to achieve required flame spread index.]

h. For outdoor locations, add ultraviolet absorbers to surfacing resin to improve weather resistance.

i. For interior locations, final coat shall be factory applied intumescent coating to achieve designated results for low smoke development.

j. Color:

1) Use no dyes, pigments, or colorants [, except in exterior gel coat].

2) Exterior gel coat shall be [white] [_____].

3. Reinforcement:

4. Veil: Chemical surfacing mat, [Type C (chemical) glass veil] [Nexus Surface Veil] [carbon veil].

5. Chopped Strand Mat: Type E glass, minimum 1-1/2 ounces per square foot, with silane finish and styrene soluble binder.

a. Continuous Roving for Chopper Gun Spray-Up: Type E glass.

b. Woven Roving: Type E glass, nominal 24 ounces per square yard, 4 by 5 weave, with silane type finish.

6. Laminate:

a. Inner Surface (Veil):

1) Resin rich, veil reinforced, 10 mils to 20 mils thick.

2) Use no additives.

3) Finish and binder compatible with lay-up resin.

4) Reinforcement Content: Not more than 20 percent.

b. Interior (Corrosion) Layer:

1) Resin rich, at least two plies of chopped strand mat, nominal 100 mils to 120 mils thick.

2) Use no additives.

3) Construct interior layer of resin reinforced with at least two plies of chopped strand mat backing the veil.

4) Reinforcement Content: 25 plus or minus 5 percent.

c. Exterior (Structural) Layer:

1) Resin with mat, cloth, woven roving or chopped strand glass reinforcement.

2) Enough resin present to prevent surface fiber show.

3) Exterior surface relatively smooth, with no exposed fibers or sharp projections.

d. Wall Thickness: As required for equipment structural integrity, but not less than 3/16 inch.

C. Housing:

1. Material: Fiberglass construction.

©COPYRIGHT 2013 CH2M HILL

2. Construction:
    a. Tubular housing shell.
    b. Integral predrilled duct connection flanges to ensure housing concentricity and housing strength.
    c. Air straightening vanes, fiberglass construction, at fan outlet, interconnected with inner and outer shell.
    d. Bearing Base and Drive Enclosure:
        1) Bearings and belts enclosed in air insulated fiberglass housing for protection from air stream gases, fumes, and vapors.
        2) Supported by tapered gussets interlocked into outer housing.
        3) Constructed of laminated glass and resin.
        4) Bearing housing furnished with a bolted, removable Teflon shaft closure plate to facilitate bearing access.
        5) Viton shaft seal.
    e. Lifting lugs, steel, bolted to fan housing flanges.
    f. Mounting brackets, steel, bolted to fan housing flanges, as required for indicated fan arrangement.
3. Inlet:
    a. Bolted, removable.
    b. Streamlined, bell mouth type.
    c. Fiberglass construction.
    d. Matched to fan wheel inlet shroud.
4. Bearing Lubrication Lines:
    a. Extended to outside of fan housing.
    b. Type 316 stainless steel construction.
    c. Terminated with zerk fittings.
5. Motor Base Plate:
    a. Minimum 3/16-inch steel plate.
    b. Bolted between gussets integral to fan housing flanges.
    c. Provision for belt tensioning and adjustment.

D. Wheel:

1. Material: Fiberglass construction.
2. Centrifugal, one-piece, nonoverloading, backwardly inclined airfoil blades.
3. Mechanically fastened to end of fan shaft by Type 316 stainless steel bolt.

E. Shaft, Bearings, Drive:

1. Shafts:
    a. Turned, ground and polished Type 316 stainless steel.
    b. Keyed for sheave installation.

©COPYRIGHT 2013 CH2M HILL

2. Bearings:
   a. Grease lubricated, precision antifriction, ball self-aligning type.
   b. Mounted in cast iron pillow block housing.
   c. Selected for average life (ABMA 9 L_{50}) of not less than 200,000 hours operation at maximum cataloged operating speed.
   d. Suitable for fan operation in vertical configuration.
3. Drives:
   a. In accordance with Paragraph Fan Drives.
   b. Factory set to specified fan revolutions per minute.
   c. Type: Belt.
4. Arrangement: [As scheduled in Equipment Schedule.] [Arrangement 1.] [Arrangement 4.] [Arrangement 9.] [Vertical.]

F. Accessories: Provide [as scheduled in Equipment Schedule.] [as follows:]

1. Housing Access Doors: Fiberglass construction, bolted, and gasketed.
2. Disconnect: Factory installed, nonfused, NEMA Type [3R] [4X].
3. Motor and Drive Cover:
   a. Factory fabricated; OSHA type.
   b. Fiberglass construction, same material as fan housing.
   c. Vented, openings sufficient size for proper motor cooling.
4. Belt Guard: Sheet metal construction, OSHA type.
5. Inlet Vanes: Variable position, for manual or automatic operation.
6. Housing Access Doors: Bolted and gasketed.
7. Shaft Seal: [Elastomeric.] [Ceramic felt.] [Lubricated.] [Stuffing box.] [Type as scheduled.]
8. Inlet Screen: Metal, spiral wire type, OSHA approved, removable.
9. Outlet Screen: Metal, spiral wire type, OSHA approved, removable.
10. Nameplates: Type 316 stainless steel manufacturer's nameplates.
11. Support Base: Welded metal, for standard platform or floor mounting.
12. Spark Resistant Construction: AMCA 99-0401 Type [A] [B] [C] [as scheduled].
13. Corrosive Service Metal Components:
    a. Metal components including fan shaft, motor pedestal, motor slide base, lube lines, accessories, hardware shall be Type 316 stainless steel.
    b. Coated steel components will not be accepted.

1. Corrosion Protection Coating:
   a. Provide factory-applied corrosion protection coating on steel fan components.
   b. [Coating system shall be [baked enamel] [baked polyester] [air-dry epoxy] [baked epoxy] [air-dry phenolic] [baked phenolic] [baked epoxy phenolic] [as scheduled in fan Equipment Schedule], and shall be in accordance with Article Corrosion Protection Coating.]

©COPYRIGHT 2013 CH2M HILL

c. [Coating system shall be in accordance with Section 09 90 00, Painting and Coating.]

B. Manufacturers and Products:
1. Aerovent; Model CBDF.
2. Hartzell; Model 40.

2.08 INLINE FAN, TUBE AXIAL

A. General:

1. Factory-assembled tube-axial fan; including housing, fixed pitch fan wheel, drive assembly, motor and accessories.
2. Bearing AMCA Certified Ratings Seal for sound and air performance.

B. Housings:

1. Material: [Steel.] [Aluminum.] [Type 304 stainless steel.] [Type 316 stainless steel.]
2. Construction:
   a. Heavy-gauge rolled metal casing, with continuous seam welding.
   b. Bearing and drive components isolated from air stream within continuously welded tunnel.
   c. Lifting lugs welded to housing.
   d. Mounting brackets, welded to housing, as required for indicated fan arrangement.
3. Bearing Lubrication Lines:
   a. Extended to outside of fan housing.
   b. Type 316 stainless steel construction.
   c. Terminate with zerk fittings.
4. Motor Base Plate: Minimum of 3/16-inch metal plate, welded to fan housing, to provide belt tensioning and adjustment.
   a. Duct Flanges: Angle ring flanges, same diameter as housing, at fan inlet and outlet, heavy construction, factory drilled.

C. Wheel:

1. Hub: Cast aluminum.
2. Blades: Cast aluminum airfoil design.
3. Wheel assembly attached to fan shaft with split taper lock bushing.

D. Shaft, Bearings, Drive:

©COPYRIGHT 2013 CH2M HILL

1. Shafts:
   a. Turned, ground, and polished hot-rolled carbon steel.
   b. Keyed for sheave installation.
   c. Corrosion protection coating.

2. Bearings:
   a. Grease lubricated, precision antifriction ball, self-aligning type.
   b. Mounted in cast iron pillow block housing.
   c. Selected for average life (ABMA 9 L_{50}) of not less than 200,000 hours operation at maximum cataloged operating speed.
   d. Suitable for fan operation in vertical configuration.
3. Drives:
   a. In accordance with Paragraph Fan Drives.
   b. Factory set to specified fan revolutions per minute.
   c. Type: [Belt or direct, as indicated in Equipment Schedule.] [Belt.] [Direct.]
   d. Arrangement: [As scheduled in Equipment Schedule.] [Arrangement 1.] [Arrangement 4.] [Arrangement 9.] [Vertical.]

E. Roof Mount Accessories:

1. Motor and Drive Cover:
   a. Factory fabricated; OSHA type.
   b. Sheet metal construction, same material as fan housing.
   c. Vented, openings sufficient size for proper motor cooling.
2. Stack Cap:
   a. Factory fabricated.
   b. Same material as fan housing.
   c. Integral backdraft dampers.
3. Curb Base:
   a. Factory fabricated.
   b. Sized to adapt fan inlet to roof curb.
   c. Same material as fan housing.

F. Accessories: Provide [as scheduled in Equipment Schedule.] [as follows:]

1. Roof Curb:
   a. Factory fabricated.
   b. [With] [Without] damper tray.
   c. Sloped to match roof pitch and to provide level top.
   d. Height Above Finished Roof: [12 inches.] [As scheduled.]
   e. [Galvanized steel] [Aluminum] construction.

©COPYRIGHT 2013 CH2M HILL

f. Mitered continuous welded corner seams.
g. Pressure-treated wood nailer.
h. Insulation: Minimum 1-1/2 inches thick, 3 pounds per cubic foot density, rigid mineral fiberboard insulation with metal liner.

2. Housing Access Doors: Bolted and gasketed.
3. Disconnect: Factory installed, nonfused, NEMA Type [3R] [4X].
4. Motor and Drive Cover:
   a. Factory fabricated; OSHA type.
   b. Sheet metal construction, same material as fan housing.
   c. Vented, openings sufficient size for proper motor cooling.
5. Belt Guard: Sheet metal construction, OSHA type.
6. Inlet Vanes: Variable position, for manual or automatic operation.
7. Shaft Seal: Elastomeric.
8. Inlet Screen: Metal, spiral wire type, OSHA approved, removable.
9. Outlet Screen: Metal, spiral wire type, OSHA approved, removable.
10. Inlet Bell: Factory fabricated aerodynamic bell, bolted to fan inlet, same material as fan housing.
11. Inlet Cone: Factory fabricated, conical fan to duct transition, bolted to housing flange, same material as fan housing.
12. Outlet Cone: Factory fabricated, conical fan to duct transition, bolted to housing flange, same material as fan housing.
13. Support Base: Welded metal, for standard platform or floor mounting.
14. Spark Resistant Construction: AMCA 99-0401 Type [A] [B] [C] [as scheduled].
15. Corrosion Protection Coating:
    a. Provide factory-applied corrosion protection coating on these fan components:
       1) Wheel (or propeller).
       2) Housing.
       3) Accessories.
       4) Interior surfaces in contact with airstream.
    b. [Coating system shall be [baked enamel] [baked polyester] [air-dry epoxy] [baked epoxy] [air-dry phenolic] [baked phenolic] [baked epoxy phenolic] [as scheduled in fan Equipment Schedule], and shall be in accordance with Article Corrosion Protection Coating.]
    c. [Coating system shall be in accordance with Section 09 90 00, Painting and Coating.]

G. Manufacturers and Products:

1. Aerovent; Model TA (Direct); TABD (Belt).
2. Cook; Model EDD (Direct); EDB (Belt).

3. Greenheck; Model TDI (Direct); TBI (Belt).

2.09 INLINE FAN, VANE AXIAL

A. General:

1. Factory-assembled vane-axial fan; including housing with integral vanes, adjustable pitch fan wheel, drive assembly, motor and accessories.
2. Bearing AMCA Certified Ratings Seal for sound and air performance.

B. Housings:

1. Material: [Steel.] [Aluminum.] [Type 304 stainless steel.] [Type 316 stainless steel.]
2. Construction:
   a. Heavy gauge rolled metal casing, with continuous seam welding.
   b. Air straightening vanes at propeller discharge, integral with housing, fully welded.
   c. Bearing and drive components isolated from air stream within continuously welded tunnel.
   d. Lifting lugs welded to housing.
   e. Mounting brackets, welded to housing, as required for indicated fan arrangement.
3. Bearing Lubrication Lines:
   a. Extended to outside of fan housing.
   b. Type 316 stainless steel construction.
   c. Terminate with zerk fittings.
   d. Motor Base Plate: Minimum of 3/16-inch metal plate, welded to fan housing, to provide belt tensioning and adjustment.
4. Duct Flanges: Angle ring flanges, same diameter as housing, at fan inlet and outlet, heavy construction, factory drilled.

C. Wheel:

1. Hub:
   a. Cast aluminum.
   b. Streamlined hub cover.
2. Blades:
   a. Cast aluminum
   b. Adjustable pitch.
   c. Factory set to required pitch.
   d. Blade angle field adjustable.

©COPYRIGHT 2013 CH2M HILL

e. Wheel assembly attached to fan shaft with split taper lock bushing.

D. Shaft, Bearings, Drive:

1. Shafts:
   a. Turned, ground, and polished hot-rolled carbon steel.
   b. Keyed for sheave installation.
   c. Corrosion protection coating.
2. Bearings:
   a. Grease lubricated, precision antifriction ball, self-aligning type.
   b. Mounted in cast iron pillow block housing.
   c. Selected for average life (ABMA 9 L_{50}) of not less than 200,000 hours operation at maximum cataloged operating speed.
   d. Suitable for fan operation in vertical configuration.
3. Drives:
   a. In accordance with Paragraph Fan Drives.
   b. Factory set to specified fan revolutions per minute.
   c. Type: [Belt or direct, as indicated in Equipment Schedule.] [Belt.] [Direct.]
   d. Arrangement: [As scheduled in Equipment Schedule.] [Arrangement 1.] [Arrangement 4.] [Arrangement 9.] [Vertical.]

E. Roof Mount Accessories:

1. Motor and Drive Cover:
   a. Factory fabricated; OSHA type.
   b. Sheet metal construction, same material as fan housing.
   c. Vented, openings sufficient size for proper motor cooling.
2. Stack Cap:
   a. Factory fabricated.
   b. Same material as fan housing.
   c. Integral backdraft dampers.
3. Curb Base:
   a. Factory fabricated.
   b. Sized to adapt fan inlet to roof curb.
   c. Same material as fan housing.
4. Accessories: Provide [as scheduled in Equipment Schedule.] [as follows:]
   a. Roof Curb:
      1) Factory fabricated.
      2) [With] [Without] damper tray.
      3) Sloped to match roof pitch and to provide level top.
      4) Height Above Finished Roof: [12 inches.] [As scheduled.]

©COPYRIGHT 2013 CH2M HILL

5) [Galvanized steel] [Aluminum] construction.
6) Mitered continuous welded corner seams.
7) Pressure-treated wood nailer.
8) Insulation: Minimum 1-1/2 inches thick, 3 pounds per cubic foot density, rigid mineral fiberboard insulation with metal liner.
9) Housing Access Doors: Bolted and gasketed.
10) Disconnect: Factory-installed, nonfused, NEMA Type [3R] [4X].
11) Motor and Drive Cover:
12) Factory fabricated; OSHA type.
13) Sheet metal construction, same material as fan housing.

b. Vented, openings sufficient size for proper motor cooling.

5. Belt Guard: Sheet metal construction; OSHA type.
6. Inlet Vanes: Variable position, for manual or automatic operation.
7. Shaft Seal: Elastomeric.
8. Inlet Screen: Metal, spiral wire type, OSHA approved, removable.
9. Outlet Screen: Metal, spiral wire type, OSHA approved, removable.
10. Inlet Bell: Factory fabricated aerodynamic bell, bolted to fan inlet, same material as fan housing.
11. Inlet Cone: Factory fabricated, conical fan to duct transition, bolted to housing flange, same material as fan housing.
12. Outlet Cone: Factory fabricated, conical fan to duct transition, bolted to housing flange, same material as fan housing.
13. Support Base: Welded metal, for standard platform or floor mounting.
14. Spark Resistant Construction: AMCA 99-0401 Type [A] [B] [C] [as scheduled].
15. Corrosion Protection Coating:
    a. Provide factory-applied corrosion protection coating on these fan components:
        1) Wheel (or propeller).
        2) Housing.
        3) Accessories.
        4) Interior surfaces in contact with airstream.
    b. [Coating system shall be [baked enamel] [baked polyester] [air-dry epoxy] [baked epoxy] [air-dry phenolic] [baked phenolic] [baked epoxy phenolic] [as scheduled in fan Equipment Schedule], and shall be in accordance with Article Corrosion Protection Coating.]
    c. [Coating system shall be in accordance with Section 09 90 00, Painting and Coating.]

2. Cook; Model AVAB (Belt); AVAD (Direct).
3. Greenheck; Model VAB (Belt); VAD (Direct).

2.10 ROOF FAN, CENTRIFUGAL UPBLAST

A. General:

1. Factory-assembled centrifugal upblast roof fan; including housing, fan wheel, drive assembly, motor and accessories.
2. Bearing AMCA Certified Ratings Seal for sound and air performance.

B. Housing:

1. Construction: Spun-formed aluminum, minimum 16-gauge marine alloy.
2. Windband: Finish with rolled bead.
3. Top Cap: Motor access via quick release latches.
4. Motor completely sealed from exhaust air stream.
5. Motor cooling via air breather tubes.
6. Integral conduit chase for wiring.
7. Drain trough at lowest point of housing.
8. Fan Inlet:
   a. Full inlet cone of aluminum construction.
   b. Match inlet shroud.

C. Wheel:

1. Aluminum construction, backward inclined centrifugal, nonoverloading type.
2. Machined, cast aluminum hub.
3. Matched to deep spun inlet venturi.

D. Shaft, Bearings, Drive:

1. Shaft:
   a. Turned, ground, and polished carbon steel.
   b. Keyed for sheave installation.
   c. Zinc-phosphate coated and oil emulsion-dipped.
2. Bearings:
   a. Grease lubricated, precision antifriction ball, self-aligning, pillow block style.
   b. Selected for average life (ABMA 9 L_{50}) of not less than 200,000 hours operation at maximum cataloged operating speed.
   c. Terminate with zerk fittings.
3. Drives:

©COPYRIGHT 2013 CH2M HILL

a. In accordance with Paragraph Fan Drives.
b. Factory set to specified fan revolutions per minute.
c. Type: [Belt or direct, as indicated in Equipment Schedule.] [Belt.] [Direct.]

E. Accessories: Provide [as scheduled on Equipment Schedule.] [as follows:]

1. Gravity Backdraft Damper: Gravity operation, adjustable counterweight, and aluminum construction.
2. Motorized Damper: Aluminum frame, aluminum blades, aluminum hinge pins with nylon bushings, [120V] [24V] operator.
3. Bird Screens: Aluminum construction.
4. Roof Curb:
   a. Factory fabricated, [galvanized steel] [aluminum] construction.
   b. [With] [Without] damper tray.
   c. Sloped to match roof pitch, and to provide level top.
   d. Height Above Finished Roof: [12 inches.] [As scheduled.]
   e. Mitered continuous welded corner seams.
   f. Pressure-treated wood nailer.
   g. Insulation: Minimum 1-1/2 inches thick, 3 pounds per cubic foot density, rigid mineral fiberboard insulation with metal liner.
5. Disconnect: Factory installed, nonfused, NEMA Type [3R] [4X] [as scheduled].
6. Bearing Lubrication Lines:
   a. Extended to outside of fan housing.
   b. Type 316 stainless steel construction.
   c. Terminate with zerk fittings.
7. Spark Resistant Construction Classification: AMCA 99-0401 Type [A] [B] [C] [as scheduled].
8. Corrosion Protection Coating:
   a. Provide factory-applied corrosion protection coating on these fan components:
      1) Wheel.
      2) Housing.
      3) Accessories.
      4) Interior surfaces in contact with airstream.
   b. [Coating system shall be [baked enamel] [baked polyester] [air-dry epoxy] [baked epoxy] [air-dry phenolic] [baked phenolic] [baked epoxy phenolic] [as scheduled in fan Equipment Schedule], and shall be in accordance with Article Corrosion Protection Coating.]
   c. [Coating system shall be in accordance with Section 09 90 00, Painting and Coating.]

©COPYRIGHT 2013 CH2M HILL

F. Manufacturers and Products:

1. Aerovent: Model ATB.
2. Cook; Model ACRUD (Direct Drive); ACRUB (Belt Drive).
3. Greenheck; Model CUE (Direct Drive); CUBE (Belt Drive).
4. ACME, Model PDU (Direct Drive); PNU (Belt Drive).
5. Twin City Fan; BCRU.

2.11 ROOF FAN, FIBERGLASS CENTRIFUGAL UPBLAST

A. General:

1. Factory-assembled centrifugal upblast fiberglass roof fan; including housing, fan wheel, drive assembly, motor, and accessories.
2. Fiberglass Construction: In accordance ASTM D4167.
3. Suitable to convey air at temperatures up to 150 degrees F.
4. Bearing AMCA Certified Ratings Seal for sound and air performance.

B. Fiberglass Material:

1. Construction: Resin reinforced fiber cloth and mat.
2. Resin:
   a. [Polyester] [Vinyl ester] thermosetting resin.
   b. No fillers or thixotropic agents.
   c. Premium grade and corrosion resistant.
   d. Structural wall resin may be of different chemical resistance, subject to conditions of service and approval by Engineer.
   e. [Flame Spread Index:
      1) ASTM E84, less than 25; fire retardant additives used only in structural layer.
      2) Structural wall resin shall contain a minimum of 3 percent antimony trioxide to achieve required flame spread index.]
   f. Add ultraviolet absorbers to surfacing resin to improve weather resistance.
   g. Color:
      1) Use no dyes, pigments, or colorants [, except in exterior gel coat].
      2) Exterior gel coat shall be [white] [manufacturer’s standard] [_____].
3. Reinforcement:
   a. Veil: Chemical surfacing mat, [Type C (chemical) glass veil] [Nexus surface veil] [carbon veil].

©COPYRIGHT 2013 CH2M HILL

b. Chopped Strand Mat: Type E glass, minimum 1-1/2 ounces per square foot, with silane finish and styrene soluble binder.
c. Continuous Roving for Chopper Gun Spray-Up: Type E glass.
d. Woven Roving: Type E glass, nominal 24 ounces per square yard, 4 by 5 weave, with silane type finish.

4. Laminate:
   a. Inner Surface (Veil):
      1) Resin rich, veil reinforced, 10 mils to 20 mils thick.
      2) Use no additives.
      3) Finish and binder compatible with lay-up resin.
      4) Reinforcement Content: Not more than 20 percent.
   b. Interior (Corrosion) Layer:
      1) Resin rich, at least two plies of chopped strand mat, nominal 100 mils to 120 mils thick.
      2) Use no additives.
      3) Construct interior layer of resin reinforced with at least two plies of chopped strand mat backing the veil.
      4) Reinforcement Content: 25 plus or minus 5 percent.
   c. Exterior (Structural) Layer:
      1) Resin with mat, cloth, woven roving or chopped strand glass reinforcement.
      2) Enough resin present to prevent surface fiber show.
      3) Exterior surface relatively smooth, with no exposed fibers or sharp projections.
   d. Outer Surface (Gel Coat):
      1) Resin rich.
      2) 10 mils to 20 mils thick.
   e. Wall Thickness: As required for equipment structural integrity, but no less than 3/16 inch.

C. Housing:

1. Windband: FRP construction, finished with smooth edge.
2. Top Cap: FRP construction, with motor access via quick release latches.
3. Motor completely sealed from exhaust air stream.
4. Motor cooling via air breather tubes.
5. Integral conduit chase for wiring, vinyl coated flexible metal.
6. Drain trough at lowest point of housing.
7. Fan Inlet:
   a. Aerodynamic inlet venturi, FRP construction.
   b. Match wheel inlet shroud.
8. Hardware: [Steel, epoxy coated.] [Type 316 stainless steel.]

©COPYRIGHT 2013 CH2M HILL

D. Wheel:

1. [Aluminum construction, fully welded, epoxy coated.] [Polypropylene.]
2. Backward inclined centrifugal, nonoverloading type.
3. Machined, cast aluminum hub.
4. Matched to housing inlet venturi.

E. Shaft, Bearings, Drive:

1. Shaft:
   a. Turned, ground, and polished Type 316 stainless steel.
   b. Keyed for sheave installation.
2. Bearings:
   a. Grease lubricated, precision antifriction ball, self-aligning, pillow block style.
   b. Selected for average life (ABMA 9 L_{50}) of not less than 200,000 hours' operation at maximum cataloged operating speed.
   c. Terminate with zerk fittings.
3. Drives:
   a. In accordance with Paragraph Fan Drives.
   b. Factory set to specified fan revolutions per minute.
   c. Type: [Belt or direct, as indicated in Equipment Schedule.] [Belt.] [Direct.]

F. Accessories: Provide [as scheduled on Equipment Schedule.] [as follows:]

1. Gravity Backdraft Damper: Gravity operation, adjustable counterweight, and aluminum construction.
2. Motorized Damper: Aluminum frame, aluminum blades, aluminum hinge pins with nylon bushings, [120V] [24V] operator.
3. Bird Screen: Aluminum construction, PVC encapsulated.
4. Roof Curb:
   a. Factory fabricated, [galvanized steel] [aluminum] [FRP] construction.
   b. [With] [Without] damper tray.
   c. Sloped to match roof pitch, and to provide level top.
   d. Height Above Finished Roof: [12 inches.] [As scheduled.]
   e. Mitered continuous welded corner seams.
   f. Pressure-treated wood nailer.
   g. Insulation: Minimum 1-1/2 inches thick, 3 pounds per cubic foot density, rigid mineral fiberboard insulation with metal liner.
5. Disconnect: Factory installed, nonfused, NEMA Type [3R] [4X] [as scheduled].

©COPYRIGHT 2013 CH2M HILL

6. Bearing Lubrication Lines:
   a. Extended to outside of fan housing.
   b. Type 316 stainless steel construction.
   c. Terminate with zerk fittings.
7. Spark Resistant Construction:
   a. AMCA 99-0401 Type [A] [B] [C] [as scheduled].
   b. Graphite impregnated in housing.
   c. Static grounding.

G. Manufacturers and Products:

1. Twin City; Whirlout Model WA/WAB.
2. Composite Fan Technology; Corro-Vent Model CVC.

2.12 ROOF FAN, HOODED PROPELLER, FILTERED SUPPLY

A. General:

1. Factory-assembled roof mounted supply air fan; including housing, hood, filters, propeller fan wheel, drive assembly, motor and accessories.
2. Bearing AMCA Certified Ratings Seal for sound and air performance.

B. Housing:

1. Minimum 16-gauge [painted steel] [galvanized steel] [aluminum] construction.
2. Integral formed venturi orifice.
3. Continuously welded corners.
4. Bolted to frame.
5. Frame:
   a. Minimum 14-gauge steel construction.
   b. Continuously welded joints.
   c. Reinforced motor base plate.

C. Hood:

1. Arched panel type with interlocking ribs.
2. Same material as housing.
3. Supported by heavy gauge galvanized steel frame.
4. Removable for fan access, bolted to top of fan housing.
5. Sized to allow no more than 500 fpm air intake face velocity.
6. Insulation: Fiberglass, [1/2] [1]-inch thickness, attached to underside of hood.

D. Filters and Frames:

©COPYRIGHT 2013 CH2M HILL

1. Metal Mesh Type:
   a. Washable, 4-mesh [zinc electroplated steel] [aluminum] screen media.
   b. Thickness: 2 inches.
   c. Minimum [25] [_____] percent dust spot efficiency in accordance with ASHRAE 52.2.
2. Frames:
   a. Located on underside of hood perimeter, permanent reusable.
   b. [16-gauge steel] [Aluminum] holding frame, retainer, and sealer frame.
   c. To allow removal of filters without removal of hood.
3. Manufacturers:
   a. Camfil Farr.
   b. American Air Filter.
   c. Viledon.

E. Curb Base:

1. Same material as housing.
2. Minimum 18 inches tall.
3. [Access door, for service of backdraft damper, motorized damper, insect screen.]
4. Rubber stripping attached to underside of fan curb cap.
5. Lifting lugs, welded to each corner.

F. Wheel:

1. Hub: Cast aluminum.
2. Propeller: Cast aluminum airfoil blade design.
3. Wheel assembly attached to fan shaft with split taper lock bushing.

G. Shaft, Bearings, Drive:

1. Shaft:
   a. Turned, ground, and polished carbon steel.
   b. Keyed for sheave installation.
   c. Zinc-phosphate coated and oil emulsion-dipped.
2. Bearings:
   a. Grease lubricated, precision antifriction ball, self-aligning, pillow block style.
   b. Selected for average life (ABMA 9 L_{50}) of not less than 200,000 hours operation at maximum cataloged operating speed.
   c. Terminate with zerk fittings.
3. Drives:

©COPYRIGHT 2013 CH2M HILL

a. In accordance with Paragraph Fan Drives.
b. Factory set to specified fan revolutions per minute.
c. Type: [As scheduled in Equipment Schedule.] [Belt.] [Direct.]

H. Accessories: Provide [as scheduled in Equipment Schedule.] [as follows:]

1. Gravity Backdraft Damper: Gravity operation, adjustable counterweight, and aluminum construction.
2. Motorized Damper: Aluminum frame, aluminum blades, aluminum hinge pins with nylon bushings, [120V] [24V] operator.
3. Insect Screen:
   a. [Galvanized steel] [Aluminum] frame.
   b. Aluminum mine mesh screen.
4. Bird Screens: Aluminum construction.
5. Roof Curb:
   a. Factory fabricated, [galvanized steel] [aluminum] construction.
   b. [With] [Without] damper tray.
   c. Sloped to match roof pitch, and to provide level top.
   d. Height Above Finished Roof: [12 inches.] [As scheduled.]
   e. Mitered continuous welded corner seams.
   f. Pressure-treated wood nailer.
   g. Insulation: Minimum 1-1/2 inches thick, 3 pounds per cubic foot density, rigid mineral fiberboard insulation with metal liner.
6. Disconnect: Factory installed, nonfused, NEMA [3R] [4] [as scheduled].
7. Bearing Lubrication Lines:
   a. Extended to outside of fan housing.
   b. Type 316 stainless steel construction.
   c. Terminate with zerk fittings.
8. Filter Pressure Gauge:
   a. Each filter bank shall be furnished with [magnehelic filter gauge (Dwyer Series 2000)] [air filter gauge (Dwyer Mark 25)] [inclined manometer (DWYER 250 AF)].
   b. With adjustable signal flag.
9. Inlet Screen: Removable 1-inch mesh screen of coated steel construction over exposed inlets.
10. Corrosion Protection Coating:
    a. Provide factory-applied corrosion protection coating on these fan components:
       1) Wheel.
       2) Housing.
       3) Accessories.
       4) Interior surfaces in contact with airstream.

©COPYRIGHT 2013 CH2M HILL

b. [Coating system shall be [baked enamel] [baked polyester] [air-dry epoxy] [baked epoxy] [air dry phenolic] [baked phenolic] [baked epoxy phenolic] [as scheduled in fan Equipment Schedule], and shall be in accordance with Article Corrosion Protection Coating.]
c. [Coating system shall be in accordance with Section 09 90 00, Painting and Coating.]

I. Manufacturers and Products:

1. Aerovent: Model FSR.
2. Greenheck; Model R (Direct Drive); RB (Belt Drive).
3. Cook; Model HEF-D.

2.13 ROOF GRAVITY VENTILATOR, LOUVERED

A. General: Factory-assembled louvered exhaust or gravity relief vent; including housing and accessories, suitable for roof mounting.

B. Housing:

1. Construction:
   a. Rectangular, tiered extruded aluminum construction, with welded miter cut joints, 12-gauge minimum thickness.
   b. Louvered on all four sides.
   c. Aluminum support structure, 8-gauge minimum thickness.
2. Base:
   a. Reinforced and braced.
   b. Integral snow and storm baffle.
   c. Minimum panel thickness, 12 gauge.
   d. Miter cut continuously welded curb cap corners.
3. Hood:
   a. Overhang sufficient to provide weatherproof inlet.
   b. Minimum panel thickness, 14 gauge.
   c. Anticondensate insulation coating inside hood.

C. Accessories: Provide [as scheduled in Equipment Schedule.] [as follows:]

1. Gravity Backdraft Damper: Gravity operation, adjustable counterweight, aluminum construction.
2. Motorized Damper: Aluminum frame, aluminum blades, aluminum hinge pins with nylon bushings, [120] [12]–volt operator.
3. Bird Screen: Aluminum construction.
4. Roof Curb:

©COPYRIGHT 2013 CH2M HILL

a. Factory fabricated.
b. [With] [Without] damper tray.
c. Sloped to match roof pitch, and to provide level top.
d. Height Above Finished Roof: [12 inches.] [As scheduled.]
e. [Galvanized steel] [Aluminum] construction.
f. Mitered, continuous welded corner seams.
g. Pressure-treated wood nailer.
h. Insulation: Minimum 1-1/2 inches thick, 3 pounds per cubic foot density, rigid mineral fiberboard insulation with metal liner.

5. Inlet Screen: Removable 1-inch mesh screen of coated steel construction over exposed inlets.
6. Corrosion Protection Coating:
   a. Provide factory-applied corrosion protection coating on these fan components:
   b. Housing.
   c. Accessories.
      1) Interior surfaces in contact with airstream.
      2) [Coating system shall be [baked enamel] [baked polyester] [air-dry epoxy] [baked epoxy] [air-dry phenolic] [baked phenolic] [baked epoxy phenolic] [as scheduled in fan Equipment Schedule], and shall be in accordance with Article Corrosion Protection Coating.]
   d. [Coating system shall be in accordance with Section 09 90 00, Painting and Coating.]

D. Manufacturers and Products:

1. Cook; Model TRE.
2. ACME; Model LEV (exhaust); Model LIV (intake).
3. Greenheck; Model WRH (relief); Model WIH (intake)

2.14 UTILITY BLOWER, CENTRIFUGAL SWSI, FIBERGLASS

A. General:

1. Factory-assembled utility blower; including housing, fan wheel, drive assembly, motor and accessories.
2. Fiberglass Construction: In accordance ASTM D4167.
3. Suitable to convey air at temperatures up to 250 degrees F.
4. Fan Performance: AMCA 99-2408 Class [I] [II] [III] [as scheduled].
5. Airstream Hardware: Type 316 stainless steel.

B. Fiberglass Material:

©COPYRIGHT 2013 CH2M HILL

1. Construction: Resin reinforced fiber cloth and mat.
2. Resin:
3. Vinyl ester or other qualified thermosetting resin.
    a. Selected by fabricator, subject to approval by Engineer and suitable for intended service with no fillers or thixotropic agents.
    b. Premium grade and corrosion resistant.
    c. Structural wall resin may be of different chemical resistance, subject to conditions of service and approval by Engineer.
    d. [Flame Spread Index:
    e. ASTM E84, less than 25; fire retardant additives used only in structural layer.
        1) Structural wall resin shall contain a minimum of 3 percent antimony trioxide to achieve required flame spread index.]
    f. For outdoor locations, add ultraviolet absorbers to surfacing resin to improve weather resistance.
    g. Color:
        1) Use no dyes, pigments, or colorants [, except in exterior gel coat].
        2) Exterior gel coat shall be [white] [_____].
    h. For interior locations, final coat shall be factory-applied intumescent coating to achieve designated results for low smoke development.
4. Reinforcement:
    a. Veil: Chemical surfacing mat, [Type C (chemical) glass veil] [Nexus Surface Veil] [carbon veil].
    b. Chopped Strand Mat: Type E glass, minimum 1-1/2 ounces per square foot, with silane finish and styrene soluble binder.
    c. Continuous Roving for Chopper Gun Spray-Up: Type E glass.
    d. Woven Roving: Type E glass, nominal 24 ounces per square yard, 4 by 5 weave, with silane type finish.
5. Laminate:
    a. Inner Surface (Veil):
        1) Resin rich, veil reinforced, 10 mils to 20 mils thick.
        2) Use no additives.
        3) Finish and binder compatible with lay-up resin.
        4) Reinforcement Content: Not more than 20 percent.
    b. Interior (Corrosion) Layer:
        1) Resin rich, at least two plies of chopped strand mat, nominal 100 mils to 120 mils thick.
        2) Use no additives.
        3) Construct interior layer of resin reinforced with at least two plies of chopped strand mat backing the veil.
        4) Reinforcement Content: 25 plus or minus 5 percent.

©COPYRIGHT 2013 CH2M HILL

c. Exterior (Structural) Layer:
   1) Resin with mat, cloth, woven roving or chopped strand glass reinforcement.
   2) Enough resin present to prevent surface fiber show.
   3) Exterior surface relatively smooth, with no exposed fibers or sharp projections.
d. Wall Thickness: As required for equipment structural integrity, but no less than 3/16 inch.

C. Housing:

1. Material: Fiberglass.
2. Construction:
   a. Curved scroll configuration.
   b. Integral flanges to ensure housing concentricity and housing strength.
   c. Flanged outlet to permit duct connection.
   d. Drain connection located at lowest point of fan housing.
   e. Inlet:
      1) Die-formed bell mouth of fiberglass construction.
      2) Fiberglass supports.
      3) Bolted to housing to permit wheel removal.
   f. Shaft Seal: Viton construction, located at shaft penetration of housing.
3. Base/Pedestal: All-welded heavy gauge [steel] [Type 316 stainless steel].

D. Wheel:

1. Material: Fiberglass.
2. Fan wheel speed not to exceed 90 percent of manufacturer's listed safe fan speed.
3. Centrifugal, one-piece, nonoverloading, [radial blade type] [backward inclined airfoil blade type] [blade type as scheduled].
4. Wheel hub permanently bonded to shaft and completely encapsulated in fiberglass.

E. Shaft, Bearings, Drive:

1. Shafts:
   a. Turned, ground, and polished Type 304 stainless steel.
   b. Ends drilled and tapped for wheel installation.
   c. Keyed for sheave installation.
2. Bearings:
   a. Grease lubricated, precision antifriction ball, self-aligning type.

©COPYRIGHT 2013 CH2M HILL

b. Mounted in cast iron pillow block housing.
c. Selected for average life (ABMA 9 L_{50}) of not less than 200,000 hours operation at maximum cataloged operating speed.

3. Drives:
   a. In accordance with Paragraph Fan Drives.
   b. Factory set to specified fan revolutions per minute.
   c. Type: [Belt or direct, as indicated in Equipment Schedule.] [Belt.] [Direct.]
   d. Arrangement: [As scheduled in Equipment Schedule.] [Arrangement 10.] [Arrangement 9.] [Arrangement 4.] [Arrangement 1.]

F. Accessories: Provide [as scheduled in Equipment Schedule.] [as follows:]

1. Housing Access Doors: Bolted and gasketed.
2. Curb Base: Molded one-piece fiberglass, seamless construction.
3. Disconnect: Factory installed, nonfused, NEMA Type [3R] [4X] [as scheduled].
4. Flanged Inlet: Heavy fiberglass construction, factory drilled and flanged.
5. Shaft Seal: Fiberglass and neoprene construction, located at shaft penetration of housing.
6. Belt Guard: OSHA type, carbon steel sheet metal, for complete coverage of belts and sheaves.
7. Shaft and Bearing Guard: Carbon steel sheet metal for complete coverage of shaft and bearings.
8. Motor and Drive Cover:
   a. Factory fabricated; OSHA type.
   b. Carbon steel sheet metal construction.
   c. Vented, openings sufficient size for proper motor cooling.
9. Inlet Screen: Removable 1-inch mesh screen of coated steel construction over exposed inlets.
10. Unitary Subbase:
    a. Structural metal subbase, same material as fan housing.
    b. Bolted to bottom of fan base/pedestal.
    c. Drilled for field installation of vibration isolators.
11. Spark Resistant Construction:
    a. Carbon fiber veil impregnated in housing and wheel fiberglass resin corrosion barrier.
    b. Static grounding.
    c. Classification: AMCA 99-0401 Type [A] [B] [C] [as scheduled].
12. Corrosion Protection Coating:
    a. Provide factory-applied corrosion protection coating on fan steel components.

©COPYRIGHT 2013 CH2M HILL

b. [Coating system shall be [baked enamel] [baked polyester] [air-dry epoxy] [baked epoxy] [air dry phenolic] [baked phenolic] [baked epoxy phenolic] [as scheduled in fan Equipment Schedule], and shall be in accordance with Article Corrosion Protection Coating.]
c. [Coating system shall be in accordance with Section 09 90 00, Painting and Coating.]

G. Manufacturers and Products:

1. Aerovent; Model RBF.
2. New York Blower; Model FE.
3. Hartzell; Series 41.

2.15 UTILITY BLOWER, CENTRIFUGAL SWSI, HEAVY DUTY

A. General:

1. Factory-assembled utility blower; including housing, fan wheel, drive assembly, motor, and accessories.
2. Suitable to convey air at temperatures up to 250 degrees F.
3. Fan Performance: AMCA 99-2408 Class [I] [II] [III] [as scheduled].
4. Bearing AMCA Certified Ratings Seal for sound and air performance.

B. Housing:

1. Material: [Steel.] [Aluminum.] [Type 304 stainless steel.] [Type 316 stainless steel.]
2. Construction:
   a. Curved scroll configuration, with continuous seam welding and side angle reinforcement.
   b. Lifting lugs welded to housing.
   c. Flanged and drilled outlet to permit duct connection.
   d. Drain connection located at lowest point of fan housing.
   e. Inlet: Spun-formed aerodynamic bell mouth.
3. Base/Pedestal: All-welded heavy gauge [steel] [Type 316 stainless steel].

C. Wheel:

1. Centrifugal, one-piece, nonoverloading, [radial blade type] [backward inclined flat blade type] [backward inclined airfoil blade type] [blade type as scheduled].
2. Fan wheel speed not to exceed 90 percent of manufacturer’s listed safe fan speed.

©COPYRIGHT 2013 CH2M HILL

3. Material: [Steel.] [Aluminum.] [Type 304 stainless steel.] [Type 316 stainless steel.]
4. Attached to fan shaft with split taper lock bushing.

D. Shaft, Bearings, Drive:

1. Shafts:
   a. Turned, ground, and polished steel.
   b. Ends drilled and countersunk for tachometer readings.
   c. Keyed for sheave installation.
2. Bearings:
   a. Grease lubricated, precision antifriction ball, self-aligning type.
   b. Mounted in cast iron pillow block housing.
   c. Selected for average life (ABMA 9 L_{50}) of not less than 200,000 hours operation at maximum cataloged operating speed.
3. Drives:
   a. In accordance with Paragraph Fan Drives.
   b. Factory set to specified fan revolutions per minute.
   c. Type: [Belt or direct, as indicated in Equipment Schedule.] [Belt.] [Direct.]
   d. Arrangement: [As scheduled in Equipment Schedule.] [Arrangement 9.] [Arrangement 10.] [Arrangement 4.] [Arrangement 1.]

E. Accessories: Provide [as scheduled in Equipment Schedule.] [as follows:]

1. Housing Access Doors: Bolted and gasketed.
2. Disconnect: Factory installed, nonfused, NEMA Type [3R] [4X] [as scheduled].
3. Flanged Inlet: Heavy gauge construction, factory drilled and flanged.
4. Shaft Seal: Viton construction, located at shaft penetration of housing.
5. Belt Guard: OSHA type, sheet metal construction same material as fan housing, for complete coverage of belts and sheaves.
6. Shaft and Bearing Guard: Sheet metal construction same material as fan housing, for complete coverage of shaft and bearings.
7. Motor and Drive Cover:
   a. Factory fabricated; OSHA type.
   b. Sheet metal construction, same material as fan housing.
   c. Vented, openings sufficient size for proper motor cooling.
8. Inlet Guard: Spiral wire type, OSHA approved, removable, same material as fan housing.
9. Unitary Subbase:
   a. Structural metal subbase, same material as fan housing.

©COPYRIGHT 2013 CH2M HILL

b. Bolted to bottom of fan base/pedestal.
c. Drilled for field installation of vibration isolators.

10. Spark Resistant Construction Classification: AMCA 99-0401 Type [A] [B] [C] [as scheduled].
11. Corrosion Protection Coating:
    a. Provide factory-applied corrosion protection coating on these fan components:
        1) Wheel (or propeller).
        2) Housing.
        3) Accessories.
        4) Interior surfaces in contact with airstream.
    b. [Coating system shall be [baked enamel] [baked polyester] [air-dry epoxy] [baked epoxy] [air dry phenolic] [baked phenolic] [baked epoxy phenolic] [as scheduled in fan Equipment Schedule], and shall be in accordance with Article Corrosion Protection Coating.]
    c. [Coating system shall be in accordance with Section 09 90 00, Painting and Coating.]

F. Manufacturers and Products:

1. Aerovent; Model BI.
2. New York Blower; Acoustafoil/PLR.
3. Cook; CP Series.

2.16 WALL FAN, CENTRIFUGAL

A. General:

1. Factory-assembled centrifugal wall fan; including housing, fan wheel, drive assembly, motor and accessories.
2. Bearing AMCA Certified Ratings Seal for sound and air performance.

B. Housing:

1. Construction: Spun-formed aluminum, minimum 16-gauge marine alloy.
2. Windband: Finish with rolled bead.
3. Cap: Motor access via quick release latches.
4. Motor completely sealed from exhaust air stream.
5. Motor cooling via air breather tubes.
6. Integral conduit chase for wiring.
7. Fan Inlet:
    a. Full inlet cone of aluminum construction.

©COPYRIGHT 2013 CH2M HILL

b. Match inlet shroud.

8. Wall Flange: Aluminum construction, with prepunched key slot holes.

C. Fan Wheels:

1. Aluminum construction, backward inclined centrifugal, nonoverloading type.
2. Machined, cast aluminum hub.
3. Matched to deep spun inlet venturi.

D. Shaft, Bearings, Drive:

1. Shaft:
   a. Turned, ground, and polished carbon steel.
   b. Keyed for sheave installation.
   c. Zinc-phosphate coated and oil emulsion-dipped.
2. Bearings:
   a. Grease lubricated, precision antifriction ball, self-aligning, pillow block style.
   b. Selected for average life (ABMA 9 L_{50}) of not less than 200,000 hours operation at maximum cataloged operating speed.
   c. Terminate with zerk fittings.
3. Drives:
   a. In accordance with Paragraph Fan Drives.
   b. Factory set to specified fan revolutions per minute.
   c. Type: [Belt or direct, as indicated in Equipment Schedule.] [Belt.] [Direct.]

E. Accessories: Provide [as scheduled in Equipment Schedule.] [as follows:]

1. Gravity Backdraft Damper: Gravity operation, adjustable counterweight, aluminum construction.
2. Motorized Damper: Aluminum frame, aluminum blades, aluminum hinge pins with nylon bushings, [120V] [24V] operator.
3. Bird Screen: Aluminum construction.
4. Disconnect: Factory installed, nonfused, NEMA Type [3R] [4X] [as scheduled].
5. Bearing Lubrication Lines:
   a. Extended to outside of fan housing.
   b. Type 316 stainless steel construction.
   c. Terminate with zerk fittings.
6. Spark Resistant Construction: Classification: AMCA 99-0401 Type [A] [B] [C] [as scheduled].

©COPYRIGHT 2013 CH2M HILL

7. Corrosion Protection Coating:
    a. Provide factory-applied corrosion protection coating on these fan components:
        1) Wheel.
        2) Housing.
        3) Accessories.
        4) Interior surfaces in contact with airstream.
    b. [Coating system shall be [baked enamel] [baked polyester] [air-dry epoxy] [baked epoxy] [air dry phenolic] [baked phenolic] [baked epoxy phenolic] [as scheduled in fan Equipment Schedule], and shall be in accordance with Article Corrosion Protection Coating.]
    c. [Coating system shall be in accordance with Section 09 90 00, Painting and Coating.]

F. Manufacturers and Products:

1. Cook; Model ACWD (Direct Drive); ACWB (Belt Drive).
2. Greenheck; Model CW (Direct Drive); CWB (Belt Drive).
3. ACME; Model PDU (Direct Drive); PNU (Belt Drive).
4. Aerovent; Model AWX.
5. Twin City; Model TCWX.

2.17 WALL FAN, PROPELLER, HEAVY DUTY

A. General: Factory-assembled wall propeller fan; including housing, propeller, drive assembly, motor and accessories.

B. Housing:

1. Material: Metal components constructed from [steel] [aluminum] [materials as indicated in Equipment Schedule].
2. Panel:
    a. Minimum 14-gauge sheet metal construction.
    b. Integral formed venturi orifice.
    c. Continuously welded corners.
    d. Bolted to frame.
3. Frame:
    a. Minimum 14-gauge metal construction.
    b. Continuously welded joints.
    c. Reinforced motor baseplate.

C. Propeller:

©COPYRIGHT 2013 CH2M HILL

1. Cast aluminum construction.
2. Hub keyed and mechanically locked to shaft.

D. Shaft, Bearings, Drive:

1. Shaft:
   a. Turned, ground, and polished carbon steel.
   b. Keyed for sheave installation.
2. Bearings:
   a. Grease lubricated, precision antifriction ball, self-aligning, sealed pillow block style.
   b. Mounted in cast iron pillow block housing.
   c. Selected for average life (ABMA 9 L_{50}) of not less than 200,000 hours operation at maximum cataloged operating speed.
3. Drives:
   a. In accordance with Paragraph Fan Drives.
   b. Factory set to specified fan revolutions per minute.
   c. Type: [Belt or direct, as indicated in Equipment Schedule.] [Belt.] [Direct.]

E. Accessories: Provide [as scheduled in Equipment Schedule.] [as follows:]

1. Disconnect: Factory-installed, nonfused, NEMA Type [12] [4X] [as scheduled].
2. Propeller-Side Guard: Galvanized steel construction.
3. Motor-Side Guard: Galvanized steel construction.
4. Weather Hood:
   a. Heavy-gauge galvanized steel construction, to match fan and accessory size.
   b. Galvanized steel expanded metal bird screen.
5. Wall Housing:
   a. Allows fan mounting on interior or exterior wall.
   b. Heavy-gauge galvanized steel construction.
6. Shutters, Gravity Operated:
   a. Welded [steel] [aluminum] frame.
   b. Extruded aluminum blades.
   c. Felt edge seals.
   d. Oil impregnated bronze bushings.
   e. Reverse flange for building exterior mounting. Standard flange for indoor mounting.
7. Shutters, Motor Operated:
   a. Welded [steel] [aluminum] frame.

©COPYRIGHT 2013 CH2M HILL

b. Extruded aluminum blades.
c. Stainless steel edge seals.
d. Oil impregnated bronze bushings.
e. 120-volt spring return damper actuator with end switch.
f. Reverse flange for building exterior mounting. Standard flange for indoor mounting.

8. Spark Resistant Construction:
   a. Nonferrous blade assembly.
   b. Classification: AMCA 99-0401 Type [A] [B] [C] [as scheduled].
9. Panel Fan Boot:
   a. To adapt fan panel to wall louver.
   b. Size to suit louver dimension as shown on Drawings or indicated in Specifications.
   c. Sheet metal construction, same material as fan housing.
10. Corrosion Protection Coating:
   a. Provide factory-applied corrosion protection coating on these fan components:
      1) Housing.
      2) Accessories.
      3) Interior surfaces in contact with airstream.
   b. [Coating system shall be [baked enamel] [baked polyester] [air-dry epoxy] [baked epoxy] [air dry phenolic] [baked phenolic] [baked epoxy phenolic] [as scheduled in fan Equipment Schedule], and shall be in accordance with Article Corrosion Protection Coating.]
   c. [Coating system shall be in accordance with Section 09 90 00, Painting and Coating.]

F. Manufacturers and Products:

1. Aerovent; Model DDP (Direct); Model BP (Belt).
2. New York Blower; Model NYC.
3. Hartzell; Model Series 02.

2.18 FILTER HOUSING

A. General:

1. Air filtration section, complete with filter media and filter racks.
2. Designed for static pressure ranges of [minus 3] [_____] inches WC to [plus 3] [_____] inches WC.
3. Design temperature not to exceed 200 degrees F.

©COPYRIGHT 2013 CH2M HILL

4. Leakage at rated airflow upstream to downstream of filter frame shall be less than1 percent at 3 inches WC. Leakage in to or out of housing shall be less than 0.5 percent at 3 inches WC.
5. [V-Bank housings to be used for airflow rates 1,000 acfm or greater.]
6. [Flat panel housings to be used for airflow rates less than 1,000 acfm.]
7. Flanged units suitable for installation in a duct and for space indicated.
8. Housing to fit standard nominal filter sizes, either 24 inches by 24 inches or 24 inches by 12 inches.
9. Maximum 500 fpm face velocity across filters.
10. Filters arranged in a suitable leak-tight frame and enclosure.

B. Housing:

1. Permanent reusable, side-loading [16-gauge galvanized or aluminized steel] [aluminum] [Type 304 stainless steel] frame and retainer.
2. Housing to be supported on a structural steel frame.
3. Doors:
   a. Provide hinged, quick-opening doors for access, service and removal of filters.
   b. Side access doors to be locked closed and opened without use of tools.
   c. Plastic door hardware to be made of UV-resistant materials.
   d. Provide doors on [one] [both] sides of unit. [See Drawings for access door location.]
4. Provide upstream and downstream outwardly turned flanges of same material as housing.
5. Provide gaskets for filter tracks and doors for positive sealing. Filter track gaskets to be replaceable.
6. Treat cabinet and accessory surfaces inside and out with rust-inhibitive surface coating and painted with prime and finish coat of machinery enamel.
7. [Provide weatherproof housing suitable for outdoor/rooftop installation. Silicone seal metal-to-metal joints for watertight seams.]
8. [Inside surfaces of housing insulated with 1-inch thick, 1-1/2-pound density insulation on outdoor units.]
9. Provide upstream and downstream static pressure taps, with 1/4-inch diameter tube connections for measuring pressure drop across filters.
10. Provide lifting lugs suitable for lifting and assembled housing and filters.
11. Provide housing hanging brackets of same material as housing suitable to supporting complete filter housing assembly.

C. Filters:

1. Filter Media Thickness: [2] [4] [6 (flat bank only)] inches.

©COPYRIGHT 2013 CH2M HILL

2. Arrangement: [Angled V-bank.] [Vertical flat bank.]
3. Pleated panel disposable filters. Nonwoven reinforced [cotton/poly (for MERV 7)] [100 percent synthetic (for MERV 8)] fabric media with a metal support grid and heavy duty beverage board enclosing frame. Minimum MERV [7] [8] [_____] efficiency per ASHRAE 52.2. Minimum [30] [_____] percent dust spot efficiency.
4. Initial clean filter resistance of 0.28-inch WC. Maximum filter resistance of 1-inch WC.
5. [UL Class 2 filter.]

D. Accessories:

1. Filter Pressure Gauge: Furnish each filter bank with [magnehelic gauge (Dwyer Series 2000)] [air filter gauge (Dwyer Mark 25)] [inclined manometer (Dwyer 250 AF)] with connecting polypropylene tubing and adjustable signal flag.

E. Manufacturers and Products:

1. [V-Bank Filter Housings:
   a. Flanders Precisionaire; Sureflo.
   b. Tri-Dim Filter Corp.; Tri-Met VB.
   c. Airguard; Model VB.]
2. [Flat Panel Filter Housings:
   a. Camfil Farr; 4P Glid Pack.
   b. Flanders Precisionair; Superpleat.
   c. Tri-Dim Filter Corp.; Tri-Met FB.
   d. Airguard; Model FB.]

2.19 CORROSION PROTECTION COATING

A. General:

1. Factory-applied corrosion protection coating for application to fan components and accessories, where required by this section.
2. Quality Control:
   a. Verify dry film thickness before final baking.
   b. Finished coating system shall be free from voids, checks, cracks, and blisters.
3. Surface Cleaning: Clean parts to be coated as follows:
   a. Immerse parts in heated cleaning solution to remove lubricants, machining oils, and residual factory contamination.

©COPYRIGHT 2013 CH2M HILL

b. Follow with immersion in potable water bath to neutralize and remove cleaning solution.
c. Chemical Pretreatment: Immerse parts in heated chemical solution, iron phosphate for steel, clear/yellow chromate for aluminum.

B. Baked Enamel:

1. Material: Alkyd modified urea-melamine single component baking enamel.
2. Surface Preparation: Clean surface to SSPC SP 3.
3. Application: Standard air-pressurized spray equipment.
4. Curing: Oven baked at a metal temperature not to exceed 300 degrees F.
5. Finished Thickness: 1-mil to 2-mil dry film thickness.
6. Performance: Coating shall meet or exceed following criteria:
   a. Impact Resistance: 10-inch pounds, ASTM D2794 test method.
   b. Pencil Hardness: 2H, ASTM D3363 test method.
   c. Service Temperature: Maximum 230 degrees F, continuous.

C. Baked Polyester:

1. Material: Polyester.
2. Surface Preparation: Sandblast surface to SSPC SP 5.
3. Application: Electrostatic spray.
4. Curing: Oven baked at a metal temperature not to exceed 400 degrees F.
5. Finished Thickness: 1.5-mil to 2.5-mil dry film thickness.
6. Performance: Coating shall meet or exceed following criteria:
   a. Salt Spray Test: Minimum 1,000-hour duration, ASTM B117 test method.
   b. Humidity Resistance: Minimum 1,000-hour duration, ASTM D2247 test method.
   c. Impact Resistance: 100-inch pounds, ASTM D2794 test method.
   d. Pencil Hardness: 2H, ASTM D3363 test method.
   e. Service Temperature: Maximum 230 degrees F, continuous.

D. Air-Dry Epoxy:

1. Material: Two-part catalyzed epoxy.
2. Surface Preparation: Clean surface to SSPC SP 3.
3. Application: Standard air-pressurized spray equipment.
4. Curing: Air dry.
5. Finished Thickness: 4-mil to 6-mil dry film thickness.
6. Performance: Coating shall meet or exceed following criteria:

©COPYRIGHT 2013 CH2M HILL

a. Salt Spray Test: Minimum 1,500-hour duration, ASTM B117 test method.
b. Pencil Hardness: H-2H, ASTM D3363 test method.
c. Service Temperature: Maximum 150 degrees F, continuous.

E. Baked Epoxy:

1. Material: Epoxy.
2. Surface Preparation: Sandblast surface to SSPC SP 10.
3. Application: Electrostatic spray.
4. Curing: Oven baked at a metal temperature not to exceed 400 degrees F.
5. Finished Thickness: 2.5-mil to 3.5-mil dry film thickness.
6. Performance: Coating shall meet or exceed following criteria:
   a. Salt Spray Test: Minimum 1,000-hour duration, ASTM B117 test method.
   b. Humidity Resistance: Minimum 1,000-hour duration, ASTM D2247 test method.
   c. Impact Resistance: 100 inch pounds, ASTM D2794 test method.
   d. Pencil Hardness: 2H, ASTM D3363 test method.
   e. Service Temperature: Maximum 230 degrees F, continuous.

F. Air Dry Phenolic:

1. Material:
   a. Phenolic resin, Heresite VR-500 Series or equal.
   b. For outdoor applications, apply an UV resistant topcoat, Heresite UC-5500 or equal.
2. Surface Preparation: Sandblast surface to SSPC SP 6.
3. Application: Standard air-pressurized spray equipment.
4. Curing: Air dry.
5. Finished Thickness: 4-mil to 6-mil dry film thickness.
6. Performance: Coating shall meet or exceed following criteria:
   a. Salt Spray Test: Minimum 500-hour duration, ASTM B117 test method.
   b. Humidity Resistance: Minimum 500-hour duration, ASTM D2247 test method.
   c. Service Temperature: Maximum 180 degrees F, continuous.

G. Baked Phenolic:

3. Material: Phenolic resin, Heresite P-403 or equal.
4. Surface Preparation: Sandblast surface to SSPC SP 5.
5. Application: Standard air-pressurized spray equipment.

©COPYRIGHT 2013 CH2M HILL

6. Curing: Oven baked at a metal temperature not to exceed 400 degrees F.
7. Finished Thickness: 5-mil to 7-mil dry film thickness.
8. Performance: Coating shall meet or exceed following criteria:
   a. Salt Spray Test: Minimum 1,000-hour duration, ASTM B117 test method.
   b. Humidity Resistance: Minimum 1,000-hour duration, ASTM D2247 test method.
   c. Impact Resistance: 100-inch pounds, ASTM D2794 test method.
   d. Pencil Hardness: 2H, ASTM D3363 test method.
   e. Service Temperature: Maximum 250 degrees F, continuous.

C. Baked Epoxy Phenolic:
   1. Material:
      a. Baking cross-linked epoxy-phenolic.
      b. For outdoor applications, apply an UV-resistant topcoat.
   2. Surface Preparation: Sandblast surface to SSPC SP 5.
   3. Application: Electrostatic or conventional compressed air spray equipment.
   4. Curing: Oven baked at a metal temperature not to exceed 400 degrees F.
   5. Finished Thickness: 6-mil to 8-mil dry film thickness.
   6. Performance: Coating shall meet or exceed following criteria:
      a. Salt Spray Test: Minimum 1,000-hour duration, ASTM B117 test method.
      b. Humidity Resistance: Minimum 1,000-hour duration, ASTM D2247 test method.
      c. Impact Resistance: 160-inch pounds, ASTM D2794 test method.
      d. Pencil Hardness: 3H, ASTM D3363 test method.
   7. Service Temperature: Maximum 350 degrees F, continuous.

2.20 MOTORS

A. General:

1. Fan motors shall comply with provisions of Section 26 20 00, Low-Voltage AC Induction Motors.
2. Provide integral self-resetting overload protection on single-phase motors.
3. Motors for fans specified for use with variable frequency drives shall be inverter duty type.
4. Motors shall not operate into service factor in any case.

B. Motor requirements shall be as follows, unless designated otherwise on Equipment Schedule:

1. Torque Characteristics: Sufficient to accelerate driven loads satisfactorily.
2. Winding Thermal Protection: None.

©COPYRIGHT 2013 CH2M HILL

3. Space Heater: No.
4. Number of Speeds: Single.
5. Number of Windings: One.
6. Motor Efficiency: [Energy efficient.] [Premium efficient.]
7. Shaft Type: Solid, carbon steel.
8. Mounting: As required for fan arrangement.
9. Service Factor: 1.15.

2.21 ACCESSORIES

A. Equipment Identification Plates: Furnish 16-gauge [Type _____] stainless steel identification plate securely mounted on each separate equipment component [and control panel] in a readily visible location. Plate shall bear [3/8] [1/4]-inch high [engraved] [die-stamped] block type [black enamel filled] equipment [identification number] [and letters] indicated in this Specification [and as shown on Drawings].

B. Lifting Lugs: Furnish suitably attached for equipment assemblies and components weighing over 100 pounds.

2.22 SOURCE QUALITY CONTROL

A. General:

1. Fan shall operate at single stable point as indicated by fan curve. Fans having two potential operating points are not acceptable.
2. Fan and motor combination shall be capable of delivering 110 percent of scheduled air quantity and static pressure. Motor shall not operate into motor service factor in any listed case.
3. Consider drive efficiency in motor selection according to manufacturer's published recommendation or according to AMCA 203, Appendix L.

B. Testing Provisions:

1. Provide tachometer access holes large enough to accept standard tachometer drive shaft.
2. Center punch fan shaft to accommodate tachometer readings.

C. Acoustical Levels:

1. Perform noise tests in accordance with AMCA 300 and AMCA 301.
2. Fan sound power levels (dB, Reference 10^{-12} Watts) shall be no greater than scheduled values.

©COPYRIGHT 2013 CH2M HILL

D. Balancing:

1. Unless noted otherwise, each fan wheel shall be statically and dynamically balanced to ASA S2.19 Grade G6.3.
2. Fans controlled by variable frequency drives shall be dynamically balanced at speeds 25 percent, 50 percent, 75 percent, and 100 percent of design revolutions per minute.

E. Vibration Test:

1. Each fan furnished with 5-horsepower or larger motor shall have factory run vibration test, including vibration signatures taken on each bearing in horizontal, vertical, and axial direction.
2. Vibration reading as measured at scheduled rotational speed shall not exceed the following values when fan is rigidly mounted:
   a. Belt Drive (except Vane Axial): 0.15 inch per second peak velocity.
   b. Belt Drive Vane Axial: 0.08 inch per second peak velocity.
   c. Direct Drive: 0.08 inch per second peak velocity.
3. Written records of run test and vibration test shall be made available upon request.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install fans level and plumb.

B. Secure roof-mounted fans to roof curbs with [cadmium-plated steel] [Type 316 stainless steel] hardware.

C. Ceiling Units: Suspend units from structure; use steel wire or metal straps.

D. Scroll Drains: Pipe drain connection through running trap to floor drain.

E. Labeling:

1. Label fans in accordance with Article Accessories.
2. Mark exhaust fans serving fume hoods with arrows to indicate proper direction of rotation, in accordance with NFPA 45.

F. Service Access: Locate units to provide access spaces required for motor, drive, bearing servicing, and fan shaft removal.

©COPYRIGHT 2013 CH2M HILL

G. Equipment Support and Restraints:

H. Refer to Section 23 05 48, Vibration Isolation [and Seismic Control].

I. Install floor-mounted units on concrete bases [designed to withstand, without damage to equipment, the seismic force required by code].

1. Secure vibration [and seismic] controls to concrete bases using anchor bolts cast in concrete base.
2. Seismic Restraint Snubbers: Install with sufficient clearance so unit isolators are not restricted for proper free isolation, but do limit movement in all directions.

J. Connections:

1. Refer to Section [23 31 13, Metal Ducts and Accessories] [and] [23 31 16.16, Thermoset Fiberglass-Reinforced Plastic Ducts and Accessories].
2. Isolate duct connections to fans.
3. Install ductwork adjacent to fans to allow proper service and maintenance.

3.02 FIELD QUALITY CONTROL

A. Functional Tests:

1. Verify blocking and bracing used during shipping are removed.
2. Verify fan is secure on mountings and supporting devices, and connections to ducts and electrical components are complete.
3. Verify proper thermal-overload protection is installed in motors, starters, and disconnect switches.
4. Verify cleaning and adjusting are complete.
5. Disconnect fan drive from motor; verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearing operation.
6. Reconnect fan drive system; align and adjust belts and install belt guards.
7. Verify lubrication for bearings and other moving parts.
8. Verify manual and automatic volume control and fire and smoke dampers in connected ductwork are in fully open position.

B. Performance Tests:

1. Starting Procedures:
   a. Energize motor and adjust fan to indicated revolutions per minute.
   b. Measure and record motor voltage and amperage.
2. Operational Test:

©COPYRIGHT 2013 CH2M HILL

3. After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
    a. Repair or replace malfunctioning units; retest as specified after repairs or replacement is made.
    b. Test and adjust control safeties.
    c. Replace damaged and malfunctioning controls and equipment.

3.03 MANUFACTURER'S SERVICES

A. Manufacturer's Representative: Present at site or classroom designated by [Owner,] [_____,] for minimum person-days listed below, travel time excluded:

1. [_____] person-days for [installation assistance] [and] [inspection.]
2. [_____] person-days for [functional] [and] [performance] testing and completion of Manufacturer's Certificate of Proper Installation.
3. [_____] person-days for prestartup classroom or site training.
4. [_____] person-days for facility startup.
5. [_____] person-days for post-startup training [of Owner's personnel.]
6. [Training shall not commence until an accepted detailed lesson plan for each training activity has been reviewed by [Owner] [Engineer] [_____].]

B. Refer [Section 01 43 33, Manufacturers' Field Services] [and] [Section 01 91 14, Equipment Testing and Facility Startup.]

3.04 ADJUSTING

A. Adjust damper linkages for proper damper operation.

B. Adjust belt tension.

C. Lubricate bearings.

D. Balancing:

1. Perform air system balancing as specified in Section 23 05 93, Testing, Adjusting, and Balancing for HVAC.
2. Replace fan and motor sheaves as required to achieve design airflow.

E. Vibration Testing:

1. Perform field testing on rotating equipment, where specified in Section 23 05 93, Testing, Adjusting, and Balancing for HVAC, to determine actual operating vibration.

©COPYRIGHT 2013 CH2M HILL

2. If vibration limits described therein are exceeded, rebalance equipment in-place until design tolerances are met.
    a. Vibration readings as measured at actual rotational speed shall not exceed the following values:
        1) Belt Drive, Flexibility Mounted: 0.25 inch per second peak velocity.
        2) Belt Drive, Rigidly Mounted: 0.16 inch per second peak velocity.

3.05 CLEANING

A. After completing system installation, including outlet fitting and devices, inspect exposed finish. Remove burrs, dirt, and construction debris, and repair damaged finishes.

B. On completion of installation, internally clean fans according to manufacturers' written instructions. Remove foreign material and construction debris. Vacuum fan wheel and cabinet.

3.06 SUPPLEMENTS

A. The supplements listed below, following "End of Section," are a part of this Specification.

1. 23 34 00.01, Fan Schedule.
2. 23 34 00.02, Ceiling Fan Schedule.

SECTION 26 05 02
BASIC ELECTRICAL REQUIREMENTS

PART 1 - GENERAL

1.01 RELATED SECTIONS

A. Requirements specified within this section apply to Division 26, Electrical. Work specified herein shall be performed as if specified in the individual sections.

1.02 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. National Electrical Contractors Association (NECA): National Electrical Installation Standards.
2. National Electrical Manufacturers Association (NEMA):
3. 250, Enclosures for Electrical Equipment (1000 Volts Maximum).
4. Z535.4, Product Safety Signs and Labels.
5. National Fire Protection Association (NFPA): 70, National Electrical Code (NEC).
6. Underwriters Laboratories, Inc. (UL).

1.03 ELECTRIC SERVICE DIVISION OF RESPONSIBILITY

A. Incoming aerial electrical service facilities provided by the serving utility as part of its normal obligation to customers is work provided outside this Contract. Under this Contract provide customer required service provisions and electrical work including, but not limited to, primary duct system, metering components and associated conduit,. Schedule and coordinate work of serving utility as required to provide electric service to the Work.

B. [Incoming telephone [and cable television] service facilities provided by the serving utilities as part of their normal obligation to customers is work provided outside this Contract. Under this Contract provide customer required service provisions and electrical work.]

C. [Interior telecommunications central and station equipment (telephone instruments, telephone switches, data switches, and hubs, servers, software, etc.) is work provided outside this Contract. Under this Contract provide [raceways,] [outlet and junction boxes,] [cover plates,] [pull wires,] [as indicated].]

©COPYRIGHT 2013 CH2M HILL

1.04 SUBMITTALS

A. Provide manufacturers' data for the following:

1. Electrical service components.
2. Telephone service components.
3. Nameplates, signs, and labels.

1.05 QUALITY ASSURANCE

A. Provide the Work in accordance with NFPA 70. Where required by Authority Having Jurisdiction (AHJ), material and equipment shall be labeled or listed by a nationally recognized testing laboratory or other organization acceptable to the AHJ, in order to provide a basis for approval under the NEC.

B. Materials and equipment manufactured within the scope of standards published by Underwriters Laboratories Inc. shall conform to those standards and shall have an applied UL listing mark or label.

C. Provide materials and equipment acceptable to AHJ for Class, Division, and Group of hazardous area indicated.

1.06 ENVIRONMENTAL CONDITIONS

A. The following areas are classified hazardous, Class I, Division 2, Group D, due to the potential for accumulation of hazardous concentrations of combustible gases, and for exposure to corrosive environment. Use materials and methods required for such areas.

1. MW Bench and TW Bench Equipment Buildings, as shown on the Drawings.

B. The following areas are classified nonhazardous, wet, and corrosive. Use materials and methods required for such areas.

1. Inside of wet wells.

C. The following areas are classified nonhazardous and wet. Use materials and methods required for such areas.

1. Outdoor abovegrade areas not covered above.
2. Belowgrade vaults.

©COPYRIGHT 2013 CH2M HILL

D. The following areas are classified as indoor and dry:

1. All other Building interior spaces not covered above.
2. Electrical Room.

E. The following areas are not classified. Use dust-tight and oil-tight NEMA 12 materials and methods.

1. Areas not covered above.

PART 2 - PRODUCTS

2.01 GENERAL

A. Where two or more units of the same class of material or equipment are required, provide products of a single manufacturer. Component parts of materials or equipment need not be products of the same manufacturer.

B. Material and equipment installed in heated and ventilated areas shall be capable of continuous operation at their specified ratings within an ambient temperature range of 40 degrees F to 122 degrees F.

C. Materials and equipment installed outdoors shall be capable of continuous operation at their specified rating within the ambient temperature range stated in Section 01 61 00, Common Product Requirements.

D. Equip panels installed outdoors in direct sun with sun shields.

E. Electrical ratings of materials and equipment that are reduced by increased elevation shall be derated as required for Site elevation specified in Section 01 61 00, Common Product Requirements.

2.02 EQUIPMENT FINISH

A. Manufacturer’s standard finish color, except where specific color is indicated. If manufacturer has no standard color, finish equipment in accordance with Section 09 90 00, Painting and Coating.

2.03 NAMEPLATES

A. Material: Laminated plastic.

B. Attachment Screws: Stainless steel.

©COPYRIGHT 2013 CH2M HILL

C. Color: Black, engraved to a white core.

D. Letter Height:

1. Pushbuttons/Selector Switches: 1/8 inch.
2. Other electrical equipment: 1/4 inch.

2.04 SIGNS AND LABELS

A. Sign size, lettering, and color shall be in accordance with NEMA Z535.4.

PART 3 - EXECUTION

3.01 GENERAL

A. Electrical Drawings show general locations of equipment, devices, and raceway, unless specifically dimensioned. Contractor shall be responsible for actual location of equipment and devices and for proper routing and support of raceways, subject to approval of ENGINEER.

B. Check approximate locations of light fixtures, switches, electrical outlets, equipment, and other electrical system components shown on Drawings for conflicts with openings, structural members, and components of other systems and equipment having fixed locations. In the event of conflicts, notify ENGINEER in writing.

C. Install work in accordance with NECA Standard of Installation, unless otherwise specified.

D. Keep openings in boxes and equipment closed during construction.

E. Lay out work carefully in advance. Do not cut or notch any structural member or building surface without specific approval of ENGINEER. Carefully perform cutting, channeling, chasing, or drilling of floors, walls, partitions, ceilings, paving, or other surfaces required for the installation, support, or anchorage of conduit, raceways, or other electrical materials and equipment. Following such work, restore surfaces to original condition.

3.02 ANCHORING AND MOUNTING

A. Equipment anchoring and mounting shall be in accordance with manufacturer’s requirements for seismic criteria given in Section 01 61 00, Common Product Requirements.

©COPYRIGHT 2013 CH2M HILL

3.03 COMBINING CIRCUITS INTO COMMON RACEWAY

A. Homerun circuits shown on Drawings indicate functional wiring requirements for power and control circuits. Circuits may be combined into common raceways in accordance with the following requirements:

1. Analog control circuits from devices in same general area to same destination.
    a. No power or AC discrete control circuits shall be combined in same conduit with analog circuits.
    b. No Class 2 or Class 3 circuits including, but not limited to, HVAC control circuits, fire alarm circuits, paging system circuits shall be combined with power or Class 1 circuits.
    c. Analog circuits shall be continuous from source to destination. Do not add TJB, splice, or combine into a multi-pair cable without authorization of ENGINEER. Raceways shall be sized per Conduit and Cable Schedule on Drawings and shall not exceed 40 percent fill. Conduit and Cable on Drawings shall Changes shall be documented on record drawings.
2. Discrete control circuits from devices in the same general area to the same destination.
    a. No power or analog control circuits shall be combined in same conduit with discrete circuits.
    b. No Class 2 or Class 3 circuits including, but not limited to, HVAC control circuits, fire alarm circuits, and paging system circuits shall be combined with power or Class 1 circuits.
    c. Raceways shall be sized per the Conduit and Cable Schedule on Drawings and shall not exceed 40 percent fill.
    d. Changes shall be documented on record drawings.
3. Power circuits from loads in same general area to same source location (such as: panelboard, switchboard, low voltage motor control center).
    a. Lighting Circuits: Combine no more than three circuits to a single raceway. Contractor shall be responsible for increasing conduit and conductor size if derating is required by NEC.
    b. Receptacle Circuits, 120-Volt Only: Combine no more than three circuits to a single raceway. Provide a separate neutral conductor for each circuit. Contractor shall be responsible for increasing conduit and conductor size if derating is required by NEC.
    c. All Other Power Circuits: May be combined as covered in part b above.

©COPYRIGHT 2013 CH2M HILL

3.04 NAMEPLATES, SIGNS, AND LABELS

A. Arc Flash Protection Warning Signs:

1. Field mark switchboards, motor control centers, panelboardsdisconnect switches, and combination motor starters to warn qualified persons of potential arc-flash hazards. Locate marking so to be clearly visible to persons before working on energized equipment.
2. Use arc flash hazard boundary, energy level, PPE level and description, shock hazard, bolted fault current, and equipment name [from study required in Section 26 05 70, Electrical Systems Analysis] [from ENGINEER] as basis for warning signs.

B. Multiple Power Supply Sign: Install permanent plaque or directory at each service disconnect location denoting other services, feeders, and branch circuits supplying the building, and the area served by each.

C. Equipment Nameplates:

1. Provide a nameplate to label electrical equipment including switchgear, switchboards, motor control centers, panelboards, motor starters, transformers, terminal junction boxes, disconnect switches, switches and control stations.
2. Switchgear, motor control center, transformer, and terminal junction box nameplates shall include equipment designation.
3. Disconnect switch, starter, and control station nameplates shall include name and number of equipment powered or controlled by that device.
4. Switchboard and panelboard nameplates shall include equipment designation, service voltage, and phases.

3.05 LOAD BALANCE

A. Drawings and Specifications indicate circuiting to electrical loads and distribution equipment.

B. Balance electrical load between phases as nearly as possible on switchboards, panelboards, motor control centers, and other equipment where balancing is required.

C. When loads must be reconnected to different circuits to balance phase loads, maintain accurate record of changes made, and provide circuit directory that lists final circuit arrangement.

©COPYRIGHT 2013 CH2M HILL

3.06 CLEANING AND TOUCHUP PAINTING

A. Cleaning: Throughout the Work, clean interior and exterior of devices and equipment by removing debris and vacuuming.

B. Touchup Paint:

1. Touchup scratches, scrapes and chips on exterior and interior surfaces of devices and equipment with finish matching type, color, and consistency and type of surface of original finish.
2. If extensive damage is done to equipment paint surfaces, refinish entire equipment in a manner that provides a finish equal to or better than factory finish, that meets requirements of Specification, and is acceptable to ENGINEER

3.07 PROTECTION FOLLOWING INSTALLATION

A. Protect materials and equipment from corrosion, physical damage, and effects of moisture on insulation and contact surfaces.

B. When equipment intended for indoor installation is installed at Contractor’s convenience in areas where subject to dampness, moisture, dirt or other adverse atmosphere until completion of construction, ensure adequate protection from these atmospheres is provided and acceptable to ENGINEER.

h. 1059, Standard for Terminal Blocks.
i. 1479, Fire Tests of Through-Penetration Fire Stops.

1.02 SUBMITTALS

A. Action Submittals:

1. Provide manufacturers' data for the following:
   a. Control devices.
   b. Control relays.
   c. Circuit breakers.
   d. Fused switches.
   e. Nonfused switches.
   f. Timers.
   g. Fuses.
   h. Magnetic contactors.
   i. Intrinsic safety barriers.
   j. Firestopping.
   k. Enclosures: Include enclosure data for products having enclosures.
2. Seismic anchorage and bracing drawings and cut sheets, as required by Section 01 88 15, Seismic Anchorage and Bracing.

B. Informational Submittals: Seismic anchorage and bracing calculations as required by Section 01 88 15, Seismic Anchorage and Bracing.

1.03 EXTRA MATERIALS

A. Furnish, tag, and box for shipment and storage the following spare parts and special tools:

1. Fuses, 0 to 600 Volts: Six of each type and each current rating installed.

PART 2 - PRODUCTS

2.01 MOLDED CASE CIRCUIT BREAKER THERMAL MAGNETIC, LOW VOLTAGE

A. General:

1. Type: Molded case.

©COPYRIGHT 2013 CH2M HILL

2. Trip Ratings: 15-800 amps.
3. Voltage Ratings: 120, 240, 277, 480, and 600V ac.
4. Suitable for mounting and operating in any position.
5. NEMA AB 1 and UL 489.

B. Operating Mechanism:

1. Overcenter, trip-free, toggle type handle.
2. Quick-make, quick-break action.
3. Locking provisions for padlocking breaker in open position.
4. ON/OFF and TRIPPED indicating positions of operating handle.
5. Operating handle to assume a center position when tripped.

C. Trip Mechanism:

1. Individual permanent thermal and magnetic trip elements in each pole.
2. Variable magnetic trip elements with a single continuous adjustment 3X to 10X for frames greater than 100 amps.
3. Two and three pole, common trip.
4. Automatically opens all poles when overcurrent occurs on one pole.
5. Test button on cover.
6. Calibrated for 50 degrees C ambient, unless shown otherwise.
7. Do not provide single-pole circuit breakers with handle ties where multi-pole circuit breakers are shown.

D. Short Circuit Interrupting Ratings:

1. [Not less than the following RMS symmetrical currents for the indicated trip ratings:
   a. Up to 100A, less than 250V ac: As shown.
   b. Up to 100A, 250-600V ac: As shown.
   c. Over 100A: As shown.
2. Series Connected Ratings: Do not apply series connected short circuit ratings.

E. Ground Fault Circuit Interrupter (GFCI): Where indicated, equip breaker as specified above with ground fault sensor and rated to trip on 5-mA ground fault within 0.025 second (UL 943, Class A sensitivity, for protection of personnel).

1. Ground fault sensor shall be rated same as circuit breaker.
2. Push-to-test button.

©COPYRIGHT 2013 CH2M HILL

F. Equipment Ground Fault Interrupter (EGFI): Where indicated, equip breaker specified above with ground fault sensor and rated to trip on 30-mA ground fault (UL-listed for equipment ground fault protection).

G. Magnetic Only Type Breakers: Where shown; instantaneous trip adjustment which simultaneously sets magnetic trip level of each individual pole continuously through a 3X to 10X trip range.

H. Accessories: Shunt trip, auxiliary switches, handle lock ON devices, mechanical interlocks, key interlocks, unit mounting bases, double lugs as shown or otherwise required. Shunt trip operators shall be continuous duty rated or have coil-clearing contacts.

I. Connections:

1. Supply (line side) at either end.
2. Mechanical wire lugs, except crimp compression lugs where shown.
3. Lugs removable/replaceable for breaker frames greater than 100 amperes.
4. Suitable for 75 degrees C rated conductors without derating breaker or conductor ampacity.
5. Use bolted bus connections, except where bolt-on is not compatible with existing breaker provisions.

J. Enclosures for Independent Mounting:

1. See Article Enclosures.
2. Service Entrance Use: Breakers in required enclosure and required accessories shall be UL 489 listed.
3. Interlock: Enclosure and switch shall interlock to prevent opening cover with switch in the ON position. Provide bypass feature for use by qualified personnel.

2.02 FUSED SWITCH, INDIVIDUAL, LOW VOLTAGE

A. UL 98 listed for use and location of installation.

B. NEMA KS 1.

C. Short Circuit Rating: 200,000 amps RMS symmetrical with Class R, Class J, or Class L fuses installed.

D. Quick-make, quick-break, motor rated, load-break, heavy-duty (HD) type with external markings clearly indicating ON/OFF positions.

©COPYRIGHT 2013 CH2M HILL

E. Connections:

1. Mechanical lugs, except crimp compression lugs where shown.
2. Lugs removable/replaceable.
3. Suitable for 75 degrees C rated conductors at NEC 75 degrees C ampacity.

F. Fuse Provisions:

1. 30-amp to 600-amp rated shall incorporate rejection feature to reject all fuses except Class R.
2. 601-amp rated and greater shall accept Class L fuses, unless otherwise shown.

B. Enclosures: See Article Enclosures.

C. Interlock: Enclosure and switch to prevent opening cover with switch in ON position. Provide bypass feature for use by qualified personnel.

2.03 NONFUSED SWITCH, INDIVIDUAL, LOW VOLTAGE

A. NEMA KS 1.

B. Quick-make, quick-break, motor rated, load-break, heavy-duty (HD) type with external markings clearly indicating ON/OFF positions.

C. Lugs: Suitable for use with 75 degrees C wire at NEC 75 degrees C ampacity.

D. Enclosures: See Article Enclosures.

E. Interlock: Enclosure and switch to prevent opening cover with switch in ON position. Provide bypass feature for use by qualified personnel.

2.04 FUSE, 250-VOLT AND 600-VOLT

A. Power Distribution, General:

1. Current-limiting, with 200,000 ampere rms interrupting rating.
2. Provide to fit mountings specified with switches.
3. UL 248.

B. Power Distribution, Ampere Ratings 1 Amp to 600 Amps:

1. Class: RK-1.
2. Type: Dual element, with time delay.

©COPYRIGHT 2013 CH2M HILL

3. Manufacturers and Products:
   a. Bussmann; Types LPS-RK (600 volts) and LPN-RK (250 volts).
   b. Littelfuse; Types LLS-RK (600 volts) and LLN-RK (250 volts).

C. Power Distribution, Ampere Ratings 601 Amps to 6,000 Amps:

1. Class: L.
2. Double O-rings and silver links.
3. Manufacturers and Products:
   a. Bussmann; Type KRP-C.
   b. Littelfuse, Inc.; Type KLPC.

D. Cable Limiters:

1. 600V or less; crimp to copper cable, bolt to bus or terminal pad.
2. Manufacturer and Product: Bussmann; K Series.

E. Ferrule:

1. 600V or less, rated for applied voltage, small dimension.
2. Ampere Ratings: 1/10 amp to 30 amps.
3. Dual-element time-delay, time-delay, or nontime-delay as required.
4. Provide with blocks or holders as indicated and suitable for location and use.
5. Manufacturers:
   a. Bussmann.
   b. Littlefuse, Inc.

2.05 PUSHBUTTON, INDICATING LIGHT, AND SELECTOR SWITCH

A. Contact Rating: 7,200VA make, 720VA break, at 600V, NEMA ICS 5 Designation A600.

B. Selector Switch Operating Lever: Standard.

C. Indicating Light: Push-to-test. LED, full voltage.

D. Pushbutton Color:

1. ON or START: Black.
2. OFF or STOP: Red.

E. Pushbutton and selector switch lockable in OFF position where indicated.

F. Legend Plate:

1. Material: Aluminum.
2. Engraving: Enamel filled in high contrasting color.
3. Text Arrangement: 11-character/spaces on one line, 14-character/spaces on each of two lines, as required, indicating specific function.
4. Letter Height: 7/64-inch.

G. Manufacturers and Products:

1. Heavy-Duty, Oil-Tight Type:
   a. General Electric Co.; Type CR 104P.
   b. Square D Co.; Type T.
   c. Eaton/Cutler-Hammer; Type 10250T.
2. Heavy-Duty, Watertight, and Corrosion-Resistant Type:
   a. Square D Co.; Type SK.
   b. General Electric Co.; Type CR 104P.
   c. Eaton/Cutler-Hammer; Type E34.
   d. Crouse-Hinds; Type NCS.

2.06 TERMINAL BLOCK, 600 VOLTS

A. UL 486E and UL 1059.

B. Size components to allow insertion of necessary wire sizes.

C. Capable of termination of control circuits entering or leaving equipment, panels, or boxes.

D. Screw clamp compression, dead front barrier type, with current bar providing direct contact with wire between compression screw and yoke.

E. Yoke, current bar, and clamping screw of high strength and high conductivity metal.

F. Yoke shall guide all strands of wire into terminal.

G. Current bar shall ensure vibration-proof connection.

H. Terminals:

1. Capable of wire connections without special preparation other than stripping.
2. Capable of jumper installation with no loss of terminal or rail space.
3. Individual, rail mounted.

©COPYRIGHT 2013 CH2M HILL

I. Marking system, allowing use of preprinted or field-marked tags.

J. Manufacturers:

1. Weidmuller, Inc.
2. Ideal.
3. Electrovert USA Corp.

2.07 MAGNETIC CONTROL RELAY

A. Industrial control with field convertible contacts rated 10 amps continuous, 7,200VA make, 720VA break.

B. NEMA ICS 2, Designation: A300 (300 volts).

C. Time Delay Relay Attachment:

1. Pneumatic type, timer adjustable from 0.2 second to 60 seconds (minimum).
2. Field convertible from ON delay to OFF delay and vice versa.

D. Latching Attachment: Mechanical latch, having unlatching coil and coil clearing contacts.

E. Manufacturers and Products:

1. Eaton/Cutler-Hammer; Type M-300.
2. General Electric Co.; Type CR120A.

2.08 TIME DELAY RELAY

A. Industrial relay with contacts rated 5 amps continuous, 3,600VA make, 360VA break.

B. NEMA ICS 2 Designation: B150 (150 volts).

C. Solid-state electronic, field convertible ON/OFF delay.

D. One normally open and one normally closed contact (minimum).

E. Repeat accuracy plus or minus 2 percent.

F. Timer adjustment from 1 second to 60 seconds, unless otherwise indicated on Drawings.

G. Manufacturers and Products:

©COPYRIGHT 2013 CH2M HILL

1. Square D Co.; Type F.
2. Eaton/Cutler-Hammer.
3. General Electric Co.

2.09 RESET TIMER

A. Drive: Synchronous motor, solenoid-operated clutch.

B. Mounting: Semiflush panel.

C. Contacts: 10 amps, 120 volts.

D. Manufacturers and Products:

1. Eagle Signal Controls; Bulletin 125.
2. Automatic Timing and Controls; Bulletin 305.

2.10 ELAPSED TIME METER

A. Drive: Synchronous motor.

B. Range: 0 hour to 99,999.9 hours, nonreset type.

C. Mounting: Semiflush panel.

D. Manufacturers and Products:

1. General Electric Co.; Type 240, 2-1/2-inch Big Look.
2. Eagle Signal Controls; Bulletin 705.

2.11 MAGNETIC CONTACTOR

A. UL listed.

B. Electrically operated, electrically held.

C. Main Contacts:

1. Power driven in one direction with mechanical spring dropout.
2. Silver alloy with wiping action and arc quenchers.
3. Continuous-duty, rated As shown.
4. Poles: As shown.

D. Control: As shown.

©COPYRIGHT 2013 CH2M HILL

E. Auxiliary Contacts: One normally open and one normally closed, rated 7200VA make, 720VA break, at 600V, A600 per NEMA ICS 5.

F. Enclosures: See Article Enclosures.

G. Manufacturers and Products:

1. Eaton/Cutler-Hammer; Class A201.
2. General Electric Co.; CR 353.
3. Square D Co.; Class 8910.

2.12 PHASE MONITOR RELAY

A. Features:

1. Voltage and phase monitor relay shall drop out on low voltage, voltage unbalance, loss of phase, or phase reversal.
2. Contacts: Single-pole, double-throw, 10 amperes, 120/240V ac. Where additional contacts are shown or required, provide magnetic control relays.
3. Adjustable trip and time delay settings.
4. Transient Protection: 1,000V ac.
5. Mounting: Multipin plug-in socket base.

B. Manufacturer and Product: Automatic Timing and Controls; SLD Series.

2.13 SUPPORT AND FRAMING CHANNELS

A. Carbon Steel Framing Channel:

1. Material: Rolled, mild strip steel, 12-gauge minimum, ASTM A1011/A1011M, Grade 33.
2. Finish: Hot-dip galvanized after fabrication.

B. Paint Coated Framing Channel: Carbon steel framing channel with electro-deposited rust inhibiting acrylic or epoxy paint.

C. PVC Coated Framing Channel: Carbon steel framing channel with 40-mil polyvinyl chloride coating.

D. Stainless Steel Framing Channel: Rolled, ASTM A167, Type 316 stainless steel, 12-gauge minimum.

E. Extruded Aluminum Framing Channel:

1. Material: Extruded from Type 6063-T6 aluminum alloy.

©COPYRIGHT 2013 CH2M HILL

2. Fittings fabricated from Alloy 5052-H32.

F. Nonmetallic Framing Channel:

1. Material: Fire retardant, fiber reinforced vinyl ester resin.
2. Channel fitting of same material as channel.
3. Nuts and bolts of long glass fiber reinforced polyurethane.

G. Manufacturers:

1. B-Line Systems, Inc.
2. Unistrut Corp.
3. Aickinstrut.

2.14 INTRINSIC SAFETY BARRIER

A. Provides a safe energy level for exposed wiring in a Class I, Division 1 or Division 2 hazardous area when circuit is connected to power source in nonhazardous area.

B. Rating: Power source shall be rated 24 volts dc, nominal, with not more than 250 volts available under fault conditions.

C. Contact Rating: 5 amps, 250 volts ac.

D. Mounting: Rail or surface.

E. Manufacturers and Products:

1. MTL, Inc.; Series 2000 or Series 3000.
2. R. Stahl, Inc.

2.15 SWITCHBOARD MATTING

A. Provide matting having a breakdown of 20 kV minimum.

B. Manufacturer: U.S. Mat and Rubber Company.

2.16 FIRESTOPS

A. General:

1. Provide UL 1479 classified hourly fire-rating equal to, or greater than, the assembly penetrated.

©COPYRIGHT 2013 CH2M HILL

2. Prevent the passage of cold smoke, toxic fumes, and water before and after exposure to flame.
3. Sealants and accessories shall have fire-resistance ratings as established by testing identical assemblies in accordance with ASTM E814, by Underwriters Laboratories Inc., or other testing and inspection agency acceptable to authorities having jurisdiction.

B. Comply with Section 07 84 00, Firestopping.

C. Firestop System:

1. Formulated for use in through-penetration firestopping around cables, conduit, pipes, and duct penetrations through fire-rated walls and floors.
2. Fill, Void, or Cavity Material: 3M Brand Fire Barrier Caulk CP25, Putty 303, Wrap/Strip FS195, Composite Sheet CS195 and Penetration Sealing Systems 7902 and 7904 Series.
3. Two-Part, Foamed-In-Place, Silicone Sealant: Dow Corning Corp. Fire Stop Foam, General Electric Co. Pensil 851.
4. Fire Stop Devices: See Section 26 05 33, Raceway and Boxes, for raceway and cable fittings.

2.17 ENCLOSURES

A. Finish: Sheet metal structural and enclosure parts shall be completely painted using an electrodeposition process so interior and exterior surfaces as well as bolted structural joints have a complete finish coat on and between them.

B. Color: Manufacturer’s standard color (gray) baked-on enamel, unless otherwise shown.

C. Barriers: Provide metal barriers within enclosures to separate wiring of different systems and voltage.

D. Enclosure Selections: Except as shown otherwise, provide electrical enclosures according to the following table:

Enclosures			
Location	**Finish**	**Environment**	**NEMA 250 Type**
Indoor	Finished	Dry	1
Indoor	Unfinished	Dry	1

Indoor and Outdoor	Any	Hazardous Dust	9

PART 3 - EXECUTION

3.01 GENERAL

A. Install equipment in accordance with manufacturer's recommendations.

3.02 PUSHBUTTON, INDICATING LIGHT, AND SELECTOR SWITCH

A. Unless otherwise shown, install heavy-duty, oil-tight type in nonhazardous, indoor, dry locations, including motor control centers, control panels, and individual stations.

B. Unless otherwise shown, install heavy-duty, watertight and corrosion-resistant type in nonhazardous, outdoor, or normally wet areas.

3.03 SUPPORT AND FRAMING CHANNEL

A. Install where required for mounting and supporting electrical equipment, raceway, and cable tray systems.

B. Channel Type:

1. Interior, Wet or Dry (Noncorrosive) Locations:
   a. Aluminum Raceway: Extruded aluminum.
   b. PVC-Coated Conduit: PVC coated.

©COPYRIGHT 2013 CH2M HILL

c. Steel Raceway and Other Systems Not Covered: Carbon steel or paint coated.

2. Interior, Corrosive (Wet or Dry) Locations:
   a. Aluminum Raceway: Extruded aluminum.
   b. PVC Conduit: Type 316 stainless steel or nonmetallic.
   c. PVC-Coated Steel Conduit and Other Systems Not Covered: Type 316 stainless steel, nonmetallic, or PVC-coated steel.
3. Outdoor, Noncorrosive Locations:
   a. Steel Raceway: Carbon steel or paint coated framing channel, except where mounted on aluminum handrail, then use aluminum framing channel.
   b. Aluminum Raceway and Other Systems Not Covered: Aluminum framing channel.
4. Outdoor Corrosive Locations:
   a. PVC Conduit: Type 316 stainless steel or nonmetallic.
   b. Aluminum Raceway: Aluminum.
   c. PVC-Coated Steel Conduit and Other Systems Not Covered: Type 316 stainless steel, nonmetallic, or PVC coated steel.

C. Paint cut ends prior to installation with the following:

1. Carbon Steel Channel: Zinc-rich primer.
2. Painted Channel: Rust-inhibiting epoxy or acrylic paint.
3. Nonmetallic Channel: Epoxy resin sealer.
4. PVC-Coated Channel: PVC patch.

3.04 INTRINSIC SAFETY BARRIERS

A. Install in compliance with ISA RP12.06.01.

B. Arrange conductors such that wiring from hazardous areas cannot short to wiring from nonhazardous area.

C. Stencil “INTRINSICALLY SAFE CIRCUIT” on all boxes enclosing barriers.

3.05 SWITCHBOARD MATTING

A. Install 36-inch width at switchgear, switchboard, motor control centers, and panelboards.

B. Matting shall run full length of all sides of equipment that have operator controls or afford access to devices.

©COPYRIGHT 2013 CH2M HILL

3.06 FIRESTOPS

A. Install in strict conformance with manufacturer's instructions. Comply with installation requirements established by testing and inspecting agency.

B. Sealant: Install sealant, including forming, packing, and other accessory materials, to fill openings around electrical services penetrating floors and walls, to provide firestops with fire-resistance ratings indicated for floor or wall assembly in which penetration occurs.

CONDUCTORS

PART 1 - GENERAL

1.01 REFERENCES

A. The following is a list of standards which may be referenced in this section:

1. Association of Edison Illuminating Companies (AEIC): CS 8, Specification for Extruded Dielectric Shielded Power Cables Rated 5 kV through 46 kV.
2. ASTM International (ASTM):
   a. A167, Standard Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip.
   b. B3, Standard Specification for Soft or Annealed Copper Wire.
   c. B8, Standard Specification for Concentric-Lay-Stranded Copper Conductors, Hard, Medium-Hard, or Soft.
   d. B496, Standard Specification for Compact Round Concentric-Lay-Stranded Copper Conductors.
3. Institute of Electrical and Electronics Engineers, Inc. (IEEE):
   a. 48, Standard Test Procedures and Requirements for Alternating-Current Cable Terminations Used on Shielded Cables Having Laminated Insulation Rated 2.5 kV through 765 kV or Extruded Insulation Rated 2.5 kV Through 500 kV.
   b. 386, Standard for Separable Insulated Connector Systems for Power Distribution Systems Above 600V.
   c. 404, Standard for Extruded and Laminated Dielectric Shielded Cable Joints Rated 2500 V to 500000 V.
4. Insulated Cable Engineer's Association, Inc. (ICEA):
   a. S-58-679, Standard for Control Cable Conductor Identification.
   b. S-73-532, Standard for Control Thermocouple Extensions and Instrumentation Cables.
   c. T-29-520, Conducting Vertical Cable Tray Flame Tests with Theoretical Heat Input of 210,000 Btu/hour.
5. National Electrical Manufacturers' Association (NEMA):
   a. CC 1, Electric Power Connectors for Substations.
   b. WC 57, Standard for Control, Thermocouple Extension, and Instrumentation Cables.
   c. WC 70, Standard for Power Cables Rated 2000 Volts or Less for the Distribution of Electrical Energy.

©COPYRIGHT 2013 CH2M HILL

d. WC 71, Standard for Nonshielded Cables Rated 2001-5000 Volts for Use in the Distribution of Electric Energy.
e. WC 74, 5-46 kV Shielded Power Cable for Use in the Transmission and Distribution of Electric Energy.

6. National Fire Protection Association (NFPA):
   a. 70, National Electrical Code (NEC).
   b. 262, Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces.
7. Telecommunications Industry Association (TIA): TIA-568-C, Commercial Building Telecommunications Cabling Standard.
8. Underwriters Laboratories Inc. (UL):
   a. 13, Standard for Safety for Power-Limited Circuit Cables.
   b. 44, Standard for Safety for Thermoset-Insulated Wires and Cables.
   c. 62, Standard for Safety for Flexible Cord and Cables.
   d. 486A-486B, Standard for Safety for Wire Connectors.
   e. 486C, Standard for Safety for Splicing Wire Connectors.
   f. 510, Standard for Safety for Polyvinyl Chloride, Polyethylene, and Rubber Insulating Tape.
   g. 854, Standard for Safety for Service-Entrance Cables.
   h. 1072, Standard for Safety for Medium-Voltage Power Cables.
   i. 1277, Standard for Safety for Electrical Power and Control Tray Cables with Optional Optical-Fiber Members.
   j. 1569, Standard for Safety for Metal-Clad Cables.
   k. 1581, Standard for Safety for Reference Standard for Electrical Wires, Cables, and Flexible Cords.

1.02 SUBMITTALS

A. Action Submittals:

1. Product Data:
   a. Wire and cable.
   b. Wire and cable accessories.
   c. Cable fault detection system.
2. Manufactured Wire Systems:
   a. Product data.
   b. Rating information.
   c. Dimensional drawings.
   d. Special fittings.
3. Busway:
   a. Product data.
   b. Rating information.

©COPYRIGHT 2013 CH2M HILL

c. Dimensional drawings.
d. Special fitting.
e. Equipment interface information for equipment to be connected to busways.

4. Cable Pulling Calculations:
   a. Ensure submitted and reviewed before cable installation.
   b. Provide for the following cable installations:
      1) Medium voltage cable runs that cannot be hand pulled.
      2) Multiconductor 600-volt cable sizes larger than 2 AWG that cannot be hand pulled.
      3) Power and control conductor, and control and instrumentation cable installations in ductbanks.
      4) Feeder circuits; single conductors #4/0 and larger.

B. Informational Submittals:

1. Certified Factory Test Report for conductors 600 volts and below.
2. Certified Factory Test Report per AEIC CS 8, including AEIC qualification report for conductors above 600 volts.

1.03 QUALITY ASSURANCE

A. Authority Having Jurisdiction (AHJ):

1. Provide the Work in accordance with NFPA 70. Where required by the AHJ, material and equipment shall be labeled or listed by a nationally recognized testing laboratory or other organization acceptable to the AHJ in order to provide a basis for approval under NEC.
2. Materials and equipment manufactured within the scope of standards published by Underwriters Laboratories Inc. shall conform to those standards and shall have an applied UL listing mark.

B. Terminations and Splices for Conductors above 600 Volts: Work shall be done by journeyman lineman with splicing credentials or electrician certified to use materials approved for cable splices and terminations.

PART 2 - PRODUCTS

2.01 CONDUCTORS 600 VOLTS AND BELOW

A. Conform to applicable requirements of NEMA WC 70.

B. Conductor Type:

©COPYRIGHT 2013 CH2M HILL

1. 120-Volt and 277-Volt Lighting, 10 AWG and Smaller: Solid copper.
2. 120-Volt Receptacle Circuits, 10 AWG and Smaller: Solid copper.
3. All Other Circuits: Stranded copper.

C. Insulation: Type THHN/THWN-2, except for sizes No. 6 and larger, with XHHW-2 insulation.

D. Direct Burial and Aerial Conductors and Cables:

1. Type USE/RHH/RHW insulation, UL 854 listed, or Type RHW-2/USE-2.
2. Conform to physical and minimum thickness requirements of NEMA WC 70.

E. Flexible Cords and Cables:

1. Type SOW-A/50 with ethylene propylene rubber insulation in accordance with UL 62.
2. Conform to physical and minimum thickness requirements of NEMA WC 70.

2.02 CONDUCTORS ABOVE 600 VOLTS

A. EPR Insulated Cable:

1. Extrusion: Single-pass, triple-tandem, of conductor screen, insulation, and insulation screen.
2. Type: [5] [8] [15] kV, [shielded,] [nonshielded,] UL 1072, Type MV-105.
3. Conductors: [Copper,] [Aluminum,] concentric lay Class B round stranded in accordance with ASTM B3, ASTM B8, and ASTM B496.
4. [Strand Fill: Waterproof strand compound enclosing conductors.]
5. Conductor Screen: Extruded, semiconducting ethylene-propylene rubber in accordance with NEMA WC 71 and AEIC CS 8.
6. Insulation: 133 percent insulation level, ethylene-propylene rubber (EPR) containing no polyethylene, in accordance with NEMA WC 71, and AEIC CS 8.
7. Insulation Thickness: [115-mil, 5 kV,] [140-mil, 8 kV,] [220-mil, 15 kV,] nominal.
8. Insulation Screen: Thermosetting, semiconducting ethylene-propylene rubber (EPR), extruded directly over insulation in accordance with NEMA WC 74 and AEIC CS 8.
9. Metallic Shield: Uncoated, 5-mil, copper shielding tape, helically applied with [12-1/2] [17-1/2] percent minimum overlap.

©COPYRIGHT 2013 CH2M HILL

10. Jacket: Extruded [polyvinyl chloride (PVC)] [neoprene (polychloroprene)] [hypalon (chlorosulfonated polyethylene)] [chlorinated polyethylene (CPE)] compound applied in accordance with NEMA WC 71 or NEMA WC 74.
11. Operating Temperature: 105 degrees C continuous normal operations, 130 degrees C emergency operating conditions, and 250 degrees C short-circuit conditions.
12. Manufacturers:
    a. Okonite Co.
    b. Pirelli Wire and Cable.
    c. General Cable.
    d. Southwire Co.

B. TR-XLP Insulated Cable:

1. Extrusion: Single-pass, triple-tandem, of conductor screen, insulation, and insulation screen.
2. Type: [5] [8] [15] kV, [shielded,] [nonshielded,] UL 1072, Type MV 105.
3. Conductors: [Copper,] [Aluminum,] concentric lay Class B round stranded in accordance with ASTM B3, ASTM B8, and ASTM B496.
4. Strand Fill: Waterproof strand compound enclosing conductors.
5. Conductor Screen: Extruded, semiconducting thermosetting compound in accordance with NEMA WC 71 and AEIC CS 8.
6. Insulation: 133 percent insulation level, thermosetting, tree-resistant, cross-link polyethylene (TR-XLP), in accordance with NEMA WC 71 and AEIC CS 8.
7. Insulation Thickness: [115-mil, 5 kV,] [140-mil, 8 kV,] [220-mil, 15 kV,] nominal.
8. Insulation Screen: Thermosetting, semiconducting cross-link polyethylene, extruded directly over insulation.
9. Metallic Shield: [Coated, 5-mil, copper shielding tape, helically applied with [12-1/2] [17-1/2] percent minimum overlap.] [Concentric serve of 24 AWG solid bare copper wires with overlapping binder tape.]
10. Jacket: Extruded [polyvinyl chloride (PVC)] [neoprene (polychloroprene)] [hypalon (chlorosulfonated polyethylene)] [chlorinated polyethylene (CPE)] compound applied in accordance with NEMA WC 71 or NEMA WC 74 and AEIC CS 8.
11. Operating Temperature: 105 degrees C continuous normal operations, 130 degrees C emergency operating conditions, and 250 degrees C short-circuit conditions.
12. Manufacturers:
    a. Okonite Co.
    b. Pirelli Wire and Cable.

©COPYRIGHT 2013 CH2M HILL

c. General Cable.
d. Southwire Co.

2.03 600-VOLT RATED CABLE

A. General:

1. Type TC, meeting requirements of UL 1277, including Vertical Tray Flame Test at 70,000 Btu per hour, and NFPA 70, Article 340, or UL 13 meeting requirements of NFPA 70, Article 725.
2. Permanently and legibly marked with manufacturer's name, maximum working voltage for which cable was tested, type of cable, and UL listing mark.
3. Suitable for installation in open air, in cable trays, or conduit.
4. Minimum Temperature Rating: 90 degrees C dry locations, 75 degrees C wet locations.
5. Overall Outer Jacket: PVC, flame-retardant, sunlight- and oil-resistant.

B. Type 1, Multiconductor Control Cable:

1. Conductors:
   a. 14 AWG, seven-strand copper.
   b. Insulation: 15-mil PVC with 4-mil nylon.
   c. UL 1581 listed as Type THHN/THWN rated VW-1.
   d. Conductor group bound with spiral wrap of barrier tape.
   e. Color Code: In accordance with ICEA S-58-679, Method 1, Table 2.
2. Cable: Passes the ICEA T-29-520, 210,000 Btu per hour Vertical Tray Flame Test.
3. Cable Sizes:

No. of Conductors	Max. Outside Diameter (Inches)	Jacket Thickness (Mils)
3	0.41	45
5	0.48	45
7	0.52	45
12	0.72	60
19	0.83	60
25	1.00	60
37	1.15	80

©COPYRIGHT 2013 CH2M HILL

4. Manufacturers:
   a. Okonite Co.
   b. Southwire.

C. Type 2, Multiconductor Power Cable:

1. General:
   a. Meet or exceed UL 1581 for cable tray use.
   b. Meet or exceed UL 1277 for direct burial and sunlight-resistance.
   c. Overall Jacket: PVC.
2. Conductors:
   a. Class B stranded, coated copper.
   b. Insulation: Chemically cross-linked ethylene-propylene or cross-linked polyethylene.
   c. UL rated VW-1 or listed Type XHHW-2.
   d. Color Code:
      1) Conductors, size 8 AWG and smaller, colored conductors, ICEA S-58-679, Method 1, Table 1.
      2) Conductors, size 6 AWG and larger, ICEA S-73-532, Method 4.
3. Cable shall pass ICEA T-29-520, 210,000 Btu per hour Vertical Tray Flame Test.
4. Cable Sizes:

Conductor Size	Minimum Ground Wire Size	No. of Current Carrying Conductors	Max. Outside Diameter (Inches)	Nominal Jacket Thickness (Mils)
12	12	2 3 4	0.42 0.45 0.49	45
10	10	2 3 4	0.54 0.58 0.63	60
8	10	3 4	0.66 0.75	60
6	8	3 4	0.74 0.88	60
4	6	3 4	0.88 1.04	60 80

©COPYRIGHT 2013 CH2M HILL

Conductor Size	Minimum Ground Wire Size	No. of Current Carrying Conductors	Max. Outside Diameter (Inches)	Nominal Jacket Thickness (Mils)
2	6	3 4	1.01 1.16	80
1	6	3 4	1.10 1.25	80
1/0	6	3 4	1.22 1.35	80
2/0	4	3 4	1.32 1.53	80

4/0	4	3 4	1.56 1.78	80 110

5. Manufacturers:
   a. Okonite Co.
   b. Southwire.

D. Type 3, 16 AWG, Twisted, Shielded Pair, Instrumentation Cable: Single pair, designed for noise rejection for process control, computer, or data log applications meeting NEMA WC 57 requirements.

1. Outer Jacket: 45-mil nominal thickness.
2. Individual Pair Shield: 1.35-mil, double-faced aluminum/synthetic polymer overlapped to provide 100 percent coverage.
3. Dimension: 0.31-inch nominal OD.
4. Conductors:
   a. Bare soft annealed copper, Class B, seven-strand concentric, meeting requirements of ASTM B8.
   b. 20 AWG, seven-strand tinned copper drain wire.
   c. Insulation: 15-mil nominal PVC.
   d. Jacket: 4-mil nominal nylon.
   e. Color Code: Pair conductors, black and red.
5. Manufacturers:
   a. Okonite Co.

©COPYRIGHT 2013 CH2M HILL

b. Alpha Wire Corp.
c. Belden.

E. Type 4, 16 AWG, Twisted, Shielded Triad Instrumentation Cable: Single triad, designed for noise rejection for process control, computer, or data log applications meeting NEMA WC 57 requirements.

1. Outer Jacket: 45-mil nominal.
2. Individual Pair Shield: 1.35-mil, double-faced aluminum/synthetic polymer, overlapped to provide 100 percent coverage.
3. Dimension: 0.32-inch nominal OD.
4. Conductors:
   a. Bare soft annealed copper, Class B, seven-strand concentric, meeting requirements of ASTM B8.
   b. 20 AWG, seven-strand, tinned copper drain wire.
   c. Insulation: 15-mil nominal PVC.
   d. Jacket: 4-mil nylon.
   e. Color Code: Triad conductors black, red, and blue.
5. Manufacturers:
   a. Okonite Co.
   b. Alpha Wire Corp.
   c. Belden.

F. Type 5, 18 AWG, Multitwisted Shielded Pairs, with a Common Overall Shield, Instrumentation Cable: Designed for use as instrumentation, process control, and computer cable, meeting NEMA WC 57 requirements.

1. Conductors:
   a. Bare soft annealed copper, Class B, seven-strand concentric, in accordance with ASTM B8.
   b. Tinned copper drain wires.
   c. Pair drain wire size AWG 20, group drain wire size AWG 18.
   d. Insulation: 15-mil PVC.
   e. Jacket: 4-mil nylon.
   f. Color Code: Pair conductors, black and red with red conductor numerically printed for group identification.
   g. Individual Pair Shield: 1.35-mil, double-faced aluminum/synthetic polymer.
2. Cable Shield: 2.35-mil, double-faced aluminum/synthetic polymer, overlapped for 100 percent coverage.
3. Cable Sizes:

   c. Belden.

G. Type 6, 18 AWG, Multitwisted Pairs with Common Overall Shield Instrumentation Cable: Designed for use as instrumentation, process control, and computer cable meeting NEMA WC 57.

1. Conductors:
   a. Bare soft annealed copper, Class B, seven-strand concentric, in accordance with ASTM B8.
   b. Tinned copper drain wire size AWG 18.
   c. Insulation: 15-mil nominal PVC.
   d. Jacket: 4-mil nylon.
   e. Color Code: Pair conductors, black and red with red conductor numerically printed for group identification.
2. Cable Shield: 2.35-mil, double-faced aluminum/synthetic polymer, overlapped for 100 percent coverage.

2.04 300-VOLT RATED CABLE

A. General:

1. Type PLTC, meeting requirements of UL 13 and NFPA 70, Article 725.
2. Permanently and legibly marked with manufacturer's name, maximum working voltage for which cable was tested, type of cable, and UL listing mark.
3. Suitable for installation in open air, in cable trays, or conduit.
4. Minimum Temperature Rating: 105 degrees C.
5. Passes Vertical Tray Flame Test.
6. Outer Jacket: PVC, flame-retardant, sunlight- and oil-resistant.

B. Type 20, 16 AWG, Twisted, Shielded Pair Instrumentation Cable: Single pair, designed for noise rejection for process control, computer, or data log applications meeting NEMA WC 57.

1. Outer Jacket: 35-mil nominal.
2. Individual Pair Shield: 1.35-mil, double-faced aluminum/synthetic polymer, overlapped to provide 100 percent coverage.
3. Dimension: 0.26-inch nominal OD.
4. Conductors:
   a. Bare soft annealed copper, Class B, seven-strand concentric, ASTM B8.
   b. 20 AWG, seven-strand tinned copper drain wire.
   c. Insulation: 15-mil PVC.
   d. Color Code: Pair conductors black and white.

5. Manufacturers:
    a. Okonite Co.
    b. Alpha Wire Corp.

C. Type 21, 16 AWG, Twisted, Shielded Triad Instrumentation Cable: Single triad, designed for noise rejection for process control, computer, or data log applications meeting requirements of NEMA WC 57.

1. Outer Jacket: 35-mil nominal thickness.
2. Individual Pair Shield: 1.35-mil, double-faced aluminum/synthetic polymer, overlapped to provide 100 percent coverage.
3. Dimension: 0.28-inch nominal OD.
4. Conductors:
    a. Bare soft annealed copper, Class B, seven-strand concentric, ASTM B8.
    b. 20 AWG, seven-strand tinned copper drain wire.
    c. Insulation: 15-mil PVC.
    d. Color Code: Triad conductors; black, red, and white.
5. Manufacturers:
    a. Okonite Co.
    b. Alpha Wire Corp.

D. Type 22, 18 AWG, Multitwisted, Shielded Pairs with a Common Overall Shield Instrumentation Cable: Designed for use as instrumentation, process control, and computer cable meeting NEMA WC 57.

1. Conductors:
    a. Bare soft annealed copper, Class B, seven-strand concentric, ASTM B8.
    b. Tinned copper drain wires.
    c. Pair drain wire size AWG 20, group drain wire size AWG 18.
    d. Insulation: 15-mil PVC.
    e. Color Code: Pair conductors black and white; white conductor numerically printed for group identification.
    f. Individual Pair Shield: 1.35-mil aluminum/mylar.
    g. Cable Shield: 2.35-mil, double-faced aluminum/synthetic polymer, overlapped for 100 percent coverage.

F. Type 24, Twisted Pair Fire Alarm Cable [, Shielded] [, Nonshielded]: Power limited fire protective signaling circuit cable meeting requirements of NFPA 70, Article 760.

1. Cable: Pass NFPA 262, 70,000 Btu flame test and listed by [California] [_____] State Fire Marshall.
2. Outer Jacket: Red in color, identified along its entire length as fire protective signaling circuit cable.
3. Conductors:
   a. Solid, tinned, or bare copper [, shielded, with stranded tinned copper drain wire].
   b. Insulation: 15-mil PVC.
   c. [Shield: Aluminum/mylar spiral wound along entire length.]
4. Cable Sizes:

2.05 SPECIAL CABLES

A. Type 30, Unshielded Twisted Pair (UTP) Telephone and Data Cable, 300V:

1. Category 6 UTP, UL listed, and third party verified to comply with TIA/EIA 568-C Category 6 requirements.
2. Suitable for high speed network applications including gigabit ethernet and video. Cable shall be interoperable with other standards compliant products and shall be backward compatible with Category 5 and Category 5e.
3. Provide four each individually twisted pair, 23 AWG conductors, with FEP insulation and blue PVC jacket.
4. NFPA 70 Plenum (CMP) rated; comply with flammability plenum requirements of NFPA 70 and NFPA 262.
5. Cable shall withstand a bend radius of 1-inch minimum at a temperature of minus 20 degrees C maximum without jacket or insulation cracking.
6. Manufacturer and Product: Belden; 7852A.

2.06 GROUNDING CONDUCTORS

A. Equipment: Stranded copper with green, Type USE/RHH/RHW-XLPE or THHN/THWN, insulation.

B. Direct Buried: Bare stranded copper.

2.07 ACCESSORIES FOR CONDUCTORS 600 VOLTS AND BELOW

A. Tape:

1. General Purpose, Flame Retardant: 7-mil, vinyl plastic, Scotch Brand 33+, rated for 90 degrees C minimum, meeting requirements of UL 510.
2. Flame Retardant, Cold and Weather Resistant: 8.5-mil, vinyl plastic, Scotch Brand 88.
3. Arc and Fireproofing:
   a. 30-mil, elastomer.
   b. Manufacturers and Products:
      1) 3M; Scotch Brand 77, with Scotch Brand 69 glass cloth tapebinder.
      2) Plymouth; 53 Plyarc, with 77 Plyglas glass cloth tapebinder.

B. Identification Devices:

©COPYRIGHT 2013 CH2M HILL

1. Sleeve:
   a. Permanent, PVC, yellow or white, with legible machine-printed black markings.
   b. Manufacturers and Products:
      1) Raychem; Type D-SCE or ZH-SCE.
      2) Brady, Type 3PS.
2. Heat Bond Marker:
   a. Transparent thermoplastic heat bonding film with acrylic pressure sensitive adhesive.
   b. Self-laminating protective shield over text.
   c. Machine printed black text.
   d. Manufacturer and Product: 3M Co.; Type SCS-HB.
3. Marker Plate: Nylon, with legible designations permanently hot stamped on plate.
4. Tie-On Cable Marker Tags:
   a. Chemical-resistant white tag.
   b. Size: 1/2 inch by 2 inches.
   c. Manufacturer and Product: Raychem; Type CM-SCE.
5. Grounding Conductor: Permanent green heat-shrink sleeve, 2-inch minimum.

C. Connectors and Terminations:

1. Nylon, Self-Insulated Crimp Connectors:
   a. Manufacturers and Products:
      1) Thomas & Betts; Sta-Kon.
      2) Burndy; Insulug.
      3) ILSCO.
2. Nylon, Self-Insulated, Crimp Locking-Fork, Torque-Type Terminator:
   a. Suitable for use with 75 degrees C wire at full NFPA 70, 75 degrees C ampacity.
   b. Seamless.
   c. Manufacturers and Products:
      1) Thomas & Betts; Sta-Kon.
      2) Burndy; Insulink.
      3) ILSCO; ILSCONS.
3. Self-Insulated, Freespring Wire Connector (Wire Nuts):
   a. UL 486C.
   b. Plated steel, square wire springs.
   c. Manufacturers and Products:
      1) Thomas & Betts.
      2) Ideal; Twister.

©COPYRIGHT 2013 CH2M HILL

2. Self-Insulated, Set Screw Wire Connector:
   a. Two piece compression type with set screw in brass barrel.
   b. Insulated by insulator cap screwed over brass barrel.
   c. Manufacturers:
      1) 3M Co.
      2) Thomas & Betts.
      3) Marrette.

D. Cable Lugs:

1. In accordance with NEMA CC 1.
2. Rated 600 volts of same material as conductor metal.
3. Uninsulated Crimp Connectors and Terminators:
   a. Suitable for use with 75 degrees C wire at full NFPA 70, 75 degrees C ampacity.
   b. Manufacturers and Products:
      1) Thomas & Betts; Color-Keyed.
      2) Burndy; Hydent.
      3) ILSCO.
4. Uninsulated, Bolted, Two-Way Connectors and Terminators:
   a. Manufacturers and Products:
      1) Thomas & Betts; Locktite.
      2) Burndy; Quiklug.
      3) ILSCO.

E. Cable Ties:

1. Nylon, adjustable, self-locking, and reusable.
2. Manufacturer and Product: Thomas & Betts; TY-RAP.

F. Heat Shrinkable Insulation:

1. Thermally stabilized cross-linked polyolefin.
2. Single wall for insulation and strain relief.
3. Dual Wall, adhesive sealant lined, for sealing and corrosion resistance.
4. Manufacturers and Products:
   a. Thomas & Betts; SHRINK-KON.
   b. Raychem; RNF-100 and ES-2000.

2.08 ACCESSORIES FOR CONDUCTORS ABOVE 600 VOLTS

A. Molded Splice Kits:

©COPYRIGHT 2013 CH2M HILL

1. Components necessary to provide insulation, metallic shielding and grounding systems, and overall jacket.
2. Capable of making splices with a current rating equal to, or greater than cable ampacity, conforming to IEEE 404.
3. Class [5] [and] [15] kV, with compression connector, EPDM molded semiconductive insert, peroxide-cured EPDM insulation, and EPDM molded semiconductive outer shield.
4. Premolded splice shall be rejacketed with a heat shrinkable adhesive-lined sleeve to provide a waterproof seal.
5. Manufacturers:
   a. Elastimold.

d. Cooper Industries.

B. Heat Shrinkable Splice Kits:

1. Components necessary to provide insulation, metallic shielding and grounding systems, and overall jacket.
2. Capable of making splices with a current rating equal to, or greater than, cable ampacity, conforming to IEEE 404.
3. Class [5] [and] [15] kV, with compression connector, splice insulating and conducting sleeves, stress-relief materials, shielding braid and mesh, and abrasion-resistant heat shrinkable adhesive-lined rejacketing sleeve to provide a waterproof seal.
4. Manufacturers:
   a. Raychem.
   b. 3M Co.

C. Termination Kits:

1. Capable of terminating [5] [8] [and] [15] kV, single-conductor, polymeric-insulated [shielded] cables [plus a shield ground clamp].
2. Capable of producing a termination with a current rating equal to, or greater than, cable ampacity meeting Class 1 requirements of IEEE 48.
3. Capable of accommodating cable shielding or construction without need for special adapters or accessories.
4. Manufacturers:
   a. Raychem.
   b. 3M Co.

D. Bus Connection Insulation:

©COPYRIGHT 2013 CH2M HILL

1. Heat shrinkable tubing, tape, and sheets of flexible cross-linked polymeric material formulated for high dielectric strength.
2. Tape and sheet products to have coating to prevent adhesion to metal surfaces.
3. [Insulating materials to be removable and reusable.]
4. Manufacturer: Raychem.

E. Elbow Connector Systems:

1. Molded, peroxide-cured, EPDM-insulated, Class [15] [25] kV, [95] [125] kV BIL, [200A, 10,000A rms load-break] [200A, 15,000A rms nonload-break] [and] [600A, 40,000 rms nonload-break] elbows [as shown,] having copper current-carrying parts in accordance with IEEE 386.
2. Protective Caps: Class [15] [25] kV, [95] [125] kV BIL, [200] [and] [600] amperes, with molded EPDM insulated body.
3. Insulated Standoff Bushings: Class [15] [25] kV, [95] [125] kV BIL, [200] [and] [600] amperes, complete with EPDM rubber body, stainless steel eyebolt with brass pressure foot, and stainless steel base bracket.
4. Bushing Inserts: Class [15] [25] kV, [95] [125] kV BIL, [200A, load-break] [200A, nonload-break] [600A, nonload-break] with EPDM rubber body and all-copper, current-carrying parts.
5. Junctions: Class [15] [25] kV, [95] [125] kV [two-way,] [three-way,] [four-way,] [200A, load-break,] [and] [600A, nonload-break,] having EPDM rubber body mounted on adjustable bracket.
6. Mounting Plates: [Two] [Three] [Four]-way, ASTM A167 stainless steel, complete with universal mounting brackets, grounding lugs and two parking stands.
7. Manufacturers:
   a. Cooper Industries.
   b. Elastimold.

F. Cable Lugs:

1. In accordance with NEMA CC1.
2. Rated [5] [and] [15] kV of same material as conductor metal.
3. Manufacturers and Products, Uninsulated Compression Connectors and Terminators:
   a. Burndy; Hydent.
   b. Thomas & Betts; Color-Keyed.
   c. ILSCO.
4. Manufacturers and Products, Uninsulated, Bolted, Two-Way Connectors and Terminators:

©COPYRIGHT 2013 CH2M HILL

a. Thomas & Betts; Locktite.
b. ILSCO.

2.09 PULLING COMPOUND

A. Nontoxic, noncorrosive, noncombustible, nonflammable, water-based lubricant; UL listed.

B. Suitable for rubber, neoprene, PVC, polyethylene, hypalon, CPE, and lead-covered wire and cable.

C. Approved for intended use by cable manufacturer.

D. Suitable for zinc-coated steel, aluminum, PVC, bituminized fiber, and fiberglass raceways.

E. Manufacturers:

1. Ideal Co.
2. Polywater, Inc.
3. Cable Grip Co.

2.10 MANUFACTURED WIRING SYSTEMS

A. System Rating:

1. 20 amperes load-carrying capacity each phase with final assemblies consisting of maximum of three-phase conductors.
2. Composition: Type MC cable with 90 degrees C insulation and stranded copper conductors.

B. Cable Configuration: Three, single-phase, five-wire circuit with standard color wire coding:

1. 208/120 Volt: Black, red, blue, white, green.
2. 480/277 Volt: Brown, orange, yellow, white, green.

C. Locking Mechanism: Latch/strike with voltage clearly marked on latch.

D. NFPA 262 listed for use in air handling plenums, listed to connect or disconnect under load, and manufactured in accordance with NFPA 70, Article No. 604.

©COPYRIGHT 2013 CH2M HILL

2.11 WARNING TAPE

A. As specified in Section 26 05 33, Raceway and Boxes.

2.12 SOURCE QUALITY CONTROL

A. Conductors 600 Volts and Below: Test in accordance with UL 44 and UL 854.

B. Conductors Above 600 Volts: Test in accordance with [NEMA WC 71 and AEIC CS 8 partial discharge level test for EPR] [NEMA WC 71 and AEIC CS 8 corona level test for TR-XLP] insulated cable.

PART 3 - EXECUTION

3.01 GENERAL

A. Conductor installation shall be in accordance with manufacturer's recommendations.

B. Conductor and cable sizing shown is based on copper conductors, unless noted otherwise.

C. Do not exceed cable manufacturer's recommendations for maximum pulling tensions and minimum bending radii.

D. Terminate conductors and cables, unless otherwise indicated.

E. Tighten screws and terminal bolts in accordance with UL 486A-486B for copper conductors.

F. Cable Lugs: Provide with correct number of holes, bolt size, and center-to-center spacing as required by equipment terminals.

G. Bundling: Where single conductors and cables in manholes, handholes, vaults, cable trays, and other indicated locations are not wrapped together by some other means, bundle conductors from each conduit throughout their exposed length with cable ties placed at intervals not exceeding 18inches on center.

H. Ream, remove burrs, and clear interior of installed conduit before pulling wires or cables.

I. Concrete-Encased Raceway Installation: Prior to installation of conductors, pull through each raceway a mandrel approximately 1/4 inch smaller than raceway inside diameter.

©COPYRIGHT 2013 CH2M HILL

3.02 POWER CONDUCTOR COLOR CODING

A. Conductors 600 Volts and Below:

1. 6 AWG and Larger: Apply general purpose, flame retardant tape at each end, and at accessible locations wrapped at least six full overlapping turns, covering area 1-1/2 inches to 2 inches wide.
2. 8 AWG and Smaller: Provide colored conductors.
3. Colors:

System	Conductor	Color
All Systems	Equipment Grounding	Green
240/120 Volts, Single-Phase, Three-Wire	Grounded Neutral One Hot Leg Other Hot Leg	White Black Red
208Y/120 Volts, Three-Phase, Four-Wire	Grounded Neutral Phase A Phase B Phase C	White Black Red Blue
240/120 Volts, Three-Phase, Four-Wire, Delta, Center Tap, Ground on Single-Phase	Grounded Neutral Phase A High (wild) Leg Phase C	White Black Orange Blue
480Y/277 Volts, Three-Phase, Four-Wire	Grounded Neutral Phase A Phase B Phase C	White Brown Orange Yellow
NOTE: Phase A, B, C implies direction of positive phase rotation.		

4. Tracer: Outer covering of white with identifiable colored strip, other than green, in accordance with NFPA 70.

B. Conductors Above 600 Volts:

1. Apply general purpose, flame retardant tape at each end, and at accessible locations wrapped at least six full overlapping turns, covering area 1-1/2 inches to 2 inches wide.
2. Colors:

©COPYRIGHT 2013 CH2M HILL

a. Grounded Neutral: White.
b. Phase A: Brown.
c. Phase B: Orange.
d. Phase C: Yellow.

3.03 CIRCUIT IDENTIFICATION

A. Identify power, instrumentation, and control conductor circuits at each termination, and in accessible locations such as manholes, handholes, panels, switchboards, motor control centers, pull boxes, and terminal boxes.

B. All wires that are electrically the same (connected to common termination points) and do not pass through a contact or other switching device shall have the same wire identification. The wire labeling code for each end of the same wire shall be identical.

1. The wire identification code for internal panel wiring shall be the number/letter as designated on the Contract elementary and/or approved shop drawings.
2. Wire labeling for field wiring shall contain the panel/equipment name as a prefix and the termination point name. (I.E. PLC50-A103 or P10-124). The hierarchy of label names is 1) PLC panel name, 2) MCC equipment name, and 3) Equipment name. Therefore, wires from PLC50 to the MCC50 P10 cubicle will be labeled PLC50-XXX. Wires from MCC50 P10 to field pressure switch PSH10 will be labeled P10-XXX.
3. Wire labels shall be exactly per interconnection submittal -- abbreviations determined in the field are not allowed. Abbreviations may be used in the wire label as submitted and approved in the interconnection drawings submittal.
4. Wire labels for lighting and receptacle circuits shall consist of the panel board and circuit number and a unique node number. (I.E. LP#3-A, LP#3-B, LP#3-N)
5. Wire labels may be omitted on “neutral jumpers” less than 8” in length.

C. Method:

1. Conductors 3 AWG and Smaller: Identify with sleeves or heat bond markers.
2. Cables and Conductors 2 AWG and Larger:
   a. Identify with marker plates or tie-on cable marker tags.
   b. Attach with nylon tie cord.
3. Taped-on markers or tags relying on adhesives not permitted.

©COPYRIGHT 2013 CH2M HILL

3.04 CONDUCTORS 600 VOLTS AND BELOW

A. Install 10 AWG or 12 AWG conductors for branch circuit power wiring in lighting and receptacle circuits.

B. Do not splice incoming service conductors and branch power distribution conductors 6 AWG and larger, unless specifically indicated or approved by Engineer.

C. Connections and Terminations:

1. Install wire nuts only on solid conductors. Wire nuts are not allowed on stranded conductors.
2. Install nylon self-insulated crimp connectors and terminators for instrumentation and control, circuit conductors.
3. Install self-insulated, set screw wire connectors for two-way connection of power circuit conductors 12 AWG and smaller.
4. Install uninsulated crimp connectors and terminators for instrumentation, control, and power circuit conductors 4 AWG through 2/0 AWG.
5. Install uninsulated, bolted, two-way connectors and terminators for power circuit conductors 3/0 AWG and larger.
6. Install uninsulated terminators bolted together on motor circuit conductors 10 AWG and larger.
7. Place no more than one conductor in any single-barrel pressure connection.
8. Install crimp connectors with tools approved by connector manufacturer.
9. Install terminals and connectors acceptable for type of material used.
10. Compression Lugs:
    a. Attach with a tool specifically designed for purpose. Tool shall provide complete, controlled crimp and shall not release until crimp is complete.
    b. Do not use plier type crimpers.

D. Do not use soldered mechanical joints.

E. Splices and Terminations:

1. Insulate uninsulated connections.
2. Indoors: Use general purpose, flame retardant tape or single wall heat shrink.
3. Outdoors, Dry Locations: Use flame retardant, cold- and weather-resistant tape or single wall heat shrink.
4. Below Grade and Wet or Damp Locations: Use dual wall heat shrink.

©COPYRIGHT 2013 CH2M HILL

F. Cap spare conductors with UL listed end caps.

G. Cabinets, Panels, and Motor Control Centers:

1. Remove surplus wire, bridle and secure.
2. Where conductors pass through openings or over edges in sheet metal, remove burrs, chamfer edges, and install bushings and protective strips of insulating material to protect the conductors.

H. Control and Instrumentation Wiring:

1. Where terminals provided will accept such lugs, terminate control and instrumentation wiring, except solid thermocouple leads, with insulated, locking-fork compression lugs.
2. Terminate with methods consistent with terminals provided, and in accordance with terminal manufacturer's instructions.
3. Locate splices in readily accessible cabinets or junction boxes using terminal strips.
4. Where connections of cables installed under this section are to be made under Section 40 90 00, Instrumentation and Control for Process Systems, leave pigtails of adequate length for bundled connections.]
5. Cable Protection:
   a. Under Infinite Access Floors: May install without bundling.
   b. All Other Areas: Install individual wires, pairs, or triads in flex conduit under floor or grouped into bundles at least 1/2 inch in diameter.
   c. Maintain integrity of shielding of instrumentation cables.
   d. Ensure grounds do not occur because of damage to jacket over shield.

I. Extra Conductor Length: For conductors to be connected by others, install minimum 6 feet of extra conductor in freestanding panels and minimum 2 feet in other assemblies.

3.05 CONDUCTORS ABOVE 600 VOLTS

A. Do not splice unless specifically indicated or approved by Engineer.

B. Make joints and terminations with splice and termination kits, in accordance with kit manufacturer's instructions.

C. Install splices or terminations as continuous operation in accessible locations under clean, dry conditions.

©COPYRIGHT 2013 CH2M HILL

D. Single Conductor Cable Terminations: Provide heat shrinkable stress control and outer nontracking insulation tubings, high relative permittivity stress relief mastic for insulation shield cutback treatment, and a heat-activated sealant for environmental sealing, plus a ground braid and clamp.

E. Install terminals or connectors acceptable for type of conductor material used.

F. Provide outdoor rain skirts for riser pole and outdoor switchgear terminations.

G. Provide shield termination and grounding for terminations.

H. Provide necessary mounting hardware, covers, and connectors.

I. Where elbow connectors are specified, install in accordance with manufacturer's instructions.

J. Connections and Terminations:

1. Install uninsulated crimp connectors and terminators for power circuit conductors 4 AWG and larger.
2. Install uninsulated, bolted, two-way connectors for motor circuit conductors No. 12 and larger.
3. Insulate bus connections with heat shrinking tubing, tape, and sheets.
4. Make bus connections removable and reusable in accordance with manufacturer's instructions.

K. Give 2 working days notice to Engineer prior to making splices or terminations.

3.06 CONDUCTOR ARC AND FIREPROOFING

A. Install arc and fireproofing tape on 600-volt single conductors and cables, except those rated Type TC at splices in manholes, handholes, vaults, cable trays, and other indicated locations.

B. [Install arc and fireproofing tape on [5 kV] [and] [15 kV] cables [throughout entire exposed length] [at splices] in manholes, handholes, vaults, cable trays, and other indicated locations].

C. Wrap conductors of same circuit entering from separate conduit together as single cable.

D. Follow tape manufacturer's installation instructions.

©COPYRIGHT 2013 CH2M HILL

E. Secure tape at intervals of [5] [10] [_____] feet with bands of tapebinder. Each band to consist of a minimum of two wraps directly over each other.

SECTION 26 05 26
GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 SUMMARY

A. Section Includes:

1. Rod electrodes.
2. Active electrodes.
3. Wire.
4. Grounding well components.
5. Mechanical connectors.
6. Exothermic connections.

B. Related Sections:

1. Section 03 20 00, Concrete Reinforcing: Bonding or welding bars when reinforcing steel is used for electrodes.
2. Section 09 69 00, Access Flooring: Grounding systems for access flooring.
3. Section 26 41 00, Facility Lightning Protection: Grounding of lightning protection system.
4. Section 33 79 00, Site Grounding: Site related grounding components for buildings and facilities.

1.02 REFERENCES

1.03 SYSTEM DESCRIPTION

A. Grounding systems use the following elements as grounding electrodes:

1. Metal underground water pipe.
2. Metal building frame.
3. Concrete-encased electrode.
4. Ground ring specified in Section 33 79 00 <<Not in this package>>.
5. Rod electrode.
6. Plate electrode.

1.04 DESIGN REQUIREMENTS

A. Construct and test grounding systems for access flooring systems on conductive floors accordance with IEEE 1100. Refer to Section 09 69 00 <<Not in this package>>.

1.05 PERFORMANCE REQUIREMENTS

A. Grounding System Resistance: 5ohms maximum.

1.06 SUBMITTALS

A. Section 01 33 00, Submittal Procedures: Requirements for submittals.

B. Product Data: Submit data on grounding electrodes and connections.

C. Test Reports: Indicate overall resistance to ground [and resistance of each electrode].

D. Manufacturer's Installation Instructions: Submit for active electrodes.

E. Manufacturer's Certificate: Certify Products meet or exceed specified requirements.

1.07 CLOSEOUT SUBMITTALS

A. Section 01 70 00, Execution and Closeout Requirements: Requirements for submittals.

B. Project Record Documents: Record actual locations of components and grounding electrodes.

©COPYRIGHT 2013 CH2M HILL

1.08 QUALITY ASSURANCE

A. Provide grounding materials conforming to requirements of NEC, IEEE 142, and UL labeled.

B. Perform Work in accordance with State of California Public Work's standard.

C. Maintain one copy of each document on site.

1.09 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing Products specified in this section with minimum three years experience.

B. Installer: Company specializing in performing work of this section with minimum three years documented experience.

1.10 , DELIVERY, STORAGE, AND HANDLING

A. Section 01 60 00, Product Requirements: Requirements for transporting, handling, storing, and protecting products.

B. Accept materials on site in original factory packaging, labeled with manufacturer's identification.

C. Protect from weather and construction traffic, dirt, water, chemical, and mechanical damage, by storing in original packaging.

D. Do not deliver items to project before time of installation. Limit shipment of bulk and multiple-use materials to quantities needed for immediate installation.

1.11 COORDINATION

A. Section 01 30 00, Administrative Requirements: Requirements for coordination.
A. Complete grounding and bonding of building reinforcing steel prior concrete placement.

PART 2 - PRODUCTS

2.01 ROD ELECTRODES

A. Manufacturers:

©COPYRIGHT 2013 CH2M HILL

1. Erico, Inc..
2. O-Z Gedney Co..
3. Thomas & Betts, Electrical l.
4.
5. Substitutions: [Section 01 60 00, Product Requirements] [Not Permitted].

B. Product Description:

1. Material: Copper-clad steel.
2. Diameter: 3/4 inch .
3. Length: 10 feet.

C. Connector: Connector for exothermic welded connection.

2.02 WIRE

A. Material: Stranded copper.

B. Foundation Electrodes: 4AWG.

C. Grounding Electrode Conductor: Copper conductor bare.

D. Bonding Conductor: Copper conductor bare.

2.03 EXOTHERMIC CONNECTIONS

A. Manufacturers:

1. Copperweld, Inc. .
2. ILSCO Corporation .
3. O-Z Gedney Co. .
4. Thomas & Betts, Electrical.
4.

B. Product Description: Exothermic materials, accessories, and tools for preparing and making permanent field connections between grounding system components.

PART 3 -EXECUTION

3.01 EXAMINATION

A. Section 01 30 00, Administrative Requirements: Verification of existing conditions before starting work.

©COPYRIGHT 2013 CH2M HILL

B. Verify final backfill and compaction has been completed before driving rod electrodes.

3.02 PREPARATION

A. Remove paint, rust, surface contaminants at connection points.

3.03 EXISTING WORK

A. Modify existing grounding system to maintain continuity to accommodate renovations.

B. Extend existing grounding system using materials and methods [compatible with existing electrical installations, or] as specified.

3.04 INSTALLATION

A. Install in accordance with IEEE [142] [1100].

B. Install rod electrodes at locations as indicated on Drawings . Install additional rod electrodes to achieve specified resistance to ground.

C. Install grounding and bonding conductors concealed from view.

D. Install grounding well pipe with cover at [each rod location] [rod locations as indicated on Drawings]. Install well pipe top flush with finished grade.

E. Install bare copper wire in foundation footing as indicated on Drawings.

3.05 FIELD QUALITY CONTROL

A. Section 01 40 00, Quality Requirements, 01 70 00, Execution and Closeout Requirements: Field inspecting, testing, adjusting, and balancing.

B. Inspect and test in accordance with NETA ATS, except Section 4.

C. Grounding and Bonding: Perform inspections and tests listed in NETA ATS, Section 7.13.

D. Perform ground resistance testing in accordance with IEEE 142.

E. Perform leakage current tests in accordance with NFPA 99.

©COPYRIGHT 2013 CH2M HILL

F. Perform continuity testing in accordance with IEEE 142.

G. When improper grounding is found on receptacles, check receptacles in entire project and correct. Perform retest.

END OF SECTION

©COPYRIGHT 2013 CH2M HILL

SECTION 26 05 33
RACEWAY AND BOXES FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.01 SUMMARY

A. Section includes conduit and tubing, surface raceways, wireways, outlet boxes, pull and junction boxes, and handholes.

B. Related Sections:

1. Section 26 05 03, Equipment Wiring Connections.
2. Section 26 05 26, Grounding and Bonding for Electrical Systems.
3. Section 26 05 53, Identification for Electrical Systems.
4. Section 26 27 16, Electrical Cabinets and Enclosures.
5. Section 26 27 26, Wiring Devices.
6. Section 27 05 33, Conduits and Backboxes for Communications Systems.
7. Section 33 71 19, Electrical Underground Ducts and Manholes.

1.02 UNIT PRICE - MEASUREMENT AND PAYMENT

A. Raceway:

1. Basis of Measurement: By linear foot.
2. Basis of Payment: Includes materials, delivery, handling, and installing.

B. Boxes:

1. Basis of Measurement: By cubic foot.
2. Basis of Payment: Includes materials, delivery, handling, and installing.

1.03 REFERENCES

A. American National Standards Institute:

1. ANSI C80.1, Rigid Steel Conduit, Zinc Coated.
2. ANSI C80.3, Specification for Electrical Metallic Tubing, Zinc Coated.
3. ANSI C80.5, Aluminum Rigid Conduit - (ARC).

2. NEMA FB 1, Fittings, Cast Metal Boxes, and Conduit Bodies for Conduit and Cable Assemblies.
3. NEMA OS 1, Sheet Steel Outlet Boxes, Device Boxes, Covers, and Box Supports.
4. NEMA OS 2, Nonmetallic Outlet Boxes, Device Boxes, Covers, and Box Supports.
5. NEMA RN 1, Polyvinyl Chloride (PVC) Externally Coated Galvanized Rigid Steel Conduit and Intermediate Metal Conduit.
6. NEMA TC 2, Electrical Polyvinyl Chloride (PVC) Tubing and Conduit.
7. NEMA TC 3, PVC Fittings for Use with Rigid PVC Conduit and Tubing.

1.04 SYSTEM DESCRIPTION

A. Raceway and boxes located as indicated on Drawings, and at other locations required for splices, taps, wire pulling, equipment connections, and compliance with regulatory requirements. Raceway and boxes are shown in approximate locations unless dimensioned. Provide raceway to complete wiring system.

B. Underground Provide conduit per schedule.

C. Outdoor Locations, Above Grade: Provide rigid steel conduit unless otherswise noted on the drawings. Provide cast metal or nonmetallic outlet, pull, and junction boxes.

D. In Slab Above Grade: Provide conduit per schedule.

1.05 DESIGN REQUIREMENTS

A. Minimum Raceway Size: 3/4 inch unless otherwise specified.

1.06 SUBMITTALS

A. Section 01 33 00, Submittal Procedures: Submittal procedures.

B. Product Data: Submit for the following:

1. Flexible metal conduit.
2. Liquidtight flexible metal conduit.
3. Nonmetallic conduit.
4. Flexible nonmetallic conduit.
5. Nonmetallic tubing.
6. Raceway fittings.
7. Conduit bodies.
8. Surface raceway.

©COPYRIGHT 2013 CH2MHILL

9. Wireway.
10. Pull and junction boxes.
11. Handholes.

C. Manufacturer's Installation Instructions: Submit application conditions and limitations of use stipulated by Product testing agency specified under Regulatory Requirements. Include instructions for storage, handling, protection, examination, preparation, and installation of Product.

1.07 CLOSEOUT SUBMITTALS

A. Section 01 70 00, Execution and Closeout Requirements: Closeout procedures.

B. Project Record Documents:

1. Record actual routing of conduits larger than 3/4 inch.
2. Record actual locations and mounting heights of outlet, pull, and junction boxes.

1.08 DELIVERY, STORAGE, AND HANDLING

A. Section 01 60 00, Product Requirements: Product storage and handling requirements.

B. Protect conduit from corrosion and entrance of debris by storing above grade. Provide appropriate covering.

C. Protect PVC conduit from sunlight.

1.09 COORDINATION

A. Section 01 30 00, Administrative Requirements: Coordination and project conditions.

B. Coordinate installation of outlet boxes for equipment connected under Section 26 05 03.

C. Coordinate mounting heights, orientation and locations of outlets mounted above counters, benches, and backsplashes.

PART 2 - PRODUCTS

2.01 METAL CONDUIT

A. Manufacturers:

©COPYRIGHT 2013 CH2MHILL

1. Carlon Electrical Products.
2. Hubbell Wiring Devices.
3. Thomas & Betts Corp.
4. Walker Systems Inc.
5. The Wiremold Co.] Model [_____].
6. Substitutions: Section 01 60 00, Product Requirements.

B. Rigid Steel Conduit: ANSI C80.1.

C. Rigid Aluminum Conduit: ANSI C80.5.

D. Fittings and Conduit Bodies: NEMA FB 1; material to match conduit

2.02 PVC COATED METAL CONDUIT

A. Manufacturers:

1. Carlon Electrical Products.
2. Hubbell Wiring Devices.
3. Thomas & Betts Corp.
4. Walker Systems Inc..
5. The Wiremold Co..
6. Substitutions: Section 01 60 00, Product Requirements.

B. Product Description: NEMA RN 1; rigid steel conduit with external PVC coating, 40 mil thick.

C. Fittings and Conduit Bodies: NEMA FB 1; steel fittings with external PVC coating to match conduit.

2.03 FLEXIBLE METAL CONDUIT

A. Manufacturers:

1. Carlon Electrical Products.
2. Hubbell Wiring Devices.
3. Thomas & Betts Corp..
4. Walker Systems Inc..
5. The Wiremold Co..
6. Substitutions: Section 01 60 00, Product Requirements.

B. Product Description: Interlocked steel construction.

C. Fittings: NEMA FB 1.

©COPYRIGHT 2013 CH2MHILL

2.04 LIQUID-TIGHT FLEXIBLE METAL CONDUIT

A. Manufacturers:

1. Carlon Electrical Products.
2. Hubbell Wiring Devices.
3. Thomas & Betts Corp..
4. Walker Systems Inc..
5. The Wiremold Co..
6. Substitutions: Section 01 60 00, Product Requirements.

B. Product Description: Interlocked steelconstruction with PVC jacket.

C. Fittings: NEMA FB 1.

2.05 ELECTRICAL METALLIC TUBING (EMT)

A. Manufacturers:

1. Carlon Electrical Products.
2. Hubbell Wiring Devices.
3. Thomas & Betts Corp..
4. Walker Systems Inc..
5. The Wiremold Co..
6. Substitutions: Section 01 60 00, Product Requirements.

B. Product Description: ANSI C80.3; galvanized tubing.

C. Fittings and Conduit Bodies: NEMA FB 1; steel or malleable iron set screw type.

2.06 NONMETALLIC CONDUIT

A. Manufacturers:

1. Carlon Electrical Products.
2. Hubbell Wiring Devices.
3. Thomas & Betts Corp..
4. Walker Systems Inc..
5. The Wiremold Co..
6. Substitutions: Section 01 60 00, Product Requirements.

B. Product Description: NEMA TC 2; Schedule 40or 80 PVC.

C. Fittings and Conduit Bodies: NEMA TC 3.

©COPYRIGHT 2013 CH2MHILL

2.07 WIREWAY

A. Manufacturers:

1. Carlon Electrical Products.
2. Hubbell Wiring Devices.
3. Thomas & Betts Corp..
4. Walker Systems Inc..
5. The Wiremold Co..
6. Substitutions: Section 01 60 00, Product Requirements.

B. Product Description: General purpose type wireway.

C. Knockouts: None.

D. Size: length as indicated on Drawings.

E. Cover: Hinged cover with full gaskets.

F. Connector: Slip-in or Flanged.

G. Fittings: Lay-in type with removable side.

H. Finish: Rust inhibiting primer coating with gray enamel finish.

2.08 OUTLET BOXES

A. Manufacturers:

1. Carlon Electrical Products.
2. Hubbell Wiring Devices.
3. Thomas & Betts Corp..
4. Walker Systems Inc..
5. The Wiremold Co..
6. Substitutions: Section 01 60 00, Product Requirements.

B. Sheet Metal Outlet Boxes: NEMA OS 1, galvanized steel.

1. Luminaire and Equipment Supporting Boxes: Rated for weight of equipment supported; furnish 1/2 inch male fixture studs where required.
2. Concrete Ceiling Boxes: Concrete type.

C. Nonmetallic Outlet Boxes: NEMA OS 2.

©COPYRIGHT 2013 CH2MHILL

D. Cast Boxes: NEMA FB 1, Type FD, cast feralloy. Furnish gasketed cover by box manufacturer.

E. Wall Plates for Finished Areas: As specified in Section 26 27 26.

F. Wall Plates for Unfinished Areas: Furnish gasketed cover.

2.09 PULL AND JUNCTION BOXES

A. Manufacturers:

1. Carlon Electrical Products.
2. Hubbell Wiring Devices.
3. Thomas & Betts Corp..
4. Walker Systems Inc..
5. The Wiremold Co..
6. Substitutions: Section 01 60 00, Product Requirements.

B. Sheet Metal Boxes: NEMA OS 1, galvanized steel.

C. Hinged Enclosures: As specified in Section 26 27 16.

D. Surface Mounted Cast Metal Box: NEMA 250, Type 4X; flat-flanged, surface mounted junction box:

1. Material: Stainless steel.
2. Cover: Furnish with ground flange, neoprene gasket, and stainless steel cover screws.

PART 3 - EXECUTION

3.01 EXAMINATION

A. Section 01 30 00, Administrative Requirements: Coordination and project conditions.

B. Verify outlet locations and routing and termination locations of raceway prior to rough-in.

3.02 INSTALLATION

A. Ground and bond raceway and boxes in accordance with Section 26 05 26.

B. Fasten raceway and box supports to structure and finishes in accordance with Section 26 05 29.

©COPYRIGHT 2013 CH2MHILL

C. Identify raceway and boxes in accordance with Section 26 05 53.

D. Arrange raceway and boxes to maintain headroom and present neat appearance.

3.03 INSTALLATION, RACEWAY

A. Raceway routing is shown in approximate locations unless dimensioned. Route to complete wiring system.

B. Arrange raceway supports to prevent misalignment during wiring installation.

C. Support raceway using coated steel or malleable iron straps, lay-in adjustable hangers, clevis hangers, and split hangers.

D. Group related raceway; support using conduit rack. Construct rack using steel channel specified in Section 26 05 29; provide space on each for 25 percent additional raceways.

E. Do not support raceway with wire or perforated pipe straps. Remove wire used for temporary supports

F. Do not attach raceway to ceiling support wires or other piping systems.

G. Construct wireway supports from steel channel specified in Section 26 05 29.

H. Route exposed raceway parallel and perpendicular to walls.

I. Route raceway installed above accessible ceilings parallel and perpendicular to walls.

J. Route conduit in and under slab from point-to-point.

K. Maximum Size Conduit in Slab Above Grade: 3/4 inch. Do not cross conduits in slab.

L. Maintain clearance between raceway and piping for maintenance purposes.

M. Maintain 12 inch clearance between raceway and surfaces with temperatures exceeding 104 degrees F.

N. Cut conduit square using saw or pipe cutter; de-burr cut ends.

O. Bring conduit to shoulder of fittings; fasten securely.

©COPYRIGHT 2013 CH2MHILL

P. Join nonmetallic conduit using cement as recommended by manufacturer. Wipe nonmetallic conduit dry and clean before joining. Apply full even coat of cement to entire area inserted in fitting. Allow joint to cure for minimum 20 minutes.

Q. Install conduit hubs or sealing locknuts to fasten conduit to sheet metal boxes in damp and wet locations and to cast boxes.

R. Install no more than equivalent of three 90 degree bends between boxes. Install conduit bodies to make sharp changes in direction, as around beams. Use hydraulic one-shot bender to fabricator installed factory elbows for bends in metal conduit larger than 2 inch size.

S. Avoid moisture traps; install junction box with drain fitting at low points in conduit system.

T. Install fittings to accommodate expansion and deflection where raceway crosses seismic, control and expansion joints.

U. Install suitable pull string or cord in each empty raceway except sleeves and nipples.

V. Install suitable caps to protect installed conduit against entrance of dirt and moisture.

W. Surface Raceway: Install flat-head screws, clips, and straps to fasten raceway channel to surfaces; mount plumb and level. Install insulating bushings and inserts at connections to outlets and corner fittings.

X. Close ends and unused openings in wireway.

3.04 INSTALLATION - BOXES

A. Install wall mounted boxes at elevations to accommodate mounting specified in section for outlet device.

B. Adjust box location up to 10 feet prior to rough-in to accommodate intended purpose.

C. Orient boxes to accommodate wiring devices oriented as specified in Section 26 27 26.

D. Install pull boxes and junction boxes above accessible ceilings and in unfinished areas only.

E. In Accessible Ceiling Areas: Install outlet and junction boxes no more than 6 inches from ceiling access panel or from removable recessed luminaire.

©COPYRIGHT 2013 CH2MHILL

F. Locate flush mounting box in masonry wall to require cutting of masonry unit corner only. Coordinate masonry cutting to achieve neat opening.

G. Do not install flush mounting box back-to-back in walls; install with minimum 6 inches separation. Install with minimum 24 inches separation in acoustic rated walls.

H. Secure flush mounting box to interior wall and partition studs. Accurately position to allow for surface finish thickness.

I. Install stamped steel bridges to fasten flush mounting outlet box between studs.

J. Install flush mounting box without damaging wall insulation or reducing its effectiveness.

K. Install adjustable steel channel fasteners for hung ceiling outlet box.

L. Do not fasten boxes to ceiling support wires or other piping systems.

M. Support boxes independently of conduit.

N. Install gang box where more than one device is mounted together. Do not use sectional box.

O. Install gang box with plaster ring for single device outlets.

3.05 INTERFACE WITH OTHER PRODUCTS

A. Install conduit to preserve fire resistance rating of partitions and other elements, using materials and methods in accordance with Section 07 84 00.

B. Route conduit through roof openings for piping and ductwork or through suitable roof jack with pitch pocket. Coordinate location with roofing installation specified in Section [_____].

C. Locate outlet boxes to allow luminaires positioned as indicated on Drawings.

D. Align adjacent wall mounted outlet boxes for switches, thermostats, and similar devices.

3.06 ADJUSTING

A. Section 01 70 00, Execution and Closeout Requirements: Testing, adjusting, and balancing.

B. Adjust flush-mounting outlets to make front flush with finished wall material.

©COPYRIGHT 2013 CH2MHILL

A. Install knockout closures in unused openings in boxes.

3.07 CLEANING

A. Section 01 70 00, Execution and Closeout Requirements: Final cleaning.

B. Clean interior of boxes to remove dust, debris, and other material.

C. Clean exposed surfaces and restore finish.

1.02 SUBMITTALS

A. Action Submittals:

©COPYRIGHT 2013 CH2M HILL

1. [Descriptive information.]
2. [Dimensional drawings.]
3. [Transformer nameplate data.]
4. [Schematic and connection diagrams.]
5. Seismic anchorage and bracing drawings and cut sheets, as required by Section 01 88 15, Seismic Anchorage and Bracing.

B. Informational Submittals:

1. Seismic anchorage and bracing calculations as required by Section 01 88 15, Seismic Anchorage and Bracing.
2. Component and attachment testing seismic certificate of compliance as required by Section 01 45 33, Special Inspection [, Observation,] and Testing.
3. [Operation and Maintenance Data: As specified in Section 01 78 23, Operation and Maintenance Data.]
4. [Factory test reports [certified].]

1.03 QUALITY ASSURANCE

A. Design, test, and assemble in accordance with applicable standards of NEMA TR 1, IEEE C57.12.00, IEEE C57.12.22, IEEE C57.12.26, and IEEE C57.12.90.

1.04 EXTRA MATERIALS

A. Furnish, tag, and box for shipment and storage [and deliver prior to [_____] percent Project completion] the following [spare parts,] [special tools,] [and] [materials:]

1. One quart of paint to match color and quality of equipment final shop finish.
2. [One] [Two] spare fuses [links] for each replaceable fuse size.
3. [Pentahead socket for 1/2-inch socket drive.]

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. Cutler-Hammer.

B. Square D Co.

C. General Electric.

©COPYRIGHT 2013 CH2M HILL

D. Cooper Power System.

2.02 GENERAL

A. Integral Unit: Compartmental type unit consisting of transformer, oil-filled tank, and high and low voltage terminating compartments, assembled on a common structural base.

B. Anchor Bolts: [Galvanized,] [Type 316 stainless steel,] [sized by equipment manufacturer,] [1/2-inch minimum diameter,] and as specified in Section 05 50 00, Metal Fabrications.

2.03 TRANSFORMER

A. kVA Rating: [150,] [225,] [300,] [500,] [750,] [and] [_____] [As shown.]

B. Primary Voltage: [4.16] [13.8] [_____] kV line-to-line, [_____] volts, [three-phase,] [as shown,] [four-wire,] 60-Hz.

C. Secondary Voltage: [240/120] [208/120] [480/277] [_____] volts, [three-phase,] [as shown,] [four-wire,] 60 Hz.

D. BIL Rating:

1. [60 BIL for 5] [95 BIL for 15] kV insulation class transformers.
2. 30 BIL for secondary.

E. Temperature Rise: [65] [55/65] degrees C above 30 degrees average ambient with maximum ambient not to exceed 40 degrees C.

F. Impedance:

1. [1.35 percent minimum for transformers rated 150 kVA and less.]
2. [3.0 percent minimum for transformers rated 225, 300, and 500 kVA.]
3. [5.75 percent for transformers rated 750 kVA and above.]

G. Efficiency: Meet or exceed values in Table 4-1 of NEMA TP 1.

H. Dielectric Coolant: [Fully biodegradable, nontoxic, and nonbio-accumulating fluid, qualifying as “less flammable” per NEC 450.23; Factory Mutual Approved or UL Classified.] [Normally formulated, hydro-refined inhibited mineral oil, meeting minimum requirements in Table 1 of ASTM D3487 and IEEE C57.106.]

©COPYRIGHT 2013 CH2M HILL

[Silicone, qualifying as "less flammable" per NEC 450.23; Factory Mutual Approved or UL Classified.]

I. Primary Taps:

1. Full capacity, two 2-1/2 percent below and two 2-1/2 percent above, rated voltage.
2. Externally operated no-load tap changer.
3. Provisions for locking handle in any position.

J. Coil Conductors: [Copper] [Aluminum] windings.

K. Wye-wye transformers wound on [five-legged] [or] [triplex] cores.

L. Sound Level: In accordance with manufacturer's standards and NEMA..

2.04 ENCLOSURE

A. In accordance with IEEE C57.12.28 requirements.

B. Welded carbon steel transformer tank, with cooling panels when required, and lifting eyes.

C. 12-gauge sheet steel terminal compartment enclosure having no exposed screws, bolts, or other fasteners that are externally removable.

D. Color: Provide [gray] [_____] finish as approved by [Owner] [Engineer].

2.05 TERMINAL COMPARTMENTS

A. General: IEEE C57.12.28, enclosed high and low voltage compartments side by side, separated by steel barrier, bolted to transformer tank.

1. Doors:
   a. Individual, full-height, air-filled.
   b. Low voltage door with three-point latching mechanism, vault type handle, and single padlocking provision.
   c. High voltage door fastenings inaccessible until low voltage door has been opened.
   d. Door Bolts: [Hex] [Penta]-head type.
   e. Lift-off, stainless steel hinges and door stops.
   f. Removable front sill to facilitate rolling or skidding over conduit stubs.

©COPYRIGHT 2013 CH2M HILL

g. Recessed lock pocket, with steel door release bolt adjacent to secondary compartment door handle.

B. High Voltage Compartment:

1. [Livefront in accordance with IEEE C57.12.22] [Deadfront in accordance with IEEE C57.12.26] type construction.
2. Protective fuses.
3. High voltage bushings.
4. Transformer grounding pad.
5. [Surge arrestors] [with] [without] [barriers].
6. [Radial feed, two] [Loop feed, four] [alternate source/primary selective] [loop/radial] position sectionalizing load-break switch.

C. Low Voltage Compartment:

1. Livefront in accordance with IEEE C57.12.26 type construction.
2. Low voltage bushings [and main circuit breaker].
3. [Main circuit breaker to have interrupting capacity of no less than that for a bolted, three-phase fault at the secondary terminals with a calculated primary source zero-impedance using actual transformer impedance and X/R ratio.]
4. Grounding pad.
5. Stainless steel equipment nameplate.
6. Liquid level gauge.
7. 1-inch upper filter press and filling plug.
8. Drain valve with sampling device.
9. Dial type thermometer.
10. Pressure relief valve.
11. [Pressure relief device, self-resealing with indicator.]
12. [Pressure-vacuum gauge.]
13. [Mounting provision for current and potential transformers.]
14. [Busway opening.]
15. Nameplate.

2.06 BUSHINGS

A. High Voltage:

1. Livefront Termination:
   a. Porcelain bushings with [clamp type connections.] [two-hole blade terminals.]

©COPYRIGHT 2013 CH2M HILL

b. Bushings externally clamped and front removable.
c. Rated for [200] [600] amperes continuous, 95 kV BIL, [5] [15] kV.

2. Deadfront Termination:
a. [Universal bushing well rated at 15 kV] [Integrated bushing rated at 8.3 kV phase-to-ground/14.4 kV phase-to-phase] in accordance with IEEE 386.
b. Bushings externally clamped and front removable.
c. Rated for [200] [600] amperes continuous, 95 kV BIL.
d. Standoff brackets located adjacent to bushings.

B. Low Voltage:

1. Molded epoxy bushing clamped to tank with [4] [6] [8] [_____] hole spade type terminals.
2. Rated 150 percent of continuous full-load current, 30 BIL, 600 volts.
3. Internally connected neutral extending to neutral bushing.

2.07 HIGH VOLTAGE SWITCHING

A. Internal, oil-immersed, gang-operated load-break, manually operated switches.

B. Hot stick operated handle located in high voltage compartment.

C. Capable of operating at full-load current.

D. Feed Switch: [Two-position, ON/OFF radial.] [Three-position, selector.] [Four-position, indexing plate, loop.] [Four-position, loop/radial.]

2.08 HIGH VOLTAGE PROTECTION

A. [Internally Mounted, Oil-Immersed Cartridge Fuses:

1. Accessible through tank handhole.
2. Sized approximately three times primary current.
3. Interrupting capability of 2,500 amperes rms asymmetrical.]

B. [Bayonet-Type, Oil-Immersed Expulsion Fuses:

1. Accessible through primary compartment.
2. Externally replaceable with hot stick.
3. [Fault] [Overload] sensing with interrupting capacity of 1,800 amperes rms asymmetrical.]

©COPYRIGHT 2013 CH2M HILL

C. [Current-Limiting, Dry Well, Canister Mounted Fuses:

1. Accessible through primary compartment.
2. [Load-break rated 100 amperes minimum.] [Non-load-break.]
3. Interrupting capacity of 50,000 amperes rms symmetrical.
4. Externally replaceable with hot stick.]

D. [Bayonet Type, Oil-Immersed Current-Limiting Fuses:

1. Accessible through primary compartment.
2. Interrupting capacity of 50,000 amperes rms symmetrical.
3. Externally replaceable with hot stick.]

E. [Combination Oil-Immersed Bayonet Expulsion and Current Limiting Fuses:

1. Accessibility:
   a. Bayonet expulsion fuse accessible through primary compartment.
   b. Current-limiting fuse accessible through tank handhole.
2. Expulsion Fuse for Low Current Faults: Interrupting capacity of 1,800 amperes rms asymmetrical.
3. Current Limiting for High Current Faults: Interrupting capacity of 50,000 amperes rms symmetrical.
4. Bayonet fuse externally replaceable with hot stick.]

2.09 LOW VOLTAGE PROTECTION

A. Molded-case circuit breaker, three-pole, 600 volt, of current rating as shown on Drawings and as specified in Section 26 05 04, Basic Electrical Material and Methods.

B. Interrupting Rating: [As shown.] [[25] [30] [35] [50] [65] [_____] amperes rms symmetrical.]

C. Circuit breaker mounted on exterior surface of transformer tank wall, below low voltage bushings.

2.10 SURGE ARRESTORS

A. [Distribution Class Type: [3] [6] [9] [_____] kV, livefront, with mounting bracket in accordance with IEEE C62.11.]

B. [Elbow Valve Type: Uninsulated body, [3] [6] [9] [_____] kV [with] [without] barriers in accordance with IEEE C62.11.]

©COPYRIGHT 2013 CH2M HILL

C. [Metal-Oxide, Varistor Type:

1. Insulated body, elbow type, [313.2] [6] [9] [_____] kV in accordance with IEEE C62.11.
2. Installed in high voltage compartment.
3. Connected to transformer high voltage terminals.]

1.1 TANK GROUNDING PADS

A. High and Low Voltage Compartments:
1. Connected together with bare No. 2/0 stranded copper conductors.
4. Wye-wye high and low voltage neutrals internally connected with link and brought out to insulated low voltage bushing externally grounded to tank.
5. Low voltage neutral connected to externally mounted insulating bushing in low voltage compartment and grounded to tank with removable strap.

2.11 TAP CHANGER WARNING SIGN

A. Red laminated plastic, engraved to white core.

B. Engrave to read: DO NOT OPERATE WHEN TRANSFORMER ENERGIZED.

C. Mount above tap changer handle.

2.12 FACTORY TESTS

A. Production tests in accordance with IEEE C57.12.90 and IEEE C57.12.00, Section 8 and Table 16.

B. [Dielectric test in accordance with IEEE C57.12.26.]

PART 3 - EXECUTION

3.01 GENERAL

A. Secure to mounting pads with anchor bolts.

B. Install plumb and longitudinally in alignment with pad or adjacent building wall.

C. Ground neutrals and enclosures in accordance with applicable codes.

©COPYRIGHT 2013 CH2M HILL

3.02 ADJUSTMENTS

A. Adjust voltage taps to obtain rated output voltage under normal operating load conditions.

2. [Certified] Factory Test Reports.
3. Manufacturer's installation instructions.
4. Component and attachment testing seismic certificate of compliance as required by Section 01 45 33, Special Inspection [, Observation,] and Testing.
5. Operation and Maintenance Data: As specified in Section 01 78 23, Operation and Maintenance Data.
6. [Manufacturer's Certificate of Proper Installation in accordance with Section 01 43 33, Manufacturers' Field Services.]

1.03 DELIVERY, STORAGE, AND HANDLING

A. Shipping Splits: [As shown] [Established by Contractor] to facilitate ingress of equipment to final installation location within the building.

1.04 EXTRA MATERIALS

A. Furnish, tag, and box for shipment and storage the following spare parts, special tools, and materials:

1. [Fuse handling tool and universal pole, compatible with installed fuses.]
2. [[One] [Two] [_____] sets of three grounding jumpers, [6] [8] [10] feet in length, complete with canvas storage bag for each set.]
3. [Voltage tester with audio and visual signals, batteries, shotgun clamp-stick adapter, and storage case.]
4. [[6] [8] feet, 5-1/2 inches long shotgun clamp stick with canvas storage bag.]
5. [Portable remote control station with 50-foot cord.]
6. [Solid material fuse [end fittings] [holders] and [fuse] [refill] units for each installed fuse size.]
7. [Electron fuse [interrupting module] [and] [control module] and [fuse] [refill] units for each installed fuse size.]
8. [Voltage transformer fuse unit for each installed fuse size.]
9. [Portable test accessory for preliminary checkout of source transfer system.]

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. S&C Co.

©COPYRIGHT 2013 CH2M HILL

B. [_____]

C. [No "or-equal" or substitute products will be considered.]

D. Provide metal-enclosed switchgear that is the product of a single manufacturer. Assembled units with component parts of several manufacturers will not be acceptable with the exception that minor items as terminal blacks, test switch, wiring, etc., may be manufactured by others.

2.02 GENERAL

A. Equipment suitable for [4,160] [12,500] [13,200] [13,800] [_____] volts, three-phase [three-wire] [four-wire] [solid] [low resistance] [high resistance] [grounded-wye] [ungrounded] electrical system having an available short-circuit current at line terminals of [_____] amperes rms symmetrical [as shown.]

B. Front accessible, metal-enclosed switchgear complete with one or more [indoor] [outdoor] self-supporting bays having interrupter switches, [solid material] [and] [electronic] power fuses, and necessary accessory components.

C. Designed, tested, and assembled in accordance with IEEE 37.20.3, IEEE C37.57, and IEEE C57.12.28 [, and UL Listed per Certificate of Compliance File No. E138023.]

D. Operating Conditions:

1. Altitude not greater than [3,300] [5,000] [6,000] feet above sea level.
2. Ambient Temperature: Maximum [40] [50] [_____] degrees C.
3. [Seismic Conditions: [IBC, Section 1616 Seismic Design Category [_____]] [UBC, Section 2313, Zone [_____,] importance factor of [_____]
4. Equipment shall be fully rated without derating for these operating conditions.

E. Anchor Bolts: [Galvanized,] [Type 316 stainless steel,] 5/8-inch diameter, length sized by manufacturer, and as specified in Section 05 50 00, Metal Fabrications.

2.03 EQUIPMENT RATINGS

A. Integrated Switchgear Assembly Ratings At 60-Hz:

1. Voltage: [4.16 kV nominal, 4.8 kV maximum.] [13.8 kV nominal, 17 kV maximum.]

©COPYRIGHT 2013 CH2MHILL

2. Insulation Level: [60] [95] kV BIL.
3. Main Bus Current: [600] [1,200] [and] [2,000] continuous amperes [, as shown on one-line diagram.]
4. Three-Pole Interrupter Switches:
   a. Current: [600] [and] [1,200] amperes continuous and live switching rating [as shown on one-line diagram.]
   b. Two-Time Duty-Cycle Fault Closing: [[125] [180] [270] amperes rms asymmetrical at rated 4.16] [[20,000] [22,400] [40,000] amperes rms asymmetrical rated at 13.8 kV nominal voltage.]
5. Short-Circuit Rating: [[17,200] [25,000] [37,500] amperes rms symmetrical, [125] [180] [270] mVA three-phase symmetrical at rated 4.16] [[12,500] [14,000] [25,000] amperes symmetrical, [300] [335] [AI: 600] mVA three-phase symmetrical at rated 13.8 kV nominal voltage.]

B. Fault-closing ratings to equal, or exceed, the short-circuit ratings of the metal-enclosed switchgear with:

1. Momentary and two-time duty-cycle rating of switches.
2. Momentary rating of bus.
3. Interrupting ratings of fuses.

2.04 ENCLOSURE

A. [Modular] [Custom] unitized monocoque modules constructed of 11-gauge sheet steel.

B. Each module a complete unit in itself with continuous 7-gauge steel base on all four sides of each module.

C. Sides, rear, and roof panels, doors, and future bus extension cover plates bolted together internally with no exposed bolt connections.

D. [IEEE C37.57, Category [A] [B] [UL Listed for enclosure in accordance with IEEE C37.57, Category A, IEEE C57.12.28 and additional padlockable covers for windows, manual operating handles, and accessories.]

E. Access Doors:

1. [Overlapping double-doors] [Bulkhead type] construction with 90-degree flange overlapping door openings.
2. Sheared edges folded back [parallel to the inside of door, except at bottom of door and on the right edge of medium voltage compartment door.] [toward inside of door.]

©COPYRIGHT 2013 CH2M HILL

3. Concealed galvanized steel hinges with Type 316 stainless steel hinge pins:
   a. Three hinges for doors over 40 inches in height.
   b. Two hinges for doors under 40 inches in height.
4. Padlockable door handles [with cover shields] for each [right-hand low voltage compartment] [bulkhead] access door.
5. [Mechanically] [Key] interlock access doors to fused interrupter switches to prevent:
   a. Opening door if switch is closed.
   b. Opening door if switch is open.
6. Padlockable, flush mounted, key-operated snaplock on access doors to nonfused interrupter switches [, hinged-bolted panels to high voltage compartments, and hinged-bolted covers to low-voltage compartments.]
7. [Mechanical] [Key] interlock access doors to stored energy switch operators to prevent operation while door is opened.
8. Flush mounted, key-operated snaplock on doors to nonfused interrupter switches.
9. Right-hand door for low voltage compartment to control access to medium voltage compartment.

F. Door Latch:

1. Automatic positive action, three-point, spring-loaded latching mechanism for [right-hand, low voltage compartment] [each medium voltage] access door.
2. Pentahead socket wrench to actuate mechanism for unlatching door and recharging spring for next closing operation in same motion.
3. Tamper-proof padlocking shackle coordinated with latches to prevent:
   a. Unlatching mechanism until padlock is removed.
   b. Inserting padlock until mechanism is completely latched closed.

G. Self-latching door holders for medium voltage compartment doors [and manual holders for low voltage compartment doors].

H. Access doors to power fuses [and fused transformers] equipped with storage space for replacement fuse components and operating instructions.

I. Raintight ventilating louvers with baffles and screens in lower and upper portion of each rear panel, lower [and upper] portion of each access door [, and upper portion of each front panel] [, complete with externally accessible glass-fiber filters].

©COPYRIGHT 2013 CH2MHILL

J. Impact resistance, molded gasketed viewing windows in doors providing access to interrupter switches.

K. 3mpartments:

1. Grounded, isolated metal enclosures for switch operators, [source transfer controls,] [meters,] [instruments,] [relays,] and low voltage components.
2. Low voltage wiring in grounded conduit and/or wireways.

L. Front accessible cable termination space.

M. Removable lifting eyes [with blind-tapped sockets] for each individual module.

N. Weatherproofing:

1. Resilient compression gaskets around all door openings [, hinged-bolted panels] [, hinged-bolted covers] [and] [future bus extension cover plates.]
2. Gasket seals at top and side edges of adjoining bays.
3. [Sides and top channel gaskets at bus openings between bays.] [External labyrinthine metal rainshields over enclosure roof flanges between adjacent bays.]
4. Applied sealant between vertical sides and roofs.
5. Insulation nondrip compound applied to underside of roof.

O. Space Heaters:

1. One strip heater with high temperature chrome steel sheath and thermostat in each high [and low] voltage compartment.
2. Wired to [external 120-volt power supply via enclosed toggle handle switch with thermal overload] [internal power supply from control transformer with secondary [fuse block and fuses] [circuit breaker]] in each cubicle.

P. Finish:

1. Multistage process applied to interior and exterior surfaces, joints, and blind areas prior to enclosure assembly.
   a. Pretreatment protective film.
   b. Baked epoxy finished coating.
   c. [Baked acrylic enamel top coating in accordance with IEEE C57.12.28.]
2. Color: [Gray finish as approved by [Owner.] [Engineer.] [Munsell 7GY3.29/1.5, olive green.] [Manufacturer’s standard.] [_____]
3. Tests:

©COPYRIGHT 2013 CH2M HILL

a. Salt-spray test in accordance with ASTM B117.
b. Humidity test in accordance with ASTM D2247 and ASTM D714.
c. Accelerated weather tests in accordance with ASTM G154, ASTM D659, and ASTM D523.
d. Adhesion tests in accordance with ASTM D3359, Method B and ASTM D2794.
e. Corrosion tests in accordance with ASTM D1654.
f. Abrasion tests in accordance with ASTM D4060.
g. Oil resistance testing with no shift in color, streaking, blistering, or loss of hardness.

2.05 HIGH VOLTAGE BUS

A. [Copper] [Aluminum] bus bar extending entire length of switchgear, bus supports [, future bus extensions,] and interconnections to have short-circuit rating equal to that of integrated assembly.

B. [Square edged, hard-drawn copper bar in accordance with ASTM B187.] [Aluminum bar with minimum 56 percent conductivity of annealed copper in accordance with ASTM B236.]

C. [Silver-plated copper-to-copper bar connection made with 1/2-inch by 13-inch stainless steel bolts with one flat-brass washer under bolthead and one flat washer and stainless steel split washer between flat washer and nut.] [Aluminum-to-aluminum bar connections made with 1/2-inch by 13-inch galvanized steel bolts with Belleview spring washers under bolthead and nut.]

D. Bus rated [600] [1,200]-ampere with provisions for [one] [two]-cable terminations per phase.

2.06 GROUND BUS

A. [Copper] [Aluminum] bus bar, bolted to nickel-plated steel brackets, extending throughout switchgear and having short-circuit rating equal to that of the integrated assembly.

B. [Square-edged, hard-drawn copper bar in accordance with ASTM B187.] [Aluminum bar with minimum 56 percent conductivity of annealed copper in accordance with ASTM B236.]

C. Minimum one welded in-place nickel-plated steel bracket per module with one Belleville spring washer per bolted bus bar connection.

©COPYRIGHT 2013 CH2MHILL

D. [Silver-plated copper-to-copper bar connections made with 1/2-inch by 13-inch stainless steel bolts with one flat brass washer under bolthead and one flat washer and stainless steel split washer between flat washer and nut.] [Aluminum-to-aluminum bar connection made with 1/2-inch by 13-inch galvanized steel bolts with Belleview spring washers under bolthead and nut.]

E. Two No. 2 through 500 kc mil [copper] [aluminum] ground cable connectors for connecting ground bus to station ground.

2.07 GROUND CONNECTION

A. [Copper] [Aluminum] ground connected, bolted to nickel-plated bracket having short-circuit rating equal to that of the integrated module.

B. Welded in-place nickel-plated, steel bracket with one Belleville spring washer.

C. Two No. 2 through 500 kc mil [copper] [aluminum] ground cable connections for connecting to station ground.

2.08 INSULATORS

A. Interrupter switch and fuse mounting insulators, insulated operating shafts, and push rods constructed of cycloaliphatic epoxy resin in accordance with NEMA C29.9 and NEMA C29.10.

2.09 ISOLATING THROUGH-BUSHINGS

A. BIL rated, nontracking, self-scouring, nonweathering, cycloaliphatic epoxy resin bushings between [bay No. _____ and bay No. _____] [all bays].

B. Maximum 9-1/2 inches overall length with 12-1/2 inches leakage distance between energized bus conductors and ground plane.

C. Close openings between bushings and bus conductors with semi-conducting grommet.

D. Rigid direct connections between bushing bus conductors and main bus conductors.

E. Formed homogeneous flange at ground plane interface.

F. Bushings secured to ground plane by clamps overlapping bushing flanges.

G. Drain channel installed above isolating through-bushings.

©COPYRIGHT 2013 CH2M HILL

2.10 INTERRUPTER SWITCHES

A. [External handle] [Power]-operated, nonfused, group-operated with quick-make quick-break mechanism for live, full load, open and close switching in accordance with IEEE C37.58.

B. Quick-make quick-break mechanism independent of switch [handle] [operator] speed.

C. Quick-make quick-break mechanism [integrally mounted to switch frame] [and] [integral part of switch] [as shown].

D. Externally, manually operated, nonremovable handle with provisions for padlocking in open and closed positions.

E. Single insulated shaft with blades and journals permanently molded in place for positive and inherently sequenced blade position.

F. One-piece, formed hard-drawn copper blades with silver-clad contact surfaces per phase for circuit closing, fault closing, continuous current carrying and circuit interruption.

G. Multifinger, convexed, silver-clad copper jaw contacts with stainless steel springs for constant contact pressure.

H. Equip each blade assembly with arc compressor, strain-guard terminals, and support insulators.

I. Circuit interruption with external arc or flame contained within interrupter, complete with vented exhaust through [labyrinthine muffler for 1,200-ampere switches] [and] [deionizing vents for 600-ampere switches].

J. Visible open gap when in open position.

K. Switch assembly and operator mounted on a rigid, welded steel frame.

L. [Switches rated 1,200-ampere] [, 600-ampere switches with 600-ampere fuses,] [and] [interance-bay] terminals to accommodate two cables per phase.

2.11 SWITCH OPERATORS

A. Switch operators installed behind hinged padlockable cover doors equipped with windows and gasketing between cover door and mounting surface.

©COPYRIGHT 2013 CH2MHILL

B. [Stored energy type with integral quick-make quick-break mechanism for opening and closing associated interrupter switch in response to a control signal and independent of charging motor speed or manual operating handle.]

C. Tripping solenoid opening and closing time not to exceed four cycles.

D. Quick-make quick-break mechanism charged by torque limiter equipped motor within 1-1/2 seconds after switch operation.

E. Local electrical trip-open and trip-closed pushbuttons [interlocked to prevent local control when source transfer is in automatic control].

F. Manual charging access port, interlocked to prevent operation of charging motor when access port is open and removable manual-charging handle.

G. Local mechanical trip-open and trip-close operation upon loss of control power.

H. Mounted on drawout carriage within grounded, metal-enclosed, low voltage compartment in switchgear stile with:

1. Decoupler on drawout carriage for testing and exercising switch operator.
2. Decoupled switch operator to allow for padlocking interrupter switch in open or closed position.
3. Mechanically interlocked to prevent recoupling switch operator unless in same open or closed position as interrupter switch.
4. Operational counter.

I. Visible targets to indicate:

1. Charged or discharged quick-make quick-break mechanism.
2. Operator switch-open or -closed position.
3. Interrupter switch-open or -closed position.
4. Coupled or decoupled operator position.

J. Stored energy type with integral quick-make quick-break mechanism for opening associated interrupter switch in response to a control signal and independent of manual charging handle.

K. Tripping solenoid opening time not to exceed four cycles.

L. Removable manual-operating handle for closing associated interrupter switch to recharge quick-make quick-break mechanism.

©COPYRIGHT 2013 CH2M HILL

M. Nondrawout operator mounted in switchgear stile.

N. Equipped with manual trip level for mechanical manual trip-open operation.

O. Visible targets to indicate open or closed position of associated interrupter switch.

P. A chain coupled to associated interrupter switch operating shaft for opening and closing interrupter switch by charging quick-make quick-break mechanism integrally mounted on interrupter switch frame.

Q. Motor drive equipped with torque limiter to open and close interrupter switch within 1-1/2 seconds.

R. Local electrical trip-open and trip-close pushbuttons [interlocked to prevent local control when source transfer is in automatic mode].

S. Manual-operating shaft with removable handle for switch operation upon loss of control power.

T. Mounted within grounded, metal-enclosed, low voltage compartment in switchgear stile with:

1. Decoupler for testing and exercising switch operator.
2. Mechanically interlocked to prevent recoupling switch operator unless in same open or closed position as interrupter switch.
3. Operational counter.

U. Visible targets to indicate:

1. Interrupter switch open or closed position.
2. Coupled or decoupled operation position.

V. Equipped with extra four-pole double-throw auxiliary switch coupled to switch operator.

W. Equipped with extra six-pole double-throw auxiliary switch coupled to interrupter switch.

X. Receptacle for attachment of remote control station for electrical trip-open and trip-close operation from adjacent area.

Y. Auxiliary tripping relay for remote supervisory operation.

©COPYRIGHT 2013 CH2MHILL

2.12 FUSES

A. Solid Material Power Fuse:

1. In accordance with NEMA SG 2.
2. End fitting, upper end pull ring fitting, blown-fuse target, expendable fuse unit, aluminum-bronze lower end fitting, and silencer.
3. Manufacturer and Product: [S&C Co.; Type SM-20.] [_____]

B. Electronic Power Fuse:

1. With fuse holder, expendable interrupting module, reusable control module, and blown-fuse target.
2. Interrupting module with main current section and fault-interrupting section arranged coaxially within single housing.
3. Control module with factory-sealed, cylindrical cast aluminum housing containing self-power electronic components and integrally mounted current transformers with no external control wiring or connections to ground.
4. Manufacturer and Product: [S&C Co.; Fault Filter.] [_____]

2.13 AUTOMATIC SOURCE TRANSFER

A. Source transfer control for [common-bus] [split-bus] primary selective system with transfer on loss and return of source voltage via capacitively coupled voltage sensor or two phases and a voltage transformer for sensing and control power on the third phase.

B. Normal condition with [one interrupter switch normally closed and one interrupter switch normally closed] [two interrupter switches normally closed and bus-tie switch normally open].

C. Control to monitor conditions of both sources and initiate automatic switching upon loss, or reduction of, [preferred] [either] voltage system.

D. Automatic switching to open the [preferred source interrupter switch and close the alternate source] [affected source interrupter switch and close the bus-tie] interrupter switch to restore power to the switchgear bus.

E. Return of normal voltage to affected source shall initiate retransfer to original configuration if in automatic mode, or await manual retransfer if in hold return mode.

©COPYRIGHT 2013 CH2M HILL

F. Control to automatic initiate retransfer to [preferred] [restored] source if [alternate source] [source in use] fails when in return mode.

G. Control to provide [open] [closed] transition on retransfer, as field programmed, when in automatic mode.

H. Control to continuously monitor negative-sequence voltage and initiate automatic switching when system unbalance exceeds predetermined value.

I. Solid state, microprocessor control modules located in grounded, metal-enclosed low voltage compartment in switchgear stile, behind hinged padlockable cover doors equipped with windows and gasketing between cover door and mounting surface.

J. Control Modules Complete with:

1. Liquid Crystal Display with Backlighting for:
    a. Operating characteristics.
    b. Operating parameters.
    c. Operational information menu.
    d. Selected diode lamp status messages.
    e. System events.
    f. Present status of discrete control input and outputs.
    g. Present voltage and current inputs.
2. Code Accessible Keypad for:
    a. Programming source transfer control operating characteristics and its voltage, current, and time-related operating parameters.
    b. Automatic calibration of known voltage on each source.
    c. Examining, by dedicated examine key, inputs and outputs.
    d. Analyzing, by dedicated event key, system events.
3. Light-Emitting Diode Lamps Indicating:
    a. Presents of acceptable high voltage on each source.
    b. Switch operator coupling and position status.
    c. Control automatic mode status.
    d. Access door closed and latched status.
    e. Control circuitry status.
    f. Built-in diagnostics status.
    g. Lockout condition.
4. Selector Switch for Manual or Automatic Operating Mode:
    a. Pushbuttons for electric trip-open and -closed operations when in manual mode.
    b. Automatic switching inhibited when in manual mode.

©COPYRIGHT 2013 CH2MHILL

5. Built-In Diagnostics for Analyzing System Events to Record for Each:
   a. System status.
   b. Source transfer control status.
   c. Display by dedicated event key.
6. Test Keys to:
   a. Simulate loss of voltage on each source.
   b. Check functioning of lamps, display, and keypad.
7. Simulate overcurrent condition on each source.
8. Overcurrent lockout to prevent automatic transfer into a fault, complete with reset key [and manual reset from remote location].
9. Remote Indication Provisions for Remote Monitoring:
   a. Presence or absence of preferred and alternate source voltage.
   b. Operating mode of source transfer mode.
   c. Status of selected diode lamps.
   d. Overcurrent lockout.
10. Supervisory control provisions for remote switch operations.
11. Test Panel for Checkout of:
   a. Source transfer scheme.
   b. Overcurrent lockout.
   c. Unbalance detection using external, adjustable, and three-phase source.
12. Gold over nickel-plated interconnecting cable connector pins and receptacle contacts and interconnecting cables.

K. Source transfer control system surge withstand capacity in accordance with IEEE C37.91.

2.14 OPEN-PHASE DETECTORS

A. Solid state device to monitor the phase sum of three-phase feeder's line-to-ground voltages via capacitively coupled voltage sensors on three-phases.

B. Located in grounded, metal-enclosed low voltage compartment in switchgear stile.

C. Field adjustable timer with range of 5 seconds to 30 seconds delay after detection of open-phase condition or voltage unbalance.

D. Equipped with trip indicator and reset pushbutton.

E. Open-phase detector surge withstand capacity in accordance with IEEE C37.90.1.

©COPYRIGHT 2013 CH2M HILL

2.15 SINGLE-PHASING PROTECTION

A. Solid state device to monitor current in each phase of feeder circuit using closed gap current sensors.

B. Located in grounded, metal-enclosed low voltage compartment in switchgear stile.

C. Field adjustable trip-level detector with range of 400 amperes to 2,400 amperes.

D. Field adjustable delay timer with range of 1 second to 35 seconds between detection of overcurrent and tripping operation.

E. 2-millisecond time delay before initiating field adjustable timer.

F. Field selective inrush restraint to inhibit 2-millisecond time delay relay for 1 second.

G. Reset if normal load current of 3.5-ampere or greater returns on all three phases before delay timer times out.

H. Blocking circuit to prevent tripping while overcurrent exceeds 600 amperes.

I. Red trip indicator target for operation of relay.

J. Indicating Lights with Push-To-Test Feature:

1. Elapsed time indicator for delay timer.
2. Pickup indicator when overcurrent exceeds trip-level setting.
3. Lamps to extinguish after operation for relays.

K. Test Jacks to:

1. Simulate proper functioning of three-phase overcurrent relays.
2. Verify pickup and trip levels.
3. Verify proper functioning of current sensors.

L. Overcurrent relays surge withstand capacity in accordance with IEEE C37.90.

2.16 CURRENT TRANSFORMER (CT)

A. Types:

1. Insulated dry indoor.
2. Window type for relaying and ground sensing.

©COPYRIGHT 2013 CH2MHILL

3. Wound type for metering.

B. Transformer Accuracy in Accordance with IEEE C57.13:

1. Class C20 or greater for relaying.
2. Class 1.2 maximum for imposed burden for metering.

C. [Rating: [5] [8] [15] kV], [[100] [200] [400] [600] [800] [1,200] /5 amperes.]

D. Mechanical Rating: Equal to short-time current carrying capability of circuit breakers.

E. Thermal Rating: Maximum 55 degrees rise above 30 degrees C ambient.

F. Size to operate continuously at rated primary current without insulation damage.

G. Identify polarity with standard mark or symbol.

H. Secondary Wiring: Install in [conduit] [PVC tubing] [or] [wiring trough].

I. Isolate from adjacent components and circuits by removable insulating or metal barriers.

J. Window type CTs accessible for replacement without removing high voltage insulated connections.

2.17 VOLTAGE SENSING DEVICES

A. Constant-current output, solid state devices equipped with secondary protective device and requiring no primary fuses.

B. To directly replace apparatus insulators at the [hinge end of fuses] [and] [lower terminal of interrupting switches].

C. Output voltage directly proportional to line-to-ground voltage with relay accuracy over an ambient temperature range of minus 40 degrees F to plus 60 degrees F.

D. Output connected to nonadjustable secondary burden.

E. Test jacks and adjustment screws for measurement and adjustment of voltage signal inputs.

©COPYRIGHT 2013 CH2M HILL

2.18 POTENTIAL TRANSFORMER (PT)

A. Type: Insulated dry, indoor.

B. Rating: [2,400] [4,200] [4,800] [7,200] [8,400] [12,000] [13,200] [14,400]/120-volt, single-phase with [60] [75] [110] kV BIL rating.

C. [One] [Two] [Three] transformers connected [phase-to-ground] [phase-to-phase].

D. Thermal Capacity: Minimum 55 degrees rise above 30 degrees C ambient.

E. Mechanical Rating: Equal to short-time current carrying capability of circuit breaker.

F. Accuracy classification in accordance with IEEE C57.13 for connected burden.

G. Primary Protection: Two integral mounted current-limiting fuses.

H. Secondary Protection: Single, separately mounted current-limiting fuse.

I. Identify polarity with standard marking or symbols.

J. [Mount on rollout carriage installed in metering module, complete with secondary wiring.]

K. [Primary and secondary terminals to be disconnected and the primary fuses grounded when rollout carriage is in open position.]

2.19 CONTROL TRANSFORMER

A. Type: Insulated dry indoor.

B. Rating:

1. [2,400] [4,160] [4,800] [7,200] [8,400] [12,000] [13,300] [_____]/240/120-volt, single-phase, three-wire with [60] [95] Kv BIL rating with two 2-1/2 percent taps above, and two 2-1/2 percent taps below, normal voltage.
2. kVA rating for control power, [_____] [and] [space heater] requirements plus 200VA for remote devices and future use.

C. [Stationary] [Drawout carriage] mounted in separate steel compartment.

D. Primary Protection: Two current-limiting fuses mounted on drawout carriage.

©COPYRIGHT 2013 CH2MHILL

E. Secondary Protection: [Fuses.] [Molded case circuit breakers.]

2.20 TERMINAL BLOCKS

A. Rating: 600 volts, 30-ampere minimum.

B. Type:

1. One-piece barrier, with strap screws.
2. Shorting type for current transformer leads.
3. Pull-apart control wiring terminal boards on all drawout units.

C. Provide for:

1. Conductors connecting to circuits external to switchgear.
2. Internal circuits crossing shipping splits.
3. Equipment parts requiring replacement and maintenance.

D. Spares: Minimum 20 percent spare unused terminals.

E. Grouped together terminal blocks for external circuit wiring leads.

F. 6-inch minimum space between columns of terminal blocks.

G. Permanently identify each terminal and columns of terminal blocks.

H. Manufacturer and Product: General Electric; Type EB-5.

2.21 CONTROL WIRING

A. NFPA 70, Type SIS, single-conductor, Class B, stranded copper, rated 600 volts for control, instrumentation, and power circuits.

B. Individual 7-strand, copper conductors, twisted and covered with a 100 percent aluminum, polyester shield with tinned copper drain wire and overall outer jacket, rated 600 volts, 90 degrees C minimum for transducer output and analog circuits.

C. Conductor Lugs: Pre-insulated, self-locking, spade type with reinforced sleeves.

D. Wire Markers: Each wire individually identified with permanent markers at each end.

E. Internal circuit wiring crossing shipping splits to have plug connectors.

©COPYRIGHT 2013 CH2M HILL

F. Splices: Not permitted.

2.22 INDICATING METERS

A. Semiflush mounted, square switchboard type.

B. One percent accuracy class in accordance with ANSI C39.1.

C. Anti-parallax scale with convex clear shadow-proof glass covers.

D. White dials with black points and markings.

E. Indicating Scale: Nominal 250-degree circular.

F. Zero Adjustment: External zero capability.

G. Control Switches:

1. Type: Rotary, cam-operated, with two contacts per stage.
2. Silver contacts and maintained positive contact position.
3. Wiping action closing contacts.
4. Adjacent contacts separated by barriers.
5. Contact assembly enclosed in removable cover.
6. Rating: Minimum 20 amperes with 600-volt insulation.
7. Marked escutcheon plates.
8. Operating Handles:
   a. Voltmeter Switches: Four-position, phase-to-phase voltage and OFF.
   b. Ammeter Switches: Four-position three-phase currents and OFF.
   c. Transfer and Auxiliary Switches: Oval type with arrow.

H. ac Voltmeters:

1. Register Size: 6.9-inch scale length, 250-degree arc.
2. Full scale [150] [250]-volt rated movement calibrated for [3,000] [5,250] [15,000] [_____] volts, 60-Hz.
3. Taut suspension type.

I. ac Ammeters:

1. Register Size: 6.9-inch scale length, 250-degree arc.
2. Full scale [5] [6.5]-ampere rated movement.
3. Taut suspension type.

©COPYRIGHT 2013 CH2MHILL

J. Watthour Meters:

1. Clock register for kilowatt hours.
2. Current rated at 2.5 amperes for three-phase, [three] [four]-wire, [grounded] [ungrounded] neutral.
3. Elements: [Two.] [Two and one-half.] [Three.]

K. Watthour/Demand:

1. Clock register for kilowatt hours and demand.
2. [Secondary] [Primary]-read ratio with [15] [30]-minute intervals.
3. Current rated at 2.5 amperes for three-phase, [three] [four]-wire, [grounded] [ungrounded] neutral.
4. Elements: [Two.] [Two and one-half.] [Three.]

L. Power Factor Meters:

1. Clock register left for lagging power factor and right for leading power factor.
2. Taut suspension type with built-in transducer for dc signal.
3. Current rated at 5 amperes for three-phase, [three] [four]-wire, [grounded] [ungrounded] neutral.

2.23 SURGE PROTECTION

A. Set of three metal oxide type, in accordance with IEEE C62.11 and NEMA LA 1.

B. Connect to line side of main [switch] [with fuses] and ground to switchgear ground bus.

C. Class: [Station.] [Intermediate.] [Distribution.]

D. Rating: [3 kV for 4.16 kv] [6 kV for 6.9 kV] [9 kV for 12 kV] [12 kV for 13.8 kV] [impedance grounded] [ungrounded] system.

2.24 LABELING

A. Nonmetallic, self-sticking with integral lettering and symbols.

B. Warning Labels:

1. Attach to exterior surface of each external door and hinged-bolted panel labels reading “CAUTION-HIGH VOLTAGE-KEEP OUT”.

©COPYRIGHT 2013 CH2M HILL

2. Attach to internal surface of each protective screen, labels reading "DANGER-HIGH VOLTAGE-KEEP OUT-QUALIFIED PERSONS ONLY."
3. Provide inside each interrupter switch access door, labels reading "SWITCH BLADES MAY BE ENERGIZED IN ANY POSITION."
4. Provide inside each fuse access door, labels reading "FUSES MAY BE ENERGIZED IN ANY POSITION."

2.25 NAMEPLATES

A. Deep etched aluminum riveted to door surface.

B. Integrated Switchgear Assembly Nameplate on External Surface of [Center] Bay Door Indicating:

1. Voltage ratings; kV nominal, maximum, and BIL.
2. Main bus continuous ampere rating.
3. Short-circuit ratings in amperes rms symmetrical and mVA three-phase symmetrical at nominal voltage.
4. Momentary and fault-closing rms symmetrical amperes.
5. Enclosure category.
6. Manufacturer's drawing number.

C. Individual Bay Nameplate on Interior Door Surface Indicating:

1. Switch continuous and interrupting ampere ratings.
2. Maximum fuse rating.
3. Catalog numbers of [fuse units and refill units] [interrupting module] [or control module].
4. Enclosure category.

2.26 FAULT INDICATORS

A. Factory installed with sensing transformer located at cable entrances to each [incoming service] [and] [branch circuit] [interrupter switches] [and] [fuse interrupters].

B. As specified in Section 26 05 05, Conductors.

2.27 ACCESSORIES

A. One fuse handling tool compatible with installed fuses.

©COPYRIGHT 2013 CH2MHILL

B. [One] [Two] [_____] sets of three grounding jumpers, 3 feet in length, complete with storage bag for each set.

C. One voltage tester with audio and visual signals, batteries, shotgun clamp-stick adapter, and storage case.

D. [Six] [Eight] feet, 5-1/2 inches long, shotgun clamp-stick with canvas storage bag.

E. [Solid material fuse [, end fittings] [, holders] and [fuse] [refill] units for each installed fuse size.]

F. Electronic fuse [, interrupting module,] [and] [control module,] and [fuse] [refill] units for each installed fuse size.

2.28 KEY INTERLOCKS

A. Mechanical-lock cylinder located at each [main] [and] [tie] interrupter switch module.

B. [Superior] [Corbin] [Kirk] type keys and lock cylinders.

C. Keys to be captive when interrupter switches are closed.

D. Two main and [[one] [two] tie] interrupter switch arrangement.

E. [Two] [Three] keys available for each group of [three] [four] locks.

2.29 SOURCE QUALITY CONTROL

A. Switchgear assembly production tested in accordance with IEEE C37.20.3.

B. Fuses production tested in accordance with IEEE C37.46.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Install equipment in accordance with manufacturer’s instructions and recommendations.

B. Secure equipment to [floor] [concrete pad] with anchor bolts of sufficient number for specified seismic conditions.

C. Install equipment plumb and in longitudinal alignment with wall.

©COPYRIGHT 2013 CH2M HILL

A. Tighten current-carrying bolted bus connections and enclosure framing and panel bolts to manufacturer's recommendations.

D. Coordinate terminal connections with installation of secondary feeders.

3.02 MANUFACTURER'S SERVICES

A. Furnish manufacturer's representative [in accordance with Section 01 43 33, Manufacturers' Field Services,] for the following services at Site, for minimum person-days listed below, travel time excluded:

1. [_____] person-days for installation assistance, final adjustment, and initial energization of equipment.
2. [_____] person-days for [functional] [and] [performance] testing and completion of Manufacturer's Certificate of Proper Installation.
3. [_____] person-days for post-startup training.

B. Furnish training of [Owner's] [_____] personnel at such times as requested by [Owner] [_____].

1.03 EXTRA MATERIALS

A. Furnish, tag, and box for shipment and storage the following special tools and material:

1. [Fuse handling tool, compatible with installed fuses.]
2. [[One] [Two] [_____] sets of three grounding jumpers 3 feet in length, complete with canvas storage bag for each set.]
3. [Voltage tester with audio and visual signals, batteries, shotgun clamp-stick adapter, and storage case.]
4. [[6] [8] feet 5-1/2 inches long shotgun clamp stick with canvas storage bag.]
5. [Solid material fuse [end fittings,] [holders,] and [fuse,] [refill] units for each installed fuse size.]
6. [Electron fuse [interrupting module] [and] [control module] and [fuse] [refill] units for each installed fuse size.]

PART 2 - PRODUCTS

2.01 MANUFACTURERS

A. S&C Co.

B. [_____]

©COPYRIGHT 2013 CH2M HILL

C. [No “or-equal” or substitute products will be considered.]

D. Provide pad mounted switchgear that is the product of a single manufacturer. Assembled units with component parts of several manufacturers will not be acceptable with the exception that minor items as terminal blacks, test switch, wiring, etc., may be manufactured by others.

2.02 GENERAL

A. Equipment suitable for [4,160] [12,500] [13,200] [13,800] [_____] volts, three-phase, [three-wire] [four-wire] [_____] [solid] [low resistance] [high resistance] [grounded-wye] [ungrounded]] electrical system having an available short-circuit current at line terminals of [_____] amperes rms symmetrical [as shown].

B. Pad mounted switchgear complete with self-supporting enclosure for [elbow-connected encased] [directly operable accessible] components.

C. Switchgear shall be [manually operated] [power operated with [remote supervisory control] [and] [automatic source transfer].]

D. [Radial] [Primary selective] [and] [looped-primary] [_____] interrupter switch configuration as shown on one-line diagram.

E. Design, test, and assemble in accordance to IEEE C37.20.3, IEEE C37.57, and IEEE C57.12.28.

F. Operating Conditions:

1. Ambient Temperature: Maximum [40] [45] [_____] degrees C.
2. Equipment shall be fully rated without derating for these operating conditions.

G. Anchor Bolts: [Galvanized,] [Type 316 stainless steel,] 5/8-inch diameter, length sized by manufacturer, and as specified in Section 05 50 00, Metal Fabrications.

2.03 EQUIPMENT RATINGS

1. Integrated switchgear assembly ratings at 60-Hz.
2. Voltage: 14.4 kV nominal, 17.0 kV maximum.
3. Insulation Level: 95 kV BIL.
4. Bus Current: [200] [and] [600] amperes continuous [, as shown on one-line diagram].

©COPYRIGHT 2013 CH2MHILL

5. Three-Pole Interrupter Switches:
   a. Current: [200] [and] [600] continuous amperes, [200] [600] load dropping amperes.
   b. Two-Time Duty-Cycle Fault Closing: 22,400 amperes rms asymmetrical.
6. Fuses with Integral Load Interrupter:
   a. Current: [200] [200E] [200K] [400] maximum amperes, [200] [400] load dropping amperes.
   b. Two-Time Duty-Cycle Fault Closing: 13,000 amperes rms asymmetrical.
7. Short-Circuit Rating: [14,000] [12,500] amperes rms symmetrical, [350] [310] mVa three-phase symmetrical at rated nominal voltage.

B. Fault-closing ratings to equal, or exceed, the short-circuit ratings of the pad mounted switchgear with:

1. Momentary and two-time duty-cycle rating of switches.
2. Momentary rating of bus.
3. Interrupting ratings of fuses.
4. [One-time duty-cycle capabilities of fuses with integral load interrupters.]

2.04 ENCLOSURE

A. Monocoque, freestanding, self-supporting construction with welded structural and butt joints having external seams ground flush and smooth.

B. Enclosure sides, doors, roof, bottom flange, [base spacer,] and steel barriers constructed with 11-gauge hot-rolled, pickled, and oiled sheet steel.

C. Tamper resistant with no externally accessible hardware in accordance with security requirements of IEEE C57.12.28.

D. Removable lifting tabs bolted to blind-tapped sockets with resilient anticorrosion material between tabs and enclosure.

E. Enclosure Base:

1. Consisting of continuous 90-degree steel flanges welded to enclosure and turned inward for bolting to [concrete pad] [polymer concrete base] [base spacer].
2. Resilient closed-cell PVC gasket applied between flange bottom and [concrete vault] [polymer concrete vault] [base spacer].
3. Coat enclosure flange with wax-based anticorrosion moisture barrier.

©COPYRIGHT 2013 CH2M HILL

F. Enclosure Roof:

1. Overlapping edges creating mechanical maze and ventilating openings.
2. Insulating nondrip compound applied to underside.

G. Doors:

1. Constructed with edge flanges overlapping door openings to form mechanical maze.
2. Two extruded-aluminum hinges with Type 316 stainless steel pins, full length of door extruded-aluminum interlocking supports, and stainless steel mounting hardware for each door.
3. Access door to power fuses equipped with storage space for replacement fuse components.
4. Hidden galvanized steel door holders swinging outward when door is in opened position.

H. Door Latch:

1. Automatic positive action, three-point, spring-loaded latching mechanism for each door or set of doors.
2. Pentahead socket wrench to actuate mechanism for unlatching door and recharging spring for next closing operation in same motion.
3. Tamper-proof padlocking shackle coordinated with latches to prevent:
   a. Unlatching mechanism until padlock is removed.
   b. Inserting padlock until mechanism is completely latched closed.

I. Finish:

1. Multistage process applied to interior and exterior surfaces, joints, and blind areas prior to enclosure assembly.
   a. Pretreatment protective film.
   b. Baked epoxy finished coating.
   c. Baked acrylic enamel top coating in accordance with IEEE C57.12.28.
2. Color: [Munsell 7GY3.29/1.5 olive green.] [Gray.] [Manufacturer’s standard.] [_____]
3. Tests:
   a. Salt-spray test in accordance with ASTM B117.
   b. Humidity test in accordance with ASTM D2247 and ASTM D714.
   c. Accelerated weather tests in accordance with ASTM G154, ASTM D4214, and ASTM D523.

©COPYRIGHT 2013 CH2MHILL

d. Adhesion tests in accordance with ASTM D3359, Method B and ASTM D2794.
e. Corrosion tests in accordance with ASTM D1645.
f. Abrasion tests in accordance with ASTM D4060.
g. Oil resistance testing with no shift in color, streaking, blistering, or loss of hardness.

2.05 BARRIERS

A. In compliance with NEMA C2.

B. Full-length steel barriers separating side-by-side compartments.

C. BIL Rated Fiberglass-Reinforced Polyester Barriers:

1. Fixed interphase and end barriers for each interrupter switch and each set of fuses.
2. Front and rear compartments [and tie bus] isolated by fixed barriers.
3. [Hanging front barriers with window panel, insertable into open gap when switch is opened, for each interrupter switch.]
4. [Hanging front barrier, insertable into open gap when fuse is removed for each fuse.]
5. [Inner barrier panel, secured in place with recessed pentahead bolts, for each high voltage door.]
6. [Hanging front barrier for each door opening.]

2.06 COMPONENT ENCASEMENT

A. In compliance with NEMA C2.

B. Switch and fuse components, and interconnecting bus enclosed in inner air-insulated, grounded, steel compartment bulkheads and 22-gauge galvanized steel floor.

C. Resilient gasketing between compartment bulkheads and enclosure roof and sides.

D. Dense closed-cell gaskets between fuse-handling mechanisms and compartment bulkhead.

E. Full-length steel barriers separating adjoining termination compartments.

F. BIL rated fiberglass-reinforced polyester barriers to isolate interphase bus from components.

©COPYRIGHT 2013 CH2M HILL

G. Wide-angle viewing window in bulkhead for visual verification of each interrupter switch position.

H. Viewing window in bulkhead adjacent to each fuse-handling mechanism for visual check of blown-fuse indicators.

I. Parking stands adjacent to each 600-ampere rated bushing and 200-ampere rated bushing well.

J. Cable guides at each fuse-handling mechanism.

2.07 GROUND-CONNECTION PADS

A. Provided in each compartment on inside at bottom door stile with momentary rating equal to, or exceeding, short-circuit ratings of switchgear.

B. Constructed of 5/8-inch-thick nickel-plated steel, with oxide inhibitor and sealant coating, welded to enclosure.

C. [Ground studs of each fuse terminal plus one ground stud at ground connection pad in each [fuse compartment] [and] [switch terminals].]

2.08 GROUND RINGS

A. Provide full width in each switch compartment and at each fuse-handling mechanism.

B. Constructed of 3/8-inch-thick copper bolted to the metal enclosure inside at bottom door stile.

C. Cable guides at each fuse-handling mechanism ground ring.

2.09 INSULATORS

A. Interrupter switch and fuse mounting insulators, insulated operating shafts, and push rods constructed of cycloaliphatic epoxy resin in accordance with NEMA C29.9 and NEMA C29.10.

2.10 HIGH VOLTAGE BUS

A. [Copper] [Aluminum] bus bar and bus supports.

©COPYRIGHT 2013 CH2MHILL

B. [Square-edged, hard-drawn copper bar in accordance with ASTM B187.] [Aluminum bar with minimum 56 percent IACS conductivity of annealed copper in accordance with ASTM B236.]

C. [Silver-plated copper-to-copper bar connection made with 1/2-inch by 13-inch stainless steel bolts with one flat-brass washer under bolthead and one flat washer and stainless steel split washer between flat washer and nut.] [Aluminum-to-aluminum bar connections made with 1/2-inch by 13-inch galvanized steel bolts with Belleview spring washers under bolthead and nut.]

D. Bus rated [600] [1,200]-ampere with provisions for [one] [two]-cable terminations per phase.

2.11 INTERRUPTER SWITCHES

A. External handle-operated, three-pole, nonfused, group-operated with quick-make quick-break mechanism for live, full load, open and close switching in accordance with IEEE C37.58.

B. Single insulated shaft with blades and journals permanently molded in-place for positive and inherently sequenced blade position.

C. One-piece, formed hard-drawn copper blades with silver-clad contact surfaces.

D. Multifinger, convexed, silver-clad copper jaw contacts with stainless steel springs for constant contact pressure.

E. Equip each switchblade assembly with arc compressor, [strain-guard terminals] [600-ampere bushings with removable threaded studs,] and support insulators.

F. Mount each switch assembly [, bushings with adjacent elbow parking stands,] and operator on a rigid, welded steel frame.

G. Switch [and bus compartment] terminals to accommodate [one] [two] cables per phase.

H. [Mounting provisions only for] base mounted metal-oxide type distribution class surge arrests rated [9] [10] [_____] kV at all source switch terminals.]

I. [Bushings, with removable threaded studs, to be constructed of cycloaliphatic epoxy resin and in compliance with IEEE 386.]

J. [Shaft lock for each switch.]

K. [Key interlocks to prevent paralleling of switches in Compartments 1 and 2.]

©COPYRIGHT 2013 CH2M HILL

L. [Key interlocks to prevent opening of fuse-terminal compartment doors unless all switches are locked open.]

2.12 FUSE INTERRUPTERS

A. Disconnect style interrupter switches suitable for [solid material] [electronic] power fuses, complete with steel base, insulators, [terminal pads,] [loadbreak connector,] mounting contacts, and lower hinge and pull-ring operated latch.

B. Fuse-interrupter mounted on a fuse-handling mechanism with mechanical interlock to prevent fuse access before opening the loadbreak connector at the fuse terminal.

C. Fuse mounting jaw contacts with integral load interrupter for live switching with hookstick.

D. Cycloaliphatic epoxy resin housing for load interrupters.

E. Load interrupters with continuous current path, self-resetting, separate contacts for fault-closing and load currents, and self-guiding fuse hinge.

F. Integral load interrupters to have one-time duty-cycle fault-closing capability equal to interrupting rating of fuse, and two-time duty-cycle fault-closing capability of 13,000-ampere rms asymmetrical at 14.4 kV.

G. Equip each fuse interrupter with [tin-plated copper terminal pads having two-position adapter] [loadbreak connector and 200-ampere bushing well having parking stand mounted adjacent to interrupter].

H. [Bushing wells to be constructed of cycloaliphatic epoxy resin and in compliance with IEEE 386.]

2.13 FUSES

A. Solid Material Power Fuse:

1. In accordance with NEMA SG 2.
2. End fitting, upper end pull ring fitting, blown-fuse target, expendable fuse unit, aluminum-bronze lower end fitting, and silencer.
3. Manufacturer and Product: [S&C Co.; Type SM-20.] [_____]

B. Electronic Power Fuse:

©COPYRIGHT 2013 CH2MHILL

1. With fuse holder, expendable interrupting module, reusable control module, and blown-fuse target.
2. Interrupting module with main current section and fault-interrupting section arranged coaxially within single housing.
3. Control module with factory-sealed, cylindrical cast aluminum housing containing self-power electronic components and integrally mounted current transformers with no external control wiring or connections to ground.
4. Manufacturer and Product: [S&C Co.; Fault Filter.] [_____]

2.14 AUTOMATIC SOURCE TRANSFER

A. Source transfer control for primary selective system with transfer on loss and return of source voltage via voltage sensors.

B. Complete with switch operators and source transfer controller, voltage sensors, switch operational counters, and accessories.

C. Installed in low voltage, steel-enclosed, grounded control compartment having fully gasketed door openings.

D. Interrupter Switch Operators:

1. Stored energy, motor-charged operators with automatic solenoid trip-open and trip-closed operation.
2. Operators to automatically charge when voltage is present on associated source.
3. Quick-make quick-break mechanism to operate within 10 cycles, excluding any intentional time delay.
4. Complete with decoupler without affecting position of switch.
5. Open/close pushbuttons for tripping quick-make quick-break mechanism.
6. Manual handle for charging and tripping quick-make quick-break mechanism.
7. Operator Targets to Indicate:
   a. Quick-Make Quick-Break Mechanism:
      1) Charged.
      2) Discharged.
   b. Operator Position:
      1) Switch-open.
      2) Switch-closed.
8. Interrupter switch target to indicate open or closed positions.
9. Three-Position Operation Selector:
   a. Operating Position for:
      1) Electrical and manual operation of switch.

©COPYRIGHT 2013 CH2M HILL

2) Exercising and testing operator with stored energy operator is decoupled without opening or closing interrupter switch.

b. Lock position to prevent electrical and manual operation when padlocked.

c. Charging position permits manual charging of quick-make quick-break mechanism while prohibiting electrical and manual tripping.
